Welcome

This is the *Amazon EC2 API Reference*. It provides descriptions, API request parameters, and the XML response for each of the Amazon EC2 Query API actions. Note that the Amazon EC2 API includes actions for Amazon EC2 plus additional services, such as Amazon EBS and Amazon VPC.

Alternatively, use one of the following methods to access the Amazon EC2 API, instead of using the Query API directly:

- AWS CLI Command Reference – ec2 commands
- AWS CloudFormation – Amazon EC2 resource type reference
- AWS Tools for PowerShell Cmdlet Reference – Amazon EC2 cmdlets
- AWS SDKs

How Do I?	Relevant Documentation
Learn about using the Query API	Making requests to the Amazon EC2 API
Learn about the permissions required to call an Amazon EC2 API action	Actions, resources, and condition keys for Amazon EC2
Get the list of API actions by service and resource	Actions by service
Get the alphabetical list of API actions	Actions
Get descriptions of the API error codes	Error codes for the Amazon EC2 API

Actions by service

The Amazon EC2 API consists of actions and data types for multiple services. To view the actions for each service, see the following pages.

Services

- AWS Client VPN actions
- Amazon EBS actions
- Amazon EC2 actions
- AWS Network Manager actions
- AWS Nitro Enclaves
- AWS Outposts actions
- AWS PrivateLink actions
- Recycle Bin
- AWS Site-to-Site VPN actions
- AWS Transit Gateway actions
- AWS Verified Access actions
- VM Import/Export actions
- Amazon VPC actions
- Secondary Networks actions
- Amazon VPC IPAM actions
- AWS Wavelength actions

AWS Client VPN actions

The following API actions are available for AWS Client VPN. To learn more about Client VPN, see the Site-to-Site VPN product page and the Site-to-Site VPN documentation.

Authorization rules

- AuthorizeClientVpnIngress
- DescribeClientVpnAuthorizationRules

- RevokeClientVpnIngress

Certificate revocation lists

- ExportClientVpnClientCertificateRevocationList
- ImportClientVpnClientCertificateRevocationList

Client connections

- DescribeClientVpnConnections
- TerminateClientVpnConnections

Client VPN endpoints

- CreateClientVpnEndpoint
- DeleteClientVpnEndpoint
- DescribeClientVpnEndpoints
- ModifyClientVpnEndpoint

Configuration files

- ExportClientVpnClientConfiguration

Routes

- CreateClientVpnRoute
- DeleteClientVpnRoute
- DescribeClientVpnRoutes

Target networks

- ApplySecurityGroupsToClientVpnTargetNetwork
- AssociateClientVpnTargetNetwork
- DescribeClientVpnTargetNetworks

- DisassociateClientVpnTargetNetwork

Amazon EBS actions

The following API actions are available for Amazon EBS. To learn more about Amazon EBS, see the Amazon EBS product page and the Amazon EBS documentation.

Encryption

- DisableEbsEncryptionByDefault
- EnableEbsEncryptionByDefault
- GetEbsDefaultKmsKeyId
- GetEbsEncryptionByDefault
- ModifyEbsDefaultKmsKeyId
- ResetEbsDefaultKmsKeyId

Fast snapshot restores

- DescribeFastSnapshotRestores
- DisableFastSnapshotRestores
- EnableFastSnapshotRestores

Snapshots

- CopySnapshot
- CreateSnapshot
- CreateSnapshots
- DescribeLockedSnapshots
- DeleteSnapshot
- DescribeSnapshotAttribute
- DescribeSnapshots
- DescribeSnapshotTierStatus
- DisableSnapshotBlockPublicAccess
- EnableSnapshotBlockPublicAccess

- GetSnapshotBlockPublicAccessState
- LockSnapshot
- ModifySnapshotAttribute
- ModifySnapshotTier
- ResetSnapshotAttribute
- RestoreSnapshotTier
- UnlockSnapshot

Volumes

- AttachVolume
- CopyVolumes
- CreateReplaceRootVolumeTask
- CreateVolume
- DeleteVolume
- DescribeReplaceRootVolumeTasks
- DescribeVolumeAttribute
- DescribeVolumes
- DescribeVolumesModifications
- DescribeVolumeStatus
- DetachVolume
- EnableVolumeIO
- ModifyVolume
- ModifyVolumeAttribute

Amazon EC2 actions

The following API actions are available for Amazon EC2. To learn more about Amazon EC2, see the Amazon EC2 product page and the Amazon EC2 documentation.

Account attributes

- DescribeAccountAttributes

AFIs

- CopyFpgaImage
- CreateFpgaImage
- DeleteFpgaImage
- DescribeFpgaImageAttribute
- DescribeFpgaImages
- ModifyFpgaImageAttribute
- ResetFpgaImageAttribute

AMIs

- CancelImageLaunchPermission
- CopyImage
- CreateImage
- CreateImageUsageReport
- CreateRestoreImageTask
- CreateStoreImageTask
- DeleteImageUsageReport
- DeregisterImage
- DescribeFastLaunchImages
- DescribeImageAttribute
- DescribeImageReferences
- DescribeImages
- DescribeImageUsageReportEntries
- DescribeImageUsageReports
- DescribeInstanceImageMetadata
- DescribeStoreImageTasks
- DisableAllowedImagesSettings
- DisableFastLaunch
- DisableImage

- DisableImageBlockPublicAccess
- DisableImageDeprecation
- DisableImageDeregistrationProtection
- EnableAllowedImagesSettings
- EnableFastLaunch
- EnableImage
- EnableImageBlockPublicAccess
- EnableImageDeprecation
- EnableImageDeregistrationProtection
- GetAllowedImagesSettings
- GetImageAncestry
- GetImageBlockPublicAccessState
- ModifyImageAttribute
- RegisterImage
- ReplaceImageCriteriaInAllowedImagesSettings
- ResetImageAttribute

AWS Marketplace

- ConfirmProductInstance

Bundle tasks

- BundleInstance
- CancelBundleTask
- DescribeBundleTasks

BYOIP

- AdvertiseByoipCidr
- DeprovisionByoipCidr
- DescribeByoipCidrs

- DescribeIpv6Pools
- DescribePublicIpv4Pools
- GetAssociatedIpv6PoolCidrs
- ProvisionByoipCidr
- WithdrawByoipCidr

Capacity Reservations

- AcceptCapacityReservationBillingOwnership
- AssociateCapacityReservationBillingOwner
- CancelCapacityReservation
- CancelCapacityReservationFleets
- CreateCapacityReservation
- CreateCapacityReservationBySplitting
- CreateCapacityReservationFleet
- DescribeCapacityBlockExtensionHistory
- DescribeCapacityBlockExtensionOfferings
- DescribeCapacityBlockOfferings
- DescribeCapacityBlocks
- DescribeCapacityBlockStatus
- DescribeCapacityReservationBillingRequests
- DescribeCapacityReservations
- DescribeCapacityReservationFleets
- DescribeMacModificationTasks
- DisassociateCapacityReservationBillingOwner
- GetCapacityReservationUsage
- GetGroupsForCapacityReservation
- ModifyCapacityReservation
- ModifyCapacityReservationFleet
- ModifyInstanceCapacityReservationAttributes
- MoveCapacityReservationInstances

- PurchaseCapacityBlock
- PurchaseCapacityBlockExtension
- RejectCapacityReservationBillingOwnership

Declarative Policies - Account Status Report

- CancelDeclarativePoliciesReport
- DescribeDeclarativePoliciesReports
- GetDeclarativePoliciesReportSummary
- StartDeclarativePoliciesReport

Dedicated Hosts

- AllocateHosts
- DescribeHostReservationOfferings
- DescribeHostReservations
- DescribeHosts
- DescribeMacHosts
- GetHostReservationPurchasePreview
- ModifyHosts
- ModifyInstancePlacement
- PurchaseHostReservation
- ReleaseHosts

EC2 Fleet

- CreateFleet
- DeleteFleets
- DescribeFleetHistory
- DescribeFleetInstances
- DescribeFleets
- ModifyFleet

EC2 Instance Connect Endpoints

- CreateInstanceConnectEndpoint
- DeleteInstanceConnectEndpoint
- DescribeInstanceConnectEndpoints
- ModifyInstanceConnectEndpoint

EC2 topology

- DescribeCapacityReservationTopology
- DescribeInstanceTopology

Elastic Graphics

- DescribeElasticGpus

Elastic IP addresses

- AcceptAddressTransfer
- AllocateAddress
- AssociateAddress
- DescribeAddresses
- DescribeAddressesAttribute
- DescribeAddressTransfers
- DisableAddressTransfer
- DisassociateAddress
- EnableAddressTransfer
- ModifyAddressAttribute
- ReleaseAddress
- ResetAddressAttribute

Event notifications

- DeregisterInstanceEventNotificationAttributes

- DescribeInstanceEventNotificationAttributes
- RegisterInstanceEventNotificationAttributes

Event windows for scheduled events

- AssociateInstanceEventWindow
- CreateInstanceEventWindow
- DeleteInstanceEventWindow
- DescribeInstanceEventWindows
- DisassociateInstanceEventWindow
- ModifyInstanceEventWindow

Instances

- AssociateIamInstanceProfile
- CreateDelegateMacVolumeOwnershipTask
- CreateMacSystemIntegrityProtectionModificationTask
- DescribeIamInstanceProfileAssociations
- DescribeInstanceAttribute
- DescribeInstanceCreditSpecifications
- DescribeInstances
- DescribeInstanceStatus
- DisassociateIamInstanceProfile
- GetConsoleOutput
- GetConsoleScreenshot
- GetDefaultCreditSpecification
- GetInstanceMetadataDefaults
- GetInstanceUefiData
- GetPasswordData
- ModifyDefaultCreditSpecification
- ModifyInstanceAttribute
- ModifyInstanceCpuOptions

- ModifyInstanceCreditSpecification
- ModifyInstanceEventStartTime
- ModifyInstanceMaintenanceOptions
- ModifyInstanceMetadataDefaults
- ModifyInstanceMetadataOptions
- ModifyInstanceNetworkPerformanceOptions
- ModifyPrivateDnsNameOptions
- ModifyPublicIpDnsNameOptions
- MonitorInstances
- RebootInstances
- ReplaceIamInstanceProfileAssociation
- ReportInstanceStatus
- ResetInstanceAttribute
- RunInstances
- SendDiagnosticInterrupt
- StartInstances
- StopInstances
- TerminateInstances
- UnmonitorInstances

Instance types

- DescribeInstanceTypeOfferings
- DescribeInstanceTypes
- GetInstanceTypesFromInstanceRequirements

Key pairs

- CreateKeyPair
- DeleteKeyPair
- DescribeKeyPairs
- ImportKeyPair

Launch templates

- CreateLaunchTemplate
- CreateLaunchTemplateVersion
- DeleteLaunchTemplate
- DeleteLaunchTemplateVersions
- DescribeLaunchTemplates
- DescribeLaunchTemplateVersions
- GetLaunchTemplateData
- ModifyLaunchTemplate

Nitro TPM

- GetInstanceTpmEkPub

Placement groups

- CreatePlacementGroup
- DeletePlacementGroup
- DescribePlacementGroups

Regions and Zones

- DescribeAvailabilityZones
- DescribeRegions
- ModifyAvailabilityZoneGroup

Reserved Instances

- AcceptReservedInstancesExchangeQuote
- CancelReservedInstancesListing
- CreateReservedInstancesListing
- DeleteQueuedReservedInstances

- DescribeReservedInstances
- DescribeReservedInstancesListings
- DescribeReservedInstancesModifications
- DescribeReservedInstancesOfferings
- GetReservedInstancesExchangeQuote
- ModifyReservedInstances
- PurchaseReservedInstancesOffering

Resource IDs

- DescribeAggregateIdFormat
- DescribeIdentityIdFormat
- DescribeIdFormat
- DescribePrincipalIdFormat
- ModifyIdentityIdFormat
- ModifyIdFormat

Serial console

- DisableSerialConsoleAccess
- EnableSerialConsoleAccess
- GetSerialConsoleAccessStatus

Scheduled Instances

- DescribeScheduledInstanceAvailability
- DescribeScheduledInstances
- PurchaseScheduledInstances
- RunScheduledInstances

Security groups

- AuthorizeSecurityGroupEgress

- AuthorizeSecurityGroupIngress
- CreateSecurityGroup
- DeleteSecurityGroup
- DescribeSecurityGroupRules
- DescribeSecurityGroups
- ModifySecurityGroupRules
- RevokeSecurityGroupEgress
- RevokeSecurityGroupIngress
- UpdateSecurityGroupRuleDescriptionsEgress
- UpdateSecurityGroupRuleDescriptionsIngress

Spot Instances

- CancelSpotInstanceRequests
- CreateSpotDatafeedSubscription
- DeleteSpotDatafeedSubscription
- DescribeSpotDatafeedSubscription
- DescribeSpotInstanceRequests
- DescribeSpotPriceHistory
- GetSpotPlacementScores
- RequestSpotInstances

Spot Fleet

- CancelSpotFleetRequests
- DescribeSpotFleetInstances
- DescribeSpotFleetRequestHistory
- DescribeSpotFleetRequests
- ModifySpotFleetRequest
- RequestSpotFleet

Tags

- CreateTags
- DeleteTags
- DescribeTags

AWS Network Manager actions

The following API actions are available for AWS Network Manager.

Infrastructure Performance

- DescribeAwsNetworkPerformanceMetricSubscriptions
- DisableAwsNetworkPerformanceMetricSubscription
- EnableAwsNetworkPerformanceMetricSubscription
- GetAwsNetworkPerformanceData

Network Access Analyzer

- CreateNetworkInsightsAccessScope
- DeleteNetworkInsightsAccessScope
- DeleteNetworkInsightsAccessScopeAnalysis
- DescribeNetworkInsightsAccessScopeAnalyses
- DescribeNetworkInsightsAccessScopes
- GetNetworkInsightsAccessScopeAnalysisFindings
- GetNetworkInsightsAccessScopeContent
- StartNetworkInsightsAccessScopeAnalysis

Reachability Analyzer

- CreateNetworkInsightsPath
- DeleteNetworkInsightsAnalysis
- DeleteNetworkInsightsPath

- DescribeNetworkInsightsAnalyses
- DescribeNetworkInsightsPaths
- EnableReachabilityAnalyzerOrganizationSharing
- StartNetworkInsightsAnalysis

AWS Nitro Enclaves

The following API actions are available for AWS Certificate Manager (ACM) for Nitro Enclaves.

- AssociateEnclaveCertificateIamRole
- DisassociateEnclaveCertificateIamRole
- GetAssociatedEnclaveCertificateIamRoles

AWS Outposts actions

The following Amazon EC2 API actions are available for AWS Outposts. There is also an API for AWS Outposts. For more information, see the AWS Outposts API Reference.

Customer-owned IP addresses

- CreateCoipCidr
- CreateCoipPool
- DeleteCoipCidr
- DeleteCoipPool
- DescribeCoipPools
- GetCoipPoolUsage

Local gateways

- CreateLocalGatewayRoute
- CreateLocalGatewayRouteTable
- CreateLocalGatewayRouteTableVirtualInterfaceGroupAssociation
- CreateLocalGatewayVirtualInterface
- CreateLocalGatewayRouteTableVpcAssociation

- CreateLocalGatewayVirtualInterface
- CreateLocalGatewayVirtualInterfaceGroup
- DeleteLocalGatewayRoute
- DeleteLocalGatewayRouteTable
- DeleteLocalGatewayRouteTableVirtualInterfaceGroupAssociation
- DeleteLocalGatewayRouteTableVpcAssociation
- DeleteLocalGatewayVirtualInterface
- DeleteLocalGatewayVirtualInterfaceGroup
- DescribeLocalGatewayRouteTables
- DescribeLocalGatewayRouteTableVirtualInterfaceGroupAssociations
- DescribeLocalGatewayRouteTableVpcAssociations
- DescribeLocalGateways
- DescribeLocalGatewayVirtualInterfaceGroups
- DescribeLocalGatewayVirtualInterfaces
- ModifyLocalGatewayRoute
- SearchLocalGatewayRoutes

Service links

- DescribeServiceLinkVirtualInterfaces

Link aggregation groups

- DescribeOutpostLags

AWS PrivateLink actions

The following API actions are available for AWS PrivateLink. To learn more about AWS PrivateLink, see the AWS PrivateLink product page and the AWS PrivateLink User Guide.

VPC endpoint services

- AcceptVpcEndpointConnections

- CreateVpcEndpointServiceConfiguration
- DeleteVpcEndpointServiceConfigurations
- DescribeVpcEndpointServiceConfigurations
- DescribeVpcEndpointServicePermissions
- DescribeVpcEndpointServices
- ModifyVpcEndpointServiceConfiguration
- ModifyVpcEndpointServicePayerResponsibility
- ModifyVpcEndpointServicePermissions
- RejectVpcEndpointConnections
- StartVpcEndpointServicePrivateDnsVerification

VPC endpoints

- CreateVpcEndpoint
- CreateVpcEndpointConnectionNotification
- DeleteVpcEndpointConnectionNotifications
- DeleteVpcEndpoints
- DescribeVpcEndpointAssociations
- DescribeVpcEndpointConnectionNotifications
- DescribeVpcEndpointConnections
- DescribeVpcEndpoints
- ModifyVpcEndpoint
- ModifyVpcEndpointConnectionNotification

Recycle Bin

The following API actions are available for Recycle Bin. For more information, see the Recycle Bin documentation.

Volumes

- ListVolumesInRecycleBin

- RestoreVolumeFromRecycleBin

Snapshots

- ListSnapshotsInRecycleBin
- RestoreSnapshotFromRecycleBin

AMIs

- ListImagesInRecycleBin
- RestoreImageFromRecycleBin

AWS Site-to-Site VPN actions

The following API actions are available for AWS Site-to-Site VPN. To learn more about Site-to-Site VPN, see the Site-to-Site VPN product page and the Site-to-Site VPN documentation.

Customer gateways

- CreateCustomerGateway
- DeleteCustomerGateway
- DescribeCustomerGateways

Virtual private gateways

- AttachVpnGateway
- CreateVpnGateway
- DeleteVpnGateway
- DescribeVpnGateways
- DetachVpnGateway

Virtual private gateway routes

- DisableVgwRoutePropagation
- EnableVgwRoutePropagation

VPN connections

- CreateVpnConnection
- CreateVpnConnectionRoute
- DeleteVpnConnection
- DeleteVpnConnectionRoute
- DescribeVpnConnections
- GetActiveVpnTunnelStatus
- GetVpnConnectionDeviceSampleConfiguration
- GetVpnConnectionDeviceTypes
- GetVpnTunnelReplacementStatus
- ModifyVpnConnection
- ModifyVpnConnectionOptions
- ModifyVpnTunnelCertificate
- ModifyVpnTunnelOptions
- ReplaceVpnTunnel

VPN Concentrators

- CreateVpnConcentrator
- DeleteVpnConcentrator
- DescribeVpnConcentrators

AWS Transit Gateway actions

The following API actions are available for AWS Transit Gateway. For more information, see the Amazon VPC Transit Gateways.

Transit gateways

- AcceptTransitGatewayVpcAttachment
- CreateTransitGateway
- CreateTransitGatewayVpcAttachment

- DeleteTransitGateway
- DeleteTransitGatewayVpcAttachment
- DescribeTransitGatewayAttachments
- DescribeTransitGateways
- DescribeTransitGatewayVpcAttachments
- ModifyTransitGateway
- ModifyTransitGatewayVpcAttachment
- RejectTransitGatewayVpcAttachment

Transit Gateway Connect

- CreateTransitGatewayConnect
- CreateTransitGatewayConnectPeer
- DeleteTransitGatewayConnect
- DeleteTransitGatewayConnectPeer
- DescribeTransitGatewayConnects
- DescribeTransitGatewayConnectPeers

Transit Gateway Multicast

- AcceptTransitGatewayMulticastDomainAssociations
- AssociateTransitGatewayMulticastDomain
- CreateTransitGatewayMulticastDomain
- DeleteTransitGatewayMulticastDomain
- DeregisterTransitGatewayMulticastGroupMembers
- DeregisterTransitGatewayMulticastGroupSources
- DescribeTransitGatewayMulticastDomains
- DisassociateTransitGatewayMulticastDomain
- GetTransitGatewayMulticastDomainAssociations
- RegisterTransitGatewayMulticastGroupMembers
- RegisterTransitGatewayMulticastGroupSources

- RejectTransitGatewayMulticastDomainAssociations
- SearchTransitGatewayMulticastGroups

Transit Gateway Peering Attachments

- AcceptTransitGatewayPeeringAttachment
- CreateTransitGatewayPeeringAttachment
- DeleteTransitGatewayPeeringAttachment
- DescribeTransitGatewayPeeringAttachments
- RejectTransitGatewayPeeringAttachment

Transit gateway policy tables

- AssociateTransitGatewayPolicyTable
- CreateTransitGatewayPolicyTable
- DeleteTransitGatewayPolicyTable
- DescribeTransitGatewayPolicyTables
- DisassociateTransitGatewayPolicyTable
- GetTransitGatewayPolicyTableAssociations
- GetTransitGatewayPolicyTableEntries

Transit gateway route tables

- AssociateTransitGatewayRouteTable
- CreateTransitGatewayPrefixListReference
- CreateTransitGatewayRoute
- CreateTransitGatewayRouteTable
- CreateTransitGatewayRouteTableAnnouncement
- DeleteTransitGatewayPrefixListReference
- DeleteTransitGatewayRoute
- DeleteTransitGatewayRouteTable
- DeleteTransitGatewayRouteTableAnnouncement

- DescribeTransitGatewayRouteTableAnnouncements
- DescribeTransitGatewayRouteTables
- DisableTransitGatewayRouteTablePropagation
- DisassociateTransitGatewayRouteTable
- EnableTransitGatewayRouteTablePropagation
- ExportTransitGatewayRoutes
- GetTransitGatewayAttachmentPropagations
- GetTransitGatewayPrefixListReferences
- GetTransitGatewayRouteTableAssociations
- GetTransitGatewayRouteTablePropagations
- ModifyTransitGatewayPrefixListReference
- ReplaceTransitGatewayRoute
- SearchTransitGatewayRoutes

AWS Verified Access actions

The following API actions are available for AWS Verified Access. To learn more about Verified Access, see the Verified Access product page and the Verified Access documentation.

Verified Access endpoints

- CreateVerifiedAccessEndpoint
- DeleteVerifiedAccessEndpoint
- DescribeVerifiedAccessEndpoints
- GetVerifiedAccessEndpointPolicy
- GetVerifiedAccessEndpointTargets
- ModifyVerifiedAccessEndpoint
- ModifyVerifiedAccessEndpointPolicy

Verified Access groups

- CreateVerifiedAccessGroup

- DeleteVerifiedAccessGroup
- DescribeVerifiedAccessGroups
- GetVerifiedAccessGroupPolicy
- ModifyVerifiedAccessGroup
- ModifyVerifiedAccessGroupPolicy

Verified Access instances

- CreateVerifiedAccessInstance
- DeleteVerifiedAccessInstance
- DescribeVerifiedAccessInstances
- ExportVerifiedAccessInstanceClientConfiguration
- ModifyVerifiedAccessInstance

Verified Access logs

- DescribeVerifiedAccessInstanceLoggingConfigurations
- ModifyVerifiedAccessInstanceLoggingConfiguration

Verified Access trust providers

- AttachVerifiedAccessTrustProvider
- CreateVerifiedAccessTrustProvider
- DeleteVerifiedAccessTrustProvider
- DescribeVerifiedAccessTrustProviders
- DetachVerifiedAccessTrustProvider
- ModifyVerifiedAccessTrustProvider

VM Import/Export actions

The following API actions are available for VM Import/Export. For more information, see the VM Import/Export documentation.

VM export

- CancelExportTask
- CreateInstanceExportTask
- DescribeExportImageTasks
- DescribeExportTasks
- ExportImage

VM import

- CancelConversionTask
- CancelImportTask
- DescribeConversionTasks
- DescribeImportImageTasks
- DescribeImportSnapshotTasks
- ImportImage
- ImportInstance
- ImportSnapshot
- ImportVolume

Amazon VPC actions

The following API actions are available for Amazon VPC. To learn more about Amazon VPC, see the Amazon VPC product page and the Amazon VPC documentation.

Block public access

- CreateVpcBlockPublicAccessExclusion
- DeleteVpcBlockPublicAccessExclusion
- DescribeVpcBlockPublicAccessExclusions
- DescribeVpcBlockPublicAccessOptions
- ModifyVpcBlockPublicAccessExclusion
- ModifyVpcBlockPublicAccessOptions

DHCP options

- AssociateDhcpOptions
- CreateDhcpOptions
- DeleteDhcpOptions
- DescribeDhcpOptions

Elastic network interfaces

- AssignIpv6Addresses
- AssignPrivateIpAddresses
- AttachNetworkInterface
- CreateNetworkInterface
- CreateNetworkInterfacePermission
- DeleteNetworkInterface

AcceptAddressTransfer

Accepts an Elastic IP address transfer. For more information, see Accept a transferred Elastic IP address in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Address

The Elastic IP address you are accepting for transfer.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TagSpecification.N

`tag`:<key> - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

addressTransfer

An Elastic IP address transfer.

Type: AddressTransfer object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

AcceptCapacityReservationBillingOwnership

Accepts a request to assign billing of the available capacity of a shared Capacity Reservation to your account. For more information, see Billing assignment for shared Amazon EC2 Capacity Reservations.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CapacityReservationId

The ID of the Capacity Reservation for which to accept the request.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4

- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

AcceptReservedInstancesExchangeQuote

Accepts the Convertible Reserved Instance exchange quote described in the GetReservedInstancesExchangeQuote call.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ReservedInstanceId.N

The IDs of the Convertible Reserved Instances to exchange for another Convertible Reserved Instance of the same or higher value.

Type: Array of strings

Required: Yes

TargetConfiguration.N

The configuration of the target Convertible Reserved Instance to exchange for your current Convertible Reserved Instances.

Type: Array of TargetConfigurationRequest objects

Required: No

Response Elements

The following elements are returned by the service.

exchangeId

The ID of the successful exchange.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

AcceptTransitGatewayMulticastDomainAssociations

Accepts a request to associate subnets with a transit gateway multicast domain.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

SubnetIds.N

The IDs of the subnets to associate with the transit gateway multicast domain.

Type: Array of strings

Required: No

TransitGatewayAttachmentId

The ID of the transit gateway attachment.

Type: String

Required: No

TransitGatewayMulticastDomainId

The ID of the transit gateway multicast domain.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

associations

Information about the multicast domain associations.

Type: TransitGatewayMulticastDomainAssociations object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

AcceptTransitGatewayPeeringAttachment

Accepts a transit gateway peering attachment request. The peering attachment must be in the `pendingAcceptance` state.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TransitGatewayAttachmentId

The ID of the transit gateway attachment.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

transitGatewayPeeringAttachment

The transit gateway peering attachment.

Type: TransitGatewayPeeringAttachment object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example accepts the specified transit gateway peering attachment by specifying its attachment ID.

Sample Request

```
https://ec2.amazonaws.com/?Action=AcceptTransitGatewayPeeringAttachment
&TransitGatewayAttachmentId=tgw-attach-12345678901abcd12
&AUTHPARAMS
```

See Also

- AWS SDK for Ruby V3

AcceptTransitGatewayVpcAttachment

Accepts a request to attach a VPC to a transit gateway.

The VPC attachment must be in the `pendingAcceptance` state. Use DescribeTransitGatewayVpcAttachments to view your pending VPC attachment requests. Use RejectTransitGatewayVpcAttachment to reject a VPC attachment request.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TransitGatewayAttachmentId

The ID of the attachment.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

transitGatewayVpcAttachment

The VPC attachment.

Type: TransitGatewayVpcAttachment object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

AcceptVpcEndpointConnections

Accepts connection requests to your VPC endpoint service.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ServiceId

The ID of the VPC endpoint service.

Type: String

Required: Yes

VpcEndpointId.N

The IDs of the interface VPC endpoints.

Type: Array of strings

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

unsuccessful

Information about the interface endpoints that were not accepted, if applicable.

Type: Array of UnsuccessfulItem objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example accepts the request for interface endpoint `vpce-0c1308d7312217123` to connect to your service `vpce-svc-abc5ebb7d9579a2b3`.

Sample Request

```
https://ec2.amazonaws.com/?Action=AcceptVpcEndpointConnections
&ServiceId=vpce-svc-abc5ebb7d9579a2b3
&VpcEndpointId.1=vpce-0c1308d7312217123
&AUTHPARAMS
```

Sample Response

```
<AcceptVpcEndpointConnectionsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>986a2264-8a40-4da8-8f11-e8aaexample</requestId>
    <unsuccessful/>
</AcceptVpcEndpointConnectionsResponse>
```

- AWS SDK for Ruby V3

AcceptVpcPeeringConnection

Accept a VPC peering connection request. To accept a request, the VPC peering connection must be in the `pending-acceptance` state, and you must be the owner of the peer VPC. Use DescribeVpcPeeringConnections to view your outstanding VPC peering connection requests.

For an inter-Region VPC peering connection request, you must accept the VPC peering connection in the Region of the accepter VPC.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

VpcPeeringConnectionId

The ID of the VPC peering connection. You must specify this parameter in the request.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

vpcPeeringConnection

Information about the VPC peering connection.

Type: VpcPeeringConnection object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example accepts the specified VPC peering connection request.

Sample Request

```
https://ec2.amazonaws.com/?Action=AcceptVpcPeeringConnection
&VpcPeeringConnectionId=pcx-1a2b3c4d
&AUTHPARAMS
```

Sample Response

```
<AcceptVpcPeeringConnectionResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>

AdvertiseByoipCidr

Advertises an IPv4 or IPv6 address range that is provisioned for use with your AWS resources through bring your own IP addresses (BYOIP).

You can perform this operation at most once every 10 seconds, even if you specify different address ranges each time.

We recommend that you stop advertising the BYOIP CIDR from other locations when you advertise it from AWS. To minimize down time, you can configure your AWS resources to use an address from a BYOIP CIDR before it is advertised, and then simultaneously stop advertising it from the current location and start advertising it through AWS.

It can take a few minutes before traffic to the specified addresses starts routing to AWS because of BGP propagation delays.

To stop advertising the BYOIP CIDR, use WithdrawByoipCidr.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Asn

The public 2-byte or 4-byte ASN that you want to advertise.

Type: String

Required: No

Cidr

The address range, in CIDR notation. This must be the exact range that you provisioned. You can't advertise only a portion of the provisioned range.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

NetworkBorderGroup

If you have Local Zones enabled, you can choose a network border group for Local Zones when you provision and advertise a BYOIPv4 CIDR. Choose the network border group carefully as the EIP and the AWS resource it is associated with must reside in the same network border group.

You can provision BYOIP address ranges to and advertise them in the following Local Zone network border groups:

- us-east-1-dfw-2
- us-west-2-lax-1
- us-west-2-phx-2

> **Note**
>
> You cannot provision or advertise BYOIPv6 address ranges in Local Zones at this time.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

byoipCidr

Information about the address range.

Type: ByoipCidr object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

AllocateAddress

Allocates an Elastic IP address to your AWS account. After you allocate the Elastic IP address you can associate it with an instance or network interface. After you release an Elastic IP address, it is released to the IP address pool and can be allocated to a different AWS account.

You can allocate an Elastic IP address from one of the following address pools:

- Amazon's pool of IPv4 addresses
- Public IPv4 address range that you own and bring to your AWS account using Bring Your Own IP Addresses (BYOIP)
- An IPv4 IPAM pool with an Amazon-provided or BYOIP public IPv4 address range
- IPv4 addresses from your on-premises network made available for use with an Outpost using a customer-owned IP address pool (CoIP pool)

For more information, see Elastic IP Addresses in the *Amazon EC2 User Guide*.

If you release an Elastic IP address, you might be able to recover it. You cannot recover an Elastic IP address that you released after it is allocated to another AWS account. To attempt to recover an Elastic IP address that you released, specify it in this operation.

You can allocate a carrier IP address which is a public IP address from a telecommunication carrier, to a network interface which resides in a subnet in a Wavelength Zone (for example an EC2 instance).

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Address

The Elastic IP address to recover or an IPv4 address from an address pool.

Type: String

Required: No

CustomerOwnedIpv4Pool

The ID of a customer-owned address pool. Use this parameter to let Amazon EC2 select an address from the address pool. Alternatively, specify a specific address from the address pool.

Type: String

Required: No

Domain

The network (`vpc`).

Type: String

Valid Values: `vpc | standard`

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

IpamPoolId

The ID of an IPAM pool which has an Amazon-provided or BYOIP public IPv4 CIDR provisioned to it. For more information, see Allocate sequential Elastic IP addresses from an IPAM pool in the *Amazon VPC IPAM User Guide*.

Type: String

Required: No

NetworkBorderGroup

A unique set of Availability Zones, Local Zones, or Wavelength Zones from which AWS advertises IP addresses. Use this parameter to limit the IP address to this location. IP addresses cannot move between network border groups.

Use DescribeAvailabilityZones to view the network border groups.

Type: String

Required: No

PublicIpv4Pool

The ID of an address pool that you own. Use this parameter to let Amazon EC2 select an address from the address pool. To specify a specific address from the address pool, use the `Address` parameter instead.

Type: String

Required: No

TagSpecification.N

The tags to assign to the Elastic IP address.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

allocationId

The ID that represents the allocation of the Elastic IP address.

Type: String

carrierIp

The carrier IP address. Available only for network interfaces that reside in a subnet in a Wavelength Zone.

Type: String

customerOwnedIp

The customer-owned IP address.

Type: String

customerOwnedIpv4Pool

The ID of the customer-owned address pool.

Type: String

domain

The network (`vpc`).

Type: String

Valid Values: `vpc | standard`

networkBorderGroup

The set of Availability Zones, Local Zones, or Wavelength Zones from which AWS advertises IP addresses.

Type: String

publicIp

The Amazon-owned IP address. Not available when using an address pool that you own.

Type: String

publicIpv4Pool

The ID of an address pool that you own.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example for Allocation

This example request allocates an Elastic IP address.

Sample Request

```
https://ec2.amazonaws.com/?Action=AllocateAddress
&Domain=vpc
&AUTHPARAMS
```

Sample Response

```
<AllocateAddressResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <publicIp>198.51.100.1</publicIp>
   <domain>vpc</domain>
   <allocationId>eipalloc-5723d13e</allocationId>
</AllocateAddressResponse>
```

Example for Recovery

This example request shows how to recover an Elastic IP address that you previously released.

Sample Request

```
https://ec2.amazonaws.com/?Action=AllocateAddress
&Domain=vpc
&Address=203.0.113.3
&AUTHPARAMS
```

- AWS SDK for Ruby V3

AllocateHosts

Allocates a Dedicated Host to your account. At a minimum, specify the supported instance type or instance family, the Availability Zone in which to allocate the host, and the number of hosts to allocate.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AssetId.N

The IDs of the Outpost hardware assets on which to allocate the Dedicated Hosts. Targeting specific hardware assets on an Outpost can help to minimize latency between your workloads. This parameter is supported only if you specify **OutpostArn**. If you are allocating the Dedicated Hosts in a Region, omit this parameter.

- If you specify this parameter, you can omit **Quantity**. In this case, Amazon EC2 allocates a Dedicated Host on each specified hardware asset.
- If you specify both **AssetIds** and **Quantity**, then the value for **Quantity** must be equal to the number of asset IDs specified.

Type: Array of strings

Required: No

AutoPlacement

Indicates whether the host accepts any untargeted instance launches that match its instance type configuration, or if it only accepts Host tenancy instance launches that specify its unique host ID. For more information, see Understanding auto-placement and affinity in the *Amazon EC2 User Guide*.

Default: `off`

Type: String

Valid Values: `on` | `off`

Required: No

AvailabilityZone

The Availability Zone in which to allocate the Dedicated Host.

Type: String

Required: No

AvailabilityZoneId

The ID of the Availability Zone.

Type: String

Required: No

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring Idempotency.

Type: String

Required: No

HostMaintenance

Indicates whether to enable or disable host maintenance for the Dedicated Host. For more information, see Host maintenance in the *Amazon EC2 User Guide*.

Type: String

Valid Values: `on` | `off`

Required: No

HostRecovery

Indicates whether to enable or disable host recovery for the Dedicated Host. Host recovery is disabled by default. For more information, see Host recovery in the *Amazon EC2 User Guide*.

Default: `off`

Type: String

Valid Values: `on` | `off`

Required: No

InstanceFamily

Specifies the instance family to be supported by the Dedicated Hosts. If you specify an instance family, the Dedicated Hosts support multiple instance types within that instance family.

If you want the Dedicated Hosts to support a specific instance type only, omit this parameter and specify **InstanceType** instead. You cannot specify **InstanceFamily** and **InstanceType** in the same request.

Type: String

Required: No

InstanceType

Specifies the instance type to be supported by the Dedicated Hosts. If you specify an instance type, the Dedicated Hosts support instances of the specified instance type only.

If you want the Dedicated Hosts to support multiple instance types in a specific instance family, omit this parameter and specify **InstanceFamily** instead. You cannot specify **InstanceType** and **InstanceFamily** in the same request.

Type: String

Required: No

OutpostArn

The Amazon Resource Name (ARN) of the AWS Outpost on which to allocate the Dedicated Host. If you specify **OutpostArn**, you can optionally specify **AssetIds**.

If you are allocating the Dedicated Host in a Region, omit this parameter.

Type: String

Required: No

Quantity

The number of Dedicated Hosts to allocate to your account with these parameters. If you are allocating the Dedicated Hosts on an Outpost, and you specify **AssetIds**, you can omit this parameter. In this case, Amazon EC2 allocates a Dedicated Host on each specified hardware asset. If you specify both **AssetIds** and **Quantity**, then the value that you specify for **Quantity** must be equal to the number of asset IDs specified.

Type: Integer

Required: No

TagSpecification.N

The tags to apply to the Dedicated Host during creation.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

hostIdSet

The ID of the allocated Dedicated Host. This is used to launch an instance onto a specific host.

Type: Array of strings

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example allocates a Dedicated Host to your account, on to which you can launch only `m5.large` instances.

Sample Request

```
https://ec2.amazonaws.com/?Action=AllocateHosts
&AvailabilityZone=us-east-1b
```

```
&InstanceType=m5.large
&Quantity=1
&AUTHPARAMS
```

Sample Response

```
<AllocateHostsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>d4904fd9-82c2-4ea5-adfe-a9cc3EXAMPLE</requestId>
    <hostIdSet>
        <item>h-00548908djdsgfs</item>
    </hostIdSet>
</AllocateHostsResponse>
```

Example 2

This example allocates a Dedicated Host to your account, on to which you can launch multiple instance types in the m5 instance family.

Sample Request

```
https://ec2.amazonaws.com/?Action=AllocateHosts
&AvailabilityZone=us-east-1b
&InstanceFamily=m5
&Quantity=1
&AUTHPARAMS
```

Sample Response

```
<AllocateHostsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>d4904fd9-82c2-4ea5-adfe-a9cc3EXAMPLE</requestId>
    <hostIdSet>
        <item>h-00548908djdsgfs</item>
    </hostIdSet>
</AllocateHostsResponse>
```

Example 3

This example allocates a Dedicated Host to your account with host recovery on.

Sample Request

```
https://ec2.amazonaws.com/?Action=AllocateHosts
```

```
&AvailabilityZone=us-east-1b
&InstanceType=m5.large
&Quantity=1
&HostRecovery=on
&AUTHPARAMS
```

Sample Response

```
<AllocateHostsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>d4904fd9-82c2-4ea5-adfe-a9cc3EXAMPLE</requestId>
    <hostIdSet>
        <item>h-00548908djdsgfs</item>
    </hostIdSet>
</AllocateHostsResponse>
```

Example 4

This example allocates a Dedicated Host to your account with auto-placement `off`.

Sample Request

```
https://ec2.amazonaws.com/?Action=AllocateHosts
&AvailabilityZone=us-east-1b
&InstanceFamily=m5
&Quantity=1
&AutoPlacement=off
&AUTHPARAMS
```

Sample Response

```
<AllocateHostsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>d4904fd9-82c2-4ea5-adfe-a9cc3EXAMPLE</requestId>
    <hostIdSet>
        <item>h-00548908djdsgfs</item>
    </hostIdSet>
</AllocateHostsResponse>
```

Example 5

This example allocates a Dedicated Host to your account, on to which you can launch only m5.2xlarge instances, and applies a tag with a key of `purpose` and a value of `production`.

Sample Request

```
https://ec2.amazonaws.com/?Action=AllocateHosts
&AvailabilityZone=us-east-1b
&InstanceType=m5.2xlarge
&Quantity=1
&TagSpecification.1.ResourceType=dedicated-host
&TagSpecification.1.Tag.1.Key=purpose
&TagSpecification.1.Tag.1.Value=production
&AUTHPARAMS
```

AllocateIpamPoolCidr

Allocate a CIDR from an IPAM pool. The Region you use should be the IPAM pool locale. The locale is the AWS Region where this IPAM pool is available for allocations.

In IPAM, an allocation is a CIDR assignment from an IPAM pool to another IPAM pool or to a resource. For more information, see Allocate CIDRs in the *Amazon VPC IPAM User Guide*.

> **Note**
>
> This action creates an allocation with strong consistency. The returned CIDR will not overlap with any other allocations from the same pool.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AllowedCidr.N

Include a particular CIDR range that can be returned by the pool. Allowed CIDRs are only allowed if using netmask length for allocation.

Type: Array of strings

Required: No

Cidr

The CIDR you would like to allocate from the IPAM pool. Note the following:

- If there is no DefaultNetmaskLength allocation rule set on the pool, you must specify either the NetmaskLength or the CIDR.
- If the DefaultNetmaskLength allocation rule is set on the pool, you can specify either the NetmaskLength or the CIDR and the DefaultNetmaskLength allocation rule will be ignored.

Possible values: Any available IPv4 or IPv6 CIDR.

Type: String

Required: No

ClientToken

A unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring idempotency.

Type: String

Required: No

Description

A description for the allocation.

Type: String

Required: No

DisallowedCidr.N

Exclude a particular CIDR range from being returned by the pool. Disallowed CIDRs are only allowed if using netmask length for allocation.

Type: Array of strings

Required: No

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

IpamPoolId

The ID of the IPAM pool from which you would like to allocate a CIDR.

Type: String

Required: Yes

NetmaskLength

The netmask length of the CIDR you would like to allocate from the IPAM pool. Note the following:

- If there is no DefaultNetmaskLength allocation rule set on the pool, you must specify either the NetmaskLength or the CIDR.
- If the DefaultNetmaskLength allocation rule is set on the pool, you can specify either the NetmaskLength or the CIDR and the DefaultNetmaskLength allocation rule will be ignored.

Possible netmask lengths for IPv4 addresses are 0 - 32. Possible netmask lengths for IPv6 addresses are 0 - 128.

Type: Integer

Required: No

PreviewNextCidr

A preview of the next available CIDR in a pool.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

ipamPoolAllocation

Information about the allocation created.

Type: IpamPoolAllocation object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

ApplySecurityGroupsToClientVpnTargetNetwork

Applies a security group to the association between the target network and the Client VPN endpoint. This action replaces the existing security groups with the specified security groups.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientVpnEndpointId

The ID of the Client VPN endpoint.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

SecurityGroupId.N

The IDs of the security groups to apply to the associated target network. Up to 5 security groups can be applied to an associated target network.

Type: Array of strings

Required: Yes

VpcId

The ID of the VPC in which the associated target network is located.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

securityGroupIds

The IDs of the applied security groups.

Type: Array of strings

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example applies a security group to a Client VPN endpoint.

Sample Request

```
https://ec2.amazonaws.com/?Action=ApplySecurityGroupsToClientVpnTargetNetwork
&ClientVpnEndpointId=cvpn-endpoint-00c5d11fc4EXAMPLE
&SecurityGroupId=sg-0618575f05EXAMPLE
&VpcId=vpc-3db97056EXAMPLE
&AUTHPARAMS
```

Sample Response

```
<ApplySecurityGroupsToClientVpnTargetNetworkResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>5ef84b7f-505e-4e39-80cd-a11dbEXAMPLE</requestId>
    <securityGroupIds>
        <item>sg-0618575f05EXAMPLE</item>
    </securityGroupIds>
```

```
</ApplySecurityGroupsToClientVpnTargetNetworkResponse>
```

AssignIpv6Addresses

Assigns the specified IPv6 addresses to the specified network interface. You can specify specific IPv6 addresses, or you can specify the number of IPv6 addresses to be automatically assigned from the subnet's IPv6 CIDR block range. You can assign as many IPv6 addresses to a network interface as you can assign private IPv4 addresses, and the limit varies by instance type.

You must specify either the IPv6 addresses or the IPv6 address count in the request.

You can optionally use Prefix Delegation on the network interface. You must specify either the IPV6 Prefix Delegation prefixes, or the IPv6 Prefix Delegation count. For information, see Assigning prefixes to network interfaces in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Ipv6AddressCount

The number of additional IPv6 addresses to assign to the network interface. The specified number of IPv6 addresses are assigned in addition to the existing IPv6 addresses that are already assigned to the network interface. Amazon EC2 automatically selects the IPv6 addresses from the subnet range. You can't use this option if specifying specific IPv6 addresses.

Type: Integer

Required: No

Ipv6Addresses.N

The IPv6 addresses to be assigned to the network interface. You can't use this option if you're specifying a number of IPv6 addresses.

Type: Array of strings

Required: No

Ipv6Prefix.N

One or more IPv6 prefixes assigned to the network interface. You can't use this option if you use the `Ipv6PrefixCount` option.

Type: Array of strings

Required: No

Ipv6PrefixCount

The number of IPv6 prefixes that AWS automatically assigns to the network interface. You cannot use this option if you use the `Ipv6Prefixes` option.

Type: Integer

Required: No

NetworkInterfaceId

The ID of the network interface.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

assignedIpv6Addresses

The new IPv6 addresses assigned to the network interface. Existing IPv6 addresses that were assigned to the network interface before the request are not included.

Type: Array of strings

assignedIpv6PrefixSet

The IPv6 prefixes that are assigned to the network interface.

Type: Array of strings

networkInterfaceId

The ID of the network interface.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example assigns two IPv6 addresses (2001:db8:1234:1a00::123 and 2001:db8:1234:1a00::456) to the specified network interface.

Sample Request

```
https://ec2.amazonaws.com/?Action=AssignIpv6Addresses
&NetworkInterfaceId=eni-d83388b1
&Ipv6Addresses.1=2001:db8:1234:1a00::123
&Ipv6Addresses.2=2001:db8:1234:1a00::456
&AUTHPARAMS
```

Sample Response

```
<AssignIpv6AddressesResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>c36d17eb-a0ba-4d38-8727-example</requestId>
    <networkInterfaceId>eni-d83388b1</networkInterfaceId>
    <assignedIpv6Addresses>
        <item>2001:db8:1234:1a00::123</item>
        <item>2001:db8:1234:1a00::456</item>
    </assignedIpv6Addresses>
</AssignIpv6AddressesResponse>
```

Example 2

This example assigns two IPv6 addresses to the specified network interface. Amazon EC2 automatically assigns the addresses from the available IPv6 addresses within the subnet's IPv6 CIDR block range.

Sample Request

```
https://ec2.amazonaws.com/?Action=AssignIpv6Addresses
&NetworkInterfaceId=eni-d83388b1
&Ipv6AddressCount=2
&AUTHPARAMS
```

Sample Response

```
<AssignIpv6AddressesResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>c36d17eb-a0ba-4d38-8727-example</requestId>
    <networkInterfaceId>eni-d83388b1</networkInterfaceId>
    <assignedIpv6Addresses>
        <item>2001:db8:1234:1a00:3304:8879:34cf:4071</item>
        <item>2002:db8:1234:1a00:9691:9503:25ad:1761</item>
    </assignedIpv6Addresses>
</AssignIpv6AddressesResponse>
```

AssignPrivateIpAddresses

Assigns the specified secondary private IP addresses to the specified network interface.

You can specify specific secondary IP addresses, or you can specify the number of secondary IP addresses to be automatically assigned from the subnet's CIDR block range. The number of secondary IP addresses that you can assign to an instance varies by instance type. For more information about Elastic IP addresses, see Elastic IP Addresses in the *Amazon EC2 User Guide*.

When you move a secondary private IP address to another network interface, any Elastic IP address that is associated with the IP address is also moved.

Remapping an IP address is an asynchronous operation. When you move an IP address from one network interface to another, check `network/interfaces/macs/mac/local-ipv4s` in the instance metadata to confirm that the remapping is complete.

You must specify either the IP addresses or the IP address count in the request.

You can optionally use Prefix Delegation on the network interface. You must specify either the IPv4 Prefix Delegation prefixes, or the IPv4 Prefix Delegation count. For information, see Assigning prefixes to network interfaces in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AllowReassignment

Indicates whether to allow an IP address that is already assigned to another network interface or instance to be reassigned to the specified network interface.

Type: Boolean

Required: No

Ipv4Prefix.N

One or more IPv4 prefixes assigned to the network interface. You can't use this option if you use the `Ipv4PrefixCount` option.

Type: Array of strings

Required: No

Ipv4PrefixCount

The number of IPv4 prefixes that AWS automatically assigns to the network interface. You can't use this option if you use the `Ipv4 Prefixes` option.

Type: Integer

Required: No

NetworkInterfaceId

The ID of the network interface.

Type: String

Required: Yes

PrivateIpAddress.N

The IP addresses to be assigned as a secondary private IP address to the network interface. You can't specify this parameter when also specifying a number of secondary IP addresses.

If you don't specify an IP address, Amazon EC2 automatically selects an IP address within the subnet range.

Type: Array of strings

Required: No

SecondaryPrivateIpAddressCount

The number of secondary IP addresses to assign to the network interface. You can't specify this parameter when also specifying private IP addresses.

Type: Integer

Required: No

Response Elements

The following elements are returned by the service.

assignedIpv4PrefixSet

The IPv4 prefixes that are assigned to the network interface.

Type: Array of Ipv4PrefixSpecification objects

assignedPrivateIpAddressesSet

The private IP addresses assigned to the network interface.

Type: Array of AssignedPrivateIpAddress objects

networkInterfaceId

The ID of the network interface.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example assigns two secondary private IP addresses (`10.0.2.1` and `10.0.2.11`) to the specified network interface.

Sample Request

```
https://ec2.amazonaws.com/?Action=AssignPrivateIpAddresses
&NetworkInterfaceId=eni-d83388b1
&PrivateIpAddress.1=10.0.2.1
&PrivateIpAddress.2=10.0.2.11
&AUTHPARAMS
```

Sample Response

```
<AssignPrivateIpAddressesResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>3fb591ba-558c-48f8-ae6b-c2f9d6d06425</requestId>
  <networkInterfaceId>eni-01d32da61c165ac3e</networkInterfaceId>
  <assignedPrivateIpAddressesSet>
    <item>
      <privateIpAddress>10.2.2.1</privateIpAddress>
    </item>
    <item>
      <privateIpAddress>10.2.2.11</privateIpAddress>
    </item>
  </assignedPrivateIpAddressesSet>
  <return>true</return>
</AssignPrivateIpAddressesResponse>
```

Example 2

This example assigns two secondary private IP addresses to the specified network interface. Amazon EC2 automatically assigns these IP addresses from the available IP addresses within the subnet's CIDR block range.

Sample Request

```
https://ec2.amazonaws.com/?Action=AssignPrivateIpAddresses
&NetworkInterfaceId=eni-d83388b1
&SecondaryPrivateIpAddressCount=2
&AUTHPARAMS
```

Sample Response

```
<AssignPrivateIpAddressesResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>3fb591ba-558c-48f8-ae6b-c2f9d6d06425</requestId>
  <networkInterfaceId>eni-01d32da61c165ac3e</networkInterfaceId>
  <assignedPrivateIpAddressesSet>
    <item>
      <privateIpAddress>10.2.2.7</privateIpAddress>
    </item>
    <item>
      <privateIpAddress>10.2.2.5</privateIpAddress>
    </item>
  </assignedPrivateIpAddressesSet>
```

```
  <return>true</return>
</AssignPrivateIpAddressesResponse>
```

AssignPrivateNatGatewayAddress

Assigns private IPv4 addresses to a private NAT gateway. For more information, see Work with NAT gateways in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

NatGatewayId

The ID of the NAT gateway.

Type: String

Required: Yes

PrivateIpAddress.N

The private IPv4 addresses you want to assign to the private NAT gateway.

Type: Array of strings

Required: No

PrivateIpAddressCount

The number of private IP addresses to assign to the NAT gateway. You can't specify this parameter when also specifying private IP addresses.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 31.

Required: No

Response Elements

The following elements are returned by the service.

natGatewayAddressSet

NAT gateway IP addresses.

Type: Array of NatGatewayAddress objects

natGatewayId

The ID of the NAT gateway.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for Ruby V3

AssociateAddress

Associates an Elastic IP address, or carrier IP address (for instances that are in subnets in Wavelength Zones) with an instance or a network interface. Before you can use an Elastic IP address, you must allocate it to your account.

If the Elastic IP address is already associated with a different instance, it is disassociated from that instance and associated with the specified instance. If you associate an Elastic IP address with an instance that has an existing Elastic IP address, the existing address is disassociated from the instance, but remains allocated to your account.

[Subnets in Wavelength Zones] You can associate an IP address from the telecommunication carrier to the instance or network interface.

You cannot associate an Elastic IP address with an interface in a different network border group.

> **Important**
>
> This is an idempotent operation. If you perform the operation more than once, Amazon EC2 doesn't return an error, and you may be charged for each time the Elastic IP address is remapped to the same instance. For more information, see the *Elastic IP Addresses* section of Amazon EC2 Pricing.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AllocationId

The allocation ID. This is required.

Type: String

Required: No

AllowReassociation

Reassociation is automatic, but you can specify false to ensure the operation fails if the Elastic IP address is already associated with another resource.

Type: Boolean

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InstanceId

The ID of the instance. The instance must have exactly one attached network interface. You can specify either the instance ID or the network interface ID, but not both.

Type: String

Required: No

NetworkInterfaceId

The ID of the network interface. If the instance has more than one network interface, you must specify a network interface ID.

You can specify either the instance ID or the network interface ID, but not both.

Type: String

Required: No

PrivateIpAddress

The primary or secondary private IP address to associate with the Elastic IP address. If no private IP address is specified, the Elastic IP address is associated with the primary private IP address.

Type: String

Required: No

PublicIp

Deprecated.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

associationId

The ID that represents the association of the Elastic IP address with an instance.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example request associates a Elastic IP address with an instance. The `AllowReassignment` parameter allows the Elastic IP address to be associated with the specified instance even if it's already associated with a different instance or a network interface.

Sample Request

```
https://ec2.amazonaws.com/?Action=AssociateAddress
&InstanceId=i-0598c7d356eba48d7
&AllocationId=eipalloc-5723d13e
```

```
&AllowReassignment=true
&AUTHPARAMS
```

Sample Response

```
<AssociateAddressResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <return>true</return>
   <associationId>eipassoc-fc5ca095</associationId>
</AssociateAddressResponse>
```

AssociateCapacityReservationBillingOwner

Initiates a request to assign billing of the unused capacity of a shared Capacity Reservation to a consumer account that is consolidated under the same AWS organizations payer account. For more information, see Billing assignment for shared Amazon EC2 Capacity Reservations.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CapacityReservationId

The ID of the Capacity Reservation.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

UnusedReservationBillingOwnerId

The ID of the consumer account to which to assign billing.

Type: String

Length Constraints: Fixed length of 12.

Pattern: `[0-9]{12}`

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

AssociateClientVpnTargetNetwork

Associates a target network with a Client VPN endpoint. A target network is a subnet in a VPC. You can associate multiple subnets from the same VPC with a Client VPN endpoint. You can associate only one subnet in each Availability Zone. We recommend that you associate at least two subnets to provide Availability Zone redundancy.

If you specified a VPC when you created the Client VPN endpoint or if you have previous subnet associations, the specified subnet must be in the same VPC. To specify a subnet that's in a different VPC, you must first modify the Client VPN endpoint (ModifyClientVpnEndpoint) and change the VPC that's associated with it.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring idempotency.

Type: String

Required: No

ClientVpnEndpointId

The ID of the Client VPN endpoint.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

SubnetId

The ID of the subnet to associate with the Client VPN endpoint.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

associationId

The unique ID of the target network association.

Type: String

requestId

The ID of the request.

Type: String

status

The current state of the target network association.

Type: AssociationStatus object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example associates a subnet with a Client VPN endpoint.

Sample Request

```
https://ec2.amazonaws.com/?Action=AssociateClientVpnTargetNetwork
```

```
&ClientVpnEndpointId=cvpn-endpoint-00c5d11fc4EXAMPLE
&SubnetId=subnet-057fa0918fEXAMPLE
&AUTHPARAMS
```

Sample Response

```
<AssociateClientVpnTargetNetworkResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>7d1f819b-7f2a-4f81-aabf-81caeEXAMPLE</requestId>
    <status>
        <code>associating</code>
    </status>
    <associationId>cvpn-assoc-0822b0983cEXAMPLE</associationId>
</AssociateClientVpnTargetNetworkRespons>
```

- AWS SDK for Ruby V3

AssociateDhcpOptions

Associates a set of DHCP options (that you've previously created) with the specified VPC, or associates no DHCP options with the VPC.

After you associate the options with the VPC, any existing instances and all new instances that you launch in that VPC use the options. You don't need to restart or relaunch the instances. They automatically pick up the changes within a few hours, depending on how frequently the instance renews its DHCP lease. You can explicitly renew the lease using the operating system on the instance.

For more information, see DHCP option sets in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DhcpOptionsId

The ID of the DHCP options set, or `default` to associate no DHCP options with the VPC.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

VpcId

The ID of the VPC.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example associates the DHCP options with the ID `dopt-7a8b9c2d` with the VPC with the ID `vpc-1a2b3c4d`.

Sample Request

```
https://ec2.amazonaws.com/?Action=AssociateDhcpOptions
&DhcpOptionsId=dopt-7a8b9c2d
&VpcId=vpc-1a2b3c4d
&AUTHPARAMS
```

Sample Response

```
<AssociateDhcpOptionsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
   <return>true</return>
</AssociateDhcpOptionsResponse>
```

Example 2

This example changes the VPC with the ID `vpc-1a2b3c4d` to have no associated DHCP options set.

Sample Request

```
https://ec2.amazonaws.com/?Action=AssociateDhcpOptions
&DhcpOptionsId=default
&VpcId=vpc-1a2b3c4d
&AUTHPARAMS
```

Sample Response

```
<AssociateDhcpOptionsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
   <return>true</return>
</AssociateDhcpOptionsResponse>
```

AssociateEnclaveCertificateIamRole

Associates an AWS Identity and Access Management (IAM) role with an AWS Certificate Manager (ACM) certificate. This enables the certificate to be used by the ACM for Nitro Enclaves application inside an enclave. For more information, see AWS Certificate Manager for Nitro Enclaves in the *AWS Nitro Enclaves User Guide*.

When the IAM role is associated with the ACM certificate, the certificate, certificate chain, and encrypted private key are placed in an Amazon S3 location that only the associated IAM role can access. The private key of the certificate is encrypted with an AWS managed key that has an attached attestation-based key policy.

To enable the IAM role to access the Amazon S3 object, you must grant it permission to call `s3:GetObject` on the Amazon S3 bucket returned by the command. To enable the IAM role to access the KMS key, you must grant it permission to call `kms:Decrypt` on the KMS key returned by the command. For more information, see Grant the role permission to access the certificate and encryption key in the *AWS Nitro Enclaves User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CertificateArn

The ARN of the ACM certificate with which to associate the IAM role.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

RoleArn

The ARN of the IAM role to associate with the ACM certificate. You can associate up to 16 IAM roles with an ACM certificate.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

certificateS3BucketName

The name of the Amazon S3 bucket to which the certificate was uploaded.

Type: String

certificateS3ObjectKey

The Amazon S3 object key where the certificate, certificate chain, and encrypted private key bundle are stored. The object key is formatted as follows: `role_arn/certificate_arn`.

Type: String

encryptionKmsKeyId

The ID of the KMS key used to encrypt the private key of the certificate.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for Ruby V3

AssociateIamInstanceProfile

Associates an IAM instance profile with a running or stopped instance. You cannot associate more than one IAM instance profile with an instance.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

IamInstanceProfile

The IAM instance profile.

Type: IamInstanceProfileSpecification object

Required: Yes

InstanceId

The ID of the instance.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

iamInstanceProfileAssociation

Information about the IAM instance profile association.

Type: IamInstanceProfileAssociation object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example associates the IAM instance profile with the specified instance.

Sample Request

```
https://ec2.amazonaws.com/?Action=AssociateIamInstanceProfile
&InstanceId=i-1234567890abcdef0
&IamInstanceProfile.Name=AdminProfile
&AUTHPARAMS
```

Sample Response

```
<AssociateIamInstanceProfileResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>e10deeaf-7cda-48e7-950b-example</requestId>
    <iamInstanceProfileAssociation>
        <associationId>iip-assoc-0750e3af14e2b40ad</associationId>
        <iamInstanceProfile>
            <arn>arn:aws:iam::123456789012:instance-profile/AdminProfile</arn>
            <id>AIPAJEDNCAA64SSD265D6</id>
        </iamInstanceProfile>
        <instanceId>i-1234567890abcdef0</instanceId>
        <state>associating</state>
    </iamInstanceProfileAssociation>
</AssociateIamInstanceProfileResponse>
```

AssociateInstanceEventWindow

Associates one or more targets with an event window. Only one type of target (instance IDs, Dedicated Host IDs, or tags) can be specified with an event window.

For more information, see Define event windows for scheduled events in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AssociationTarget

One or more targets associated with the specified event window.

Type: InstanceEventWindowAssociationRequest object

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InstanceEventWindowId

The ID of the event window.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

instanceEventWindow

Information about the event window.

Type: InstanceEventWindow object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

AssociateIpamByoasn

Associates your Autonomous System Number (ASN) with a BYOIP CIDR that you own in the same AWS Region. For more information, see Tutorial: Bring your ASN to IPAM in the *Amazon VPC IPAM guide*.

After the association succeeds, the ASN is eligible for advertisement. You can view the association with DescribeByoipCidrs. You can advertise the CIDR with AdvertiseByoipCidr.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Asn

A public 2-byte or 4-byte ASN.

Type: String

Required: Yes

Cidr

The BYOIP CIDR you want to associate with an ASN.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

asnAssociation

The ASN and BYOIP CIDR association.

Type: AsnAssociation object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

AssociateIpamResourceDiscovery

Associates an IPAM resource discovery with an Amazon VPC IPAM. A resource discovery is an IPAM component that enables IPAM to manage and monitor resources that belong to the owning account.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

A client token.

Type: String

Required: No

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

IpamId

An IPAM ID.

Type: String

Required: Yes

IpamResourceDiscoveryId

A resource discovery ID.

Type: String

Required: Yes

TagSpecification.N

Tag specifications.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

ipamResourceDiscoveryAssociation

A resource discovery association. An associated resource discovery is a resource discovery that has been associated with an IPAM.

Type: IpamResourceDiscoveryAssociation object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for Ruby V3

AssociateNatGatewayAddress

Associates Elastic IP addresses (EIPs) and private IPv4 addresses with a public NAT gateway. For more information, see Work with NAT gateways in the *Amazon VPC User Guide*.

By default, you can associate up to 2 Elastic IP addresses per public NAT gateway. You can increase the limit by requesting a quota adjustment. For more information, see Elastic IP address quotas in the *Amazon VPC User Guide*.

Important

When you associate an EIP or secondary EIPs with a public NAT gateway, the network border group of the EIPs must match the network border group of the Availability Zone (AZ) that the public NAT gateway is in. If it's not the same, the EIP will fail to associate. You can see the network border group for the subnet's AZ by viewing the details of the subnet. Similarly, you can view the network border group of an EIP by viewing the details of the EIP address. For more information about network border groups and EIPs, see Allocate an Elastic IP address in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AllocationId.N

The allocation IDs of EIPs that you want to associate with your NAT gateway.

Type: Array of strings

Required: Yes

AvailabilityZone

For regional NAT gateways only: The Availability Zone where you want to associate an Elastic IP address (EIP). The regional NAT gateway uses a separate EIP in each AZ to handle outbound NAT traffic from that AZ.

A regional NAT gateway is a single NAT Gateway that works across multiple availability zones (AZs) in your VPC, providing redundancy, scalability and availability across all the AZs in a Region.

Type: String

Required: No

AvailabilityZoneId

For regional NAT gateways only: The ID of the Availability Zone where you want to associate an Elastic IP address (EIP). The regional NAT gateway uses a separate EIP in each AZ to handle outbound NAT traffic from that AZ. Use this instead of AvailabilityZone for consistent identification of AZs across AWS Regions.

A regional NAT gateway is a single NAT Gateway that works across multiple availability zones (AZs) in your VPC, providing redundancy, scalability and availability across all the AZs in a Region.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

NatGatewayId

The ID of the NAT gateway.

Type: String

Required: Yes

PrivateIpAddress.N

The private IPv4 addresses that you want to assign to the NAT gateway.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

natGatewayAddressSet

The IP addresses.

Type: Array of NatGatewayAddress objects

natGatewayId

The ID of the NAT gateway.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

AssociateRouteServer

Associates a route server with a VPC to enable dynamic route updates.

A route server association is the connection established between a route server and a VPC.

For more information see Dynamic routing in your VPC with VPC Route Server in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

RouteServerId

The unique identifier for the route server to be associated.

Type: String

Required: Yes

VpcId

The ID of the VPC to associate with the route server.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

routeServerAssociation

Information about the association between the route server and the VPC.

Type: RouteServerAssociation object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

AssociateRouteTable

Associates a subnet in your VPC or an internet gateway or virtual private gateway attached to your VPC with a route table in your VPC. This association causes traffic from the subnet or gateway to be routed according to the routes in the route table. The action returns an association ID, which you need in order to disassociate the route table later. A route table can be associated with multiple subnets.

For more information, see Route tables in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

GatewayId

The ID of the internet gateway or virtual private gateway.

Type: String

Required: No

PublicIpv4Pool

The ID of a public IPv4 pool. A public IPv4 pool is a pool of IPv4 addresses that you've brought to AWS with BYOIP.

Type: String

Required: No

RouteTableId

The ID of the route table.

Type: String

Required: Yes

SubnetId

The ID of the subnet.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

associationId

The route table association ID. This ID is required for disassociating the route table.

Type: String

associationState

The state of the association.

Type: RouteTableAssociationState object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example associates a route table with the ID `rtb-11223344556677889` with a subnet with the ID `subnet-12345678901234567`.

Sample Request

```
https://ec2.amazonaws.com/?Action=AssociateRouteTable
&RouteTableId=rtb-11223344556677889
&SubnetId=subnet-12345678901234567
```

Sample Response

```
<AssociateRouteTableResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <associationId>rtbassoc-04ca27a6914a0b4f</associationId>
</AssociateRouteTableResponse>
```

Example 2

This example associates a route table with the ID `rtb-11223344556677889` with an internet gateway with the ID `igw-1a2b3c4d1a2b3c4d1`.

Sample Request

```
https://ec2.amazonaws.com/?Action=AssociateRouteTable
&RouteTableId=rtb-11223344556677889
&GatewayId=igw-1a2b3c4d1a2b3c4d1
```

AssociateSecurityGroupVpc

Associates a security group with another VPC in the same Region. This enables you to use the same security group with network interfaces and instances in the specified VPC.

Note

- The VPC you want to associate the security group with must be in the same Region.
- You can associate the security group with another VPC if your account owns the VPC or if the VPC was shared with you.
- You must own the security group.
- You cannot use this feature with default security groups.
- You cannot use this feature with the default VPC.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

GroupId

A security group ID.

Type: String

Required: Yes

VpcId

A VPC ID.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

state

The state of the association.

Type: String

Valid Values: `associating | associated | association-failed | disassociating | disassociated | disassociation-failed`

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

AssociateSubnetCidrBlock

Associates a CIDR block with your subnet. You can only associate a single IPv6 CIDR block with your subnet.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Ipv6CidrBlock

The IPv6 CIDR block for your subnet.

Type: String

Required: No

Ipv6IpamPoolId

An IPv6 IPAM pool ID.

Type: String

Required: No

Ipv6NetmaskLength

An IPv6 netmask length.

Type: Integer

Required: No

SubnetId

The ID of your subnet.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

ipv6CidrBlockAssociation

Information about the IPv6 association.

Type: SubnetIpv6CidrBlockAssociation object

requestId

The ID of the request.

Type: String

subnetId

The ID of the subnet.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example associates IPv6 CIDR block `2001:db8:1234:1a00::/64` with subnet `subnet-1a2b3c4d`.

Sample Request

```
https://ec2.amazonaws.com/?Action=AssociateSubnetCidrBlock
&SubnetId=subnet-1a2b3c4d
&Ipv6CidrBlock=2001:db8:1234:1a00::/64
&AUTHPARAMS
```

Sample Response

```
<AssociateSubnetCidrBlock xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <subnetId>vpc-1a2b3c4d</subnetId>
   <ipv6CidrBlockAssociation>
```

```
        <ipv6CidrBlock>2001:db8:1234:1a00::/64</ipv6CidrBlock>
        <ipv6CidrBlockState>
            <state>associating</state>
        </ipv6CidrBlockState>
        <associationId>subnet-cidr-assoc-3aa54053</associationId>
   </ipv6CidrBlockAssociation>
</AssociateSubnetCidrBlock>
```

AssociateTransitGatewayMulticastDomain

Associates the specified subnets and transit gateway attachments with the specified transit gateway multicast domain.

The transit gateway attachment must be in the available state before you can add a resource. Use DescribeTransitGatewayAttachments to see the state of the attachment.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

SubnetIds.N

The IDs of the subnets to associate with the transit gateway multicast domain.

Type: Array of strings

Required: Yes

TransitGatewayAttachmentId

The ID of the transit gateway attachment to associate with the transit gateway multicast domain.

Type: String

Required: Yes

TransitGatewayMulticastDomainId

The ID of the transit gateway multicast domain.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

associations

Information about the transit gateway multicast domain associations.

Type: TransitGatewayMulticastDomainAssociations object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example associates the transit gateway attachment `tgw-attach-028c1dd0f8EXAMPLE` with the multicast domain `tgw-mcast-domain-0c4905cef7EXAMPLE`.

Sample Request

```
https://ec2.amazonaws.com/?Action=AssociateTransitGatewayMulticastDomain
&TransitGatewayAttachmentId=tgw-attach-028c1dd0f8EXAMPLE
&TransitGatewayMulticastDomainId=tgw-mcast-domain-0c4905cef7EXAMPLE
&AUTHPARAMS
```

Sample Response

```
<AssociateTransitGatewayMulticastDomainResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
```

```
    <requestId>fa968e66-0290-4479-a8ca-e5c83EXAMPLE</requestId>
    <associations>
        <resourceId>vpc-01128d2c24EXAMPLE</resourceId>
        <resourceType>vpc</resourceType>
        <subnets>
            <item>
                <state>associating</state>
                <subnetId>subnet-000de86e3bEXAMPLE</subnetId>
            </item>
        </subnets>
        <transitGatewayAttachmentId>tgw-attach-028c1dd0f8EXAMPLE</
transitGatewayAttachmentId>
        <transitGatewayMulticastDomainId>tgw-mcast-domain-0c4905cef7EXAMPLE</
transitGatewayMulticastDomainId>
    </associations>
</AssociateTransitGatewayMulticastDomainResponse>
```

AssociateTransitGatewayPolicyTable

Associates the specified transit gateway attachment with a transit gateway policy table.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TransitGatewayAttachmentId

The ID of the transit gateway attachment to associate with the policy table.

Type: String

Required: Yes

TransitGatewayPolicyTableId

The ID of the transit gateway policy table to associate with the transit gateway attachment.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

association

Describes the association of a transit gateway and a transit gateway policy table.

Type: TransitGatewayPolicyTableAssociation object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

AssociateTransitGatewayRouteTable

Associates the specified attachment with the specified transit gateway route table. You can associate only one route table with an attachment.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TransitGatewayAttachmentId

The ID of the attachment.

Type: String

Required: Yes

TransitGatewayRouteTableId

The ID of the transit gateway route table.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

association

The ID of the association.

Type: TransitGatewayAssociation object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

AssociateTrunkInterface

Associates a branch network interface with a trunk network interface.

Before you create the association, use CreateNetworkInterface command and set the interface type to `trunk`. You must also create a network interface for each branch network interface that you want to associate with the trunk network interface.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

BranchInterfaceId

The ID of the branch network interface.

Type: String

Required: Yes

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring idempotency.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

GreKey

The application key. This applies to the GRE protocol.

Type: Integer

Required: No

TrunkInterfaceId

The ID of the trunk network interface.

Type: String

Required: Yes

VlanId

The ID of the VLAN. This applies to the VLAN protocol.

Type: Integer

Required: No

Response Elements

The following elements are returned by the service.

clientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring idempotency.

Type: String

interfaceAssociation

Information about the association between the trunk network interface and branch network interface.

Type: TrunkInterfaceAssociation object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

AssociateVpcCidrBlock

Associates a CIDR block with your VPC. You can associate a secondary IPv4 CIDR block, an Amazon-provided IPv6 CIDR block, or an IPv6 CIDR block from an IPv6 address pool that you provisioned through bring your own IP addresses (BYOIP).

You must specify one of the following in the request: an IPv4 CIDR block, an IPv6 pool, or an Amazon-provided IPv6 CIDR block.

For more information about associating CIDR blocks with your VPC and applicable restrictions, see IP addressing for your VPCs and subnets in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AmazonProvidedIpv6CidrBlock

Requests an Amazon-provided IPv6 CIDR block with a /56 prefix length for the VPC. You cannot specify the range of IPv6 addresses or the size of the CIDR block.

Type: Boolean

Required: No

CidrBlock

An IPv4 CIDR block to associate with the VPC.

Type: String

Required: No

Ipv4IpamPoolId

Associate a CIDR allocated from an IPv4 IPAM pool to a VPC. For more information about Amazon VPC IP Address Manager (IPAM), see What is IPAM? in the *Amazon VPC IPAM User Guide*.

Type: String

Required: No

Ipv4NetmaskLength

The netmask length of the IPv4 CIDR you would like to associate from an Amazon VPC IP Address Manager (IPAM) pool. For more information about IPAM, see What is IPAM? in the *Amazon VPC IPAM User Guide*.

Type: Integer

Required: No

Ipv6CidrBlock

An IPv6 CIDR block from the IPv6 address pool. You must also specify `Ipv6Pool` in the request.

To let Amazon choose the IPv6 CIDR block for you, omit this parameter.

Type: String

Required: No

Ipv6CidrBlockNetworkBorderGroup

The name of the location from which we advertise the IPV6 CIDR block. Use this parameter to limit the CIDR block to this location.

You must set `AmazonProvidedIpv6CidrBlock` to `true` to use this parameter.

You can have one IPv6 CIDR block association per network border group.

Type: String

Required: No

Ipv6IpamPoolId

Associates a CIDR allocated from an IPv6 IPAM pool to a VPC. For more information about Amazon VPC IP Address Manager (IPAM), see What is IPAM? in the *Amazon VPC IPAM User Guide*.

Type: String

Required: No

Ipv6NetmaskLength

The netmask length of the IPv6 CIDR you would like to associate from an Amazon VPC IP Address Manager (IPAM) pool. For more information about IPAM, see What is IPAM? in the *Amazon VPC IPAM User Guide*.

Type: Integer

Required: No

Ipv6Pool

The ID of an IPv6 address pool from which to allocate the IPv6 CIDR block.

Type: String

Required: No

VpcId

The ID of the VPC.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

cidrBlockAssociation

Information about the IPv4 CIDR block association.

Type: VpcCidrBlockAssociation object

ipv6CidrBlockAssociation

Information about the IPv6 CIDR block association.

Type: VpcIpv6CidrBlockAssociation object

requestId

The ID of the request.

Type: String

vpcId

The ID of the VPC.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example associates an IPv6 CIDR block with VPC `vpc-1a2b3c4d`.

Sample Request

```
https://ec2.amazonaws.com/?Action=AssociateVpcCidrBlock
&VpcId=vpc-1a2b3c4d
&AmazonProvidedIpv6CidrBlock=true
&AUTHPARAMS
```

Sample Response

```
<AssociateVpcCidrBlock xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <ipv6CidrBlockAssociation>
        <ipv6CidrBlockState>
            <state>associating</state>
        </ipv6CidrBlockState>
        <associationId>vpc-cidr-assoc-e2a5408b</associationId>
    </ipv6CidrBlockAssociation>
   <vpcId>vpc-1a2b3c4d</vpcId>
</AssociateVpcCidrBlock>
```

Example 2

This example associates the IPv4 CIDR block `10.2.0.0/16` with VPC `vpc-1a2b3c4d`.

Sample Request

```
https://ec2.amazonaws.com/?Action=AssociateVpcCidrBlock
&VpcId=vpc-1a2b3c4d
```

```
&CidrBlock=10.2.0.0/16
&AUTHPARAMS
```

Sample Response

```
<AssociateVpcCidrBlockResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>33af6c54-1139-4d50-b4f7-15a8example</requestId>
    <vpcId>vpc-1a2b3c4d</vpcId>
    <cidrBlockAssociation>
        <associationId>vpc-cidr-assoc-0280ab6b</associationId>
        <cidrBlock>10.2.0.0/16</cidrBlock>
        <cidrBlockState>
            <state>associating</state>
        </cidrBlockState>
    </cidrBlockAssociation>
</AssociateVpcCidrBlockResponse>
```

AttachClassicLinkVpc

> **Note**
>
> This action is deprecated.

Links an EC2-Classic instance to a ClassicLink-enabled VPC through one or more of the VPC security groups. You cannot link an EC2-Classic instance to more than one VPC at a time. You can only link an instance that's in the `running` state. An instance is automatically unlinked from a VPC when it's stopped - you can link it to the VPC again when you restart it.

After you've linked an instance, you cannot change the VPC security groups that are associated with it. To change the security groups, you must first unlink the instance, and then link it again.

Linking your instance to a VPC is sometimes referred to as *attaching* your instance.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InstanceId

The ID of the EC2-Classic instance.

Type: String

Required: Yes

SecurityGroupId.N

The IDs of the security groups. You cannot specify security groups from a different VPC.

Type: Array of strings

Required: Yes

VpcId

The ID of the ClassicLink-enabled VPC.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

AttachInternetGateway

Attaches an internet gateway or a virtual private gateway to a VPC, enabling connectivity between the internet and the VPC. For more information, see Internet gateways in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InternetGatewayId

The ID of the internet gateway.

Type: String

Required: Yes

VpcId

The ID of the VPC.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example attaches the internet gateway with the ID `igw-eaad4883` to the VPC with the ID `vpc-11ad4878`.

Sample Request

```
https://ec2.amazonaws.com/?Action=AttachInternetGateway
&InternetGatewayId=igw-eaad4883
&VpcId=vpc-11ad4878
&AUTHPARAMS
```

Sample Response

```
<AttachInternetGatewayResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <return>true</return>
</AttachInternetGatewayResponse>
```

- AWS SDK for Ruby V3

AttachNetworkInterface

Attaches a network interface to an instance.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DeviceIndex

The index of the device for the network interface attachment.

Type: Integer

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

EnaQueueCount

The number of ENA queues to be created with the instance.

Type: Integer

Required: No

EnaSrdSpecification

Configures ENA Express for the network interface that this action attaches to the instance.

Type: EnaSrdSpecification object

Required: No

InstanceId

The ID of the instance.

Type: String

Required: Yes

NetworkCardIndex

The index of the network card. Some instance types support multiple network cards. The primary network interface must be assigned to network card index 0. The default is network card index 0.

Type: Integer

Required: No

NetworkInterfaceId

The ID of the network interface.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

attachmentId

The ID of the network interface attachment.

Type: String

networkCardIndex

The index of the network card.

Type: Integer

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example attaches the specified network interface to the specified instance.

Sample Request

```
https://ec2.amazonaws.com/?Action=AttachNetworkInterface
&DeviceIndex=1
&InstanceId=i-1234567890abcdef0
&NetworkInterfaceId=eni-ffda3197
&AUTHPARAMS
```

Sample Response

```
<AttachNetworkInterfaceResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>ace8cd1e-e685-4e44-90fb-92014d907212</requestId>
    <attachmentId>eni-attach-d94b09b0</attachmentId>
</AttachNetworkInterfaceResponse>
```

AttachVerifiedAccessTrustProvider

Attaches the specified AWS Verified Access trust provider to the specified AWS Verified Access instance.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

A unique, case-sensitive token that you provide to ensure idempotency of your modification request. For more information, see Ensuring idempotency.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

VerifiedAccessInstanceId

The ID of the Verified Access instance.

Type: String

Required: Yes

VerifiedAccessTrustProviderId

The ID of the Verified Access trust provider.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

verifiedAccessInstance

Details about the Verified Access instance.

Type: VerifiedAccessInstance object

verifiedAccessTrustProvider

Details about the Verified Access trust provider.

Type: VerifiedAccessTrustProvider object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for PHP V3
- AWS SDK for Python

- AWS SDK for Ruby V3

AttachVolume

Attaches an Amazon EBS volume to a `running` or `stopped` instance, and exposes it to the instance with the specified device name.

> **Note**
>
> The maximum number of Amazon EBS volumes that you can attach to an instance depends on the instance type. If you exceed the volume attachment limit for an instance type, the attachment request fails with the `AttachmentLimitExceeded` error. For more information, see Instance volume limits.

After you attach an EBS volume, you must make it available for use. For more information, see Make an EBS volume available for use.

If a volume has an AWS Marketplace product code:

- The volume can be attached only to a stopped instance.
- AWS Marketplace product codes are copied from the volume to the instance.
- You must be subscribed to the product.
- The instance type and operating system of the instance must support the product. For example, you can't detach a volume from a Windows instance and attach it to a Linux instance.

For more information, see Attach an Amazon EBS volume to an instance in the *Amazon EBS User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Device

The device name (for example, `/dev/sdh` or `xvdh`).

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

EbsCardIndex

The index of the EBS card. Some instance types support multiple EBS cards. The default EBS card index is 0.

Type: Integer

Required: No

InstanceId

The ID of the instance.

Type: String

Required: Yes

VolumeId

The ID of the EBS volume. The volume and instance must be within the same Availability Zone.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

associatedResource

The ARN of the AWS-managed resource to which the volume is attached.

Type: String

attachTime

The time stamp when the attachment initiated.

Type: Timestamp

deleteOnTermination

Indicates whether the EBS volume is deleted on instance termination.

Type: Boolean

device

The device name.

If the volume is attached to an AWS-managed resource, this parameter returns `null`.

Type: String

ebsCardIndex

The index of the EBS card. Some instance types support multiple EBS cards. The default EBS card index is 0.

Type: Integer

instanceId

The ID of the instance.

If the volume is attached to an AWS-managed resource, this parameter returns `null`.

Type: String

instanceOwningService

The service principal of the AWS service that owns the underlying resource to which the volume is attached.

This parameter is returned only for volumes that are attached to AWS-managed resources.

Type: String

requestId

The ID of the request.

Type: String

status

The attachment state of the volume.

Type: String

Valid Values: `attaching | attached | detaching | detached | busy`

volumeId

The ID of the volume.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example request attaches the volume with the ID `vol-1234567890abcdef0` to the instance with the ID `i-1234567890abcdef0` and exposes it as `/dev/sdh`.

Sample Request

```
https://ec2.amazonaws.com/?Action=AttachVolume
&VolumeId=vol-1234567890abcdef0
&InstanceId=i-1234567890abcdef0
&Device=/dev/sdh
&AUTHPARAMS
```

Sample Response

```
<AttachVolumeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <volumeId>vol-1234567890abcdef0</volumeId>
  <instanceId>i-1234567890abcdef0</instanceId>
  <device>/dev/sdh</device>
```

```
  <status>attaching</status>
  <attachTime>YYYY-MM-DDTHH:MM:SS.000Z</attachTime>
</AttachVolumeResponse>
```

AttachVpnGateway

Attaches an available virtual private gateway to a VPC. You can attach one virtual private gateway to one VPC at a time.

For more information, see AWS Site-to-Site VPN in the *AWS Site-to-Site VPN User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

VpcId

The ID of the VPC.

Type: String

Required: Yes

VpnGatewayId

The ID of the virtual private gateway.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

attachment

Information about the attachment.

Type: VpcAttachment object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example attaches the virtual private gateway with the ID `vgw-8db04f81` to the VPC with the ID `vpc-1a2b3c4d`.

Sample Request

```
https://ec2.amazonaws.com/?Action=AttachVpnGateway
&VpnGatewayId=vgw-8db04f81
&VpcId=vpc-1a2b3c4d
&AUTHPARAMS
```

Sample Response

```
<AttachVpnGatewayResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
   <attachment>
      <vpcId>vpc-1a2b3c4d</vpcId>
      <state>attaching</state>
   </attachment>
</AttachVpnGatewayResponse>
```

- AWS SDK for Ruby V3

AuthorizeClientVpnIngress

Adds an ingress authorization rule to a Client VPN endpoint. Ingress authorization rules act as firewall rules that grant access to networks. You must configure ingress authorization rules to enable clients to access resources in AWS or on-premises networks.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AccessGroupId

The ID of the group to grant access to, for example, the Active Directory group or identity provider (IdP) group. Required if `AuthorizeAllGroups` is `false` or not specified.

Type: String

Required: No

AuthorizeAllGroups

Indicates whether to grant access to all clients. Specify `true` to grant all clients who successfully establish a VPN connection access to the network. Must be set to `true` if `AccessGroupId` is not specified.

Type: Boolean

Required: No

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring idempotency.

Type: String

Required: No

ClientVpnEndpointId

The ID of the Client VPN endpoint.

Type: String

Required: Yes

Description

A brief description of the authorization rule.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TargetNetworkCidr

The IPv4 address range, in CIDR notation, of the network for which access is being authorized.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

status

The current state of the authorization rule.

Type: ClientVpnAuthorizationRuleStatus object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example adds an authorization rule to a subnet and grants access to all users.

Sample Request

```
https://ec2.amazonaws.com/?Action=AuthorizeClientVpnIngress
&ClientVpnEndpointId=cvpn-endpoint-00c5d11fc4EXAMPLE
&TargetNetworkCidr=10.0.0.0/16
&AuthorizeAllGroups=true
&AUTHPARAMS
```

Sample Response

```
<AuthorizeClientVpnIngressResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>afafad8c-274c-4584-bbd1-75a21EXAMPLE</requestId>
    <status>
        <code>authorizing</code>
    </status>
</AuthorizeClientVpnIngressResponse>
```

AuthorizeSecurityGroupEgress

Adds the specified outbound (egress) rules to a security group.

An outbound rule permits instances to send traffic to the specified IPv4 or IPv6 address ranges, the IP address ranges specified by a prefix list, or the instances that are associated with a source security group. For more information, see Security group rules.

You must specify exactly one of the following destinations: an IPv4 or IPv6 address range, a prefix list, or a security group. You must specify a protocol for each rule (for example, TCP). If the protocol is TCP or UDP, you must also specify a port or port range. If the protocol is ICMP or ICMPv6, you must also specify the ICMP type and code.

Rule changes are propagated to instances associated with the security group as quickly as possible. However, a small delay might occur.

For examples of rules that you can add to security groups for specific access scenarios, see Security group rules for different use cases in the *Amazon EC2 User Guide*.

For information about security group quotas, see Amazon VPC quotas in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CidrIp

Not supported. Use IP permissions instead.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

FromPort

Not supported. Use IP permissions instead.

Type: Integer

Required: No

GroupId

The ID of the security group.

Type: String

Required: Yes

IpPermissions.N

The permissions for the security group rules.

Type: Array of IpPermission objects

Required: No

IpProtocol

Not supported. Use IP permissions instead.

Type: String

Required: No

SourceSecurityGroupName

Not supported. Use IP permissions instead.

Type: String

Required: No

SourceSecurityGroupOwnerId

Not supported. Use IP permissions instead.

Type: String

Required: No

TagSpecification.N

The tags applied to the security group rule.

Type: Array of TagSpecification objects

Required: No

ToPort

Not supported. Use IP permissions instead.

Type: Integer

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Returns `true` if the request succeeds; otherwise, returns an error.

Type: Boolean

securityGroupRuleSet

Information about the outbound (egress) security group rules that were added.

Type: Array of SecurityGroupRule objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example request grants your security group with the ID `sg-1a2b3c4d` access to the `192.0.2.0/24` and `198.51.100.0/24` IPv4 address ranges on TCP port 80.

Sample Request

```
https://ec2.amazonaws.com/?Action=AuthorizeSecurityGroupEgress
&GroupId=sg-1a2b3c4d
&IpPermissions.1.IpProtocol=tcp
&IpPermissions.1.FromPort=80
&IpPermissions.1.ToPort=80
&IpPermissions.1.IpRanges.1.CidrIp=192.0.2.0/24
&IpPermissions.1.IpRanges.2.CidrIp=198.51.100.0/24
&AUTHPARAMS
```

Sample Response

```
<AuthorizeSecurityGroupEgressResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <return>true</return>
</AuthorizeSecurityGroupEgressResponse>
```

Example 2

This example request grants egress access from the security group with the ID `sg-1a2b3c4d` to the security group with the ID `sg-9a8d7f5c` on TCP port 1433.

Sample Request

```
https://ec2.amazonaws.com/?Action=AuthorizeSecurityGroupEgress
&GroupId=sg-1a2b3c4d
&IpPermissions.1.IpProtocol=tcp
&IpPermissions.1.FromPort=1433
&IpPermissions.1.ToPort=1433
&IpPermissions.1.Groups.1.GroupId=sg-9a8d7f5c
&AUTHPARAMS
```

Example 3

This example request grants your security group with the ID `sg-1a2b3c4d` access to the `2001:db8:1234:1a00::/64` IPv6 address range on TCP port 22.

Sample Request

```
https://ec2.amazonaws.com/?Action=AuthorizeSecurityGroupEgress
&GroupId=sg-1a2b3c4d
&IpPermissions.1.IpProtocol=tcp
&IpPermissions.1.FromPort=22
&IpPermissions.1.ToPort=22
&IpPermissions.1.Ipv6Ranges.1.CidrIpv6=2001:db8:1234:1a00::/64
&AUTHPARAMS
```

Example 4

This example grants access over port 3389 (RDP) to the `192.0.2.0/24` IPv4 address range, and includes a description for the rule to help you identify the rule later.

Sample Request

```
https://ec2.amazonaws.com/?Action=AuthorizeSecurityGroupEgress
&GroupId=sg-112233
&IpPermissions.1.IpProtocol=tcp
&IpPermissions.1.FromPort=3389
&IpPermissions.1.ToPort=3389
&IpPermissions.1.IpRanges.1.CidrIp=192.0.2.0/24
&IpPermissions.1.IpRanges.1.Description=Access to London office
```

AuthorizeSecurityGroupIngress

Adds the specified inbound (ingress) rules to a security group.

An inbound rule permits instances to receive traffic from the specified IPv4 or IPv6 address range, the IP address ranges that are specified by a prefix list, or the instances that are associated with a destination security group. For more information, see Security group rules.

You must specify exactly one of the following sources: an IPv4 or IPv6 address range, a prefix list, or a security group. You must specify a protocol for each rule (for example, TCP). If the protocol is TCP or UDP, you must also specify a port or port range. If the protocol is ICMP or ICMPv6, you must also specify the ICMP/ICMPv6 type and code.

Rule changes are propagated to instances associated with the security group as quickly as possible. However, a small delay might occur.

For examples of rules that you can add to security groups for specific access scenarios, see Security group rules for different use cases in the *Amazon EC2 User Guide*.

For more information about security group quotas, see Amazon VPC quotas in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CidrIp

The IPv4 address range, in CIDR format.

> **Note**
>
> AWS canonicalizes IPv4 and IPv6 CIDRs. For example, if you specify 100.68.0.18/18 for the CIDR block, AWS canonicalizes the CIDR block to 100.68.0.0/18. Any subsequent DescribeSecurityGroups and DescribeSecurityGroupRules calls will return the canonicalized form of the CIDR block. Additionally, if you attempt to add another rule with the non-canonical form of the CIDR (such as 100.68.0.18/18) and there is already a rule for the canonicalized form of the CIDR block (such as 100.68.0.0/18), the API throws an duplicate rule error.

To specify an IPv6 address range, use IP permissions instead.

To specify multiple rules and descriptions for the rules, use IP permissions instead.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

FromPort

If the protocol is TCP or UDP, this is the start of the port range. If the protocol is ICMP, this is the ICMP type or -1 (all ICMP types).

To specify multiple rules and descriptions for the rules, use IP permissions instead.

Type: Integer

Required: No

GroupId

The ID of the security group.

Type: String

Required: No

GroupName

[Default VPC] The name of the security group. For security groups for a default VPC you can specify either the ID or the name of the security group. For security groups for a nondefault VPC, you must specify the ID of the security group.

Type: String

Required: No

IpPermissions.N

The permissions for the security group rules.

Type: Array of IpPermission objects

Required: No

IpProtocol

The IP protocol name (`tcp`, `udp`, `icmp`) or number (see Protocol Numbers). To specify all protocols, use `-1`.

To specify `icmpv6`, use IP permissions instead.

If you specify a protocol other than one of the supported values, traffic is allowed on all ports, regardless of any ports that you specify.

To specify multiple rules and descriptions for the rules, use IP permissions instead.

Type: String

Required: No

SourceSecurityGroupName

[Default VPC] The name of the source security group.

The rule grants full ICMP, UDP, and TCP access. To create a rule with a specific protocol and port range, specify a set of IP permissions instead.

Type: String

Required: No

SourceSecurityGroupOwnerId

The AWS account ID for the source security group, if the source security group is in a different account.

The rule grants full ICMP, UDP, and TCP access. To create a rule with a specific protocol and port range, use IP permissions instead.

Type: String

Required: No

TagSpecification.N

The tags applied to the security group rule.

Type: Array of TagSpecification objects

Required: No

ToPort

If the protocol is TCP or UDP, this is the end of the port range. If the protocol is ICMP, this is the ICMP code or -1 (all ICMP codes). If the start port is -1 (all ICMP types), then the end port must be -1 (all ICMP codes).

To specify multiple rules and descriptions for the rules, use IP permissions instead.

Type: Integer

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Returns `true` if the request succeeds; otherwise, returns an error.

Type: Boolean

securityGroupRuleSet

Information about the inbound (ingress) security group rules that were added.

Type: Array of SecurityGroupRule objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example request grants TCP port 80 access from the source group `sg-2a2b3c4d` to the security group `sg-1a2b3c4d`. The source security group must be in the same VPC or in a peer VPC (requires a VPC peering connection).

Sample Request

```
https://ec2.amazonaws.com/?Action=AuthorizeSecurityGroupIngress
&GroupId=sg-1a2b3c4d
&IpPermissions.1.IpProtocol=tcp
&IpPermissions.1.FromPort=80
&IpPermissions.1.ToPort=80
&IpPermissions.1.Groups.1.GroupId=sg-2a2b3c4d
&AUTHPARAMS
```

Example 2

This example grants SSH access (port 22) from the IPv6 range `2001:db8:1234:1a00::/64`.

Sample Request

```
https://ec2.amazonaws.com/
?Action=AuthorizeSecurityGroupIngress
&GroupId=sg-1a2b3c4d
&IpPermissions.1.IpProtocol=tcp
&IpPermissions.1.FromPort=22
&IpPermissions.1.ToPort=22
&IpPermissions.1.Ipv6Ranges.1.CidrIpv6=2001:db8:1234:1a00::/64
&AUTHPARAMS
```

Example 3

This example grants access over port 3389 (RDP) from the `192.0.2.0/24` IPv4 address range, and includes a description for the rule to help you identify the rule later.

Sample Request

```
https://ec2.amazonaws.com/?Action=AuthorizeSecurityGroupIngress
&GroupId=sg-112233
&IpPermissions.1.IpProtocol=tcp
&IpPermissions.1.FromPort=3389
&IpPermissions.1.ToPort=3389
&IpPermissions.1.IpRanges.1.CidrIp=192.0.2.0/24
&IpPermissions.1.IpRanges.1.Description=Access from New York office
```

BundleInstance

Bundles an Amazon instance store-backed Windows instance.

During bundling, only the root device volume (C:\) is bundled. Data on other instance store volumes is not preserved.

> **Note**
>
> This action is not applicable for Linux/Unix instances or Windows instances that are backed by Amazon EBS.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InstanceId

The ID of the instance to bundle.

Default: None

Type: String

Required: Yes

Storage

The bucket in which to store the AMI. You can specify a bucket that you already own or a new bucket that Amazon EC2 creates on your behalf. If you specify a bucket that belongs to someone else, Amazon EC2 returns an error.

Type: Storage object

Required: Yes

Response Elements

The following elements are returned by the service.

bundleInstanceTask

Information about the bundle task.

Type: BundleTask object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example request bundles the specified instance.

Before you specify a value for your access key ID, review and follow the guidance in Best Practices for AWS accounts in the *AWS Account Management Reference Guide*.

Sample Request

```
https://ec2.amazonaws.com/?Action=BundleInstance
&InstanceId=i-1234567890abcdef0
&Storage.S3.AWSAccessKeyId='AKIAIOSFODNN7EXAMPLE'
&Storage.S3.Bucket=myawsbucket
&Storage.S3.Prefix=winami
&Storage.S3.UploadPolicy=eyJleHBpcmF0aW9uIjogIjIwMDgtMDgtMzBUMDg6NDk6MD
```

```
laIiwiY29uZGl0aW9ucyI6IFt7ImJ1Y2tldCI6ICJteS1idWNrZXQifSxbInN0YXJ0cy13aXRoIiwgI
iRrZXkiLCAibXktbmV3LWltYWdlIl0seyJhY2wiOiAiZWMyLWJ1bmRsZS1yZWFkIn1dfEXAMPLE
&Storage.S3.UploadPolicySignature=fh5tyyyQD8W4COEthj3nlGNEXAMPLE
&AUTHPARAMS
```

Sample Response

```
<BundleInstanceResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <bundleInstanceTask>
      <instanceId>i-1234567890abcdef0</instanceId>
      <bundleId>bun-c1a540a8</bundleId>
      <state>bundling</state>
      <startTime>2008-10-07T11:41:50.000Z</startTime>
      <updateTime>2008-10-07T11:51:50.000Z</updateTime>
      <progress>70%</progress>
      <storage>
        <S3>
          <bucket>myawsbucket</bucket>
          <prefix>winami</prefix>
        </S3>
      </storage>
  </bundleInstanceTask>
</BundleInstanceResponse>
```

CancelBundleTask

Cancels a bundling operation for an instance store-backed Windows instance.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

BundleId

The ID of the bundle task.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

bundleInstanceTask

Information about the bundle task.

Type: BundleTask object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example request cancels the specified bundle task.

Sample Request

```
https://ec2.amazonaws.com/?Action=CancelBundleTask
&BundleId=bun-cla322b9
&AUTHPARAMS
```

Sample Response

```
<CancelBundleTaskResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <bundleInstanceTask>
      <instanceId>i-1234567890abcdef0</instanceId>
      <bundleId>bun-cla322b9</bundleId>
      <state>canceling</state>
      <startTime>2008-10-07T11:41:50.000Z</startTime>
      <updateTime>2008-10-07T11:51:50.000Z</updateTime>
      <progress>20%</progress>
      <storage>
        <S3>
          <bucket>myawsbucket</bucket>
          <prefix>my-new-image</prefix>
        </S3>
      </storage>
  </bundleInstanceTask>
</CancelBundleTaskResponse>
```

- AWS SDK for Ruby V3

CancelCapacityReservation

Cancels the specified Capacity Reservation, releases the reserved capacity, and changes the Capacity Reservation's state to `cancelled`.

You can cancel a Capacity Reservation that is in the following states:

- `assessing`
- `active` and there is no commitment duration or the commitment duration has elapsed. You can't cancel a future-dated Capacity Reservation during the commitment duration.

> **Note**
>
> You can't modify or cancel a Capacity Block. For more information, see Capacity Blocks for ML.

If a future-dated Capacity Reservation enters the `delayed` state, the commitment duration is waived, and you can cancel it as soon as it enters the `active` state.

Instances running in the reserved capacity continue running until you stop them. Stopped instances that target the Capacity Reservation can no longer launch. Modify these instances to either target a different Capacity Reservation, launch On-Demand Instance capacity, or run in any open Capacity Reservation that has matching attributes and sufficient capacity.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CapacityReservationId

The ID of the Capacity Reservation to be cancelled.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

CancelCapacityReservationFleets

Cancels one or more Capacity Reservation Fleets. When you cancel a Capacity Reservation Fleet, the following happens:

- The Capacity Reservation Fleet's status changes to `cancelled`.
- The individual Capacity Reservations in the Fleet are cancelled. Instances running in the Capacity Reservations at the time of cancelling the Fleet continue to run in shared capacity.
- The Fleet stops creating new Capacity Reservations.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CapacityReservationFleetId.N

The IDs of the Capacity Reservation Fleets to cancel.

Type: Array of strings

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

failedFleetCancellationSet

Information about the Capacity Reservation Fleets that could not be cancelled.

Type: Array of FailedCapacityReservationFleetCancellationResult objects

requestId

The ID of the request.

Type: String

successfulFleetCancellationSet

Information about the Capacity Reservation Fleets that were successfully cancelled.

Type: Array of CapacityReservationFleetCancellationState objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

CancelConversionTask

Cancels an active conversion task. The task can be the import of an instance or volume. The action removes all artifacts of the conversion, including a partially uploaded volume or instance. If the conversion is complete or is in the process of transferring the final disk image, the command fails and returns an exception.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ConversionTaskId

The ID of the conversion task.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ReasonMessage

The reason for canceling the conversion task.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example request cancels the conversion task with the ID `import-i-fh95npoc`.

Sample Request

```
https://ec2.amazonaws.com/?Action=CancelConversionTask
&ConversionTaskId=import-i-fh95npoc
&AUTHPARAMS
```

Sample Response

```
<CancelConversionTaskResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <return>true</return>
</CancelConversionTaskResponse>
```

- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

CancelDeclarativePoliciesReport

Cancels the generation of an account status report.

You can only cancel a report while it has the `running` status. Reports with other statuses (`complete`, `cancelled`, or `error`) can't be canceled.

For more information, see Generating the account status report for declarative policies in the *AWS Organizations User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ReportId

The ID of the report.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

CancelExportTask

Cancels an active export task. The request removes all artifacts of the export, including any partially-created Amazon S3 objects. If the export task is complete or is in the process of transferring the final disk image, the command fails and returns an error.

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ExportTaskId

The ID of the export task. This is the ID returned by the `CreateInstanceExportTask` and `ExportImage` operations.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example request cancels the export task with the ID `export-i-1234wxyz`.

Sample Request

```
https://ec2.amazonaws.com/?Action=CancelExportTask
&exportTaskId=export-i-1234wxyz
&AUTHPARAMS
```

Sample Response

```
<CancelExportTask xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
<requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
<return>true</return>
</CancelExportTask>
```

CancelImageLaunchPermission

Removes your AWS account from the launch permissions for the specified AMI. For more information, see Cancel having an AMI shared with your AWS account in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ImageId

The ID of the AMI that was shared with your AWS account.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

CancelImportTask

Cancels an in-process import virtual machine or import snapshot task.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CancelReason

The reason for canceling the task.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ImportTaskId

The ID of the import image or import snapshot task to be canceled.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

importTaskId

The ID of the task being canceled.

Type: String

previousState

The current state of the task being canceled.

Type: String

requestId

The ID of the request.

Type: String

state

The current state of the task being canceled.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

CancelReservedInstancesListing

Cancels the specified Reserved Instance listing in the Reserved Instance Marketplace.

For more information, see Sell in the Reserved Instance Marketplace in the *Amazon EC2 User Guide*.

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ReservedInstancesListingId

The ID of the Reserved Instance listing.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

reservedInstancesListingsSet

The Reserved Instance listing.

Type: Array of ReservedInstancesListing objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example request cancels a Reserved Instance listing in the Reserved Instance Marketplace. The response shows that the status is cancelled.

Sample Request

```
https://ec2.amazonaws.com/?Action=CancelReservedInstancesListing
&ReservedInstancesListingId=3ebe97b5-f273-43b6-a204-7a18cEXAMPLE
&AUTHPARAMS
```

Sample Response

```
<CancelReservedInstancesListingResponse>

CancelSpotFleetRequests

Cancels the specified Spot Fleet requests.

After you cancel a Spot Fleet request, the Spot Fleet launches no new instances.

You must also specify whether a canceled Spot Fleet request should terminate its instances. If you choose to terminate the instances, the Spot Fleet request enters the `cancelled_terminating` state. Otherwise, the Spot Fleet request enters the `cancelled_running` state and the instances continue to run until they are interrupted or you terminate them manually.

Important

Terminating an instance is permanent and irreversible.
After you terminate an instance, you can no longer connect to it, and it can't be recovered. All attached Amazon EBS volumes that are configured to be deleted on termination are also permanently deleted and can't be recovered. All data stored on instance store volumes is permanently lost. For more information, see How instance termination works.
Before you terminate an instance, ensure that you have backed up all data that you need to retain after the termination to persistent storage.

Restrictions

- You can delete up to 100 fleets in a single request. If you exceed the specified number, no fleets are deleted.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

SpotFleetRequestId.N

The IDs of the Spot Fleet requests.

Constraint: You can specify up to 100 IDs in a single request.

Type: Array of strings

Required: Yes

TerminateInstances

Indicates whether to terminate the associated instances when the Spot Fleet request is canceled. The default is to terminate the instances.

To let the instances continue to run after the Spot Fleet request is canceled, specify `no-terminate-instances`.

Type: Boolean

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

successfulFleetRequestSet

Information about the Spot Fleet requests that are successfully canceled.

Type: Array of CancelSpotFleetRequestsSuccessItem objects

unsuccessfulFleetRequestSet

Information about the Spot Fleet requests that are not successfully canceled.

Type: Array of CancelSpotFleetRequestsErrorItem objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example cancels Spot Fleet request sfr-123f8fc2-cb31-425e-abcd-example2710 and terminates all instances that were launched by the request.

Sample Request

```
https://ec2.amazonaws.com/?Action=CancelSpotFleetRequests
&SpotFleetRequestId.1=sfr-123f8fc2-cb31-425e-abcd-example2710
&TerminateInstances=true
&AUTHPARAMS
```

Sample Response

```
<CancelSpotFleetRequestsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>e12d2fe5-6503-4b4b-911c-example</requestId>
    <unsuccessfulFleetRequestSet/>
    <successfulFleetRequestSet>
        <item>
            <spotFleetRequestId>sfr-123f8fc2-cb31-425e-abcd-example2710</
spotFleetRequestId>
            <currentSpotFleetRequestState>cancelled_terminating</
currentSpotFleetRequestState>
            <previousSpotFleetRequestState>active</previousSpotFleetRequestState>
        </item>
    </successfulFleetRequestSet>
</CancelSpotFleetRequestsResponse>
```

CancelSpotInstanceRequests

Cancels one or more Spot Instance requests.

> **Important**
>
> Canceling a Spot Instance request does not terminate running Spot Instances associated with the request.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

SpotInstanceRequestId.N

The IDs of the Spot Instance requests.

Type: Array of strings

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

spotInstanceRequestSet

The Spot Instance requests.

Type: Array of CancelledSpotInstanceRequest objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example cancels the specified Spot Instance request.

Sample Request

```
https://ec2.amazonaws.com/?Action=CancelSpotInstanceRequests
&SpotInstanceRequestId.1=sir-1a2b3c4d
&AUTHPARAMS
```

Sample Response

```
<CancelSpotInstanceRequestsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <spotInstanceRequestSet>
    <item>
      <spotInstanceRequestId>sir-1a2b3c4d</spotInstanceRequestId>
      <state>cancelled</state>
    </item>
  </spotInstanceRequestSet>
</CancelSpotInstanceRequestsResponse>
```

ConfirmProductInstance

Determines whether a product code is associated with an instance. This action can only be used by the owner of the product code. It is useful when a product code owner must verify whether another user's instance is eligible for support.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InstanceId

The ID of the instance.

Type: String

Required: Yes

ProductCode

The product code. This must be a product code that you own.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

ownerId

The AWS account ID of the instance owner. This is only present if the product code is attached to the instance.

Type: String

requestId

The ID of the request.

Type: String

return

The return value of the request. Returns `true` if the specified product code is owned by the requester and associated with the specified instance.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example determines whether the specified product code is associated with the specified instance.

Sample Request

```
https://ec2.amazonaws.com/?Action=ConfirmProductInstance
&ProductCode=774F4FF8
&InstanceId=i-1234567890abcdef0
&AUTHPARAMS
```

Sample Response

```
<ConfirmProductInstanceResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
```

```
  <return>true</return>
  <ownerId>111122223333</ownerId>
</ConfirmProductInstanceResponse>
```

CopyFpgaImage

Copies the specified Amazon FPGA Image (AFI) to the current Region.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring idempotency.

Type: String

Required: No

Description

The description for the new AFI.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Name

The name for the new AFI. The default is the name of the source AFI.

Type: String

Required: No

SourceFpgaImageId

The ID of the source AFI.

Type: String

Required: Yes

SourceRegion

The Region that contains the source AFI.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

fpgaImageId

The ID of the new AFI.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example copies the specified AFI from the `us-east-1` Region to the current Region (`eu-west-1`).

Sample Request

```
https://ec2.eu-west-1.amazonaws.com/?Action=CopyFpgaImage
&Name=eu-afi
&SourceFpgaImageId=afi-0d123eabcbfc85456
&SourceRegion=us-east-1
&AUTHPARAMS
```

Sample Response

```
<CopyFpgaImageResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>2d55d021-9ca9-45a1-8c5c-453example</requestId>
    <fpgaImageId>afi-06b12350a123fbabc</fpgaImageId>
</CopyFpgaImageResponse>
```

CopyImage

Initiates an AMI copy operation. You must specify the source AMI ID and both the source and destination locations. The copy operation must be initiated in the destination Region.

CopyImage supports the following source to destination copies:

- Region to Region
- Region to Outpost
- Parent Region to Local Zone
- Local Zone to parent Region
- Between Local Zones with the same parent Region (only supported for certain Local Zones)

CopyImage does not support the following source to destination copies:

- Local Zone to non-parent Regions
- Between Local Zones with different parent Regions
- Local Zone to Outpost
- Outpost to Local Zone
- Outpost to Region
- Between Outposts
- Within same Outpost
- Cross-partition copies (use CreateStoreImageTask instead)

Destination specification

- Region to Region: The destination Region is the Region in which you initiate the copy operation.
- Region to Outpost: Specify the destination using the `DestinationOutpostArn` parameter (the ARN of the Outpost)
- Region to Local Zone, and Local Zone to Local Zone copies: Specify the destination using the `DestinationAvailabilityZone` parameter (the name of the destination Local Zone) or `DestinationAvailabilityZoneId` parameter (the ID of the destination Local Zone).

Snapshot encryption

- Region to Outpost: Backing snapshots copied to an Outpost are encrypted by default using the default encryption key for the Region or the key that you specify. Outposts do not support unencrypted snapshots.
- Region to Local Zone, and Local Zone to Local Zone: Not all Local Zones require encrypted snapshots. In Local Zones that require encrypted snapshots, backing snapshots are automatically encrypted during copy. In Local Zones where encryption is not required, snapshots retain their original encryption state (encrypted or unencrypted) by default.

For more information, including the required permissions for copying an AMI, see Copy an Amazon EC2 AMI in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier you provide to ensure idempotency of the request. For more information, see Ensuring idempotency in Amazon EC2 API requests in the *Amazon EC2 API Reference*.

Type: String

Required: No

CopyImageTags

Specifies whether to copy your user-defined AMI tags to the new AMI.

The following tags are not be copied:

- System tags (prefixed with `aws:`)
- For public and shared AMIs, user-defined tags that are attached by other AWS accounts

Default: Your user-defined AMI tags are not copied.

Type: Boolean

Required: No

Description

A description for the new AMI.

Type: String

Required: No

DestinationAvailabilityZone

The Local Zone for the new AMI (for example, `cn-north-1-pkx-1a`).

Only one of `DestinationAvailabilityZone`, `DestinationAvailabilityZoneId`, or `DestinationOutpostArn` can be specified.

Type: String

Required: No

DestinationAvailabilityZoneId

The ID of the Local Zone for the new AMI (for example, `cnn1-pkx1-az1`).

Only one of `DestinationAvailabilityZone`, `DestinationAvailabilityZoneId`, or `DestinationOutpostArn` can be specified.

Type: String

Required: No

DestinationOutpostArn

The Amazon Resource Name (ARN) of the Outpost for the new AMI.

Only specify this parameter when copying an AMI from an AWS Region to an Outpost. The AMI must be in the Region of the destination Outpost. You can't copy an AMI from an Outpost to a Region, from one Outpost to another, or within the same Outpost.

For more information, see Copy AMIs from an AWS Region to an Outpost in the *Amazon EBS User Guide*.

Only one of `DestinationAvailabilityZone`, `DestinationAvailabilityZoneId`, or `DestinationOutpostArn` can be specified.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Encrypted

Specifies whether to encrypt the snapshots of the copied image.

You can encrypt a copy of an unencrypted snapshot, but you cannot create an unencrypted copy of an encrypted snapshot. The default KMS key for Amazon EBS is used unless you specify a non-default AWS Key Management Service (AWS KMS) KMS key using `KmsKeyId`. For more information, see Use encryption with EBS-backed AMIs in the *Amazon EC2 User Guide*.

Type: Boolean

Required: No

KmsKeyId

The identifier of the symmetric AWS Key Management Service (AWS KMS) KMS key to use when creating encrypted volumes. If this parameter is not specified, your AWS managed KMS key for Amazon EBS is used. If you specify a KMS key, you must also set the encrypted state to `true`.

You can specify a KMS key using any of the following:

- Key ID. For example, 1234abcd-12ab-34cd-56ef-1234567890ab.
- Key alias. For example, alias/ExampleAlias.
- Key ARN. For example, arn:aws:kms:us-east-1:012345678910:key/1234abcd-12ab-34cd-56ef-1234567890ab.
- Alias ARN. For example, arn:aws:kms:us-east-1:012345678910:alias/ExampleAlias.

AWS authenticates the KMS key asynchronously. Therefore, if you specify an identifier that is not valid, the action can appear to complete, but eventually fails.

The specified KMS key must exist in the destination Region.

Amazon EBS does not support asymmetric KMS keys.

Type: String

Required: No

Name

The name of the new AMI.

Type: String

Required: Yes

SnapshotCopyCompletionDurationMinutes

Specify a completion duration, in 15 minute increments, to initiate a time-based AMI copy. The specified completion duration applies to each of the snapshots associated with the AMI. Each snapshot associated with the AMI will be completed within the specified completion duration, with copy throughput automatically adjusted for each snapshot based on its size to meet the timing target.

If you do not specify a value, the AMI copy operation is completed on a best-effort basis.

> **Note**
>
> This parameter is not supported when copying an AMI to or from a Local Zone, or to an Outpost.

For more information, see Time-based copies for Amazon EBS snapshots and EBS-backed AMIs.

Type: Long

Required: No

SourceImageId

The ID of the AMI to copy.

Type: String

Required: Yes

SourceRegion

The name of the Region that contains the AMI to copy.

Type: String

Required: Yes

TagSpecification.N

The tags to apply to the new AMI and new snapshots. You can tag the AMI, the snapshots, or both.

- To tag the new AMI, the value for `ResourceType` must be `image`.
- To tag the new snapshots, the value for `ResourceType` must be `snapshot`. The same tag is applied to all the new snapshots.

If you specify other values for `ResourceType`, the request fails.

To tag an AMI or snapshot after it has been created, see CreateTags.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

imageId

The ID of the new AMI.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example request copies the AMI in `us-west-2` with the ID `ami-1a2b3c4d`, naming the new AMI `My-Standard-AMI`.

Sample Request

```
https://ec2.amazonaws.com/?Action=CopyImage
&SourceRegion=us-west-2
&SourceImageId=ami-1a2b3c4d
&Name=My-Standard-AMI
&Description=This%20is%20the%20new%20version%20of%20My-Standard-AMI
&ClientToken=550e8400-e29b-41d4-a716-446655440000
&AUTHPARAMS
```

Sample Response

```
<CopyImageResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>60bc441d-fa2c-494d-b155-5d6a3EXAMPLE</requestId>
   <imageId>ami-4d3c2b1a</imageId>
</CopyImageResponse>
```

- AWS SDK for Python

- AWS SDK for Ruby V3

CopySnapshot

Creates an exact copy of an Amazon EBS snapshot.

The location of the source snapshot determines whether you can copy it or not, and the allowed destinations for the snapshot copy.

- If the source snapshot is in a Region, you can copy it within that Region, to another Region, to an Outpost associated with that Region, or to a Local Zone in that Region.
- If the source snapshot is in a Local Zone, you can copy it within that Local Zone, to another Local Zone in the same zone group, or to the parent Region of the Local Zone.
- If the source snapshot is on an Outpost, you can't copy it.

When copying snapshots to a Region, the encryption outcome for the snapshot copy depends on the Amazon EBS encryption by default setting for the destination Region, the encryption status of the source snapshot, and the encryption parameters you specify in the request. For more information, see Encryption and snapshot copying.

Snapshots copied to an Outpost must be encrypted. Unencrypted snapshots are not supported on Outposts. For more information, Amazon EBS local snapshots on Outposts.

> **Note**
>
> Snapshots copies have an arbitrary source volume ID. Do not use this volume ID for any purpose.

For more information, see Copy an Amazon EBS snapshot in the *Amazon EBS User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CompletionDurationMinutes

> **Note**
>
> Not supported when copying snapshots to or from Local Zones or Outposts.

Specify a completion duration, in 15 minute increments, to initiate a time-based snapshot copy. Time-based snapshot copy operations complete within the specified duration. For more information, see Time-based copies.

If you do not specify a value, the snapshot copy operation is completed on a best-effort basis.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 2880.

Required: No

Description

A description for the EBS snapshot.

Type: String

Required: No

DestinationAvailabilityZone

The Local Zone, for example, `cn-north-1-pkx-1a` to which to copy the snapshot.

> **Note**
>
> Only supported when copying a snapshot to a Local Zone.

Type: String

Required: No

DestinationOutpostArn

The Amazon Resource Name (ARN) of the Outpost to which to copy the snapshot.

> **Note**
>
> Only supported when copying a snapshot to an Outpost.

For more information, see Copy snapshots from an AWS Region to an Outpost in the *Amazon EBS User Guide*.

Type: String

Required: No

DestinationRegion

The destination Region to use in the `PresignedUrl` parameter of a snapshot copy operation. This parameter is only valid for specifying the destination Region in a `PresignedUrl` parameter, where it is required.

The snapshot copy is sent to the regional endpoint that you sent the HTTP request to (for example, `ec2.us-east-1.amazonaws.com`).

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Encrypted

To encrypt a copy of an unencrypted snapshot if encryption by default is not enabled, enable encryption using this parameter. Otherwise, omit this parameter. Copies of encrypted snapshots are encrypted, even if you omit this parameter and encryption by default is not enabled. You cannot set this parameter to false. For more information, see Amazon EBS encryption in the *Amazon EBS User Guide*.

Type: Boolean

Required: No

KmsKeyId

The identifier of the AWS KMS key to use for Amazon EBS encryption. If this parameter is not specified, your AWS KMS key for Amazon EBS is used. If `KmsKeyId` is specified, the encrypted state must be `true`.

You can specify the KMS key using any of the following:

- Key ID. For example, 1234abcd-12ab-34cd-56ef-1234567890ab.
- Key alias. For example, alias/ExampleAlias.
- Key ARN. For example, arn:aws:kms:us-east-1:012345678910:key/1234abcd-12ab-34cd-56ef-1234567890ab.
- Alias ARN. For example, arn:aws:kms:us-east-1:012345678910:alias/ExampleAlias.

AWS authenticates the KMS key asynchronously. Therefore, if you specify an ID, alias, or ARN that is not valid, the action can appear to complete, but eventually fails.

Type: String

Required: No

PresignedUrl

When you copy an encrypted source snapshot using the Amazon EC2 Query API, you must supply a pre-signed URL. This parameter is optional for unencrypted snapshots. For more information, see Query requests.

The `PresignedUrl` should use the snapshot source endpoint, the `CopySnapshot` action, and include the `SourceRegion`, `SourceSnapshotId`, and `DestinationRegion` parameters. The `PresignedUrl` must be signed using AWS Signature Version 4. Because EBS snapshots are stored in Amazon S3, the signing algorithm for this parameter uses the same logic that is described in Authenticating Requests: Using Query Parameters (AWS Signature Version 4) in the *Amazon S3 API Reference*. An invalid or improperly signed `PresignedUrl` will cause the copy operation to fail asynchronously, and the snapshot will move to an `error` state.

Type: String

Required: No

SourceRegion

The ID of the Region that contains the snapshot to be copied.

Type: String

Required: Yes

SourceSnapshotId

The ID of the EBS snapshot to copy.

Type: String

Required: Yes

TagSpecification.N

The tags to apply to the new snapshot.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

snapshotId

The ID of the new snapshot.

Type: String

tagSet

Any tags applied to the new snapshot.

Type: Array of Tag objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Create copy of an unencrypted snapshot in the same Region as the original

This example request copies the snapshot in the us-west-1 Region with the ID `snap-1234567890abcdef0`.

Sample Request

```
https://ec2.amazonaws.com/?Action=CopySnapshot
&SourceRegion=us-west-1
&SourceSnapshotId=snap-1234567890abcdef0
&Description=My_snapshot
&AUTHPARAMS
```

Sample Response

```
<CopySnapshotResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>60bc441d-fa2c-494d-b155-5d6a3EXAMPLE</requestId>
  <snapshotId>snap-1234567890abcdef1</snapshotId>
</CopySnapshotResponse<
```

Create a copy of an encrypted snapshot in a Region different from the original

This example request copies an encrypted snapshot in the us-west-1 Region to the us-east-1 Region with the ID `snap-0987654321abcdef0`.

Sample Request

```
https://ec2.amazonaws.com/?SourceSnapshotId=snap-005a01bf6eEXAMPLE
&SourceRegion=us-west-1
&KmsKeyId=arn%3Aaws%3Akms%3Aus-west-2%3A210774411744%3Akey%2FfEXAMPLE-24bc-479b-
a9da-7132eEXAMPLE
&Action=CopySnapshot
&Encrypted=true
&DestinationRegion=us-east-1
&AUTHPARAMS
```

Sample Response

```
<CopySnapshotResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
 <requestId>256f6c57-6648-4544-a79a-35a03EXAMPLE</requestId>
 <snapshotId>snap-0987654321abcdef0</snapshotId>
</CopySnapshotResponse>
```

CopyVolumes

Creates a crash-consistent, point-in-time copy of an existing Amazon EBS volume within the same Availability Zone. The volume copy can be attached to an Amazon EC2 instance once it reaches the `available` state. For more information, see Copy an Amazon EBS volume.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensure Idempotency.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Iops

The number of I/O operations per second (IOPS) to provision for the volume copy. Required for `io1` and `io2` volumes. Optional for `gp3` volumes. Omit for all other volume types. Full provisioned IOPS performance can be achieved only once the volume copy is fully initialized.

Valid ranges:

- gp3: `3,000` (*default*) - `80,000` IOPS
- io1: `100` - `64,000` IOPS
- io2: `100` - `256,000` IOPS

> **Note**
>
> Instances built on the Nitro System can support up to 256,000 IOPS. Other instances can support up to 32,000 IOPS.

Type: Integer

Required: No

MultiAttachEnabled

Indicates whether to enable Amazon EBS Multi-Attach for the volume copy. If you enable Multi-Attach, you can attach the volume to up to 16 Nitro instances in the same Availability Zone simultaneously. Supported with `io1` and `io2` volumes only. For more information, see Amazon EBS Multi-Attach.

Type: Boolean

Required: No

Size

The size of the volume copy, in GiBs. The size must be equal to or greater than the size of the source volume. If not specified, the size defaults to the size of the source volume.

Maximum supported sizes:

- gp2: `16,384` GiB
- gp3: `65,536` GiB
- io1: `16,384` GiB
- io2: `65,536` GiB
- st1 and sc1: `16,384` GiB
- standard: `1024` GiB

Type: Integer

Required: No

SourceVolumeId

The ID of the source EBS volume to copy.

Type: String

Required: Yes

TagSpecification.N

The tags to apply to the volume copy during creation.

Type: Array of TagSpecification objects

Required: No

Throughput

The throughput to provision for the volume copy, in MiB/s. Supported for gp3 volumes only. Omit for all other volume types. Full provisioned throughput performance can be achieved only once the volume copy is fully initialized.

Valid Range: `125 - 2000` MiB/s

Type: Integer

Required: No

VolumeType

The volume type for the volume copy. If not specified, the volume type defaults to gp2.

Type: String

Valid Values: `standard | io1 | io2 | gp2 | sc1 | st1 | gp3`

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

volumeSet

Information about the volume copy.

Type: Array of Volume objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

CreateCapacityManagerDataExport

Creates a new data export configuration for EC2 Capacity Manager. This allows you to automatically export capacity usage data to an S3 bucket on a scheduled basis. The exported data includes metrics for On-Demand, Spot, and Capacity Reservations usage across your organization.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensure Idempotency.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

OutputFormat

The file format for the exported data. Parquet format is recommended for large datasets and better compression.

Type: String

Valid Values: `csv | parquet`

Required: Yes

S3BucketName

The name of the S3 bucket where the capacity data export files will be delivered. The bucket must exist and you must have write permissions to it.

Type: String

Required: Yes

S3BucketPrefix

The S3 key prefix for the exported data files. This allows you to organize exports in a specific folder structure within your bucket. If not specified, files are placed at the bucket root.

Type: String

Required: No

Schedule

The frequency at which data exports are generated.

Type: String

Valid Values: `hourly`

Required: Yes

TagSpecification.N

The tags to apply to the data export configuration. You can tag the export for organization and cost tracking purposes.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

capacityManagerDataExportId

The unique identifier for the created data export configuration. Use this ID to reference the export in other API calls.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for Ruby V3

CreateCapacityReservation

Creates a new Capacity Reservation with the specified attributes. Capacity Reservations enable you to reserve capacity for your Amazon EC2 instances in a specific Availability Zone for any duration.

You can create a Capacity Reservation at any time, and you can choose when it starts. You can create a Capacity Reservation for immediate use or you can request a Capacity Reservation for a future date.

For more information, see Reserve compute capacity with On-Demand Capacity Reservations in the *Amazon EC2 User Guide*.

Your request to create a Capacity Reservation could fail if:

- Amazon EC2 does not have sufficient capacity. In this case, try again at a later time, try in a different Availability Zone, or request a smaller Capacity Reservation. If your workload is flexible across instance types and sizes, try with different instance attributes.
- The requested quantity exceeds your On-Demand Instance quota. In this case, increase your On-Demand Instance quota for the requested instance type and try again. For more information, see Amazon EC2 Service Quotas in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AvailabilityZone

The Availability Zone in which to create the Capacity Reservation.

Type: String

Required: No

AvailabilityZoneId

The ID of the Availability Zone in which to create the Capacity Reservation.

Type: String

Required: No

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensure Idempotency.

Type: String

Required: No

CommitmentDuration

> **Note**
>
> Required for future-dated Capacity Reservations only. To create a Capacity Reservation for immediate use, omit this parameter.

Specify a commitment duration, in seconds, for the future-dated Capacity Reservation.

The commitment duration is a minimum duration for which you commit to having the future-dated Capacity Reservation in the `active` state in your account after it has been delivered.

For more information, see Commitment duration.

Type: Long

Valid Range: Minimum value of 1. Maximum value of 200000000.

Required: No

DeliveryPreference

> **Note**
>
> Required for future-dated Capacity Reservations only. To create a Capacity Reservation for immediate use, omit this parameter.

Indicates that the requested capacity will be delivered in addition to any running instances or reserved capacity that you have in your account at the requested date and time.

The only supported value is `incremental`.

Type: String

Valid Values: `fixed | incremental`

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

EbsOptimized

Indicates whether the Capacity Reservation supports EBS-optimized instances. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal I/O performance. This optimization isn't available with all instance types. Additional usage charges apply when using an EBS- optimized instance.

Type: Boolean

Required: No

EndDate

The date and time at which the Capacity Reservation expires. When a Capacity Reservation expires, the reserved capacity is released and you can no longer launch instances into it. The Capacity Reservation's state changes to `expired` when it reaches its end date and time.

You must provide an `EndDate` value if `EndDateType` is `limited`. Omit `EndDate` if `EndDateType` is `unlimited`.

If the `EndDateType` is `limited`, the Capacity Reservation is cancelled within an hour from the specified time. For example, if you specify 5/31/2019, 13:30:55, the Capacity Reservation is guaranteed to end between 13:30:55 and 14:30:55 on 5/31/2019.

If you are requesting a future-dated Capacity Reservation, you can't specify an end date and time that is within the commitment duration.

Type: Timestamp

Required: No

EndDateType

Indicates the way in which the Capacity Reservation ends. A Capacity Reservation can have one of the following end types:

- `unlimited` - The Capacity Reservation remains active until you explicitly cancel it. Do not provide an `EndDate` if the `EndDateType` is `unlimited`.
- `limited` - The Capacity Reservation expires automatically at a specified date and time. You must provide an `EndDate` value if the `EndDateType` value is `limited`.

Type: String

Valid Values: `unlimited | limited`

Required: No

EphemeralStorage

Deprecated.

Type: Boolean

Required: No

InstanceCount

The number of instances for which to reserve capacity.

> **Note**
>
> You can request future-dated Capacity Reservations for an instance count with a minimum of 32 vCPUs. For example, if you request a future-dated Capacity Reservation for `m5.xlarge` instances, you must request at least 8 instances (*8 * m5.xlarge = 32 vCPUs*).

Valid range: 1 - 1000

Type: Integer

Required: Yes

InstanceMatchCriteria

Indicates the type of instance launches that the Capacity Reservation accepts. The options include:

- `open` - The Capacity Reservation automatically matches all instances that have matching attributes (instance type, platform, and Availability Zone). Instances that have matching attributes run in the Capacity Reservation automatically without specifying any additional parameters.
- `targeted` - The Capacity Reservation only accepts instances that have matching attributes (instance type, platform, and Availability Zone), and explicitly target the Capacity Reservation. This ensures that only permitted instances can use the reserved capacity.

> **Note**
>
> If you are requesting a future-dated Capacity Reservation, you must specify `targeted`.

Default: `open`

Type: String

Valid Values: `open | targeted`

Required: No

InstancePlatform

The type of operating system for which to reserve capacity.

Type: String

Valid Values: `Linux/UNIX | Red Hat Enterprise Linux | SUSE Linux | Windows | Windows with SQL Server | Windows with SQL Server Enterprise | Windows with SQL Server Standard | Windows with SQL Server Web | Linux with SQL Server Standard | Linux with SQL Server Web | Linux with SQL Server Enterprise | RHEL with SQL Server Standard | RHEL with SQL Server Enterprise | RHEL with SQL Server Web | RHEL with HA | RHEL with HA and SQL Server Standard | RHEL with HA and SQL Server Enterprise | Ubuntu Pro`

Required: Yes

InstanceType

The instance type for which to reserve capacity.

> **Note**
>
> You can request future-dated Capacity Reservations for instance types in the C, M, R, I, T, and G instance families only.

For more information, see Instance types in the *Amazon EC2 User Guide*.

Type: String

Required: Yes

OutpostArn

> **Note**
>
> Not supported for future-dated Capacity Reservations.

The Amazon Resource Name (ARN) of the Outpost on which to create the Capacity Reservation.

Type: String

Pattern: `^arn:aws([a-z-]+)?:outposts:[a-z\d-]+:\d{12}:outpost/op-[a-f0-9]{17}$`

Required: No

PlacementGroupArn

> **Note**
>
> Not supported for future-dated Capacity Reservations.

The Amazon Resource Name (ARN) of the cluster placement group in which to create the Capacity Reservation. For more information, see Capacity Reservations for cluster placement groups in the *Amazon EC2 User Guide*.

Type: String

Pattern: `^arn:aws([a-z-]+)?:ec2:[a-z\d-]+:\d{12}:placement-group/^.{1,255}$`

Required: No

StartDate

> **Note**
>
> Required for future-dated Capacity Reservations only. To create a Capacity Reservation for immediate use, omit this parameter.

The date and time at which the future-dated Capacity Reservation should become available for use, in the ISO8601 format in the UTC time zone (`YYYY-MM-DDThh:mm:ss.sssZ`).

You can request a future-dated Capacity Reservation between 5 and 120 days in advance.

Type: Timestamp

Required: No

TagSpecifications.N

The tags to apply to the Capacity Reservation during launch.

Type: Array of TagSpecification objects

Required: No

Tenancy

Indicates the tenancy of the Capacity Reservation. A Capacity Reservation can have one of the following tenancy settings:

- `default` - The Capacity Reservation is created on hardware that is shared with other AWS accounts.
- `dedicated` - The Capacity Reservation is created on single-tenant hardware that is dedicated to a single AWS account.

Type: String

Valid Values: `default | dedicated`

Required: No

Response Elements

The following elements are returned by the service.

capacityReservation

Information about the Capacity Reservation.

Type: CapacityReservation object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

CreateCapacityReservationBySplitting

Create a new Capacity Reservation by splitting the capacity of the source Capacity Reservation. The new Capacity Reservation will have the same attributes as the source Capacity Reservation except for tags. The source Capacity Reservation must be `active` and owned by your AWS account.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensure Idempotency.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InstanceCount

The number of instances to split from the source Capacity Reservation.

Type: Integer

Required: Yes

SourceCapacityReservationId

The ID of the Capacity Reservation from which you want to split the capacity.

Type: String

Required: Yes

TagSpecification.N

The tags to apply to the new Capacity Reservation.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

destinationCapacityReservation

Information about the destination Capacity Reservation.

Type: CapacityReservation object

instanceCount

The number of instances in the new Capacity Reservation. The number of instances in the source Capacity Reservation was reduced by this amount.

Type: Integer

requestId

The ID of the request.

Type: String

sourceCapacityReservation

Information about the source Capacity Reservation.

Type: CapacityReservation object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4

- AWS SDK for Ruby V3

CreateCapacityReservationFleet

Creates a Capacity Reservation Fleet. For more information, see Create a Capacity Reservation Fleet in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AllocationStrategy

The strategy used by the Capacity Reservation Fleet to determine which of the specified instance types to use. Currently, only the `prioritized` allocation strategy is supported. For more information, see Allocation strategy in the *Amazon EC2 User Guide*.

Valid values: `prioritized`

Type: String

Required: No

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensure Idempotency.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

EndDate

The date and time at which the Capacity Reservation Fleet expires. When the Capacity Reservation Fleet expires, its state changes to `expired` and all of the Capacity Reservations in the Fleet expire.

The Capacity Reservation Fleet expires within an hour after the specified time. For example, if you specify `5/31/2019`, `13:30:55`, the Capacity Reservation Fleet is guaranteed to expire between `13:30:55` and `14:30:55` on `5/31/2019`.

Type: Timestamp

Required: No

InstanceMatchCriteria

Indicates the type of instance launches that the Capacity Reservation Fleet accepts. All Capacity Reservations in the Fleet inherit this instance matching criteria.

Currently, Capacity Reservation Fleets support `open` instance matching criteria only. This means that instances that have matching attributes (instance type, platform, and Availability Zone) run in the Capacity Reservations automatically. Instances do not need to explicitly target a Capacity Reservation Fleet to use its reserved capacity.

Type: String

Valid Values: `open`

Required: No

InstanceTypeSpecification.N

Information about the instance types for which to reserve the capacity.

Type: Array of ReservationFleetInstanceSpecification objects

Required: Yes

TagSpecification.N

The tags to assign to the Capacity Reservation Fleet. The tags are automatically assigned to the Capacity Reservations in the Fleet.

Type: Array of TagSpecification objects

Required: No

Tenancy

Indicates the tenancy of the Capacity Reservation Fleet. All Capacity Reservations in the Fleet inherit this tenancy. The Capacity Reservation Fleet can have one of the following tenancy settings:

- `default` - The Capacity Reservation Fleet is created on hardware that is shared with other AWS accounts.
- `dedicated` - The Capacity Reservations are created on single-tenant hardware that is dedicated to a single AWS account.

Type: String

Valid Values: `default`

Required: No

TotalTargetCapacity

The total number of capacity units to be reserved by the Capacity Reservation Fleet. This value, together with the instance type weights that you assign to each instance type used by the Fleet determine the number of instances for which the Fleet reserves capacity. Both values are based on units that make sense for your workload. For more information, see Total target capacity in the *Amazon EC2 User Guide*.

Type: Integer

Required: Yes

Response Elements

The following elements are returned by the service.

allocationStrategy

The allocation strategy used by the Capacity Reservation Fleet.

Type: String

capacityReservationFleetId

The ID of the Capacity Reservation Fleet.

Type: String

createTime

The date and time at which the Capacity Reservation Fleet was created.

Type: Timestamp

endDate

The date and time at which the Capacity Reservation Fleet expires.

Type: Timestamp

fleetCapacityReservationSet

Information about the individual Capacity Reservations in the Capacity Reservation Fleet.

Type: Array of FleetCapacityReservation objects

instanceMatchCriteria

The instance matching criteria for the Capacity Reservation Fleet.

Type: String

Valid Values: open

requestId

The ID of the request.

Type: String

state

The status of the Capacity Reservation Fleet.

Type: String

Valid Values: `submitted | modifying | active | partially_fulfilled | expiring | expired | cancelling | cancelled | failed`

tagSet

The tags assigned to the Capacity Reservation Fleet.

Type: Array of Tag objects

tenancy

Indicates the tenancy of Capacity Reservation Fleet.

Type: String

Valid Values: `default`

totalFulfilledCapacity

The requested capacity units that have been successfully reserved.

Type: Double

totalTargetCapacity

The total number of capacity units for which the Capacity Reservation Fleet reserves capacity.

Type: Integer

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

CreateCarrierGateway

Creates a carrier gateway. For more information about carrier gateways, see Carrier gateways in the *AWS Wavelength Developer Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see How to ensure idempotency.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TagSpecification.N

The tags to associate with the carrier gateway.

Type: Array of TagSpecification objects

Required: No

VpcId

The ID of the VPC to associate with the carrier gateway.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

carrierGateway

Information about the carrier gateway.

Type: CarrierGateway object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for Python
- AWS SDK for Ruby V3

CreateClientVpnEndpoint

Creates a Client VPN endpoint. A Client VPN endpoint is the resource you create and configure to enable and manage client VPN sessions. It is the destination endpoint at which all client VPN sessions are terminated.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Authentication.N

Information about the authentication method to be used to authenticate clients.

Type: Array of ClientVpnAuthenticationRequest objects

Required: Yes

ClientCidrBlock

The IPv4 address range, in CIDR notation, from which to assign client IP addresses. The address range cannot overlap with the local CIDR of the VPC in which the associated subnet is located, or the routes that you add manually. The address range cannot be changed after the Client VPN endpoint has been created. Client CIDR range must have a size of at least /22 and must not be greater than /12.

Type: String

Required: No

ClientConnectOptions

The options for managing connection authorization for new client connections.

Type: ClientConnectOptions object

Required: No

ClientLoginBannerOptions

Options for enabling a customizable text banner that will be displayed on AWS provided clients when a VPN session is established.

Type: ClientLoginBannerOptions object

Required: No

ClientRouteEnforcementOptions

Client route enforcement is a feature of the Client VPN service that helps enforce administrator defined routes on devices connected through the VPN. T his feature helps improve your security posture by ensuring that network traffic originating from a connected client is not inadvertently sent outside the VPN tunnel.

Client route enforcement works by monitoring the route table of a connected device for routing policy changes to the VPN connection. If the feature detects any VPN routing policy modifications, it will automatically force an update to the route table, reverting it back to the expected route configurations.

Type: ClientRouteEnforcementOptions object

Required: No

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring idempotency.

Type: String

Required: No

ConnectionLogOptions

Information about the client connection logging options.

If you enable client connection logging, data about client connections is sent to a Cloudwatch Logs log stream. The following information is logged:

- Client connection requests
- Client connection results (successful and unsuccessful)
- Reasons for unsuccessful client connection requests
- Client connection termination time

Type: ConnectionLogOptions object

Required: Yes

Description

A brief description of the Client VPN endpoint.

Type: String

Required: No

DisconnectOnSessionTimeout

Indicates whether the client VPN session is disconnected after the maximum timeout specified in `SessionTimeoutHours` is reached. If `true`, users are prompted to reconnect client VPN. If `false`, client VPN attempts to reconnect automatically. The default value is `true`.

Type: Boolean

Required: No

DnsServers.N

Information about the DNS servers to be used for DNS resolution. A Client VPN endpoint can have up to two DNS servers. If no DNS server is specified, the DNS address configured on the device is used for the DNS server.

Type: Array of strings

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

EndpointIpAddressType

The IP address type for the Client VPN endpoint. Valid values are `ipv4` (default) for IPv4 addressing only, `ipv6` for IPv6 addressing only, or `dual-stack` for both IPv4 and IPv6 addressing. When set to `dual-stack`, clients can connect to the endpoint using either IPv4 or IPv6 addresses..

Type: String

Valid Values: `ipv4 | ipv6 | dual-stack`

Required: No

SecurityGroupId.N

The IDs of one or more security groups to apply to the target network. You must also specify the ID of the VPC that contains the security groups.

Type: Array of strings

Required: No

SelfServicePortal

Specify whether to enable the self-service portal for the Client VPN endpoint.

Default Value: `enabled`

Type: String

Valid Values: `enabled | disabled`

Required: No

ServerCertificateArn

The ARN of the server certificate. For more information, see the AWS Certificate Manager User Guide.

Type: String

Required: Yes

SessionTimeoutHours

The maximum VPN session duration time in hours.

Valid values: `8 | 10 | 12 | 24`

Default value: `24`

Type: Integer

Required: No

SplitTunnel

Indicates whether split-tunnel is enabled on the AWS Client VPN endpoint.

By default, split-tunnel on a VPN endpoint is disabled.

For information about split-tunnel VPN endpoints, see Split-tunnel AWS Client VPN endpoint in the *AWS Client VPN Administrator Guide*.

Type: Boolean

Required: No

TagSpecification.N

The tags to apply to the Client VPN endpoint during creation.

Type: Array of TagSpecification objects

Required: No

TrafficIpAddressType

The IP address type for traffic within the Client VPN tunnel. Valid values are `ipv4` (default) for IPv4 traffic only, `ipv6` for IPv6 addressing only, or `dual-stack` for both IPv4 and IPv6 traffic. When set to `dual-stack`, clients can access both IPv4 and IPv6 resources through the VPN .

Type: String

Valid Values: `ipv4 | ipv6 | dual-stack`

Required: No

TransportProtocol

The transport protocol to be used by the VPN session.

Default value: udp

Type: String

Valid Values: `tcp | udp`

Required: No

VpcId

The ID of the VPC to associate with the Client VPN endpoint. If no security group IDs are specified in the request, the default security group for the VPC is applied.

Type: String

Required: No

VpnPort

The port number to assign to the Client VPN endpoint for TCP and UDP traffic.

Valid Values: 443 | 1194

Default Value: 443

Type: Integer

Required: No

Response Elements

The following elements are returned by the service.

clientVpnEndpointId

The ID of the Client VPN endpoint.

Type: String

dnsName

The DNS name to be used by clients when establishing their VPN session.

Type: String

requestId

The ID of the request.

Type: String

status

The current state of the Client VPN endpoint.

Type: ClientVpnEndpointStatus object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example creates a Client VPN endpoint.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateClientVpnEndpoint
&ClientCidrBlock=11.0.0.0/16
&ServerCertificateArn=arn:aws:acm:us-
east-1:123456789098:certificate/82916b3c-7449-43cf-ab9e-EXAMPLE
&Authentication.1.Type=certificate-authentication
&Authentication.1.MutualAuthentication.1.ClientRootCertificateChainArn=arn:aws:acm:us-
east-1:123456789098:certificate/82916b3c-7449-43cf-ab9e-EXAMPLE
&ConnectionLogOptions.Enabled=false
&DnsServers=11.11.0.1
&AUTHPARAMS
```

Sample Response

```
<CreateClientVpnEndpointResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>c11b2aa2-c48d-4711-a394-43cbe8961c46</requestId>

CreateClientVpnRoute

Adds a route to a network to a Client VPN endpoint. Each Client VPN endpoint has a route table that describes the available destination network routes. Each route in the route table specifies the path for traffic to specific resources or networks.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring idempotency.

Type: String

Required: No

ClientVpnEndpointId

The ID of the Client VPN endpoint to which to add the route.

Type: String

Required: Yes

Description

A brief description of the route.

Type: String

Required: No

DestinationCidrBlock

The IPv4 address range, in CIDR notation, of the route destination. For example:

- To add a route for Internet access, enter `0.0.0.0/0`
- To add a route for a peered VPC, enter the peered VPC's IPv4 CIDR range
- To add a route for an on-premises network, enter the AWS Site-to-Site VPN connection's IPv4 CIDR range

- To add a route for the local network, enter the client CIDR range

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TargetVpcSubnetId

The ID of the subnet through which you want to route traffic. The specified subnet must be an existing target network of the Client VPN endpoint.

Alternatively, if you're adding a route for the local network, specify `local`.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

status

The current state of the route.

Type: ClientVpnRouteStatus object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example adds a route for Internet access to the Client VPN endpoint.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateClientVpnRoute
&ClientVpnEndpointId=cvpn-endpoint-00c5d11fc4EXAMPLE
&DestinationCidrBlock=0.0.0.0/0
&TargetVpcSubnetId=subnet-057fa0918fEXAMPLE
&AUTHPARAMS
```

Sample Response

```
<CreateClientVpnRouteResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>5b301186-e6d3-436b-87d6-7c400EXAMPLE</requestId>
    <status>
        <code>creating</code>
    </status>
</CreateClientVpnRouteResponse>
```

CreateCoipCidr

Creates a range of customer-owned IP addresses.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Cidr

A customer-owned IP address range to create.

Type: String

Required: Yes

CoipPoolId

The ID of the address pool.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

coipCidr

Information about a range of customer-owned IP addresses.

Type: CoipCidr object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

CreateCoipPool

Creates a pool of customer-owned IP (CoIP) addresses.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

LocalGatewayRouteTableId

The ID of the local gateway route table.

Type: String

Required: Yes

TagSpecification.N

The tags to assign to the CoIP address pool.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

coipPool

Information about the CoIP address pool.

Type: CoipPool object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

CreateCustomerGateway

Provides information to AWS about your customer gateway device. The customer gateway device is the appliance at your end of the VPN connection. You must provide the IP address of the customer gateway device's external interface. The IP address must be static and can be behind a device performing network address translation (NAT).

For devices that use Border Gateway Protocol (BGP), you can also provide the device's BGP Autonomous System Number (ASN). You can use an existing ASN assigned to your network. If you don't have an ASN already, you can use a private ASN. For more information, see Customer gateway options for your Site-to-Site VPN connection in the *AWS Site-to-Site VPN User Guide*.

To create more than one customer gateway with the same VPN type, IP address, and BGP ASN, specify a unique device name for each customer gateway. An identical request returns information about the existing customer gateway; it doesn't create a new customer gateway.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

BgpAsn

For customer gateway devices that support BGP, specify the device's ASN. You must specify either `BgpAsn` or `BgpAsnExtended` when creating the customer gateway. If the ASN is larger than `2,147,483,647`, you must use `BgpAsnExtended`.

Default: 65000

Valid values: 1 to `2,147,483,647`

Type: Integer

Required: No

BgpAsnExtended

For customer gateway devices that support BGP, specify the device's ASN. You must specify either `BgpAsn` or `BgpAsnExtended` when creating the customer gateway. If the ASN is larger than `2,147,483,647`, you must use `BgpAsnExtended`.

Valid values: 2,147,483,648 to 4,294,967,295

Type: Long

Required: No

CertificateArn

The Amazon Resource Name (ARN) for the customer gateway certificate.

Type: String

Required: No

DeviceName

A name for the customer gateway device.

Length Constraints: Up to 255 characters.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

IpAddress

The IP address for the customer gateway device's outside interface. The address must be static. If `OutsideIpAddressType` in your VPN connection options is set to `PrivateIpv4`, you can use an RFC6598 or RFC1918 private IPv4 address. If `OutsideIpAddressType` is set to `Ipv6`, you can use an IPv6 address.

Type: String

Required: No

PublicIp

This member has been deprecated. The Internet-routable IP address for the customer gateway's outside interface. The address must be static.

Type: String

Required: No

TagSpecification.N

The tags to apply to the customer gateway.

Type: Array of TagSpecification objects

Required: No

Type

The type of VPN connection that this customer gateway supports (`ipsec.1`).

Type: String

Valid Values: `ipsec.1`

Required: Yes

Response Elements

The following elements are returned by the service.

customerGateway

Information about the customer gateway.

Type: CustomerGateway object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example creates a customer gateway with the name `my-device`, the IP address `12.1.2.3`, and BGP ASN 65534.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateCustomerGateway
&Type=ipsec.1
&IpAddress=12.1.2.3
&BgpAsn=65534
&DeviceName=my-device
&AUTHPARAMS
```

Sample Response

```
<CreateCustomerGatewayResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
   <customerGateway>
      <customerGatewayId>cgw-11223344556677abc</customerGatewayId>
      <state>pending</state>
      <type>ipsec.1</type>
      <ipAddress>12.1.2.3</ipAddress>
      <bgpAsn>65534</bgpAsn>
      <deviceName>my-device</deviceName>
      <tagSet/>
   </customerGateway>
</CreateCustomerGatewayResponse>
```

CreateDefaultSubnet

Creates a default subnet with a size `/20` IPv4 CIDR block in the specified Availability Zone in your default VPC. You can have only one default subnet per Availability Zone. For more information, see Create a default subnet in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AvailabilityZone

The Availability Zone in which to create the default subnet.

Either `AvailabilityZone` or `AvailabilityZoneId` must be specified, but not both.

Type: String

Required: No

AvailabilityZoneId

The ID of the Availability Zone.

Either `AvailabilityZone` or `AvailabilityZoneId` must be specified, but not both.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Ipv6Native

Indicates whether to create an IPv6 only subnet. If you already have a default subnet for this Availability Zone, you must delete it before you can create an IPv6 only subnet.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

subnet

Information about the subnet.

Type: Subnet object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example creates a default subnet in Availability Zone `us-east-2a`.

Sample Request

```
https://ec2.us-east-2.amazonaws.com/?Action=CreateDefaultSubnet
&AvailabilityZone=us-east-2a
&AUTHPARAMS
```

Sample Response

```
<CreateDefaultSubnetResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>12e2fb2e-e566-488a-926d-4655example</requestId>
    <subnet>
```

```
        <assignIpv6AddressOnCreation>false</assignIpv6AddressOnCreation>
        <availabilityZone>us-east-2a</availabilityZone>
        <availableIpAddressCount>4091</availableIpAddressCount>
        <cidrBlock>172.31.32.0/20</cidrBlock>
        <defaultForAz>true</defaultForAz>
        <ipv6CidrBlockAssociationSet/>
        <mapPublicIpOnLaunch>true</mapPublicIpOnLaunch>
        <state>available</state>
        <subnetId>subnet-111f7123</subnetId>
        <tagSet/>
        <vpcId>vpc-8eaaeabc</vpcId>
    </subnet>
</CreateDefaultSubnetResponse>
```

CreateDefaultVpc

Creates a default VPC with a size /16 IPv4 CIDR block and a default subnet in each Availability Zone. For more information about the components of a default VPC, see Default VPCs in the *Amazon VPC User Guide*. You cannot specify the components of the default VPC yourself.

If you deleted your previous default VPC, you can create a default VPC. You cannot have more than one default VPC per Region.

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

vpc

Information about the VPC.

Type: Vpc object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example creates a default VPC.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateDefaultVpc
&AUTHPARAMS
```

Sample Response

```
<CreateDefaultVpcResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>056298f3-5f3e-48fb-9221-7c0example</requestId>
    <vpc>
        <cidrBlock>172.31.0.0/16</cidrBlock>
        <dhcpOptionsId>dopt-61079b07</dhcpOptionsId>
        <instanceTenancy>default</instanceTenancy>
        <ipv6CidrBlockAssociationSet/>
        <isDefault>true</isDefault>
        <state>pending</state>
        <tagSet/>
        <vpcId>vpc-3f139646</vpcId>
    </vpc>
</CreateDefaultVpcResponse>
```

CreateDelegateMacVolumeOwnershipTask

Delegates ownership of the Amazon EBS root volume for an Apple silicon Mac instance to an administrative user.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring Idempotency.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InstanceId

The ID of the Amazon EC2 Mac instance.

Type: String

Required: Yes

MacCredentials

Specifies the following credentials:

- **Internal disk administrative user**
  - **Username** - Only the default administrative user (`aws-managed-user`) is supported and it is used by default. You can't specify a different administrative user.

- **Password** - If you did not change the default password for `aws-managed-user`, specify the default password, which is *blank*. Otherwise, specify your password.

- **Amazon EBS root volume administrative user**
  - **Username** - If you did not change the default administrative user, specify `ec2-user`. Otherwise, specify the username for your administrative user.
  - **Password** - Specify the password for the administrative user.

The credentials must be specified in the following JSON format:

```
{ "internalDiskPassword":"internal-disk-admin_password",
"rootVolumeUsername":"root-volume-admin_username",
"rootVolumepassword":"root-volume-admin_password" }
```

Type: String

Required: Yes

TagSpecification.N

The tags to assign to the volume ownership delegation task.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

macModificationTask

Information about the volume ownership delegation task.

Type: MacModificationTask object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

CreateDhcpOptions

Creates a custom set of DHCP options. After you create a DHCP option set, you associate it with a VPC. After you associate a DHCP option set with a VPC, all existing and newly launched instances in the VPC use this set of DHCP options.

The following are the individual DHCP options you can specify. For more information, see DHCP option sets in the *Amazon VPC User Guide*.

- `domain-name` - If you're using AmazonProvidedDNS in `us-east-1`, specify `ec2.internal`. If you're using AmazonProvidedDNS in any other Region, specify `region.compute.internal`. Otherwise, specify a custom domain name. This value is used to complete unqualified DNS hostnames.

  Some Linux operating systems accept multiple domain names separated by spaces. However, Windows and other Linux operating systems treat the value as a single domain, which results in unexpected behavior. If your DHCP option set is associated with a VPC that has instances running operating systems that treat the value as a single domain, specify only one domain name.
- `domain-name-servers` - The IP addresses of up to four DNS servers, or AmazonProvidedDNS. To specify multiple domain name servers in a single parameter, separate the IP addresses using commas. To have your instances receive custom DNS hostnames as specified in `domain-name`, you must specify a custom DNS server.
- `ntp-servers` - The IP addresses of up to eight Network Time Protocol (NTP) servers (four IPv4 addresses and four IPv6 addresses).
- `netbios-name-servers` - The IP addresses of up to four NetBIOS name servers.
- `netbios-node-type` - The NetBIOS node type (1, 2, 4, or 8). We recommend that you specify 2. Broadcast and multicast are not supported. For more information about NetBIOS node types, see RFC 2132.
- `ipv6-address-preferred-lease-time` - A value (in seconds, minutes, hours, or years) for how frequently a running instance with an IPv6 assigned to it goes through DHCPv6 lease renewal. Acceptable values are between 140 and 2147483647 seconds (approximately 68 years). If no value is entered, the default lease time is 140 seconds. If you use long-term addressing for EC2 instances, you can increase the lease time and avoid frequent lease renewal requests. Lease renewal typically occurs when half of the lease time has elapsed.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DhcpConfiguration.N

A DHCP configuration option.

Type: Array of NewDhcpConfiguration objects

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TagSpecification.N

The tags to assign to the DHCP option.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

dhcpOptions

A set of DHCP options.

Type: DhcpOptions object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example creates a set of DHCP options with a domain name `example.com` and two DNS servers (`10.2.5.1` and `10.2.5.2`). The DNS servers' IP addresses are specified in a single parameter, separated by commas, to preserve the order in which they are specified.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateDhcpOptions
&DhcpConfiguration.1.Key=domain-name
&DhcpConfiguration.1.Value.1=example.com
&DhcpConfiguration.2.Key=domain-name-servers
&DhcpConfiguration.2.Value.1=10.2.5.1,10.2.5.2
&DhcpConfiguration.3.Key=ipv6-address-preferred-lease-time
&DhcpConfiguration.3.Value.1=140
&AUTHPARAMS
```

Sample Response

```
<CreateDhcpOptionsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>

CreateEgressOnlyInternetGateway

[IPv6 only] Creates an egress-only internet gateway for your VPC. An egress-only internet gateway is used to enable outbound communication over IPv6 from instances in your VPC to the internet, and prevents hosts outside of your VPC from initiating an IPv6 connection with your instance.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring idempotency.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TagSpecification.N

The tags to assign to the egress-only internet gateway.

Type: Array of TagSpecification objects

Required: No

VpcId

The ID of the VPC for which to create the egress-only internet gateway.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

clientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request.

Type: String

egressOnlyInternetGateway

Information about the egress-only internet gateway.

Type: EgressOnlyInternetGateway object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example creates an egress-only internet gateway in VPC vpc-1a2b3c4d.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateEgressOnlyInternetGateway
&VpcId=vpc-1a2b3c4d
&AUTHPARAMS
```

Sample Response

```
<CreateEgressOnlyInternetGatewayResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
```

```
    <requestId>c617595f-6c29-4a00-a941-example</requestId>
    <egressOnlyInternetGateway>
        <attachmentSet>
            <item>
                <state>attached</state>
                <vpcId>vpc-1a2b3c4d</vpcId>
            </item>
        </attachmentSet>
        <egressOnlyInternetGatewayId>eigw-01eadbd45ecd7943f</
egressOnlyInternetGatewayId>
    </egressOnlyInternetGateway>
</CreateEgressOnlyInternetGatewayResponse>
```

CreateFleet

Creates an EC2 Fleet that contains the configuration information for On-Demand Instances and Spot Instances. Instances are launched immediately if there is available capacity.

A single EC2 Fleet can include multiple launch specifications that vary by instance type, AMI, Availability Zone, or subnet.

For more information, see EC2 Fleet in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. If you do not specify a client token, a randomly generated token is used for the request to ensure idempotency.

For more information, see Ensuring idempotency.

Type: String

Required: No

Context

Reserved.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ExcessCapacityTerminationPolicy

Indicates whether running instances should be terminated if the total target capacity of the EC2 Fleet is decreased below the current size of the EC2 Fleet.

Supported only for fleets of type `maintain`.

Type: String

Valid Values: `no-termination | termination`

Required: No

LaunchTemplateConfigs.N

The configuration for the EC2 Fleet.

Type: Array of FleetLaunchTemplateConfigRequest objects

Array Members: Minimum number of 0 items. Maximum number of 50 items.

Required: Yes

OnDemandOptions

Describes the configuration of On-Demand Instances in an EC2 Fleet.

Type: OnDemandOptionsRequest object

Required: No

ReplaceUnhealthyInstances

Indicates whether EC2 Fleet should replace unhealthy Spot Instances. Supported only for fleets of type `maintain`. For more information, see EC2 Fleet health checks in the *Amazon EC2 User Guide*.

Type: Boolean

Required: No

SpotOptions

Describes the configuration of Spot Instances in an EC2 Fleet.

Type: SpotOptionsRequest object

Required: No

TagSpecification.N

The key-value pair for tagging the EC2 Fleet request on creation. For more information, see Tag your resources.

If the fleet type is `instant`, specify a resource type of `fleet` to tag the fleet or `instance` to tag the instances at launch.

If the fleet type is `maintain` or `request`, specify a resource type of `fleet` to tag the fleet. You cannot specify a resource type of `instance`. To tag instances at launch, specify the tags in a launch template.

Type: Array of TagSpecification objects

Required: No

TargetCapacitySpecification

The number of units to request.

Type: TargetCapacitySpecificationRequest object

Required: Yes

TerminateInstancesWithExpiration

Indicates whether running instances should be terminated when the EC2 Fleet expires.

Type: Boolean

Required: No

Type

The fleet type. The default value is `maintain`.

- `maintain` - The EC2 Fleet places an asynchronous request for your desired capacity, and continues to maintain your desired Spot capacity by replenishing interrupted Spot Instances.
- `request` - The EC2 Fleet places an asynchronous one-time request for your desired capacity, but does submit Spot requests in alternative capacity pools if Spot capacity is unavailable, and does not maintain Spot capacity if Spot Instances are interrupted.

- `instant` - The EC2 Fleet places a synchronous one-time request for your desired capacity, and returns errors for any instances that could not be launched.

For more information, see EC2 Fleet request types in the *Amazon EC2 User Guide*.

Type: String

Valid Values: `request | maintain | instant`

Required: No

ValidFrom

The start date and time of the request, in UTC format (for example, *YYYY-MM-DD*T*HH*:*MM*:*SS*Z). The default is to start fulfilling the request immediately.

Type: Timestamp

Required: No

ValidUntil

The end date and time of the request, in UTC format (for example, *YYYY-MM-DD*T*HH*:*MM*:*SS*Z). At this point, no new EC2 Fleet requests are placed or able to fulfill the request. If no value is specified, the request remains until you cancel it.

Type: Timestamp

Required: No

Response Elements

The following elements are returned by the service.

errorSet

Information about the instances that could not be launched by the fleet. Supported only for fleets of type `instant`.

Type: Array of CreateFleetError objects

fleetId

The ID of the EC2 Fleet.

Type: String

fleetInstanceSet

Information about the instances that were launched by the fleet. Supported only for fleets of type `instant`.

Type: Array of CreateFleetInstance objects

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

CreateFlowLogs

Creates one or more flow logs to capture information about IP traffic for a specific network interface, subnet, or VPC.

Flow log data for a monitored network interface is recorded as flow log records, which are log events consisting of fields that describe the traffic flow. For more information, see Flow log records in the *Amazon VPC User Guide*.

When publishing to CloudWatch Logs, flow log records are published to a log group, and each network interface has a unique log stream in the log group. When publishing to Amazon S3, flow log records for all of the monitored network interfaces are published to a single log file object that is stored in the specified bucket.

For more information, see VPC Flow Logs in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see How to ensure idempotency.

Type: String

Required: No

DeliverCrossAccountRole

The ARN of the IAM role that allows Amazon EC2 to publish flow logs across accounts.

Type: String

Required: No

DeliverLogsPermissionArn

The ARN of the IAM role that allows Amazon EC2 to publish flow logs to the log destination.

This parameter is required if the destination type is `cloud-watch-logs`, or if the destination type is `kinesis-data-firehose` and the delivery stream and the resources to monitor are in different accounts.

Type: String

Required: No

DestinationOptions

The destination options.

Type: DestinationOptionsRequest object

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

LogDestination

The destination for the flow log data. The meaning of this parameter depends on the destination type.

- If the destination type is `cloud-watch-logs`, specify the ARN of a CloudWatch Logs log group. For example:

  arn:aws:logs:*region*:*account_id*:log-group:*my_group*

  Alternatively, use the `LogGroupName` parameter.
- If the destination type is `s3`, specify the ARN of an S3 bucket. For example:

  arn:aws:s3:::*my_bucket*/*my_subfolder*/

  The subfolder is optional. Note that you can't use `AWSLogs` as a subfolder name.
- If the destination type is `kinesis-data-firehose`, specify the ARN of a Kinesis Data Firehose delivery stream. For example:

arn:aws:firehose:*region*:*account_id*:deliverystream:*my_stream*

Type: String

Required: No

LogDestinationType

The type of destination for the flow log data.

Default: `cloud-watch-logs`

Type: String

Valid Values: `cloud-watch-logs | s3 | kinesis-data-firehose`

Required: No

LogFormat

The fields to include in the flow log record. List the fields in the order in which they should appear. If you omit this parameter, the flow log is created using the default format. If you specify this parameter, you must include at least one field. For more information about the available fields, see Flow log records in the *Amazon VPC User Guide* or Transit Gateway Flow Log records in the *AWS Transit Gateway Guide*.

Specify the fields using the `${field-id}` format, separated by spaces.

Type: String

Required: No

LogGroupName

The name of a new or existing CloudWatch Logs log group where Amazon EC2 publishes your flow logs.

This parameter is valid only if the destination type is `cloud-watch-logs`.

Type: String

Required: No

MaxAggregationInterval

The maximum interval of time during which a flow of packets is captured and aggregated into a flow log record. The possible values are 60 seconds (1 minute) or 600 seconds (10 minutes). This parameter must be 60 seconds for transit gateway resource types.

When a network interface is attached to a Nitro-based instance, the aggregation interval is always 60 seconds or less, regardless of the value that you specify.

Default: 600

Type: Integer

Required: No

ResourceId.N

The IDs of the resources to monitor. For example, if the resource type is VPC, specify the IDs of the VPCs.

Constraints: Maximum of 25 for transit gateway resource types. Maximum of 1000 for the other resource types.

Type: Array of strings

Required: Yes

ResourceType

The type of resource to monitor.

Type: String

Valid Values: `VPC | Subnet | NetworkInterface | TransitGateway | TransitGatewayAttachment | RegionalNatGateway`

Required: Yes

TagSpecification.N

The tags to apply to the flow logs.

Type: Array of TagSpecification objects

Required: No

TrafficType

The type of traffic to monitor (accepted traffic, rejected traffic, or all traffic). This parameter is not supported for transit gateway resource types. It is required for the other resource types.

Type: String

Valid Values: `ACCEPT | REJECT | ALL`

Required: No

Response Elements

The following elements are returned by the service.

clientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request.

Type: String

flowLogIdSet

The IDs of the flow logs.

Type: Array of strings

requestId

The ID of the request.

Type: String

unsuccessful

Information about the flow logs that could not be created successfully.

Type: Array of UnsuccessfulItem objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

(CloudWatch Logs) This example creates a flow log that captures all rejected traffic for network interface eni-aa22bb33 and publishes the data to an CloudWatch Logs log group named `my-flow-logs` in account `123456789101`, using the IAM role `publishFlowLogs`.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateFlowLogs
&ResourceType=NetworkInterface
&TrafficType=REJECT
&ResourceId.1=eni-aa22bb33
&DeliverLogsPermissionArn=arn:aws:iam::123456789101:role/publishFlowLogs
&LogDestinationType=cloud-watch-logs
&LogDestination=arn:aws:logs:us-east-1:123456789101:log-group:my-flow-logs
&AUTHPARAMS
```

Sample Response

```
<CreateFlowLogsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>2d96dae3-504b-4fc4-bf50-266EXAMPLE</requestId>
    <unsuccessful/>
    <flowLogIdSet>
        <item>fl-1a2b3c4d</item>
    </flowLogIdSet>
</CreateFlowLogsResponse>
```

Example 2

(Amazon S3) This example creates a flow log that captures all traffic for the specified network interface and publishes the data to an Amazon S3 bucket named amzn-s3-demo-bucket.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateFlowLogs
&ResourceType=NetworkInterface
&TrafficType=ALL
&ResourceId.1=eni-1235b8ca123456789
&LogDestinationType=s3
```

```
&LogDestination=arn:aws:s3:::amzn-s3-demo-bucket
&AUTHPARAMS
```

Example 3

(Amazon S3) This example creates a flow log with a custom flow log format that captures the version, instance ID, network interface ID, type, packet source address, packet destination address, protocol, bytes, the start time, the end time, and the action of the traffic, in that order. The flow log is published to an Amazon S3 bucket named amzn-s3-demo-bucket.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateFlowLogs
&ResourceType=NetworkInterface
&TrafficType=ALL
&ResourceId.1=eni-1235b8ca123456789
&LogDestinationType=s3
&LogDestination=arn:aws:s3:::amzn-s3-demo-bucket
&LogFormat='${version} ${instance-id} ${interface-id} ${type} ${pkt-srcaddr} ${pkt-
dstaddr} ${protocol} ${bytes} ${start} ${end} ${action}'
&AUTHPARAMS
```

CreateFpgaImage

Creates an Amazon FPGA Image (AFI) from the specified design checkpoint (DCP).

The create operation is asynchronous. To verify that the AFI was successfully created and is ready for use, check the output logs.

An AFI contains the FPGA bitstream that is ready to download to an FPGA. You can securely deploy an AFI on multiple FPGA-accelerated instances. For more information, see the AWS FPGA Hardware Development Kit.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring Idempotency.

Type: String

Required: No

Description

A description for the AFI.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InputStorageLocation

The location of the encrypted design checkpoint in Amazon S3. The input must be a tarball.

Type: StorageLocation object

Required: Yes

LogsStorageLocation

The location in Amazon S3 for the output logs.

Type: StorageLocation object

Required: No

Name

A name for the AFI.

Type: String

Required: No

TagSpecification.N

The tags to apply to the FPGA image during creation.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

fpgaImageGlobalId

The global FPGA image identifier (AGFI ID).

Type: String

fpgaImageId

The FPGA image identifier (AFI ID).

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example creates an AFI from the specified tarball in the specified bucket.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateFpgaImage
&Name=my-afi
&Description=test-afi
&InputStorageLocation.Bucket=my-fpga-bucket
&InputStorageLocation.Key=dcp/17_12_22-103226.Developer_CL.tar
&LogsStorageLocation.Bucket=my-fpga-bucket
&LogsStorageLocation.Key=logs
&AUTHPARAMS
```

Sample Response

```
<CreateFpgaImageResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>d97baa5e-d3dd-4ead-9586-c68example</requestId>
    <fpgaImageId>afi-0d123e123bfc85abc</fpgaImageId>
    <fpgaImageGlobalId>agfi-123cb27b5e84a0abc</fpgaImageGlobalId>
</CreateFpgaImageResponse>
```

CreateImage

Creates an Amazon EBS-backed AMI from an Amazon EBS-backed instance that is either running or stopped.

If you customized your instance with instance store volumes or Amazon EBS volumes in addition to the root device volume, the new AMI contains block device mapping information for those volumes. When you launch an instance from this new AMI, the instance automatically launches with those additional volumes.

The location of the source instance determines where you can create the snapshots of the AMI:

- If the source instance is in a Region, you must create the snapshots in the same Region as the instance.
- If the source instance is in a Local Zone, you can create the snapshots in the same Local Zone or in its parent Region.

For more information, see Create an Amazon EBS-backed AMI in the *Amazon Elastic Compute Cloud User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

BlockDeviceMapping.N

The block device mappings.

When using the CreateImage action:

- You can't change the volume size using the VolumeSize parameter. If you want a different volume size, you must first change the volume size of the source instance.
- You can't modify the encryption status of existing volumes or snapshots. To create an AMI with volumes or snapshots that have a different encryption status (for example, where the source volume and snapshots are unencrypted, and you want to create an AMI with encrypted volumes or snapshots), copy the image instead.
- The only option that can be changed for existing mappings or snapshots is `DeleteOnTermination`.

Type: Array of BlockDeviceMapping objects

Required: No

Description

A description for the new image.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InstanceId

The ID of the instance.

Type: String

Required: Yes

Name

A name for the new image.

Constraints: 3-128 alphanumeric characters, parentheses (()), square brackets ([]), spaces ( ), periods (.), slashes (/), dashes (-), single quotes ('), at-signs (@), or underscores(_)

Type: String

Required: Yes

NoReboot

Indicates whether or not the instance should be automatically rebooted before creating the image. Specify one of the following values:

- `true` - The instance is not rebooted before creating the image. This creates crash-consistent snapshots that include only the data that has been written to the volumes at the time the

snapshots are created. Buffered data and data in memory that has not yet been written to the volumes is not included in the snapshots.

- `false` - The instance is rebooted before creating the image. This ensures that all buffered data and data in memory is written to the volumes before the snapshots are created.

Default: `false`

Type: Boolean

Required: No

SnapshotLocation

> **Note**
>
> Only supported for instances in Local Zones. If the source instance is not in a Local Zone, omit this parameter.

The Amazon S3 location where the snapshots will be stored.

- To create local snapshots in the same Local Zone as the source instance, specify `local`.
- To create regional snapshots in the parent Region of the Local Zone, specify `regional` or omit this parameter.

Default: `regional`

Type: String

Valid Values: `regional | local`

Required: No

TagSpecification.N

The tags to apply to the AMI and snapshots on creation. You can tag the AMI, the snapshots, or both.

- To tag the AMI, the value for `ResourceType` must be `image`.
- To tag the snapshots that are created of the root volume and of other Amazon EBS volumes that are attached to the instance, the value for `ResourceType` must be `snapshot`. The same tag is applied to all of the snapshots that are created.

If you specify other values for `ResourceType`, the request fails.

To tag an AMI or snapshot after it has been created, see CreateTags.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

imageId

The ID of the new AMI.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example request creates an AMI from the specified instance.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateImage
&Description=Standard+Web+Server+v1.0
&InstanceId=i-1234567890abcdef0
&Name=standard-web-server-v1.0
&AUTHPARAMS
```

Sample Response

```
<CreateImageResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <imageId>ami-4fa54026</imageId>
</CreateImageResponse>
```

Example 2

This example request creates an AMI from the specified instance, and sets the NoReboot parameter to true (the instance is not rebooted before the image is created).

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateImage
&Description=Standard+Web+Server+v1.0
&InstanceId=i-1234567890abcdef0
&Name=standard-web-server-v1.0
&NoReboot=true
&AUTHPARAMS
```

Sample Response

```
<CreateImageResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <imageId>ami-4fa54026</imageId>
</CreateImageResponse>
```

Example 3

This example request creates an AMI from the specified instance, and tags on creation the AMI and the snapshots that are created of the root volume and of other Amazon EBS volumes that are attached to the instance. In this example, the tag that is applied to the AMI and the snapshots is the same, with a key of `purpose` and a value of `test`.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateImage
&InstanceId=i-1234567890abcdef0
&TagSpecification.1.ResourceType=image
```

```
&TagSpecification.1.Tag.1.Key=purpose
&TagSpecification.1.Tag.1.Value=test
&TagSpecification.2.ResourceType=snapshot
&TagSpecification.2.Tag.1.Key=purpose
&TagSpecification.2.Tag.1.Value=test
&AUTHPARAMS
```

Sample Response

```
<CreateImageResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <imageId>ami-4fa54026</imageId>
</CreateImageResponse>
```

CreateImageUsageReport

Creates a report that shows how your image is used across other AWS accounts. The report provides visibility into which accounts are using the specified image, and how many resources (EC2 instances or launch templates) are referencing it.

For more information, see View your AMI usage in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AccountId.N

The AWS account IDs to include in the report. To include all accounts, omit this parameter.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 200 items.

Required: No

ClientToken

A unique, case-sensitive identifier that you provide to ensure idempotency of the request.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ImageId

The ID of the image to report on.

Type: String

Required: Yes

ResourceType.N

The resource types to include in the report.

Type: Array of ImageUsageResourceTypeRequest objects

Required: Yes

TagSpecification.N

The tags to apply to the report on creation. The `ResourceType` must be set to `image-usage-report`; any other value will cause the report creation to fail.

To tag a report after it has been created, see CreateTags.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

reportId

The ID of the report.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2

- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

CreateInstanceConnectEndpoint

Creates an EC2 Instance Connect Endpoint.

An EC2 Instance Connect Endpoint allows you to connect to an instance, without requiring the instance to have a public IPv4 or public IPv6 address. For more information, see Connect to your instances using EC2 Instance Connect Endpoint in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

IpAddressType

The IP address type of the endpoint.

If no value is specified, the default value is determined by the IP address type of the subnet:

- `dualstack` - If the subnet has both IPv4 and IPv6 CIDRs
- `ipv4` - If the subnet has only IPv4 CIDRs
- `ipv6` - If the subnet has only IPv6 CIDRs

> **Note**
>
> `PreserveClientIp` is only supported on IPv4 EC2 Instance Connect Endpoints. To use `PreserveClientIp`, the value for `IpAddressType` must be `ipv4`.

Type: String

Valid Values: `ipv4 | dualstack | ipv6`

Required: No

PreserveClientIp

Indicates whether the client IP address is preserved as the source. The following are the possible values.

- `true` - Use the client IP address as the source.
- `false` - Use the network interface IP address as the source.

> **Note**
>
> `PreserveClientIp` is only supported on IPv4 EC2 Instance Connect Endpoints. To use `PreserveClientIp`, the value for `IpAddressType` must be `ipv4`.

Default: `false`

Type: Boolean

Required: No

SecurityGroupId.N

One or more security groups to associate with the endpoint. If you don't specify a security group, the default security group for your VPC will be associated with the endpoint.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 16 items.

Required: No

SubnetId

The ID of the subnet in which to create the EC2 Instance Connect Endpoint.

Type: String

Required: Yes

TagSpecification.N

The tags to apply to the EC2 Instance Connect Endpoint during creation.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

clientToken

Unique, case-sensitive idempotency token provided by the client in the the request.

Type: String

instanceConnectEndpoint

Information about the EC2 Instance Connect Endpoint.

Type: Ec2InstanceConnectEndpoint object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example: Create an EC2 Instance Connect Endpoint

This example creates an EC2 Instance Connect Endpoint in the specified subnet.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateInstanceConnectEndpoint
&SubnetId=subnet-0123456789example
&AUTHPARAMS
```

Sample Response

```
<CreateInstanceConnectEndpointResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
  <requestId>a9effc88-e86c-4730-b1e8-30ba091babd1</requestId>
  <instanceConnectEndpoint>
    <createdAt>2023-06-06T20:01:31.000Z</createdAt>
    <instanceConnectEndpointArn>arn:aws:ec2:region:account-id:instance-connect-
endpoint/eice-0123456789example</instanceConnectEndpointArn>
    <instanceConnectEndpointId>eice-0123456789example</instanceConnectEndpointId>
    <networkInterfaceIdSet />
    <ownerId>account-id</ownerId>
    <preserveClientIp>false</preserveClientIp>
    <securityGroupIdSet>
      <item>sg-0123456789example</item>
    </securityGroupIdSet>
    <state>create-in-progress</state>
    <stateMessage />
    <subnetId>subnet-0123456789example</subnetId>
    <tagSet />
    <vpcId>vpc-0123456789example</vpcId>
  </instanceConnectEndpoint>
</CreateInstanceConnectEndpointResponse>
```

CreateInstanceEventWindow

Creates an event window in which scheduled events for the associated Amazon EC2 instances can run.

You can define either a set of time ranges or a cron expression when creating the event window, but not both. All event window times are in UTC.

You can create up to 200 event windows per AWS Region.

When you create the event window, targets (instance IDs, Dedicated Host IDs, or tags) are not yet associated with it. To ensure that the event window can be used, you must associate one or more targets with it by using the AssociateInstanceEventWindow API.

Important

Event windows are applicable only for scheduled events that stop, reboot, or terminate instances.
Event windows are *not* applicable for:

- Expedited scheduled events and network maintenance events.
- Unscheduled maintenance such as AutoRecovery and unplanned reboots.

For more information, see Define event windows for scheduled events in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CronExpression

The cron expression for the event window, for example, `* 0-4,20-23 * * 1,5`. If you specify a cron expression, you can't specify a time range.

Constraints:

- Only hour and day of the week values are supported.

- For day of the week values, you can specify either integers `0` through `6`, or alternative single values `SUN` through `SAT`.
- The minute, month, and year must be specified by `*`.
- The hour value must be one or a multiple range, for example, `0-4` or `0-4,20-23`.
- Each hour range must be >= 2 hours, for example, `0-2` or `20-23`.
- The event window must be >= 4 hours. The combined total time ranges in the event window must be >= 4 hours.

For more information about cron expressions, see cron on the *Wikipedia website*.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Name

The name of the event window.

Type: String

Required: No

TagSpecification.N

The tags to apply to the event window.

Type: Array of TagSpecification objects

Required: No

TimeRange.N

The time range for the event window. If you specify a time range, you can't specify a cron expression.

Type: Array of InstanceEventWindowTimeRangeRequest objects

Required: No

Response Elements

The following elements are returned by the service.

instanceEventWindow

Information about the event window.

Type: InstanceEventWindow object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

CreateInstanceExportTask

Exports a running or stopped instance to an Amazon S3 bucket.

For information about the prerequisites for your Amazon S3 bucket, supported operating systems, image formats, and known limitations for the types of instances you can export, see Exporting an instance as a VM Using VM Import/Export in the *VM Import/Export User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Description

A description for the conversion task or the resource being exported. The maximum length is 255 characters.

Type: String

Required: No

ExportToS3

The format and location for an export instance task.

Type: ExportToS3TaskSpecification object

Required: Yes

InstanceId

The ID of the instance.

Type: String

Required: Yes

TagSpecification.N

The tags to apply to the export instance task during creation.

Type: Array of TagSpecification objects

Required: No

TargetEnvironment

The target virtualization environment.

Type: String

Valid Values: `citrix | vmware | microsoft`

Required: Yes

Response Elements

The following elements are returned by the service.

exportTask

Information about the export instance task.

Type: ExportTask object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example request creates an Export VM task that makes a Windows instance available as an OVA.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateInstanceExportTask
&Description=Example%20for%20docs
&InstanceId=i-1234567890abcdef0
```

```
&TargetEnvironment=VMWare
&ExportToS3.DiskImageFormat=VMDK
&ExportToS3.ContainerFormat=OVA
&ExportToS3.S3bucket=amzn-s3-demo-for-exported-vm
&ExportToS3.S3prefix=my-exports/
&AUTHPARAMS
```

Sample Response

```
<CreateInstanceExportTaskResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
<requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <exportTask>
   <exportTaskId>export-i-1234wxyz</exportTaskId>
   <description>Example for docs</description>
   <state>active</state>
   <statusMessage>Running</statusMessage>
    <instanceExport>
     <instanceId>i-1234567890abcdef0</instanceId>
     <targetEnvironment>VMWare</targetEnvironment>
    </instanceExport>
    <exportToS3>
     <diskImageFormat>VMDK</diskImageFormat>
     <containerFormat>OVA</containerFormat>
     <s3Bucket>amzn-s3-demo-for-exported-vm</s3Bucket>
     <s3Key>my-exports/ export-i-1234wxyz.ova</s3Key>
    </exportToS3>
  </exportTask>
</CreateInstanceExportTaskResponse>
```

CreateInternetGateway

Creates an internet gateway for use with a VPC. After creating the internet gateway, you attach it to a VPC using AttachInternetGateway.

For more information, see Internet gateways in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TagSpecification.N

The tags to assign to the internet gateway.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

internetGateway

Information about the internet gateway.

Type: InternetGateway object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example creates an internet gateway.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateInternetGateway
&AUTHPARAMS
```

Sample Response

```
<CreateInternetGatewayResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <internetGateway>
      <internetGatewayId>igw-eaad4883</internetGatewayId>
      <attachmentSet/>
      <tagSet/>
   </internetGateway>
</CreateInternetGatewayResponse>
```

CreateInterruptibleCapacityReservationAllocation

Creates an interruptible Capacity Reservation by specifying the number of unused instances you want to allocate from your source reservation. This helps you make unused capacity available for other workloads within your account while maintaining control to reclaim it.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CapacityReservationId

The ID of the source Capacity Reservation from which to create the interruptible Capacity Reservation. Your Capacity Reservation must be in active state with no end date set and have available capacity for allocation.

Type: String

Required: Yes

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response.

Type: Boolean

Required: No

InstanceCount

The number of instances to allocate from your source reservation. You can only allocate available instances (also called unused capacity).

Type: Integer

Required: Yes

TagSpecification.N

The tags to apply to the interruptible Capacity Reservation during creation.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

interruptionType

The type of interruption applied to the interruptible reservation.

Type: String

Valid Values: adhoc

requestId

The ID of the request.

Type: String

sourceCapacityReservationId

The ID of the source Capacity Reservation from which the interruptible Capacity Reservation was created.

Type: String

status

The current status of the allocation request (creating, active, updating).

Type: String

Valid Values: `pending | active | updating | canceling | canceled | failed`

targetInstanceCount

The number of instances allocated to the interruptible reservation.

Type: Integer

Errors

For information about the errors that are common to all actions, see Common client error codes.

CreateIpam

Create an IPAM. Amazon VPC IP Address Manager (IPAM) is a VPC feature that you can use to automate your IP address management workflows including assigning, tracking, troubleshooting, and auditing IP addresses across AWS Regions and accounts throughout your AWS Organization.

For more information, see Create an IPAM in the *Amazon VPC IPAM User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

A unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring idempotency.

Type: String

Required: No

Description

A description for the IPAM.

Type: String

Required: No

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

EnablePrivateGua

Enable this option to use your own GUA ranges as private IPv6 addresses. This option is disabled by default.

Type: Boolean

Required: No

MeteredAccount

A metered account is an AWS account that is charged for active IP addresses managed in IPAM. For more information, see Enable cost distribution in the *Amazon VPC IPAM User Guide*.

Possible values:

- `ipam-owner` (default): The AWS account which owns the IPAM is charged for all active IP addresses managed in IPAM.
- `resource-owner`: The AWS account that owns the IP address is charged for the active IP address.

Type: String

Valid Values: `ipam-owner | resource-owner`

Required: No

OperatingRegion.N

The operating Regions for the IPAM. Operating Regions are AWS Regions where the IPAM is allowed to manage IP address CIDRs. IPAM only discovers and monitors resources in the AWS Regions you select as operating Regions.

For more information about operating Regions, see Create an IPAM in the *Amazon VPC IPAM User Guide*.

Type: Array of AddIpamOperatingRegion objects

Array Members: Minimum number of 0 items. Maximum number of 50 items.

Required: No

TagSpecification.N

The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.

Type: Array of TagSpecification objects

Required: No

Tier

IPAM is offered in a Free Tier and an Advanced Tier. For more information about the features available in each tier and the costs associated with the tiers, see Amazon VPC pricing > IPAM tab.

Type: String

Valid Values: `free | advanced`

Required: No

Response Elements

The following elements are returned by the service.

ipam

Information about the IPAM created.

Type: Ipam object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

CreateIpamExternalResourceVerificationToken

Create a verification token.

A verification token is an AWS-generated random value that you can use to prove ownership of an external resource. For example, you can use a verification token to validate that you control a public IP address range when you bring an IP address range to AWS (BYOIP).

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

A unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring idempotency.

Type: String

Required: No

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

IpamId

The ID of the IPAM that will create the token.

Type: String

Required: Yes

TagSpecification.N

Token tags.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

ipamExternalResourceVerificationToken

The verification token.

Type: IpamExternalResourceVerificationToken object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

CreateIpamPolicy

Creates an IPAM policy.

An IPAM policy is a set of rules that define how public IPv4 addresses from IPAM pools are allocated to AWS resources. Each rule maps an AWS service to IPAM pools that the service will use to get IP addresses. A single policy can have multiple rules and be applied to multiple AWS Regions. If the IPAM pool run out of addresses then the services fallback to Amazon-provided IP addresses. A policy can be applied to an individual AWS account or an entity within AWS Organizations.

For more information, see Define public IPv4 allocation strategy with IPAM policies in the *Amazon VPC IPAM User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

A unique, case-sensitive identifier to ensure the idempotency of the request.

Type: String

Required: No

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

IpamId

The ID of the IPAM for which you're creating the policy.

Type: String

Required: Yes

TagSpecification.N

The tags to assign to the IPAM policy.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

ipamPolicy

Information about the created IPAM policy.

An IPAM policy is a set of rules that define how public IPv4 addresses from IPAM pools are allocated to AWS resources. Each rule maps an AWS service to IPAM pools that the service will use to get IP addresses. A single policy can have multiple rules and be applied to multiple AWS Regions. If the IPAM pool run out of addresses then the services fallback to Amazon-provided IP addresses. A policy can be applied to an individual AWS account or an entity within AWS Organizations.

Type: IpamPolicy object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

CreateIpamPool

Create an IP address pool for Amazon VPC IP Address Manager (IPAM). In IPAM, a pool is a collection of contiguous IP addresses CIDRs. Pools enable you to organize your IP addresses according to your routing and security needs. For example, if you have separate routing and security needs for development and production applications, you can create a pool for each.

For more information, see Create a top-level pool in the *Amazon VPC IPAM User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AddressFamily

The IP protocol assigned to this IPAM pool. You must choose either IPv4 or IPv6 protocol for a pool.

Type: String

Valid Values: `ipv4 | ipv6`

Required: Yes

AllocationDefaultNetmaskLength

The default netmask length for allocations added to this pool. If, for example, the CIDR assigned to this pool is 10.0.0.0/8 and you enter 16 here, new allocations will default to 10.0.0.0/16.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 128.

Required: No

AllocationMaxNetmaskLength

The maximum netmask length possible for CIDR allocations in this IPAM pool to be compliant. The maximum netmask length must be greater than the minimum netmask length. Possible netmask lengths for IPv4 addresses are 0 - 32. Possible netmask lengths for IPv6 addresses are 0 - 128.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 128.

Required: No

AllocationMinNetmaskLength

The minimum netmask length required for CIDR allocations in this IPAM pool to be compliant. The minimum netmask length must be less than the maximum netmask length. Possible netmask lengths for IPv4 addresses are 0 - 32. Possible netmask lengths for IPv6 addresses are 0 - 128.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 128.

Required: No

AllocationResourceTag.N

Tags that are required for resources that use CIDRs from this IPAM pool. Resources that do not have these tags will not be allowed to allocate space from the pool. If the resources have their tags changed after they have allocated space or if the allocation tagging requirements are changed on the pool, the resource may be marked as noncompliant.

Type: Array of RequestIpamResourceTag objects

Required: No

AutoImport

If selected, IPAM will continuously look for resources within the CIDR range of this pool and automatically import them as allocations into your IPAM. The CIDRs that will be allocated for these resources must not already be allocated to other resources in order for the import to succeed. IPAM will import a CIDR regardless of its compliance with the pool's allocation rules, so a resource might be imported and subsequently marked as noncompliant. If IPAM discovers multiple CIDRs that overlap, IPAM will import the largest CIDR only. If IPAM discovers multiple CIDRs with matching CIDRs, IPAM will randomly import one of them only.

A locale must be set on the pool for this feature to work.

Type: Boolean

Required: No

AwsService

Limits which service in AWS that the pool can be used in. "ec2", for example, allows users to use space for Elastic IP addresses and VPCs.

Type: String

Valid Values: `ec2 | global-services`

Required: No

ClientToken

A unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring idempotency.

Type: String

Required: No

Description

A description for the IPAM pool.

Type: String

Required: No

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

IpamScopeId

The ID of the scope in which you would like to create the IPAM pool.

Type: String

Required: Yes

Locale

The locale for the pool should be one of the following:

- An AWS Region where you want this IPAM pool to be available for allocations.
- The network border group for an AWS Local Zone where you want this IPAM pool to be available for allocations (supported Local Zones). This option is only available for IPAM IPv4 pools in the public scope.

Possible values: Any AWS Region or supported AWS Local Zone. Default is none and means any locale.

Type: String

Required: No

PublicIpSource

The IP address source for pools in the public scope. Only used for provisioning IP address CIDRs to pools in the public scope. Default is `byoip`. For more information, see Create IPv6 pools in the *Amazon VPC IPAM User Guide*. By default, you can add only one Amazon-provided IPv6 CIDR block to a top-level IPv6 pool if PublicIpSource is `amazon`. For information on increasing the default limit, see Quotas for your IPAM in the *Amazon VPC IPAM User Guide*.

Type: String

Valid Values: `amazon | byoip`

Required: No

PubliclyAdvertisable

Determines if the pool is publicly advertisable. The request can only contain `PubliclyAdvertisable` if `AddressFamily` is `ipv6` and `PublicIpSource` is `byoip`.

Type: Boolean

Required: No

SourceIpamPoolId

The ID of the source IPAM pool. Use this option to create a pool within an existing pool. Note that the CIDR you provision for the pool within the source pool must be available in the source pool's CIDR range.

Type: String

Required: No

SourceResource

The resource used to provision CIDRs to a resource planning pool.

Type: IpamPoolSourceResourceRequest object

Required: No

TagSpecification.N

The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

ipamPool

Information about the IPAM pool created.

Type: IpamPool object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

CreateIpamPrefixListResolver

Creates an IPAM prefix list resolver.

An IPAM prefix list resolver is a component that manages the synchronization between IPAM's CIDR selection rules and customer-managed prefix lists. It automates connectivity configurations by selecting CIDRs from IPAM's database based on your business logic and synchronizing them with prefix lists used in resources such as VPC route tables and security groups.

For more information about IPAM prefix list resolver, see Automate prefix list updates with IPAM in the *Amazon VPC IPAM User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AddressFamily

The address family for the IPAM prefix list resolver. Valid values are `ipv4` and `ipv6`. You must create separate resolvers for IPv4 and IPv6 CIDRs as they cannot be mixed in the same resolver.

Type: String

Valid Values: `ipv4 | ipv6`

Required: Yes

ClientToken

A unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring idempotency.

Type: String

Required: No

Description

A description for the IPAM prefix list resolver to help you identify its purpose and configuration.

Type: String

Required: No

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

IpamId

The ID of the IPAM that will serve as the source of the IP address database for CIDR selection. The IPAM must be in the Advanced tier to use this feature.

Type: String

Required: Yes

Rule.N

The CIDR selection rules for the resolver.

CIDR selection rules define the business logic for selecting CIDRs from IPAM. If a CIDR matches any of the rules, it will be included. If a rule has multiple conditions, the CIDR has to match every condition of that rule. You can create a prefix list resolver without any CIDR selection rules, but it will generate empty versions (containing no CIDRs) until you add rules.

Type: Array of IpamPrefixListResolverRuleRequest objects

Required: No

TagSpecification.N

The tags to apply to the IPAM prefix list resolver during creation. Tags help you organize and manage your AWS resources.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

ipamPrefixListResolver

Information about the IPAM prefix list resolver that was created.

Type: IpamPrefixListResolver object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

CreateIpamPrefixListResolverTarget

Creates an IPAM prefix list resolver target.

An IPAM prefix list resolver target is an association between a specific customer-managed prefix list and an IPAM prefix list resolver. The target enables the resolver to synchronize CIDRs selected by its rules into the specified prefix list, which can then be referenced in AWS resources.

For more information about IPAM prefix list resolver, see Automate prefix list updates with IPAM in the *Amazon VPC IPAM User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

A unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring idempotency.

Type: String

Required: No

DesiredVersion

The specific version of the prefix list to target. If not specified, the resolver will target the latest version.

Type: Long

Required: No

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

IpamPrefixListResolverId

The ID of the IPAM prefix list resolver that will manage the synchronization of CIDRs to the target prefix list.

Type: String

Required: Yes

PrefixListId

The ID of the managed prefix list that will be synchronized with CIDRs selected by the IPAM prefix list resolver. This prefix list becomes an IPAM managed prefix list.

An IPAM-managed prefix list is a customer-managed prefix list that has been associated with an IPAM prefix list resolver target. When a prefix list becomes IPAM managed, its CIDRs are automatically synchronized based on the IPAM prefix list resolver's CIDR selection rules, and direct CIDR modifications are restricted.

Type: String

Required: Yes

PrefixListRegion

The AWS Region where the prefix list is located. This is required when referencing a prefix list in a different Region.

Type: String

Required: Yes

TagSpecification.N

The tags to apply to the IPAM prefix list resolver target during creation. Tags help you organize and manage your AWS resources.

Type: Array of TagSpecification objects

Required: No

TrackLatestVersion

Indicates whether the resolver target should automatically track the latest version of the prefix list. When enabled, the target will always synchronize with the most current version of the prefix list.

Choose this for automatic updates when you want your prefix lists to stay current with infrastructure changes without manual intervention.

Type: Boolean

Required: Yes

Response Elements

The following elements are returned by the service.

ipamPrefixListResolverTarget

Information about the IPAM prefix list resolver target that was created.

Type: IpamPrefixListResolverTarget object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for Ruby V3

CreateIpamResourceDiscovery

Creates an IPAM resource discovery. A resource discovery is an IPAM component that enables IPAM to manage and monitor resources that belong to the owning account.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

A client token for the IPAM resource discovery.

Type: String

Required: No

Description

A description for the IPAM resource discovery.

Type: String

Required: No

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

OperatingRegion.N

Operating Regions for the IPAM resource discovery. Operating Regions are AWS Regions where the IPAM is allowed to manage IP address CIDRs. IPAM only discovers and monitors resources in the AWS Regions you select as operating Regions.

Type: Array of AddIpamOperatingRegion objects

Array Members: Minimum number of 0 items. Maximum number of 50 items.

Required: No

TagSpecification.N

Tag specifications for the IPAM resource discovery.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

ipamResourceDiscovery

An IPAM resource discovery.

Type: IpamResourceDiscovery object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

CreateIpamScope

Create an IPAM scope. In IPAM, a scope is the highest-level container within IPAM. An IPAM contains two default scopes. Each scope represents the IP space for a single network. The private scope is intended for all private IP address space. The public scope is intended for all public IP address space. Scopes enable you to reuse IP addresses across multiple unconnected networks without causing IP address overlap or conflict.

For more information, see Add a scope in the *Amazon VPC IPAM User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

A unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring idempotency.

Type: String

Required: No

Description

A description for the scope you're creating.

Type: String

Required: No

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ExternalAuthorityConfiguration

The configuration that links an Amazon VPC IPAM scope to an external authority system. It specifies the type of external system and the external resource identifier that identifies your account or instance in that system.

In IPAM, an external authority is a third-party IP address management system that provides CIDR blocks when you provision address space for top-level IPAM pools. This allows you to use your existing IP management system to control which address ranges are allocated to AWS while using Amazon VPC IPAM to manage subnets within those ranges.

Type: ExternalAuthorityConfiguration object

Required: No

IpamId

The ID of the IPAM for which you're creating this scope.

Type: String

Required: Yes

TagSpecification.N

The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

ipamScope

Information about the created scope.

Type: IpamScope object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2

- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

CreateKeyPair

Creates an ED25519 or 2048-bit RSA key pair with the specified name and in the specified format. Amazon EC2 stores the public key and displays the private key for you to save to a file. The private key is returned as an unencrypted PEM encoded PKCS#1 private key or an unencrypted PPK formatted private key for use with PuTTY. If a key with the specified name already exists, Amazon EC2 returns an error.

The key pair returned to you is available only in the AWS Region in which you create it. If you prefer, you can create your own key pair using a third-party tool and upload it to any Region using ImportKeyPair.

You can have up to 5,000 key pairs per AWS Region.

For more information, see Amazon EC2 key pairs in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

KeyFormat

The format of the key pair.

Default: `pem`

Type: String

Valid Values: `pem` | `ppk`

Required: No

KeyName

A unique name for the key pair.

Constraints: Up to 255 ASCII characters

Type: String

Required: Yes

KeyType

The type of key pair. Note that ED25519 keys are not supported for Windows instances.

Default: `rsa`

Type: String

Valid Values: `rsa | ed25519`

Required: No

TagSpecification.N

The tags to apply to the new key pair.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

keyFingerprint

- For RSA key pairs, the key fingerprint is the SHA-1 digest of the DER encoded private key.
- For ED25519 key pairs, the key fingerprint is the base64-encoded SHA-256 digest, which is the default for OpenSSH, starting with OpenSSH 6.8.

Type: String

keyMaterial

An unencrypted PEM encoded RSA or ED25519 private key.

Type: String

keyName

The name of the key pair.

Type: String

keyPairId

The ID of the key pair.

Type: String

requestId

The ID of the request.

Type: String

tagSet

Any tags applied to the key pair.

Type: Array of Tag objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example request creates a key pair named `my-key-pair`, and applies a tag with a key of `purpose` and a value of `production`.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateKeyPair
&KeyName=my-key-pair
&TagSpecification.1.ResourceType=key-pair
&TagSpecification.1.Tag.1.Key=purpose
```

```
&TagSpecification.1.Tag.1.Value=production
&AUTHPARAMS
```

Sample Response

```
<CreateKeyPairResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>1b5b5bcf-3670-4c16-83d7-c2c9example</requestId>
  <keyName>my-key-pair</keyName>
  <keyPairId>key-abcd12345eEXAMPLE</keyPairId>
  <keyFingerprint>1f:51:ae:28:bf:89:e9:d8:1f:25:5d:37:2d:7d:b8:ca:9f:f5:f1:6f</
keyFingerprint>

      <key>purpose</key>
      <value>production</value>
    </item>
  </tagSet>
</CreateKeyPairResponse>
```

Saving the file

Create a file named `my-key-pair.pem` and paste the entire key from the response into this file. Keep this file in a safe place; it is required to decrypt login information when you connect to an instance that you launched using this key pair. If you're using an SSH client on a Linux computer to connect to your instance, use the following command to set the permissions of your private key file so that only you can read it.

Sample Request

```
chmod 400 my-key-pair.pem
```

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3

- AWS SDK for Ruby V3

CreateLaunchTemplate

Creates a launch template.

A launch template contains the parameters to launch an instance. When you launch an instance using RunInstances, you can specify a launch template instead of providing the launch parameters in the request. For more information, see Store instance launch parameters in Amazon EC2 launch templates in the *Amazon EC2 User Guide*.

To clone an existing launch template as the basis for a new launch template, use the Amazon EC2 console. The API, SDKs, and CLI do not support cloning a template. For more information, see Create a launch template from an existing launch template in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier you provide to ensure the idempotency of the request. If a client token isn't specified, a randomly generated token is used in the request to ensure idempotency.

For more information, see Ensuring idempotency.

Constraint: Maximum 128 ASCII characters.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

LaunchTemplateData

The information for the launch template.

Type: RequestLaunchTemplateData object

Required: Yes

LaunchTemplateName

A name for the launch template.

Type: String

Length Constraints: Minimum length of 3. Maximum length of 128.

Pattern: `[a-zA-Z0-9\(\)\.\-/_]+`

Required: Yes

Operator

Reserved for internal use.

Type: OperatorRequest object

Required: No

TagSpecification.N

The tags to apply to the launch template on creation. To tag the launch template, the resource type must be `launch-template`.

To specify the tags for the resources that are created when an instance is launched, you must use the `TagSpecifications` parameter in the launch template data structure.

Type: Array of TagSpecification objects

Required: No

VersionDescription

A description for the first version of the launch template.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 255.

Required: No

Response Elements

The following elements are returned by the service.

launchTemplate

Information about the launch template.

Type: LaunchTemplate object

requestId

The ID of the request.

Type: String

warning

If the launch template contains parameters or parameter combinations that are not valid, an error code and an error message are returned for each issue that's found.

Type: ValidationWarning object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

The following example creates a launch template that specifies AMI `ami-1a2b3c4d` and an instance type of `t2.micro`.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateLaunchTemplate
```

```
&LaunchTemplateName=MyLaunchTemplate
&VersionDescription=FirstVersion
&LaunchTemplateData.ImageId=ami-1a2b3c4d
&LaunchTemplateData.InstanceType=t2.micro
&AUTHPARAMS
```

Sample Response

```
<CreateLaunchTemplateResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>39f602bc-7580-4239-a6d8-af56example</requestId>
    <launchTemplate>
        <createTime>2017-10-31T11:38:52.000Z</createTime>
        <createdBy>arn:aws:iam::123456789012:root</createdBy>
        <defaultVersionNumber>1</defaultVersionNumber>
        <latestVersionNumber>1</latestVersionNumber>
        <launchTemplateId>lt-0a20c965061f64abc</launchTemplateId>
        <launchTemplateName>MyLaunchTemplate</launchTemplateName>
    </launchTemplate>
</CreateLaunchTemplateResponse>
```

Example 2

The following example creates a launch template that specifies the subnet in which to launch the instance (`subnet-7b16de0c`), assigns a public IP address and an IPv6 address to the instance, and creates a tag for the instance (`Name=webserver`).

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateLaunchTemplate
&LaunchTemplateName=TemplateForWebServer
&VersionDescription=WebVersion1
&LaunchTemplateData.ImageId=ami-8c1be5f6
&LaunchTemplateData.InstanceType=t2.micro
&LaunchTemplateData.NetworkInterface.1.AssociatePublicIpAddress=true
&LaunchTemplateData.NetworkInterface.1.DeviceIndex=0
&LaunchTemplateData.NetworkInterface.1.SubnetId=subnet-7b16de0c
&LaunchTemplateData.NetworkInterface.1.Ipv6AddressCount=1
&LaunchTemplateData.TagSpecification.1.ResourceType=instance
&LaunchTemplateData.TagSpecification.1.Tag.1.Key=Name
&LaunchTemplateData.TagSpecification.1.Tag.1.Value=webserver
&AUTHPARAMS
```

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

CreateLaunchTemplateVersion

Creates a new version of a launch template. You must specify an existing launch template, either by name or ID. You can determine whether the new version inherits parameters from a source version, and add or overwrite parameters as needed.

Launch template versions are numbered in the order in which they are created. You can't specify, change, or replace the numbering of launch template versions.

Launch templates are immutable; after you create a launch template, you can't modify it. Instead, you can create a new version of the launch template that includes the changes that you require.

For more information, see Modify a launch template (manage launch template versions) in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier you provide to ensure the idempotency of the request. If a client token isn't specified, a randomly generated token is used in the request to ensure idempotency.

For more information, see Ensuring idempotency.

Constraint: Maximum 128 ASCII characters.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

LaunchTemplateData

The information for the launch template.

Type: RequestLaunchTemplateData object

Required: Yes

LaunchTemplateId

The ID of the launch template.

You must specify either the launch template ID or the launch template name, but not both.

Type: String

Required: No

LaunchTemplateName

The name of the launch template.

You must specify either the launch template ID or the launch template name, but not both.

Type: String

Length Constraints: Minimum length of 3. Maximum length of 128.

Pattern: `[a-zA-Z0-9\(\)\.\-/_]+`

Required: No

ResolveAlias

If `true`, and if a Systems Manager parameter is specified for `ImageId`, the AMI ID is displayed in the response for `imageID`. For more information, see Use a Systems Manager parameter instead of an AMI ID in the *Amazon EC2 User Guide*.

Default: `false`

Type: Boolean

Required: No

SourceVersion

The version of the launch template on which to base the new version. Snapshots applied to the block device mapping are ignored when creating a new version unless they are explicitly included.

If you specify this parameter, the new version inherits the launch parameters from the source version. If you specify additional launch parameters for the new version, they overwrite any corresponding launch parameters inherited from the source version.

If you omit this parameter, the new version contains only the launch parameters that you specify for the new version.

Type: String

Required: No

VersionDescription

A description for the version of the launch template.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 255.

Required: No

Response Elements

The following elements are returned by the service.

launchTemplateVersion

Information about the launch template version.

Type: LaunchTemplateVersion object

requestId

The ID of the request.

Type: String

warning

If the new version of the launch template contains parameters or parameter combinations that are not valid, an error code and an error message are returned for each issue that's found.

Type: ValidationWarning object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

The following example creates a new launch template version for launch template `MyLaunchTemplate` and uses version 2 of the launch template as the base for the new version. The new launch template uses `ami-aabbccdd`. All other launch template data is inherited from the source version.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateLaunchTemplate
&SourceVersion=2
&LaunchTemplateName=MyLaunchTemplate
&VersionDescription=VersionWithNewAMI
&LaunchTemplateData.ImageId=ami-aabbccdd
&AUTHPARAMS
```

Sample Response

```
<CreateLaunchTemplateVersionResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>6657423a-2616-461a-9ce5-3c65example</requestId>
    <launchTemplateVersion>
        <createTime>2017-10-31T11:56:00.000Z</createTime>
        <createdBy>arn:aws:iam::123456789012:root</createdBy>
        <defaultVersion>false</defaultVersion>
        <launchTemplateData>
            <imageId>ami-aabbccdd</imageId>
            <instanceType>t2.micro</instanceType>
        </launchTemplateData>
```

```
        <launchTemplateId>lt-0a20c965061f6454a</launchTemplateId>
        <launchTemplateName>MyLaunchTemplate</launchTemplateName>
        <versionDescription>VersionWithNewAMI</versionDescription>
        <versionNumber>4</versionNumber>
    </launchTemplateVersion>
</CreateLaunchTemplateVersionResponse>
```

CreateLocalGatewayRoute

Creates a static route for the specified local gateway route table. You must specify one of the following targets:

- `LocalGatewayVirtualInterfaceGroupId`
- `NetworkInterfaceId`

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DestinationCidrBlock

The CIDR range used for destination matches. Routing decisions are based on the most specific match.

Type: String

Required: No

DestinationPrefixListId

The ID of the prefix list. Use a prefix list in place of `DestinationCidrBlock`. You cannot use `DestinationPrefixListId` and `DestinationCidrBlock` in the same request.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

LocalGatewayRouteTableId

The ID of the local gateway route table.

Type: String

Required: Yes

LocalGatewayVirtualInterfaceGroupId

The ID of the virtual interface group.

Type: String

Required: No

NetworkInterfaceId

The ID of the network interface.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

route

Information about the route.

Type: LocalGatewayRoute object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

CreateLocalGatewayRouteTable

Creates a local gateway route table.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

LocalGatewayId

The ID of the local gateway.

Type: String

Required: Yes

Mode

The mode of the local gateway route table.

Type: String

Valid Values: `direct-vpc-routing | coip`

Required: No

TagSpecification.N

The tags assigned to the local gateway route table.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

localGatewayRouteTable

Information about the local gateway route table.

Type: LocalGatewayRouteTable object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

CreateLocalGatewayRouteTableVirtualInterfaceGroupAssociation

Creates a local gateway route table virtual interface group association.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

LocalGatewayRouteTableId

The ID of the local gateway route table.

Type: String

Required: Yes

LocalGatewayVirtualInterfaceGroupId

The ID of the local gateway route table virtual interface group association.

Type: String

Required: Yes

TagSpecification.N

The tags assigned to the local gateway route table virtual interface group association.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

localGatewayRouteTableVirtualInterfaceGroupAssociation

Information about the local gateway route table virtual interface group association.

Type: LocalGatewayRouteTableVirtualInterfaceGroupAssociation object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

CreateLocalGatewayRouteTableVpcAssociation

Associates the specified VPC with the specified local gateway route table.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

LocalGatewayRouteTableId

The ID of the local gateway route table.

Type: String

Required: Yes

TagSpecification.N

The tags to assign to the local gateway route table VPC association.

Type: Array of TagSpecification objects

Required: No

VpcId

The ID of the VPC.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

localGatewayRouteTableVpcAssociation

Information about the association.

Type: LocalGatewayRouteTableVpcAssociation object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

CreateLocalGatewayVirtualInterface

Create a virtual interface for a local gateway.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

LocalAddress

The IP address assigned to the local gateway virtual interface on the Outpost side. Only IPv4 is supported.

Type: String

Required: Yes

LocalGatewayVirtualInterfaceGroupId

The ID of the local gateway virtual interface group.

Type: String

Required: Yes

OutpostLagId

References the Link Aggregation Group (LAG) that connects the Outpost to on-premises network devices.

Type: String

Required: Yes

PeerAddress

The peer IP address for the local gateway virtual interface. Only IPv4 is supported.

Type: String

Required: Yes

PeerBgpAsn

The Autonomous System Number (ASN) of the Border Gateway Protocol (BGP) peer.

Type: Integer

Required: No

PeerBgpAsnExtended

The extended 32-bit ASN of the BGP peer for use with larger ASN values.

Type: Long

Required: No

TagSpecification.N

The tags to apply to a resource when the local gateway virtual interface is being created.

Type: Array of TagSpecification objects

Required: No

Vlan

The virtual local area network (VLAN) used for the local gateway virtual interface.

Type: Integer

Required: Yes

Response Elements

The following elements are returned by the service.

localGatewayVirtualInterface

Information about the local gateway virtual interface.

Type: LocalGatewayVirtualInterface object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for Python
- AWS SDK for Ruby V3

CreateLocalGatewayVirtualInterfaceGroup

Create a local gateway virtual interface group.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

LocalBgpAsn

The Autonomous System Number(ASN) for the local Border Gateway Protocol (BGP).

Type: Integer

Required: No

LocalBgpAsnExtended

The extended 32-bit ASN for the local BGP configuration.

Type: Long

Required: No

LocalGatewayId

The ID of the local gateway.

Type: String

Required: Yes

TagSpecification.N

The tags to apply to the local gateway virtual interface group when the resource is being created.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

localGatewayVirtualInterfaceGroup

Information about the created local gateway virtual interface group.

Type: LocalGatewayVirtualInterfaceGroup object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

CreateMacSystemIntegrityProtectionModificationTask

Creates a System Integrity Protection (SIP) modification task to configure the SIP settings for an x86 Mac instance or Apple silicon Mac instance. For more information, see Configure SIP for Amazon EC2 instances in the *Amazon EC2 User Guide*.

When you configure the SIP settings for your instance, you can either enable or disable all SIP settings, or you can specify a custom SIP configuration that selectively enables or disables specific SIP settings.

> **Note**
>
> If you implement a custom configuration, connect to the instance and verify the settings to ensure that your requirements are properly implemented and functioning as intended. SIP configurations might change with macOS updates. We recommend that you review custom SIP settings after any macOS version upgrade to ensure continued compatibility and proper functionality of your security configurations.

To enable or disable all SIP settings, use the **MacSystemIntegrityProtectionStatus** parameter only. For example, to enable all SIP settings, specify the following:

- `MacSystemIntegrityProtectionStatus=enabled`

To specify a custom configuration that selectively enables or disables specific SIP settings, use the **MacSystemIntegrityProtectionStatus** parameter to enable or disable all SIP settings, and then use the **MacSystemIntegrityProtectionConfiguration** parameter to specify exceptions. In this case, the exceptions you specify for **MacSystemIntegrityProtectionConfiguration** override the value you specify for **MacSystemIntegrityProtectionStatus**. For example, to enable all SIP settings, except `NvramProtections`, specify the following:

- `MacSystemIntegrityProtectionStatus=enabled`
- `MacSystemIntegrityProtectionConfigurationRequest "NvramProtections=disabled"`

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring Idempotency.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InstanceId

The ID of the Amazon EC2 Mac instance.

Type: String

Required: Yes

MacCredentials

[Apple silicon Mac instances only] Specifies the following credentials:

- **Internal disk administrative user**
  - **Username** - Only the default administrative user (`aws-managed-user`) is supported and it is used by default. You can't specify a different administrative user.
  - **Password** - If you did not change the default password for `aws-managed-user`, specify the default password, which is *blank*. Otherwise, specify your password.
- **Amazon EBS root volume administrative user**
  - **Username** - If you did not change the default administrative user, specify `ec2-user`. Otherwise, specify the username for your administrative user.

- **Password** - Specify the password for the administrative user.

The credentials must be specified in the following JSON format:

```
{ "internalDiskPassword":"internal-disk-admin_password",
"rootVolumeUsername":"root-volume-admin_username",
"rootVolumepassword":"root-volume-admin_password" }
```

Type: String

Required: No

MacSystemIntegrityProtectionConfiguration

Specifies the overrides to selectively enable or disable individual SIP settings. The individual settings you specify here override the overall SIP status you specify for **MacSystemIntegrityProtectionStatus**.

Type: MacSystemIntegrityProtectionConfigurationRequest object

Required: No

MacSystemIntegrityProtectionStatus

Specifies the overall SIP status for the instance. To enable all SIP settings, specify `enabled`. To disable all SIP settings, specify `disabled`.

Type: String

Valid Values: `enabled | disabled`

Required: Yes

TagSpecification.N

Specifies tags to apply to the SIP modification task.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

macModificationTask

Information about the SIP modification task.

Type: MacModificationTask object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

CreateManagedPrefixList

Creates a managed prefix list. You can specify entries for the prefix list. Each entry consists of a CIDR block and an optional description.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AddressFamily

The IP address type.

Valid Values: `IPv4` | `IPv6`

Type: String

Required: Yes

ClientToken

Unique, case-sensitive identifier you provide to ensure the idempotency of the request. For more information, see Ensuring idempotency.

Constraints: Up to 255 UTF-8 characters in length.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Entry.N

One or more entries for the prefix list.

Type: Array of AddPrefixListEntry objects

Array Members: Minimum number of 0 items. Maximum number of 100 items.

Required: No

MaxEntries

The maximum number of entries for the prefix list.

Type: Integer

Required: Yes

PrefixListName

A name for the prefix list.

Constraints: Up to 255 characters in length. The name cannot start with `com.amazonaws`.

Type: String

Required: Yes

TagSpecification.N

The tags to apply to the prefix list during creation.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

prefixList

Information about the prefix list.

Type: ManagedPrefixList object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example creates a managed prefix list with a maximum of 10 entries, and adds 2 entries. The prefix list support IPv4 CIDR blocks.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateManagedPrefixList
&PrefixListName=tgw-attachments
&Entry.1.Cidr=10.0.0.0/16
&Entry.1.Description=vpc-a
&Entry.2.Cidr=10.2.0.0/16
&Entry.2.Description=vpc-b
&MaxEntries=10
&AddressFamily=IPv4
&AUTHPARAMS
```

Sample Response

```
<CreateManagedPrefixListResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>2989de6e-5305-49c7-809a-example</requestId>
    <prefixList>
            <addressFamily>IPv4</addressFamily>
            <maxEntries>10</maxEntries>
            <ownerId>123456789012</ownerId>
            <prefixListArn>arn:aws:ec2:us-east-1:123456789012:prefix-list/
pl-0123123123123abcd</prefixListArn>
            <prefixListId>pl-0123123123123abcd</prefixListId>
            <prefixListName>tgw-attachments</prefixListName>
            <state>create-in-progress</state>
            <tagSet/>
            <version>1</version>
    </prefixList>
```

```
</CreateManagedPrefixListResponse>
```

CreateNatGateway

Creates a NAT gateway in the specified subnet. This action creates a network interface in the specified subnet with a private IP address from the IP address range of the subnet. You can create either a public NAT gateway or a private NAT gateway.

With a public NAT gateway, internet-bound traffic from a private subnet can be routed to the NAT gateway, so that instances in a private subnet can connect to the internet.

With a private NAT gateway, private communication is routed across VPCs and on-premises networks through a transit gateway or virtual private gateway. Common use cases include running large workloads behind a small pool of allowlisted IPv4 addresses, preserving private IPv4 addresses, and communicating between overlapping networks.

For more information, see NAT gateways in the *Amazon VPC User Guide*.

Important

When you create a public NAT gateway and assign it an EIP or secondary EIPs, the network border group of the EIPs must match the network border group of the Availability Zone (AZ) that the public NAT gateway is in. If it's not the same, the NAT gateway will fail to launch. You can see the network border group for the subnet's AZ by viewing the details of the subnet. Similarly, you can view the network border group of an EIP by viewing the details of the EIP address. For more information about network border groups and EIPs, see Allocate an Elastic IP address in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AllocationId

[Public NAT gateways only] The allocation ID of an Elastic IP address to associate with the NAT gateway. You cannot specify an Elastic IP address with a private NAT gateway. If the Elastic IP address is associated with another resource, you must first disassociate it.

Type: String

Required: No

AvailabilityMode

Specifies whether to create a zonal (single-AZ) or regional (multi-AZ) NAT gateway. Defaults to `zonal`.

A zonal NAT gateway is a NAT Gateway that provides redundancy and scalability within a single availability zone. A regional NAT gateway is a single NAT Gateway that works across multiple availability zones (AZs) in your VPC, providing redundancy, scalability and availability across all the AZs in a Region.

For more information, see Regional NAT gateways for automatic multi-AZ expansion in the *Amazon VPC User Guide*.

Type: String

Valid Values: `zonal | regional`

Required: No

AvailabilityZoneAddress.N

For regional NAT gateways only: Specifies which Availability Zones you want the NAT gateway to support and the Elastic IP addresses (EIPs) to use in each AZ. The regional NAT gateway uses these EIPs to handle outbound NAT traffic from their respective AZs. If not specified, the NAT gateway will automatically expand to new AZs and associate EIPs upon detection of an elastic network interface. If you specify this parameter, auto-expansion is disabled and you must manually manage AZ coverage.

A regional NAT gateway is a single NAT Gateway that works across multiple availability zones (AZs) in your VPC, providing redundancy, scalability and availability across all the AZs in a Region.

For more information, see Regional NAT gateways for automatic multi-AZ expansion in the *Amazon VPC User Guide*.

Type: Array of AvailabilityZoneAddress objects

Required: No

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring idempotency.

Constraint: Maximum 64 ASCII characters.

Type: String

Required: No

ConnectivityType

Indicates whether the NAT gateway supports public or private connectivity. The default is public connectivity.

Type: String

Valid Values: `private | public`

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

PrivateIpAddress

The private IPv4 address to assign to the NAT gateway. If you don't provide an address, a private IPv4 address will be automatically assigned.

Type: String

Required: No

SecondaryAllocationId.N

Secondary EIP allocation IDs. For more information, see Create a NAT gateway in the *Amazon VPC User Guide*.

Type: Array of strings

Required: No

SecondaryPrivateIpAddress.N

Secondary private IPv4 addresses. For more information about secondary addresses, see Create a NAT gateway in the *Amazon VPC User Guide*.

Type: Array of strings

Required: No

SecondaryPrivateIpAddressCount

[Private NAT gateway only] The number of secondary private IPv4 addresses you want to assign to the NAT gateway. For more information about secondary addresses, see Create a NAT gateway in the *Amazon VPC User Guide*.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 31.

Required: No

SubnetId

The ID of the subnet in which to create the NAT gateway.

Type: String

Required: No

TagSpecification.N

The tags to assign to the NAT gateway.

Type: Array of TagSpecification objects

Required: No

VpcId

The ID of the VPC where you want to create a regional NAT gateway.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

clientToken

Unique, case-sensitive identifier to ensure the idempotency of the request. Only returned if a client token was provided in the request.

Type: String

natGateway

Information about the NAT gateway.

Type: NatGateway object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example creates a public NAT gateway in the specified subnet and associates the Elastic IP address with the specified allocation ID to the NAT gateway.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateNatGateway
&SubnetId=subnet-1234567890abcdef0
&AllocationId=eipalloc-0abcdef1234567890
```

```
&AUTHPARAMS
```

Sample Response

```
<CreateNatGatewayResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>1b74dc5c-bcda-403f-867d-example</requestId>
    <natGateway>
        <subnetId>subnet-1234567890abcdef0</subnetId>
        <natGatewayAddressSet>
            <item>
                <allocationId>eipalloc-0abcdef1234567890</allocationId>
                <networkInterfaceId>eni-0123abc456def7890</networkInterfaceId>
                <privateIp>10.0.0.191</privateIp>
                <publicIp>203.0.113.5</publicIp>
            </item>
        </natGatewayAddressSet>
        <createTime>2019-11-25T14:00:55.416Z</createTime>
        <vpcId>vpc-0598c7d356eba48d7</vpcId>
        <natGatewayId>nat-04e77a5e9c34432f9</natGatewayId>
        <connectivityType>public</connectivityType>
        <state>pending</state>
    </natGateway>
</CreateNatGatewayResponse>
```

Example 2

This example creates a private NAT gateway in the specified subnet.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateNatGateway
&SubnetId=subnet-1234567890abcdef0
&ConnectivityType=private
&AUTHPARAMS
```

Sample Response

```
<CreateNatGatewayResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>1b74dc5c-bcda-403f-867d-example</requestId>
    <natGateway>
        <subnetId>subnet-1234567890abcdef0</subnetId>
        <natGatewayAddressSet>
```

```
            <item>
                <networkInterfaceId>eni-1a2b3c4d5e6f78901</networkInterfaceId>
                <privateIp>10.0.1.26</privateIp>
            </item>
        </natGatewayAddressSet>
        <createTime>2021-06-05T14:00:55.416Z</createTime>
        <vpcId>vpc-0598c7d356eba48d7</vpcId>
        <natGatewayId>nat-04e77a5e9c34432f9</natGatewayId>
        <connectivityType>private</connectivityType>
        <state>pending</state>
    </natGateway>
</CreateNatGatewayResponse>
```

CreateNetworkAcl

Creates a network ACL in a VPC. Network ACLs provide an optional layer of security (in addition to security groups) for the instances in your VPC.

For more information, see Network ACLs in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring idempotency.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TagSpecification.N

The tags to assign to the network ACL.

Type: Array of TagSpecification objects

Required: No

VpcId

The ID of the VPC.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

clientToken

Unique, case-sensitive identifier to ensure the idempotency of the request. Only returned if a client token was provided in the request.

Type: String

networkAcl

Information about the network ACL.

Type: NetworkAcl object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example creates a network ACL in the specified IPv6-enabled VPC. The response includes default IPv4 and IPv6 entries for egress and ingress traffic, each with a high rule number. These are the last entries we process to decide whether traffic is allowed in or out of an associated subnet. If the traffic doesn't match any rules with a lower rule number, then these default entries ultimately deny the traffic.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateNetworkAcl
&VpcId=vpc-11ad4878
&AUTHPARAMS
```

Sample Response

```
<CreateNetworkAclResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <networkAcl>
      <networkAclId>acl-5fb85d36</networkAclId>
      <vpcId>vpc-11ad4878</vpcId>
      <default>false</default>
      <entrySet>
         <item>
            <ruleNumber>32767</ruleNumber>
            <protocol>all</protocol>
            <ruleAction>deny</ruleAction>
            <egress>true</egress>
            <cidrBlock>0.0.0.0/0</cidrBlock>
         </item>
         <item>
            <ruleNumber>32767</ruleNumber>
            <protocol>all</protocol>
            <ruleAction>deny</ruleAction>
            <egress>false</egress>
            <cidrBlock>0.0.0.0/0</cidrBlock>
         </item>
        <item>
           <ruleNumber>32768</ruleNumber>
           <protocol>all</protocol>
           <ruleAction>deny</ruleAction>
           <egress>true</egress>
           <ipv6CidrBlock>::/0</ipv6CidrBlock>
        </item>
        <item>
           <ruleNumber>32768</ruleNumber>
           <protocol>all</protocol>
           <ruleAction>deny</ruleAction>
           <egress>false</egress>
           <ipv6CidrBlock>::/0</ipv6CidrBlock>
        </item>
```

```
      </entrySet>
      <associationSet/>
      <tagSet/>
   </networkAcl>
</CreateNetworkAclResponse>
```

CreateNetworkAclEntry

Creates an entry (a rule) in a network ACL with the specified rule number. Each network ACL has a set of numbered ingress rules and a separate set of numbered egress rules. When determining whether a packet should be allowed in or out of a subnet associated with the ACL, we process the entries in the ACL according to the rule numbers, in ascending order. Each network ACL has a set of ingress rules and a separate set of egress rules.

We recommend that you leave room between the rule numbers (for example, 100, 110, 120, ...), and not number them one right after the other (for example, 101, 102, 103, ...). This makes it easier to add a rule between existing ones without having to renumber the rules.

After you add an entry, you can't modify it; you must either replace it, or create an entry and delete the old one.

For more information about network ACLs, see Network ACLs in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CidrBlock

The IPv4 network range to allow or deny, in CIDR notation (for example `172.16.0.0/24`). We modify the specified CIDR block to its canonical form; for example, if you specify `100.68.0.18/18`, we modify it to `100.68.0.0/18`.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Egress

Indicates whether this is an egress rule (rule is applied to traffic leaving the subnet).

Type: Boolean

Required: Yes

Icmp

ICMP protocol: The ICMP or ICMPv6 type and code. Required if specifying protocol 1 (ICMP) or protocol 58 (ICMPv6) with an IPv6 CIDR block.

Type: IcmpTypeCode object

Required: No

Ipv6CidrBlock

The IPv6 network range to allow or deny, in CIDR notation (for example `2001:db8:1234:1a00::/64`).

Type: String

Required: No

NetworkAclId

The ID of the network ACL.

Type: String

Required: Yes

PortRange

TCP or UDP protocols: The range of ports the rule applies to. Required if specifying protocol 6 (TCP) or 17 (UDP).

Type: PortRange object

Required: No

Protocol

The protocol number. A value of "-1" means all protocols. If you specify "-1" or a protocol number other than "6" (TCP), "17" (UDP), or "1" (ICMP), traffic on all ports is allowed, regardless

of any ports or ICMP types or codes that you specify. If you specify protocol "58" (ICMPv6) and specify an IPv4 CIDR block, traffic for all ICMP types and codes allowed, regardless of any that you specify. If you specify protocol "58" (ICMPv6) and specify an IPv6 CIDR block, you must specify an ICMP type and code.

Type: String

Required: Yes

RuleAction

Indicates whether to allow or deny the traffic that matches the rule.

Type: String

Valid Values: `allow | deny`

Required: Yes

RuleNumber

The rule number for the entry (for example, 100). ACL entries are processed in ascending order by rule number.

Constraints: Positive integer from 1 to 32766. The range 32767 to 65535 is reserved for internal use.

Type: Integer

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example creates an entry with rule number 110 in the specified network ACL. The rule allows ingress traffic from any IPv4 address (`0.0.0.0/0`) on UDP port 53.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateNetworkAclEntry
&NetworkAclId=acl-2cb85d45
&RuleNumber=110
&Protocol="17"
&RuleAction=allow
&Egress=false
&CidrBlock=0.0.0.0/0
&PortRange.From=53
&PortRange.To=53
&AUTHPARAMS
```

Sample Response

```
<CreateNetworkAclEntryResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <return>true</return>
</CreateNetworkAclEntryResponse>
```

Example 2

This example creates an entry with rule number 120 in the specified network ACL. The rule allows ingress traffic from any IPv6 address (`::/0`) on TCP port 80.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateNetworkAclEntry
```

```
&NetworkAclId=acl-2cb85d45
&RuleNumber=120
&Protocol="6"
&RuleAction=allow
&Egress=false
&Ipv6CidrBlock=::/0
&PortRange.From=80
&PortRange.To=80
&AUTHPARAMS
```

CreateNetworkInsightsAccessScope

Creates a Network Access Scope.

AWS Network Access Analyzer enables cloud networking and cloud operations teams to verify that their networks on AWS conform to their network security and governance objectives. For more information, see the AWS Network Access Analyzer Guide.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see How to ensure idempotency.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ExcludePath.N

The paths to exclude.

Type: Array of AccessScopePathRequest objects

Required: No

MatchPath.N

The paths to match.

Type: Array of AccessScopePathRequest objects

Required: No

TagSpecification.N

The tags to apply.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

networkInsightsAccessScope

The Network Access Scope.

Type: NetworkInsightsAccessScope object

networkInsightsAccessScopeContent

The Network Access Scope content.

Type: NetworkInsightsAccessScopeContent object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

CreateNetworkInsightsPath

Creates a path to analyze for reachability.

Reachability Analyzer enables you to analyze and debug network reachability between two resources in your virtual private cloud (VPC). For more information, see the Reachability Analyzer Guide.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see How to ensure idempotency.

Type: String

Required: Yes

Destination

The ID or ARN of the destination. If the resource is in another account, you must specify an ARN.

Type: String

Required: No

DestinationIp

The IP address of the destination.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 15.

Pattern: `^([0-9]{1,3}.){3}[0-9]{1,3}$`

Required: No

DestinationPort

The destination port.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 65535.

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

FilterAtDestination

Scopes the analysis to network paths that match specific filters at the destination. If you specify this parameter, you can't specify the parameter for the destination IP address.

Type: PathRequestFilter object

Required: No

FilterAtSource

Scopes the analysis to network paths that match specific filters at the source. If you specify this parameter, you can't specify the parameters for the source IP address or the destination port.

Type: PathRequestFilter object

Required: No

Protocol

The protocol.

Type: String

Valid Values: `tcp | udp`

Required: Yes

Source

The ID or ARN of the source. If the resource is in another account, you must specify an ARN.

Type: String

Required: Yes

SourceIp

The IP address of the source.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 15.

Pattern: `^([0-9]{1,3}.){3}[0-9]{1,3}$`

Required: No

TagSpecification.N

The tags to add to the path.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

networkInsightsPath

Information about the path.

Type: NetworkInsightsPath object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

CreateNetworkInterface

Creates a network interface in the specified subnet.

The number of IP addresses you can assign to a network interface varies by instance type.

For more information about network interfaces, see Elastic network interfaces in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring idempotency.

Type: String

Required: No

ConnectionTrackingSpecification

A connection tracking specification for the network interface.

Type: ConnectionTrackingSpecificationRequest object

Required: No

Description

A description for the network interface.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

EnablePrimaryIpv6

If you're creating a network interface in a dual-stack or IPv6-only subnet, you have the option to assign a primary IPv6 IP address. A primary IPv6 address is an IPv6 GUA address associated with an ENI that you have enabled to use a primary IPv6 address. Use this option if the instance that this ENI will be attached to relies on its IPv6 address not changing. AWS will automatically assign an IPv6 address associated with the ENI attached to your instance to be the primary IPv6 address. Once you enable an IPv6 GUA address to be a primary IPv6, you cannot disable it. When you enable an IPv6 GUA address to be a primary IPv6, the first IPv6 GUA will be made the primary IPv6 address until the instance is terminated or the network interface is detached. If you have multiple IPv6 addresses associated with an ENI attached to your instance and you enable a primary IPv6 address, the first IPv6 GUA address associated with the ENI becomes the primary IPv6 address.

Type: Boolean

Required: No

InterfaceType

The type of network interface. The default is `interface`.

If you specify `efa-only`, do not assign any IP addresses to the network interface. EFA-only network interfaces do not support IP addresses.

Type: String

Valid Values: `interface | efa | efa-only | trunk`

Required: No

Ipv4Prefix.N

The IPv4 prefixes assigned to the network interface.

You can't specify IPv4 prefixes if you've specified one of the following: a count of IPv4 prefixes, specific private IPv4 addresses, or a count of private IPv4 addresses.

Type: Array of Ipv4PrefixSpecificationRequest objects

Required: No

Ipv4PrefixCount

The number of IPv4 prefixes that AWS automatically assigns to the network interface.

You can't specify a count of IPv4 prefixes if you've specified one of the following: specific IPv4 prefixes, specific private IPv4 addresses, or a count of private IPv4 addresses.

Type: Integer

Required: No

Ipv6AddressCount

The number of IPv6 addresses to assign to a network interface. Amazon EC2 automatically selects the IPv6 addresses from the subnet range.

You can't specify a count of IPv6 addresses using this parameter if you've specified one of the following: specific IPv6 addresses, specific IPv6 prefixes, or a count of IPv6 prefixes.

If your subnet has the `AssignIpv6AddressOnCreation` attribute set, you can override that setting by specifying 0 as the IPv6 address count.

Type: Integer

Required: No

Ipv6Addresses.N

The IPv6 addresses from the IPv6 CIDR block range of your subnet.

You can't specify IPv6 addresses using this parameter if you've specified one of the following: a count of IPv6 addresses, specific IPv6 prefixes, or a count of IPv6 prefixes.

Type: Array of InstanceIpv6Address objects

Required: No

Ipv6Prefix.N

The IPv6 prefixes assigned to the network interface.

You can't specify IPv6 prefixes if you've specified one of the following: a count of IPv6 prefixes, specific IPv6 addresses, or a count of IPv6 addresses.

Type: Array of Ipv6PrefixSpecificationRequest objects

Required: No

Ipv6PrefixCount

The number of IPv6 prefixes that AWS automatically assigns to the network interface.

You can't specify a count of IPv6 prefixes if you've specified one of the following: specific IPv6 prefixes, specific IPv6 addresses, or a count of IPv6 addresses.

Type: Integer

Required: No

Operator

Reserved for internal use.

Type: OperatorRequest object

Required: No

PrivateIpAddress

The primary private IPv4 address of the network interface. If you don't specify an IPv4 address, Amazon EC2 selects one for you from the subnet's IPv4 CIDR range. If you specify an IP address, you cannot indicate any IP addresses specified in `privateIpAddresses` as primary (only one IP address can be designated as primary).

Type: String

Required: No

PrivateIpAddresses.N

The private IPv4 addresses.

You can't specify private IPv4 addresses if you've specified one of the following: a count of private IPv4 addresses, specific IPv4 prefixes, or a count of IPv4 prefixes.

Type: Array of PrivateIpAddressSpecification objects

Required: No

SecondaryPrivateIpAddressCount

The number of secondary private IPv4 addresses to assign to a network interface. When you specify a number of secondary IPv4 addresses, Amazon EC2 selects these IP addresses within the subnet's IPv4 CIDR range. You can't specify this option and specify more than one private IP address using `privateIpAddresses`.

You can't specify a count of private IPv4 addresses if you've specified one of the following: specific private IPv4 addresses, specific IPv4 prefixes, or a count of IPv4 prefixes.

Type: Integer

Required: No

SecurityGroupId.N

The IDs of the security groups.

Type: Array of strings

Required: No

SubnetId

The ID of the subnet to associate with the network interface.

Type: String

Required: Yes

TagSpecification.N

The tags to apply to the new network interface.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

clientToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

networkInterface

Information about the network interface.

Type: NetworkInterface object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example creates a network interface in the specified subnet with a primary IPv4 address that is automatically selected by Amazon EC2.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateNetworkInterface
&SubnetId=subnet-b2a249da
&AUTHPARAMS
```

Sample Response

```
<CreateNetworkInterfaceResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
 <requestId>8dbe591e-5a22-48cb-b948-example</requestId>
    <networkInterface>
        <networkInterfaceId>eni-cfca76a6</networkInterfaceId>
        <subnetId>subnet-b2a249da</subnetId>
        <vpcId>vpc-c31dafaa</vpcId>
        <availabilityZone>ap-southeast-1b</availabilityZone>
        <description/>
        <ownerId>251839141158</ownerId>
        <requesterManaged>false</requesterManaged>
        <status>available</status>
        <macAddress>02:74:b0:72:79:61</macAddress>
        <privateIpAddress>10.0.2.157</privateIpAddress>
        <privateDnsName>ip-10-0-2-157.ap-southeast-1.compute.internal</privateDnsName>
        <sourceDestCheck>true</sourceDestCheck>
        <groupSet>
            <item>
```

```
                <groupId>sg-1a2b3c4d</groupId>
                <groupName>default</groupName>
            </item>
        </groupSet>
        <tagSet/>
        <privateIpAddressesSet>
            <item>
                <privateIpAddress>10.0.2.157</privateIpAddress>
                <privateDnsName>ip-10-0-2-157.ap-southeast-1.compute.internal</
privateDnsName>
                <primary>true</primary>
            </item>
        </privateIpAddressesSet>
        <ipv6AddressesSet/>
    </networkInterface>
</CreateNetworkInterfaceResponse>
```

Example 2

This example creates a network interface in the specified subnet with a primary IPv4 address of `10.0.2.140` and four secondary private IPv4 addresses that are automatically selected by Amazon EC2.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateNetworkInterface
&PrivateIpAddresses.1.Primary=true
&PrivateIpAddresses.1.PrivateIpAddress=10.0.2.140
&SecondaryPrivateIpAddressCount=4
&SubnetId=subnet-a61dafcf
&AUTHPARAMS
```

Sample Response

```
<CreateNetworkInterfaceResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
 <requestId>bd78c839-0895-4fac-a17f-example</requestId>
    <networkInterface>
        <networkInterfaceId>eni-1bcb7772</networkInterfaceId>
        <subnetId>subnet-a61dafcf</subnetId>
        <vpcId>vpc-c31dafaa</vpcId>
        <availabilityZone>ap-southeast-1b</availabilityZone>
        <description/>
```

```
        <ownerId>251839141158</ownerId>
        <requesterManaged>false</requesterManaged>
        <status>pending</status>
        <macAddress>02:74:b0:70:7f:1a</macAddress>
        <privateIpAddress>10.0.2.140</privateIpAddress>
        <sourceDestCheck>true</sourceDestCheck>
        <groupSet>
            <item>
                <groupId>sg-1a2b3c4d</groupId>
                <groupName>default</groupName>
            </item>
        </groupSet>
        <tagSet/>
        <privateIpAddressesSet>
            <item>
                <privateIpAddress>10.0.2.140</privateIpAddress>
                <primary>true</primary>
            </item>
            <item>
                <privateIpAddress>10.0.2.172</privateIpAddress>
                <primary>false</primary>
            </item>
            <item>
                <privateIpAddress>10.0.2.169</privateIpAddress>
                <primary>false</primary>
            </item>
            <item>
                <privateIpAddress>10.0.2.170</privateIpAddress>
                <primary>false</primary>
            </item>
            <item>
                <privateIpAddress>10.0.2.171</privateIpAddress>
                <primary>false</primary>
            </item>
        </privateIpAddressesSet>
        <ipv6AddressesSet/>
    </networkInterface>
</CreateNetworkInterfaceResponse>
```

Example 3

This example creates a network interface with a primary private IPv4 address of 10.0.2.130 and two secondary IPv4 addresses of 10.0.2.132 and 10.0.2.133.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateNetworkInterface
&PrivateIpAddresses.1.Primary=true
&PrivateIpAddresses.1.PrivateIpAddress=10.0.2.130
&PrivateIpAddresses.2.Primary=false
&PrivateIpAddresses.2.PrivateIpAddress=10.0.2.132
&PrivateIpAddresses.3.Primary=false
&PrivateIpAddresses.3.PrivateIpAddress=10.0.2.133
&SubnetId=subnet-a61dafcf
&AUTHPARAMS
```

Example 4

This example creates a network interface with a primary private IPv4 address of 10.0.2.130 and two IPv6 addresses that are selected by Amazon EC2.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateNetworkInterface
&PrivateIpAddresses.1.Primary=true
&PrivateIpAddresses.1.PrivateIpAddress=10.0.2.130
&Ipv6AddressCount=2
&SubnetId=subnet-a61dafcf
&AUTHPARAMS
```

Sample Response

```
<CreateNetworkInterfaceResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
<requestId>a9565f4c-f928-4113-859b-example</requestId>
    <networkInterface>
        <networkInterfaceId>eni-41c47828</networkInterfaceId>
        <subnetId>subnet-a61dafcf</subnetId>
        <vpcId>vpc-c31dafaa</vpcId>

CreateNetworkInterfacePermission

Grants an AWS-authorized account permission to attach the specified network interface to an instance in their account.

You can grant permission to a single AWS account only, and only one account at a time.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AwsAccountId

The AWS account ID.

Type: String

Required: No

AwsService

The AWS service. Currently not supported.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

NetworkInterfaceId

The ID of the network interface.

Type: String

Required: Yes

Permission

The type of permission to grant.

Type: String

Valid Values: `INSTANCE-ATTACH | EIP-ASSOCIATE`

Required: Yes

Response Elements

The following elements are returned by the service.

interfacePermission

Information about the permission for the network interface.

Type: NetworkInterfacePermission object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example grants permission to account `123456789012` to attach network interface `eni-1a2b3c4d` to an instance.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateNetworkInterfacePermission
```

```
&NetworkInterfaceId=eni-1a2b3c4d
&AwsAccountId=123456789012
&Permission=INSTANCE-ATTACH
&AUTHPARAMS
```

Sample Response

```
<CreateNetworkInterfacePermissionResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>e9633d41-093e-4944-981b-ca7example</requestId>
    <interfacePermission>
        <awsAccountId>123456789012</awsAccountId>
        <networkInterfaceId>eni-1a2b3c4d</networkInterfaceId>
        <networkInterfacePermissionId>eni-perm-06fd19020ede149ea</
networkInterfacePermissionId>
        <permission>INSTANCE-ATTACH</permission>
        <permissionState>
            <state>GRANTED</state>
        </permissionState>
    </interfacePermission>
</CreateNetworkInterfacePermissionResponse>
```

CreatePlacementGroup

Creates a placement group in which to launch instances. The strategy of the placement group determines how the instances are organized within the group.

A `cluster` placement group is a logical grouping of instances within a single Availability Zone that benefit from low network latency, high network throughput. A `spread` placement group places instances on distinct hardware. A `partition` placement group places groups of instances in different partitions, where instances in one partition do not share the same hardware with instances in another partition.

For more information, see Placement groups in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

GroupName

A name for the placement group. Must be unique within the scope of your account for the Region.

Constraints: Up to 255 ASCII characters

Type: String

Required: No

LinkedGroupId

Reserved for future use.

Type: String

Required: No

Operator

Reserved for internal use.

Type: OperatorRequest object

Required: No

PartitionCount

The number of partitions. Valid only when **Strategy** is set to `partition`.

Type: Integer

Required: No

SpreadLevel

Determines how placement groups spread instances.

- Host – You can use `host` only with Outpost placement groups.
- Rack – No usage restrictions.

Type: String

Valid Values: `host | rack`

Required: No

Strategy

The placement strategy.

Type: String

Valid Values: `cluster | spread | partition`

Required: No

TagSpecification.N

The tags to apply to the new placement group.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

placementGroup

Information about the placement group.

Type: PlacementGroup object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example creates a cluster placement group named `XYZ-cluster`, and applies a tag with a key of `purpose` and a value of `production`.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreatePlacementGroup
&GroupName=XYZ-cluster
&Strategy=cluster
&TagSpecification.1.ResourceType=placement-group
&TagSpecification.1.Tag.1.Key=purpose
&TagSpecification.1.Tag.1.Value=production
&AUTHPARAMS
```

Sample Response

```
<CreatePlacementGroupResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>1bbcaf48-7155-4154-a7ac-c6031EXAMPLE</requestId>
    <return>true</return>
    <placementGroup>
        <groupName>XYZ-cluster</groupName>
        <groupId>pg-0bea00ad0bexample</groupId>
        <strategy>cluster</strategy>
        <state>available</state>
        <tagSet>
            <item>
                <key>purpose</key>
                <value>production</value>
            </item>
        </tagSet>
    </placementGroup>
</CreatePlacementGroupResponse>
```

Example

This example creates a partition placement group named `HDFS-Group-A` with five partitions.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreatePlacementGroup
&GroupName=HDFS-Group-A
&Strategy=partition
&PartitionCount=5
&AUTHPARAMS
```

Sample Response

```
<CreatePlacementGroupResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>1bbcaf48-7155-4154-a7ac-c6031EXAMPLE</requestId>
    <return>true</return>
    <placementGroup>
        <groupName>HDFS-Group-A</groupName>
        <groupId>pg-0fc13f6eb3example</groupId>
        <strategy>partition</strategy>
        <state>available</state>
        <partitionCount>5</partitionCount>
```

```
    </placementGroup>
</CreatePlacementGroupResponse>
```

CreatePublicIpv4Pool

Creates a public IPv4 address pool. A public IPv4 pool is an EC2 IP address pool required for the public IPv4 CIDRs that you own and bring to AWS to manage with IPAM. IPv6 addresses you bring to AWS, however, use IPAM pools only. To monitor the status of pool creation, use DescribePublicIpv4Pools.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

NetworkBorderGroup

The Availability Zone (AZ) or Local Zone (LZ) network border group that the resource that the IP address is assigned to is in. Defaults to an AZ network border group. For more information on available Local Zones, see Local Zone availability in the *Amazon EC2 User Guide*.

Type: String

Required: No

TagSpecification.N

The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

poolId

The ID of the public IPv4 pool.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

CreateReplaceRootVolumeTask

Replaces the EBS-backed root volume for a `running` instance with a new volume that is restored to the original root volume's launch state, that is restored to a specific snapshot taken from the original root volume, or that is restored from an AMI that has the same key characteristics as that of the instance.

For more information, see Replace a root volume in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier you provide to ensure the idempotency of the request. If you do not specify a client token, a randomly generated token is used for the request to ensure idempotency. For more information, see Ensuring idempotency.

Type: String

Required: No

DeleteReplacedRootVolume

Indicates whether to automatically delete the original root volume after the root volume replacement task completes. To delete the original root volume, specify `true`. If you choose to keep the original root volume after the replacement task completes, you must manually delete it when you no longer need it.

Type: Boolean

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ImageId

The ID of the AMI to use to restore the root volume. The specified AMI must have the same product code, billing information, architecture type, and virtualization type as that of the instance.

If you want to restore the replacement volume from a specific snapshot, or if you want to restore it to its launch state, omit this parameter.

Type: String

Required: No

InstanceId

The ID of the instance for which to replace the root volume.

Type: String

Required: Yes

SnapshotId

The ID of the snapshot from which to restore the replacement root volume. The specified snapshot must be a snapshot that you previously created from the original root volume.

If you want to restore the replacement root volume to the initial launch state, or if you want to restore the replacement root volume from an AMI, omit this parameter.

Type: String

Required: No

TagSpecification.N

The tags to apply to the root volume replacement task.

Type: Array of TagSpecification objects

Required: No

VolumeInitializationRate

Specifies the Amazon EBS Provisioned Rate for Volume Initialization (volume initialization rate), in MiB/s, at which to download the snapshot blocks from Amazon S3 to the replacement

root volume. This is also known as *volume initialization*. Specifying a volume initialization rate ensures that the volume is initialized at a predictable and consistent rate after creation.

Omit this parameter if:

- You want to create the volume using fast snapshot restore. You must specify a snapshot that is enabled for fast snapshot restore. In this case, the volume is fully initialized at creation.

  > **Note**
  >
  > If you specify a snapshot that is enabled for fast snapshot restore and a volume initialization rate, the volume will be initialized at the specified rate instead of fast snapshot restore.

- You want to create a volume that is initialized at the default rate.

For more information, see Initialize Amazon EBS volumes in the *Amazon EC2 User Guide*.

Valid range: 100 - 300 MiB/s

Type: Long

Required: No

Response Elements

The following elements are returned by the service.

replaceRootVolumeTask

Information about the root volume replacement task.

Type: ReplaceRootVolumeTask object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

CreateReservedInstancesListing

Creates a listing for Amazon EC2 Standard Reserved Instances to be sold in the Reserved Instance Marketplace. You can submit one Standard Reserved Instance listing at a time. To get a list of your Standard Reserved Instances, you can use the DescribeReservedInstances operation.

> **Note**
>
> Only Standard Reserved Instances can be sold in the Reserved Instance Marketplace. Convertible Reserved Instances cannot be sold.

The Reserved Instance Marketplace matches sellers who want to resell Standard Reserved Instance capacity that they no longer need with buyers who want to purchase additional capacity. Reserved Instances bought and sold through the Reserved Instance Marketplace work like any other Reserved Instances.

To sell your Standard Reserved Instances, you must first register as a seller in the Reserved Instance Marketplace. After completing the registration process, you can create a Reserved Instance Marketplace listing of some or all of your Standard Reserved Instances, and specify the upfront price to receive for them. Your Standard Reserved Instance listings then become available for purchase. To view the details of your Standard Reserved Instance listing, you can use the DescribeReservedInstancesListings operation.

For more information, see Sell in the Reserved Instance Marketplace in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier you provide to ensure idempotency of your listings. This helps avoid duplicate listings. For more information, see Ensuring Idempotency.

Type: String

Required: Yes

InstanceCount

The number of instances that are a part of a Reserved Instance account to be listed in the Reserved Instance Marketplace. This number should be less than or equal to the instance count associated with the Reserved Instance ID specified in this call.

Type: Integer

Required: Yes

PriceSchedules.N

A list specifying the price of the Standard Reserved Instance for each month remaining in the Reserved Instance term.

Type: Array of PriceScheduleSpecification objects

Required: Yes

ReservedInstancesId

The ID of the active Standard Reserved Instance.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

reservedInstancesListingsSet

Information about the Standard Reserved Instance listing.

Type: Array of ReservedInstancesListing objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example creates a Reserved Instance Marketplace listing from the specified Standard Reserved Instance, which has 11 months remaining in its term. In this example, we set the upfront price at $2.50, and the price drops over the course of the 11-month term if the instance is still not sold.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateReservedInstancesListing
&ClientToken=myIdempToken1
&InstanceCount=1
&PriceSchedules.1.Price=2.5
&PriceSchedules.1.Term=11
&PriceSchedules.2.Price=2.0
&PriceSchedules.2.Term=8
&PriceSchedules.3.Price=1.5
&PriceSchedules.3.Term=5
&PriceSchedules.4.Price=0.7
&PriceSchedules.4.Term=3
&PriceSchedules.5.Price=0.1
&PriceSchedules.5.Term=1
&ReservedInstancesId=e5a2ff3b-7d14-494f-90af-0b5d0EXAMPLE
&AUTHPARAMS
```

Sample Response

```
<CreateReservedInstancesListingResponse>

CreateRestoreImageTask

Starts a task that restores an AMI from an Amazon S3 object that was previously created by using CreateStoreImageTask.

To use this API, you must have the required permissions. For more information, see Permissions for storing and restoring AMIs using S3 in the *Amazon EC2 User Guide*.

For more information, see Store and restore an AMI using S3 in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Bucket

The name of the Amazon S3 bucket that contains the stored AMI object.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Name

The name for the restored AMI. The name must be unique for AMIs in the Region for this account. If you do not provide a name, the new AMI gets the same name as the original AMI.

Type: String

Required: No

ObjectKey

The name of the stored AMI object in the bucket.

Type: String

Required: Yes

TagSpecification.N

The tags to apply to the AMI and snapshots on restoration. You can tag the AMI, the snapshots, or both.

- To tag the AMI, the value for `ResourceType` must be `image`.
- To tag the snapshots, the value for `ResourceType` must be `snapshot`. The same tag is applied to all of the snapshots that are created.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

imageId

The AMI ID.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for Python
- AWS SDK for Ruby V3

CreateRoute

Creates a route in a route table within a VPC.

You must specify either a destination CIDR block or a prefix list ID. You must also specify exactly one of the resources from the parameter list.

When determining how to route traffic, we use the route with the most specific match. For example, traffic is destined for the IPv4 address `192.0.2.3`, and the route table includes the following two IPv4 routes:

- `192.0.2.0/24` (goes to some target A)
- `192.0.2.0/28` (goes to some target B)

Both routes apply to the traffic destined for `192.0.2.3`. However, the second route in the list covers a smaller number of IP addresses and is therefore more specific, so we use that route to determine where to target the traffic.

For more information about route tables, see Route tables in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CarrierGatewayId

The ID of the carrier gateway.

You can only use this option when the VPC contains a subnet which is associated with a Wavelength Zone.

Type: String

Required: No

CoreNetworkArn

The Amazon Resource Name (ARN) of the core network.

Type: String

Required: No

DestinationCidrBlock

The IPv4 CIDR address block used for the destination match. Routing decisions are based on the most specific match. We modify the specified CIDR block to its canonical form; for example, if you specify `100.68.0.18/18`, we modify it to `100.68.0.0/18`.

Type: String

Required: No

DestinationIpv6CidrBlock

The IPv6 CIDR block used for the destination match. Routing decisions are based on the most specific match.

Type: String

Required: No

DestinationPrefixListId

The ID of a prefix list used for the destination match.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

EgressOnlyInternetGatewayId

[IPv6 traffic only] The ID of an egress-only internet gateway.

Type: String

Required: No

GatewayId

The ID of an internet gateway or virtual private gateway attached to your VPC.

Type: String

Required: No

InstanceId

The ID of a NAT instance in your VPC. The operation fails if you specify an instance ID unless exactly one network interface is attached.

Type: String

Required: No

LocalGatewayId

The ID of the local gateway.

Type: String

Required: No

NatGatewayId

[IPv4 traffic only] The ID of a NAT gateway.

Type: String

Required: No

NetworkInterfaceId

The ID of a network interface.

Type: String

Required: No

OdbNetworkArn

The Amazon Resource Name (ARN) of the ODB network.

Type: String

Required: No

RouteTableId

The ID of the route table for the route.

Type: String

Required: Yes

TransitGatewayId

The ID of a transit gateway.

Type: String

Required: No

VpcEndpointId

The ID of a VPC endpoint. Supported for Gateway Load Balancer endpoints only.

Type: String

Required: No

VpcPeeringConnectionId

The ID of a VPC peering connection.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example creates a route in the route table with the ID `rtb-1122334455667788a`. The route matches all IPv4 traffic (`0.0.0.0/0`) and routes it to the internet gateway with the ID `igw-eaad4883`.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateRoute
&RouteTableId=rtb-1122334455667788a
&DestinationCidrBlock=0.0.0.0/0
&GatewayId=igw-eaad4883
&AUTHPARAMS
```

Example 2

This example creates a route in the route table with the ID `rtb-1122334455667788a`. The route sends all IPv4 traffic (`0.0.0.0/0`) to the NAT instance with the ID `i-1234567890abcdef0`.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateRoute
&RouteTableId=rtb-1122334455667788a
&DestinationCidrBlock=0.0.0.0/0
&InstanceId=i-1234567890abcdef0
&AUTHPARAMS
```

Example 3

This example creates a route in route table `rtb-1122334455667788a`. The route matches traffic for the IPv4 CIDR block `10.0.0.0/16` and routes it to VPC peering connection, `pcx-111aaa22`.

This route enables IPv4 traffic to be directed to the other peered VPC in the VPC peering connection.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateRoute
&RouteTableId=rtb-1122334455667788a&DestinationCidrBlock=10.0.0.0/16
&vpcPeeringConnectionId=pcx-111aaa22
&AUTHPARAMS
```

Example 4

This example creates a route in route table `rtb-1122334455667788a`. The route sends all IPv6 traffic `::/0` to an egress-only internet gateway.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateRoute
&RouteTableId=rtb-1122334455667788a
&DestinationIpv6CidrBlock=::/0
&EgressOnlyInternetGatewayId=eigw-1234567890abc1234
&AUTHPARAMS
```

CreateRouteServer

Creates a new route server to manage dynamic routing in a VPC.

Amazon VPC Route Server simplifies routing for traffic between workloads that are deployed within a VPC and its internet gateways. With this feature, VPC Route Server dynamically updates VPC and internet gateway route tables with your preferred IPv4 or IPv6 routes to achieve routing fault tolerance for those workloads. This enables you to automatically reroute traffic within a VPC, which increases the manageability of VPC routing and interoperability with third-party workloads.

Route server supports the follow route table types:

- VPC route tables not associated with subnets
- Subnet route tables
- Internet gateway route tables

Route server does not support route tables associated with virtual private gateways. To propagate routes into a transit gateway route table, use Transit Gateway Connect.

For more information see Dynamic routing in your VPC with VPC Route Server in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AmazonSideAsn

The private Autonomous System Number (ASN) for the Amazon side of the BGP session. Valid values are from 1 to 4294967295. We recommend using a private ASN in the 64512–65534 (16-bit ASN) or 4200000000–4294967294 (32-bit ASN) range.

Type: Long

Required: Yes

ClientToken

Unique, case-sensitive identifier to ensure idempotency of the request.

Type: String

Required: No

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

PersistRoutes

Indicates whether routes should be persisted after all BGP sessions are terminated.

Type: String

Valid Values: `enable | disable | reset`

Required: No

PersistRoutesDuration

The number of minutes a route server will wait after BGP is re-established to unpersist the routes in the FIB and RIB. Value must be in the range of 1-5. Required if PersistRoutes is `enabled`.

If you set the duration to 1 minute, then when your network appliance re-establishes BGP with route server, it has 1 minute to relearn it's adjacent network and advertise those routes to route server before route server resumes normal functionality. In most cases, 1 minute is probably sufficient. If, however, you have concerns that your BGP network may not be capable of fully re-establishing and re-learning everything in 1 minute, you can increase the duration up to 5 minutes.

Type: Long

Required: No

SnsNotificationsEnabled

Indicates whether SNS notifications should be enabled for route server events. Enabling SNS notifications persists BGP status changes to an SNS topic provisioned by AWS.

Type: Boolean

Required: No

TagSpecification.N

The tags to apply to the route server during creation.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

routeServer

Information about the created route server.

Type: RouteServer object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

CreateRouteServerEndpoint

Creates a new endpoint for a route server in a specified subnet.

A route server endpoint is an AWS-managed component inside a subnet that facilitates BGP (Border Gateway Protocol) connections between your route server and your BGP peers.

For more information see Dynamic routing in your VPC with VPC Route Server in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier to ensure idempotency of the request.

Type: String

Required: No

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

RouteServerId

The ID of the route server for which to create an endpoint.

Type: String

Required: Yes

SubnetId

The ID of the subnet in which to create the route server endpoint.

Type: String

Required: Yes

TagSpecification.N

The tags to apply to the route server endpoint during creation.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

routeServerEndpoint

Information about the created route server endpoint.

Type: RouteServerEndpoint object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

CreateRouteServerPeer

Creates a new BGP peer for a specified route server endpoint.

A route server peer is a session between a route server endpoint and the device deployed in AWS (such as a firewall appliance or other network security function running on an EC2 instance). The device must meet these requirements:

- Have an elastic network interface in the VPC
- Support BGP (Border Gateway Protocol)
- Can initiate BGP sessions

For more information see Dynamic routing in your VPC with VPC Route Server in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

BgpOptions

The BGP options for the peer, including ASN (Autonomous System Number) and BFD (Bidirectional Forwarding Detection) settings.

Type: RouteServerBgpOptionsRequest object

Required: Yes

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

PeerAddress

The IPv4 address of the peer device.

Type: String

Required: Yes

RouteServerEndpointId

The ID of the route server endpoint for which to create a peer.

Type: String

Required: Yes

TagSpecification.N

The tags to apply to the route server peer during creation.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

routeServerPeer

Information about the created route server peer.

Type: RouteServerPeer object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

CreateRouteTable

Creates a route table for the specified VPC. After you create a route table, you can add routes and associate the table with a subnet.

For more information, see Route tables in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring idempotency.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TagSpecification.N

The tags to assign to the route table.

Type: Array of TagSpecification objects

Required: No

VpcId

The ID of the VPC.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

clientToken

Unique, case-sensitive identifier to ensure the idempotency of the request. Only returned if a client token was provided in the request.

Type: String

requestId

The ID of the request.

Type: String

routeTable

Information about the route table.

Type: RouteTable object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example creates a route table for the VPC with the ID `vpc-1122334455667788a`. By default, every route table includes a local route that enables traffic to flow within the VPC. The following response shows that route.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateRouteTable
&VpcId=vpc-1122334455667788a
```

```
&AUTHPARAMS
```

Sample Response

```
<CreateRouteTableResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <routeTable>
      <routeTableId>rtb-029e01e661a8fffd9</routeTableId>
      <vpcId>vpc-11ad4878</vpcId>
      <routeSet>
         <item>
            <destinationCidrBlock>10.0.0.0/22</destinationCidrBlock>
            <gatewayId>local</gatewayId>
            <state>active</state>
         </item>
      </routeSet>
      <associationSet/>
      <tagSet/>
   </routeTable>
</CreateRouteTableResponse>
```

Example 2

This example creates a route table for a VPC that has an associated IPv6 CIDR block. The route table includes a local route that enables IPv6 traffic to flow within the VPC.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateRouteTable
&VpcId=vpc-1a2b3c4d
&AUTHPARAMS
```

Sample Response

```
<CreateRouteTableResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <routeTable>
        <routeTableId>rtb-8bda6cef</routeTableId>
        <vpcId>vpc-1a2b3c4d</vpcId>
        <routeSet>
            <item>
                <destinationCidrBlock>10.0.0.0/16</destinationCidrBlock>
```

```
                <gatewayId>local</gatewayId>
                <state>active</state>
                <origin>CreateRouteTable</origin>
            </item>
            <item>
                <destinationIpv6CidrBlock>2001:db8:1234:1a00::/56</
destinationIpv6CidrBlock>
                <gatewayId>local</gatewayId>
                <state>active</state>
                <origin>CreateRouteTable</origin>
            </item>
        </routeSet>
        <associationSet/>
        <propagatingVgwSet/>
        <tagSet/>
    </routeTable>
</CreateRouteTableResponse>
```

CreateSecondaryNetwork

Creates a secondary network.

The allowed size for a secondary network CIDR block is between /28 netmask (16 IP addresses) and /12 netmask (1,048,576 IP addresses).

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensure Idempotency.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Ipv4CidrBlock

The IPv4 CIDR block for the secondary network. The CIDR block size must be between /12 and /28.

Type: String

Required: Yes

NetworkType

The type of secondary network.

Type: String

Valid Values: `rdma`

Required: Yes

TagSpecification.N

The tags to assign to the secondary network.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

clientToken

Unique, case-sensitive identifier to ensure the idempotency of the request. Only returned if a client token was provided in the request.

Type: String

requestId

The ID of the request.

Type: String

secondaryNetwork

Information about the secondary network.

Type: SecondaryNetwork object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example creates a rdma secondary network with a /16 CIDR block.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateSecondaryNetwork
   &Ipv4CidrBlock=10.0.0.0/16
   &NetworkType=rdma
   &ClientToken=550e8400-e29b-41d4-a716-446655440000
   &TagSpecification.1.ResourceType=secondary-network
   &TagSpecification.1.Tag.1.Key=Name
   &TagSpecification.1.Tag.1.Value=Prod%20Secondary%20Network
   &AUTHPARAMS
```

Sample Response

```
<CreateSecondaryNetworkResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <secondaryNetwork>
      <secondaryNetworkId>sn-0123456789abcdef0</secondaryNetworkId>
      <secondaryNetworkArn>arn:aws:ec2:us-east-2:123456789012:secondary-network/
sn-0123456789abcdef0</secondaryNetworkArn>
      <ownerId>123456789012</ownerId>
      <type>rdma</type>
      <state>create-in-progress</state>
      <ipv4CidrBlockAssociations>
         <item>
            <associationId>sn-cidr-assoc-56789901234abcdef0</associationId>
            <cidrBlock>10.0.0.0/16</cidrBlock>
            <state>associating</state>
         </item>
      </ipv4CidrBlockAssociations>
      <tagSet>
         <item>
            <key>Name</key>
            <value>Prod Secondary Network</value>
         </item>
      </tagSet>
   </secondaryNetwork>
   <clientToken>550e8400-e29b-41d4-a716-446655440000</clientToken>
</CreateSecondaryNetworkResponse>
```

CreateSecondarySubnet

Creates a secondary subnet in a secondary network.

A secondary subnet CIDR block must not overlap with the CIDR block of an existing secondary subnet in the secondary network. After you create a secondary subnet, you can't change its CIDR block.

The allowed size for a secondary subnet CIDR block is between /28 netmask (16 IP addresses) and /12 netmask (1,048,576 IP addresses). Amazon reserves the first four IP addresses and the last IP address in each secondary subnet for internal use.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AvailabilityZone

The Availability Zone for the secondary subnet. You cannot specify both `AvailabilityZone` and `AvailabilityZoneId` in the same request.

Type: String

Required: No

AvailabilityZoneId

The ID of the Availability Zone for the secondary subnet. This option is preferred over `AvailabilityZone` as it provides a consistent identifier across AWS accounts. You cannot specify both `AvailabilityZone` and `AvailabilityZoneId` in the same request.

Type: String

Required: No

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensure Idempotency.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Ipv4CidrBlock

The IPv4 CIDR block for the secondary subnet. The CIDR block size must be between /12 and /28.

Type: String

Required: Yes

SecondaryNetworkId

The ID of the secondary network in which to create the secondary subnet.

Type: String

Required: Yes

TagSpecification.N

The tags to assign to the secondary subnet.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

clientToken

Unique, case-sensitive identifier to ensure the idempotency of the request. Only returned if a client token was provided in the request.

Type: String

requestId

The ID of the request.

Type: String

secondarySubnet

Information about the secondary subnet.

Type: SecondarySubnet object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example creates a secondary subnet with a /24 CIDR block in the specified secondary network and Availability Zone.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateSecondarySubnet
   &SecondaryNetworkId=sn-0123456789abcdef0
   &Ipv4CidrBlock=10.0.0.0/24
   &AvailabilityZoneId=use2-az1
   &ClientToken=550e8400-e29b-41d4-a716-446655440000
   &TagSpecification.1.ResourceType=secondary-subnet
   &TagSpecification.1.Tag.1.Key=Name
   &TagSpecification.1.Tag.1.Value=Prod%20Secondary%20Subnet
   &TagSpecification.1.Tag.2.Key=Environment
   &TagSpecification.1.Tag.2.Value=Production
   &AUTHPARAMS
```

Sample Response

```
<CreateSecondarySubnetResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
```

```
   <secondarySubnet>
      <secondarySubnetId>ss-0123456789abcdef0</secondarySubnetId>
      <secondarySubnetArn>arn:aws:ec2:us-east-2:123456789012:secondary-subnet/
ss-0123456789abcdef0</secondarySubnetArn>
      <secondaryNetworkId>sn-0123456789abcdef0</secondaryNetworkId>
      <secondaryNetworkType>rdma</secondaryNetworkType>
      <ownerId>123456789012</ownerId>
      <availabilityZoneId>use2-az1</availabilityZoneId>
      <availabilityZone>us-east-2a</availabilityZone>
      <ipv4CidrBlockAssociations>
         <item>
            <associationId>ss-cidr-assoc-56789901234abcdef0</associationId>
            <cidrBlock>10.0.0.0/24</cidrBlock>
            <state>associating</state>
         </item>
      </ipv4CidrBlockAssociations>
      <state>create-in-progress</state>
      <tagSet>
         <item>
            <key>Name</key>
            <value>Prod Secondary Subnet</value>
         </item>
         <item>
            <key>Environment</key>
            <value>Production</value>
         </item>
      </tagSet>
   </secondarySubnet>
   <clientToken>550e8400-e29b-41d4-a716-446655440000</clientToken>
</CreateSecondarySubnetResponse>
```

CreateSecurityGroup

Creates a security group.

A security group acts as a virtual firewall for your instance to control inbound and outbound traffic. For more information, see Amazon EC2 security groups in the *Amazon EC2 User Guide* and Security groups for your VPC in the *Amazon VPC User Guide*.

When you create a security group, you specify a friendly name of your choice. You can't have two security groups for the same VPC with the same name.

You have a default security group for use in your VPC. If you don't specify a security group when you launch an instance, the instance is launched into the appropriate default security group. A default security group includes a default rule that grants instances unrestricted network access to each other.

You can add or remove rules from your security groups using AuthorizeSecurityGroupIngress, AuthorizeSecurityGroupEgress, RevokeSecurityGroupIngress, and RevokeSecurityGroupEgress.

For more information about VPC security group limits, see Amazon VPC Limits.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

GroupDescription

A description for the security group.

Constraints: Up to 255 characters in length

Valid characters: a-z, A-Z, 0-9, spaces, and ._-:/()#,@[]+=&;{}!$*

Type: String

Required: Yes

GroupName

The name of the security group. Names are case-insensitive and must be unique within the VPC.

Constraints: Up to 255 characters in length. Can't start with `sg-`.

Valid characters: a-z, A-Z, 0-9, spaces, and ._-:/()#,@[]+=&;{}!$*

Type: String

Required: Yes

TagSpecification.N

The tags to assign to the security group.

Type: Array of TagSpecification objects

Required: No

VpcId

The ID of the VPC. Required for a nondefault VPC.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

groupId

The ID of the security group.

Type: String

requestId

The ID of the request.

Type: String

securityGroupArn

The security group ARN.

Type: String

tagSet

The tags assigned to the security group.

Type: Array of Tag objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example creates a security group named `WebServerSG` for the specified VPC.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateSecurityGroup
&GroupName=WebServerSG
&GroupDescription=Web Servers
&VpcId=vpc-3325caf2
&AUTHPARAMS
```

Sample Response

```
<CreateSecurityGroupResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <return>true</return>
   <groupId>sg-0a42d66a</groupId>
```

```
</CreateSecurityGroupResponse>
```

CreateSnapshot

Creates a snapshot of an EBS volume and stores it in Amazon S3. You can use snapshots for backups, to make copies of EBS volumes, and to save data before shutting down an instance.

The location of the source EBS volume determines where you can create the snapshot.

- If the source volume is in a Region, you must create the snapshot in the same Region as the volume.
- If the source volume is in a Local Zone, you can create the snapshot in the same Local Zone or in its parent AWS Region.
- If the source volume is on an Outpost, you can create the snapshot on the same Outpost or in its parent AWS Region.

When a snapshot is created, any AWS Marketplace product codes that are associated with the source volume are propagated to the snapshot.

You can take a snapshot of an attached volume that is in use. However, snapshots only capture data that has been written to your Amazon EBS volume at the time the snapshot command is issued; this might exclude any data that has been cached by any applications or the operating system. If you can pause any file systems on the volume long enough to take a snapshot, your snapshot should be complete. However, if you cannot pause all file writes to the volume, you should unmount the volume from within the instance, issue the snapshot command, and then remount the volume to ensure a consistent and complete snapshot. You may remount and use your volume while the snapshot status is `pending`.

When you create a snapshot for an EBS volume that serves as a root device, we recommend that you stop the instance before taking the snapshot.

Snapshots that are taken from encrypted volumes are automatically encrypted. Volumes that are created from encrypted snapshots are also automatically encrypted. Your encrypted volumes and any associated snapshots always remain protected. For more information, see Amazon EBS encryption in the *Amazon EBS User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Description

A description for the snapshot.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Location

> **Note**
>
> Only supported for volumes in Local Zones. If the source volume is not in a Local Zone, omit this parameter.

- To create a local snapshot in the same Local Zone as the source volume, specify `local`.
- To create a regional snapshot in the parent Region of the Local Zone, specify `regional` or omit this parameter.

Default value: `regional`

Type: String

Valid Values: `regional | local`

Required: No

OutpostArn

> **Note**
>
> Only supported for volumes on Outposts. If the source volume is not on an Outpost, omit this parameter.

- To create the snapshot on the same Outpost as the source volume, specify the ARN of that Outpost. The snapshot must be created on the same Outpost as the volume.
- To create the snapshot in the parent Region of the Outpost, omit this parameter.

For more information, see Create local snapshots from volumes on an Outpost in the *Amazon EBS User Guide*.

Type: String

Required: No

TagSpecification.N

The tags to apply to the snapshot during creation.

Type: Array of TagSpecification objects

Required: No

VolumeId

The ID of the Amazon EBS volume.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

availabilityZone

The Availability Zone or Local Zone of the snapshot. For example, `us-west-1a` (Availability Zone) or `us-west-2-lax-1a` (Local Zone).

Type: String

completionDurationMinutes

> **Note**
>
> Only for snapshot copies created with time-based snapshot copy operations.

The completion duration requested for the time-based snapshot copy operation.

Type: Integer

completionTime

The time stamp when the snapshot was completed.

Type: Timestamp

dataEncryptionKeyId

The data encryption key identifier for the snapshot. This value is a unique identifier that corresponds to the data encryption key that was used to encrypt the original volume or snapshot copy. Because data encryption keys are inherited by volumes created from snapshots, and vice versa, if snapshots share the same data encryption key identifier, then they belong to the same volume/snapshot lineage. This parameter is only returned by DescribeSnapshots.

Type: String

description

The description for the snapshot.

Type: String

encrypted

Indicates whether the snapshot is encrypted.

Type: Boolean

fullSnapshotSizeInBytes

The full size of the snapshot, in bytes.

> **Important**
>
> This is **not** the incremental size of the snapshot. This is the full snapshot size and represents the size of all the blocks that were written to the source volume at the time the snapshot was created.

Type: Long

kmsKeyId

The Amazon Resource Name (ARN) of the AWS KMS key that was used to protect the volume encryption key for the parent volume.

Type: String

outpostArn

The ARN of the Outpost on which the snapshot is stored. For more information, see Amazon EBS local snapshots on Outposts in the *Amazon EBS User Guide*.

Type: String

ownerAlias

The AWS owner alias, from an Amazon-maintained list (`amazon`). This is not the user-configured AWS account alias set using the IAM console.

Type: String

ownerId

The ID of the AWS account that owns the EBS snapshot.

Type: String

progress

The progress of the snapshot, as a percentage.

Type: String

requestId

The ID of the request.

Type: String

restoreExpiryTime

Only for archived snapshots that are temporarily restored. Indicates the date and time when a temporarily restored snapshot will be automatically re-archived.

Type: Timestamp

snapshotId

The ID of the snapshot. Each snapshot receives a unique identifier when it is created.

Type: String

sseType

Reserved for future use.

Type: String

Valid Values: `sse-ebs | sse-kms | none`

startTime

The time stamp when the snapshot was initiated.

Type: Timestamp

status

The snapshot state.

Type: String

Valid Values: `pending | completed | error | recoverable | recovering`

statusMessage

Encrypted Amazon EBS snapshots are copied asynchronously. If a snapshot copy operation fails (for example, if the proper AWS KMS permissions are not obtained) this field displays error state details to help you diagnose why the error occurred. This parameter is only returned by DescribeSnapshots.

Type: String

storageTier

The storage tier in which the snapshot is stored. `standard` indicates that the snapshot is stored in the standard snapshot storage tier and that it is ready for use. `archive` indicates that the snapshot is currently archived and that it must be restored before it can be used.

Type: String

Valid Values: `archive | standard`

tagSet

Any tags assigned to the snapshot.

Type: Array of Tag objects

transferType

> **Note**
>
> Only for snapshot copies.

Indicates whether the snapshot copy was created with a standard or time-based snapshot copy operation. Time-based snapshot copy operations complete within the completion duration specified in the request. Standard snapshot copy operations are completed on a best-effort basis.

- `standard` - The snapshot copy was created with a standard snapshot copy operation.
- `time-based` - The snapshot copy was created with a time-based snapshot copy operation.

Type: String

Valid Values: `time-based | standard`

volumeId

The ID of the volume that was used to create the snapshot. Snapshots created by a copy snapshot operation have an arbitrary volume ID that you should not use for any purpose.

Type: String

volumeSize

The size of the volume, in GiB.

Type: Integer

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example creates a snapshot of the volume with the ID `vol-1234567890abcdef0`.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateSnapshot
&VolumeId=vol-1234567890abcdef0
&Description=Daily+Backup
&AUTHPARAMS
```

Sample Response

```
<CreateSnapshotResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <snapshotId>snap-1234567890abcdef0</snapshotId>
  <volumeId>vol-1234567890abcdef0</volumeId>
  <status>pending</status>
  <startTime>YYYY-MM-DDTHH:MM:SS.000Z</startTime>
  <progress>60%</progress>
  <ownerId>111122223333</ownerId>
  <volumeSize>30</volumeSize>
  <description>Daily Backup</description>
</CreateSnapshotResponse>
```

CreateSnapshots

Creates crash-consistent snapshots of multiple EBS volumes attached to an Amazon EC2 instance. Volumes are chosen by specifying an instance. Each volume attached to the specified instance will produce one snapshot that is crash-consistent across the instance. You can include all of the volumes currently attached to the instance, or you can exclude the root volume or specific data (non-root) volumes from the multi-volume snapshot set.

The location of the source instance determines where you can create the snapshots.

- If the source instance is in a Region, you must create the snapshots in the same Region as the instance.
- If the source instance is in a Local Zone, you can create the snapshots in the same Local Zone or in its parent AWS Region.
- If the source instance is on an Outpost, you can create the snapshots on the same Outpost or in its parent AWS Region.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CopyTagsFromSource

Copies the tags from the specified volume to corresponding snapshot.

Type: String

Valid Values: `volume`

Required: No

Description

A description propagated to every snapshot specified by the instance.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InstanceSpecification

The instance to specify which volumes should be included in the snapshots.

Type: InstanceSpecification object

Required: Yes

Location

> **Note**
>
> Only supported for instances in Local Zones. If the source instance is not in a Local Zone, omit this parameter.

- To create local snapshots in the same Local Zone as the source instance, specify `local`.
- To create regional snapshots in the parent Region of the Local Zone, specify `regional` or omit this parameter.

Default value: `regional`

Type: String

Valid Values: `regional | local`

Required: No

OutpostArn

> **Note**
>
> Only supported for instances on Outposts. If the source instance is not on an Outpost, omit this parameter.

- To create the snapshots on the same Outpost as the source instance, specify the ARN of that Outpost. The snapshots must be created on the same Outpost as the instance.
- To create the snapshots in the parent Region of the Outpost, omit this parameter.

For more information, see Create local snapshots from volumes on an Outpost in the *Amazon EBS User Guide*.

Type: String

Required: No

TagSpecification.N

Tags to apply to every snapshot specified by the instance.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

snapshotSet

List of snapshots.

Type: Array of SnapshotInfo objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for Ruby V3

CreateSpotDatafeedSubscription

Creates a data feed for Spot Instances, enabling you to view Spot Instance usage logs. You can create one data feed per AWS account. For more information, see Spot Instance data feed in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Bucket

The name of the Amazon S3 bucket in which to store the Spot Instance data feed. For more information about bucket names, see Bucket naming rules in the *Amazon S3 User Guide*.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Prefix

The prefix for the data feed file names.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

spotDatafeedSubscription

The Spot Instance data feed subscription.

Type: SpotDatafeedSubscription object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example creates a Spot Instance data feed for the account.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateSpotDatafeedSubscription
&Bucket=amzn-s3-demo-bucket
&AUTHPARAMS
```

Sample Response

```
<CreateSpotDatafeedSubscriptionResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <spotDatafeedSubscription>
    <ownerId>123456789012</ownerId>
    <bucket>amzn-s3-demo-bucket</bucket>
    <prefix>spotdata_</prefix>
    <state>Active</state>
  </spotDatafeedSubscription>
</CreateSpotDatafeedSubscriptionResponse>
```

CreateStoreImageTask

Stores an AMI as a single object in an Amazon S3 bucket.

To use this API, you must have the required permissions. For more information, see Permissions for storing and restoring AMIs using S3 in the *Amazon EC2 User Guide*.

For more information, see Store and restore an AMI using S3 in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Bucket

The name of the Amazon S3 bucket in which the AMI object will be stored. The bucket must be in the Region in which the request is being made. The AMI object appears in the bucket only after the upload task has completed.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ImageId

The ID of the AMI.

Type: String

Required: Yes

S3ObjectTag.N

The tags to apply to the AMI object that will be stored in the Amazon S3 bucket.

Type: Array of S3ObjectTag objects

Required: No

Response Elements

The following elements are returned by the service.

objectKey

The name of the stored AMI object in the S3 bucket.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for Ruby V3

CreateSubnet

Creates a subnet in the specified VPC. For an IPv4 only subnet, specify an IPv4 CIDR block. If the VPC has an IPv6 CIDR block, you can create an IPv6 only subnet or a dual stack subnet instead. For an IPv6 only subnet, specify an IPv6 CIDR block. For a dual stack subnet, specify both an IPv4 CIDR block and an IPv6 CIDR block.

A subnet CIDR block must not overlap the CIDR block of an existing subnet in the VPC. After you create a subnet, you can't change its CIDR block.

The allowed size for an IPv4 subnet is between a /28 netmask (16 IP addresses) and a /16 netmask (65,536 IP addresses). AWS reserves both the first four and the last IPv4 address in each subnet's CIDR block. They're not available for your use.

If you've associated an IPv6 CIDR block with your VPC, you can associate an IPv6 CIDR block with a subnet when you create it.

If you add more than one subnet to a VPC, they're set up in a star topology with a logical router in the middle.

When you stop an instance in a subnet, it retains its private IPv4 address. It's therefore possible to have a subnet with no running instances (they're all stopped), but no remaining IP addresses available.

For more information, see Subnets in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AvailabilityZone

The Availability Zone or Local Zone for the subnet.

Default: AWS selects one for you. If you create more than one subnet in your VPC, we do not necessarily select a different zone for each subnet.

To create a subnet in a Local Zone, set this value to the Local Zone ID, for example `us-west-2-lax-1a`. For information about the Regions that support Local Zones, see Available Local Zones.

To create a subnet in an Outpost, set this value to the Availability Zone for the Outpost and specify the Outpost ARN.

Type: String

Required: No

AvailabilityZoneId

The AZ ID or the Local Zone ID of the subnet.

Type: String

Required: No

CidrBlock

The IPv4 network range for the subnet, in CIDR notation. For example, `10.0.0.0/24`. We modify the specified CIDR block to its canonical form; for example, if you specify `100.68.0.18/18`, we modify it to `100.68.0.0/18`.

This parameter is not supported for an IPv6 only subnet.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Ipv4IpamPoolId

An IPv4 IPAM pool ID for the subnet.

Type: String

Required: No

Ipv4NetmaskLength

An IPv4 netmask length for the subnet.

Type: Integer

Required: No

Ipv6CidrBlock

The IPv6 network range for the subnet, in CIDR notation. This parameter is required for an IPv6 only subnet.

Type: String

Required: No

Ipv6IpamPoolId

An IPv6 IPAM pool ID for the subnet.

Type: String

Required: No

Ipv6Native

Indicates whether to create an IPv6 only subnet.

Type: Boolean

Required: No

Ipv6NetmaskLength

An IPv6 netmask length for the subnet.

Type: Integer

Required: No

OutpostArn

The Amazon Resource Name (ARN) of the Outpost. If you specify an Outpost ARN, you must also specify the Availability Zone of the Outpost subnet.

Type: String

Required: No

TagSpecification.N

The tags to assign to the subnet.

Type: Array of TagSpecification objects

Required: No

VpcId

The ID of the VPC.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

subnet

Information about the subnet.

Type: Subnet object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example creates a subnet with CIDR block `10.0.1.0/24` in the VPC with the ID `vpc-1a2b3c4d`.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateSubnet
&VpcId=vpc-1a2b3c4d
```

```
&CidrBlock=10.0.1.0/24
&AUTHPARAMS
```

Sample Response

```
<CreateSubnetResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>e6cb93f0-eb09-40ee-b9aa-16db90a0524f</requestId>
    <subnet>
        <subnetId>subnet-0397b6c47c42e4dc0</subnetId>
        <subnetArn>arn:aws:ec2:us-east-2:111122223333:subnet/subnet-0397b6c47cEXAMPLE</
subnetArn>
        <state>pending</state>
        <ownerId>111122223333</ownerId>
        <vpcId>vpc-06b7830650EXAMPLE</vpcId>
        <cidrBlock>10.0.0.0/24</cidrBlock>
        <ipv6CidrBlockAssociationSet/>
        <availableIpAddressCount>251</availableIpAddressCount>
        <availabilityZone>us-east-2a</availabilityZone>
        <availabilityZoneId>use2-az1</availabilityZoneId>
        <defaultForAz>false</defaultForAz>
        <mapPublicIpOnLaunch>false</mapPublicIpOnLaunch>
        <assignIpv6AddressOnCreation>false</assignIpv6AddressOnCreation>
    </subnet>
</CreateSubnetResponse>
```

Example 2

This example creates a subnet with an IPv6 CIDR block in the VPC `vpc-1a2b3c4d`.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateSubnet
&VpcId=vpc-07e8ffd50fEXAMPLE
&CidrBlock=10.0.1.0/24
&Ipv6CidrBlock=2600:1f16:115:200::/64
&AUTHPARAMS
```

Sample Response

```
<CreateSubnetResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
  <subnet>
```

```
   <subnetId>subnet-02bf4c428bEXAMPLE</subnetId>
   <subnetArn>arn:aws:ec2:us-east-2:111122223333:subnet/subnet-02bf4c428bEXAMPLE</
subnetArn>
   <state>available</state>
   <ownerId>111122223333</ownerId>
   <vpcId>vpc-07e8ffd50fEXAMPLE</vpcId>
   <cidrBlock>10.0.0.0/24</cidrBlock>
   <ipv6CidrBlockAssociationSet>
      <item>
       <ipv6CidrBlock>2600:1f16:115:200::/64</ipv6CidrBlock>
       <associationId>subnet-cidr-assoc-002afb9f3cEXAMPLE</associationId>
       <ipv6CidrBlockState>
          <state>associated</state>
       </ipv6CidrBlockState>
    </item>
    </ipv6CidrBlockAssociationSet>
    <availableIpAddressCount>251</availableIpAddressCount>
    <availabilityZone>us-east-2b</availabilityZone>
    <availabilityZoneId>use2-az2</availabilityZoneId>
    <defaultForAz>false</defaultForAz>
    <mapPublicIpOnLaunch>false</mapPublicIpOnLaunch>
    <assignIpv6AddressOnCreation>false</assignIpv6AddressOnCreation
  </subnet>
</CreateSubnetResponse>
```

Example 3

This example creates a subnet with an IPv6 CIDR block in the specified Local Zone.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateSubnet
&VpcId=vpc-07e8ffd50fEXAMPLE
&CidrBlock=10.0.1.0/24
&Ipv6CidrBlock=2600:1f16:115:200::/64
&AvailabilityZone=us-west-2-lax-1a
&AUTHPARAMS
```

Sample Response

```
<CreateSubnetResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
 <subnet>
```

```
    <subnetId>subnet-093cb4a1ecEXAMPLE</subnetId>
    <subnetArn>arn:aws:ec2:us-west-2:111122223333:subnet/subnet-093cb4a1ecEXAMPLE</
subnetArn><subnetArn>
   <state>available</state>
   <ownerId>111122223333</ownerId>
   <vpcId>vpc-07d80fe1a43298172</vpcId>
   <cidrBlock>10.0.0.0/24</cidrBlock>
   <ipv6CidrBlockAssociationSet>
      <item>
       <ipv6CidrBlock>2600:1f16:115:200::/64</ipv6CidrBlock>
       <associationId>subnet-cidr-assoc-002afb9f3cEXAMPLE</associationId>
       <ipv6CidrBlockState>
          <state>associated</state>
       </ipv6CidrBlockState>
    </item>
    </ipv6CidrBlockAssociationSet>
    <availableIpAddressCount>251</availableIpAddressCount>
    <availabilityZone>us-west-2-lax-1a</availabilityZone>
     <availabilityZoneId>usw2-lax1-az1</availabilityZoneId>
    <defaultForAz>false</defaultForAz>
    <mapPublicIpOnLaunch>false</mapPublicIpOnLaunch>
    <assignIpv6AddressOnCreation>false</assignIpv6AddressOnCreation
  </subnet>
</CreateSubnetResponse>
```

CreateSubnetCidrReservation

Creates a subnet CIDR reservation. For more information, see Subnet CIDR reservations in the *Amazon VPC User Guide* and Manage prefixes for your network interfaces in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Cidr

The IPv4 or IPV6 CIDR range to reserve.

Type: String

Required: Yes

Description

The description to assign to the subnet CIDR reservation.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ReservationType

The type of reservation. The reservation type determines how the reserved IP addresses are assigned to resources.

- `prefix` - AWS assigns the reserved IP addresses to network interfaces.

- `explicit` - You assign the reserved IP addresses to network interfaces.

Type: String

Valid Values: `prefix | explicit`

Required: Yes

SubnetId

The ID of the subnet.

Type: String

Required: Yes

TagSpecification.N

The tags to assign to the subnet CIDR reservation.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

subnetCidrReservation

Information about the created subnet CIDR reservation.

Type: SubnetCidrReservation object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4

- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

CreateTags

Adds or overwrites only the specified tags for the specified Amazon EC2 resource or resources. When you specify an existing tag key, the value is overwritten with the new value. Each resource can have a maximum of 50 tags. Each tag consists of a key and optional value. Tag keys must be unique per resource.

For more information about tags, see Tag your Amazon EC2 resources in the *Amazon Elastic Compute Cloud User Guide*. For more information about creating IAM policies that control users' access to resources based on tags, see Supported resource-level permissions for Amazon EC2 API actions in the *Amazon Elastic Compute Cloud User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ResourceId.N

The IDs of the resources, separated by spaces.

Constraints: Up to 1000 resource IDs. We recommend breaking up this request into smaller batches.

Type: Array of strings

Required: Yes

Tag.N

The tags. The `value` parameter is required, but if you don't want the tag to have a value, specify the parameter with no value, and we set the value to an empty string.

Type: Array of Tag objects

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example request adds (or overwrites) two tags for an AMI and an instance. One of the tags is a key (`webserver`), with no value (we set the value to an empty string). The other tag consists of a key (`stack`) and value (`Production`).

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateTags
&ResourceId.1=ami-1a2b3c4d
&ResourceId.2=i-1234567890abcdef0
&Tag.1.Key=webserver
&Tag.1.Value=
&Tag.2.Key=stack
&Tag.2.Value=Production
```

```
&AUTHPARAMS
```

Sample Response

```
<CreateTagsResponse
xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
  <return>true</return>
</CreateTagsResponse>
```

- AWS SDK for Ruby V3

CreateTrafficMirrorFilter

Creates a Traffic Mirror filter.

A Traffic Mirror filter is a set of rules that defines the traffic to mirror.

By default, no traffic is mirrored. To mirror traffic, use CreateTrafficMirrorFilterRule to add Traffic Mirror rules to the filter. The rules you add define what traffic gets mirrored. You can also use ModifyTrafficMirrorFilterNetworkServices to mirror supported network services.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see How to ensure idempotency.

Type: String

Required: No

Description

The description of the Traffic Mirror filter.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TagSpecification.N

The tags to assign to a Traffic Mirror filter.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

clientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see How to ensure idempotency.

Type: String

requestId

The ID of the request.

Type: String

trafficMirrorFilter

Information about the Traffic Mirror filter.

Type: TrafficMirrorFilter object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

CreateTrafficMirrorFilterRule

Creates a Traffic Mirror filter rule.

A Traffic Mirror rule defines the Traffic Mirror source traffic to mirror.

You need the Traffic Mirror filter ID when you create the rule.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see How to ensure idempotency.

Type: String

Required: No

Description

The description of the Traffic Mirror rule.

Type: String

Required: No

DestinationCidrBlock

The destination CIDR block to assign to the Traffic Mirror rule.

Type: String

Required: Yes

DestinationPortRange

The destination port range.

Type: TrafficMirrorPortRangeRequest object

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Protocol

The protocol, for example UDP, to assign to the Traffic Mirror rule.

For information about the protocol value, see Protocol Numbers on the Internet Assigned Numbers Authority (IANA) website.

Type: Integer

Required: No

RuleAction

The action to take on the filtered traffic.

Type: String

Valid Values: `accept | reject`

Required: Yes

RuleNumber

The number of the Traffic Mirror rule. This number must be unique for each Traffic Mirror rule in a given direction. The rules are processed in ascending order by rule number.

Type: Integer

Required: Yes

SourceCidrBlock

The source CIDR block to assign to the Traffic Mirror rule.

Type: String

Required: Yes

SourcePortRange

The source port range.

Type: TrafficMirrorPortRangeRequest object

Required: No

TagSpecification.N

Traffic Mirroring tags specifications.

Type: Array of TagSpecification objects

Required: No

TrafficDirection

The type of traffic.

Type: String

Valid Values: `ingress | egress`

Required: Yes

TrafficMirrorFilterId

The ID of the filter that this rule is associated with.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

clientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see How to ensure idempotency.

Type: String

requestId

The ID of the request.

Type: String

trafficMirrorFilterRule

The Traffic Mirror rule.

Type: TrafficMirrorFilterRule object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

CreateTrafficMirrorSession

Creates a Traffic Mirror session.

A Traffic Mirror session actively copies packets from a Traffic Mirror source to a Traffic Mirror target. Create a filter, and then assign it to the session to define a subset of the traffic to mirror, for example all TCP traffic.

The Traffic Mirror source and the Traffic Mirror target (monitoring appliances) can be in the same VPC, or in a different VPC connected via VPC peering or a transit gateway.

By default, no traffic is mirrored. Use CreateTrafficMirrorFilter to create filter rules that specify the traffic to mirror.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see How to ensure idempotency.

Type: String

Required: No

Description

The description of the Traffic Mirror session.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

NetworkInterfaceId

The ID of the source network interface.

Type: String

Required: Yes

PacketLength

The number of bytes in each packet to mirror. These are bytes after the VXLAN header. Do not specify this parameter when you want to mirror the entire packet. To mirror a subset of the packet, set this to the length (in bytes) that you want to mirror. For example, if you set this value to 100, then the first 100 bytes that meet the filter criteria are copied to the target.

If you do not want to mirror the entire packet, use the `PacketLength` parameter to specify the number of bytes in each packet to mirror.

For sessions with Network Load Balancer (NLB) Traffic Mirror targets the default `PacketLength` will be set to 8500. Valid values are 1-8500. Setting a `PacketLength` greater than 8500 will result in an error response.

Type: Integer

Required: No

SessionNumber

The session number determines the order in which sessions are evaluated when an interface is used by multiple sessions. The first session with a matching filter is the one that mirrors the packets.

Valid values are 1-32766.

Type: Integer

Required: Yes

TagSpecification.N

The tags to assign to a Traffic Mirror session.

Type: Array of TagSpecification objects

Required: No

TrafficMirrorFilterId

The ID of the Traffic Mirror filter.

Type: String

Required: Yes

TrafficMirrorTargetId

The ID of the Traffic Mirror target.

Type: String

Required: Yes

VirtualNetworkId

The VXLAN ID for the Traffic Mirror session. For more information about the VXLAN protocol, see RFC 7348. If you do not specify a `VirtualNetworkId`, an account-wide unique ID is chosen at random.

Type: Integer

Required: No

Response Elements

The following elements are returned by the service.

clientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see How to ensure idempotency.

Type: String

requestId

The ID of the request.

Type: String

trafficMirrorSession

Information about the Traffic Mirror session.

Type: TrafficMirrorSession object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

CreateTrafficMirrorTarget

Creates a target for your Traffic Mirror session.

A Traffic Mirror target is the destination for mirrored traffic. The Traffic Mirror source and the Traffic Mirror target (monitoring appliances) can be in the same VPC, or in different VPCs connected via VPC peering or a transit gateway.

A Traffic Mirror target can be a network interface, a Network Load Balancer, or a Gateway Load Balancer endpoint.

To use the target in a Traffic Mirror session, use CreateTrafficMirrorSession.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see How to ensure idempotency.

Type: String

Required: No

Description

The description of the Traffic Mirror target.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

GatewayLoadBalancerEndpointId

The ID of the Gateway Load Balancer endpoint.

Type: String

Required: No

NetworkInterfaceId

The network interface ID that is associated with the target.

Type: String

Required: No

NetworkLoadBalancerArn

The Amazon Resource Name (ARN) of the Network Load Balancer that is associated with the target.

Type: String

Required: No

TagSpecification.N

The tags to assign to the Traffic Mirror target.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

clientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see How to ensure idempotency.

Type: String

requestId

The ID of the request.

Type: String

trafficMirrorTarget

Information about the Traffic Mirror target.

Type: TrafficMirrorTarget object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

CreateTransitGateway

Creates a transit gateway.

You can use a transit gateway to interconnect your virtual private clouds (VPC) and on-premises networks. After the transit gateway enters the `available` state, you can attach your VPCs and VPN connections to the transit gateway.

To attach your VPCs, use CreateTransitGatewayVpcAttachment.

To attach a VPN connection, use CreateCustomerGateway to create a customer gateway and specify the ID of the customer gateway and the ID of the transit gateway in a call to CreateVpnConnection.

When you create a transit gateway, we create a default transit gateway route table and use it as the default association route table and the default propagation route table. You can use CreateTransitGatewayRouteTable to create additional transit gateway route tables. If you disable automatic route propagation, we do not create a default transit gateway route table. You can use EnableTransitGatewayRouteTablePropagation to propagate routes from a resource attachment to a transit gateway route table. If you disable automatic associations, you can use AssociateTransitGatewayRouteTable to associate a resource attachment with a transit gateway route table.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Description

A description of the transit gateway.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Options

The transit gateway options.

Type: TransitGatewayRequestOptions object

Required: No

TagSpecification.N

The tags to apply to the transit gateway.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

transitGateway

Information about the transit gateway.

Type: TransitGateway object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

CreateTransitGatewayConnect

Creates a Connect attachment from a specified transit gateway attachment. A Connect attachment is a GRE-based tunnel attachment that you can use to establish a connection between a transit gateway and an appliance.

A Connect attachment uses an existing VPC or AWS Direct Connect attachment as the underlying transport mechanism.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Options

The Connect attachment options.

Type: CreateTransitGatewayConnectRequestOptions object

Required: Yes

TagSpecification.N

The tags to apply to the Connect attachment.

Type: Array of TagSpecification objects

Required: No

TransportTransitGatewayAttachmentId

The ID of the transit gateway attachment. You can specify a VPC attachment or AWS Direct Connect attachment.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

transitGatewayConnect

Information about the Connect attachment.

Type: TransitGatewayConnect object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python

- AWS SDK for Ruby V3

CreateTransitGatewayConnectPeer

Creates a Connect peer for a specified transit gateway Connect attachment between a transit gateway and an appliance.

The peer address and transit gateway address must be the same IP address family (IPv4 or IPv6).

For more information, see Connect peers in the *AWS Transit Gateways Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

BgpOptions

The BGP options for the Connect peer.

Type: TransitGatewayConnectRequestBgpOptions object

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InsideCidrBlocks.N

The range of inside IP addresses that are used for BGP peering. You must specify a size /29 IPv4 CIDR block from the `169.254.0.0/16` range. The first address from the range must be configured on the appliance as the BGP IP address. You can also optionally specify a size /125 IPv6 CIDR block from the `fd00::/8` range.

Type: Array of strings

Required: Yes

PeerAddress

The peer IP address (GRE outer IP address) on the appliance side of the Connect peer.

Type: String

Required: Yes

TagSpecification.N

The tags to apply to the Connect peer.

Type: Array of TagSpecification objects

Required: No

TransitGatewayAddress

The peer IP address (GRE outer IP address) on the transit gateway side of the Connect peer, which must be specified from a transit gateway CIDR block. If not specified, Amazon automatically assigns the first available IP address from the transit gateway CIDR block.

Type: String

Required: No

TransitGatewayAttachmentId

The ID of the Connect attachment.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

transitGatewayConnectPeer

Information about the Connect peer.

Type: TransitGatewayConnectPeer object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

CreateTransitGatewayMeteringPolicy

Creates a metering policy for a transit gateway to track and measure network traffic.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

MiddleboxAttachmentId.N

The IDs of the middlebox attachments to include in the metering policy.

Type: Array of strings

Required: No

TagSpecifications.N

The tags to assign to the metering policy.

Type: Array of TagSpecification objects

Required: No

TransitGatewayId

The ID of the transit gateway for which to create the metering policy.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

transitGatewayMeteringPolicy

Information about the created transit gateway metering policy.

Type: TransitGatewayMeteringPolicy object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

CreateTransitGatewayMeteringPolicyEntry

Creates an entry in a transit gateway metering policy to define traffic measurement rules.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DestinationCidrBlock

The destination CIDR block for traffic matching.

Type: String

Required: No

DestinationPortRange

The destination port range for traffic matching.

Type: String

Required: No

DestinationTransitGatewayAttachmentId

The ID of the destination transit gateway attachment for traffic matching.

Type: String

Required: No

DestinationTransitGatewayAttachmentType

The type of the destination transit gateway attachment for traffic matching. Note that the `tgw-peering` resource type has been deprecated. To configure metering policies for Connect, use the transport attachment type.

Type: String

Valid Values: `vpc | vpn | vpn-concentrator | direct-connect-gateway | connect | peering | tgw-peering`

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

MeteredAccount

The AWS account ID to which the metered traffic should be attributed.

Type: String

Valid Values: `source-attachment-owner | destination-attachment-owner | transit-gateway-owner`

Required: Yes

PolicyRuleNumber

The rule number for the metering policy entry. Rules are processed in order from lowest to highest number.

Type: Integer

Required: Yes

Protocol

The protocol for traffic matching (1, 6, 17, etc.).

Type: String

Required: No

SourceCidrBlock

The source CIDR block for traffic matching.

Type: String

Required: No

SourcePortRange

The source port range for traffic matching.

Type: String

Required: No

SourceTransitGatewayAttachmentId

The ID of the source transit gateway attachment for traffic matching.

Type: String

Required: No

SourceTransitGatewayAttachmentType

The type of the source transit gateway attachment for traffic matching. Note that the `tgw-peering` resource type has been deprecated. To configure metering policies for Connect, use the transport attachment type.

Type: String

Valid Values: `vpc | vpn | vpn-concentrator | direct-connect-gateway | connect | peering | tgw-peering`

Required: No

TransitGatewayMeteringPolicyId

The ID of the transit gateway metering policy to add the entry to.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

transitGatewayMeteringPolicyEntry

Information about the created transit gateway metering policy entry.

Type: TransitGatewayMeteringPolicyEntry object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

CreateTransitGatewayMulticastDomain

Creates a multicast domain using the specified transit gateway.

The transit gateway must be in the available state before you create a domain. Use DescribeTransitGateways to see the state of transit gateway.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Options

The options for the transit gateway multicast domain.

Type: CreateTransitGatewayMulticastDomainRequestOptions object

Required: No

TagSpecification.N

The tags for the transit gateway multicast domain.

Type: Array of TagSpecification objects

Required: No

TransitGatewayId

The ID of the transit gateway.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

transitGatewayMulticastDomain

Information about the transit gateway multicast domain.

Type: TransitGatewayMulticastDomain object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example creates a multicast domain for the specified transit gateway.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateTransitMulticastDomain
&TransitGatewayId=tgw-0d88d2d0d5EXAMPLE
&AUTHPARAMS
```

Sample Response

```
<CreateTransitGatewayMulticastDomainResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>763fb04b-258f-4710-8f91-b202aEXAMPLE</requestId>
    <transitGatewayMulticastDomain>
        <creationTime>2019-11-20T22:02:03.000Z</creationTime>
```

```
        <state>pending</state>
        <transitGatewayId>tgw-0d88d2d0d5EXAMPLE</transitGatewayId>
        <transitGatewayMulticastDomainId>tgw-mcast-domain-02bb79002EXAMPLE</
transitGatewayMulticastDomainId>
    </transitGatewayMulticastDomain>
</CreateTransitGatewayMulticastDomainResponse>
```

CreateTransitGatewayPeeringAttachment

Requests a transit gateway peering attachment between the specified transit gateway (requester) and a peer transit gateway (accepter). The peer transit gateway can be in your account or a different AWS account.

After you create the peering attachment, the owner of the accepter transit gateway must accept the attachment request.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Options

Requests a transit gateway peering attachment.

Type: CreateTransitGatewayPeeringAttachmentRequestOptions object

Required: No

PeerAccountId

The ID of the AWS account that owns the peer transit gateway.

Type: String

Required: Yes

PeerRegion

The Region where the peer transit gateway is located.

Type: String

Required: Yes

PeerTransitGatewayId

The ID of the peer transit gateway with which to create the peering attachment.

Type: String

Required: Yes

TagSpecification.N

The tags to apply to the transit gateway peering attachment.

Type: Array of TagSpecification objects

Required: No

TransitGatewayId

The ID of the transit gateway.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

transitGatewayPeeringAttachment

The transit gateway peering attachment.

Type: TransitGatewayPeeringAttachment object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example creates a transit gateway peering attachment for the specified transit gateways. The accepter (peer) transit gateway is in the `us-west-2` Region.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateTransitGatewayPeeringAttachment
&TransitGatewayId=tgw-11223344aabbcc112
&PeerTransitGatewayId=tgw-1234567890abc1234
&PeerAccountId=123456789012
&PeerRegion=us-west-2
&AUTHPARAMS
```

Sample Response

```
<CreateTransitGatewayPeeringAttachmentResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>701859fa-6a57-4e55-858c-e63example</requestId>
    <transitGatewayPeeringAttachment>
        <accepterTgwInfo>
            <ownerId>123456789012</ownerId>
            <region>us-west-2</region>
            <transitGatewayId>tgw-1234567890abc1234</transitGatewayId>
        </accepterTgwInfo>
        <creationTime>2019-11-11T11:36:30.000Z</creationTime>
        <requesterTgwInfo>
            <ownerId>123456789012</ownerId>
            <region>us-east-1</region>
            <transitGatewayId>tgw-11223344aabbcc112</transitGatewayId>
        </requesterTgwInfo>
        <state>initiatingRequest</state>
        <transitGatewayAttachmentId>tgw-attach-0a73702c5c7123123</
transitGatewayAttachmentId>
    </transitGatewayPeeringAttachment>
</CreateTransitGatewayPeeringAttachmentResponse>
```

CreateTransitGatewayPolicyTable

Creates a transit gateway policy table.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TagSpecifications.N

The tags specification for the transit gateway policy table created during the request.

Type: Array of TagSpecification objects

Required: No

TransitGatewayId

The ID of the transit gateway used for the policy table.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

transitGatewayPolicyTable

Describes the created transit gateway policy table.

Type: TransitGatewayPolicyTable object

Errors

For information about the errors that are common to all actions, see Common client error codes.

CreateTransitGatewayPrefixListReference

Creates a reference (route) to a prefix list in a specified transit gateway route table.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Blackhole

Indicates whether to drop traffic that matches this route.

Type: Boolean

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

PrefixListId

The ID of the prefix list that is used for destination matches.

Type: String

Required: Yes

TransitGatewayAttachmentId

The ID of the attachment to which traffic is routed.

Type: String

Required: No

TransitGatewayRouteTableId

The ID of the transit gateway route table.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

transitGatewayPrefixListReference

Information about the prefix list reference.

Type: TransitGatewayPrefixListReference object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example creates a reference to a prefix list in the specified transit gateway route table.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateTransitGatewayPrefixListReference
&TransitGatewayRouteTableId=tgw-rtb-0f98a0a5d09abcabc
&PrefixListId=pl-001122334455aabbc
&TransitGatewayAttachmentId=tgw-attach-01234567abcabcabc
&AUTHPARAMS
```

Sample Response

```
<CreateTransitGatewayPrefixListReferenceResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
```

```
    <requestId>326fdc31-cd8d-491a-824a-example</requestId>
    <transitGatewayPrefixListReference>
        <blackhole>false</blackhole>
        <prefixListId>pl-001122334455aabbc</prefixListId>
        <prefixListOwnerId>123456789012</prefixListOwnerId>
        <state>pending</state>
        <transitGatewayAttachment>
            <resourceId>vpn-12312312312312312</resourceId>
            <resourceType>vpn</resourceType>
            <transitGatewayAttachmentId>tgw-attach-01234567abcabcabc</
transitGatewayAttachmentId>
        </transitGatewayAttachment>
        <transitGatewayRouteTableId>tgw-rtb-0f98a0a5d09abcabc</
transitGatewayRouteTableId>
    </transitGatewayPrefixListReference>
</CreateTransitGatewayPrefixListReferenceResponse>
```

CreateTransitGatewayRoute

Creates a static route for the specified transit gateway route table.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Blackhole

Indicates whether to drop traffic that matches this route.

Type: Boolean

Required: No

DestinationCidrBlock

The CIDR range used for destination matches. Routing decisions are based on the most specific match.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TransitGatewayAttachmentId

The ID of the attachment.

Type: String

Required: No

TransitGatewayRouteTableId

The ID of the transit gateway route table.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

route

Information about the route.

Type: TransitGatewayRoute object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

CreateTransitGatewayRouteTable

Creates a route table for the specified transit gateway.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TagSpecifications.N

The tags to apply to the transit gateway route table.

Type: Array of TagSpecification objects

Required: No

TransitGatewayId

The ID of the transit gateway.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

transitGatewayRouteTable

Information about the transit gateway route table.

Type: TransitGatewayRouteTable object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example creates a transit gateway route table for the specified transit gateway.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateTransitGatewayRouteTable
&TransitGatewayId=tgw-02f776b1a7EXAMPLE
&AUTHPARAMS
```

Sample Response

```
<CreateTransitGatewayRouteTableResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>9c6751fa-a1ee-4006-92a8-c6cc1816a0f5</requestId>
    <transitGatewayRouteTable>
        <creationTime>2019-07-17T20:27:26.000Z</creationTime>
        <defaultAssociationRouteTable>false</defaultAssociationRouteTable>
        <defaultPropagationRouteTable>false</defaultPropagationRouteTable>
        <state>pending</state>
        <transitGatewayId>tgw-02f776b1a7EXAMPLE</transitGatewayId>
        <transitGatewayRouteTableId>tgw-rtb-0b6f6aaa01EXAMPLE</
transitGatewayRouteTableId>
    </transitGatewayRouteTable>
</CreateTransitGatewayRouteTableResponse>
```

CreateTransitGatewayRouteTableAnnouncement

Advertises a new transit gateway route table.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

PeeringAttachmentId

The ID of the peering attachment.

Type: String

Required: Yes

TagSpecification.N

The tags specifications applied to the transit gateway route table announcement.

Type: Array of TagSpecification objects

Required: No

TransitGatewayRouteTableId

The ID of the transit gateway route table.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

transitGatewayRouteTableAnnouncement

Provides details about the transit gateway route table announcement.

Type: TransitGatewayRouteTableAnnouncement object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

CreateTransitGatewayVpcAttachment

Attaches the specified VPC to the specified transit gateway.

If you attach a VPC with a CIDR range that overlaps the CIDR range of a VPC that is already attached, the new VPC CIDR range is not propagated to the default propagation route table.

To send VPC traffic to an attached transit gateway, add a route to the VPC route table using CreateRoute.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Options

The VPC attachment options.

Type: CreateTransitGatewayVpcAttachmentRequestOptions object

Required: No

SubnetIds.N

The IDs of one or more subnets. You can specify only one subnet per Availability Zone. You must specify at least one subnet, but we recommend that you specify two subnets for better availability. The transit gateway uses one IP address from each specified subnet.

Type: Array of strings

Required: Yes

TagSpecifications.N

The tags to apply to the VPC attachment.

Type: Array of TagSpecification objects

Required: No

TransitGatewayId

The ID of the transit gateway.

Type: String

Required: Yes

VpcId

The ID of the VPC.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

transitGatewayVpcAttachment

Information about the VPC attachment.

Type: TransitGatewayVpcAttachment object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example creates a transit gateway VPC attachment for the specified transit gateway.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateTransitGatewayVpcAttachment
&TransitGatewayId=tgw-02f776b1a7EXAMPLE
&VpcID=vpc-0065acced4EXAMPLE
&SubnetIds.1=subnet-0187aff814EXAMPLE
&Options.DnsSupport=enable
&Options.Ipv6Support=disable
&AUTHPARAMS
```

Sample Response

```
<CreateTransitGatewayVpcAttachmentResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>374ab4fd-5ccd-4d98-93f5-034c80f67d79</requestId>
    <transitGatewayVpcAttachment>
        <creationTime>2019-07-17T16:04:27.000Z</creationTime>
        <options>
            <dnsSupport>enable</dnsSupport>
            <ipv6Support>disable</ipv6Support>
        </options>
        <state>pending</state>
        <subnetIds>
            <item>subnet-0187aff814EXAMPLE</item>
        </subnetIds>
        <transitGatewayAttachmentId>tgw-attach-0d2c54bdb3EXAMPLE</
transitGatewayAttachmentId>
        <transitGatewayId>tgw-02f776b1a7EXAMPLE</transitGatewayId>
        <vpcId>vpc-0065acced4EXAMPLE</vpcId>
        <vpcOwnerId>111122223333</vpcOwnerId>
    </transitGatewayVpcAttachment>
</CreateTransitGatewayVpcAttachmentResponse>
```

CreateVerifiedAccessEndpoint

An AWS Verified Access endpoint is where you define your application along with an optional endpoint-level access policy.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ApplicationDomain

The DNS name for users to reach your application.

Type: String

Required: No

AttachmentType

The type of attachment.

Type: String

Valid Values: `vpc`

Required: Yes

CidrOptions

The CIDR options. This parameter is required if the endpoint type is `cidr`.

Type: CreateVerifiedAccessEndpointCidrOptions object

Required: No

ClientToken

A unique, case-sensitive token that you provide to ensure idempotency of your modification request. For more information, see Ensuring idempotency.

Type: String

Required: No

Description

A description for the Verified Access endpoint.

Type: String

Required: No

DomainCertificateArn

The ARN of the public TLS/SSL certificate in AWS Certificate Manager to associate with the endpoint. The CN in the certificate must match the DNS name your end users will use to reach your application.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

EndpointDomainPrefix

A custom identifier that is prepended to the DNS name that is generated for the endpoint.

Type: String

Required: No

EndpointType

The type of Verified Access endpoint to create.

Type: String

Valid Values: `load-balancer | network-interface | rds | cidr`

Required: Yes

LoadBalancerOptions

The load balancer details. This parameter is required if the endpoint type is `load-balancer`.

Type: CreateVerifiedAccessEndpointLoadBalancerOptions object

Required: No

NetworkInterfaceOptions

The network interface details. This parameter is required if the endpoint type is `network-interface`.

Type: CreateVerifiedAccessEndpointEniOptions object

Required: No

PolicyDocument

The Verified Access policy document.

Type: String

Required: No

RdsOptions

The RDS details. This parameter is required if the endpoint type is `rds`.

Type: CreateVerifiedAccessEndpointRdsOptions object

Required: No

SecurityGroupId.N

The IDs of the security groups to associate with the Verified Access endpoint. Required if `AttachmentType` is set to `vpc`.

Type: Array of strings

Required: No

SseSpecification

The options for server side encryption.

Type: VerifiedAccessSseSpecificationRequest object

Required: No

TagSpecification.N

The tags to assign to the Verified Access endpoint.

Type: Array of TagSpecification objects

Required: No

VerifiedAccessGroupId

The ID of the Verified Access group to associate the endpoint with.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

verifiedAccessEndpoint

Details about the Verified Access endpoint.

Type: VerifiedAccessEndpoint object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2

- AWS SDK for Ruby V3

CreateVerifiedAccessGroup

An AWS Verified Access group is a collection of AWS Verified Access endpoints who's associated applications have similar security requirements. Each instance within a Verified Access group shares an Verified Access policy. For example, you can group all Verified Access instances associated with "sales" applications together and use one common Verified Access policy.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

A unique, case-sensitive token that you provide to ensure idempotency of your modification request. For more information, see Ensuring idempotency.

Type: String

Required: No

Description

A description for the Verified Access group.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

PolicyDocument

The Verified Access policy document.

Type: String

Required: No

SseSpecification

The options for server side encryption.

Type: VerifiedAccessSseSpecificationRequest object

Required: No

TagSpecification.N

The tags to assign to the Verified Access group.

Type: Array of TagSpecification objects

Required: No

VerifiedAccessInstanceId

The ID of the Verified Access instance.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

verifiedAccessGroup

Details about the Verified Access group.

Type: VerifiedAccessGroup object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

CreateVerifiedAccessInstance

An AWS Verified Access instance is a regional entity that evaluates application requests and grants access only when your security requirements are met.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CidrEndpointsCustomSubDomain

The custom subdomain.

Type: String

Required: No

ClientToken

A unique, case-sensitive token that you provide to ensure idempotency of your modification request. For more information, see Ensuring idempotency.

Type: String

Required: No

Description

A description for the Verified Access instance.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

FIPSEnabled

Enable or disable support for Federal Information Processing Standards (FIPS) on the instance.

Type: Boolean

Required: No

TagSpecification.N

The tags to assign to the Verified Access instance.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

verifiedAccessInstance

Details about the Verified Access instance.

Type: VerifiedAccessInstance object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2

- AWS SDK for .NET V4

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

CreateVerifiedAccessTrustProvider

A trust provider is a third-party entity that creates, maintains, and manages identity information for users and devices. When an application request is made, the identity information sent by the trust provider is evaluated by Verified Access before allowing or denying the application request.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

A unique, case-sensitive token that you provide to ensure idempotency of your modification request. For more information, see Ensuring idempotency.

Type: String

Required: No

Description

A description for the Verified Access trust provider.

Type: String

Required: No

DeviceOptions

The options for a device-based trust provider. This parameter is required when the provider type is `device`.

Type: CreateVerifiedAccessTrustProviderDeviceOptions object

Required: No

DeviceTrustProviderType

The type of device-based trust provider. This parameter is required when the provider type is `device`.

Type: String

Valid Values: `jamf | crowdstrike | jumpcloud`

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

NativeApplicationOidcOptions

The OpenID Connect (OIDC) options.

Type: CreateVerifiedAccessNativeApplicationOidcOptions object

Required: No

OidcOptions

The options for a OpenID Connect-compatible user-identity trust provider. This parameter is required when the provider type is `user`.

Type: CreateVerifiedAccessTrustProviderOidcOptions object

Required: No

PolicyReferenceName

The identifier to be used when working with policy rules.

Type: String

Required: Yes

SseSpecification

The options for server side encryption.

Type: VerifiedAccessSseSpecificationRequest object

Required: No

TagSpecification.N

The tags to assign to the Verified Access trust provider.

Type: Array of TagSpecification objects

Required: No

TrustProviderType

The type of trust provider.

Type: String

Valid Values: `user | device`

Required: Yes

UserTrustProviderType

The type of user-based trust provider. This parameter is required when the provider type is `user`.

Type: String

Valid Values: `iam-identity-center | oidc`

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

verifiedAccessTrustProvider

Details about the Verified Access trust provider.

Type: VerifiedAccessTrustProvider object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

CreateVolume

Creates an EBS volume that can be attached to an instance in the same Availability Zone.

You can create a new empty volume or restore a volume from an EBS snapshot. Any AWS Marketplace product codes from the snapshot are propagated to the volume.

You can create encrypted volumes. Encrypted volumes must be attached to instances that support Amazon EBS encryption. Volumes that are created from encrypted snapshots are also automatically encrypted. For more information, see Amazon EBS encryption in the *Amazon EBS User Guide*.

You can tag your volumes during creation. For more information, see Tag your Amazon EC2 resources in the *Amazon EC2 User Guide*.

For more information, see Create an Amazon EBS volume in the *Amazon EBS User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AvailabilityZone

The ID of the Availability Zone in which to create the volume. For example, `us-east-1a`.

Either `AvailabilityZone` or `AvailabilityZoneId` must be specified, but not both.

Type: String

Required: No

AvailabilityZoneId

The ID of the Availability Zone in which to create the volume. For example, `use1-az1`.

Either `AvailabilityZone` or `AvailabilityZoneId` must be specified, but not both.

Type: String

Required: No

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensure Idempotency.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Encrypted

Indicates whether the volume should be encrypted. The effect of setting the encryption state to `true` depends on the volume origin (new or from a snapshot), starting encryption state, ownership, and whether encryption by default is enabled. For more information, see Encryption by default in the *Amazon EBS User Guide*.

Encrypted Amazon EBS volumes must be attached to instances that support Amazon EBS encryption. For more information, see Supported instance types.

Type: Boolean

Required: No

Iops

The number of I/O operations per second (IOPS) to provision for the volume. Required for `io1` and `io2` volumes. Optional for `gp3` volumes. Omit for all other volume types.

Valid ranges:

- gp3: `3,000` (*default*) - `80,000` IOPS
- io1: `100` - `64,000` IOPS
- io2: `100` - `256,000` IOPS

> **Note**
>
> Instances built on the Nitro System can support up to 256,000 IOPS. Other instances can support up to 32,000 IOPS.

Type: Integer

Required: No

KmsKeyId

The identifier of the AWS KMS key to use for Amazon EBS encryption. If this parameter is not specified, your AWS KMS key for Amazon EBS is used. If `KmsKeyId` is specified, the encrypted state must be `true`.

You can specify the KMS key using any of the following:

- Key ID. For example, 1234abcd-12ab-34cd-56ef-1234567890ab.
- Key alias. For example, alias/ExampleAlias.
- Key ARN. For example, arn:aws:kms:us-east-1:012345678910:key/1234abcd-12ab-34cd-56ef-1234567890ab.
- Alias ARN. For example, arn:aws:kms:us-east-1:012345678910:alias/ExampleAlias.

AWS authenticates the KMS key asynchronously. Therefore, if you specify an ID, alias, or ARN that is not valid, the action can appear to complete, but eventually fails.

Type: String

Required: No

MultiAttachEnabled

Indicates whether to enable Amazon EBS Multi-Attach. If you enable Multi-Attach, you can attach the volume to up to 16 Instances built on the Nitro System in the same Availability Zone. This parameter is supported with `io1` and `io2` volumes only. For more information, see Amazon EBS Multi-Attach in the *Amazon EBS User Guide*.

Type: Boolean

Required: No

Operator

Reserved for internal use.

Type: OperatorRequest object

Required: No

OutpostArn

The Amazon Resource Name (ARN) of the Outpost on which to create the volume.

If you intend to use a volume with an instance running on an outpost, then you must create the volume on the same outpost as the instance. You can't use a volume created in an AWS Region with an instance on an AWS outpost, or the other way around.

Type: String

Required: No

Size

The size of the volume, in GiBs. You must specify either a snapshot ID or a volume size. If you specify a snapshot, the default is the snapshot size, and you can specify a volume size that is equal to or larger than the snapshot size.

Valid sizes:

- gp2: `1 - 16,384` GiB
- gp3: `1 - 65,536` GiB
- io1: `4 - 16,384` GiB
- io2: `4 - 65,536` GiB
- st1 and sc1: `125 - 16,384` GiB
- standard: `1 - 1024` GiB

Type: Integer

Required: No

SnapshotId

The snapshot from which to create the volume. You must specify either a snapshot ID or a volume size.

Type: String

Required: No

TagSpecification.N

The tags to apply to the volume during creation.

Type: Array of TagSpecification objects

Required: No

Throughput

The throughput to provision for the volume, in MiB/s. Supported for gp3 volumes only. Omit for all other volume types.

Valid Range: `125 - 2000` MiB/s

Type: Integer

Required: No

VolumeInitializationRate

Specifies the Amazon EBS Provisioned Rate for Volume Initialization (volume initialization rate), in MiB/s, at which to download the snapshot blocks from Amazon S3 to the volume. This is also known as *volume initialization*. Specifying a volume initialization rate ensures that the volume is initialized at a predictable and consistent rate after creation.

This parameter is supported only for volumes created from snapshots. Omit this parameter if:

- You want to create the volume using fast snapshot restore. You must specify a snapshot that is enabled for fast snapshot restore. In this case, the volume is fully initialized at creation.

  > **Note**
  >
  > If you specify a snapshot that is enabled for fast snapshot restore and a volume initialization rate, the volume will be initialized at the specified rate instead of fast snapshot restore.

- You want to create a volume that is initialized at the default rate.

For more information, see Initialize Amazon EBS volumes in the *Amazon EC2 User Guide*.

Valid range: 100 - 300 MiB/s

Type: Integer

Required: No

VolumeType

The volume type. This parameter can be one of the following values:

- General Purpose SSD: gp2 | gp3
- Provisioned IOPS SSD: io1 | io2
- Throughput Optimized HDD: st1
- Cold HDD: sc1
- Magnetic: standard

> **Important**
>
> Throughput Optimized HDD (st1) and Cold HDD (sc1) volumes can't be used as boot volumes.

For more information, see Amazon EBS volume types in the *Amazon EBS User Guide*.

Default: gp2

Type: String

Valid Values: standard | io1 | io2 | gp2 | sc1 | st1 | gp3

Required: No

Response Elements

The following elements are returned by the service.

attachmentSet

> **Note**
>
> This parameter is not returned by CreateVolume.

Information about the volume attachments.

Type: Array of VolumeAttachment objects

availabilityZone

The Availability Zone for the volume.

Type: String

availabilityZoneId

The ID of the Availability Zone for the volume.

Type: String

createTime

The time stamp when volume creation was initiated.

Type: Timestamp

encrypted

Indicates whether the volume is encrypted.

Type: Boolean

fastRestored

> **Note**
>
> This parameter is not returned by CreateVolume.

Indicates whether the volume was created using fast snapshot restore.

Type: Boolean

iops

The number of I/O operations per second (IOPS). For `gp3`, `io1`, and `io2` volumes, this represents the number of IOPS that are provisioned for the volume. For `gp2` volumes, this represents the baseline performance of the volume and the rate at which the volume accumulates I/O credits for bursting.

Type: Integer

kmsKeyId

The Amazon Resource Name (ARN) of the AWS KMS key that was used to protect the volume encryption key for the volume.

Type: String

multiAttachEnabled

Indicates whether Amazon EBS Multi-Attach is enabled.

Type: Boolean

operator

The service provider that manages the volume.

Type: OperatorResponse object

outpostArn

The Amazon Resource Name (ARN) of the Outpost.

Type: String

requestId

The ID of the request.

Type: String

size

The size of the volume, in GiBs.

Type: Integer

snapshotId

The snapshot from which the volume was created, if applicable.

Type: String

sourceVolumeId

The ID of the source volume from which the volume copy was created. Only for volume copies.

Type: String

sseType

> **Note**
>
> This parameter is not returned by CreateVolume.

Reserved for future use.

Type: String

Valid Values: `sse-ebs | sse-kms | none`

status

The volume state.

Type: String

Valid Values: `creating | available | in-use | deleting | deleted | error`

tagSet

Any tags assigned to the volume.

Type: Array of Tag objects

throughput

The throughput that the volume supports, in MiB/s.

Type: Integer

volumeId

The ID of the volume.

Type: String

volumeInitializationRate

The Amazon EBS Provisioned Rate for Volume Initialization (volume initialization rate) specified for the volume during creation, in MiB/s. If no volume initialization rate was specified, the value is `null`.

Type: Integer

volumeType

The volume type.

Type: String

Valid Values: `standard | io1 | io2 | gp2 | sc1 | st1 | gp3`

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example request creates an 150 GiB Multi-Attach enabled `io1` volume in the `us-east-1a` Availability Zone.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateVolume
&VolumeType=io1
&Size=150
&Iops=7500
&AvailabilityZone=us-east-1a
&MultiAttachEnabled=true
&AUTHPARAMS
```

Sample Response

```
<CreateVolumeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <volumeId>vol-1234567890abcdef0</volumeId>
  <size>150</size>
  <iops>7500</iops>
  <snapshotId/>
  <availabilityZone>us-east-1a</availabilityZone>
  <status>creating</status>
  <createTime>YYYY-MM-DDTHH:MM:SS.000Z</createTime>
  <volumeType>io1;</volumeType>
  <encrypted>true</encrypted>
```

```
  <multiAttachEnabled>true</multiAttachEnabled>
</CreateVolumeResponse>
```

Example 2

This example request creates an 80 GiB encrypted volume in the Availability Zone `us-east-1a`.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateVolume
&Size=80
&AvailabilityZone=us-east-1a
&Encrypted=true
&AUTHPARAMS
```

Sample Response

```
<CreateVolumeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>248f69ab-c7a9-4ad2-8e7c-b7556EXAMPLE</requestId>
    <volumeId>vol-08bf1d00afabcdef0</volumeId>
    <size>80</size>
    <snapshotId></snapshotId>
    <availabilityZone>us-east-1a</availabilityZone>
    <status>creating</status>
    <createTime>2020-11-30T10:39:56.000Z</createTime>
    <volumeType>gp2</volumeType>
    <iops>189</iops>
    <encrypted>true</encrypted>
    <kmsKeyId>arn:aws:kms:us-east-1:123456789012:key/237eb1a7-2fa1-44dc-
b95e-6c526EXAMPLE</kmsKeyId>
    <tagSet/>
    <multiAttachEnabled>false</multiAttachEnabled>
</CreateVolumeResponse>
```

Example 3

This example request creates a volume and applies a tag with a key of `stack` and a value of `production`.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateVolume
```

```
&Size=80
&AvailabilityZone=us-east-1a
&TagSpecification.1.ResourceType=volume
&TagSpecification.1.Tag.1.Key=stack
&TagSpecification.1.Tag.1.Value=production
&AUTHPARAMS
```

Sample Response

```
<CreateVolumeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>bb216d10-54b9-4bc2-958d-fcfe2EXAMPLE</requestId>
    <volumeId>vol-043c91f2fa4abcdef</volumeId>
    <size>80</size>
    <snapshotId></snapshotId>
    <availabilityZone>us-east-1a</availabilityZone>
    <status>creating</status>
    <createTime>2020-11-30T10:47:43.000Z</createTime>
    <volumeType>gp2</volumeType>
    <iops>189</iops>
    <encrypted>true</encrypted>
    <kmsKeyId>arn:aws:kms:us-east-1:123456789012:key/237eb1a7-2fa1-44dc-
b95e-6c526EXAMPLE</kmsKeyId>
    <tagSet>
        <item>
            <key>stack</key>
            <value>production</value>
        </item>
    </tagSet>
    <multiAttachEnabled>false</multiAttachEnabled>
</CreateVolumeResponse>
```

CreateVpc

Creates a VPC with the specified CIDR blocks.

A VPC must have an associated IPv4 CIDR block. You can choose an IPv4 CIDR block or an IPAM-allocated IPv4 CIDR block. You can optionally associate an IPv6 CIDR block with a VPC. You can choose an IPv6 CIDR block, an Amazon-provided IPv6 CIDR block, an IPAM-allocated IPv6 CIDR block, or an IPv6 CIDR block that you brought to AWS. For more information, see IP addressing for your VPCs and subnets in the *Amazon VPC User Guide*.

By default, each instance that you launch in the VPC has the default DHCP options, which include only a default DNS server that we provide (AmazonProvidedDNS). For more information, see DHCP option sets in the *Amazon VPC User Guide*.

You can specify DNS options and tenancy for a VPC when you create it. You can't change the tenancy of a VPC after you create it. For more information, see VPC configuration options in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AmazonProvidedIpv6CidrBlock

Requests an Amazon-provided IPv6 CIDR block with a /56 prefix length for the VPC. You cannot specify the range of IP addresses, or the size of the CIDR block.

Type: Boolean

Required: No

CidrBlock

The IPv4 network range for the VPC, in CIDR notation. For example, `10.0.0.0/16`. We modify the specified CIDR block to its canonical form; for example, if you specify `100.68.0.18/18`, we modify it to `100.68.0.0/18`.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InstanceTenancy

The tenancy options for instances launched into the VPC. For `default`, instances are launched with shared tenancy by default. You can launch instances with any tenancy into a shared tenancy VPC. For `dedicated`, instances are launched as dedicated tenancy instances by default. You can only launch instances with a tenancy of `dedicated` or `host` into a dedicated tenancy VPC.

Important: The `host` value cannot be used with this parameter. Use the `default` or `dedicated` values only.

Default: `default`

Type: String

Valid Values: `default | dedicated | host`

Required: No

Ipv4IpamPoolId

The ID of an IPv4 IPAM pool you want to use for allocating this VPC's CIDR. For more information, see What is IPAM? in the *Amazon VPC IPAM User Guide*.

Type: String

Required: No

Ipv4NetmaskLength

The netmask length of the IPv4 CIDR you want to allocate to this VPC from an Amazon VPC IP Address Manager (IPAM) pool. For more information about IPAM, see What is IPAM? in the *Amazon VPC IPAM User Guide*.

Type: Integer

Required: No

Ipv6CidrBlock

The IPv6 CIDR block from the IPv6 address pool. You must also specify `Ipv6Pool` in the request.

To let Amazon choose the IPv6 CIDR block for you, omit this parameter.

Type: String

Required: No

Ipv6CidrBlockNetworkBorderGroup

The name of the location from which we advertise the IPV6 CIDR block. Use this parameter to limit the address to this location.

You must set `AmazonProvidedIpv6CidrBlock` to `true` to use this parameter.

Type: String

Required: No

Ipv6IpamPoolId

The ID of an IPv6 IPAM pool which will be used to allocate this VPC an IPv6 CIDR. IPAM is a VPC feature that you can use to automate your IP address management workflows including assigning, tracking, troubleshooting, and auditing IP addresses across AWS Regions and accounts throughout your AWS Organization. For more information, see What is IPAM? in the *Amazon VPC IPAM User Guide*.

Type: String

Required: No

Ipv6NetmaskLength

The netmask length of the IPv6 CIDR you want to allocate to this VPC from an Amazon VPC IP Address Manager (IPAM) pool. For more information about IPAM, see What is IPAM? in the *Amazon VPC IPAM User Guide*.

Type: Integer

Required: No

Ipv6Pool

The ID of an IPv6 address pool from which to allocate the IPv6 CIDR block.

Type: String

Required: No

TagSpecification.N

The tags to assign to the VPC.

Type: Array of TagSpecification objects

Required: No

VpcEncryptionControl

Specifies the encryption control configuration to apply to the VPC during creation. VPC Encryption Control enables you to enforce encryption for all data in transit within and between VPCs to meet compliance requirements.

For more information, see Enforce VPC encryption in transit in the *Amazon VPC User Guide*.

Type: VpcEncryptionControlConfiguration object

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

vpc

Information about the VPC.

Type: Vpc object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example creates a VPC with the IPv4 CIDR block `10.0.0.0/16` and a tag with the key set to `tag` and the value set to `example`.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateVpc
&CidrBlock=10.0.0.0/16
&TagSpecification.1.ResourceType=vpc
&TagSpecification.1.Key=vpc
&TagSpecification.1.Value=example
&AUTHPARAMS
```

Sample Response

```
<CreateVpcResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>63c5a2ed-4195-4445-b841-294629e7d8bd</requestId>
    <vpc>
        <vpcId>vpc-06b7830650EXAMPLE</vpcId>
        <ownerId>111122223333</ownerId>
        <state>pending</state>
        <cidrBlock>10.0.0.0/16</cidrBlock>
        <cidrBlockAssociationSet>
            <item>
                <cidrBlock>10.0.0.0/16</cidrBlock>
                <associationId>vpc-cidr-assoc-017043e963EXAMPLE</associationId>
                <cidrBlockState>
                    <state>associated</state>
                </cidrBlockState>
            </item>
        </cidrBlockAssociationSet>
        <ipv6CidrBlockAssociationSet/>
        <dhcpOptionsId>dopt-19edf471</dhcpOptionsId>
        <tagSet/>
        <instanceTenancy>default</instanceTenancy>
```

```
        <isDefault>false</isDefault>
        <tagSet>
            <item>
                <key>example</key>
                <value>tag</value>
            </item>
        </tagSet>
    </vpc>
</CreateVpcResponse>
```

Example 2

This example creates a VPC with the `dedicated` tenancy option.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateVpc
&CidrBlock=10.32.0.0/16
&InstanceTenancy=dedicated
&AUTHPARAMS
```

Sample Response

```
<CreateVpcResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>1d536f17-5a03-4030-95b4-4d051e65e7bb</requestId>
    <vpc>
        <vpcId>vpc-07ddea827dEXAMPLE</vpcId>
        <ownerId>111122223333</ownerId>
        <state>pending</state>
        <cidrBlock>10.32.0.0/16</cidrBlock>
        <cidrBlockAssociationSet>
            <item>
                <cidrBlock>10.32.0.0/16</cidrBlock>
                <associationId>vpc-cidr-assoc-0cc7b90dfeEXAMPLE</associationId>
                <cidrBlockState>
                    <state>associated</state>
                </cidrBlockState>
            </item>
        </cidrBlockAssociationSet>
        <ipv6CidrBlockAssociationSet/>
        <dhcpOptionsId>dopt-19edf471</dhcpOptionsId>
        <tagSet/>
        <instanceTenancy>dedicated</instanceTenancy>
```

```
        <isDefault>false</isDefault>
    </vpc>
</CreateVpcResponse>
```

Example 3

This example creates a VPC and requests an IPv6 CIDR block for the VPC.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateVpc
&CidrBlock=10.0.0.0/16
&AmazonProvidedIpv6CidrBlock=true
&AUTHPARAMS
```

Sample Response

```
<CreateVpcResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>b1a2b2b5-5806-4e24-824b-0c8996c608c1</requestId>

CreateVpcBlockPublicAccessExclusion

Create a VPC Block Public Access (BPA) exclusion. A VPC BPA exclusion is a mode that can be applied to a single VPC or subnet that exempts it from the account's BPA mode and will allow bidirectional or egress-only access. You can create BPA exclusions for VPCs and subnets even when BPA is not enabled on the account to ensure that there is no traffic disruption to the exclusions when VPC BPA is turned on. To learn more about VPC BPA, see Block public access to VPCs and subnets in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InternetGatewayExclusionMode

The exclusion mode for internet gateway traffic.

- `allow-bidirectional`: Allow all internet traffic to and from the excluded VPCs and subnets.
- `allow-egress`: Allow outbound internet traffic from the excluded VPCs and subnets. Block inbound internet traffic to the excluded VPCs and subnets. Only applies when VPC Block Public Access is set to Bidirectional.

Type: String

Valid Values: `allow-bidirectional | allow-egress`

Required: Yes

SubnetId

A subnet ID.

Type: String

Required: No

TagSpecification.N

`tag` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.

Type: Array of TagSpecification objects

Required: No

VpcId

A VPC ID.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

vpcBlockPublicAccessExclusion

Details about an exclusion.

Type: VpcBlockPublicAccessExclusion object

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for Ruby V3

CreateVpcEncryptionControl

Creates a VPC Encryption Control configuration for a specified VPC. VPC Encryption Control enables you to enforce encryption for all data in transit within and between VPCs to meet compliance requirements for standards like HIPAA, FedRAMP, and PCI DSS.

For more information, see Enforce VPC encryption in transit in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TagSpecification.N

The tags to apply to the VPC Encryption Control resource.

Type: Array of TagSpecification objects

Required: No

VpcId

The ID of the VPC for which to create the encryption control configuration.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

vpcEncryptionControl

Information about the VPC Encryption Control configuration.

Type: VpcEncryptionControl object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

CreateVpcEndpoint

Creates a VPC endpoint. A VPC endpoint provides a private connection between the specified VPC and the specified endpoint service. You can use an endpoint service provided by AWS, an AWS Marketplace Partner, or another AWS account. For more information, see the AWS PrivateLink User Guide.

Use DescribeVpcEndpointServices to list the supported services.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see How to ensure idempotency.

Type: String

Required: No

DnsOptions

The DNS options for the endpoint.

Type: DnsOptionsSpecification object

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

IpAddressType

The IP address type for the endpoint.

Type: String

Valid Values: `ipv4 | dualstack | ipv6`

Required: No

PolicyDocument

(Interface and gateway endpoints) A policy to attach to the endpoint that controls access to the service. The policy must be in valid JSON format. If this parameter is not specified, we attach a default policy that allows full access to the service.

Type: String

Required: No

PrivateDnsEnabled

(Interface endpoint) Indicates whether to associate a private hosted zone with the specified VPC. The private hosted zone contains a record set for the default public DNS name for the service for the Region (for example, `kinesis.us-east-1.amazonaws.com`), which resolves to the private IP addresses of the endpoint network interfaces in the VPC. This enables you to make requests to the default public DNS name for the service instead of the public DNS names that are automatically generated by the VPC endpoint service.

To use a private hosted zone, you must set the following VPC attributes to `true`: `enableDnsHostnames` and `enableDnsSupport`. Use ModifyVpcAttribute to set the VPC attributes.

Type: Boolean

Required: No

ResourceConfigurationArn

The Amazon Resource Name (ARN) of a resource configuration that will be associated with the VPC endpoint of type resource.

Type: String

Required: No

RouteTableId.N

(Gateway endpoint) The route table IDs.

Type: Array of strings

Required: No

SecurityGroupId.N

(Interface endpoint) The IDs of the security groups to associate with the endpoint network interfaces. If this parameter is not specified, we use the default security group for the VPC.

Type: Array of strings

Required: No

ServiceName

The name of the endpoint service.

Type: String

Required: No

ServiceNetworkArn

The Amazon Resource Name (ARN) of a service network that will be associated with the VPC endpoint of type service-network.

Type: String

Required: No

ServiceRegion

The Region where the service is hosted. The default is the current Region.

Type: String

Required: No

SubnetConfiguration.N

The subnet configurations for the endpoint.

Type: Array of SubnetConfiguration objects

Required: No

SubnetId.N

(Interface and Gateway Load Balancer endpoints) The IDs of the subnets in which to create endpoint network interfaces. For a Gateway Load Balancer endpoint, you can specify only one subnet.

Type: Array of strings

Required: No

TagSpecification.N

The tags to associate with the endpoint.

Type: Array of TagSpecification objects

Required: No

VpcEndpointType

The type of endpoint.

Default: Gateway

Type: String

Valid Values: `Interface | Gateway | GatewayLoadBalancer | Resource | ServiceNetwork`

Required: No

VpcId

The ID of the VPC.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

clientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request.

Type: String

requestId

The ID of the request.

Type: String

vpcEndpoint

Information about the endpoint.

Type: VpcEndpoint object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example creates a gateway endpoint between `vpc-1a2b3c4d` and Amazon S3 in us-east-1, and associates route table `rtb-11aa22bb` with the endpoint.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateVpcEndpoint
&VpcId=vpc-1a2b3c4d
&ServiceName=com.amazonaws.us-east-1.s3
&RouteTableId.1=rtb-11aa22bb
&AUTHPARAMS
```

Sample Response

```
<CreateVpcEndpointResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <vpcEndpoint>
        <vpcId>vpc-1a2b3c4d</vpcId>
        <state>available</state>
        <routeTableIdSet>
            <item>rtb-11aa22bb</item>
        </routeTableIdSet>
       <vpcEndpointId>vpce-abc12345</vpcEndpointId>
        <creationTimestamp>2015-02-20T16:46:40Z</creationTimestamp>
```

```
        <policyDocument>{"Version":"2008-10-17",       "Statement":
[{"Sid":"","Effect":"Allow","Principal":"*","Action":"*","Resource":"*"}]}</
policyDocument>
        <serviceName>com.amazonaws.us-west-1.s3</serviceName>
    </vpcEndpoint>
    <requestId>4b373100-473a-46a0-9006-example</requestId>
</CreateVpcEndpointResponse>
```

Example 2

This example creates an interface endpoint between `vpc-1a2b3c4d` and Elastic Load Balancing in us-east-1 in subnet `subnet-1a2b3c4d`, and associates security group `sg-11aa22bb` with the network interface.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateVpcEndpoint
&VpcId=vpc-1a2b3c4d
&ServiceName=com.amazonaws.us-east-1.elasticloadbalancing
&VpcEndpointType=Interface
&SubnetId.1=subnet-1a2b3c4d
&SecurityGroupId.1=sg-11aa22bb
&AUTHPARAMS
```

Sample Response

```
<CreateVpcEndpointResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>bf5a49f9-4c36-41c9-a4be-13dexample</requestId>
    <vpcEndpoint>
        <policyDocument>{
  "Statement": [
    {
      "Action": "*",
      "Effect": "Allow",
      "Principal": "*",
      "Resource": "*"
    }
  ]
}</policyDocument>
        <routeTableIdSet/>
        <dnsEntrySet>
            <item>
                <hostedZoneId>Z7HUB22UULQXV</hostedZoneId>
```

```
                <dnsName>vpce-0324151a02f327ff5-3k8nfxtt.elasticloadbalancing.us-
east-1.vpce.amazonaws.com</dnsName>
            </item>
            <item>
                <hostedZoneId>Z7HUB22UULQXV</hostedZoneId>
                <dnsName>vpce-0324151a02f327ff5-3k8nfxtt-us-
east-1a.elasticloadbalancing.us-east-1.vpce.amazonaws.com</dnsName>
            </item>
            <item>
                <hostedZoneId>Z2THV5YBYUN78V</hostedZoneId>
                <dnsName>elasticloadbalancing.us-east-1.amazonaws.com</dnsName>
            </item>
        </dnsEntrySet>
        <serviceName>com.amazonaws.us-east-1.elasticloadbalancing</serviceName>
        <privateDnsEnabled>true</privateDnsEnabled>
        <groupSet>
            <item>
                <groupName>default</groupName>
                <groupId>sg-11aa22bb</groupId>
            </item>
        </groupSet>
        <vpcEndpointId>vpce-0324151a02f327ff5</vpcEndpointId>
        <subnetIdSet>
            <item>subnet-1a2b3c4d</item>
        </subnetIdSet>
        <networkInterfaceIdSet>
            <item>eni-cd1a3319</item>
        </networkInterfaceIdSet>
        <vpcEndpointType>Interface</vpcEndpointType>
        <vpcId>vpc-1a2b3c4d</vpcId>
        <creationTimestamp>2017-09-05T20:57:46.307Z</creationTimestamp>
        <state>pending</state>
    </vpcEndpoint>
</CreateVpcEndpointResponse>
```

Example 3

This example creates a Gateway Load Balancer endpoint between `vpc-11122223333344445` and a VPC endpoint service that's configured using a Gateway Load Balancer.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateVpcEndpoint
```

```
&VpcId=vpc-11122223333344445
&ServiceName=com.amazonaws.vpce.us-east-1.vpce-svc-123abcc1298abc123
&VpcEndpointType=GatewayLoadBalancer
&SubnetId.1=subnet-aaaa1111bbbb22233
&AUTHPARAMS
```

Sample Response

```
<CreateVpcEndpointResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>bf5a49f9-4c36-41c9-a4be-13dexample</requestId>
    <vpcEndpoint>
        <ownerId>123456789012</ownerId>
        <requesterManaged>false</requesterManaged>
        <serviceName>com.amazonaws.vpce.us-east-1.vpce-svc-123abcc1298abc123</
serviceName>
        <vpcEndpointId>vpce-bbbbbb2222222333</vpcEndpointId>
        <subnetIdSet>
            <item>subnet-aaaa1111bbbb22233</item>
        </subnetIdSet>
        <networkInterfaceIdSet>
            <item>eni-11111111222222aaa</item>
        </networkInterfaceIdSet>
        <vpcEndpointType>GatewayLoadBalancer</vpcEndpointType>
        <vpcId>vpc-11122223333344445</vpcId>
        <creationTimestamp>2020-11-11T08:06:03.522Z</creationTimestamp>
        <state>pending</state>
    </vpcEndpoint>
</CreateVpcEndpointResponse>
```

CreateVpcEndpointConnectionNotification

Creates a connection notification for a specified VPC endpoint or VPC endpoint service. A connection notification notifies you of specific endpoint events. You must create an SNS topic to receive notifications. For more information, see Creating an Amazon SNS topic in the *Amazon SNS Developer Guide*.

You can create a connection notification for interface endpoints only.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see How to ensure idempotency.

Type: String

Required: No

ConnectionEvents.N

The endpoint events for which to receive notifications. Valid values are `Accept`, `Connect`, `Delete`, and `Reject`.

Type: Array of strings

Required: Yes

ConnectionNotificationArn

The ARN of the SNS topic for the notifications.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ServiceId

The ID of the endpoint service.

Type: String

Required: No

VpcEndpointId

The ID of the endpoint.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

clientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request.

Type: String

connectionNotification

Information about the notification.

Type: ConnectionNotification object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example creates a notification for the endpoint `vpce-1234151a02f327123`. The notification is sent when the endpoint is rejected or deleted.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateVpcEndpointConnectionNotification
&VpcEndpointId=vpce-1234151a02f327123
&ConnectionNotificationArn=arn:aws:sns:us-east-1:123456789012:endpointtopic
&ConnectionEvents.1=Reject
&ConnectionEvents.2=Delete
&AUTHPARAMS
```

Sample Response

```
<CreateVpcEndpointConnectionNotificationResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>6bf51e2a-a99e-4839-af31-a0d72example</requestId>
    <connectionNotification>
        <connectionNotificationArn>arn:aws:sns:us-east-1:123456789012:endpointtopic</
connectionNotificationArn>
        <connectionEvents>
            <item>Delete</item>
            <item>Reject</item>
        </connectionEvents>
        <connectionNotificationType>Topic</connectionNotificationType>
        <connectionNotificationState>Enabled</connectionNotificationState>
        <connectionNotificationId>vpce-nfn-04bcb952bc8af759b</connectionNotificationId>
        <vpcEndpointId>vpce-1234151a02f327123</vpcEndpointId>
    </connectionNotification>
</CreateVpcEndpointConnectionNotificationResponse>
```

CreateVpcEndpointServiceConfiguration

Creates a VPC endpoint service to which service consumers (AWS accounts, users, and IAM roles) can connect.

Before you create an endpoint service, you must create one of the following for your service:

- A Network Load Balancer. Service consumers connect to your service using an interface endpoint.
- A Gateway Load Balancer. Service consumers connect to your service using a Gateway Load Balancer endpoint.

If you set the private DNS name, you must prove that you own the private DNS domain name.

For more information, see the AWS PrivateLink Guide.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AcceptanceRequired

Indicates whether requests from service consumers to create an endpoint to your service must be accepted manually.

To accept a request manually, use AcceptVpcEndpointConnections. To reject a request, use RejectVpcEndpointConnections.

Type: Boolean

Required: No

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see How to ensure idempotency.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

GatewayLoadBalancerArn.N

The Amazon Resource Names (ARNs) of the Gateway Load Balancers.

Type: Array of strings

Required: No

NetworkLoadBalancerArn.N

The Amazon Resource Names (ARNs) of the Network Load Balancers.

Type: Array of strings

Required: No

PrivateDnsName

(Interface endpoint configuration) The private DNS name to assign to the VPC endpoint service.

Type: String

Required: No

SupportedIpAddressType.N

The supported IP address types. The possible values are `ipv4` and `ipv6`.

Type: Array of strings

Required: No

SupportedRegion.N

The Regions from which service consumers can access the service.

Type: Array of strings

Required: No

TagSpecification.N

The tags to associate with the service.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

clientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request.

Type: String

requestId

The ID of the request.

Type: String

serviceConfiguration

Information about the service configuration.

Type: ServiceConfiguration object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example creates a VPC endpoint service configuration using the specified Network Load Balancer. This example also specifies that requests to connect to the service through a VPC endpoint must be accepted or rejected manually.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateVpcEndpointServiceConfiguration
&NetworkLoadBalancerArn.1=arn:aws:elasticloadbalancing:us-
east-1:123456789012:loadbalancer/net/my-nlb/e94221227f1ba532
&AcceptanceRequired=true
&AUTHPARAMS
```

Sample Response

```
<CreateVpcEndpointServiceConfigurationResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>1b2f25d4-9d9f-4256-a8e3-297f7example</requestId>
    <serviceConfiguration>
        <serviceState>Available</serviceState>
        <serviceType>
            <item>
                <serviceType>Interface</serviceType>
            </item>
        </serviceType>
        <baseEndpointDnsNameSet>
            <item>vpce-svc-0552b9c1298c4f123.us-east-1.vpce.amazonaws.com</item>
        </baseEndpointDnsNameSet>
        <acceptanceRequired>true</acceptanceRequired>
        <availabilityZoneSet>
            <item>us-east-1d</item>
        </availabilityZoneSet>
        <serviceId>vpce-svc-0552b9c1298c4f123</serviceId>
        <serviceName>com.amazonaws.vpce.us-east-1.vpce-svc-0552b9c1298c4f123</
serviceName>
        <networkLoadBalancerArnSet>
            <item>arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/net/
my-nlb/e94221227f1ba532</item>
        </networkLoadBalancerArnSet>
    </serviceConfiguration>
</CreateVpcEndpointServiceConfigurationResponse>
```

Example 2

This example creates a VPC endpoint service configuration using the specified Gateway Load Balancer. This example also specifies that all requests to connect to the service are accepted automatically.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateVpcEndpointServiceConfiguration
&GatewayLoadBalancerArn.1=arn:aws:elasticloadbalancing:us-
east-1:123456789012:loadbalancer/gwy/GWLBService/abc210844e429abc
&AcceptanceRequired=false
&AUTHPARAMS
```

Sample Response

```
<CreateVpcEndpointServiceConfigurationResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>1b2f25d4-9d9f-4256-a8e3-297f7example</requestId>
    <serviceConfiguration>
        <serviceState>Available</serviceState>
        <serviceType>
            <item>
                <serviceType>GatewayLoadBalancer</serviceType>
            </item>
        </serviceType>
        <acceptanceRequired>false</acceptanceRequired>
        <availabilityZoneSet>
            <item>us-east-1d</item>
        </availabilityZoneSet>
        <serviceId>vpce-svc-123abcc1298abc123</serviceId>
        <serviceName>com.amazonaws.vpce.us-east-1.vpce-svc-123abcc1298abc123</
serviceName>
        <gatewayLoadBalancerArnSet>
            <item>arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/gwy/
GWLBService/abc210844e429abc</item>
        </gatewayLoadBalancerArnSet>
    </serviceConfiguration>
</CreateVpcEndpointServiceConfigurationResponse>
```

CreateVpcPeeringConnection

Requests a VPC peering connection between two VPCs: a requester VPC that you own and an accepter VPC with which to create the connection. The accepter VPC can belong to another AWS account and can be in a different Region to the requester VPC. The requester VPC and accepter VPC cannot have overlapping CIDR blocks.

> **Note**
>
> Limitations and rules apply to a VPC peering connection. For more information, see the VPC peering limitations in the *VPC Peering Guide*.

The owner of the accepter VPC must accept the peering request to activate the peering connection. The VPC peering connection request expires after 7 days, after which it cannot be accepted or rejected.

If you create a VPC peering connection request between VPCs with overlapping CIDR blocks, the VPC peering connection has a status of `failed`.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

PeerOwnerId

The AWS account ID of the owner of the accepter VPC.

Default: Your AWS account ID

Type: String

Required: No

PeerRegion

The Region code for the accepter VPC, if the accepter VPC is located in a Region other than the Region in which you make the request.

Default: The Region in which you make the request.

Type: String

Required: No

PeerVpcId

The ID of the VPC with which you are creating the VPC peering connection. You must specify this parameter in the request.

Type: String

Required: No

TagSpecification.N

The tags to assign to the peering connection.

Type: Array of TagSpecification objects

Required: No

VpcId

The ID of the requester VPC. You must specify this parameter in the request.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

vpcPeeringConnection

Information about the VPC peering connection.

Type: VpcPeeringConnection object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example requests a peering connection between your VPC (vpc-1a2b3c4d), and a VPC (vpc-a1b2c3d4) that belongs to AWS account 123456789012.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateVpcPeeringConnection
&VpcId=vpc-1a2b3c4d
&PeerVpcId=vpc-a1b2c3d4
&PeerOwnerId=123456789012
&AUTHPARAMS
```

Sample Response

```
<CreateVpcPeeringConnectionResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
 <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
 <vpcPeeringConnection>
  <vpcPeeringConnectionId>pcx-73a5401a</vpcPeeringConnectionId>
    <requesterVpcInfo>
     <ownerId>777788889999</ownerId>
     <vpcId>vpc-1a2b3c4d</vpcId>
     <cidrBlock>10.0.0.0/28</cidrBlock>
     <peeringOptions>
```

```
       <allowEgressFromLocalClassicLinkToRemoteVpc>false</
allowEgressFromLocalClassicLinkToRemoteVpc>
       <allowEgressFromLocalVpcToRemoteClassicLink>false</
allowEgressFromLocalVpcToRemoteClassicLink>
       <allowDnsResolutionFromRemoteVpc>false</allowDnsResolutionFromRemoteVpc>
     </peeringOptions>
    </requesterVpcInfo>
    <accepterVpcInfo>
      <ownerId>123456789012</ownerId>
      <vpcId>vpc-a1b2c3d4</vpcId>
    </accepterVpcInfo>
    <status>
     <code>initiating-request</code>
     <message>Initiating Request to 123456789012</message>
    </status>
    <expirationTime>2014-02-18T14:37:25.000Z</expirationTime>
    <tagSet/>
 </vpcPeeringConnection>
</CreateVpcPeeringConnectionResponse>
```

Example 2

This example requests a peering connection between your VPCs `vpc-1a2b3c4d` and `vpc-11122233`.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateVpcPeeringConnection
&VpcId=vpc-1a2b3c4d
&PeerVpcId=vpc-11122233
&AUTHPARAMS
```

Example 3

This example requests an inter-region peering connection between two VPCs in your account. VPC `vpc-1a2b3c4d` is located in the US East (N. Virginia) Region (`us-east-1`), and accepter VPC `vpc-a1b2c3d4` is located in the US West (Oregon) Region (`us-west-2`). The VPC peering connection must be accepted in the `us-west-2` Region.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateVpcPeeringConnection
```

```
&VpcId=vpc-1a2b3c4d
&PeerVpcId=vpc-a1b2c3d4
&PeerRegion=us-west-2
&AUTHPARAMS
```

CreateVpnConcentrator

Creates a VPN concentrator that aggregates multiple VPN connections to a transit gateway.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TagSpecification.N

The tags to apply to the VPN concentrator during creation.

Type: Array of TagSpecification objects

Required: No

TransitGatewayId

The ID of the transit gateway to attach the VPN concentrator to.

Type: String

Required: No

Type

The type of VPN concentrator to create.

Type: String

Valid Values: `ipsec.1`

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

vpnConcentrator

Information about the VPN concentrator.

Type: VpnConcentrator object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example creates a VPN Concentrator on the Transit Gateway `tgw-0eae06e326d7c27d8`.

Sample Request

```
https://ec2.us-east-1.amazonaws.com/?Version=2016-11-15&Action=CreateVpnConcentrator
                  &Type=ipsec.1
                  &TransitGatewayId=tgw-0eae06e326d7c27d8
```

Sample Response

```
<CreateVpnConcentratorResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>c875a725-2eb7-4deb-ad8f-4445c071460f</requestId>
    <vpnConcentrator>
        <state>pending</state>
        <transitGatewayAttachmentId>tgw-attach-04a445da95a6814cc</
transitGatewayAttachmentId>
        <transitGatewayId>tgw-0eae06e326d7c27d8</transitGatewayId>
        <type>ipsec.1</type>
```

```
        <vpnConcentratorId>vcn-0767cb7521c5c4945</vpnConcentratorId>
    </vpnConcentrator>
</CreateVpnConcentratorResponse>
```

CreateVpnConnection

Creates a VPN connection between an existing virtual private gateway or transit gateway and a customer gateway. The supported connection type is `ipsec.1`.

The response includes information that you need to give to your network administrator to configure your customer gateway.

> **Important**
>
> We strongly recommend that you use HTTPS when calling this operation because the response contains sensitive cryptographic information for configuring your customer gateway device.

If you decide to shut down your VPN connection for any reason and later create a new VPN connection, you must reconfigure your customer gateway with the new information returned from this call.

This is an idempotent operation. If you perform the operation more than once, Amazon EC2 doesn't return an error.

For more information, see AWS Site-to-Site VPN in the *AWS Site-to-Site VPN User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CustomerGatewayId

The ID of the customer gateway.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Options

The options for the VPN connection.

Type: VpnConnectionOptionsSpecification object

Required: No

PreSharedKeyStorage

Specifies the storage mode for the pre-shared key (PSK). Valid values are `Standard`" (stored in the Site-to-Site VPN service) or `SecretsManager` (stored in AWS Secrets Manager).

Type: String

Required: No

TagSpecification.N

The tags to apply to the VPN connection.

Type: Array of TagSpecification objects

Required: No

TransitGatewayId

The ID of the transit gateway. If you specify a transit gateway, you cannot specify a virtual private gateway.

Type: String

Required: No

Type

The type of VPN connection (`ipsec.1`).

Type: String

Required: Yes

VpnConcentratorId

The ID of the VPN concentrator to associate with the VPN connection.

Type: String

Required: No

VpnGatewayId

The ID of the virtual private gateway. If you specify a virtual private gateway, you cannot specify a transit gateway.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

vpnConnection

Information about the VPN connection.

Type: VpnConnection object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example creates a VPN connection between the specified virtual private gateway and the specified customer gateway. The response includes configuration information for configuring the customer gateway device. Because it's a long set of information, we haven't included the complete response here. To see an example of the configuration information, see the Your customer gateway device.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateVpnConnection
&Type=ipsec.1
&CustomerGatewayId=cgw-112233445566aabbc
&VpnGatewayId=vgw-aabbccddee1234567
&AUTHPARAMS
```

Sample Response

```
<CreateVpnConnectionResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>22896b9b-e2fe-4574-9a20-example</requestId>
    <vpnConnection>
        <vpnConnectionId>vpn-01234abcabc123456</vpnConnectionId>
        <state>pending</state>
        <customerGatewayConfiguration>...Customer gateway configuration data in escaped
 XML format...</customerGatewayConfiguration>
        <customerGatewayId>cgw-112233445566aabbc</customerGatewayId>
        <vpnGatewayId>vgw-aabbccddee1234567</vpnGatewayId>
        <tagSet/>
        <options>
            <enableAcceleration>false</enableAcceleration>
            <staticRoutesOnly>false</staticRoutesOnly>
            <localIpv4NetworkCidr>0.0.0.0/0</localIpv4NetworkCidr>
            <remoteIpv4NetworkCidr>0.0.0.0/0</remoteIpv4NetworkCidr>
            <tunnelInsideIpVersion>ipv4</tunnelInsideIpVersion>
            <tunnelOptionSet>
                <item/>
                <item/>
            </tunnelOptionSet>
        </options>
        <routes/>
        <category>VPN</category>
    </vpnConnection>
</CreateVpnConnectionResponse>
```

Example 2

This example creates a VPN connection with the static routes option between the virtual private gateway with the ID `vgw-8db04f81`, and the customer gateway with the ID `cgw-b4dc3961`, for a device that does not support the Border Gateway Protocol (BGP).

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateVpnConnection
&Type=ipsec.1
&CustomerGatewayId=cgw-b4dc3961
&VpnGatewayId=vgw-8db04f81
&Options.StaticRoutesOnly=true
&AUTHPARAMS
```

Example 3

This example creates a VPN connection between the virtual private gateway with the ID `vgw-8db04f81` and the customer gateway with the ID `cgw-b4dc3961` and specifies the inside IP address CIDR block and a custom pre-shared key for each tunnel.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateVpnConnection
&Type=ipsec.1
&CustomerGatewayId=cgw-b4dc3961
&VpnGatewayId=vgw-8db04f81
&Options.TunnelOptions.1.PreSharedKey=wMp_IGfO1d1o9AT4lF6tJLFN4EXAMPLE
&Options.TunnelOptions.1.TunnelInsideCidr=169.254.44.110/30
&Options.TunnelOptions.2.PreSharedKey=HAM8lcnFYEvfl6gUrOatJLFN4EXAMPLE
&Options.TunnelOptions.2.TunnelInsideCidr=169.254.44.240/30
&AUTHPARAMS
```

Example 4

This example creates a VPN connection between the specified transit gateway and the specified customer gateway. The VPN connection processes IPv6 traffic inside the tunnels, and the tunnel options for both tunnels specify that AWS must initiate the IKE negotiation. A tag with a key of `Location` and a value of `NewYorkVPN` is applied to the VPN connection.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateVpnConnection
&Type=ipsec.1
&CustomerGatewayId=cgw-112233445566aabbc
&TransitGatewayId=tgw-0123f96e7b3f5babc
&Options.StaticRoutesOnly=false
```

```
&Options.TunnelInsideIpVersion=ipv6
&Options.TunnelOptions.1.StartupAction=start
&Options.TunnelOptions.2.StartupAction=start
&TagSpecification.1.ResourceType=vpn-connection
&TagSpecification.1.Tag.1.Key=Location
&TagSpecification.1.Tag.1.Value=NewYorkVPN
&AUTHPARAMS
```

CreateVpnConnectionRoute

Creates a static route associated with a VPN connection between an existing virtual private gateway and a VPN customer gateway. The static route allows traffic to be routed from the virtual private gateway to the VPN customer gateway.

For more information, see AWS Site-to-Site VPN in the *AWS Site-to-Site VPN User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DestinationCidrBlock

The CIDR block associated with the local subnet of the customer network.

Type: String

Required: Yes

VpnConnectionId

The ID of the VPN connection.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example creates a static route to the VPN connection for the VPN connection with the ID vpn-83ad48ea to the destination CIDR block 11.12.0.0/16. Note that when using the Query API the "/" is denoted as "%2F".

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateVpnConnectionRoute
&DestinationCidrBlock=11.12.0.0%2F16
&VpnConnectionId=vpn-83ad48ea
&AUTHPARAMS
```

Sample Response

```
<CreateVpnConnectionRouteResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>4f35a1b2-c2c3-4093-b51f-abb9d7311990</requestId>
    <return>true</return>
</CreateVpnConnectionRouteResponse>
```

CreateVpnGateway

Creates a virtual private gateway. A virtual private gateway is the endpoint on the VPC side of your VPN connection. You can create a virtual private gateway before creating the VPC itself.

For more information, see AWS Site-to-Site VPN in the *AWS Site-to-Site VPN User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AmazonSideAsn

A private Autonomous System Number (ASN) for the Amazon side of a BGP session. If you're using a 16-bit ASN, it must be in the 64512 to 65534 range. If you're using a 32-bit ASN, it must be in the 4200000000 to 4294967294 range.

Default: 64512

Type: Long

Required: No

AvailabilityZone

The Availability Zone for the virtual private gateway.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TagSpecification.N

The tags to apply to the virtual private gateway.

Type: Array of TagSpecification objects

Required: No

Type

The type of VPN connection this virtual private gateway supports.

Type: String

Valid Values: `ipsec.1`

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

vpnGateway

Information about the virtual private gateway.

Type: VpnGateway object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example creates a virtual private gateway.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateVpnGateway
&Type=ipsec.1
&AUTHPARAMS
```

Sample Response

```
<CreateVpnGatewayResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
  <vpnGateway>
        <vpnGatewayId>vgw-fe4aa197</vpnGatewayId>
        <state>available</state>
        <type>ipsec.1</type>
        <amazonSideAsn>64512</amazonSideAsn>
        <attachments/>
    </vpnGateway>
</CreateVpnGatewayResponse>
```

Example 2

This example creates a virtual private gateway and specifies a private ASN of 65001 for the Amazon side of the gateway.

Sample Request

```
https://ec2.amazonaws.com/?Action=CreateVpnGateway
&Type=ipsec.1
&AmazonSideAsn=65001
&AUTHPARAMS
```

Sample Response

```
<CreateVpnGatewayResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>fe90b404-d4e5-4153-8677-31dexample</requestId>
    <vpnGateway>
        <vpnGatewayId>vgw-f74aa19e</vpnGatewayId>
        <state>available</state>
        <type>ipsec.1</type>
        <amazonSideAsn>65001</amazonSideAsn>
        <attachments/>
```

```
    </vpnGateway>
</CreateVpnGatewayResponse>
```

DeleteCapacityManagerDataExport

Deletes an existing Capacity Manager data export configuration. This stops future scheduled exports but does not delete previously exported files from S3.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CapacityManagerDataExportId

The unique identifier of the data export configuration to delete.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

capacityManagerDataExportId

The unique identifier of the deleted data export configuration.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteCarrierGateway

Deletes a carrier gateway.

> **Important**
>
> If you do not delete the route that contains the carrier gateway as the Target, the route is a blackhole route. For information about how to delete a route, see DeleteRoute.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CarrierGatewayId

The ID of the carrier gateway.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

carrierGateway

Information about the carrier gateway.

Type: CarrierGateway object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteClientVpnEndpoint

Deletes the specified Client VPN endpoint. You must disassociate all target networks before you can delete a Client VPN endpoint.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientVpnEndpointId

The ID of the Client VPN to be deleted.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

status

The current state of the Client VPN endpoint.

Type: ClientVpnEndpointStatus object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example applies a security group to a Client VPN endpoint.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteClientVpnEndpoint
&ClientVpnEndpointId=cvpn-endpoint-00c5d11fc4EXAMPLE
&AUTHPARAMS
```

Sample Response

```
<DeleteClientVpnEndpointResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>f1e0fdfc-96a4-4d7d-bc78-22eb0EXAMPLE</requestId>
    <status>
        <code>deleting</code>
    </status>
</DeleteClientVpnEndpointResponse>
```

See Also

- AWS SDK for PHP V3

- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteClientVpnRoute

Deletes a route from a Client VPN endpoint. You can only delete routes that you manually added using the **CreateClientVpnRoute** action. You cannot delete routes that were automatically added when associating a subnet. To remove routes that have been automatically added, disassociate the target subnet from the Client VPN endpoint.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientVpnEndpointId

The ID of the Client VPN endpoint from which the route is to be deleted.

Type: String

Required: Yes

DestinationCidrBlock

The IPv4 address range, in CIDR notation, of the route to be deleted.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TargetVpcSubnetId

The ID of the target subnet used by the route.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

status

The current state of the route.

Type: ClientVpnRouteStatus object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes a route from a Client VPN endpoint.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteClientVpnRoute
&ClientVpnEndpointId=cvpn-endpoint-00c5d11fc4EXAMPLE
&DestinationCidrBlock=0.0.0.0/0
&TargetVpcSubnetId=subnet-057fa0918fEXAMPLE
&AUTHPARAMS
```

Sample Response

```
<DeleteClientVpnRouteResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>00d80748-708d-40f7-8635-f34acEXAMPLE</requestId>
    <status>
```

```
        <code>deleting</code>
    </status>
</DeleteClientVpnRouteResponse>
```

DeleteCoipCidr

Deletes a range of customer-owned IP addresses.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Cidr

A customer-owned IP address range that you want to delete.

Type: String

Required: Yes

CoipPoolId

The ID of the customer-owned address pool.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

coipCidr

Information about a range of customer-owned IP addresses.

Type: CoipCidr object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

DeleteCoipPool

Deletes a pool of customer-owned IP (CoIP) addresses.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CoipPoolId

The ID of the CoIP pool that you want to delete.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

coipPool

Information about the CoIP address pool.

Type: CoipPool object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteCustomerGateway

Deletes the specified customer gateway. You must delete the VPN connection before you can delete the customer gateway.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CustomerGatewayId

The ID of the customer gateway.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes the specified customer gateway.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteCustomerGateway
&CustomerGatewayId=cgw-b4dc3961
&AUTHPARAMS
```

Sample Response

```
<DeleteCustomerGatewayResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
   <return>true</return>
</DeleteCustomerGatewayResponse>
```

DeleteDhcpOptions

Deletes the specified set of DHCP options. You must disassociate the set of DHCP options before you can delete it. You can disassociate the set of DHCP options by associating either a new set of options or the default set of options with the VPC.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DhcpOptionsId

The ID of the DHCP options set.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes the specified set of DHCP options.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteDhcpOptions
&DhcpOptionsId=dopt-7a8b9c2d
&AUTHPARAMS
```

Sample Response

```
<DeleteDhcpOptionsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
   <return>true</return>
</DeleteDhcpOptionsResponse>
```

DeleteEgressOnlyInternetGateway

Deletes an egress-only internet gateway.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

EgressOnlyInternetGatewayId

The ID of the egress-only internet gateway.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

returnCode

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes the specified egress-only internet gateway.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteEgressOnlyInternetGateway
&EgressOnlyInternetGatewayId=eigw-015e0e244e24dfe8a
&AUTHPARAMS
```

Sample Response

```
<DeleteEgressOnlyInternetGateway xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <returnCode>true</returnCode>
</DeleteEgressOnlyInternetGateway>
```

- AWS SDK for Python

- AWS SDK for Ruby V3

DeleteFleets

Deletes the specified EC2 Fleet request.

After you delete an EC2 Fleet request, it launches no new instances.

You must also specify whether a deleted EC2 Fleet request should terminate its instances. If you choose to terminate the instances, the EC2 Fleet request enters the `deleted_terminating` state. Otherwise, it enters the `deleted_running` state, and the instances continue to run until they are interrupted or you terminate them manually.

A deleted `instant` fleet with running instances is not supported. When you delete an `instant` fleet, Amazon EC2 automatically terminates all its instances. For fleets with more than 1000 instances, the deletion request might fail. If your fleet has more than 1000 instances, first terminate most of the instances manually, leaving 1000 or fewer. Then delete the fleet, and the remaining instances will be terminated automatically.

> **Important**
>
> **Terminating an instance is permanent and irreversible.**
> After you terminate an instance, you can no longer connect to it, and it can't be recovered. All attached Amazon EBS volumes that are configured to be deleted on termination are also permanently deleted and can't be recovered. All data stored on instance store volumes is permanently lost. For more information, see How instance termination works.
> Before you terminate an instance, ensure that you have backed up all data that you need to retain after the termination to persistent storage.

Restrictions

- You can delete up to 25 fleets of type `instant` in a single request.
- You can delete up to 100 fleets of type `maintain` or `request` in a single request.
- You can delete up to 125 fleets in a single request, provided you do not exceed the quota for each fleet type, as specified above.
- If you exceed the specified number of fleets to delete, no fleets are deleted.

For more information, see Delete an EC2 Fleet request and the instances in the fleet in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

FleetId.N

The IDs of the EC2 Fleets.

Constraints: In a single request, you can specify up to 25 `instant` fleet IDs and up to 100 `maintain` or `request` fleet IDs.

Type: Array of strings

Required: Yes

TerminateInstances

Indicates whether to terminate the associated instances when the EC2 Fleet is deleted. The default is to terminate the instances.

To let the instances continue to run after the EC2 Fleet is deleted, specify `no-terminate-instances`. Supported only for fleets of type `maintain` and `request`.

For `instant` fleets, you cannot specify `NoTerminateInstances`. A deleted `instant` fleet with running instances is not supported.

Type: Boolean

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

successfulFleetDeletionSet

Information about the EC2 Fleets that are successfully deleted.

Type: Array of DeleteFleetSuccessItem objects

unsuccessfulFleetDeletionSet

Information about the EC2 Fleets that are not successfully deleted.

Type: Array of DeleteFleetErrorItem objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteFlowLogs

Deletes one or more flow logs.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

FlowLogId.N

One or more flow log IDs.

Constraint: Maximum of 1000 flow log IDs.

Type: Array of strings

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

unsuccessful

Information about the flow logs that could not be deleted successfully.

Type: Array of UnsuccessfulItem objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes flow log fl-1a2b3c4d.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteFlowLogs
&FlowLogId.1=fl-1a2b3c4d
&AUTHPARAMS
```

Sample Response

```
<DeleteFlowLogsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>c5c4f51f-f4e9-42bc-8700-EXAMPLE</requestId>
    <unsuccessful/>
</DeleteFlowLogsResponse>
```

- AWS SDK for Ruby V3

DeleteFpgaImage

Deletes the specified Amazon FPGA Image (AFI).

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

FpgaImageId

The ID of the AFI.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes the specified AFI.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteFpgaImage
&FpgaImageId=afi-0d123e21abcc85abc
&AUTHPARAMS
```

Sample Response

```
<DeleteFpgaImageResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>dd3bf051-468e-4490-ad8a-2ffexample</requestId>
    <return>true</return>
</DeleteFpgaImageResponse>
```

DeleteImageUsageReport

Deletes the specified image usage report.

For more information, see View your AMI usage in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ReportId

The ID of the report to delete.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

DeleteInstanceConnectEndpoint

Deletes the specified EC2 Instance Connect Endpoint.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InstanceConnectEndpointId

The ID of the EC2 Instance Connect Endpoint to delete.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

instanceConnectEndpoint

Information about the EC2 Instance Connect Endpoint.

Type: Ec2InstanceConnectEndpoint object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example: Delete an EC2 Instance Connect Endpoint

This example deletes the specified EC2 Instance Connect Endpoint.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteInstanceConnectEndpoint
&InstanceConnectEndpointId=eice-0123456789example
&AUTHPARAMS
```

Sample Response

```
<DeleteInstanceConnectEndpointResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
  <requestId>d732c12a-2f0c-49b4-b2a9-f2922e5f5635</requestId>
  <instanceConnectEndpoint>
    <availabilityZone>availability-zone</availabilityZone>
    <availabilityZoneId>availability-zone-id</availabilityZoneId>
    <createdAt>2023-06-06T20:01:31.000Z</createdAt>
    <instanceConnectEndpointArn>arn:aws:ec2:region:account-id:instance-connect-
endpoint/eice-0123456789example</instanceConnectEndpointArn>
    <instanceConnectEndpointId>eice-0123456789example</instanceConnectEndpointId>
    <networkInterfaceIdSet />
    <ownerId>account-id</ownerId>
    <preserveClientIp>false</preserveClientIp>
    <securityGroupIdSet>
      <item>sg-0123456789example</item>
    </securityGroupIdSet>
    <state>delete-in-progress</state>
    <stateMessage />
    <subnetId>subnet-0123456789example</subnetId>
    <vpcId>vpc-0123456789example</vpcId>
  </instanceConnectEndpoint>
</DeleteInstanceConnectEndpointResponse>
```

DeleteInstanceEventWindow

Deletes the specified event window.

For more information, see Define event windows for scheduled events in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ForceDelete

Specify `true` to force delete the event window. Use the force delete parameter if the event window is currently associated with targets.

Type: Boolean

Required: No

InstanceEventWindowId

The ID of the event window.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

instanceEventWindowState

The state of the event window.

Type: InstanceEventWindowStateChange object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteInternetGateway

Deletes the specified internet gateway. You must detach the internet gateway from the VPC before you can delete it.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InternetGatewayId

The ID of the internet gateway.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes the specified internet gateway.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteInternetGateway
&InternetGatewayId=igw-eaad4883
&AUTHPARAMS
```

Sample Response

```
<DeleteInternetGatewayResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</DeleteInternetGatewayResponse>
```

- AWS SDK for Ruby V3

DeleteIpam

Delete an IPAM. Deleting an IPAM removes all monitored data associated with the IPAM including the historical data for CIDRs.

For more information, see Delete an IPAM in the *Amazon VPC IPAM User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Cascade

Enables you to quickly delete an IPAM, private scopes, pools in private scopes, and any allocations in the pools in private scopes. You cannot delete the IPAM with this option if there is a pool in your public scope. If you use this option, IPAM does the following:

- Deallocates any CIDRs allocated to VPC resources (such as VPCs) in pools in private scopes.

> **Note**
>
> No VPC resources are deleted as a result of enabling this option. The CIDR associated with the resource will no longer be allocated from an IPAM pool, but the CIDR itself will remain unchanged.

- Deprovisions all IPv4 CIDRs provisioned to IPAM pools in private scopes.
- Deletes all IPAM pools in private scopes.
- Deletes all non-default private scopes in the IPAM.
- Deletes the default public and private scopes and the IPAM.

Type: Boolean

Required: No

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

IpamId

The ID of the IPAM to delete.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

ipam

Information about the results of the deletion.

Type: Ipam object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2

- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteIpamExternalResourceVerificationToken

Delete a verification token.

A verification token is an AWS-generated random value that you can use to prove ownership of an external resource. For example, you can use a verification token to validate that you control a public IP address range when you bring an IP address range to AWS (BYOIP).

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

IpamExternalResourceVerificationTokenId

The token ID.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

ipamExternalResourceVerificationToken

The verification token.

Type: IpamExternalResourceVerificationToken object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteIpamPolicy

Deletes an IPAM policy.

An IPAM policy is a set of rules that define how public IPv4 addresses from IPAM pools are allocated to AWS resources. Each rule maps an AWS service to IPAM pools that the service will use to get IP addresses. A single policy can have multiple rules and be applied to multiple AWS Regions. If the IPAM pool run out of addresses then the services fallback to Amazon-provided IP addresses. A policy can be applied to an individual AWS account or an entity within AWS Organizations.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

IpamPolicyId

The ID of the IPAM policy to delete.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

ipamPolicy

Information about the deleted IPAM policy.

An IPAM policy is a set of rules that define how public IPv4 addresses from IPAM pools are allocated to AWS resources. Each rule maps an AWS service to IPAM pools that the service will use to get IP addresses. A single policy can have multiple rules and be applied to multiple AWS Regions. If the IPAM pool run out of addresses then the services fallback to Amazon-provided IP addresses. A policy can be applied to an individual AWS account or an entity within AWS Organizations.

Type: IpamPolicy object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteIpamPool

Delete an IPAM pool.

> **Note**
>
> You cannot delete an IPAM pool if there are allocations in it or CIDRs provisioned to it. To release allocations, see ReleaseIpamPoolAllocation. To deprovision pool CIDRs, see DeprovisionIpamPoolCidr.

For more information, see Delete a pool in the *Amazon VPC IPAM User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Cascade

Enables you to quickly delete an IPAM pool and all resources within that pool, including provisioned CIDRs, allocations, and other pools.

> **Important**
>
> You can only use this option to delete pools in the private scope or pools in the public scope with a source resource. A source resource is a resource used to provision CIDRs to a resource planning pool.

Type: Boolean

Required: No

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

IpamPoolId

The ID of the pool to delete.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

ipamPool

Information about the results of the deletion.

Type: IpamPool object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteIpamPrefixListResolver

Deletes an IPAM prefix list resolver. Before deleting a resolver, you must first delete all resolver targets associated with it.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

IpamPrefixListResolverId

The ID of the IPAM prefix list resolver to delete.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

ipamPrefixListResolver

Information about the IPAM prefix list resolver that was deleted.

Type: IpamPrefixListResolver object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteIpamPrefixListResolverTarget

Deletes an IPAM prefix list resolver target. This removes the association between the resolver and the managed prefix list, stopping automatic CIDR synchronization.

For more information about IPAM prefix list resolver, see Automate prefix list updates with IPAM in the *Amazon VPC IPAM User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

IpamPrefixListResolverTargetId

The ID of the IPAM prefix list resolver target to delete.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

ipamPrefixListResolverTarget

Information about the IPAM prefix list resolver target that was deleted.

Type: IpamPrefixListResolverTarget object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteIpamResourceDiscovery

Deletes an IPAM resource discovery. A resource discovery is an IPAM component that enables IPAM to manage and monitor resources that belong to the owning account.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

IpamResourceDiscoveryId

The IPAM resource discovery ID.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

ipamResourceDiscovery

The IPAM resource discovery.

Type: IpamResourceDiscovery object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteIpamScope

Delete the scope for an IPAM. You cannot delete the default scopes.

For more information, see Delete a scope in the *Amazon VPC IPAM User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

IpamScopeId

The ID of the scope to delete.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

ipamScope

Information about the results of the deletion.

Type: IpamScope object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

DeleteKeyPair

Deletes the specified key pair, by removing the public key from Amazon EC2.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

KeyName

The name of the key pair.

Type: String

Required: No

KeyPairId

The ID of the key pair.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

keyPairId

The ID of the key pair.

Type: String

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example request deletes the key pair named `my-key-pair`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteKeyPair
&KeyName=my-key-pair
&AUTHPARAMS
```

Sample Response

```
<DeleteKeyPairResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <return>true</return>
  <keyPairId>key-12345abcdeEXAMPLE</keyPairId>
</DeleteKeyPairResponse>
```

Example 2

This example request deletes a key pair with the ID `key-abcd12345eEXAMPLE`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteKeyPair
```

```
&KeyPairId=key-abcd12345eEXAMPLE
&AUTHPARAMS
```

Sample Response

```
<DeleteKeyPairResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <return>true</return>
  <keyPairId>key-abcd12345eEXAMPLE</keyPairId>
</DeleteKeyPairResponse>
```

DeleteLaunchTemplate

Deletes a launch template. Deleting a launch template deletes all of its versions.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

LaunchTemplateId

The ID of the launch template.

You must specify either the launch template ID or the launch template name, but not both.

Type: String

Required: No

LaunchTemplateName

The name of the launch template.

You must specify either the launch template ID or the launch template name, but not both.

Type: String

Length Constraints: Minimum length of 3. Maximum length of 128.

Pattern: `[a-zA-Z0-9\(\)\.\-/_]+`

Required: No

Response Elements

The following elements are returned by the service.

launchTemplate

Information about the launch template.

Type: LaunchTemplate object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes launch template `lt-0a20c965061f64abc`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteLaunchTemplate
&LaunchTemplateId=lt-0a20c965061f64abc
&AUTHPARAMS
```

Sample Response

```
<DeleteLaunchTemplateResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>c12605de-c470-4eaa-a4d0-ab4dexample</requestId>
    <launchTemplate>
        <createTime>2017-10-31T11:38:52.000Z</createTime>
        <createdBy>arn:aws:iam::123456789012:root</createdBy>
        <defaultVersionNumber>2</defaultVersionNumber>
        <latestVersionNumber>2</latestVersionNumber>
        <launchTemplateId>lt-0a20c965061f64abc</launchTemplateId>
```

```
        <launchTemplateName>MyLaunchTemplate</launchTemplateName>
    </launchTemplate>
</DeleteLaunchTemplateResponse>
```

See Also

- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteLaunchTemplateVersions

Deletes one or more versions of a launch template.

You can't delete the default version of a launch template; you must first assign a different version as the default. If the default version is the only version for the launch template, you must delete the entire launch template using DeleteLaunchTemplate.

You can delete up to 200 launch template versions in a single request. To delete more than 200 versions in a single request, use DeleteLaunchTemplate, which deletes the launch template and all of its versions.

For more information, see Delete a launch template version in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

LaunchTemplateId

The ID of the launch template.

You must specify either the launch template ID or the launch template name, but not both.

Type: String

Required: No

LaunchTemplateName

The name of the launch template.

You must specify either the launch template ID or the launch template name, but not both.

Type: String

Length Constraints: Minimum length of 3. Maximum length of 128.

Pattern: `[a-zA-Z0-9\(\)\.\-/_]+`

Required: No

LaunchTemplateVersion.N

The version numbers of one or more launch template versions to delete. You can specify up to 200 launch template version numbers.

Type: Array of strings

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

successfullyDeletedLaunchTemplateVersionSet

Information about the launch template versions that were successfully deleted.

Type: Array of DeleteLaunchTemplateVersionsResponseSuccessItem objects

unsuccessfullyDeletedLaunchTemplateVersionSet

Information about the launch template versions that could not be deleted.

Type: Array of DeleteLaunchTemplateVersionsResponseErrorItem objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes version 3 of launch template `lt-0a20c965061f64abc`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteLaunchTemplateVersions
&LaunchTemplateId=lt-0a20c965061f64abc
&LaunchTemplateVersion.1=3
&AUTHPARAMS
```

Sample Response

```
<DeleteLaunchTemplateVersionsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>67fc746a-1b3f-467e-8583-7061cexample</requestId>
    <unsuccessfullyDeletedLaunchTemplateVersionSet/>
    <successfullyDeletedLaunchTemplateVersionSet>
        <item>
            <launchTemplateId>lt-0a20c965061f64abc</launchTemplateId>
            <launchTemplateName>MyLaunchTemplate</launchTemplateName>
            <versionNumber>3</versionNumber>
        </item>
    </successfullyDeletedLaunchTemplateVersionSet>
</DeleteLaunchTemplateVersionsResponse>
```

DeleteLocalGatewayRoute

Deletes the specified route from the specified local gateway route table.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DestinationCidrBlock

The CIDR range for the route. This must match the CIDR for the route exactly.

Type: String

Required: No

DestinationPrefixListId

Use a prefix list in place of `DestinationCidrBlock`. You cannot use `DestinationPrefixListId` and `DestinationCidrBlock` in the same request.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

LocalGatewayRouteTableId

The ID of the local gateway route table.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

route

Information about the route.

Type: LocalGatewayRoute object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteLocalGatewayRouteTable

Deletes a local gateway route table.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

LocalGatewayRouteTableId

The ID of the local gateway route table.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

localGatewayRouteTable

Information about the local gateway route table.

Type: LocalGatewayRouteTable object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteLocalGatewayRouteTableVirtualInterfaceGroupAssociation

Deletes a local gateway route table virtual interface group association.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

LocalGatewayRouteTableVirtualInterfaceGroupAssociationId

The ID of the local gateway route table virtual interface group association.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

localGatewayRouteTableVirtualInterfaceGroupAssociation

Information about the association.

Type: LocalGatewayRouteTableVirtualInterfaceGroupAssociation object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

DeleteLocalGatewayRouteTableVpcAssociation

Deletes the specified association between a VPC and local gateway route table.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

LocalGatewayRouteTableVpcAssociationId

The ID of the association.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

localGatewayRouteTableVpcAssociation

Information about the association.

Type: LocalGatewayRouteTableVpcAssociation object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteLocalGatewayVirtualInterface

Deletes the specified local gateway virtual interface.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

LocalGatewayVirtualInterfaceId

The ID of the local virtual interface to delete.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

localGatewayVirtualInterface

Information about the deleted local gateway virtual interface.

Type: LocalGatewayVirtualInterface object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteLocalGatewayVirtualInterfaceGroup

Delete the specified local gateway interface group.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

LocalGatewayVirtualInterfaceGroupId

The ID of the local gateway virtual interface group to delete.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

localGatewayVirtualInterfaceGroup

Information about the deleted local gateway virtual interface group.

Type: LocalGatewayVirtualInterfaceGroup object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteManagedPrefixList

Deletes the specified managed prefix list. You must first remove all references to the prefix list in your resources.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

PrefixListId

The ID of the prefix list.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

prefixList

Information about the prefix list.

Type: ManagedPrefixList object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes the specified prefix list.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteManagedPrefixList
&PrefixListId=pl-0123123123123aabb
&AUTHPARAMS
```

Sample Response

```
<DeleteManagedPrefixListResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>06152571-575a-49aa-af95-example</requestId>
    <prefixList>
        <addressFamily>IPv6</addressFamily>
        <maxEntries>25</maxEntries>
        <ownerId>123456789012</ownerId>
        <prefixListArn>arn:aws:ec2:us-east-1:123456789012:prefix-list/
pl-0123123123123aabb</prefixListArn>
        <prefixListId>pl-0123123123123aabb</prefixListId>
        <prefixListName>test-pl</prefixListName>
        <state>delete-in-progress</state>
        <version>1</version>
    </prefixList>
</DeleteManagedPrefixListResponse>'
```

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteNatGateway

Deletes the specified NAT gateway. Deleting a public NAT gateway disassociates its Elastic IP address, but does not release the address from your account. Deleting a NAT gateway does not delete any NAT gateway routes in your route tables.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

NatGatewayId

The ID of the NAT gateway.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

natGatewayId

The ID of the NAT gateway.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes NAT gateway nat-04ae55e711cec5680.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteNatGateway
&NatGatewayId=nat-04ae55e711cec5680
&AUTHPARAMS
```

Sample Response

```
<DeleteNatGatewayResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>741fc8ab-6ebe-452b-b92b-example</requestId>
    <natGatewayId>nat-04ae55e711cec5680</natGatewayId>
</DeleteNatGatewayResponse>
```

- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteNetworkAcl

Deletes the specified network ACL. You can't delete the ACL if it's associated with any subnets. You can't delete the default network ACL.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

NetworkAclId

The ID of the network ACL.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes the specified network ACL.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteNetworkAcl
&NetworkAclId=acl-2cb85d45
&AUTHPARAMS
```

Sample Response

```
<DeleteNetworkAclResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <return>true</return>
</DeleteNetworkAclResponse>
```

DeleteNetworkAclEntry

Deletes the specified ingress or egress entry (rule) from the specified network ACL.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Egress

Indicates whether the rule is an egress rule.

Type: Boolean

Required: Yes

NetworkAclId

The ID of the network ACL.

Type: String

Required: Yes

RuleNumber

The rule number of the entry to delete.

Type: Integer

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes ingress rule number 100 from the specified network ACL.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteNetworkAclEntry
&NetworkAclId=acl-2cb85d45
&RuleNumber=100
&AUTHPARAMS
```

Sample Response

```
<DeleteNetworkAclEntryResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <return>true</return>
</DeleteNetworkAclEntryResponse>
```

DeleteNetworkInsightsAccessScope

Deletes the specified Network Access Scope.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

NetworkInsightsAccessScopeId

The ID of the Network Access Scope.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

networkInsightsAccessScopeId

The ID of the Network Access Scope.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

DeleteNetworkInsightsAccessScopeAnalysis

Deletes the specified Network Access Scope analysis.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

NetworkInsightsAccessScopeAnalysisId

The ID of the Network Access Scope analysis.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

networkInsightsAccessScopeAnalysisId

The ID of the Network Access Scope analysis.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for Ruby V3

DeleteNetworkInsightsAnalysis

Deletes the specified network insights analysis.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

NetworkInsightsAnalysisId

The ID of the network insights analysis.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

networkInsightsAnalysisId

The ID of the network insights analysis.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

DeleteNetworkInsightsPath

Deletes the specified path.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

NetworkInsightsPathId

The ID of the path.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

networkInsightsPathId

The ID of the path.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteNetworkInterface

Deletes the specified network interface. You must detach the network interface before you can delete it.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

NetworkInterfaceId

The ID of the network interface.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes the specified network interface.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteNetworkInterface
&NetworkInterfaceId=eni-ffda3197
&AUTHPARAMS
```

Sample Response

```
<DeleteNetworkInterfaceResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>e1c6d73b-edaa-4e62-9909-6611404e1739</requestId>
    <return>true</return>
</DeleteNetworkInterfaceResponse>
```

- AWS SDK for Ruby V3

DeleteNetworkInterfacePermission

Deletes a permission for a network interface. By default, you cannot delete the permission if the account for which you're removing the permission has attached the network interface to an instance. However, you can force delete the permission, regardless of any attachment.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Force

Specify `true` to remove the permission even if the network interface is attached to an instance.

Type: Boolean

Required: No

NetworkInterfacePermissionId

The ID of the network interface permission.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes the specified network interface permission.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteNetworkInterfacePermission
&NetworkInterfacePermissionId=eni-perm-06fd19020ede149ea
&AUTHPARAMS
```

Sample Response

```
<DeleteNetworkInterfacePermissionResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>7a296942-8fa0-45a3-8406-09e9example</requestId>
    <return>true</return>
</DeleteNetworkInterfacePermissionResponse>
```

DeletePlacementGroup

Deletes the specified placement group. You must terminate all instances in the placement group before you can delete the placement group. For more information, see Placement groups in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

GroupName

The name of the placement group.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes the placement group named `XYZ-cluster`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeletePlacementGroup
&GroupName=XYZ-cluster
&AUTHPARAMS
```

Sample Response

```
<DeletePlacementGroupResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>d4904fd9-82c2-4ea5-adfe-a9cc3EXAMPLE</requestId>
   <return>true</return>
</DeletePlacementGroupResponse>
```

DeletePublicIpv4Pool

Delete a public IPv4 pool. A public IPv4 pool is an EC2 IP address pool required for the public IPv4 CIDRs that you own and bring to AWS to manage with IPAM. IPv6 addresses you bring to AWS, however, use IPAM pools only.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

NetworkBorderGroup

The Availability Zone (AZ) or Local Zone (LZ) network border group that the resource that the IP address is assigned to is in. Defaults to an AZ network border group. For more information on available Local Zones, see Local Zone availability in the *Amazon EC2 User Guide*.

Type: String

Required: No

PoolId

The ID of the public IPv4 pool you want to delete.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

returnValue

Information about the result of deleting the public IPv4 pool.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

DeleteQueuedReservedInstances

Deletes the queued purchases for the specified Reserved Instances.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ReservedInstancesId.N

The IDs of the Reserved Instances.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 100 items.

Required: Yes

Response Elements

The following elements are returned by the service.

failedQueuedPurchaseDeletionSet

Information about the queued purchases that could not be deleted.

Type: Array of FailedQueuedPurchaseDeletion objects

requestId

The ID of the request.

Type: String

successfulQueuedPurchaseDeletionSet

Information about the queued purchases that were successfully deleted.

Type: Array of SuccessfulQueuedPurchaseDeletion objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2

- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteRoute

Deletes the specified route from the specified route table.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DestinationCidrBlock

The IPv4 CIDR range for the route. The value you specify must match the CIDR for the route exactly.

Type: String

Required: No

DestinationIpv6CidrBlock

The IPv6 CIDR range for the route. The value you specify must match the CIDR for the route exactly.

Type: String

Required: No

DestinationPrefixListId

The ID of the prefix list for the route.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

RouteTableId

The ID of the route table.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example deletes the route with destination IPv4 CIDR `172.16.1.0/24` from the specified route table.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteRoute
&RouteTableId=rtb-1122334455667788a
&DestinationCidrBlock=172.16.1.0/24
&AUTHPARAMS
```

Sample Response

```
<DeleteRouteResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <return>true</return>
</DeleteRouteResponse>
```

Example 2

This example deletes the route with destination IPv6 CIDR `::/0` from the specified route table.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteRoute
&RouteTableId=rtb-1122334455667788a
&DestinationIpv6CidrBlock=::/0
&AUTHPARAMS
```

- AWS SDK for Ruby V3

DeleteRouteServer

Deletes the specified route server.

Amazon VPC Route Server simplifies routing for traffic between workloads that are deployed within a VPC and its internet gateways. With this feature, VPC Route Server dynamically updates VPC and internet gateway route tables with your preferred IPv4 or IPv6 routes to achieve routing fault tolerance for those workloads. This enables you to automatically reroute traffic within a VPC, which increases the manageability of VPC routing and interoperability with third-party workloads.

Route server supports the follow route table types:

- VPC route tables not associated with subnets
- Subnet route tables
- Internet gateway route tables

Route server does not support route tables associated with virtual private gateways. To propagate routes into a transit gateway route table, use Transit Gateway Connect.

For more information see Dynamic routing in your VPC with VPC Route Server in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

RouteServerId

The ID of the route server to delete.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

routeServer

Information about the deleted route server.

Type: RouteServer object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for PHP V3
- AWS SDK for Python

- AWS SDK for Ruby V3

DeleteRouteServerEndpoint

Deletes the specified route server endpoint.

A route server endpoint is an AWS-managed component inside a subnet that facilitates BGP (Border Gateway Protocol) connections between your route server and your BGP peers.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

RouteServerEndpointId

The ID of the route server endpoint to delete.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

routeServerEndpoint

Information about the deleted route server endpoint.

Type: RouteServerEndpoint object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteRouteServerPeer

Deletes the specified BGP peer from a route server.

A route server peer is a session between a route server endpoint and the device deployed in AWS (such as a firewall appliance or other network security function running on an EC2 instance). The device must meet these requirements:

- Have an elastic network interface in the VPC
- Support BGP (Border Gateway Protocol)
- Can initiate BGP sessions

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

RouteServerPeerId

The ID of the route server peer to delete.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

routeServerPeer

Information about the deleted route server peer.

Type: RouteServerPeer object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteRouteTable

Deletes the specified route table. You must disassociate the route table from any subnets before you can delete it. You can't delete the main route table.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

RouteTableId

The ID of the route table.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes the specified route table.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteRouteTable
&RouteTableId=rtb-1122334455667788a
&AUTHPARAMS
```

Sample Response

```
<DeleteRouteTableResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <return>true</return>
</DeleteRouteTableResponse>
```

- AWS SDK for Ruby V3

DeleteSecondaryNetwork

Deletes a secondary network. You must delete all secondary subnets in the secondary network before you can delete the secondary network.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensure Idempotency.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

SecondaryNetworkId

The ID of the secondary network.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

clientToken

Unique, case-sensitive identifier to ensure the idempotency of the request. Only returned if a client token was provided in the request.

Type: String

requestId

The ID of the request.

Type: String

secondaryNetwork

Information about the secondary network.

Type: SecondaryNetwork object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes a secondary network.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteSecondaryNetwork
   &SecondaryNetworkId=sn-0123456789abcdef0
   &ClientToken=550e8400-e29b-41d4-a716-446655440000
   &AUTHPARAMS
```

Sample Response

```
<DeleteSecondaryNetworkResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <secondaryNetwork>
      <secondaryNetworkId>sn-0123456789abcdef0</secondaryNetworkId>
```

```
      <secondaryNetworkArn>arn:aws:ec2:us-east-2:123456789012:secondary-network/
sn-0123456789abcdef0</secondaryNetworkArn>
      <ownerId>123456789012</ownerId>
      <type>rdma</type>
      <state>delete-in-progress</state>
      <ipv4CidrBlockAssociations>
         <item>
            <associationId>sn-cidr-assoc-56789901234abcdef0</associationId>
            <cidrBlock>10.0.0.0/16</cidrBlock>
            <state>disassociating</state>
         </item>
      </ipv4CidrBlockAssociations>
      <tagSet>
         <item>
            <key>Name</key>
            <value>Prod Secondary Network</value>
         </item>
      </tagSet>
   </secondaryNetwork>
   <clientToken>550e8400-e29b-41d4-a716-446655440000</clientToken>
</DeleteSecondaryNetworkResponse>
```

DeleteSecondarySubnet

Deletes a secondary subnet. A secondary subnet must not contain any secondary interfaces prior to deletion.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensure Idempotency.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

SecondarySubnetId

The ID of the secondary subnet to delete.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

clientToken

Unique, case-sensitive identifier to ensure the idempotency of the request. Only returned if a client token was provided in the request.

Type: String

requestId

The ID of the request.

Type: String

secondarySubnet

Information about the secondary subnet being deleted.

Type: SecondarySubnet object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes a secondary subnet.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteSecondarySubnet
   &SecondarySubnetId=ss-0123456789abcdef0
   &ClientToken=550e8400-e29b-41d4-a716-446655440000
   &AUTHPARAMS
```

Sample Response

```
<DeleteSecondarySubnetResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <secondarySubnet>
      <secondarySubnetId>ss-0123456789abcdef0</secondarySubnetId>
```

```
      <secondarySubnetArn>arn:aws:ec2:us-east-2:123456789012:secondary-subnet/
ss-0123456789abcdef0</secondarySubnetArn>
      <secondaryNetworkId>sn-0123456789abcdef0</secondaryNetworkId>
      <secondaryNetworkType>rdma</secondaryNetworkType>
      <ownerId>123456789012</ownerId>
      <availabilityZoneId>use2-az1</availabilityZoneId>
      <availabilityZone>us-east-2a</availabilityZone>
      <ipv4CidrBlockAssociations>
         <item>
            <associationId>ss-cidr-assoc-56789901234abcdef0</associationId>
            <cidrBlock>10.0.0.0/24</cidrBlock>
            <state>disassociating</state>
         </item>
      </ipv4CidrBlockAssociations>
      <state>delete-in-progress</state>
      <tagSet>
         <item>
            <key>Name</key>
            <value>Prod Secondary Subnet</value>
         </item>
      </tagSet>
   </secondarySubnet>
   <clientToken>550e8400-e29b-41d4-a716-446655440000</clientToken>
</DeleteSecondarySubnetResponse>
```

DeleteSecurityGroup

Deletes a security group.

If you attempt to delete a security group that is associated with an instance or network interface, is referenced by another security group in the same VPC, or has a VPC association, the operation fails with `DependencyViolation`.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

GroupId

The ID of the security group.

Type: String

Required: No

GroupName

[Default VPC] The name of the security group. You can specify either the security group name or the security group ID. For security groups in a nondefault VPC, you must specify the security group ID.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

groupId

The ID of the deleted security group.

Type: String

requestId

The ID of the request.

Type: String

return

Returns `true` if the request succeeds; otherwise, returns an error.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes the specified security group.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteSecurityGroup
&GroupId=sg-1a2b3c4d
&AUTHPARAMS
```

Sample Response

```
<DeleteSecurityGroupResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
```

```
  <return>true</return>
</DeleteSecurityGroupResponse>
```

DeleteSnapshot

Deletes the specified snapshot.

When you make periodic snapshots of a volume, the snapshots are incremental, and only the blocks on the device that have changed since your last snapshot are saved in the new snapshot. When you delete a snapshot, only the data not needed for any other snapshot is removed. So regardless of which prior snapshots have been deleted, all active snapshots will have access to all the information needed to restore the volume.

You cannot delete a snapshot of the root device of an EBS volume used by a registered AMI. You must first deregister the AMI before you can delete the snapshot.

For more information, see Delete an Amazon EBS snapshot in the *Amazon EBS User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

SnapshotId

The ID of the EBS snapshot.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example request deletes the snapshot with the ID `snap-1234567890abcdef0`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteSnapshot

&SnapshotId.1=snap-1234567890abcdef0
&AUTHPARAMS
```

Sample Response

```
<DeleteSnapshotResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</DeleteSnapshotResponse>
```

DeleteSpotDatafeedSubscription

Deletes the data feed for Spot Instances.

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example request deletes the data feed for the AWS account.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteSpotDatafeedSubscription
&AUTHPARAMS
```

Sample Response

```
<DeleteSpotDatafeedSubscriptionResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</DeleteSpotDatafeedSubscriptionResponse>
```

DeleteSubnet

Deletes the specified subnet. You must terminate all running instances in the subnet before you can delete the subnet.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

SubnetId

The ID of the subnet.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes the specified subnet.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteSubnet
&SubnetId=subnet-9d4a7b6c
&AUTHPARAMS
```

Sample Response

```
<DeleteSubnetResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
   <return>true</return>
</DeleteSubnetResponse>
```

DeleteSubnetCidrReservation

Deletes a subnet CIDR reservation.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

SubnetCidrReservationId

The ID of the subnet CIDR reservation.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

deletedSubnetCidrReservation

Information about the deleted subnet CIDR reservation.

Type: SubnetCidrReservation object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteTags

Deletes the specified set of tags from the specified set of resources.

To list the current tags, use DescribeTags. For more information about tags, see Tag your Amazon EC2 resources in the *Amazon Elastic Compute Cloud User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ResourceId.N

The IDs of the resources, separated by spaces.

Constraints: Up to 1000 resource IDs. We recommend breaking up this request into smaller batches.

Type: Array of strings

Required: Yes

Tag.N

The tags to delete. Specify a tag key and an optional tag value to delete specific tags. If you specify a tag key without a tag value, we delete any tag with this key regardless of its value. If you specify a tag key with an empty string as the tag value, we delete the tag only if its value is an empty string.

If you omit this parameter, we delete all user-defined tags for the specified resources. We do not delete AWS-generated tags (tags that have the `aws:` prefix).

Constraints: Up to 1000 tags.

Type: Array of Tag objects

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes all the user-defined tags for the AMI with the ID `ami-1a2b3c4d`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteTags
&ResourceId.1=ami-1a2b3c4d
&AUTHPARAMS
```

Sample Response

```
<DeleteTagsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
```

```
   <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
   <return>true</return>
</DeleteTagsResponse>
```

Example

This example deletes the `stack` and `webserver` tags for two particular instances.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteTags
&ResourceId.1=i-1234567890abcdef0
&ResourceId.2=i-0598c7d356eba48d7
&Tag.1.Key=stack
&Tag.2.Key=webserver
&AUTHPARAMS
```

Example

You can specify a tag key without a corresponding tag value to delete the tag regardless of its value. This example request deletes all tags that have a key of `Purpose`, regardless of the tag value.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteTags
&ResourceId.1=i-0598c7d356eba48d7
&Tag.1.Key=Purpose
&AUTHPARAMS
```

Example

When you create a tag, you can set the tag value to the empty string. Correspondingly, you can delete only tags that have a specific key and whose value is the empty string. This example request deletes all tags for the specified instance where the key is `Purpose` and the tag value is the empty string.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteTags
```

```
&ResourceId.1=i-1234567890abcdef0
&Tag.1.Key=Purpose
&Tag.2.Value=
&AUTHPARAMS
```

DeleteTrafficMirrorFilter

Deletes the specified Traffic Mirror filter.

You cannot delete a Traffic Mirror filter that is in use by a Traffic Mirror session.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TrafficMirrorFilterId

The ID of the Traffic Mirror filter.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

trafficMirrorFilterId

The ID of the Traffic Mirror filter.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for Ruby V3

DeleteTrafficMirrorFilterRule

Deletes the specified Traffic Mirror rule.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TrafficMirrorFilterRuleId

The ID of the Traffic Mirror rule.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

trafficMirrorFilterRuleId

The ID of the deleted Traffic Mirror rule.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteTrafficMirrorSession

Deletes the specified Traffic Mirror session.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TrafficMirrorSessionId

The ID of the Traffic Mirror session.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

trafficMirrorSessionId

The ID of the deleted Traffic Mirror session.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteTrafficMirrorTarget

Deletes the specified Traffic Mirror target.

You cannot delete a Traffic Mirror target that is in use by a Traffic Mirror session.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TrafficMirrorTargetId

The ID of the Traffic Mirror target.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

trafficMirrorTargetId

The ID of the deleted Traffic Mirror target.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteTransitGateway

Deletes the specified transit gateway.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TransitGatewayId

The ID of the transit gateway.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

transitGateway

Information about the deleted transit gateway.

Type: TransitGateway object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteTransitGatewayConnect

Deletes the specified Connect attachment. You must first delete any Connect peers for the attachment.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TransitGatewayAttachmentId

The ID of the Connect attachment.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

transitGatewayConnect

Information about the deleted Connect attachment.

Type: TransitGatewayConnect object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteTransitGatewayConnectPeer

Deletes the specified Connect peer.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TransitGatewayConnectPeerId

The ID of the Connect peer.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

transitGatewayConnectPeer

Information about the deleted Connect peer.

Type: TransitGatewayConnectPeer object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteTransitGatewayMeteringPolicy

Deletes a transit gateway metering policy.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TransitGatewayMeteringPolicyId

The ID of the transit gateway metering policy to delete.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

transitGatewayMeteringPolicy

Information about the deleted transit gateway metering policy.

Type: TransitGatewayMeteringPolicy object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

DeleteTransitGatewayMeteringPolicyEntry

Deletes an entry from a transit gateway metering policy.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

PolicyRuleNumber

The rule number of the metering policy entry to delete.

Type: Integer

Required: Yes

TransitGatewayMeteringPolicyId

The ID of the transit gateway metering policy containing the entry to delete.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

transitGatewayMeteringPolicyEntry

Information about the deleted transit gateway metering policy entry.

Type: TransitGatewayMeteringPolicyEntry object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteTransitGatewayMulticastDomain

Deletes the specified transit gateway multicast domain.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TransitGatewayMulticastDomainId

The ID of the transit gateway multicast domain.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

transitGatewayMulticastDomain

Information about the deleted transit gateway multicast domain.

Type: TransitGatewayMulticastDomain object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example deletes the multicast domain `tgw-mcast-domain-0c4905cef7EXAMPLE`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteTransitGatewayMulticastDomain
&TransitGatewayMulticastDomainId=tgw-mcast-domain-02bb79002bEXAMPLE
&AUTHPARAMS
```

Sample Response

```
<DeleteTransitGatewayMulticastDomainResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>19914ba0-eb6c-43aa-9381-0bdafEXAMPLE</requestId>
    <transitGatewayMulticastDomain>
        <creationTime>2019-11-20T22:02:03.000Z</creationTime>
        <state>deleting</state>
        <transitGatewayId>tgw-0d88d2d0d5EXAMPLE</transitGatewayId>
        <transitGatewayMulticastDomainId>tgw-mcast-domain-02bb79002bEXAMPLE</
transitGatewayMulticastDomainId>
    </transitGatewayMulticastDomain>
</DeleteTransitGatewayMulticastDomainResponse>
```

DeleteTransitGatewayPeeringAttachment

Deletes a transit gateway peering attachment.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TransitGatewayAttachmentId

The ID of the transit gateway peering attachment.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

transitGatewayPeeringAttachment

The transit gateway peering attachment.

Type: TransitGatewayPeeringAttachment object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes the specified transit gateway peering attachment by specifying its attachment ID.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteTransitGatewayPeeringAttachment
&TransitGatewayAttachmentId=tgw-attach-12345678901abcd12
&AUTHPARAMS
```

DeleteTransitGatewayPolicyTable

Deletes the specified transit gateway policy table.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TransitGatewayPolicyTableId

The transit gateway policy table to delete.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

transitGatewayPolicyTable

Provides details about the deleted transit gateway policy table.

Type: TransitGatewayPolicyTable object

Errors

For information about the errors that are common to all actions, see Common client error codes.

DeleteTransitGatewayPrefixListReference

Deletes a reference (route) to a prefix list in a specified transit gateway route table.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

PrefixListId

The ID of the prefix list.

Type: String

Required: Yes

TransitGatewayRouteTableId

The ID of the route table.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

transitGatewayPrefixListReference

Information about the deleted prefix list reference.

Type: TransitGatewayPrefixListReference object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes the specified prefix list reference in the specified transit gateway route table.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteTransitGatewayPrefixListReference
&TransitGatewayRouteTableId=tgw-rtb-0f98a0a5d09abcabc
&PrefixListId=pl-001122334455aabbc
&AUTHPARAMS
```

Sample Response

```
<DeleteTransitGatewayPrefixListReferenceResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>482823e8-8165-4312-86ee-example</requestId>
    <transitGatewayPrefixListReference>

DeleteTransitGatewayRoute

Deletes the specified route from the specified transit gateway route table.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DestinationCidrBlock

The CIDR range for the route. This must match the CIDR for the route exactly.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TransitGatewayRouteTableId

The ID of the transit gateway route table.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

route

Information about the route.

Type: TransitGatewayRoute object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteTransitGatewayRouteTable

Deletes the specified transit gateway route table. If there are any route tables associated with the transit gateway route table, you must first run DisassociateRouteTable before you can delete the transit gateway route table. This removes any route tables associated with the transit gateway route table.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TransitGatewayRouteTableId

The ID of the transit gateway route table.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

transitGatewayRouteTable

Information about the deleted transit gateway route table.

Type: TransitGatewayRouteTable object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteTransitGatewayRouteTableAnnouncement

Advertises to the transit gateway that a transit gateway route table is deleted.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TransitGatewayRouteTableAnnouncementId

The transit gateway route table ID that's being deleted.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

transitGatewayRouteTableAnnouncement

Provides details about a deleted transit gateway route table.

Type: TransitGatewayRouteTableAnnouncement object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteTransitGatewayVpcAttachment

Deletes the specified VPC attachment.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TransitGatewayAttachmentId

The ID of the attachment.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

transitGatewayVpcAttachment

Information about the deleted VPC attachment.

Type: TransitGatewayVpcAttachment object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteVerifiedAccessEndpoint

Delete an AWS Verified Access endpoint.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

A unique, case-sensitive token that you provide to ensure idempotency of your modification request. For more information, see Ensuring idempotency.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

VerifiedAccessEndpointId

The ID of the Verified Access endpoint.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

verifiedAccessEndpoint

Details about the Verified Access endpoint.

Type: VerifiedAccessEndpoint object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteVerifiedAccessGroup

Delete an AWS Verified Access group.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

A unique, case-sensitive token that you provide to ensure idempotency of your modification request. For more information, see Ensuring idempotency.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

VerifiedAccessGroupId

The ID of the Verified Access group.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

verifiedAccessGroup

Details about the Verified Access group.

Type: VerifiedAccessGroup object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteVerifiedAccessInstance

Delete an AWS Verified Access instance.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

A unique, case-sensitive token that you provide to ensure idempotency of your modification request. For more information, see Ensuring idempotency.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

VerifiedAccessInstanceId

The ID of the Verified Access instance.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

verifiedAccessInstance

Details about the Verified Access instance.

Type: VerifiedAccessInstance object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteVerifiedAccessTrustProvider

Delete an AWS Verified Access trust provider.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

A unique, case-sensitive token that you provide to ensure idempotency of your modification request. For more information, see Ensuring idempotency.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

VerifiedAccessTrustProviderId

The ID of the Verified Access trust provider.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

verifiedAccessTrustProvider

Details about the Verified Access trust provider.

Type: VerifiedAccessTrustProvider object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteVolume

Deletes the specified EBS volume. The volume must be in the `available` state (not attached to an instance).

The volume can remain in the `deleting` state for several minutes.

For more information, see Delete an Amazon EBS volume in the *Amazon EBS User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

VolumeId

The ID of the volume.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example request deletes the volume with the ID `vol-1234567890abcdef0`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteVolume
&VolumeId=vol-1234567890abcdef0
&AUTHPARAMS
```

Sample Response

```
<DeleteVolumeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</DeleteVolumeResponse>
```

See Also

- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteVpc

Deletes the specified VPC. You must detach or delete all gateways and resources that are associated with the VPC before you can delete it. For example, you must terminate all instances running in the VPC, delete all security groups associated with the VPC (except the default one), delete all route tables associated with the VPC (except the default one), and so on. When you delete the VPC, it deletes the default security group, network ACL, and route table for the VPC.

If you created a flow log for the VPC that you are deleting, note that flow logs for deleted VPCs are eventually automatically removed.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

VpcId

The ID of the VPC.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes the specified VPC.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteVpc
&VpcId=vpc-1a2b3c4d
&AUTHPARAMS
```

Sample Response

```
<DeleteVpcResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
   <return>true</return>
</DeleteVpcResponse>
```

- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteVpcBlockPublicAccessExclusion

Delete a VPC Block Public Access (BPA) exclusion. A VPC BPA exclusion is a mode that can be applied to a single VPC or subnet that exempts it from the account's BPA mode and will allow bidirectional or egress-only access. You can create BPA exclusions for VPCs and subnets even when BPA is not enabled on the account to ensure that there is no traffic disruption to the exclusions when VPC BPA is turned on. To learn more about VPC BPA, see Block public access to VPCs and subnets in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ExclusionId

The ID of the exclusion.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

vpcBlockPublicAccessExclusion

Details about an exclusion.

Type: VpcBlockPublicAccessExclusion object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteVpcEncryptionControl

Deletes a VPC Encryption Control configuration. This removes the encryption policy enforcement from the specified VPC.

For more information, see Enforce VPC encryption in transit in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

VpcEncryptionControlId

The ID of the VPC Encryption Control resource to delete.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

vpcEncryptionControl

Information about the deleted VPC Encryption Control configuration.

Type: VpcEncryptionControl object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteVpcEndpointConnectionNotifications

Deletes the specified VPC endpoint connection notifications.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ConnectionNotificationId.N

The IDs of the notifications.

Type: Array of strings

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

unsuccessful

Information about the notifications that could not be deleted successfully.

Type: Array of UnsuccessfulItem objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes connection notification `vpce-nfn-04bcb952bc8af7123`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteVpcEndpointConnectionNotifications
&ConnectionNotificationId.1=vpce-nfn-04bcb952bc8af7123
&AUTHPARAMS
```

Sample Response

```
<DeleteVpcEndpointConnectionNotificationsResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>2bf45d2e-a871-4375-9a93-f4188example</requestId>
    <unsuccessful/>
</DeleteVpcEndpointConnectionNotificationsResponse>
```

- AWS SDK for Python

- AWS SDK for Ruby V3

DeleteVpcEndpoints

Deletes the specified VPC endpoints.

When you delete a gateway endpoint, we delete the endpoint routes in the route tables for the endpoint.

When you delete a Gateway Load Balancer endpoint, we delete its endpoint network interfaces. You can only delete Gateway Load Balancer endpoints when the routes that are associated with the endpoint are deleted.

When you delete an interface endpoint, we delete its endpoint network interfaces.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

VpcEndpointId.N

The IDs of the VPC endpoints.

Type: Array of strings

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

unsuccessful

Information about the VPC endpoints that were not successfully deleted.

Type: Array of UnsuccessfulItem objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes endpoint `vpce-aa22bb33`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteVpcEndpoints
&VpcEndpointId.1=vpce-aa22bb33
&AUTHPARAMS
```

Sample Response

```
<DeleteVpcEndpointsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <unsuccessful/>
    <requestId>b59c2643-789a-4bf7-aac4-example</requestId>
</DeleteVpcEndpointsResponse>
```

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteVpcEndpointServiceConfigurations

Deletes the specified VPC endpoint service configurations. Before you can delete an endpoint service configuration, you must reject any `Available` or `PendingAcceptance` interface endpoint connections that are attached to the service.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ServiceId.N

The IDs of the services.

Type: Array of strings

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

unsuccessful

Information about the service configurations that were not deleted, if applicable.

Type: Array of UnsuccessfulItem objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes your VPC endpoint service configuration `vpce-svc-03d5ebb7d9579a2b3`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteVpcEndpointServiceConfigurations
ServiceId.1=vpce-svc-03d5ebb7d9579a2b3
&AUTHPARAMS
```

Sample Response

```
<DeleteVpcEndpointServiceConfigurationsResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>12345d2e-a871-4375-9a93-f4188example</requestId>
    <unsuccessful/>
</DeleteVpcEndpointServiceConfigurations>
```

- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteVpcPeeringConnection

Deletes a VPC peering connection. Either the owner of the requester VPC or the owner of the accepter VPC can delete the VPC peering connection if it's in the `active` state. The owner of the requester VPC can delete a VPC peering connection in the `pending-acceptance` state. You cannot delete a VPC peering connection that's in the `failed` or `rejected` state.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

VpcPeeringConnectionId

The ID of the VPC peering connection.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes the specified VPC peering connection.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteVpcPeeringConnection
 &vpcPeeringConnectionId=pcx-1a2b3c4d
&AUTHPARAMS
```

Sample Response

```
<DeleteVpcPeeringConnectionResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
  <return>true</return>
</DeleteVpcPeeringConnectionResponse>
```

See Also

- AWS SDK for Ruby V3

DeleteVpnConcentrator

Deletes the specified VPN concentrator.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

VpnConcentratorId

The ID of the VPN concentrator to delete.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes VPN Concentrator `vcn-0767cb7521c5c4945`.

Sample Request

```
https://ec2.us-east-1.amazonaws.com/?Version=2016-11-15&Action=DeleteVpnConcentrator
&VpnConcentratorId=vcn-0767cb7521c5c4945
```

Sample Response

```
<DeleteVpnConcentratorResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>2912d285-2e87-4e3b-aa4b-80772cc5913b</requestId>
    <return>true</return>
</DeleteVpnConcentratorResponse>
```

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeleteVpnConnection

Deletes the specified VPN connection.

If you're deleting the VPC and its associated components, we recommend that you detach the virtual private gateway from the VPC and delete the VPC before deleting the VPN connection. If you believe that the tunnel credentials for your VPN connection have been compromised, you can delete the VPN connection and create a new one that has new keys, without needing to delete the VPC or virtual private gateway. If you create a new VPN connection, you must reconfigure the customer gateway device using the new configuration information returned with the new VPN connection ID.

For certificate-based authentication, delete all AWS Certificate Manager (ACM) private certificates used for the AWS-side tunnel endpoints for the VPN connection before deleting the VPN connection.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

VpnConnectionId

The ID of the VPN connection.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes the specified VPN connection.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteVpnConnection
&vpnConnectionId=vpn-44a8938f
&AUTHPARAMS
```

Sample Response

```
<DeleteVpnConnectionResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
   <return>true</return>
</DeleteVpnConnectionResponse>
```

- AWS SDK for Ruby V3

DeleteVpnConnectionRoute

Deletes the specified static route associated with a VPN connection between an existing virtual private gateway and a VPN customer gateway. The static route allows traffic to be routed from the virtual private gateway to the VPN customer gateway.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DestinationCidrBlock

The CIDR block associated with the local subnet of the customer network.

Type: String

Required: Yes

VpnConnectionId

The ID of the VPN connection.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes a static route to the destination CIDR block `11.12.0.0/16` associated with the VPN connection with the ID `vpn-83ad48ea`. Note that when using the Query API, the "/" is denoted as "%2F".

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteVpnConnectionRoute
&DestinationCidrBlock=11.12.0.0%2F16
&VpnConnectionId=vpn-83ad48ea
&AUTHPARAMS
```

Sample Response

```
<DeleteVpnConnectionRouteResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>4f35a1b2-c2c3-4093-b51f-abb9d7311990</requestId>
    <return>true</return>
</DeleteVpnConnectionRouteResponse>
```

- AWS SDK for Ruby V3

DeleteVpnGateway

Deletes the specified virtual private gateway. You must first detach the virtual private gateway from the VPC. Note that you don't need to delete the virtual private gateway if you plan to delete and recreate the VPN connection between your VPC and your network.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

VpnGatewayId

The ID of the virtual private gateway.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deletes the specified virtual private gateway.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeleteVpnGateway
&vpnGatewayId=vgw-8db04f81
&AUTHPARAMS
```

Sample Response

```
<DeleteVpnGatewayResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
   <return>true</return>
</DeleteVpnGatewayResponse>
```

DeprovisionByoipCidr

Releases the specified address range that you provisioned for use with your AWS resources through bring your own IP addresses (BYOIP) and deletes the corresponding address pool.

Before you can release an address range, you must stop advertising it and you must not have any IP addresses allocated from its address range.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Cidr

The address range, in CIDR notation. The prefix must be the same prefix that you specified when you provisioned the address range.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

byoipCidr

Information about the address range.

Type: ByoipCidr object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeprovisionIpamByoasn

Deprovisions your Autonomous System Number (ASN) from your AWS account. This action can only be called after any BYOIP CIDR associations are removed from your AWS account with DisassociateIpamByoasn. For more information, see Tutorial: Bring your ASN to IPAM in the *Amazon VPC IPAM guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Asn

An ASN.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

IpamId

The IPAM ID.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

byoasn

An ASN and BYOIP CIDR association.

Type: Byoasn object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DeprovisionIpamPoolCidr

Deprovision a CIDR provisioned from an IPAM pool. If you deprovision a CIDR from a pool that has a source pool, the CIDR is recycled back into the source pool. For more information, see Deprovision pool CIDRs in the *Amazon VPC IPAM User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Cidr

The CIDR which you want to deprovision from the pool.

Type: String

Required: No

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

IpamPoolId

The ID of the pool that has the CIDR you want to deprovision.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

ipamPoolCidr

The deprovisioned pool CIDR.

Type: IpamPoolCidr object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

DeprovisionPublicIpv4PoolCidr

Deprovision a CIDR from a public IPv4 pool.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Cidr

The CIDR you want to deprovision from the pool.

Type: String

Required: Yes

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

PoolId

The ID of the pool that you want to deprovision the CIDR from.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

deprovisionedAddressSet

The deprovisioned CIDRs.

Type: Array of strings

poolId

The ID of the pool that you deprovisioned the CIDR from.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

DeregisterImage

Deregisters the specified AMI. A deregistered AMI can't be used to launch new instances.

If a deregistered EBS-backed AMI matches a Recycle Bin retention rule, it moves to the Recycle Bin for the specified retention period. It can be restored before its retention period expires, after which it is permanently deleted. If the deregistered AMI doesn't match a retention rule, it is permanently deleted immediately. For more information, see Recover deleted Amazon EBS snapshots and EBS-backed AMIs with Recycle Bin in the *Amazon EBS User Guide*.

When deregistering an EBS-backed AMI, you can optionally delete its associated snapshots at the same time. However, if a snapshot is associated with multiple AMIs, it won't be deleted even if specified for deletion, although the AMI will still be deregistered.

Deregistering an AMI does not delete the following:

- Instances already launched from the AMI. You'll continue to incur usage costs for the instances until you terminate them.
- For EBS-backed AMIs: Snapshots that are associated with multiple AMIs. You'll continue to incur snapshot storage costs.
- For instance store-backed AMIs: The files uploaded to Amazon S3 during AMI creation. You'll continue to incur S3 storage costs.

For more information, see Deregister an Amazon EC2 AMI in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DeleteAssociatedSnapshots

Specifies whether to delete the snapshots associated with the AMI during deregistration.

> **Note**
>
> If a snapshot is associated with multiple AMIs, it is not deleted, regardless of this setting.

Default: The snapshots are not deleted.

Type: Boolean

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ImageId

The ID of the AMI.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

deleteSnapshotResultSet

The deletion result for each snapshot associated with the AMI, including the snapshot ID and its success or error code.

Type: Array of DeleteSnapshotReturnCode objects

requestId

The ID of the request.

Type: String

return

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example request deregisters the specified AMI.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeregisterImage
&ImageId=ami-4fa54026
&AUTHPARAMS
```

Sample Response

```
<DeregisterImageResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</DeregisterImageResponse>
```

DeregisterInstanceEventNotificationAttributes

Deregisters tag keys to prevent tags that have the specified tag keys from being included in scheduled event notifications for resources in the Region.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InstanceTagAttribute

Information about the tag keys to deregister.

Type: DeregisterInstanceTagAttributeRequest object

Required: No

Response Elements

The following elements are returned by the service.

instanceTagAttribute

The resulting set of tag keys.

Type: InstanceTagNotificationAttribute object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

DeregisterTransitGatewayMulticastGroupMembers

Deregisters the specified members (network interfaces) from the transit gateway multicast group.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

GroupIpAddress

The IP address assigned to the transit gateway multicast group.

Type: String

Required: No

NetworkInterfaceIds.N

The IDs of the group members' network interfaces.

Type: Array of strings

Required: No

TransitGatewayMulticastDomainId

The ID of the transit gateway multicast domain.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

deregisteredMulticastGroupMembers

Information about the deregistered members.

Type: TransitGatewayMulticastDeregisteredGroupMembers object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example deregisters the network interface as a group member `eni-0e246d3269EXAMPLE` from the multicast domain `tgw-mcast-domain-0c4905cef7EXAMPLE`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeregisterTransitGatewayMulticastGroupMembers
&TransitGatewayMulticastDomainId=tgw-mcast-domain-0c4905cef7EXAMPLE
&NetworkInterfaceIds=eni-0e246d3269EXAMPLE
&AUTHPARAMS
```

Sample Response

```
<DeregisterTransitGatewayMulticastGroupMembersResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>6f4167cd-0870-4858-8872-f1c34EXAMPLE</requestId>
    <registeredMulticastGroupMembers>
        <groupIpAddress>224.0.1.0</groupIpAddress>
```

```
        <registeredNetworkInterfaceIds>
            <item>eni-0e246d3269EXAMPLE</item>
        </registeredNetworkInterfaceIds>
        <transitGatewayMulticastDomainId>tgw-mcast-domain-0c4905cef7EXAMPLE</
transitGatewayMulticastDomainId>
    </registeredMulticastGroupMembers>
</DeregisterTransitGatewayMulticastGroupMembersResponse>
```

DeregisterTransitGatewayMulticastGroupSources

Deregisters the specified sources (network interfaces) from the transit gateway multicast group.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

GroupIpAddress

The IP address assigned to the transit gateway multicast group.

Type: String

Required: No

NetworkInterfaceIds.N

The IDs of the group sources' network interfaces.

Type: Array of strings

Required: No

TransitGatewayMulticastDomainId

The ID of the transit gateway multicast domain.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

deregisteredMulticastGroupSources

Information about the deregistered group sources.

Type: TransitGatewayMulticastDeregisteredGroupSources object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example deregisters the network interface as a group source `eni-07f290fc3cEXAMPLE` from the multicast domain `tgw-mcast-domain-0c4905cef7EXAMPLE`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DeregisterTransitGatewayMulticastGroupSources
&TransitGatewayMulticastDomainId=tgw-mcast-domain-0c4905cef7EXAMPLE
&NetworkInterfaceIds=eni-07f290fc3cEXAMPLE
&AUTHPARAMS
```

Sample Response

```
<DeregisterTransitGatewayMulticastGroupSourcesResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>1ca916e8-a4b5-4ff8-9fc3-3052dEXAMPLE</requestId>
    <deregisteredMulticastGroupSources>
        <deregisteredNetworkInterfaceIds>
```

```
            <item>eni-07f290fc3cEXAMPLE</item>
        </deregisteredNetworkInterfaceIds>
        <groupIpAddress>224.0.1.0</groupIpAddress>
        <transitGatewayMulticastDomainId>tgw-mcast-domain-0c4905cef7EXAMPLE</
transitGatewayMulticastDomainId>
    </deregisteredMulticastGroupSources>
</DeregisterTransitGatewayMulticastGroupSourcesResponse>
```

DescribeAccountAttributes

Describes attributes of your AWS account. The following are the supported account attributes:

- `default-vpc`: The ID of the default VPC for your account, or none.
- `max-instances`: This attribute is no longer supported. The returned value does not reflect your actual vCPU limit for running On-Demand Instances. For more information, see On-Demand Instance Limits in the *Amazon Elastic Compute Cloud User Guide*.
- `max-elastic-ips`: The maximum number of Elastic IP addresses that you can allocate.
- `supported-platforms`: This attribute is deprecated.
- `vpc-max-elastic-ips`: The maximum number of Elastic IP addresses that you can allocate.
- `vpc-max-security-groups-per-interface`: The maximum number of security groups that you can assign to a network interface.

> **Note**
>
> The order of the elements in the response, including those within nested structures, might vary. Applications should not assume the elements appear in a particular order.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AttributeName.N

The account attribute names.

Type: Array of strings

Valid Values: `supported-platforms | default-vpc`

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

accountAttributeSet

Information about the account attributes.

Type: Array of AccountAttribute objects

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeAddresses

Describes the specified Elastic IP addresses or all of your Elastic IP addresses.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AllocationId.N

Information about the allocation IDs.

Type: Array of strings

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters. Filter names and values are case-sensitive.

- `allocation-id` - The allocation ID for the address.
- `association-id` - The association ID for the address.
- `instance-id` - The ID of the instance the address is associated with, if any.
- `network-border-group` - A unique set of Availability Zones, Local Zones, or Wavelength Zones from where AWS advertises IP addresses.
- `network-interface-id` - The ID of the network interface that the address is associated with, if any.
- `network-interface-owner-id` - The AWS account ID of the owner.
- `private-ip-address` - The private IP address associated with the Elastic IP address.

- `public-ip` - The Elastic IP address, or the carrier IP address.
- `tag:<key>` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.

Type: Array of Filter objects

Required: No

PublicIp.N

One or more Elastic IP addresses.

Default: Describes all your Elastic IP addresses.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

addressesSet

Information about the Elastic IP addresses.

Type: Array of Address objects

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example request describes a specific Elastic IP address allocated to your account.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeAddresses
&AllocationId.1= eipalloc-08229861
&AUTHPARAMS
```

Sample Response

```
<DescribeAddressesResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>f7de5e98-491a-4c19-a92d-908d6EXAMPLE</requestId>
   <addressesSet>
     <item>
       <publicIp>203.0.113.41</publicIp>
       <allocationId>eipalloc-08229861</allocationId>
       <domain>vpc</domain>
       <instanceId>i-0598c7d356eba48d7</instanceId>
       <associationId>eipassoc-f0229899</associationId>
       <networkInterfaceId>eni-ef229886</networkInterfaceId>
       <networkInterfaceOwnerId>053230519467</networkInterfaceOwnerId>
       <privateIpAddress>10.0.0.228</privateIpAddress>
     </item>
   </addressesSet>
</DescribeAddressesResponse>
```

DescribeAddressesAttribute

Describes the attributes of the specified Elastic IP addresses. For requirements, see Using reverse DNS for email applications.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AllocationId.N

[EC2-VPC] The allocation IDs.

Type: Array of strings

Required: No

Attribute

The attribute of the IP address.

Type: String

Valid Values: `domain-name`

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

addressSet

Information about the IP addresses.

Type: Array of AddressAttribute objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

DescribeAddressTransfers

Describes an Elastic IP address transfer. For more information, see Transfer Elastic IP addresses in the *Amazon VPC User Guide*.

When you transfer an Elastic IP address, there is a two-step handshake between the source and transfer AWS accounts. When the source account starts the transfer, the transfer account has seven days to accept the Elastic IP address transfer. During those seven days, the source account can view the pending transfer by using this action. After seven days, the transfer expires and ownership of the Elastic IP address returns to the source account. Accepted transfers are visible to the source account for 14 days after the transfers have been accepted.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AllocationId.N

The allocation IDs of Elastic IP addresses.

Type: Array of strings

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

MaxResults

The maximum number of address transfers to return in one page of results.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

Specify the pagination token from a previous request to retrieve the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

addressTransferSet

The Elastic IP address transfer.

Type: Array of AddressTransfer objects

nextToken

Specify the pagination token from a previous request to retrieve the next page of results.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeAggregateIdFormat

Describes the longer ID format settings for all resource types in a specific Region. This request is useful for performing a quick audit to determine whether a specific Region is fully opted in for longer IDs (17-character IDs).

This request only returns information about resource types that support longer IDs.

The following resource types support longer IDs: `bundle` | `conversion-task` | `customer-gateway` | `dhcp-options` | `elastic-ip-allocation` | `elastic-ip-association` | `export-task` | `flow-log` | `image` | `import-task` | `instance` | `internet-gateway` | `network-acl` | `network-acl-association` | `network-interface` | `network-interface-attachment` | `prefix-list` | `reservation` | `route-table` | `route-table-association` | `security-group` | `snapshot` | `subnet` | `subnet-cidr-block-association` | `volume` | `vpc` | `vpc-cidr-block-association` | `vpc-endpoint` | `vpc-peering-connection` | `vpn-connection` | `vpn-gateway`.

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

statusSet

Information about each resource's ID format.

Type: Array of IdFormat objects

useLongIdsAggregated

Indicates whether all resource types in the Region are configured to use longer IDs. This value is only `true` if all users are configured to use longer IDs for all resources types in the Region.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes the overall ID format settings for the default Region.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeAggregateIdFormat
&AUTHPARAMS
```

Sample Response

```
<DescribeAggregateIdFormatResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
    <useLongIdsAggregated>true</useLongIdsAggregated>

DescribeAvailabilityZones

Describes the Availability Zones, Local Zones, and Wavelength Zones that are available to you.

For more information about Availability Zones, Local Zones, and Wavelength Zones, see Regions and zones in the *Amazon EC2 User Guide*.

> **Note**
>
> The order of the elements in the response, including those within nested structures, might vary. Applications should not assume the elements appear in a particular order.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AllAvailabilityZones

Include all Availability Zones, Local Zones, and Wavelength Zones regardless of your opt-in status.

If you do not use this parameter, the results include only the zones for the Regions where you have chosen the option to opt in.

Type: Boolean

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `group-long-name` - The long name of the zone group for the Availability Zone (for example, `US West (Oregon) 1`), the Local Zone (for example, for Zone group `us-west-2-lax-1`, it is `US West (Los Angeles)`, or the Wavelength Zone (for example, for Zone group `us-east-1-wl1`, it is `US East (Verizon)`.
- `group-name` - The name of the zone group for the Availability Zone (for example, `us-east-1-zg-1`), the Local Zone (for example, `us-west-2-lax-1`), or the Wavelength Zone (for example, `us-east-1-wl1`).
- `message` - The Zone message.
- `opt-in-status` - The opt-in status (`opted-in` | `not-opted-in` | `opt-in-not-required`).
- `parent-zone-id` - The ID of the zone that handles some of the Local Zone and Wavelength Zone control plane operations, such as API calls.
- `parent-zone-name` - The ID of the zone that handles some of the Local Zone and Wavelength Zone control plane operations, such as API calls.
- `region-name` - The name of the Region for the Zone (for example, `us-east-1`).
- `state` - The state of the Availability Zone, the Local Zone, or the Wavelength Zone (`available` | `unavailable` | `constrained`).
- `zone-id` - The ID of the Availability Zone (for example, `use1-az1`), the Local Zone (for example, `usw2-lax1-az1`), or the Wavelength Zone (for example, `us-east-1-wl1-bos-wlz-1`).
- `zone-name` - The name of the Availability Zone (for example, `us-east-1a`), the Local Zone (for example, `us-west-2-lax-1a`), or the Wavelength Zone (for example, `us-east-1-wl1-bos-wlz-1`).
- `zone-type` - The type of zone (`availability-zone` | `local-zone` | `wavelength-zone`).

Type: Array of Filter objects

Required: No

ZoneId.N

The IDs of the Availability Zones, Local Zones, and Wavelength Zones.

Type: Array of strings

Required: No

ZoneName.N

The names of the Availability Zones, Local Zones, and Wavelength Zones.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

availabilityZoneInfo

Information about the Availability Zones, Local Zones, and Wavelength Zones.

Type: Array of AvailabilityZone objects

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example request describes the zones in the current Region that are enabled for your account.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeAvailabilityZones
&AUTHPARAMS
```

Sample Response

```
<DescribeAvailabilityZonesResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>e23c5a54-a29c-43ee-8b55-0c13c26e9e01</requestId>
```

```
    <availabilityZoneInfo>
        <item>

DescribeAwsNetworkPerformanceMetricSubscriptions

Describes the current Infrastructure Performance metric subscriptions.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 100.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

subscriptionSet

Describes the current Infrastructure Performance subscriptions.

Type: Array of Subscription objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for Ruby V3

DescribeBundleTasks

Describes the specified bundle tasks or all of your bundle tasks.

> **Note**
>
> Completed bundle tasks are listed for only a limited time. If your bundle task is no longer in the list, you can still register an AMI from it. Just use `RegisterImage` with the Amazon S3 bucket name and image manifest name you provided to the bundle task.

> **Note**
>
> The order of the elements in the response, including those within nested structures, might vary. Applications should not assume the elements appear in a particular order.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

BundleId.N

The bundle task IDs.

Default: Describes all your bundle tasks.

Type: Array of strings

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `bundle-id` - The ID of the bundle task.
- `error-code` - If the task failed, the error code returned.
- `error-message` - If the task failed, the error message returned.
- `instance-id` - The ID of the instance.
- `progress` - The level of task completion, as a percentage (for example, 20%).
- `s3-bucket` - The Amazon S3 bucket to store the AMI.
- `s3-prefix` - The beginning of the AMI name.
- `start-time` - The time the task started (for example, 2013-09-15T17:15:20.000Z).
- `state` - The state of the task (`pending` | `waiting-for-shutdown` | `bundling` | `storing` | `cancelling` | `complete` | `failed`).
- `update-time` - The time of the most recent update for the task.

Type: Array of Filter objects

Required: No

Response Elements

The following elements are returned by the service.

bundleInstanceTasksSet

Information about the bundle tasks.

Type: Array of BundleTask objects

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example describes the status of the specified bundle task.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeBundleTasks
&bundleId.1=bun-c1a540a8
&AUTHPARAMS
```

Sample Response

```
<DescribeBundleTasksResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <bundleInstanceTasksSet>
      <item>
         <instanceId>i-1234567890abcdef0</instanceId>
         <bundleId>bun-c1a540a8</bundleId>
         <state>cancelling</state>
         <startTime>2008-10-07T11:41:50.000Z</startTime>
         <updateTime>2008-10-07T11:51:50.000Z</updateTime>
         <storage>
            <S3>
               <bucket>myawsbucket</bucket>
               <prefix>winami</prefix>
            </S3>
         </storage>
         <progress>20%</progress>
      </item>
   <bundleInstanceTasksSet>
</DescribeBundleTasksResponse>
```

Example 2

This example filters the response to include only bundle tasks whose state is either `complete` or `failed`, and in addition are targeted for the Amazon S3 bucket named `myawsbucket`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeBundleTasks
```

```
&Filter.1.Name=s3-bucket
&Filter.1.Value.1=myawsbucket
&Filter.2.Name=state
&Filter.2.Name.1=complete
&Filter.2.Name.2=failed
&AUTHPARAMS
```

DescribeByoipCidrs

Describes the IP address ranges that were provisioned for use with AWS resources through through bring your own IP addresses (BYOIP).

To describe the address pools that were created when you provisioned the address ranges, use DescribePublicIpv4Pools or DescribeIpv6Pools.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 100.

Required: Yes

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

byoipCidrSet

Information about your address ranges.

Type: Array of ByoipCidr objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

DescribeCapacityBlockExtensionHistory

Describes the events for the specified Capacity Block extension during the specified time.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CapacityReservationId.N

The IDs of Capacity Block reservations that you want to display the history for.

Type: Array of strings

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters

- `availability-zone` - The Availability Zone of the extension.
- `availability-zone-id` - The Availability Zone ID of the extension.
- `capacity-block-extension-offering-id` - The ID of the extension offering.
- `capacity-block-extension-status` - The status of the extension (`payment-pending` | `payment-failed` | `payment-succeeded`).
- `capacity-reservation-id` - The reservation ID of the extension.
- `instance-type` - The instance type of the extension.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 1000.

Required: No

NextToken

The token to use to retrieve the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

capacityBlockExtensionSet

Describes one or more of your Capacity Block extensions. The results describe only the Capacity Block extensions in the AWS Region that you're currently using.

Type: Array of CapacityBlockExtension objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2

- AWS SDK for Ruby V3

DescribeCapacityBlockExtensionOfferings

Describes Capacity Block extension offerings available for purchase in the AWS Region that you're currently using.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CapacityBlockExtensionDurationHours

The duration of the Capacity Block extension offering in hours.

Type: Integer

Required: Yes

CapacityReservationId

The ID of the Capacity reservation to be extended.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 1000.

Required: No

NextToken

The token to use to retrieve the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

capacityBlockExtensionOfferingSet

The recommended Capacity Block extension offerings for the dates specified.

Type: Array of CapacityBlockExtensionOffering objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2

- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeCapacityBlockOfferings

Describes Capacity Block offerings available for purchase in the AWS Region that you're currently using. With Capacity Blocks, you can purchase a specific GPU instance type or EC2 UltraServer for a period of time.

To search for an available Capacity Block offering, you specify a reservation duration and instance count.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AllAvailabilityZones

Include all Availability Zones and Local Zones, regardless of your opt-in status. If you do not use this parameter, the results include available offerings from all Availability Zones in the AWS Region and Local Zones you are opted into.

Type: Boolean

Required: No

CapacityDurationHours

The reservation duration for the Capacity Block, in hours. You must specify the duration in 1-day increments up 14 days, and in 7-day increments up to 182 days.

Type: Integer

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

EndDateRange

The latest end date for the Capacity Block offering.

Type: Timestamp

Required: No

InstanceCount

The number of instances for which to reserve capacity. Each Capacity Block can have up to 64 instances, and you can have up to 256 instances across Capacity Blocks.

Type: Integer

Required: No

InstanceType

The type of instance for which the Capacity Block offering reserves capacity.

Type: String

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 1000.

Required: No

NextToken

The token to use to retrieve the next page of results.

Type: String

Required: No

StartDateRange

The earliest start date for the Capacity Block offering.

Type: Timestamp

Required: No

UltraserverCount

The number of EC2 UltraServers in the offerings.

Type: Integer

Required: No

UltraserverType

The EC2 UltraServer type of the Capacity Block offerings.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

capacityBlockOfferingSet

The recommended Capacity Block offering for the dates specified.

Type: Array of CapacityBlockOffering objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeCapacityBlocks

Describes details about Capacity Blocks in the AWS Region that you're currently using.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CapacityBlockId.N

The IDs of the Capacity Blocks.

Type: Array of strings

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `capacity-block-id` - The ID of the Capacity Block.
- `ultraserver-type` - The Capacity Block type. The type can be `instances` or `ultraservers`.
- `availability-zone` - The Availability Zone of the Capacity Block.
- `start-date` - The date and time at which the Capacity Block was started.
- `end-date` - The date and time at which the Capacity Block expires. When a Capacity Block expires, all instances in the Capacity Block are terminated.
- `create-date` - The date and time at which the Capacity Block was created.
- `state` - The state of the Capacity Block (`active` | `expired` | `unavailable` | `cancelled` | `failed` | `scheduled` | `payment-pending` | `payment-failed`).

- `tags` - The tags assigned to the Capacity Block.

  Type: Array of Filter objects

  Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 1000.

Required: No

NextToken

The token to use to retrieve the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

capacityBlockSet

The Capacity Blocks.

Type: Array of CapacityBlock objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeCapacityBlockStatus

Describes the availability of capacity for the specified Capacity blocks, or all of your Capacity Blocks.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CapacityBlockId.N

The ID of the Capacity Block.

Type: Array of strings

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `interconnect-status` - The status of the interconnect for the Capacity Block (ok | `impaired` | `insufficient-data`).

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 1000.

Required: No

NextToken

The token to use to retrieve the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

capacityBlockStatusSet

The availability of capacity for a Capacity Block.

Type: Array of CapacityBlockStatus objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeCapacityManagerDataExports

Describes one or more Capacity Manager data export configurations. Returns information about export settings, delivery status, and recent export activity.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CapacityManagerDataExportId.N

The IDs of the data export configurations to describe. If not specified, all export configurations are returned.

Type: Array of strings

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters to narrow the results. Supported filters include export status, creation date, and S3 bucket name.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return in a single call. If not specified, up to 1000 results are returned.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results. Use this value in a subsequent call to retrieve additional results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

capacityManagerDataExportSet

Information about the data export configurations, including export settings, delivery status, and recent activity.

Type: Array of CapacityManagerDataExportResponse objects

nextToken

The token to use to retrieve the next page of results. This value is null when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeCapacityReservationBillingRequests

Describes a request to assign the billing of the unused capacity of a Capacity Reservation. For more information, see Billing assignment for shared Amazon EC2 Capacity Reservations.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CapacityReservationId.N

The ID of the Capacity Reservation.

Type: Array of strings

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `status` - The state of the request (`pending` | `accepted` | `rejected` | `cancelled` | `revoked` | `expired`).
- `requested-by` - The account ID of the Capacity Reservation owner that initiated the request. Not supported if you specify `requested-by` for **Role**.
- `unused-reservation-billing-owner` - The ID of the consumer account to which the request was sent. Not supported if you specify `unused-reservation-billing-owner` for **Role**.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 1000.

Required: No

NextToken

The token to use to retrieve the next page of results.

Type: String

Required: No

Role

Specify one of the following:

- `odcr-owner` - If you are the Capacity Reservation owner, specify this value to view requests that you have initiated. Not supported with the `requested-by` filter.
- `unused-reservation-billing-owner` - If you are the consumer account, specify this value to view requests that have been sent to you. Not supported with the `unused-reservation-billing-owner` filter.

Type: String

Valid Values: `odcr-owner | unused-reservation-billing-owner`

Required: Yes

Response Elements

The following elements are returned by the service.

capacityReservationBillingRequestSet

Information about the request.

Type: Array of CapacityReservationBillingRequest objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeCapacityReservationFleets

Describes one or more Capacity Reservation Fleets.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CapacityReservationFleetId.N

The IDs of the Capacity Reservation Fleets to describe.

Type: Array of strings

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `state` - The state of the Fleet (`submitted` | `modifying` | `active` | `partially_fulfilled` | `expiring` | `expired` | `cancelling` | `cancelled` | `failed`).
- `instance-match-criteria` - The instance matching criteria for the Fleet. Only open is supported.
- `tenancy` - The tenancy of the Fleet (`default` | `dedicated`).
- `allocation-strategy` - The allocation strategy used by the Fleet. Only `prioritized` is supported.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 100.

Required: No

NextToken

The token to use to retrieve the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

capacityReservationFleetSet

Information about the Capacity Reservation Fleets.

Type: Array of CapacityReservationFleet objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeCapacityReservations

Describes one or more of your Capacity Reservations. The results describe only the Capacity Reservations in the AWS Region that you're currently using.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CapacityReservationId.N

The ID of the Capacity Reservation.

Type: Array of strings

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `instance-type` - The type of instance for which the Capacity Reservation reserves capacity.
- `owner-id` - The ID of the AWS account that owns the Capacity Reservation.
- `instance-platform` - The type of operating system for which the Capacity Reservation reserves capacity.
- `availability-zone` - The Availability Zone of the Capacity Reservation.
- `tenancy` - Indicates the tenancy of the Capacity Reservation. A Capacity Reservation can have one of the following tenancy settings:
  - `default` - The Capacity Reservation is created on hardware that is shared with other AWS accounts.

  - `dedicated` - The Capacity Reservation is created on single-tenant hardware that is dedicated to a single AWS account.
- `outpost-arn` - The Amazon Resource Name (ARN) of the Outpost on which the Capacity Reservation was created.
- `state` - The current state of the Capacity Reservation. A Capacity Reservation can be in one of the following states:
  - `active`- The Capacity Reservation is active and the capacity is available for your use.
  - `expired` - The Capacity Reservation expired automatically at the date and time specified in your request. The reserved capacity is no longer available for your use.
  - `cancelled` - The Capacity Reservation was cancelled. The reserved capacity is no longer available for your use.
  - `pending` - The Capacity Reservation request was successful but the capacity provisioning is still pending.
  - `failed` - The Capacity Reservation request has failed. A request might fail due to invalid request parameters, capacity constraints, or instance limit constraints. Failed requests are retained for 60 minutes.
- `start-date` - The date and time at which the Capacity Reservation was started.
- `end-date` - The date and time at which the Capacity Reservation expires. When a Capacity Reservation expires, the reserved capacity is released and you can no longer launch instances into it. The Capacity Reservation's state changes to expired when it reaches its end date and time.
- `end-date-type` - Indicates the way in which the Capacity Reservation ends. A Capacity Reservation can have one of the following end types:
  - `unlimited` - The Capacity Reservation remains active until you explicitly cancel it.
  - `limited` - The Capacity Reservation expires automatically at a specified date and time.
- `instance-match-criteria` - Indicates the type of instance launches that the Capacity Reservation accepts. The options include:
  - `open` - The Capacity Reservation accepts all instances that have matching attributes (instance type, platform, and Availability Zone). Instances that have matching attributes launch into the Capacity Reservation automatically without specifying any additional parameters.

- `targeted` - The Capacity Reservation only accepts instances that have matching attributes (instance type, platform, and Availability Zone), and explicitly target the Capacity Reservation. This ensures that only permitted instances can use the reserved capacity.
- `placement-group-arn` - The ARN of the cluster placement group in which the Capacity Reservation was created.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 1000.

Required: No

NextToken

The token to use to retrieve the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

capacityReservationSet

Information about the Capacity Reservations.

Type: Array of CapacityReservation objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeCapacityReservationTopology

Describes a tree-based hierarchy that represents the physical host placement of your pending or active Capacity Reservations within an Availability Zone or Local Zone. You can use this information to determine the relative proximity of your capacity within the AWS network before it is launched and use this information to allocate capacity together to support your tightly coupled workloads.

Capacity Reservation topology is supported for specific instance types only. For more information, see Prerequisites for Amazon EC2 instance topology in the *Amazon EC2 User Guide*.

> **Note**
>
> The Amazon EC2 API follows an eventual consistency model due to the distributed nature of the system supporting it. As a result, when you call the DescribeCapacityReservationTopology API command immediately after launching instances, the response might return a `null` value for `capacityBlockId` because the data might not have fully propagated across all subsystems. For more information, see Eventual consistency in the Amazon EC2 API in the *Amazon EC2 Developer Guide*.

For more information, see Amazon EC2 topology in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CapacityReservationId.N

The Capacity Reservation IDs.

Default: Describes all your Capacity Reservations.

Constraints: Maximum 100 explicitly specified Capacity Reservation IDs.

Type: Array of strings

Required: No

DryRun

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `availability-zone` - The name of the Availability Zone (for example, `us-west-2a`) or Local Zone (for example, `us-west-2-lax-1b`) that the Capacity Reservation is in.
- `instance-type` - The instance type (for example, `p4d.24xlarge`) or instance family (for example, `p4d*`). You can use the `*` wildcard to match zero or more characters, or the `?` wildcard to match zero or one character.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

You can't specify this parameter and the Capacity Reservation IDs parameter in the same request.

Default: `10`

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 10.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

capacityReservationSet

Information about the topology of each Capacity Reservation.

Type: Array of CapacityReservationTopology objects

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeCarrierGateways

Describes one or more of your carrier gateways.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CarrierGatewayId.N

One or more carrier gateway IDs.

Type: Array of strings

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `carrier-gateway-id` - The ID of the carrier gateway.
- `state` - The state of the carrier gateway (`pending` | `failed` | `available` | `deleting` | `deleted`).
- `owner-id` - The AWS account ID of the owner of the carrier gateway.
- `tag:<key>` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.

- `vpc-id` - The ID of the VPC associated with the carrier gateway.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

carrierGatewaySet

Information about the carrier gateway.

Type: Array of CarrierGateway objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeClassicLinkInstances

> **Note**
>
> This action is deprecated.

Describes your linked EC2-Classic instances. This request only returns information about EC2-Classic instances linked to a VPC through ClassicLink. You cannot use this request to return information about other instances.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `group-id` - The ID of a VPC security group that's associated with the instance.
- `instance-id` - The ID of the instance.
- `tag` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.
- `vpc-id` - The ID of the VPC to which the instance is linked.

Type: Array of Filter objects

Required: No

InstanceId.N

The instance IDs. Must be instances linked to a VPC through ClassicLink.

Type: Array of strings

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Constraint: If the value is greater than 1000, we return only 1000 items.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

instancesSet

Information about one or more linked EC2-Classic instances.

Type: Array of ClassicLinkInstance objects

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

DescribeClientVpnAuthorizationRules

Describes the authorization rules for a specified Client VPN endpoint.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientVpnEndpointId

The ID of the Client VPN endpoint.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters. Filter names and values are case-sensitive.

- `description` - The description of the authorization rule.
- `destination-cidr` - The CIDR of the network to which the authorization rule applies.
- `group-id` - The ID of the Active Directory group to which the authorization rule grants access.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return for the request in a single page. The remaining results can be seen by sending another request with the nextToken value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token to retrieve the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

authorizationRule

Information about the authorization rules.

Type: Array of AuthorizationRule objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes the authorization rules for a specific Client VPN endpoint.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeClientVpnAuthorizationRules
&ClientVpnEndpointId.1=cvpn-endpoint-EXAMPLEc8db8d3536
&AUTHPARAMS
```

Sample Response

```
<DescribeClientVpnAuthorizationRulesResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>9d5c69db-763e-4b63-88ee-EXAMPLE</requestId>
    <authorizationRule>
        <item>
            <accessAll>true</accessAll>
            <description>auth-rule-one</description>
            <destinationCidr>10.0.0.0/16</destinationCidr>
            <clientVpnEndpointId>cvpn-endpoint-EXAMPLEc8db8d3536</clientVpnEndpointId>
            <groupId/>
            <status>
                <code>active</code>
            </status>
        </item>
    </authorizationRule>
</DescribeClientVpnAuthorizationRulesResponse>
```

- AWS SDK for Ruby V3

DescribeClientVpnConnections

Describes active client connections and connections that have been terminated within the last 60 minutes for the specified Client VPN endpoint.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientVpnEndpointId

The ID of the Client VPN endpoint.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters. Filter names and values are case-sensitive.

- `connection-id` - The ID of the connection.
- `username` - For Active Directory client authentication, the user name of the client who established the client connection.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return for the request in a single page. The remaining results can be seen by sending another request with the nextToken value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token to retrieve the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

connections

Information about the active and terminated client connections.

Type: Array of ClientVpnConnection objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes Client VPN endpoint connections.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeClientVpnConnections
&ClientVpnEndpointId=cvpn-endpoint-00c5d11fc4EXAMPLE
&TargetNetworkCidr=10.0.0.0/16
&RevokeAllGroups=true
&AUTHPARAMS
```

Sample Response

```
<DescribeClientVpnConnectionsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>7263df00-d3ed-4f32-a3b9-88177EXAMPLE</requestId>
    <connections>
        <item>
            <clientIp>11.0.0.98</clientIp>
            <commonName>client1</commonName>
            <connectionEndTime>2018-12-13 18:38:10</connectionEndTime>
            <connectionEstablishedTime>2018-12-13 18:32:49</connectionEstablishedTime>
            <connectionId>cvpn-connection-010b1282b7EXAMPLE</connectionId>
            <egressBytes>14891</egressBytes>
            <egressPackets>309</egressPackets>
            <clientVpnEndpointId>cvpn-endpoint-00c5d11fc4EXAMPLE</clientVpnEndpointId>
            <ingressBytes>14947</ingressBytes>
            <ingressPackets>285</ingressPackets>
            <status>
                <code>terminated</code>
            </status>
            <timestamp>2018-12-13 18:38:10</timestamp>
        </item>
    </connections>
</DescribeClientVpnConnectionsResponse>
```

DescribeClientVpnEndpoints

Describes one or more Client VPN endpoints in the account.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientVpnEndpointId.N

The ID of the Client VPN endpoint.

Type: Array of strings

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters. Filter names and values are case-sensitive.

- `endpoint-id` - The ID of the Client VPN endpoint.
- `transport-protocol` - The transport protocol (`tcp` | `udp`).

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return for the request in a single page. The remaining results can be seen by sending another request with the nextToken value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token to retrieve the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

clientVpnEndpoint

Information about the Client VPN endpoints.

Type: Array of ClientVpnEndpoint objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes the Client VPN endpoints in your account.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeClientVpnEndpointsResponse
&AUTHPARAMS
```

Sample Response

```
<DescribeClientVpnEndpointsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/"">

DescribeClientVpnRoutes

Describes the routes for the specified Client VPN endpoint.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientVpnEndpointId

The ID of the Client VPN endpoint.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters. Filter names and values are case-sensitive.

- `destination-cidr` - The CIDR of the route destination.
- `origin` - How the route was associated with the Client VPN endpoint (`associate` | `add-route`).
- `target-subnet` - The ID of the subnet through which traffic is routed.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return for the request in a single page. The remaining results can be seen by sending another request with the nextToken value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token to retrieve the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

routes

Information about the Client VPN endpoint routes.

Type: Array of ClientVpnRoute objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes the routes for a specific Client VPN endpoint.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeClientVpnRoutes
&ClientVpnEndpointId.1=cvpn-endpoint-EXAMPLEc8db8d3536
&AUTHPARAMS
```

Sample Response

```
<DescribeClientVpnRoutesResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>08fb643f-4d8f-443b-b853-EXAMPLE9cc8c</requestId>
    <routes>
        <item>
            <destinationCidr>10.0.0.0/16</destinationCidr>
            <clientVpnEndpointId>cvpn-endpoint-EXAMPLEc8db8d3536</clientVpnEndpointId>
            <origin>associate</origin>
            <status>
                <code>active</code>
            </status>
            <targetSubnet>subnet-EXAMPLE18f440ab91</targetSubnet>
            <type>Nat</type>
        </item>
        <item>
            <destinationCidr>10.0.1.128/28</destinationCidr>
            <clientVpnEndpointId>cvpn-endpoint-EXAMPLEc8db8d3536</clientVpnEndpointId>
            <origin>add-route</origin>
            <status>
                <code>active</code>
            </status>
            <targetSubnet>EXAMPLE18f440ab91</targetSubnet>
            <type>Nat</type>
        </item>
    </routes>
</DescribeClientVpnRoutesResponse>
```

DescribeClientVpnTargetNetworks

Describes the target networks associated with the specified Client VPN endpoint.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AssociationIds.N

The IDs of the target network associations.

Type: Array of strings

Required: No

ClientVpnEndpointId

The ID of the Client VPN endpoint.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters. Filter names and values are case-sensitive.

- `association-id` - The ID of the association.
- `target-network-id` - The ID of the subnet specified as the target network.
- `vpc-id` - The ID of the VPC in which the target network is located.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return for the request in a single page. The remaining results can be seen by sending another request with the nextToken value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token to retrieve the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

clientVpnTargetNetworks

Information about the associated target networks.

Type: Array of TargetNetwork objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes the target networks associated with a Client VPN endpoint.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeClientVpnTargetNetworks
&ClientVpnEndpointId=cvpn-endpoint-00c5d11fc4EXAMPLE
&AUTHPARAMS
```

Sample Response

```
<DescribeClientVpnTargetNetworksResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>1f92d56a-4494-4cbe-ad85-d9387EXAMPLE</requestId>
    <clientVpnTargetNetworks>
        <item>
            <associationId>cvpn-assoc-0822b0983cEXAMPLE</associationId>
            <clientVpnEndpointId>cvpn-endpoint-00c5d11fc4EXAMPLE</clientVpnEndpointId>
            <targetNetworkId>subnet-057fa0918fEXAMPLE</targetNetworkId>
            <securityGroups>
                <item>sg-123456EXAMPLE</item>
            </securityGroups>
            <status>
                <code>associated</code>
            </status>
            <vpcId>vpc-3db97056EXAMPLE</vpcId>
        </item>
    </clientVpnTargetNetworks>
</DescribeClientVpnTargetNetworksRespons>
```

DescribeCoipPools

Describes the specified customer-owned address pools or all of your customer-owned address pools.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `coip-pool.local-gateway-route-table-id` - The ID of the local gateway route table.
- `coip-pool.pool-id` - The ID of the address pool.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

PoolId.N

The IDs of the address pools.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

coipPoolSet

Information about the address pools.

Type: Array of CoipPool objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

DescribeConversionTasks

Describes the specified conversion tasks or all your conversion tasks. For more information, see the VM Import/Export User Guide.

For information about the import manifest referenced by this API action, see VM Import Manifest.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ConversionTaskId.N

The conversion task IDs.

Type: Array of strings

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

conversionTasks

Information about the conversion tasks.

Type: Array of ConversionTask objects

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes all your conversion tasks.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeConversionTasks
&AUTHPARAMS
```

Sample Response

```
<DescribeConversionTasksResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <conversionTasks>
     <item>
        <conversionTask>
           <conversionTaskId>import-i-fh95npoc</conversionTaskId>

DescribeCustomerGateways

Describes one or more of your VPN customer gateways.

For more information, see AWS Site-to-Site VPN in the *AWS Site-to-Site VPN User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CustomerGatewayId.N

One or more customer gateway IDs.

Default: Describes all your customer gateways.

Type: Array of strings

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `bgp-asn` - The customer gateway's Border Gateway Protocol (BGP) Autonomous System Number (ASN).
- `customer-gateway-id` - The ID of the customer gateway.
- `ip-address` - The IP address of the customer gateway device's external interface.
- `state` - The state of the customer gateway (`pending` | `available` | `deleting` | `deleted`).
- `type` - The type of customer gateway. Currently, the only supported type is `ipsec.1`.

- `tag:<key>` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.

Type: Array of Filter objects

Required: No

Response Elements

The following elements are returned by the service.

customerGatewaySet

Information about one or more customer gateways.

Type: Array of CustomerGateway objects

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example request describes the specified customer gateway.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeCustomerGateways
```

```
&CustomerGatewayId.1=cgw-b4dc3961
&AUTHPARAMS
```

Sample Response

```
<DescribeCustomerGatewaysResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
  <customerGatewaySet>
    <item>
       <customerGatewayId>cgw-b4dc3961</customerGatewayId>
       <state>available</state>
       <type>ipsec.1</type>
       <ipAddress>12.1.2.3</ipAddress>
       <bgpAsn>65534</bgpasn>
       <tagSet/>
    </item>
  </customerGatewaySet>
</DescribeCustomerGatewaysResponse>
```

Example 2

This example request uses filters to describe any customer gateway you own whose IP address is `12.1.2.3`, and whose state is either `pending` or `available`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeCustomerGateways
&Filter.1.Name=ip-address
&Filter.1.Value.1=12.1.2.3
&Filter.2.Name=state
&Filter.2.Value.1=pending
&Filter.2.Value.2=available
&AUTHPARAMS
```

DescribeDeclarativePoliciesReports

Describes the metadata of an account status report, including the status of the report.

To view the full report, download it from the Amazon S3 bucket where it was saved. Reports are accessible only when they have the `complete` status. Reports with other statuses (`running`, `cancelled`, or `error`) are not available in the S3 bucket. For more information about downloading objects from an S3 bucket, see Downloading objects in the *Amazon Simple Storage Service User Guide*.

For more information, see Generating the account status report for declarative policies in the *AWS Organizations User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 1000.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

ReportId.N

One or more report IDs.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

reportSet

The report metadata.

Type: Array of DeclarativePoliciesReport objects

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeDhcpOptions

Describes your DHCP option sets. The default is to describe all your DHCP option sets. Alternatively, you can specify specific DHCP option set IDs or filter the results to include only the DHCP option sets that match specific criteria.

For more information, see DHCP option sets in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DhcpOptionsId.N

The IDs of DHCP option sets.

Type: Array of strings

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `dhcp-options-id` - The ID of a DHCP options set.
- `key` - The key for one of the options (for example, `domain-name`).
- `value` - The value for one of the options.
- `owner-id` - The ID of the AWS account that owns the DHCP options set.
- `tag` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have

a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.

- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

dhcpOptionsSet

Information about the DHCP options sets.

Type: Array of DhcpOptions objects

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example describes all of your DHCP option sets.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeDhcpOptions
&AUTHPARAMS
```

Sample Response

```
<DescribeDhcpOptionsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>a0d78ea6-7bc7-4cb8-b827-c5ff0aff0140</requestId>
    <dhcpOptionsSet>
        <item>
            <dhcpOptionsId>dopt-1EXAMPLE</dhcpOptionsId>
            <ownerId>111122223333</ownerId>
            <dhcpConfigurationSet>
                <item>
                    <key>domain-name</key>
                    <valueSet>
                        <item>
                            <value>us-east-2.compute.internal</value>
                        </item>
                    </valueSet>

                        </item>
                    </valueSet>
                </item>
            </dhcpConfigurationSet>
        </item>
        <item>
            <dhcpOptionsId>dopt-fEXAMPLE</dhcpOptionsId>
            <ownerId>111122223333</ownerId>
            <dhcpConfigurationSet>
                <item>
                    <key>domain-name</key>
                    <valueSet>
                        <item>
                            <value>us-east-2.compute.internal</value>
                        </item>
                    </valueSet>
                </item>
                <item>
                    <key>domain-name-servers</key>
                    <valueSet>
                        <item>
                            <value>AmazonProvidedDNS</value>
                        </item>
                    </valueSet>
                </item>
            </dhcpConfigurationSet>
        </item>
    </dhcpOptionsSet>
</DescribeDhcpOptionsResponse>
```

Example 2

This example uses filters to describe any DHCP option sets that include a `domain-name` option whose value includes the string `example`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeDhcpOptions
&Filter.1.Name=key
&Filter.1.Value.1=domain-name
```

```
&Filter.2.Name=value
&Filter.2.Value.1=*example*
&AUTHPARAMS
```

DescribeEgressOnlyInternetGateways

Describes your egress-only internet gateways. The default is to describe all your egress-only internet gateways. Alternatively, you can specify specific egress-only internet gateway IDs or filter the results to include only the egress-only internet gateways that match specific criteria.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

EgressOnlyInternetGatewayId.N

The IDs of the egress-only internet gateways.

Type: Array of strings

Required: No

Filter.N

The filters.

- `tag` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 255.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

egressOnlyInternetGatewaySet

Information about the egress-only internet gateways.

Type: Array of EgressOnlyInternetGateway objects

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes all of your egress-only internet gateways.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeEgressOnlyInternetGateways
&AUTHPARAMS
```

Sample Response

```
<DescribeEgressOnlyInternetGatewaysResponse xmlns="http://ec2.amazonaws.com/

DescribeElasticGpus

> **Note**
>
> Amazon Elastic Graphics reached end of life on January 8, 2024.

Describes the Elastic Graphics accelerator associated with your instances.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ElasticGpuId.N

The Elastic Graphics accelerator IDs.

Type: Array of strings

Required: No

Filter.N

The filters.

- `availability-zone` - The Availability Zone in which the Elastic Graphics accelerator resides.
- `elastic-gpu-health` - The status of the Elastic Graphics accelerator (`OK` | `IMPAIRED`).
- `elastic-gpu-state` - The state of the Elastic Graphics accelerator (`ATTACHED`).
- `elastic-gpu-type` - The type of Elastic Graphics accelerator; for example, `eg1.medium`.

- `instance-id` - The ID of the instance to which the Elastic Graphics accelerator is associated.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return in a single call. To retrieve the remaining results, make another call with the returned `NextToken` value. This value can be between 5 and 1000.

Type: Integer

Valid Range: Minimum value of 10. Maximum value of 1000.

Required: No

NextToken

The token to request the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

elasticGpuSet

Information about the Elastic Graphics accelerators.

Type: Array of ElasticGpus objects

maxResults

The total number of items to return. If the total number of items available is more than the value specified in max-items then a Next-Token will be provided in the output that you can use to resume pagination.

Type: Integer

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes all of the Elastic Graphics accelerators associated with your instances.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeElasticGpus
&AUTHPARAMS
```

Sample Response

```
<DescribeElasticGpusResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
<requestId>450268ba-0e1d-4401-958e-9a3example</requestId>
  <elasticGpuSet>
     <item>
        <elasticGpuId>egpu-0833fd743e7227123</elasticGpuId>
        <availabilityZone>us-east-1a</availabilityZone>
        <elasticGpuType>eg1.small</elasticGpuType>
        <elasticGpuHealth>OK</elasticGpuHealth>
        <elasticGpuState>ATTACHED</elasticGpuState>
        <instanceId>i-1234567890abc1234</instanceId>
      </item>
  </elasticGpuSet>
```

```
</DescribeElasticGpusResponse>
```

DescribeExportImageTasks

Describes the specified export image tasks or all of your export image tasks.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ExportImageTaskId.N

The IDs of the export image tasks.

Type: Array of strings

Required: No

Filter.N

Filter tasks using the `task-state` filter and one of the following values: `active`, `completed`, `deleting`, or `deleted`.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return in a single call.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 500.

Required: No

NextToken

A token that indicates the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

exportImageTaskSet

Information about the export image tasks.

Type: Array of ExportImageTask objects

nextToken

The token to use to get the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

DescribeExportTasks

Describes the specified export instance tasks or all of your export instance tasks.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ExportTaskId.N

The export task IDs.

Type: Array of strings

Required: No

Filter.N

the filters for the export tasks.

Type: Array of Filter objects

Required: No

Response Elements

The following elements are returned by the service.

exportTaskSet

Information about the export tasks.

Type: Array of ExportTask objects

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes a single export task.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeExportTasks
&exportTaskId.1=export-i-1234wxyz
&AUTHPARAMS
```

Sample Response

```
<DescribeExportTasksResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
<requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>

DescribeFastLaunchImages

Describe details for Windows AMIs that are configured for Windows fast launch.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

Use the following filters to streamline results.

- `resource-type` - The resource type for pre-provisioning.
- `owner-id` - The owner ID for the pre-provisioning resource.
- `state` - The current state of fast launching for the Windows AMI.

Type: Array of Filter objects

Required: No

ImageId.N

Specify one or more Windows AMI image IDs for the request.

Type: Array of strings

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 200.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

fastLaunchImageSet

A collection of details about the fast-launch enabled Windows images that meet the requested criteria.

Type: Array of DescribeFastLaunchImagesSuccessItem objects

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeFastSnapshotRestores

Describes the state of fast snapshot restores for your snapshots.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters. The possible values are:

- `availability-zone`: The Availability Zone of the snapshot. For example, `us-east-2a`.
- `availability-zone-id`: The ID of the Availability Zone of the snapshot. For example, `use2-az1`.
- `owner-id`: The ID of the AWS account that enabled fast snapshot restore on the snapshot.
- `snapshot-id`: The ID of the snapshot.
- `state`: The state of fast snapshot restores for the snapshot (`enabling` | `optimizing` | `enabled` | `disabling` | `disabled`).

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 200.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

fastSnapshotRestoreSet

Information about the state of fast snapshot restores.

Type: Array of DescribeFastSnapshotRestoreSuccessItem objects

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

DescribeFleetHistory

Describes the events for the specified EC2 Fleet during the specified time.

EC2 Fleet events are delayed by up to 30 seconds before they can be described. This ensures that you can query by the last evaluated time and not miss a recorded event. EC2 Fleet events are available for 48 hours.

For more information, see Monitor fleet events using Amazon EventBridge in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

EventType

The type of events to describe. By default, all events are described.

Type: String

Valid Values: `instance-change | fleet-change | service-error`

Required: No

FleetId

The ID of the EC2 Fleet.

Type: String

Required: Yes

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

StartTime

The start date and time for the events, in UTC format (for example, *YYYY-MM-DD*T*HH*:*MM*:*SS*Z).

Type: Timestamp

Required: Yes

Response Elements

The following elements are returned by the service.

fleetId

The ID of the EC Fleet.

Type: String

historyRecordSet

Information about the events in the history of the EC2 Fleet.

Type: Array of HistoryRecordEntry objects

lastEvaluatedTime

The last date and time for the events, in UTC format (for example, *YYYY-MM-DD*T*HH*:*MM*:*SS*Z). All records up to this time were retrieved.

If `nextToken` indicates that there are more items, this value is not present.

Type: Timestamp

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

startTime

The start date and time for the events, in UTC format (for example, *YYYY*-*MM*-*DD*T*HH*:*MM*:*SS*Z).

Type: Timestamp

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3

- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeFleetInstances

Describes the running instances for the specified EC2 Fleet.

> **Note**
>
> Currently, `DescribeFleetInstances` does not support fleets of type `instant`. Instead, use `DescribeFleets`, specifying the `instant` fleet ID in the request.

For more information, see Describe your EC2 Fleet in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `instance-type` - The instance type.

Type: Array of Filter objects

Required: No

FleetId

The ID of the EC2 Fleet.

Type: String

Required: Yes

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

activeInstanceSet

The running instances. This list is refreshed periodically and might be out of date.

Type: Array of ActiveInstance objects

fleetId

The ID of the EC2 Fleet.

Type: String

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeFleets

Describes the specified EC2 Fleet or all of your EC2 Fleets.

> **Important**
>
> If a fleet is of type `instant`, you must specify the fleet ID in the request, otherwise the fleet does not appear in the response.

For more information, see Describe your EC2 Fleet in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `activity-status` - The progress of the EC2 Fleet (`error` | `pending-fulfillment` | `pending-termination` | `fulfilled`).
- `excess-capacity-termination-policy` - Indicates whether to terminate running instances if the target capacity is decreased below the current EC2 Fleet size (`true` | `false`).
- `fleet-state` - The state of the EC2 Fleet (`submitted` | `active` | `deleted` | `failed` | `deleted-running` | `deleted-terminating` | `modifying`).
- `replace-unhealthy-instances` - Indicates whether EC2 Fleet should replace unhealthy instances (`true` | `false`).
- `type` - The type of request (`instant` | `request` | `maintain`).

Type: Array of Filter objects

Required: No

FleetId.N

The IDs of the EC2 Fleets.

> **Note**
>
> If a fleet is of type `instant`, you must specify the fleet ID, otherwise it does not appear in the response.

Type: Array of strings

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

fleetSet

Information about the EC2 Fleets.

Type: Array of FleetData objects

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeFlowLogs

Describes one or more flow logs.

To view the published flow log records, you must view the log destination. For example, the CloudWatch Logs log group, the Amazon S3 bucket, or the Kinesis Data Firehose delivery stream.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `deliver-log-status` - The status of the logs delivery (`SUCCESS` | `FAILED`).
- `log-destination-type` - The type of destination for the flow log data (`cloud-watch-logs` | `s3` | `kinesis-data-firehose`).
- `flow-log-id` - The ID of the flow log.
- `log-group-name` - The name of the log group.
- `resource-id` - The ID of the VPC, subnet, or network interface.
- `traffic-type` - The type of traffic (`ACCEPT` | `REJECT` | `ALL`).
- `tag`:<key> - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.

Type: Array of Filter objects

Required: No

FlowLogId.N

One or more flow log IDs.

Constraint: Maximum of 1000 flow log IDs.

Type: Array of strings

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Required: No

NextToken

The token to request the next page of items. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

flowLogSet

Information about the flow logs.

Type: Array of FlowLog objects

nextToken

The token to request the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes all of your flow logs.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeFlowLogs
&AUTHPARAMS
```

Sample Response

```

DescribeFpgaImageAttribute

Describes the specified attribute of the specified Amazon FPGA Image (AFI).

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Attribute

The AFI attribute.

Type: String

Valid Values: `description | name | loadPermission | productCodes`

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

FpgaImageId

The ID of the AFI.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

fpgaImageAttribute

Information about the attribute.

Type: FpgaImageAttribute object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes the load permissions for the specified AFI.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeFpgaImageAttribute
&FpgaImageId=afi-0d123e21abcc85abc
&Attribute=loadPermission
&AUTHPARAMS
```

Sample Response

```
<DescribeFpgaImageAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>19106033-3723-481e-8cc4-aedexample</requestId>
    <fpgaImageAttribute>
        <fpgaImageId>afi-0d123e21abcc85abc</fpgaImageId>
        <loadPermissions>
            <item>
                <userId>123456789012</userId>
            </item>
        </loadPermissions>
    </fpgaImageAttribute>
</DescribeFpgaImageAttributeResponse>
```

- AWS SDK for Ruby V3

DescribeFpgaImages

Describes the Amazon FPGA Images (AFIs) available to you. These include public AFIs, private AFIs that you own, and AFIs owned by other AWS accounts for which you have load permissions.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `create-time` - The creation time of the AFI.
- `fpga-image-id` - The FPGA image identifier (AFI ID).
- `fpga-image-global-id` - The global FPGA image identifier (AGFI ID).
- `name` - The name of the AFI.
- `owner-id` - The AWS account ID of the AFI owner.
- `product-code` - The product code.
- `shell-version` - The version of the AWS Shell that was used to create the bitstream.
- `state` - The state of the AFI (`pending` | `failed` | `available` | `unavailable`).
- `tag`:<key> - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.
- `update-time` - The time of the most recent update.

Type: Array of Filter objects

Required: No

FpgaImageId.N

The AFI IDs.

Type: Array of strings

Required: No

MaxResults

The maximum number of results to return in a single call.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token to retrieve the next page of results.

Type: String

Required: No

Owner.N

Filters the AFI by owner. Specify an AWS account ID, `self` (owner is the sender of the request), or an AWS owner alias (valid values are `amazon` | `aws-marketplace`).

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

fpgaImageSet

Information about the FPGA images.

Type: Array of FpgaImage objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes AFIs that are owned by account 123456789012.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeFpgaImages
&Filter.1.Name=owner-id
&Filter.1.Value.1=123456789012
&AUTHPARAMS
```

Sample Response

```
<DescribeFpgaImagesResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">

DescribeHostReservationOfferings

Describes the Dedicated Host reservations that are available to purchase.

The results describe all of the Dedicated Host reservation offerings, including offerings that might not match the instance family and Region of your Dedicated Hosts. When purchasing an offering, ensure that the instance family and Region of the offering matches that of the Dedicated Hosts with which it is to be associated. For more information about supported instance types, see Dedicated Hosts in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Filter.N

The filters.

- `instance-family` - The instance family of the offering (for example, `m4`).
- `payment-option` - The payment option (`NoUpfront` | `PartialUpfront` | `AllUpfront`).

Type: Array of Filter objects

Required: No

MaxDuration

This is the maximum duration of the reservation to purchase, specified in seconds. Reservations are available in one-year and three-year terms. The number of seconds specified must be the number of seconds in a year (365x24x60x60) times one of the supported durations (1 or 3). For example, specify 94608000 for three years.

Type: Integer

Required: No

MaxResults

The maximum number of results to return for the request in a single page. The remaining results can be seen by sending another request with the returned `nextToken` value. This value can be between 5 and 500. If `maxResults` is given a larger value than 500, you receive an error.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 500.

Required: No

MinDuration

This is the minimum duration of the reservation you'd like to purchase, specified in seconds. Reservations are available in one-year and three-year terms. The number of seconds specified must be the number of seconds in a year (365x24x60x60) times one of the supported durations (1 or 3). For example, specify 31536000 for one year.

Type: Integer

Required: No

NextToken

The token to use to retrieve the next page of results.

Type: String

Required: No

OfferingId

The ID of the reservation offering.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

offeringSet

Information about the offerings.

Type: Array of HostOffering objects

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example describes all of the Dedicated Host Reservation offerings.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeHostReservationOfferings
&AUTHPARAMS
```

Sample Response

```
<DescribeHostReservationOfferingsResult xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">

DescribeHostReservations

Describes reservations that are associated with Dedicated Hosts in your account.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Filter.N

The filters.

- `instance-family` - The instance family (for example, `m4`).
- `payment-option` - The payment option (`NoUpfront` | `PartialUpfront` | `AllUpfront`).
- `state` - The state of the reservation (`payment-pending` | `payment-failed` | `active` | `retired`).
- `tag:<key>` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.

Type: Array of Filter objects

Required: No

HostReservationIdSet.N

The host reservation IDs.

Type: Array of strings

Required: No

MaxResults

The maximum number of results to return for the request in a single page. The remaining results can be seen by sending another request with the returned `nextToken` value. This value can be between 5 and 500. If `maxResults` is given a larger value than 500, you receive an error.

Type: Integer

Required: No

NextToken

The token to use to retrieve the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

hostReservationSet

Details about the reservation's configuration.

Type: Array of HostReservation objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes all of the Dedicated Host reservations in your account.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeHostReservations
&AUTHPARAMS
```

Sample Response

```
<DescribeHostReservationsResult xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
<requestId>d4904fd9-84c3-4ea5-gtyk-a9983EXAMPLE</requestId>
<hostReservationSet>
    <item>
        <upfrontPrice>0.000</upfrontPrice>
        <count>2</count>
        <start>2016-08-01T15:43:15Z</start>
        <instanceFamily>m4</instanceFamily>
        <offeringId>hro-0875903778903856fg</offeringId>
        <duration>31536000</duration>
        <paymentOption>NoUpfront</paymentOption>
        <end>2017-08-01T15:43:15Z</end>
        <hostReservationId>hr-0875903778903856fg</hostReservationId>
        <state>active</state>
        <hourlyPrice>1.990</hourlyPrice>
        <hostIdSet>
            <item>h-0897086hfkttn</item>
            <item>h-0891346hytrtn</item>
        </hostIdSet>
    </item>
</hostReservationSet>
</DescribeHostReservationsResult>
```

DescribeHosts

Describes the specified Dedicated Hosts or all your Dedicated Hosts.

The results describe only the Dedicated Hosts in the Region you're currently using. All listed instances consume capacity on your Dedicated Host. Dedicated Hosts that have recently been released are listed with the state `released`.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Filter.N

The filters.

- `auto-placement` - Whether auto-placement is enabled or disabled (on | `off`).
- `availability-zone` - The Availability Zone of the host.
- `client-token` - The idempotency token that you provided when you allocated the host.
- `host-reservation-id` - The ID of the reservation assigned to this host.
- `instance-type` - The instance type size that the Dedicated Host is configured to support.
- `state` - The allocation state of the Dedicated Host (`available` | `under-assessment` | `permanent-failure` | `released` | `released-permanent-failure`).
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.

Type: Array of Filter objects

Required: No

HostId.N

The IDs of the Dedicated Hosts. The IDs are used for targeted instance launches.

Type: Array of strings

Required: No

MaxResults

The maximum number of results to return for the request in a single page. The remaining results can be seen by sending another request with the returned `nextToken` value. This value can be between 5 and 500. If `maxResults` is given a larger value than 500, you receive an error.

You cannot specify this parameter and the host IDs parameter in the same request.

Type: Integer

Required: No

NextToken

The token to use to retrieve the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

hostSet

Information about the Dedicated Hosts.

Type: Array of Host objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example describes the Dedicated Hosts in your account.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeHosts
&AUTHPARAMS
```

Sample Response

```
<DescribeHostsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
<requestId>d4904fd9-82c2-4ea5-adfe-a9cc3EXAMPLE</requestId>
<hostSet>
    <item>

DescribeIamInstanceProfileAssociations

Describes your IAM instance profile associations.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AssociationId.N

The IAM instance profile associations.

Type: Array of strings

Required: No

Filter.N

The filters.

- `instance-id` - The ID of the instance.
- `state` - The state of the association (`associating` | `associated` | `disassociating`).

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

iamInstanceProfileAssociationSet

Information about the IAM instance profile associations.

Type: Array of IamInstanceProfileAssociation objects

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes all of your IAM instance profile associations.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeIamInstanceProfileAssociations
&AUTHPARAMS
```

Sample Response

```
<DescribeIamInstanceProfileAssociationsResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>84c2d2a6-12dc-491f-a9ee-example</requestId>
    <iamInstanceProfileAssociations>
        <item>
            <associationId>iip-assoc-08049da59357d598c</associationId>
            <iamInstanceProfile>
                <arn>arn:aws:iam::123456789012:instance-profile/AdminProfile</arn>
                <id>AIPAJEDNCAA64SSD265D6</id>
            </iamInstanceProfile>
            <instanceId>i-1234567890abcdef0</instanceId>
            <state>associated</state>
        </item>
    </iamInstanceProfileAssociations>
</DescribeIamInstanceProfileAssociationsResponse>
```

DescribeIdentityIdFormat

Describes the ID format settings for resources for the specified IAM user, IAM role, or root user. For example, you can view the resource types that are enabled for longer IDs. This request only returns information about resource types whose ID formats can be modified; it does not return information about other resource types. For more information, see Resource IDs in the *Amazon Elastic Compute Cloud User Guide*.

The following resource types support longer IDs: `bundle` | `conversion-task` | `customer-gateway` | `dhcp-options` | `elastic-ip-allocation` | `elastic-ip-association` | `export-task` | `flow-log` | `image` | `import-task` | `instance` | `internet-gateway` | `network-acl` | `network-acl-association` | `network-interface` | `network-interface-attachment` | `prefix-list` | `reservation` | `route-table` | `route-table-association` | `security-group` | `snapshot` | `subnet` | `subnet-cidr-block-association` | `volume` | `vpc` | `vpc-cidr-block-association` | `vpc-endpoint` | `vpc-peering-connection` | `vpn-connection` | `vpn-gateway`.

These settings apply to the principal specified in the request. They do not apply to the principal that makes the request.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

PrincipalArn

The ARN of the principal, which can be an IAM role, IAM user, or the root user.

Type: String

Required: Yes

Resource

The type of resource: `bundle` | `conversion-task` | `customer-gateway` | `dhcp-options` | `elastic-ip-allocation` | `elastic-ip-association` | `export-task` | `flow-log` | `image` | `import-task` | `instance` | `internet-gateway` | `network-acl` | `network-acl-association` | `network-interface` | `network-interface-attachment` | `prefix-list` | `reservation` | `route-table` | `route-table-association` | `security-group`

| `snapshot` | `subnet` | `subnet-cidr-block-association` | `volume` | `vpc` | `vpc-cidr-block-association` | `vpc-endpoint` | `vpc-peering-connection` | `vpn-connection` | `vpn-gateway`

Type: String

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

statusSet

Information about the ID format for the resources.

Type: Array of IdFormat objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes the ID format for the IAM role 'EC2Role'.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeIdentityIdFormat
&PrincipalArn=arn:aws:iam::123456789012:role/EC2Role
&AUTHPARAMS
```

Sample Response

```
<DescribeIdentityIdFormatResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">

DescribeIdFormat

Describes the ID format settings for your resources on a per-Region basis, for example, to view which resource types are enabled for longer IDs. This request only returns information about resource types whose ID formats can be modified; it does not return information about other resource types.

The following resource types support longer IDs: `bundle` | `conversion-task` | `customer-gateway` | `dhcp-options` | `elastic-ip-allocation` | `elastic-ip-association` | `export-task` | `flow-log` | `image` | `import-task` | `instance` | `internet-gateway` | `network-acl` | `network-acl-association` | `network-interface` | `network-interface-attachment` | `prefix-list` | `reservation` | `route-table` | `route-table-association` | `security-group` | `snapshot` | `subnet` | `subnet-cidr-block-association` | `volume` | `vpc` | `vpc-cidr-block-association` | `vpc-endpoint` | `vpc-peering-connection` | `vpn-connection` | `vpn-gateway`.

These settings apply to the IAM user who makes the request; they do not apply to the entire AWS account. By default, an IAM user defaults to the same settings as the root user, unless they explicitly override the settings by running the ModifyIdFormat command. Resources created with longer IDs are visible to all IAM users, regardless of these settings and provided that they have permission to use the relevant `Describe` command for the resource type.

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Resource

The type of resource: `bundle` | `conversion-task` | `customer-gateway` | `dhcp-options` | `elastic-ip-allocation` | `elastic-ip-association` | `export-task` | `flow-log` | `image` | `import-task` | `instance` | `internet-gateway` | `network-acl` | `network-acl-association` | `network-interface` | `network-interface-attachment` | `prefix-list` | `reservation` | `route-table` | `route-table-association` | `security-group` | `snapshot` | `subnet` | `subnet-cidr-block-association` | `volume` | `vpc` | `vpc-cidr-block-association` | `vpc-endpoint` | `vpc-peering-connection` | `vpn-connection` | `vpn-gateway`

Type: String

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

statusSet

Information about the ID format for the resource.

Type: Array of IdFormat objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes the ID format for all resources that support longer IDs.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeIdFormat
&AUTHPARAMS
```

Sample Response

```
<DescribeIdFormatResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
    <statusSet>
        <item>
            <resource>reservation</resource>
            <useLongIds>true</useLongIds>
            <deadline>2016-12-15T12:00:00.000Z</deadline>
```

```
        </item>
        <item>
            <resource>instance</resource>
            <useLongIds>true</useLongIds>
            <deadline>2016-12-15T12:00:00.000Z</deadline>
        </item>
        <item>
            <resource>volume</resource>
            <useLongIds>true</useLongIds>
            <deadline>2016-12-15T12:00:00.000Z</deadline>
        </item>
        <item>
            <resource>snapshot</resource>

DescribeImageAttribute

Describes the specified attribute of the specified AMI. You can specify only one attribute at a time.

> **Note**
>
> The order of the elements in the response, including those within nested structures, might vary. Applications should not assume the elements appear in a particular order.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Attribute

The AMI attribute.

Note: The `blockDeviceMapping` attribute is deprecated. Using this attribute returns the `Client.AuthFailure` error. To get information about the block device mappings for an AMI, describe the image instead.

Type: String

Valid Values: `description | kernel | ramdisk | launchPermission | productCodes | blockDeviceMapping | sriovNetSupport | bootMode | tpmSupport | uefiData | lastLaunchedTime | imdsSupport | deregistrationProtection`

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ImageId

The ID of the AMI.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

blockDeviceMapping

The block device mapping entries.

Type: Array of BlockDeviceMapping objects

bootMode

The boot mode.

Type: AttributeValue object

deregistrationProtection

Indicates whether deregistration protection is enabled for the AMI.

Type: AttributeValue object

description

A description for the AMI.

Type: AttributeValue object

imageId

The ID of the AMI.

Type: String

imdsSupport

If `v2.0`, it indicates that IMDSv2 is specified in the AMI. Instances launched from this AMI will have `HttpTokens` automatically set to `required` so that, by default, the instance requires that

IMDSv2 is used when requesting instance metadata. In addition, `HttpPutResponseHopLimit` is set to 2. For more information, see Configure the AMI in the *Amazon EC2 User Guide*.

Type: AttributeValue object

kernel

The kernel ID.

Type: AttributeValue object

lastLaunchedTime

The date and time, in ISO 8601 date-time format, when the AMI was last used to launch an EC2 instance. When the AMI is used to launch an instance, there is a 24-hour delay before that usage is reported.

> **Note**
>
> `lastLaunchedTime` data is available starting April 2017.

Type: AttributeValue object

launchPermission

The launch permissions.

Type: Array of LaunchPermission objects

productCodes

The product codes.

Type: Array of ProductCode objects

ramdisk

The RAM disk ID.

Type: AttributeValue object

requestId

The ID of the request.

Type: String

sriovNetSupport

Indicates whether enhanced networking with the Intel 82599 Virtual Function interface is enabled.

Type: AttributeValue object

tpmSupport

If the image is configured for NitroTPM support, the value is `v2.0`.

Type: AttributeValue object

uefiData

Base64 representation of the non-volatile UEFI variable store. To retrieve the UEFI data, use the GetInstanceUefiData command. You can inspect and modify the UEFI data by using the python-uefivars tool on GitHub. For more information, see UEFI Secure Boot for Amazon EC2 instances in the *Amazon EC2 User Guide*.

Type: AttributeValue object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example lists the launch permissions for the specified AMI.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeImageAttribute
&ImageId=ami-61a54008
&Attribute=launchPermission
&AUTHPARAMS
```

Sample Response

```
<DescribeImageAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
```

```
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <imageId>ami-61a54008</imageId>
   <launchPermission>
      <item>
         <group>all</group>
      </item>
      <item>
         <userId>495219933132</userId>
      </item>
   </launchPermission>
</DescribeImageAttributeResponse>
```

Example 2

This example lists the product codes for the specified AMI.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeImageAttribute
&ImageId=ami-2bb65342
&Attribute=productCodes
&AUTHPARAMS
```

Sample Response

```
<DescribeImageAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/>
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <imageId>ami-2bb65342</imageId>
   <productCodes>
      <item>
        <productCode>a1b2c3d4e5f6g7h8i9j10k11</productCode>
        <type>marketplace</type>
      </item>
   </productCodes>
</DescribeImageAttributeResponse>
```

DescribeImageReferences

Describes your AWS resources that are referencing the specified images.

For more information, see Identify your resources referencing specified AMIs in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ImageId.N

The IDs of the images to check for resource references.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 10 items.

Required: Yes

IncludeAllResourceTypes

Specifies whether to check all supported AWS resource types for image references. When specified, default values are applied for `ResourceTypeOptions`. For the default values, see How AMI reference checks work in the *Amazon EC2 User Guide*. If you also specify `ResourceTypes` with `ResourceTypeOptions`, your specified values override the default values.

Supported resource types: `ec2:Instance` | `ec2:LaunchTemplate` | `ssm:Parameter` | `imagebuilder:ImageRecipe` | `imagebuilder:ContainerRecipe`

Either `IncludeAllResourceTypes` or `ResourceTypes` must be specified.

Type: Boolean

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

ResourceType.N

The AWS resource types to check for image references.

Either `IncludeAllResourceTypes` or `ResourceTypes` must be specified.

Type: Array of ResourceTypeRequest objects

Required: No

Response Elements

The following elements are returned by the service.

imageReferenceSet

The resources that are referencing the specified images.

Type: Array of ImageReference objects

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeImages

Describes the specified images (AMIs, AKIs, and ARIs) available to you or all of the images available to you.

The images available to you include public images, private images that you own, and private images owned by other AWS accounts for which you have explicit launch permissions.

Recently deregistered images appear in the returned results for a short interval and then return empty results. After all instances that reference a deregistered AMI are terminated, specifying the ID of the image will eventually return an error indicating that the AMI ID cannot be found.

When Allowed AMIs is set to `enabled`, only allowed images are returned in the results, with the `imageAllowed` field set to `true` for each image. In `audit-mode`, the `imageAllowed` field is set to `true` for images that meet the account's Allowed AMIs criteria, and `false` for images that don't meet the criteria. For more information, see Allowed AMIs.

The Amazon EC2 API follows an eventual consistency model. This means that the result of an API command you run that creates or modifies resources might not be immediately available to all subsequent commands you run. For guidance on how to manage eventual consistency, see Eventual consistency in the Amazon EC2 API in the *Amazon EC2 Developer Guide*.

Important

We strongly recommend using only paginated requests. Unpaginated requests are susceptible to throttling and timeouts.

Note

The order of the elements in the response, including those within nested structures, might vary. Applications should not assume the elements appear in a particular order.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ExecutableBy.N

Scopes the images by users with explicit launch permissions. Specify an AWS account ID, `self` (the sender of the request), or `all` (public AMIs).

- If you specify an AWS account ID that is not your own, only AMIs shared with that specific AWS account ID are returned. However, AMIs that are shared with the account's organization or organizational unit (OU) are not returned.
- If you specify `self` or your own AWS account ID, AMIs shared with your account are returned. In addition, AMIs that are shared with the organization or OU of which you are member are also returned.
- If you specify `all`, all public AMIs are returned.

Type: Array of strings

Required: No

Filter.N

The filters.

- `architecture` - The image architecture (`i386` | `x86_64` | `arm64` | `x86_64_mac` | `arm64_mac`).
- `block-device-mapping.delete-on-termination` - A Boolean value that indicates whether the Amazon EBS volume is deleted on instance termination.
- `block-device-mapping.device-name` - The device name specified in the block device mapping (for example, `/dev/sdh` or `xvdh`).
- `block-device-mapping.snapshot-id` - The ID of the snapshot used for the Amazon EBS volume.
- `block-device-mapping.volume-size` - The volume size of the Amazon EBS volume, in GiB.

- `block-device-mapping.volume-type` - The volume type of the Amazon EBS volume (`io1` | `io2` | `gp2` | `gp3` | `sc1` | `st1` | `standard`).
- `block-device-mapping.encrypted` - A Boolean that indicates whether the Amazon EBS volume is encrypted.
- `creation-date` - The time when the image was created, in the ISO 8601 format in the UTC time zone (YYYY-MM-DDThh:mm:ss.sssZ), for example, `2021-09-29T11:04:43.305Z`. You can use a wildcard (`*`), for example, `2021-09-29T*`, which matches an entire day.
- `description` - The description of the image (provided during image creation).
- `ena-support` - A Boolean that indicates whether enhanced networking with ENA is enabled.
- `free-tier-eligible` - A Boolean that indicates whether this image can be used under the AWS Free Tier (`true` | `false`).
- `hypervisor` - The hypervisor type (`ovm` | `xen`).
- `image-allowed` - A Boolean that indicates whether the image meets the criteria specified for Allowed AMIs.
- `image-id` - The ID of the image.
- `image-type` - The image type (`machine` | `kernel` | `ramdisk`).
- `is-public` - A Boolean that indicates whether the image is public.
- `kernel-id` - The kernel ID.
- `manifest-location` - The location of the image manifest.
- `name` - The name of the AMI (provided during image creation).
- `owner-alias` - The owner alias (`amazon` | `aws-backup-vault` | `aws-marketplace`). The valid aliases are defined in an Amazon-maintained list. This is not the AWS account alias that can be set using the IAM console. We recommend that you use the **Owner** request parameter instead of this filter.
- `owner-id` - The AWS account ID of the owner. We recommend that you use the **Owner** request parameter instead of this filter.
- `platform` - The platform. The only supported value is `windows`.
- `product-code` - The product code.
- `product-code.type` - The type of the product code (`marketplace`).
- `ramdisk-id` - The RAM disk ID.
- `root-device-name` - The device name of the root device volume (for example, `/dev/sda1`).

- `root-device-type` - The type of the root device volume (`ebs` | `instance-store`).
- `source-image-id` - The ID of the source AMI from which the AMI was created.
- `source-image-region` - The Region of the source AMI.
- `source-instance-id` - The ID of the instance that the AMI was created from if the AMI was created using CreateImage. This filter is applicable only if the AMI was created using CreateImage.
- `state` - The state of the image (`available` | `pending` | `failed`).
- `state-reason-code` - The reason code for the state change.
- `state-reason-message` - The message for the state change.
- `sriov-net-support` - A value of `simple` indicates that enhanced networking with the Intel 82599 VF interface is enabled.
- `tag:<key>` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.
- `virtualization-type` - The virtualization type (`paravirtual` | `hvm`).

Type: Array of Filter objects

Required: No

ImageId.N

The image IDs.

Default: Describes all images available to you.

Type: Array of strings

Required: No

IncludeDeprecated

Specifies whether to include deprecated AMIs.

Default: No deprecated AMIs are included in the response.

> **Note**
>
> If you are the AMI owner, all deprecated AMIs appear in the response regardless of what you specify for this parameter.

Type: Boolean

Required: No

IncludeDisabled

Specifies whether to include disabled AMIs.

Default: No disabled AMIs are included in the response.

Type: Boolean

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Owner.N

Scopes the results to images with the specified owners. You can specify a combination of AWS account IDs, `self`, `amazon`, `aws-backup-vault`, and `aws-marketplace`. If you omit this parameter, the results include all images for which you have launch permissions, regardless of ownership.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

imagesSet

Information about the images.

Type: Array of Image objects

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example describes the specified AMI.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeImages
```

```
&ImageId.1=ami-1234567890EXAMPLE
&AUTHPARAMS
```

Sample Response

```
<DescribeImagesResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>

      <tagSet/>
    </item>
  </imagesSet>
</DescribeImagesResponse>
```

Example 2

This example filters the response to include only public Windows images with an x86_64 architecture.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeImages
&Filter.1.Name=is-public
&Filter.1.Value.1=true
&Filter.2.Name=architecture
&Filter.2.Value.1=x86_64
&Filter.3.Name=platform
&Filter.3.Value.1=windows
&AUTHPARAMS
```

Sample Response

```
<DescribeImagesResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <imagesSet>
      <item>
         <imageId>ami-1a2b3c4d</imageId>
         <imageLocation>ec2-public-windows-images/Server2003r2-x86_64-Win-
v1.07.manifest.xml</imageLocation>
         <imageState>available</imageState>
         <imageOwnerId>123456789012</imageOwnerId>
         <isPublic>true</isPublic>
         <architecture>x86_64</architecture>
         <imageType>machine</imageType>
         <platform>windows</platform>
         <imageOwnerAlias>amazon</imageOwnerAlias>
         <rootDeviceType>instance-store</rootDeviceType>
         <blockDeviceMapping/>

DescribeImageUsageReportEntries

Describes the entries in image usage reports, showing how your images are used across other AWS accounts.

For more information, see View your AMI usage in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `account-id` - A 12-digit AWS account ID.
- `creation-time` - The time when the report was created, in the ISO 8601 format in the UTC time zone (YYYY-MM-DDThh:mm:ss.sssZ), for example, `2025-11-29T11:04:43.305Z`. You can use a wildcard (`*`), for example, `2025-11-29T*`, which matches an entire day.
- `resource-type` - The resource type (`ec2:Instance` | `ec2:LaunchTemplate`).

Type: Array of Filter objects

Required: No

ImageId.N

The IDs of the images for filtering the report entries. If specified, only report entries containing these images are returned.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 200 items.

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 1.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

ReportId.N

The IDs of the usage reports.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 200 items.

Required: No

Response Elements

The following elements are returned by the service.

imageUsageReportEntrySet

The content of the usage reports.

Type: Array of ImageUsageReportEntry objects

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeImageUsageReports

Describes the configuration and status of image usage reports, filtered by report IDs or image IDs.

For more information, see View your AMI usage in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `creation-time` - The time when the report was created, in the ISO 8601 format in the UTC time zone (YYYY-MM-DDThh:mm:ss.sssZ), for example, `2025-11-29T11:04:43.305Z`. You can use a wildcard (`*`), for example, `2025-11-29T*`, which matches an entire day.
- `state` - The state of the report (`available` | `pending` | `error`).
- `tag:<key>` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.

Type: Array of Filter objects

Required: No

ImageId.N

The IDs of the images for filtering the reports. If specified, only reports containing these images are returned.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 200 items.

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 1.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

ReportId.N

The IDs of the image usage reports.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 200 items.

Required: No

Response Elements

The following elements are returned by the service.

imageUsageReportSet

The image usage reports.

Type: Array of ImageUsageReport objects

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

DescribeImportImageTasks

Displays details about an import virtual machine or import snapshot tasks that are already created.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filters.N

Filter tasks using the `task-state` filter and one of the following values: `active`, `completed`, `deleting`, or `deleted`.

Type: Array of Filter objects

Required: No

ImportTaskId.N

The IDs of the import image tasks.

Type: Array of strings

Required: No

MaxResults

The maximum number of results to return in a single call.

Type: Integer

Required: No

NextToken

A token that indicates the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

importImageTaskSet

A list of zero or more import image tasks that are currently active or were completed or canceled in the previous 7 days.

Type: Array of ImportImageTask objects

nextToken

The token to use to get the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeImportSnapshotTasks

Describes your import snapshot tasks.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filters.N

The filters.

Type: Array of Filter objects

Required: No

ImportTaskId.N

A list of import snapshot task IDs.

Type: Array of strings

Required: No

MaxResults

The maximum number of results to return in a single call. To retrieve the remaining results, make another call with the returned `NextToken` value.

Type: Integer

Required: No

NextToken

A token that indicates the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

importSnapshotTaskSet

A list of zero or more import snapshot tasks that are currently active or were completed or canceled in the previous 7 days.

Type: Array of ImportSnapshotTask objects

nextToken

The token to use to get the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

DescribeInstanceAttribute

Describes the specified attribute of the specified instance. You can specify only one attribute at a time. Available attributes include SQL license exemption configuration for instances registered with the SQL LE service.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Attribute

The instance attribute.

Note that the `enaSupport` attribute is not supported.

Type: String

Valid Values: `instanceType | kernel | ramdisk | userData | disableApiTermination | instanceInitiatedShutdownBehavior | rootDeviceName | blockDeviceMapping | productCodes | sourceDestCheck | groupSet | ebsOptimized | sriovNetSupport | enaSupport | enclaveOptions | disableApiStop`

Required: Yes

DryRun

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InstanceId

The ID of the instance.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

blockDeviceMapping

The block device mapping of the instance.

Type: Array of InstanceBlockDeviceMapping objects

disableApiStop

Indicates whether stop protection is enabled for the instance.

Type: AttributeBooleanValue object

disableApiTermination

Indicates whether termination protection is enabled. If the value is `true`, you can't terminate the instance using the Amazon EC2 console, command line tools, or API.

Type: AttributeBooleanValue object

ebsOptimized

Indicates whether the instance is optimized for Amazon EBS I/O.

Type: AttributeBooleanValue object

enaSupport

Indicates whether enhanced networking with ENA is enabled.

Type: AttributeBooleanValue object

enclaveOptions

Indicates whether the instance is enabled for AWS Nitro Enclaves.

Type: EnclaveOptions object

groupSet

The security groups associated with the instance.

Type: Array of GroupIdentifier objects

instanceId

The ID of the instance.

Type: String

instanceInitiatedShutdownBehavior

Indicates whether an instance stops or terminates when you initiate shutdown from the instance (using the operating system command for system shutdown).

Type: AttributeValue object

instanceType

The instance type.

Type: AttributeValue object

kernel

The kernel ID.

Type: AttributeValue object

productCodes

The product codes.

Type: Array of ProductCode objects

ramdisk

The RAM disk ID.

Type: AttributeValue object

requestId

The ID of the request.

Type: String

rootDeviceName

The device name of the root device volume (for example, `/dev/sda1`).

Type: AttributeValue object

sourceDestCheck

Indicates whether source/destination checks are enabled.

Type: AttributeBooleanValue object

sriovNetSupport

Indicates whether enhanced networking with the Intel 82599 Virtual Function interface is enabled.

Type: AttributeValue object

userData

The user data.

Type: AttributeValue object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example lists the instance type of the specified instance.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeInstanceAttribute
&InstanceId=i-1234567890abcdef0
&Attribute=instanceType
&AUTHPARAMS
```

Sample Response

```
<DescribeInstanceAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <instanceId>i-1234567890abcdef0</instanceId>
  <instanceType>
```

```
    <value>t1.micro</value>
  </instanceType>
</DescribeInstanceAttributeResponse>
```

Example 2

This example lists the current value of the `InstanceInitiatedShutdownBehavior` attribute for the specified instance.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeInstanceAttribute
&InstanceId=i-1234567890abcdef0
&Attribute=instanceInitiatedShutdownBehavior
&AUTHPARAMS
```

Sample Response

```
<DescribeInstanceAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <instanceId>i-1234567890abcdef0</instanceId>
  <instanceInitiatedShutdownBehavior>
    <value>stop</value>
  </instanceInitiatedShutdownBehavior>
</DescribeInstanceAttributeResponse>
```

Example 3

This example lists the current value of the `DisableApiTermination` attribute for the specified instance.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeInstanceAttribute
&InstanceId=i-1234567890abcdef0
&Attribute=disableApiTermination
&AUTHPARAMS
```

Sample Response

```
<DescribeInstanceAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
```

```
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <instanceId>i-1234567890abcdef0</instanceId>
  <disableApiTermination>
    <value>false</value>
  </disableApiTermination>
</DescribeInstanceAttributeResponse>
```

- AWS SDK for Ruby V3

DescribeInstanceConnectEndpoints

Describes the specified EC2 Instance Connect Endpoints or all EC2 Instance Connect Endpoints.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `instance-connect-endpoint-id` - The ID of the EC2 Instance Connect Endpoint.
- `state` - The state of the EC2 Instance Connect Endpoint (`create-in-progress` | `create-complete` | `create-failed` | `delete-in-progress` | `delete-complete` | `delete-failed`).
- `subnet-id` - The ID of the subnet in which the EC2 Instance Connect Endpoint was created.
- `tag:<key>` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.
- `tag-value` - The value of a tag assigned to the resource. Use this filter to find all resources that have a tag with a specific value, regardless of tag key.
- `vpc-id` - The ID of the VPC in which the EC2 Instance Connect Endpoint was created.

Type: Array of Filter objects

Required: No

InstanceConnectEndpointId.N

One or more EC2 Instance Connect Endpoint IDs.

Type: Array of strings

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 50.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

instanceConnectEndpointSet

Information about the EC2 Instance Connect Endpoints.

Type: Array of Ec2InstanceConnectEndpoint objects

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeInstanceCreditSpecifications

Describes the credit option for CPU usage of the specified burstable performance instances. The credit options are `standard` and `unlimited`.

If you do not specify an instance ID, Amazon EC2 returns burstable performance instances with the `unlimited` credit option, as well as instances that were previously configured as T2, T3, and T3a with the `unlimited` credit option. For example, if you resize a T2 instance, while it is configured as `unlimited`, to an M4 instance, Amazon EC2 returns the M4 instance.

If you specify one or more instance IDs, Amazon EC2 returns the credit option (`standard` or `unlimited`) of those instances. If you specify an instance ID that is not valid, such as an instance that is not a burstable performance instance, an error is returned.

Recently terminated instances might appear in the returned results. This interval is usually less than one hour.

If an Availability Zone is experiencing a service disruption and you specify instance IDs in the affected zone, or do not specify any instance IDs at all, the call fails. If you specify only instance IDs in an unaffected zone, the call works normally.

For more information, see Burstable performance instances in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `instance-id` - The ID of the instance.

Type: Array of Filter objects

Required: No

InstanceId.N

The instance IDs.

Default: Describes all your instances.

Constraints: Maximum 1000 explicitly specified instance IDs.

Type: Array of strings

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

You cannot specify this parameter and the instance IDs parameter in the same call.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

instanceCreditSpecificationSet

Information about the credit option for CPU usage of an instance.

Type: Array of InstanceCreditSpecification objects

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This request describes the current credit option for CPU usage of the specified instance.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeInstanceCreditSpecifications
&InstanceId.1=i-1234567890abcdef0
&AUTHPARAMS
```

Sample Response

```
<DescribeInstanceCreditSpecificationsResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>1b234b5c-d6ef-7gh8-90i1-j2345678901</requestId>
    <instanceCreditSpecificationSet>
        <item>
```

```
            <cpuCredits>unlimited</cpuCredits>
            <instanceId>i-1234567890abcdef0</instanceId>
        </item>
    </instanceCreditSpecificationSet>
</DescribeInstanceCreditSpecificationsResponse>
```

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeInstanceEventNotificationAttributes

Describes the tag keys that are registered to appear in scheduled event notifications for resources in the current Region.

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

instanceTagAttribute

Information about the registered tag keys.

Type: InstanceTagNotificationAttribute object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeInstanceEventWindows

Describes the specified event windows or all event windows.

If you specify event window IDs, the output includes information for only the specified event windows. If you specify filters, the output includes information for only those event windows that meet the filter criteria. If you do not specify event windows IDs or filters, the output includes information for all event windows, which can affect performance. We recommend that you use pagination to ensure that the operation returns quickly and successfully.

For more information, see Define event windows for scheduled events in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `dedicated-host-id` - The event windows associated with the specified Dedicated Host ID.
- `event-window-name` - The event windows associated with the specified names.
- `instance-id` - The event windows associated with the specified instance ID.
- `instance-tag` - The event windows associated with the specified tag and value.
- `instance-tag-key` - The event windows associated with the specified tag key, regardless of the value.
- `instance-tag-value` - The event windows associated with the specified tag value, regardless of the key.

- `tag:<key>` - The key/value combination of a tag assigned to the event window. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `CMX`, specify `tag:Owner` for the filter name and `CMX` for the filter value.
- `tag-key` - The key of a tag assigned to the event window. Use this filter to find all event windows that have a tag with a specific key, regardless of the tag value.
- `tag-value` - The value of a tag assigned to the event window. Use this filter to find all event windows that have a tag with a specific value, regardless of the tag key.

Type: Array of Filter objects

Required: No

InstanceEventWindowId.N

The IDs of the event windows.

Type: Array of strings

Required: No

MaxResults

The maximum number of results to return in a single call. To retrieve the remaining results, make another call with the returned `NextToken` value. This value can be between 20 and 500. You cannot specify this parameter and the event window IDs parameter in the same call.

Type: Integer

Valid Range: Minimum value of 20. Maximum value of 500.

Required: No

NextToken

The token to request the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

instanceEventWindowSet

Information about the event windows.

Type: Array of InstanceEventWindow objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for Ruby V3

DescribeInstanceImageMetadata

Describes the AMI that was used to launch an instance, even if the AMI is deprecated, deregistered, made private (no longer public or shared with your account), or not allowed.

If you specify instance IDs, the output includes information for only the specified instances. If you specify filters, the output includes information for only those instances that meet the filter criteria. If you do not specify instance IDs or filters, the output includes information for all instances, which can affect performance.

If you specify an instance ID that is not valid, an instance that doesn't exist, or an instance that you do not own, an error (`InvalidInstanceID.NotFound`) is returned.

Recently terminated instances might appear in the returned results. This interval is usually less than one hour.

In the rare case where an Availability Zone is experiencing a service disruption and you specify instance IDs that are in the affected Availability Zone, or do not specify any instance IDs at all, the call fails. If you specify only instance IDs that are in an unaffected Availability Zone, the call works normally.

> **Note**
>
> The order of the elements in the response, including those within nested structures, might vary. Applications should not assume the elements appear in a particular order.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `availability-zone` - The name of the Availability Zone (for example, `us-west-2a`) or Local Zone (for example, `us-west-2-lax-1b`) of the instance.
- `instance-id` - The ID of the instance.
- `image-allowed` - A Boolean that indicates whether the image meets the criteria specified for Allowed AMIs.
- `instance-state-name` - The state of the instance (`pending` | `running` | `shutting-down` | `terminated` | `stopping` | `stopped`).
- `instance-type` - The type of instance (for example, `t3.micro`).
- `launch-time` - The time when the instance was launched, in the ISO 8601 format in the UTC time zone (YYYY-MM-DDThh:mm:ss.sssZ), for example, `2023-09-29T11:04:43.305Z`. You can use a wildcard (`*`), for example, `2023-09-29T*`, which matches an entire day.
- `owner-alias` - The owner alias (`amazon` | `aws-marketplace` | `aws-backup-vault`). The valid aliases are defined in an Amazon-maintained list. This is not the AWS account alias that can be set using the IAM console. We recommend that you use the `Owner` request parameter instead of this filter.
- `owner-id` - The AWS account ID of the owner. We recommend that you use the `Owner` request parameter instead of this filter.
- `tag:<key>` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.
- `zone-id` - The ID of the Availability Zone (for example, `usw2-az2`) or Local Zone (for example, `usw2-lax1-az1`) of the instance.

Type: Array of Filter objects

Required: No

InstanceId.N

The instance IDs.

If you don't specify an instance ID or filters, the output includes information for all instances.

Type: Array of strings

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Default: 1000

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 1000.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

instanceImageMetadataSet

Information about the instance and the AMI used to launch the instance.

Type: Array of InstanceImageMetadata objects

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeInstances

Describes the specified instances or all instances.

If you specify instance IDs, the output includes information for only the specified instances. If you specify filters, the output includes information for only those instances that meet the filter criteria. If you do not specify instance IDs or filters, the output includes information for all instances, which can affect performance. We recommend that you use pagination to ensure that the operation returns quickly and successfully.

The response includes SQL license exemption status information for instances registered with the SQL LE service, providing visibility into license exemption configuration and status.

If you specify an instance ID that is not valid, an error is returned. If you specify an instance that you do not own, it is not included in the output.

Recently terminated instances might appear in the returned results. This interval is usually less than one hour.

If you describe instances in the rare case where an Availability Zone is experiencing a service disruption and you specify instance IDs that are in the affected zone, or do not specify any instance IDs at all, the call fails. If you describe instances and specify only instance IDs that are in an unaffected zone, the call works normally.

The Amazon EC2 API follows an eventual consistency model. This means that the result of an API command you run that creates or modifies resources might not be immediately available to all subsequent commands you run. For guidance on how to manage eventual consistency, see Eventual consistency in the Amazon EC2 API in the *Amazon EC2 Developer Guide*.

Important

We strongly recommend using only paginated requests. Unpaginated requests are susceptible to throttling and timeouts.

Note

The order of the elements in the response, including those within nested structures, might vary. Applications should not assume the elements appear in a particular order.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `affinity` - The affinity setting for an instance running on a Dedicated Host (`default` | `host`).
- `architecture` - The instance architecture (`i386` | `x86_64` | `arm64`).
- `availability-zone` - The Availability Zone of the instance.
- `availability-zone-id` - The ID of the Availability Zone of the instance.
- `block-device-mapping.attach-time` - The attach time for an EBS volume mapped to the instance, for example, `2022-09-15T17:15:20.000Z`.
- `block-device-mapping.delete-on-termination` - A Boolean that indicates whether the EBS volume is deleted on instance termination.
- `block-device-mapping.device-name` - The device name specified in the block device mapping (for example, `/dev/sdh` or `xvdh`).
- `block-device-mapping.status` - The status for the EBS volume (`attaching` | `attached` | `detaching` | `detached`).
- `block-device-mapping.volume-id` - The volume ID of the EBS volume.
- `boot-mode` - The boot mode that was specified by the AMI (`legacy-bios` | `uefi` | `uefi-preferred`).
- `capacity-reservation-id` - The ID of the Capacity Reservation into which the instance was launched.

- capacity-reservation-specification.capacity-reservation-preference - The instance's Capacity Reservation preference (open | none).
- capacity-reservation-specification.capacity-reservation-target.capacity-reservation-id - The ID of the targeted Capacity Reservation.
- capacity-reservation-specification.capacity-reservation-target.capacity-reservation-resource-group-arn - The ARN of the targeted Capacity Reservation group.
- client-token - The idempotency token you provided when you launched the instance.
- current-instance-boot-mode - The boot mode that is used to launch the instance at launch or start (legacy-bios | uefi).
- dns-name - The public DNS name of the instance.
- ebs-optimized - A Boolean that indicates whether the instance is optimized for Amazon EBS I/O.
- ena-support - A Boolean that indicates whether the instance is enabled for enhanced networking with ENA.
- enclave-options.enabled - A Boolean that indicates whether the instance is enabled for AWS Nitro Enclaves.
- hibernation-options.configured - A Boolean that indicates whether the instance is enabled for hibernation. A value of true means that the instance is enabled for hibernation.
- host-id - The ID of the Dedicated Host on which the instance is running, if applicable.
- hypervisor - The hypervisor type of the instance (ovm | xen). The value xen is used for both Xen and Nitro hypervisors.
- iam-instance-profile.arn - The instance profile associated with the instance. Specified as an ARN.
- iam-instance-profile.id - The instance profile associated with the instance. Specified as an ID.
- image-id - The ID of the image used to launch the instance.
- instance-id - The ID of the instance.
- instance-lifecycle - Indicates whether this is a Spot Instance, a Scheduled Instance, or a Capacity Block (spot | scheduled | capacity-block).
- instance-state-code - The state of the instance, as a 16-bit unsigned integer. The high byte is used for internal purposes and should be ignored. The low byte is set based on the

state represented. The valid values are: 0 (pending), 16 (running), 32 (shutting-down), 48 (terminated), 64 (stopping), and 80 (stopped).

- `instance-state-name` - The state of the instance (`pending` | `running` | `shutting-down` | `terminated` | `stopping` | `stopped`).
- `instance-type` - The type of instance (for example, `t2.micro`).
- `instance.group-id` - The ID of the security group for the instance.
- `instance.group-name` - The name of the security group for the instance.
- `ip-address` - The public IPv4 address of the instance.
- `ipv6-address` - The IPv6 address of the instance.
- `kernel-id` - The kernel ID.
- `key-name` - The name of the key pair used when the instance was launched.
- `launch-index` - When launching multiple instances, this is the index for the instance in the launch group (for example, 0, 1, 2, and so on).
- `launch-time` - The time when the instance was launched, in the ISO 8601 format in the UTC time zone (YYYY-MM-DDThh:mm:ss.sssZ), for example, `2021-09-29T11:04:43.305Z`. You can use a wildcard (`*`), for example, `2021-09-29T*`, which matches an entire day.
- `maintenance-options.auto-recovery` - The current automatic recovery behavior of the instance (`disabled` | `default`).
- `metadata-options.http-endpoint` - The status of access to the HTTP metadata endpoint on your instance (`enabled` | `disabled`)
- `metadata-options.http-protocol-ipv4` - Indicates whether the IPv4 endpoint is enabled (`disabled` | `enabled`).
- `metadata-options.http-protocol-ipv6` - Indicates whether the IPv6 endpoint is enabled (`disabled` | `enabled`).
- `metadata-options.http-put-response-hop-limit` - The HTTP metadata request put response hop limit (integer, possible values 1 to 64)
- `metadata-options.http-tokens` - The metadata request authorization state (`optional` | `required`)
- `metadata-options.instance-metadata-tags` - The status of access to instance tags from the instance metadata (`enabled` | `disabled`)
- `metadata-options.state` - The state of the metadata option changes (`pending` | `applied`).

- `monitoring-state` - Indicates whether detailed monitoring is enabled (`disabled` | `enabled`).
- `network-interface.addresses.association.allocation-id` - The allocation ID.
- `network-interface.addresses.association.association-id` - The association ID.
- `network-interface.addresses.association.carrier-ip` - The carrier IP address.
- `network-interface.addresses.association.customer-owned-ip` - The customer-owned IP address.
- `network-interface.addresses.association.ip-owner-id` - The owner ID of the private IPv4 address associated with the network interface.
- `network-interface.addresses.association.public-dns-name` - The public DNS name.
- `network-interface.addresses.association.public-ip` - The ID of the association of an Elastic IP address (IPv4) with a network interface.
- `network-interface.addresses.primary` - Specifies whether the IPv4 address of the network interface is the primary private IPv4 address.
- `network-interface.addresses.private-dns-name` - The private DNS name.
- `network-interface.addresses.private-ip-address` - The private IPv4 address associated with the network interface.
- `network-interface.association.allocation-id` - The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface.
- `network-interface.association.association-id` - The association ID returned when the network interface was associated with an IPv4 address.
- `network-interface.association.carrier-ip` - The customer-owned IP address.
- `network-interface.association.customer-owned-ip` - The customer-owned IP address.
- `network-interface.association.ip-owner-id` - The owner of the Elastic IP address (IPv4) associated with the network interface.
- `network-interface.association.public-dns-name` - The public DNS name.
- `network-interface.association.public-ip` - The address of the Elastic IP address (IPv4) bound to the network interface.
- `network-interface.attachment.attach-time` - The time that the network interface was attached to an instance.

- network-interface.attachment.attachment-id - The ID of the interface attachment.
- network-interface.attachment.delete-on-termination - Specifies whether the attachment is deleted when an instance is terminated.
- network-interface.attachment.device-index - The device index to which the network interface is attached.
- network-interface.attachment.instance-id - The ID of the instance to which the network interface is attached.
- network-interface.attachment.instance-owner-id - The owner ID of the instance to which the network interface is attached.
- network-interface.attachment.network-card-index - The index of the network card.
- network-interface.attachment.status - The status of the attachment (attaching | attached | detaching | detached).
- network-interface.availability-zone - The Availability Zone for the network interface.
- network-interface.deny-all-igw-traffic - A Boolean that indicates whether a network interface with an IPv6 address is unreachable from the public internet.
- network-interface.description - The description of the network interface.
- network-interface.group-id - The ID of a security group associated with the network interface.
- network-interface.group-name - The name of a security group associated with the network interface.
- network-interface.ipv4-prefixes.ipv4-prefix - The IPv4 prefixes that are assigned to the network interface.
- network-interface.ipv6-address - The IPv6 address associated with the network interface.
- network-interface.ipv6-addresses.ipv6-address - The IPv6 address associated with the network interface.
- network-interface.ipv6-addresses.is-primary-ipv6 - A Boolean that indicates whether this is the primary IPv6 address.
- network-interface.ipv6-native - A Boolean that indicates whether this is an IPv6 only network interface.

- network-interface.ipv6-prefixes.ipv6-prefix - The IPv6 prefix assigned to the network interface.
- network-interface.mac-address - The MAC address of the network interface.
- network-interface.network-interface-id - The ID of the network interface.
- network-interface.operator.managed - A Boolean that indicates whether the instance has a managed network interface.
- network-interface.operator.principal - The principal that manages the network interface. Only valid for instances with managed network interfaces, where managed is true.
- network-interface.outpost-arn - The ARN of the Outpost.
- network-interface.owner-id - The ID of the owner of the network interface.
- network-interface.private-dns-name - The private DNS name of the network interface.
- network-interface.private-ip-address - The private IPv4 address.
- network-interface.public-dns-name - The public DNS name.
- network-interface.requester-id - The requester ID for the network interface.
- network-interface.requester-managed - Indicates whether the network interface is being managed by AWS.
- network-interface.status - The status of the network interface (available) | in-use).
- network-interface.source-dest-check - Whether the network interface performs source/destination checking. A value of true means that checking is enabled, and false means that checking is disabled. The value must be false for the network interface to perform network address translation (NAT) in your VPC.
- network-interface.subnet-id - The ID of the subnet for the network interface.
- network-interface.tag-key - The key of a tag assigned to the network interface.
- network-interface.tag-value - The value of a tag assigned to the network interface.
- network-interface.vpc-id - The ID of the VPC for the network interface.
- network-performance-options.bandwidth-weighting - Where the performance boost is applied, if applicable. Valid values: default, vpc-1, ebs-1.
- operator.managed - A Boolean that indicates whether this is a managed instance.
- operator.principal - The principal that manages the instance. Only valid for managed instances, where managed is true.

- `outpost-arn` - The Amazon Resource Name (ARN) of the Outpost.
- `owner-id` - The AWS account ID of the instance owner.
- `placement-group-name` - The name of the placement group for the instance.
- `placement-partition-number` - The partition in which the instance is located.
- `platform` - The platform. To list only Windows instances, use `windows`.
- `platform-details` - The platform (`Linux/UNIX` | `Red Hat BYOL Linux` | `Red Hat Enterprise Linux` | `Red Hat Enterprise Linux with HA` | `Red Hat Enterprise Linux with High Availability` | `Red Hat Enterprise Linux with SQL Server Standard and HA` | `Red Hat Enterprise Linux with SQL Server Enterprise and HA` | `Red Hat Enterprise Linux with SQL Server Standard` | `Red Hat Enterprise Linux with SQL Server Web` | `Red Hat Enterprise Linux with SQL Server Enterprise` | `SQL Server Enterprise` | `SQL Server Standard` | `SQL Server Web` | `SUSE Linux` | `Ubuntu Pro` | `Windows` | `Windows BYOL` | `Windows with SQL Server Enterprise` | `Windows with SQL Server Standard` | `Windows with SQL Server Web`).
- `private-dns-name` - The private IPv4 DNS name of the instance.
- `private-dns-name-options.enable-resource-name-dns-a-record` - A Boolean that indicates whether to respond to DNS queries for instance hostnames with DNS A records.
- `private-dns-name-options.enable-resource-name-dns-aaaa-record` - A Boolean that indicates whether to respond to DNS queries for instance hostnames with DNS AAAA records.
- `private-dns-name-options.hostname-type` - The type of hostname (`ip-name` | `resource-name`).
- `private-ip-address` - The private IPv4 address of the instance. This can only be used to filter by the primary IP address of the network interface attached to the instance. To filter by additional IP addresses assigned to the network interface, use the filter `network-interface.addresses.private-ip-address`.
- `product-code` - The product code associated with the AMI used to launch the instance.
- `product-code.type` - The type of product code (`devpay` | `marketplace`).
- `ramdisk-id` - The RAM disk ID.
- `reason` - The reason for the current state of the instance (for example, shows "User Initiated [date]" when you stop or terminate the instance). Similar to the state-reason-code filter.

- `requester-id` - The ID of the entity that launched the instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on).
- `reservation-id` - The ID of the instance's reservation. A reservation ID is created any time you launch an instance. A reservation ID has a one-to-one relationship with an instance launch request, but can be associated with more than one instance if you launch multiple instances using the same launch request. For example, if you launch one instance, you get one reservation ID. If you launch ten instances using the same launch request, you also get one reservation ID.
- `root-device-name` - The device name of the root device volume (for example, `/dev/sda1`).
- `root-device-type` - The type of the root device volume (`ebs` | `instance-store`).
- `source-dest-check` - Indicates whether the instance performs source/destination checking. A value of `true` means that checking is enabled, and `false` means that checking is disabled. The value must be `false` for the instance to perform network address translation (NAT) in your VPC.
- `spot-instance-request-id` - The ID of the Spot Instance request.
- `state-reason-code` - The reason code for the state change.
- `state-reason-message` - A message that describes the state change.
- `subnet-id` - The ID of the subnet for the instance.
- `tag:<key>` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources that have a tag with a specific key, regardless of the tag value.
- `tenancy` - The tenancy of an instance (`dedicated` | `default` | `host`).
- `tpm-support` - Indicates if the instance is configured for NitroTPM support (`v2.0`).
- `usage-operation` - The usage operation value for the instance (`RunInstances` | `RunInstances:00g0` | `RunInstances:0010` | `RunInstances:1010` | `RunInstances:1014` | `RunInstances:1110` | `RunInstances:0014` | `RunInstances:0210` | `RunInstances:0110` | `RunInstances:0100` | `RunInstances:0004` | `RunInstances:0200` | `RunInstances:000g` | `RunInstances:0g00` | `RunInstances:0002` | `RunInstances:0800` | `RunInstances:0102` | `RunInstances:0006` | `RunInstances:0202`).

- `usage-operation-update-time` - The time that the usage operation was last updated, for example, `2022-09-15T17:15:20.000Z`.
- `virtualization-type` - The virtualization type of the instance (`paravirtual` | `hvm`).
- `vpc-id` - The ID of the VPC that the instance is running in.

Type: Array of Filter objects

Required: No

InstanceId.N

The instance IDs.

Default: Describes all your instances.

Type: Array of strings

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

You cannot specify this parameter and the instance IDs parameter in the same request.

Type: Integer

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

reservationSet

Information about the reservations.

Type: Array of Reservation objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1: Describe all instances

This example describes all instances owned by your AWS account in the current Region. It uses pagination. The first example request gets the first page of results. The second example request uses the token returned by the previous request. Continue until there are no more results.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeInstances
&MaxResults=10
&AUTHPARAMS
```

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeInstances
&MaxResults=10
&NextToken=eyJOZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiEXAMPLE=
&AUTHPARAMS
```

Example 2: Describe an instance

This example describes the specified instance.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeInstances
&InstanceId.1=i-1234567890abcdef0
&AUTHPARAMS
```

Sample Response

```
<DescribeInstancesResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>8f7724cf-496f-496e-8fe3-example</requestId>
    <reservationSet>
        <item>
            <reservationId>r-1234567890abcdef0</reservationId>
            <ownerId>123456789012</ownerId>
            <groupSet/>
            <instancesSet>
                <item>

</DescribeInstancesResponse>
```

Example 3: Filter by instance type

This example describes only the instances that have the `m1.small` or `m1.large` instance type and an attached Amazon EBS volume to be deleted on termination.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeInstances
&Filter.1.Name=instance-type
&Filter.1.Value.1=m1.small
&Filter.1.Value.2=m1.large
&Filter.2.Name=block-device-mapping.status
&Filter.2.Value.1=attached
&Filter.3.Name=block-device-mapping.delete-on-termination
&Filter.3.Value.1=true
&AUTHPARAMS
```

Example 4: Filter by VPC

This example describes all instances that are running in the specified VPC.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeInstances
&Filter.1.Name=vpc-id
&Filter.1.Value.1=*
```

```
&AUTHPARAMS
```

Example 5: Filter by tag key

This example describes any instances that have a tag with the key `Owner`, regardless of the value of the tag.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeInstances
&Filter.1.Name=tag-key
&Filter.1.Value.1=Owner
&AUTHPARAMS
```

Example 6: Filter by tag key and value

This example lists only the instances that have a tag with the key `Owner` and the value `DbAdmin`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeInstances
&Filter.1.Name=tag:Owner
&Filter.1.Value.1=DbAdmin
&AUTHPARAMS
```

Example 7: Filter by placement group

This example describes any instances that are in the placement group with the name `HDFS-Group-A`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeInstances
&Filter.1.Name=placement-group-name
&Filter.1.Value=HDFS-Group-A
&AUTHPARAMS
```

Example 8: Filter by placement group partition

This example describes only the instances that are in partition 2 of the placement group with the name `HDFS-Group-A`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeInstances
&Filter.1.Name=placement-group-name
&Filter.1.Value=HDFS-Group-A
&Filter.2.Name=placement-partition-number
&Filter.2.Value=2
&AUTHPARAMS
```

Example 9: Filter by metadata authentication

The following example displays details about your instances that are not using any token header authentication requirement to access instance metadata. The response is truncated to show only the relevant pieces.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeInstances
&Filter.Name=metadata-options.http-tokens
&Filter.Values=optional
&AUTHPARAMS
```

Sample Response

```
<DescribeInstances xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <instanceId>i-1234567890abcdef0</instanceId>
    <MetadataOptions>
          <state>applied</state>
          <HttpTokens>optional</HttpTokens>
          <HttpPutResponseHopLimit>1</HttpPutResponseHopLimit>
          <HttpEndpoint>enabled</HttpEndpoint>
    </MetadataOptions>
</DescribeInstances>
```

DescribeInstanceSqlHaHistoryStates

Describes the historical SQL Server High Availability states for Amazon EC2 instances that are enabled for Amazon EC2 High Availability for SQL Server monitoring.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

EndTime

The end data and time of the period for which to get historical SQL Server High Availability states. If omitted, the API returns historical states up to the current date and time.

Timezone: UTC

Format: `YYYY-MM-DDThh:mm:ss.sssZ`

Type: Timestamp

Required: No

Filter.N

One or more filters to apply to the results. Supported filters include:

- `tag:<key>` - The tag key and value pair assigned to the instance. For example, to find all instances tagged with `Owner:TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The tag key assigned to the instance.
- `haStatus` - The SQL Server High Availability status of the SQL Server High Availability instance (`processing` | `active` | `standby` | `invalid`).

- `sqlServerLicenseUsage` - The license type for the SQL Server license (`full` | `waived`).

Type: Array of Filter objects

Required: No

InstanceId.N

The IDs of the SQL Server High Availability instances to describe. If omitted, the API returns historical states for all SQL Server High Availability instances.

Type: Array of strings

Required: No

MaxResults

The maximum number of results to return for the request in a single page. The remaining results can be seen by sending another request with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 1000.

Required: No

NextToken

The token to use to retrieve the next page of results.

Type: String

Required: No

StartTime

The start data and time of the period for which to get the historical SQL Server High Availability states. If omitted, the API returns all available historical states.

Timezone: UTC

Format: `YYYY-MM-DDThh:mm:ss.sssZ`

Type: Timestamp

Required: No

Response Elements

The following elements are returned by the service.

instanceSet

Information about the historical SQL Server High Availability states of the SQL Server High Availability instances.

Type: Array of RegisteredInstance objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

DescribeInstanceSqlHaStates

Describes the SQL Server High Availability states for Amazon EC2 instances that are enabled for Amazon EC2 High Availability for SQL Server monitoring.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters to apply to the results. Supported filters include:

- `tag:<key>` - The tag key and value pair assigned to the instance. For example, to find all instances tagged with `Owner:TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The tag key assigned to the instance.
- `haStatus` - The SQL Server High Availability status of the SQL Server High Availability instance (`processing` | `active` | `standby` | `invalid`).
- `sqlServerLicenseUsage` - The license type for the SQL Server license (`full` | `waived`).

Type: Array of Filter objects

Required: No

InstanceId.N

The IDs of the SQL Server High Availability instances to describe. If omitted, the API returns SQL Server High Availability states for all SQL Server High Availability instances.

Type: Array of strings

Required: No

MaxResults

The maximum number of results to return for the request in a single page. The remaining results can be seen by sending another request with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 1000.

Required: No

NextToken

The token to use to retrieve the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

instanceSet

Information about the SQL Server High Availability instances.

Type: Array of RegisteredInstance objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

DescribeInstanceStatus

Describes the status of the specified instances or all of your instances. By default, only running instances are described, unless you specifically indicate to return the status of all instances.

Instance status includes the following components:

- **Status checks** - Amazon EC2 performs status checks on running EC2 instances to identify hardware and software issues. For more information, see Status checks for your instances and Troubleshoot instances with failed status checks in the *Amazon EC2 User Guide*.
- **Scheduled events** - Amazon EC2 can schedule events (such as reboot, stop, or terminate) for your instances related to hardware issues, software updates, or system maintenance. For more information, see Scheduled events for your instances in the *Amazon EC2 User Guide*.
- **Instance state** - You can manage your instances from the moment you launch them through their termination. For more information, see Instance lifecycle in the *Amazon EC2 User Guide*.

The Amazon EC2 API follows an eventual consistency model. This means that the result of an API command you run that creates or modifies resources might not be immediately available to all subsequent commands you run. For guidance on how to manage eventual consistency, see Eventual consistency in the Amazon EC2 API in the *Amazon EC2 Developer Guide*.

> **Note**
>
> The order of the elements in the response, including those within nested structures, might vary. Applications should not assume the elements appear in a particular order.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `availability-zone` - The Availability Zone of the instance.
- `availability-zone-id` - The ID of the Availability Zone of the instance.
- `event.code` - The code for the scheduled event (`instance-reboot` | `system-reboot` | `system-maintenance` | `instance-retirement` | `instance-stop`).
- `event.description` - A description of the event.
- `event.instance-event-id` - The ID of the event whose date and time you are modifying.
- `event.not-after` - The latest end time for the scheduled event (for example, `2014-09-15T17:15:20.000Z`).
- `event.not-before` - The earliest start time for the scheduled event (for example, `2014-09-15T17:15:20.000Z`).
- `event.not-before-deadline` - The deadline for starting the event (for example, `2014-09-15T17:15:20.000Z`).
- `instance-state-code` - The code for the instance state, as a 16-bit unsigned integer. The high byte is used for internal purposes and should be ignored. The low byte is set based on the state represented. The valid values are 0 (pending), 16 (running), 32 (shutting-down), 48 (terminated), 64 (stopping), and 80 (stopped).
- `instance-state-name` - The state of the instance (`pending` | `running` | `shutting-down` | `terminated` | `stopping` | `stopped`).
- `instance-status.reachability` - Filters on instance status where the name is `reachability` (`passed` | `failed` | `initializing` | `insufficient-data`).
- `instance-status.status` - The status of the instance (ok | `impaired` | `initializing` | `insufficient-data` | `not-applicable`).
- `operator.managed` - A Boolean that indicates whether this is a managed instance.
- `operator.principal` - The principal that manages the instance. Only valid for managed instances, where `managed` is `true`.
- `system-status.reachability` - Filters on system status where the name is `reachability` (`passed` | `failed` | `initializing` | `insufficient-data`).

- `system-status.status` - The system status of the instance (ok | `impaired` | `initializing` | `insufficient-data` | `not-applicable`).
- `attached-ebs-status.status` - The status of the attached EBS volume for the instance (ok | `impaired` | `initializing` | `insufficient-data` | `not-applicable`).

Type: Array of Filter objects

Required: No

IncludeAllInstances

When `true`, includes the health status for all instances. When `false`, includes the health status for running instances only.

Default: `false`

Type: Boolean

Required: No

InstanceId.N

The instance IDs.

Default: Describes all your instances.

Constraints: Maximum 100 explicitly specified instance IDs.

Type: Array of strings

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

You cannot specify this parameter and the instance IDs parameter in the same request.

Type: Integer

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

instanceStatusSet

Information about the status of the instances.

Type: Array of InstanceStatus objects

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example returns instance status descriptions for all running instances.

Sample Request

```
https://ec2.amazonaws.com/?
Action=DescribeInstanceStatus
&AUTHPARAMS
```

Example 2

This example returns instance status descriptions for the specified instances.

Sample Request

```
https://ec2.amazonaws.com/?
Action=DescribeInstanceStatus
&InstanceId.1=i-1234567890abcdef0
&InstanceId.2=i-0598c7d356eba48d7
&AUTHPARAMS
```

Example 3

This example returns instance status descriptions for all instances specified by supported DescribeInstanceStatus filters.

Sample Request

```
https://ec2.amazonaws.com/?
Action=DescribeInstanceStatus
&Filter.1.Name=system-status.reachability
&Filter.1.Value.failed
&AUTHPARAMS
```

Sample Response

```
<DescribeInstanceStatusResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>3be1508e-c444-4fef-89cc-0b1223c4f02fEXAMPLE</requestId>
    <instanceStatusSet>
        <item>
            <instanceId>i-1234567890abcdef0</instanceId>
            <availabilityZone>us-east-1d</availabilityZone>
            <instanceState>
                <code>16</code>
                <name>running</name>
            </instanceState>
            <systemStatus>
                <status>impaired</status>
                <details>
                    <item>
                        <name>reachability</name>
                        <status>failed</status>

DescribeInstanceTopology

Describes a tree-based hierarchy that represents the physical host placement of your EC2 instances within an Availability Zone or Local Zone. You can use this information to determine the relative proximity of your EC2 instances within the AWS network to support your tightly coupled workloads.

Instance topology is supported for specific instance types only. For more information, see Prerequisites for Amazon EC2 instance topology in the *Amazon EC2 User Guide*.

> **Note**
>
> The Amazon EC2 API follows an eventual consistency model due to the distributed nature of the system supporting it. As a result, when you call the DescribeInstanceTopology API command immediately after launching instances, the response might return a `null` value for `capacityBlockId` because the data might not have fully propagated across all subsystems. For more information, see Eventual consistency in the Amazon EC2 API in the *Amazon EC2 Developer Guide*.

For more information, see Amazon EC2 topology in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `availability-zone` - The name of the Availability Zone (for example, `us-west-2a`) or Local Zone (for example, `us-west-2-lax-1b`) that the instance is in.
- `instance-type` - The instance type (for example, `p4d.24xlarge`) or instance family (for example, `p4d*`). You can use the `*` wildcard to match zero or more characters, or the `?` wildcard to match zero or one character.
- `zone-id` - The ID of the Availability Zone (for example, `usw2-az2`) or Local Zone (for example, `usw2-lax1-az1`) that the instance is in.

Type: Array of Filter objects

Required: No

GroupName.N

The name of the placement group that each instance is in.

Constraints: Maximum 100 explicitly specified placement group names.

Type: Array of strings

Required: No

InstanceId.N

The instance IDs.

Default: Describes all your instances.

Constraints: Maximum 100 explicitly specified instance IDs.

Type: Array of strings

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

You can't specify this parameter and the instance IDs parameter in the same request.

Default: `20`

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 100.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

instanceSet

Information about the topology of each instance.

Type: Array of InstanceTopology objects

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

DescribeInstanceTypeOfferings

Lists the instance types that are offered for the specified location. If no location is specified, the default is to list the instance types that are offered in the current Region.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters. Filter names and values are case-sensitive.

- `instance-type` - The instance type. For a list of possible values, see Instance.
- `location` - The location. For a list of possible identifiers, see Regions and Zones.

Type: Array of Filter objects

Required: No

LocationType

The location type.

- `availability-zone` - The Availability Zone. When you specify a location filter, it must be an Availability Zone for the current Region.
- `availability-zone-id` - The AZ ID. When you specify a location filter, it must be an AZ ID for the current Region.
- `outpost` - The Outpost ARN. When you specify a location filter, it must be an Outpost ARN for the current Region.

- `region` - The current Region. If you specify a location filter, it must match the current Region.

Type: String

Valid Values: `region | availability-zone | availability-zone-id | outpost`

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

instanceTypeOfferingSet

The instance types offered in the location.

Type: Array of InstanceTypeOffering objects

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4

- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeInstanceTypes

Describes the specified instance types. By default, all instance types for the current Region are described. Alternatively, you can filter the results.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters. Filter names and values are case-sensitive.

- `auto-recovery-supported` - Indicates whether Amazon CloudWatch action based recovery is supported (`true` | `false`).
- `bare-metal` - Indicates whether it is a bare metal instance type (`true` | `false`).
- `burstable-performance-supported` - Indicates whether the instance type is a burstable performance T instance type (`true` | `false`).
- `current-generation` - Indicates whether this instance type is the latest generation instance type of an instance family (`true` | `false`).
- `dedicated-hosts-supported` - Indicates whether the instance type supports Dedicated Hosts. (`true` | `false`)
- `ebs-info.attachment-limit-type` - The type of Amazon EBS volume attachment limit (`shared` | `dedicated`).
- `ebs-info.maximum-ebs-attachments` - The maximum number of Amazon EBS volumes that can be attached to the instance type.
- `ebs-info.ebs-optimized-info.baseline-bandwidth-in-mbps` - The baseline bandwidth performance for an EBS-optimized instance type, in Mbps.

- `ebs-info.ebs-optimized-info.baseline-iops` - The baseline input/output storage operations per second for an EBS-optimized instance type.
- `ebs-info.ebs-optimized-info.baseline-throughput-in-mbps` - The baseline throughput performance for an EBS-optimized instance type, in MB/s.
- `ebs-info.ebs-optimized-info.maximum-bandwidth-in-mbps` - The maximum bandwidth performance for an EBS-optimized instance type, in Mbps.
- `ebs-info.ebs-optimized-info.maximum-iops` - The maximum input/output storage operations per second for an EBS-optimized instance type.
- `ebs-info.ebs-optimized-info.maximum-throughput-in-mbps` - The maximum throughput performance for an EBS-optimized instance type, in MB/s.
- `ebs-info.ebs-optimized-support` - Indicates whether the instance type is EBS-optimized (`supported` | `unsupported` | `default`).
- `ebs-info.encryption-support` - Indicates whether EBS encryption is supported (`supported` | `unsupported`).
- `ebs-info.nvme-support` - Indicates whether non-volatile memory express (NVMe) is supported for EBS volumes (`required` | `supported` | `unsupported`).
- `free-tier-eligible` - A Boolean that indicates whether this instance type can be used under the AWS Free Tier (`true` | `false`).
- `hibernation-supported` - Indicates whether On-Demand hibernation is supported (`true` | `false`).
- `hypervisor` - The hypervisor (`nitro` | `xen`).
- `instance-storage-info.disk.count` - The number of local disks.
- `instance-storage-info.disk.size-in-gb` - The storage size of each instance storage disk, in GB.
- `instance-storage-info.disk.type` - The storage technology for the local instance storage disks (`hdd` | `ssd`).
- `instance-storage-info.encryption-support` - Indicates whether data is encrypted at rest (`required` | `supported` | `unsupported`).
- `instance-storage-info.nvme-support` - Indicates whether non-volatile memory express (NVMe) is supported for instance store (`required` | `supported` | `unsupported`).
- `instance-storage-info.total-size-in-gb` - The total amount of storage available from all local instance storage, in GB.

- `instance-storage-supported` - Indicates whether the instance type has local instance storage (`true` | `false`).
- `instance-type` - The instance type (for example `c5.2xlarge` or c5*).
- `memory-info.size-in-mib` - The memory size.
- `network-info.bandwidth-weightings` - For instances that support bandwidth weighting to boost performance (`default`, `vpc-1`, `ebs-1`).
- `network-info.efa-info.maximum-efa-interfaces` - The maximum number of Elastic Fabric Adapters (EFAs) per instance.
- `network-info.efa-supported` - Indicates whether the instance type supports Elastic Fabric Adapter (EFA) (`true` | `false`).
- `network-info.ena-support` - Indicates whether Elastic Network Adapter (ENA) is supported or required (`required` | `supported` | `unsupported`).
- `network-info.flexible-ena-queues-support` - Indicates whether an instance supports flexible ENA queues (`supported` | `unsupported`).
- `network-info.encryption-in-transit-supported` - Indicates whether the instance type automatically encrypts in-transit traffic between instances (`true` | `false`).
- `network-info.ipv4-addresses-per-interface` - The maximum number of private IPv4 addresses per network interface.
- `network-info.ipv6-addresses-per-interface` - The maximum number of private IPv6 addresses per network interface.
- `network-info.ipv6-supported` - Indicates whether the instance type supports IPv6 (`true` | `false`).
- `network-info.maximum-network-cards` - The maximum number of network cards per instance.
- `network-info.maximum-network-interfaces` - The maximum number of network interfaces per instance.
- `network-info.network-performance` - The network performance (for example, "25 Gigabit").
- `nitro-enclaves-support` - Indicates whether Nitro Enclaves is supported (`supported` | `unsupported`).
- `nitro-tpm-support` - Indicates whether NitroTPM is supported (`supported` | `unsupported`).
- `nitro-tpm-info.supported-versions` - The supported NitroTPM version (`2.0`).

- processor-info.supported-architecture - The CPU architecture (arm64 | i386 | x86_64).
- processor-info.sustained-clock-speed-in-ghz - The CPU clock speed, in GHz.
- processor-info.supported-features - The supported CPU features (amd-sev-snp).
- reboot-migration-support - Indicates whether enabling reboot migration is supported (supported | unsupported).
- supported-boot-mode - The boot mode (legacy-bios | uefi).
- supported-root-device-type - The root device type (ebs | instance-store).
- supported-usage-class - The usage class (on-demand | spot | capacity-block).
- supported-virtualization-type - The virtualization type (hvm | paravirtual).
- vcpu-info.default-cores - The default number of cores for the instance type.
- vcpu-info.default-threads-per-core - The default number of threads per core for the instance type.
- vcpu-info.default-vcpus - The default number of vCPUs for the instance type.
- vcpu-info.valid-cores - The number of cores that can be configured for the instance type.
- vcpu-info.valid-threads-per-core - The number of threads per core that can be configured for the instance type. For example, "1" or "1,2".

Type: Array of Filter objects

Required: No

InstanceType.N

The instance types.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 100 items.

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 100.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

instanceTypeSet

The instance type.

Type: Array of InstanceTypeInfo objects

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2

- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeInternetGateways

Describes your internet gateways. The default is to describe all your internet gateways. Alternatively, you can specify specific internet gateway IDs or filter the results to include only the internet gateways that match specific criteria.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `attachment.state` - The current state of the attachment between the gateway and the VPC (`available`). Present only if a VPC is attached.
- `attachment.vpc-id` - The ID of an attached VPC.
- `internet-gateway-id` - The ID of the Internet gateway.
- `owner-id` - The ID of the AWS account that owns the internet gateway.
- `tag` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.

Type: Array of Filter objects

Required: No

InternetGatewayId.N

The IDs of the internet gateways.

Default: Describes all your internet gateways.

Type: Array of strings

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

internetGatewaySet

Information about the internet gateways.

Type: Array of InternetGateway objects

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes all your internet gateways.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeInternetGateways
&AUTHPARAMS
```

Sample Response

```
<DescribeInternetGatewaysResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>e0fbdd4f-8e6d-437c-92eb-bc72864831d8</requestId>

DescribeIpamByoasn

Describes your Autonomous System Numbers (ASNs), their provisioning statuses, and the BYOIP CIDRs with which they are associated. For more information, see Tutorial: Bring your ASN to IPAM in the *Amazon VPC IPAM guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 100.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

byoasnSet

ASN and BYOIP CIDR associations.

Type: Array of Byoasn objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeIpamExternalResourceVerificationTokens

Describe verification tokens.

A verification token is an AWS-generated random value that you can use to prove ownership of an external resource. For example, you can use a verification token to validate that you control a public IP address range when you bring an IP address range to AWS (BYOIP).

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters for the request. For more information about filtering, see Filtering CLI output.

Available filters:

- `ipam-arn`
- `ipam-external-resource-verification-token-arn`
- `ipam-external-resource-verification-token-id`
- `ipam-id`
- `ipam-region`
- `state`
- `status`
- `token-name`
- `token-value`

Type: Array of Filter objects

Required: No

IpamExternalResourceVerificationTokenId.N

Verification token IDs.

Type: Array of strings

Required: No

MaxResults

The maximum number of tokens to return in one page of results.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

ipamExternalResourceVerificationTokenSet

Verification tokens.

Type: Array of IpamExternalResourceVerificationToken objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeIpamPolicies

Describes one or more IPAM policies.

An IPAM policy is a set of rules that define how public IPv4 addresses from IPAM pools are allocated to AWS resources. Each rule maps an AWS service to IPAM pools that the service will use to get IP addresses. A single policy can have multiple rules and be applied to multiple AWS Regions. If the IPAM pool run out of addresses then the services fallback to Amazon-provided IP addresses. A policy can be applied to an individual AWS account or an entity within AWS Organizations.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters for the IPAM policy description.

Type: Array of Filter objects

Required: No

IpamPolicyId.N

The IDs of the IPAM policies to describe.

Type: Array of strings

Required: No

MaxResults

The maximum number of results to return in a single call.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

ipamPolicySet

Information about the IPAM policies.

An IPAM policy is a set of rules that define how public IPv4 addresses from IPAM pools are allocated to AWS resources. Each rule maps an AWS service to IPAM pools that the service will use to get IP addresses. A single policy can have multiple rules and be applied to multiple AWS Regions. If the IPAM pool run out of addresses then the services fallback to Amazon-provided IP addresses. A policy can be applied to an individual AWS account or an entity within AWS Organizations.

Type: Array of IpamPolicy objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeIpamPools

Get information about your IPAM pools.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters for the request. For more information about filtering, see Filtering CLI output.

Type: Array of Filter objects

Required: No

IpamPoolId.N

The IDs of the IPAM pools you would like information on.

Type: Array of strings

Required: No

MaxResults

The maximum number of results to return in the request.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

ipamPoolSet

Information about the IPAM pools.

Type: Array of IpamPool objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

DescribeIpamPrefixListResolvers

Describes one or more IPAM prefix list resolvers. Use this operation to view the configuration, status, and properties of your resolvers.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters to limit the results.

Type: Array of Filter objects

Required: No

IpamPrefixListResolverId.N

The IDs of the IPAM prefix list resolvers to describe. If not specified, all resolvers in your account are described.

Type: Array of strings

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

ipamPrefixListResolverSet

Information about the IPAM prefix list resolvers.

Type: Array of IpamPrefixListResolver objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeIpamPrefixListResolverTargets

Describes one or more IPAM prefix list resolver Targets. Use this operation to view the configuration and status of resolver targets.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters to limit the results.

Type: Array of Filter objects

Required: No

IpamPrefixListResolverId

The ID of the IPAM prefix list resolver to filter targets by. Only targets associated with this resolver will be returned.

Type: String

Required: No

IpamPrefixListResolverTargetId.N

The IDs of the IPAM prefix list resolver Targets to describe. If not specified, all targets in your account are described.

Type: Array of strings

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

ipamPrefixListResolverTargetSet

Information about the IPAM prefix list resolver Targets.

Type: Array of IpamPrefixListResolverTarget objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4

- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeIpamResourceDiscoveries

Describes IPAM resource discoveries. A resource discovery is an IPAM component that enables IPAM to manage and monitor resources that belong to the owning account.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The resource discovery filters.

Type: Array of Filter objects

Required: No

IpamResourceDiscoveryId.N

The IPAM resource discovery IDs.

Type: Array of strings

Required: No

MaxResults

The maximum number of resource discoveries to return in one page of results.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

ipamResourceDiscoverySet

The resource discoveries.

Type: Array of IpamResourceDiscovery objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2

- AWS SDK for .NET V4

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeIpamResourceDiscoveryAssociations

Describes resource discovery association with an Amazon VPC IPAM. An associated resource discovery is a resource discovery that has been associated with an IPAM..

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The resource discovery association filters.

Type: Array of Filter objects

Required: No

IpamResourceDiscoveryAssociationId.N

The resource discovery association IDs.

Type: Array of strings

Required: No

MaxResults

The maximum number of resource discovery associations to return in one page of results.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

Specify the pagination token from a previous request to retrieve the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

ipamResourceDiscoveryAssociationSet

The resource discovery associations.

Type: Array of IpamResourceDiscoveryAssociation objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2

- AWS SDK for .NET V4

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeIpams

Get information about your IPAM pools.

For more information, see What is IPAM? in the *Amazon VPC IPAM User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters for the request. For more information about filtering, see Filtering CLI output.

Type: Array of Filter objects

Required: No

IpamId.N

The IDs of the IPAMs you want information on.

Type: Array of strings

Required: No

MaxResults

The maximum number of results to return in the request.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

ipamSet

Information about the IPAMs.

Type: Array of Ipam objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeIpamScopes

Get information about your IPAM scopes.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters for the request. For more information about filtering, see Filtering CLI output.

Type: Array of Filter objects

Required: No

IpamScopeId.N

The IDs of the scopes you want information on.

Type: Array of strings

Required: No

MaxResults

The maximum number of results to return in the request.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

ipamScopeSet

The scopes you want information on.

Type: Array of IpamScope objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2

- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeIpv6Pools

Describes your IPv6 address pools.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `tag`:<key> - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

PoolId.N

The IDs of the IPv6 address pools.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

ipv6PoolSet

Information about the IPv6 address pools.

Type: Array of Ipv6Pool objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeKeyPairs

Describes the specified key pairs or all of your key pairs.

For more information about key pairs, see Amazon EC2 key pairs in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `key-pair-id` - The ID of the key pair.
- `fingerprint` - The fingerprint of the key pair.
- `key-name` - The name of the key pair.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.
- `tag:`<key> - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.

Type: Array of Filter objects

Required: No

IncludePublicKey

If `true`, the public key material is included in the response.

Default: `false`

Type: Boolean

Required: No

KeyName.N

The key pair names.

Default: Describes all of your key pairs.

Type: Array of strings

Required: No

KeyPairId.N

The IDs of the key pairs.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

keySet

Information about the key pairs.

Type: Array of KeyPairInfo objects

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes the key pair with name my-key-pair.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeKeyPairs
&KeyName.1=my-key-pair
&AUTHPARAMS
```

Sample Response

```
<DescribeKeyPairsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
    <keySet>
      <item>
         <keyName>my-key-pair</keyName>
         <keyFingerprint>1f:51:ae:28:bf:89:e9:d8:1f:25:5d:37:2d:7d:b8:ca:9f:f5:f1:6f</
keyFingerprint>
      </item>
   </keySet>
</DescribeKeyPairsResponse>
```

Example

This example filters the response to include only key pairs whose names include the string Dave.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeKeyPairs
&Filter.1.Name=key-name
&Filter.1.Value.1=*Dave*
&AUTHPARAMS
```

- AWS SDK for Ruby V3

DescribeLaunchTemplates

Describes one or more launch templates.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `create-time` - The time the launch template was created.
- `launch-template-name` - The name of the launch template.
- `tag:<key>` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.

Type: Array of Filter objects

Required: No

LaunchTemplateId.N

One or more launch template IDs.

Type: Array of strings

Required: No

LaunchTemplateName.N

One or more launch template names.

Type: Array of strings

Length Constraints: Minimum length of 3. Maximum length of 128.

Pattern: `[a-zA-Z0-9\(\)\.\-/_]+`

Required: No

MaxResults

The maximum number of results to return in a single call. To retrieve the remaining results, make another call with the returned `NextToken` value. This value can be between 1 and 200.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 200.

Required: No

NextToken

The token to request the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

launchTemplates

Information about the launch templates.

Type: Array of LaunchTemplate objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes all of your launch templates.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeLaunchTemplates
&AUTHPARAMS
```

Sample Response

```
<DescribeLaunchTemplatesResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>1afa6e44-eb38-4229-8db6-d5eaexample</requestId>
    <launchTemplates>
        <item>
            <createTime>2017-10-31T11:38:52.000Z</createTime>
            <createdBy>arn:aws:iam::123456789012:root</createdBy>
            <defaultVersionNumber>1</defaultVersionNumber>
            <latestVersionNumber>1</latestVersionNumber>
            <launchTemplateId>lt-0a20c965061f64abc</launchTemplateId>
            <launchTemplateName>MyLaunchTemplate</launchTemplateName>
        </item>
    </launchTemplates>
```

```
</DescribeLaunchTemplatesResponse>
```

- AWS SDK for Ruby V3

DescribeLaunchTemplateVersions

Describes one or more versions of a specified launch template. You can describe all versions, individual versions, or a range of versions. You can also describe all the latest versions or all the default versions of all the launch templates in your account.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `create-time` - The time the launch template version was created.
- `ebs-optimized` - A boolean that indicates whether the instance is optimized for Amazon EBS I/O.
- `http-endpoint` - Indicates whether the HTTP metadata endpoint on your instances is enabled (`enabled` | `disabled`).
- `http-protocol-ipv4` - Indicates whether the IPv4 endpoint for the instance metadata service is enabled (`enabled` | `disabled`).
- `host-resource-group-arn` - The ARN of the host resource group in which to launch the instances.
- `http-tokens` - The state of token usage for your instance metadata requests (`optional` | `required`).
- `iam-instance-profile` - The ARN of the IAM instance profile.
- `image-id` - The ID of the AMI.
- `instance-type` - The instance type.

- `is-default-version` - A boolean that indicates whether the launch template version is the default version.
- `kernel-id` - The kernel ID.
- `license-configuration-arn` - The ARN of the license configuration.
- `network-card-index` - The index of the network card.
- `ram-disk-id` - The RAM disk ID.

Type: Array of Filter objects

Required: No

LaunchTemplateId

The ID of the launch template.

To describe one or more versions of a specified launch template, you must specify either the launch template ID or the launch template name, but not both.

To describe all the latest or default launch template versions in your account, you must omit this parameter.

Type: String

Required: No

LaunchTemplateName

The name of the launch template.

To describe one or more versions of a specified launch template, you must specify either the launch template name or the launch template ID, but not both.

To describe all the latest or default launch template versions in your account, you must omit this parameter.

Type: String

Length Constraints: Minimum length of 3. Maximum length of 128.

Pattern: `[a-zA-Z0-9\(\)\.\-/_]+`

Required: No

LaunchTemplateVersion.N

One or more versions of the launch template. Valid values depend on whether you are describing a specified launch template (by ID or name) or all launch templates in your account.

To describe one or more versions of a specified launch template, valid values are `$Latest`, `$Default`, and numbers.

To describe all launch templates in your account that are defined as the latest version, the valid value is `$Latest`. To describe all launch templates in your account that are defined as the default version, the valid value is `$Default`. You can specify `$Latest` and `$Default` in the same request. You cannot specify numbers.

Type: Array of strings

Required: No

MaxResults

The maximum number of results to return in a single call. To retrieve the remaining results, make another call with the returned `NextToken` value. This value can be between 1 and 200.

Type: Integer

Required: No

MaxVersion

The version number up to which to describe launch template versions.

Type: String

Required: No

MinVersion

The version number after which to describe launch template versions.

Type: String

Required: No

NextToken

The token to request the next page of results.

Type: String

Required: No

ResolveAlias

If `true`, and if a Systems Manager parameter is specified for `ImageId`, the AMI ID is displayed in the response for `imageId`.

If `false`, and if a Systems Manager parameter is specified for `ImageId`, the parameter is displayed in the response for `imageId`.

For more information, see Use a Systems Manager parameter instead of an AMI ID in the *Amazon EC2 User Guide*.

Default: `false`

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

launchTemplateVersionSet

Information about the launch template versions.

Type: Array of LaunchTemplateVersion objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example describes all versions of launch template `lt-0a20c965061f64abc` up to version 3.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeLaunchTemplateVersions
&LaunchTemplateId=lt-0a20c965061f64abc
&MaxVersion=3
&AUTHPARAMS
```

Sample Response

```
<DescribeLaunchTemplateVersionsResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>65cadec1-b364-4354-8ca8-4176dexample</requestId>
    <launchTemplateVersionSet>
        <item>
            <createTime>2017-10-31T11:38:52.000Z</createTime>
            <createdBy>arn:aws:iam::123456789012:root</createdBy>
            <defaultVersion>true</defaultVersion>
            <launchTemplateData>
                <imageId>ami-8c1be5f6</imageId>

DescribeLocalGatewayRouteTables

Describes one or more local gateway route tables. By default, all local gateway route tables are described. Alternatively, you can filter the results.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `local-gateway-id` - The ID of a local gateway.
- `local-gateway-route-table-arn` - The Amazon Resource Name (ARN) of the local gateway route table.
- `local-gateway-route-table-id` - The ID of a local gateway route table.
- `outpost-arn` - The Amazon Resource Name (ARN) of the Outpost.
- `owner-id` - The ID of the AWS account that owns the local gateway route table.
- `state` - The state of the local gateway route table.

Type: Array of Filter objects

Required: No

LocalGatewayRouteTableId.N

The IDs of the local gateway route tables.

Type: Array of strings

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

localGatewayRouteTableSet

Information about the local gateway route tables.

Type: Array of LocalGatewayRouteTable objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeLocalGatewayRouteTableVirtualInterfaceGroupAssociations

Describes the associations between virtual interface groups and local gateway route tables.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `local-gateway-id` - The ID of a local gateway.
- `local-gateway-route-table-arn` - The Amazon Resource Name (ARN) of the local gateway route table for the virtual interface group.
- `local-gateway-route-table-id` - The ID of the local gateway route table.
- `local-gateway-route-table-virtual-interface-group-association-id` - The ID of the association.
- `local-gateway-route-table-virtual-interface-group-id` - The ID of the virtual interface group.
- `owner-id` - The ID of the AWS account that owns the local gateway virtual interface group association.
- `state` - The state of the association.

Type: Array of Filter objects

Required: No

LocalGatewayRouteTableVirtualInterfaceGroupAssociationId.N

The IDs of the associations.

Type: Array of strings

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

localGatewayRouteTableVirtualInterfaceGroupAssociationSet

Information about the associations.

Type: Array of LocalGatewayRouteTableVirtualInterfaceGroupAssociation objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeLocalGatewayRouteTableVpcAssociations

Describes the specified associations between VPCs and local gateway route tables.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `local-gateway-id` - The ID of a local gateway.
- `local-gateway-route-table-arn` - The Amazon Resource Name (ARN) of the local gateway route table for the association.
- `local-gateway-route-table-id` - The ID of the local gateway route table.
- `local-gateway-route-table-vpc-association-id` - The ID of the association.
- `owner-id` - The ID of the AWS account that owns the local gateway route table for the association.
- `state` - The state of the association.
- `vpc-id` - The ID of the VPC.

Type: Array of Filter objects

Required: No

LocalGatewayRouteTableVpcAssociationId.N

The IDs of the associations.

Type: Array of strings

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

localGatewayRouteTableVpcAssociationSet

Information about the associations.

Type: Array of LocalGatewayRouteTableVpcAssociation objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeLocalGateways

Describes one or more local gateways. By default, all local gateways are described. Alternatively, you can filter the results.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `local-gateway-id` - The ID of a local gateway.
- `outpost-arn` - The Amazon Resource Name (ARN) of the Outpost.
- `owner-id` - The ID of the AWS account that owns the local gateway.
- `state` - The state of the association.

Type: Array of Filter objects

Required: No

LocalGatewayId.N

The IDs of the local gateways.

Type: Array of strings

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

localGatewaySet

Information about the local gateways.

Type: Array of LocalGateway objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeLocalGatewayVirtualInterfaceGroups

Describes the specified local gateway virtual interface groups.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `local-gateway-id` - The ID of a local gateway.
- `local-gateway-virtual-interface-group-id` - The ID of the virtual interface group.
- `local-gateway-virtual-interface-id` - The ID of the virtual interface.
- `owner-id` - The ID of the AWS account that owns the local gateway virtual interface group.

Type: Array of Filter objects

Required: No

LocalGatewayVirtualInterfaceGroupId.N

The IDs of the virtual interface groups.

Type: Array of strings

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

localGatewayVirtualInterfaceGroupSet

The virtual interface groups.

Type: Array of LocalGatewayVirtualInterfaceGroup objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeLocalGatewayVirtualInterfaces

Describes the specified local gateway virtual interfaces.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `local-address` - The local address.
- `local-bgp-asn` - The Border Gateway Protocol (BGP) Autonomous System Number (ASN) of the local gateway.
- `local-gateway-id` - The ID of the local gateway.
- `local-gateway-virtual-interface-id` - The ID of the virtual interface.
- `owner-id` - The ID of the AWS account that owns the local gateway virtual interface.
- `peer-address` - The peer address.
- `peer-bgp-asn` - The peer BGP ASN.
- `vlan` - The ID of the VLAN.

Type: Array of Filter objects

Required: No

LocalGatewayVirtualInterfaceId.N

The IDs of the virtual interfaces.

Type: Array of strings

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

localGatewayVirtualInterfaceSet

Information about the virtual interfaces.

Type: Array of LocalGatewayVirtualInterface objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

DescribeLockedSnapshots

Describes the lock status for a snapshot.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `lock-state` - The state of the snapshot lock (`compliance-cooloff` | `governance` | `compliance` | `expired`).

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

SnapshotId.N

The IDs of the snapshots for which to view the lock status.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

snapshotSet

Information about the snapshots.

Type: Array of LockedSnapshotsInfo objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

DescribeMacHosts

Describes the specified EC2 Mac Dedicated Host or all of your EC2 Mac Dedicated Hosts.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Filter.N

The filters.

- `availability-zone` - The Availability Zone of the EC2 Mac Dedicated Host.
- `instance-type` - The instance type size that the EC2 Mac Dedicated Host is configured to support.

Type: Array of Filter objects

Required: No

HostId.N

The IDs of the EC2 Mac Dedicated Hosts.

Type: Array of strings

Required: No

MaxResults

The maximum number of results to return for the request in a single page. The remaining results can be seen by sending another request with the returned `nextToken` value. This value can be between 5 and 500. If `maxResults` is given a larger value than 500, you receive an error.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 500.

Required: No

NextToken

The token to use to retrieve the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

macHostSet

Information about the EC2 Mac Dedicated Hosts.

Type: Array of MacHost objects

nextToken

The token to use to retrieve the next page of results.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeMacModificationTasks

Describes a System Integrity Protection (SIP) modification task or volume ownership delegation task for an Amazon EC2 Mac instance. For more information, see Configure SIP for Amazon EC2 instances in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

Specifies one or more filters for the request:

- `instance-id` - The ID of the instance for which the task was created.
- `task-state` - The state of the task (`successful` | `failed` | `in-progress` | `pending`).
- `mac-system-integrity-protection-configuration.sip-status` - The overall SIP state requested in the task (`enabled` | `disabled`).
- `start-time` - The date and time the task was created.
- `task-type` - The type of task (`sip-modification` | `volume-ownership-delegation`).

Type: Array of Filter objects

Required: No

MacModificationTaskId.N

The ID of task.

Type: Array of strings

Required: No

MaxResults

The maximum number of results to return for the request in a single page. The remaining results can be seen by sending another request with the returned `nextToken` value. This value can be between 5 and 500. If `maxResults` is given a larger value than 500, you receive an error.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 500.

Required: No

NextToken

The token to use to retrieve the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

macModificationTaskSet

Information about the tasks.

Type: Array of MacModificationTask objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

DescribeManagedPrefixLists

Describes your managed prefix lists and any AWS-managed prefix lists.

To view the entries for your prefix list, use GetManagedPrefixListEntries.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `owner-id` - The ID of the prefix list owner.
- `prefix-list-id` - The ID of the prefix list.
- `prefix-list-name` - The name of the prefix list.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 100.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

PrefixListId.N

One or more prefix list IDs.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

prefixListSet

Information about the prefix lists.

Type: Array of ManagedPrefixList objects

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes managed prefix lists and filters by the prefix lists owned by account 123456789012.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeManagedPrefixList
&Filter.1.Name=owner-id
&Filter.1.Value.1=123456789012
&AUTHPARAMS
```

Sample Response

```
<DescribeManagedPrefixListsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>ace27020-4268-4c9c-a8d3-example</requestId>
    <prefixListSet>
            <item>
                <addressFamily>IPv4</addressFamily>
                <maxEntries>10</maxEntries>
                <ownerId>123456789012</ownerId>
                <prefixListArn>arn:aws:ec2:us-east-1:123456789012:prefix-list/
pl-0123123123123aabb</prefixListArn>
                <prefixListId>pl-0123123123123aabb</prefixListId>
                <prefixListName>tgw-attachments</prefixListName>
                <state>create-complete</state>
                <tagSet>
                    <item>
                      <key>Purpose</key>
                      <value>For TGW-1a attachments</value>
                    </item>
                </tagSet>
                <version>1</version>
            </item>
    </prefixListSet>
</DescribeManagedPrefixListsResponse>
```

DescribeMovingAddresses

> **Note**
>
> This action is deprecated.

Describes your Elastic IP addresses that are being moved from or being restored to the EC2-Classic platform. This request does not return information about any other Elastic IP addresses in your account.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `moving-status` - The status of the Elastic IP address (`MovingToVpc` | `RestoringToClassic`).

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return for the request in a single page. The remaining results of the initial request can be seen by sending another request with the returned `NextToken` value. This value can be between 5 and 1000; if `MaxResults` is given a value outside of this range, an error is returned.

Default: If no value is provided, the default is 1000.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

PublicIp.N

One or more Elastic IP addresses.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

movingAddressStatusSet

The status for each Elastic IP address.

Type: Array of MovingAddressStatus objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeNatGateways

Describes your NAT gateways. The default is to describe all your NAT gateways. Alternatively, you can specify specific NAT gateway IDs or filter the results to include only the NAT gateways that match specific criteria.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `nat-gateway-id` - The ID of the NAT gateway.
- `state` - The state of the NAT gateway (`pending` | `failed` | `available` | `deleting` | `deleted`).
- `subnet-id` - The ID of the subnet in which the NAT gateway resides.
- `tag` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.
- `vpc-id` - The ID of the VPC in which the NAT gateway resides.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NatGatewayId.N

The IDs of the NAT gateways.

Type: Array of strings

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

natGatewaySet

Information about the NAT gateways.

Type: Array of NatGateway objects

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes all of your NAT gateways.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeNatGateways
&AUTHPARAMS
```

Sample Response

```
<DescribeNatGatewaysResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>fcb1ea98-1c04-4f9f-a96d-61442example</requestId>
    <natGatewaySet>

DescribeNetworkAcls

Describes your network ACLs. The default is to describe all your network ACLs. Alternatively, you can specify specific network ACL IDs or filter the results to include only the network ACLs that match specific criteria.

For more information, see Network ACLs in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `association.association-id` - The ID of an association ID for the ACL.
- `association.network-acl-id` - The ID of the network ACL involved in the association.
- `association.subnet-id` - The ID of the subnet involved in the association.
- `default` - Indicates whether the ACL is the default network ACL for the VPC.
- `entry.cidr` - The IPv4 CIDR range specified in the entry.
- `entry.icmp.code` - The ICMP code specified in the entry, if any.
- `entry.icmp.type` - The ICMP type specified in the entry, if any.
- `entry.ipv6-cidr` - The IPv6 CIDR range specified in the entry.
- `entry.port-range.from` - The start of the port range specified in the entry.
- `entry.port-range.to` - The end of the port range specified in the entry.
- `entry.protocol` - The protocol specified in the entry (`tcp` | `udp` | `icmp` or a protocol number).

- `entry.rule-action` - Allows or denies the matching traffic (`allow` | `deny`).
- `entry.egress` - A Boolean that indicates the type of rule. Specify `true` for egress rules, or `false` for ingress rules.
- `entry.rule-number` - The number of an entry (in other words, rule) in the set of ACL entries.
- `network-acl-id` - The ID of the network ACL.
- `owner-id` - The ID of the AWS account that owns the network ACL.
- `tag` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.
- `vpc-id` - The ID of the VPC for the network ACL.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NetworkAclId.N

The IDs of the network ACLs.

Type: Array of strings

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

networkAclSet

Information about the network ACLs.

Type: Array of NetworkAcl objects

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes all your network ACLs.

- AWS SDK for Ruby V3

DescribeNetworkInsightsAccessScopeAnalyses

Describes the specified Network Access Scope analyses.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AnalysisStartTimeBegin

Filters the results based on the start time. The analysis must have started on or after this time.

Type: Timestamp

Required: No

AnalysisStartTimeEnd

Filters the results based on the start time. The analysis must have started on or before this time.

Type: Timestamp

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

There are no supported filters.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 100.

Required: No

NetworkInsightsAccessScopeAnalysisId.N

The IDs of the Network Access Scope analyses.

Type: Array of strings

Required: No

NetworkInsightsAccessScopeId

The ID of the Network Access Scope.

Type: String

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

networkInsightsAccessScopeAnalysisSet

The Network Access Scope analyses.

Type: Array of NetworkInsightsAccessScopeAnalysis objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for Ruby V3

DescribeNetworkInsightsAccessScopes

Describes the specified Network Access Scopes.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

There are no supported filters.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 100.

Required: No

NetworkInsightsAccessScopeId.N

The IDs of the Network Access Scopes.

Type: Array of strings

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

networkInsightsAccessScopeSet

The Network Access Scopes.

Type: Array of NetworkInsightsAccessScope objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

DescribeNetworkInsightsAnalyses

Describes one or more of your network insights analyses.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AnalysisEndTime

The time when the network insights analyses ended.

Type: Timestamp

Required: No

AnalysisStartTime

The time when the network insights analyses started.

Type: Timestamp

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters. The following are the possible values:

- path-found - A Boolean value that indicates whether a feasible path is found.
- status - The status of the analysis (running | succeeded | failed).

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 100.

Required: No

NetworkInsightsAnalysisId.N

The ID of the network insights analyses. You must specify either analysis IDs or a path ID.

Type: Array of strings

Required: No

NetworkInsightsPathId

The ID of the path. You must specify either a path ID or analysis IDs.

Type: String

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

networkInsightsAnalysisSet

Information about the network insights analyses.

Type: Array of NetworkInsightsAnalysis objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeNetworkInsightsPaths

Describes one or more of your paths.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters. The following are the possible values:

- destination - The ID of the resource.
- filter-at-source.source-address - The source IPv4 address at the source.
- filter-at-source.source-port-range - The source port range at the source.
- filter-at-source.destination-address - The destination IPv4 address at the source.
- filter-at-source.destination-port-range - The destination port range at the source.
- filter-at-destination.source-address - The source IPv4 address at the destination.
- filter-at-destination.source-port-range - The source port range at the destination.
- filter-at-destination.destination-address - The destination IPv4 address at the destination.
- filter-at-destination.destination-port-range - The destination port range at the destination.
- protocol - The protocol.
- source - The ID of the resource.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 100.

Required: No

NetworkInsightsPathId.N

The IDs of the paths.

Type: Array of strings

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

networkInsightsPathSet

Information about the paths.

Type: Array of NetworkInsightsPath objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

DescribeNetworkInterfaceAttribute

Describes a network interface attribute. You can specify only one attribute at a time.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Attribute

The attribute of the network interface. This parameter is required.

Type: String

Valid Values: `description | groupSet | sourceDestCheck | attachment | associatePublicIpAddress`

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

NetworkInterfaceId

The ID of the network interface.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

associatePublicIpAddress

Indicates whether to assign a public IPv4 address to a network interface. This option can be enabled for any network interface but will only apply to the primary network interface (eth0).

Type: Boolean

attachment

The attachment (if any) of the network interface.

Type: NetworkInterfaceAttachment object

description

The description of the network interface.

Type: AttributeValue object

groupSet

The security groups associated with the network interface.

Type: Array of GroupIdentifier objects

networkInterfaceId

The ID of the network interface.

Type: String

requestId

The ID of the request.

Type: String

sourceDestCheck

Indicates whether source/destination checking is enabled.

Type: AttributeBooleanValue object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes the `sourceDestCheck` attribute of the specified network interface.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeNetworkInterfaceAttribute
&NetworkInterfaceId=eni-686ea200
&Attribute=sourceDestCheck
&AUTHPARAMS
```

Sample Response

```
<DescribeNetworkInterfaceAttributeResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
  <requestId>7a20c6b2-d71c-45fb-bba7-37306850544b</requestId>
  <networkInterfaceId>eni-686ea200</networkInterfaceId>
  <sourceDestCheck>
    <value>true</value>
  </sourceDestCheck>
</DescribeNetworkInterfaceAttributeResponse>
```

See Also

- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python

- AWS SDK for Ruby V3

DescribeNetworkInterfacePermissions

Describes the permissions for your network interfaces.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Filter.N

One or more filters.

- `network-interface-permission.network-interface-permission-id` - The ID of the permission.
- `network-interface-permission.network-interface-id` - The ID of the network interface.
- `network-interface-permission.aws-account-id` - The AWS account ID.
- `network-interface-permission.aws-service` - The AWS service.
- `network-interface-permission.permission` - The type of permission (`INSTANCE-ATTACH` | `EIP-ASSOCIATE`).

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. If this parameter is not specified, up to 50 results are returned by default. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 255.

Required: No

NetworkInterfacePermissionId.N

The network interface permission IDs.

Type: Array of strings

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

networkInterfacePermissions

The network interface permissions.

Type: Array of NetworkInterfacePermission objects

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes all of your network interface permissions.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeNetworkInterfacePermissions
&AUTHPARAMS
```

Sample Response

```
<DescribeNetworkInterfacePermissionsResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>6d4fe5e1-4bd2-4e76-8980-04cexample</requestId>
    <networkInterfacePermissions>
        <item>
            <awsAccountId>123456789012</awsAccountId>
            <networkInterfaceId>eni-b909511a</networkInterfaceId>
            <networkInterfacePermissionId>eni-perm-06fd19020ede149ea</
networkInterfacePermissionId>
            <permission>INSTANCE-ATTACH</permission>
            <permissionState>
                <state>GRANTED</state>
            </permissionState>
        </item>
    </networkInterfacePermissions>
</DescribeNetworkInterfacePermissionsResponse>
```

- AWS SDK for Ruby V3

DescribeNetworkInterfaces

Describes the specified network interfaces or all your network interfaces.

If you have a large number of network interfaces, the operation fails unless you use pagination or one of the following filters: `group-id`, `mac-address`, `private-dns-name`, `private-ip-address`, `subnet-id`, or `vpc-id`.

> **Important**
>
> We strongly recommend using only paginated requests. Unpaginated requests are susceptible to throttling and timeouts.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `association.allocation-id` - The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface.
- `association.association-id` - The association ID returned when the network interface was associated with an IPv4 address.
- `addresses.association.owner-id` - The owner ID of the addresses associated with the network interface.
- `addresses.association.public-ip` - The association ID returned when the network interface was associated with the Elastic IP address (IPv4).

- `addresses.primary` - Whether the private IPv4 address is the primary IP address associated with the network interface.
- `addresses.private-ip-address` - The private IPv4 addresses associated with the network interface.
- `association.ip-owner-id` - The owner of the Elastic IP address (IPv4) associated with the network interface.
- `association.public-ip` - The address of the Elastic IP address (IPv4) bound to the network interface.
- `association.public-dns-name` - The public DNS name for the network interface (IPv4).
- `attachment.attach-time` - The time that the network interface was attached to an instance.
- `attachment.attachment-id` - The ID of the interface attachment.
- `attachment.delete-on-termination` - Indicates whether the attachment is deleted when an instance is terminated.
- `attachment.device-index` - The device index to which the network interface is attached.
- `attachment.instance-id` - The ID of the instance to which the network interface is attached.
- `attachment.instance-owner-id` - The owner ID of the instance to which the network interface is attached.
- `attachment.status` - The status of the attachment (`attaching` | `attached` | `detaching` | `detached`).
- `availability-zone` - The Availability Zone of the network interface.
- `availability-zone-id` - The ID of the Availability Zone of the network interface.
- `description` - The description of the network interface.
- `group-id` - The ID of a security group associated with the network interface.
- `ipv6-addresses.ipv6-address` - An IPv6 address associated with the network interface.
- `interface-type` - The type of network interface (`api_gateway_managed` | `aws_codestar_connections_managed` | `branch` | `ec2_instance_connect_endpoint` | `efa` | `efa-only` | `efs` | `evs` | `gateway_load_balancer` | `gateway_load_balancer_endpoint` | `global_accelerator_managed` | `interface` | `iot_rules_managed` | `lambda` | `load_balancer` | `nat_gateway` | `network_load_balancer` | `quicksight` | `transit_gateway` | `trunk` | `vpc_endpoint`).
- `mac-address` - The MAC address of the network interface.

- `network-interface-id` - The ID of the network interface.
- `operator.managed` - A Boolean that indicates whether this is a managed network interface.
- `operator.principal` - The principal that manages the network interface. Only valid for managed network interfaces, where `managed` is `true`.
- `owner-id` - The AWS account ID of the network interface owner.
- `private-dns-name` - The private DNS name of the network interface (IPv4).
- `private-ip-address` - The private IPv4 address or addresses of the network interface.
- `requester-id` - The alias or AWS account ID of the principal or service that created the network interface.
- `requester-managed` - Indicates whether the network interface is being managed by an AWS service (for example, AWS Management Console, Auto Scaling, and so on).
- `source-dest-check` - Indicates whether the network interface performs source/destination checking. A value of `true` means checking is enabled, and `false` means checking is disabled. The value must be `false` for the network interface to perform network address translation (NAT) in your VPC.
- `status` - The status of the network interface. If the network interface is not attached to an instance, the status is `available`; if a network interface is attached to an instance the status is `in-use`.
- `subnet-id` - The ID of the subnet for the network interface.
- `tag`:<key> - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.
- `vpc-id` - The ID of the VPC for the network interface.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. You cannot specify this parameter and the network interface IDs parameter in the same request. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NetworkInterfaceId.N

The network interface IDs.

Default: Describes all your network interfaces.

Type: Array of strings

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

networkInterfaceSet

Information about the network interfaces.

Type: Array of NetworkInterface objects

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example describes all your network interfaces.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeNetworkInterfaces
&AUTHPARAMS
```

Sample Response

```
<DescribeNetworkInterfacesResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">

         </ipv6AddressesSet>
        </item>
      </networkInterfaceSet>
</DescribeNetworkInterfacesResponse>
```

Example 2

This example uses a filter to describe only network interfaces that are in Availability Zone `us-east-2a`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeNetworkInterfaces
&Filter.1.Name=availability-zone
&Filter.1.Value.1=us-east-2a
&AUTHPARAMS
```

DescribeOutpostLags

Describes the Outposts link aggregation groups (LAGs).

> **Note**
>
> LAGs are only available for second-generation Outposts racks at this time.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters to use for narrowing down the request. The following filters are supported:

- `service-link-virtual-interface-id` - The ID of the service link virtual interface.
- `service-link-virtual-interface-arn` - The ARN of the service link virtual interface.
- `outpost-id` - The Outpost ID.
- `outpost-arn` - The Outpost ARN.
- `owner-id` - The ID of the AWS account that owns the service link virtual interface.
- `vlan` - The ID of the address pool.
- `local-address` - The local address.
- `peer-address` - The peer address.
- `peer-bgp-asn` - The peer BGP ASN.
- `outpost-lag-id` - The Outpost LAG ID.

- `configuration-state` - The configuration state of the service link virtual interface.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

OutpostLagId.N

The IDs of the Outpost LAGs.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

outpostLagSet

The Outpost LAGs.

Type: Array of OutpostLag objects

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

DescribePlacementGroups

Describes the specified placement groups or all of your placement groups.

> **Note**
>
> To describe a specific placement group that is *shared* with your account, you must specify the ID of the placement group using the `GroupId` parameter. Specifying the name of a *shared* placement group using the `GroupNames` parameter will result in an error.

For more information, see Placement groups in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `group-name` - The name of the placement group.
- `group-arn` - The Amazon Resource Name (ARN) of the placement group.
- `spread-level` - The spread level for the placement group (`host` | `rack`).
- `state` - The state of the placement group (`pending` | `available` | `deleting` | `deleted`).
- `strategy` - The strategy of the placement group (`cluster` | `spread` | `partition`).
- `tag:<key>` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that

have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.

- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources that have a tag with a specific key, regardless of the tag value.

Type: Array of Filter objects

Required: No

GroupId.N

The IDs of the placement groups.

Type: Array of strings

Required: No

GroupName.N

The names of the placement groups.

Constraints:

- You can specify a name only if the placement group is owned by your account.
- If a placement group is *shared* with your account, specifying the name results in an error. You must use the `GroupId` parameter instead.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

placementGroupSet

Information about the placement groups.

Type: Array of PlacementGroup objects

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example describes the placement group named `ABC-spread`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribePlacementGroups
&GroupName.1=ABC-spread
&AUTHPARAMS
```

Sample Response

```
<DescribePlacementGroupsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestID>d4904fd9-82c2-4ea5-adfe-a9cc3EXAMPLE</requestID>
   <placementGroupSet>
      <item>
         <groupName>ABC-spread</groupName>
         <spreadLevel>rack</spreadLevel>
         <strategy>spread</strategy>
         <state>available</state>
      </item>
   </placementGroupSet>
</DescribePlacementGroupsResponse>
```

Example 2

This example filters the response to include only placement groups that include the string `Project` in the name.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribePlacementGroups
```

```
&Filter.1.Name=group-name
&Filter.1.Value=*Project*
&AUTHPARAMS
```

Sample Response

```
<DescribePlacementGroupsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestID>d4904fd9-82c2-4ea5-adfe-a9cc3EXAMPLE</requestID>
   <placementGroupSet>
      <item>
         <groupName>Project-cluster</groupName>
         <strategy>cluster</strategy>
         <state>available</state>
      </item>
   </placementGroupSet>
</DescribePlacementGroupsResponse>
```

Example 3

This example describes the partition placement group named `HDSF-Group-A` with three partitions.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribePlacementGroups
&GroupName.1=HDSF-Group-A
&AUTHPARAMS
```

Sample Response

```
<DescribePlacementGroupsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestID>d4904fd9-82c2-4ea5-adfe-a9cc3EXAMPLE</requestID>
   <placementGroupSet>
      <item>
         <groupName>HDSF-Group-A</groupName>
         <strategy>partition</strategy>
         <partitionCount>3</partitionCount>
         <state>available</state>
      </item>
   </placementGroupSet>
</DescribePlacementGroupsResponse>
```

DescribePrefixLists

Describes available AWS services in a prefix list format, which includes the prefix list name and prefix list ID of the service and the IP address range for the service.

We recommend that you use DescribeManagedPrefixLists instead.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `prefix-list-id`: The ID of a prefix list.
- `prefix-list-name`: The name of a prefix list.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

PrefixListId.N

One or more prefix list IDs.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

prefixListSet

All available prefix lists.

Type: Array of PrefixList objects

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example lists all available AWS prefix lists.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribePrefixLists
&AUTHPARAMS
```

Sample Response

```
<DescribePrefixListsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <prefixListSet>
        <item>
            <prefixListName>com.amazonaws.us-west-2.s3</prefixListName>
            <prefixListId>pl-12345678</prefixListId>
            <cidrSet>
              <item>54.123.456.7/19</item>
            </cidrSet>
        </item>
    </prefixListSet>
    <requestId>614db4d4-ac7b-4cb6-853e-example</requestId>
</DescribePrefixListsResponse>
```

DescribePrincipalIdFormat

Describes the ID format settings for the root user and all IAM roles and IAM users that have explicitly specified a longer ID (17-character ID) preference.

By default, all IAM roles and IAM users default to the same ID settings as the root user, unless they explicitly override the settings. This request is useful for identifying those IAM users and IAM roles that have overridden the default ID settings.

The following resource types support longer IDs: `bundle` | `conversion-task` | `customer-gateway` | `dhcp-options` | `elastic-ip-allocation` | `elastic-ip-association` | `export-task` | `flow-log` | `image` | `import-task` | `instance` | `internet-gateway` | `network-acl` | `network-acl-association` | `network-interface` | `network-interface-attachment` | `prefix-list` | `reservation` | `route-table` | `route-table-association` | `security-group` | `snapshot` | `subnet` | `subnet-cidr-block-association` | `volume` | `vpc` | `vpc-cidr-block-association` | `vpc-endpoint` | `vpc-peering-connection` | `vpn-connection` | `vpn-gateway`.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

MaxResults

The maximum number of results to return in a single call. To retrieve the remaining results, make another call with the returned NextToken value.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 1000.

Required: No

NextToken

The token to request the next page of results.

Type: String

Required: No

Resource.N

The type of resource: `bundle` | `conversion-task` | `customer-gateway` | `dhcp-options` | `elastic-ip-allocation` | `elastic-ip-association` | `export-task` | `flow-log` | `image` | `import-task` | `instance` | `internet-gateway` | `network-acl` | `network-acl-association` | `network-interface` | `network-interface-attachment` | `prefix-list` | `reservation` | `route-table` | `route-table-association` | `security-group` | `snapshot` | `subnet` | `subnet-cidr-block-association` | `volume` | `vpc` | `vpc-cidr-block-association` | `vpc-endpoint` | `vpc-peering-connection` | `vpn-connection` | `vpn-gateway`

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is null when there are no more results to return.

Type: String

principalSet

Information about the ID format settings for the ARN.

Type: Array of PrincipalIdFormat objects

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes the ID format for the root user and all IAM roles and IAM users that have explicitly specified a longer ID preference.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribePrincipalIdFormat
&AUTHPARAMS
```

DescribePublicIpv4Pools

Describes the specified IPv4 address pools.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Filter.N

One or more filters.

- `tag:<key>` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 10.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

PoolId.N

The IDs of the address pools.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

publicIpv4PoolSet

Information about the address pools.

Type: Array of PublicIpv4Pool objects

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

DescribeRegions

Describes the Regions that are enabled for your account, or all Regions.

For a list of the Regions supported by Amazon EC2, see Amazon EC2 service endpoints.

For information about enabling and disabling Regions for your account, see Specify which AWS Regions your account can use in the *AWS Account Management Reference Guide*.

> **Note**
>
> The order of the elements in the response, including those within nested structures, might vary. Applications should not assume the elements appear in a particular order.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AllRegions

Indicates whether to display all Regions, including Regions that are disabled for your account.

Type: Boolean

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `endpoint` - The endpoint of the Region (for example, `ec2.us-east-1.amazonaws.com`).

- `opt-in-status` - The opt-in status of the Region (`opt-in-not-required` | `opted-in` | `not-opted-in`).
- `region-name` - The name of the Region (for example, `us-east-1`).

Type: Array of Filter objects

Required: No

RegionName.N

The names of the Regions. You can specify any Regions, whether they are enabled and disabled for your account.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

regionInfo

Information about the Regions.

Type: Array of Region objects

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example displays information about all Regions enabled for your account.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeRegions
&AUTHPARAMS
```

Example 2

This example displays information about all Regions, even the Regions that are disabled for your account.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeRegions
&AllRegions=true
&AUTHPARAMS
```

Example 3

This example displays information about the specified Regions only.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeRegions
&RegionName.1=us-east-1
&RegionName.2=eu-west-1
&AUTHPARAMS
```

Sample Response

```
<DescribeRegionsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <regionInfo>
      <item>
         <regionName>us-east-1</regionName>
         <regionEndpoint>ec2.us-east-1.amazonaws.com</regionEndpoint>
      </item>
      <item>
         <regionName>eu-west-1</regionName>
         <regionEndpoint>ec2.eu-west-1.amazonaws.com</regionEndpoint>
      </item>
   </regionInfo>
```

```
</DescribeRegionsResponse>
```

DescribeReplaceRootVolumeTasks

Describes a root volume replacement task. For more information, see Replace a root volume in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

Filter to use:

- `instance-id` - The ID of the instance for which the root volume replacement task was created.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 50.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

ReplaceRootVolumeTaskId.N

The ID of the root volume replacement task to view.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

replaceRootVolumeTaskSet

Information about the root volume replacement task.

Type: Array of ReplaceRootVolumeTask objects

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for Ruby V3

DescribeReservedInstances

Describes one or more of the Reserved Instances that you purchased.

For more information about Reserved Instances, see Reserved Instances in the *Amazon EC2 User Guide*.

> **Note**
>
> The order of the elements in the response, including those within nested structures, might vary. Applications should not assume the elements appear in a particular order.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `availability-zone` - The Availability Zone where the Reserved Instance can be used.
- `availability-zone-id` - The ID of the Availability Zone where the Reserved Instance can be used.
- `duration` - The duration of the Reserved Instance (one year or three years), in seconds (`31536000` | `94608000`).
- `end` - The time when the Reserved Instance expires (for example, 2015-08-07T11:54:42.000Z).
- `fixed-price` - The purchase price of the Reserved Instance (for example, 9800.0).

- `instance-type` - The instance type that is covered by the reservation.
- `scope` - The scope of the Reserved Instance (`Region` or `Availability Zone`).
- `product-description` - The Reserved Instance product platform description (`Linux/UNIX` | `Linux with SQL Server Standard` | `Linux with SQL Server Web` | `Linux with SQL Server Enterprise` | `SUSE Linux` | `Red Hat Enterprise Linux` | `Red Hat Enterprise Linux with HA` | `Windows` | `Windows with SQL Server Standard` | `Windows with SQL Server Web` | `Windows with SQL Server Enterprise`).
- `reserved-instances-id` - The ID of the Reserved Instance.
- `start` - The time at which the Reserved Instance purchase request was placed (for example, 2014-08-07T11:54:42.000Z).
- `state` - The state of the Reserved Instance (`payment-pending` | `active` | `payment-failed` | `retired`).
- `tag:<key>` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.
- `usage-price` - The usage price of the Reserved Instance, per hour (for example, 0.84).

Type: Array of Filter objects

Required: No

OfferingClass

Describes whether the Reserved Instance is Standard or Convertible.

Type: String

Valid Values: `standard | convertible`

Required: No

OfferingType

The Reserved Instance offering type. If you are using tools that predate the 2011-11-01 API version, you only have access to the `Medium Utilization` Reserved Instance offering type.

Type: String

Valid Values: `Heavy Utilization | Medium Utilization | Light Utilization | No Upfront | Partial Upfront | All Upfront`

Required: No

ReservedInstancesId.N

One or more Reserved Instance IDs.

Default: Describes all your Reserved Instances, or only those otherwise specified.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

reservedInstancesSet

A list of Reserved Instances.

Type: Array of ReservedInstances objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes Reserved Instances owned by your account.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeReservedInstances
```

```
&AUTHPARAMS
```

Sample Response

```
<DescribeReservedInstancesResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <reservedInstancesSet>
   ...
      <item>
         <reservedInstancesId>e5a2ff3b-7d14-494f-90af-0b5d0EXAMPLE</
reservedInstancesId>
         <instanceType>m1.xlarge</instanceType>
         <availabilityZone>us-east-1b</availabilityZone>
         <start>2015-07-14T11:00:00:00.000Z</start>
         <end>2016-07-13T1212:00:00:000Z</end>
         <duration>31536000</duration>
         <fixedPrice>0.0</fixedPrice>
         <usagePrice>0.034</usagePrice>
         <instanceCount>2</instanceCount>
         <productDescription>Linux/UNIX (Amazon VPC)</productDescription>
         <state>active</state>
         <instanceTenancy>default</instanceTenancy>
         <currencyCode>USD</currencyCode>
         <offeringType>Partial Upfront</offeringType>
         <recurringCharges>
                  <item>
                        <frequency>Hourly</frequency>
                        <amount>0.05</amount>
                  </item>
         </recurringCharges>
         <offeringClass>standard</offeringClass>
         <scope>AvailabilityZone</scope>
      </item>
      ...
   </reservedInstancesSet>
</DescribeReservedInstancesResponse>
```

Example

This example filters the response to include only one-year, `m1.small` Linux/UNIX Reserved Instances. If you want Linux/UNIX Reserved Instances specifically for use with a VPC, set the product description to `Linux/UNIX (Amazon VPC)`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeReservedInstances
&Filter.1.Name=duration
&Filter.1.Value.1=31536000
&Filter.2.Name=instance-type
&Filter.2.Value.1=m1.small
&Filter.3.Name=product-description
&Filter.3.Value.1=Linux%2FUNIX
&AUTHPARAMS
```

- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeReservedInstancesListings

Describes your account's Reserved Instance listings in the Reserved Instance Marketplace.

The Reserved Instance Marketplace matches sellers who want to resell Reserved Instance capacity that they no longer need with buyers who want to purchase additional capacity. Reserved Instances bought and sold through the Reserved Instance Marketplace work like any other Reserved Instances.

As a seller, you choose to list some or all of your Reserved Instances, and you specify the upfront price to receive for them. Your Reserved Instances are then listed in the Reserved Instance Marketplace and are available for purchase.

As a buyer, you specify the configuration of the Reserved Instance to purchase, and the Marketplace matches what you're searching for with what's available. The Marketplace first sells the lowest priced Reserved Instances to you, and continues to sell available Reserved Instance listings to you until your demand is met. You are charged based on the total price of all of the listings that you purchase.

For more information, see Sell in the Reserved Instance Marketplace in the *Amazon EC2 User Guide*.

> **Note**
>
> The order of the elements in the response, including those within nested structures, might vary. Applications should not assume the elements appear in a particular order.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Filter.N

One or more filters.

- `reserved-instances-id` - The ID of the Reserved Instances.
- `reserved-instances-listing-id` - The ID of the Reserved Instances listing.
- `status` - The status of the Reserved Instance listing (`pending` | `active` | `cancelled` | `closed`).

- `status-message` - The reason for the status.

Type: Array of Filter objects

Required: No

ReservedInstancesId

One or more Reserved Instance IDs.

Type: String

Required: No

ReservedInstancesListingId

One or more Reserved Instance listing IDs.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

reservedInstancesListingsSet

Information about the Reserved Instance listing.

Type: Array of ReservedInstancesListing objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example shows all the listings associated with your account.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeReservedInstancesListings
&AUTHPARAMS
```

Sample Response

```
<DescribeReservedInstancesListingsResponse>
    <requestId>cec5c904-8f3a-4de5-8f5a-ff7f9EXAMPLE</requestId>

DescribeReservedInstancesModifications

Describes the modifications made to your Reserved Instances. If no parameter is specified, information about all your Reserved Instances modification requests is returned. If a modification ID is specified, only information about the specific modification is returned.

For more information, see Modify Reserved Instances in the *Amazon EC2 User Guide*.

> **Note**
>
> The order of the elements in the response, including those within nested structures, might vary. Applications should not assume the elements appear in a particular order.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Filter.N

One or more filters.

- `client-token` - The idempotency token for the modification request.
- `create-date` - The time when the modification request was created.
- `effective-date` - The time when the modification becomes effective.
- `modification-result.reserved-instances-id` - The ID for the Reserved Instances created as part of the modification request. This ID is only available when the status of the modification is `fulfilled`.
- `modification-result.target-configuration.availability-zone` - The Availability Zone for the new Reserved Instances.
- `modification-result.target-configuration.availability-zone-id` - The ID of the Availability Zone for the new Reserved Instances.
- `modification-result.target-configuration.instance-count` - The number of new Reserved Instances.
- `modification-result.target-configuration.instance-type` - The instance type of the new Reserved Instances.

- `reserved-instances-id` - The ID of the Reserved Instances modified.
- `reserved-instances-modification-id` - The ID of the modification request.
- `status` - The status of the Reserved Instances modification request (`processing` | `fulfilled` | `failed`).
- `status-message` - The reason for the status.
- `update-date` - The time when the modification request was last updated.

Type: Array of Filter objects

Required: No

NextToken

The token to retrieve the next page of results.

Type: String

Required: No

ReservedInstancesModificationId.N

IDs for the submitted modification request.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

reservedInstancesModificationsSet

The Reserved Instance modification information.

Type: Array of ReservedInstancesModification objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example illustrates one usage of DescribeReservedInstancesModifications.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeReservedInstancesModifications
&AUTHPARAMS
```

Example 2

This example filters the response to include only Reserved Instances modification requests with status `processing`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeReservedInstancesModifications
&Filter.1.Name=status
&Filter.1.Value.1=processing
&AUTHPARAMS
```

DescribeReservedInstancesOfferings

Describes Reserved Instance offerings that are available for purchase. With Reserved Instances, you purchase the right to launch instances for a period of time. During that time period, you do not receive insufficient capacity errors, and you pay a lower usage rate than the rate charged for On-Demand instances for the actual time used.

If you have listed your own Reserved Instances for sale in the Reserved Instance Marketplace, they will be excluded from these results. This is to ensure that you do not purchase your own Reserved Instances.

For more information, see Sell in the Reserved Instance Marketplace in the *Amazon EC2 User Guide*.

> **Note**
>
> The order of the elements in the response, including those within nested structures, might vary. Applications should not assume the elements appear in a particular order.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AvailabilityZone

The Availability Zone in which the Reserved Instance can be used.

Either `AvailabilityZone` or `AvailabilityZoneId` can be specified, but not both.

Type: String

Required: No

AvailabilityZoneId

The ID of the Availability Zone.

Either `AvailabilityZone` or `AvailabilityZoneId` can be specified, but not both.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `availability-zone` - The Availability Zone where the Reserved Instance can be used.
- `availability-zone-id` - The ID of the Availability Zone where the Reserved Instance can be used.
- `duration` - The duration of the Reserved Instance (for example, one year or three years), in seconds (`31536000` | `94608000`).
- `fixed-price` - The purchase price of the Reserved Instance (for example, 9800.0).
- `instance-type` - The instance type that is covered by the reservation.
- `marketplace` - Set to `true` to show only Reserved Instance Marketplace offerings. When this filter is not used, which is the default behavior, all offerings from both AWS and the Reserved Instance Marketplace are listed.
- `product-description` - The Reserved Instance product platform description (`Linux/UNIX` | `Linux with SQL Server Standard` | `Linux with SQL Server Web` | `Linux with SQL Server Enterprise` | `SUSE Linux` | `Red Hat Enterprise Linux` | `Red Hat Enterprise Linux with HA` | `Windows` | `Windows with SQL Server Standard` | `Windows with SQL Server Web` | `Windows with SQL Server Enterprise`).
- `reserved-instances-offering-id` - The Reserved Instances offering ID.
- `scope` - The scope of the Reserved Instance (`Availability Zone` or `Region`).
- `usage-price` - The usage price of the Reserved Instance, per hour (for example, 0.84).

Type: Array of Filter objects

Required: No

IncludeMarketplace

Include Reserved Instance Marketplace offerings in the response.

Type: Boolean

Required: No

InstanceTenancy

The tenancy of the instances covered by the reservation. A Reserved Instance with a tenancy of `dedicated` is applied to instances that run in a VPC on single-tenant hardware (i.e., Dedicated Instances).

Important: The `host` value cannot be used with this parameter. Use the `default` or `dedicated` values only.

Default: `default`

Type: String

Valid Values: `default | dedicated | host`

Required: No

InstanceType

The instance type that the reservation will cover (for example, `m1.small`). For more information, see Amazon EC2 instance types in the *Amazon EC2 User Guide*.

Type: String

Valid Values: `a1.medium | a1.large | a1.xlarge | a1.2xlarge | a1.4xlarge | a1.metal | c1.medium | c1.xlarge | c3.large | c3.xlarge | c3.2xlarge | c3.4xlarge | c3.8xlarge | c4.large | c4.xlarge | c4.2xlarge | c4.4xlarge | c4.8xlarge | c5.large | c5.xlarge | c5.2xlarge | c5.4xlarge | c5.9xlarge | c5.12xlarge | c5.18xlarge | c5.24xlarge | c5.metal | c5a.large | c5a.xlarge | c5a.2xlarge | c5a.4xlarge | c5a.8xlarge | c5a.12xlarge | c5a.16xlarge | c5a.24xlarge | c5ad.large | c5ad.xlarge | c5ad.2xlarge | c5ad.4xlarge | c5ad.8xlarge | c5ad.12xlarge | c5ad.16xlarge | c5ad.24xlarge | c5d.large | c5d.xlarge | c5d.2xlarge | c5d.4xlarge | c5d.9xlarge | c5d.12xlarge | c5d.18xlarge | c5d.24xlarge | c5d.metal | c5n.large | c5n.xlarge | c5n.2xlarge | c5n.4xlarge | c5n.9xlarge | c5n.18xlarge | c5n.metal | c6g.medium | c6g.large | c6g.xlarge | c6g.2xlarge | c6g.4xlarge | c6g.8xlarge | c6g.12xlarge | c6g.16xlarge | c6g.metal | c6gd.medium | c6gd.large | c6gd.xlarge`

Required: No

MaxDuration

The maximum duration (in seconds) to filter when searching for offerings.

Default: 94608000 (3 years)

Type: Long

Required: No

MaxInstanceCount

The maximum number of instances to filter when searching for offerings.

Default: 20

Type: Integer

Required: No

MaxResults

The maximum number of results to return for the request in a single page. The remaining results of the initial request can be seen by sending another request with the returned `NextToken` value. The maximum is 100.

Default: 100

Type: Integer

Required: No

MinDuration

The minimum duration (in seconds) to filter when searching for offerings.

Default: 2592000 (1 month)

Type: Long

Required: No

NextToken

The token to retrieve the next page of results.

Type: String

Required: No

OfferingClass

The offering class of the Reserved Instance. Can be `standard` or `convertible`.

Type: String

Valid Values: `standard | convertible`

Required: No

OfferingType

The Reserved Instance offering type. If you are using tools that predate the 2011-11-01 API version, you only have access to the `Medium Utilization` Reserved Instance offering type.

Type: String

Valid Values: `Heavy Utilization | Medium Utilization | Light Utilization | No Upfront | Partial Upfront | All Upfront`

Required: No

ProductDescription

The Reserved Instance product platform description. Instances that include `(Amazon VPC)` in the description are for use with Amazon VPC.

Type: String

Valid Values: `Linux/UNIX | Linux/UNIX (Amazon VPC) | Windows | Windows (Amazon VPC)`

Required: No

ReservedInstancesOfferingId.N

One or more Reserved Instances offering IDs.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

reservedInstancesOfferingsSet

A list of Reserved Instances offerings.

Type: Array of ReservedInstancesOffering objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example Describing Reserved Instance Marketplace Offerings Only

This example requests a list of Linux/UNIX, No Upfront Reserved Instances that are available through the Reserved Instance Marketplace only. When using the Query API, all strings must be URL-encoded.

Sample Request

```

</DescribeReservedInstancesOfferingsResponse>
```

Example Using Tokens to Manage Results

You can use pagination support to query the results sequentially and in parts.

Specify the maximum number of results that are returned in the response. Then, each paginated response contains a token that can be provided as input to a subsequent DescribeReservedInstancesOfferings call to fetch the next page. (Make sure that you use URL encoding for the token value.)

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeReservedInstancesOfferings
```

```
&MaxResults=5
&AUTHPARAMS
```

Sample Response

```
<DescribeReservedInstancesOfferingsResponse>
  <requestId>d072f652-cc57-458c-89e0-e6c02EXAMPLE</requestId>
  <reservedInstancesOfferingsSet>
  ...

  ...
  </reservedInstancesOfferingsSet>
  <nextToken>h/C8YKPQBHEjW8xKz1827/Zzyb0VqsqkjRo3TqhFYeE=</nextToken>
</DescribeReservedInstancesOfferingsResponse>
&MaxResults=5
&NextToken=h%2FC8YKPQBHEjW8xKz1827%2FZzyb0VqsqkjRo3TqhFYeE%3D
&AUTHPARAMS
```

Example Using Filters

This example filters the response to include only one-year, `m1.small` or `m1.large` Linux/UNIX Reserved Instances. If you want Linux/UNIX Reserved Instances specifically for use with a VPC, set the product description to `Linux/UNIX (Amazon VPC)`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeReservedInstancesOfferings
&Filter.1.Name=duration
&Filter.1.Value.1=31536000
&Filter.2.Name=instance-type
&Filter.2.Value.1=m1.small
&Filter.2.Value.2=m1.large
&Filter.3.Name=product-description
&Filter.3.Value.1=Linux%2FUNIX
&AUTHPARAMS
```

DescribeRouteServerEndpoints

Describes one or more route server endpoints.

A route server endpoint is an AWS-managed component inside a subnet that facilitates BGP (Border Gateway Protocol) connections between your route server and your BGP peers.

For more information see Dynamic routing in your VPC with VPC Route Server in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters to apply to the describe request.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

RouteServerEndpointId.N

The IDs of the route server endpoints to describe.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

routeServerEndpointSet

Information about the described route server endpoints.

Type: Array of RouteServerEndpoint objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeRouteServerPeers

Describes one or more route server peers.

A route server peer is a session between a route server endpoint and the device deployed in AWS (such as a firewall appliance or other network security function running on an EC2 instance). The device must meet these requirements:

- Have an elastic network interface in the VPC
- Support BGP (Border Gateway Protocol)
- Can initiate BGP sessions

For more information see Dynamic routing in your VPC with VPC Route Server in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters to apply to the describe request.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

RouteServerPeerId.N

The IDs of the route server peers to describe.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

routeServerPeerSet

Information about the described route server peers.

Type: Array of RouteServerPeer objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for Ruby V3

DescribeRouteServers

Describes one or more route servers.

Amazon VPC Route Server simplifies routing for traffic between workloads that are deployed within a VPC and its internet gateways. With this feature, VPC Route Server dynamically updates VPC and internet gateway route tables with your preferred IPv4 or IPv6 routes to achieve routing fault tolerance for those workloads. This enables you to automatically reroute traffic within a VPC, which increases the manageability of VPC routing and interoperability with third-party workloads.

Route server supports the follow route table types:

- VPC route tables not associated with subnets
- Subnet route tables
- Internet gateway route tables

Route server does not support route tables associated with virtual private gateways. To propagate routes into a transit gateway route table, use Transit Gateway Connect.

For more information see Dynamic routing in your VPC with VPC Route Server in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters to apply to the describe request.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

RouteServerId.N

The IDs of the route servers to describe.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

routeServerSet

Information about the described route servers.

Type: Array of RouteServer objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeRouteTables

Describes your route tables. The default is to describe all your route tables. Alternatively, you can specify specific route table IDs or filter the results to include only the route tables that match specific criteria.

Each subnet in your VPC must be associated with a route table. If a subnet is not explicitly associated with any route table, it is implicitly associated with the main route table. This command does not return the subnet ID for implicit associations.

For more information, see Route tables in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `association.gateway-id` - The ID of the gateway involved in the association.
- `association.route-table-association-id` - The ID of an association ID for the route table.
- `association.route-table-id` - The ID of the route table involved in the association.
- `association.subnet-id` - The ID of the subnet involved in the association.
- `association.main` - Indicates whether the route table is the main route table for the VPC (`true` | `false`). Route tables that do not have an association ID are not returned in the response.

- owner-id - The ID of the AWS account that owns the route table.
- route-table-id - The ID of the route table.
- route.destination-cidr-block - The IPv4 CIDR range specified in a route in the table.
- route.destination-ipv6-cidr-block - The IPv6 CIDR range specified in a route in the route table.
- route.destination-prefix-list-id - The ID (prefix) of the AWS service specified in a route in the table.
- route.egress-only-internet-gateway-id - The ID of an egress-only Internet gateway specified in a route in the route table.
- route.gateway-id - The ID of a gateway specified in a route in the table.
- route.instance-id - The ID of an instance specified in a route in the table.
- route.nat-gateway-id - The ID of a NAT gateway.
- route.transit-gateway-id - The ID of a transit gateway.
- route.origin - Describes how the route was created. CreateRouteTable indicates that the route was automatically created when the route table was created; CreateRoute indicates that the route was manually added to the route table; EnableVgwRoutePropagation indicates that the route was propagated by route propagation.
- route.state - The state of a route in the route table (active | blackhole). The blackhole state indicates that the route's target isn't available (for example, the specified gateway isn't attached to the VPC, the specified NAT instance has been terminated, and so on).
- route.vpc-peering-connection-id - The ID of a VPC peering connection specified in a route in the table.
- tag - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key Owner and the value TeamA, specify tag:Owner for the filter name and TeamA for the filter value.
- tag-key - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.
- vpc-id - The ID of the VPC for the route table.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 100.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

RouteTableId.N

The IDs of the route tables.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

routeTableSet

Information about the route tables.

Type: Array of RouteTable objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes all your route tables. The first route table in the returned list is the VPC's main route table. Its association ID represents the association between the table and the VPC.

DescribeScheduledInstanceAvailability

Finds available schedules that meet the specified criteria.

You can search for an available schedule no more than 3 months in advance. You must meet the minimum required duration of 1,200 hours per year. For example, the minimum daily schedule is 4 hours, the minimum weekly schedule is 24 hours, and the minimum monthly schedule is 100 hours.

After you find a schedule that meets your needs, call PurchaseScheduledInstances to purchase Scheduled Instances with that schedule.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `availability-zone` - The Availability Zone (for example, `us-west-2a`).
- `instance-type` - The instance type (for example, `c4.large`).
- `platform` - The platform (`Linux/UNIX` or `Windows`).

Type: Array of Filter objects

Required: No

FirstSlotStartTimeRange

The time period for the first schedule to start.

Type: SlotDateTimeRangeRequest object

Required: Yes

MaxResults

The maximum number of results to return in a single call. This value can be between 5 and 300. The default value is 300. To retrieve the remaining results, make another call with the returned `NextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 300.

Required: No

MaxSlotDurationInHours

The maximum available duration, in hours. This value must be greater than `MinSlotDurationInHours` and less than 1,720.

Type: Integer

Required: No

MinSlotDurationInHours

The minimum available duration, in hours. The minimum required duration is 1,200 hours per year. For example, the minimum daily schedule is 4 hours, the minimum weekly schedule is 24 hours, and the minimum monthly schedule is 100 hours.

Type: Integer

Required: No

NextToken

The token for the next set of results.

Type: String

Required: No

Recurrence

The schedule recurrence.

Type: ScheduledInstanceRecurrenceRequest object

Required: Yes

Response Elements

The following elements are returned by the service.

nextToken

The token required to retrieve the next set of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

scheduledInstanceAvailabilitySet

Information about the available Scheduled Instances.

Type: Array of ScheduledInstanceAvailability objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeScheduledInstances

Describes the specified Scheduled Instances or all your Scheduled Instances.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `availability-zone` - The Availability Zone (for example, `us-west-2a`).
- `instance-type` - The instance type (for example, `c4.large`).
- `platform` - The platform (`Linux/UNIX` or `Windows`).

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return in a single call. This value can be between 5 and 300. The default value is 100. To retrieve the remaining results, make another call with the returned `NextToken` value.

Type: Integer

Required: No

NextToken

The token for the next set of results.

Type: String

Required: No

ScheduledInstanceId.N

The Scheduled Instance IDs.

Type: Array of strings

Required: No

SlotStartTimeRange

The time period for the first schedule to start.

Type: SlotStartTimeRangeRequest object

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token required to retrieve the next set of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

scheduledInstanceSet

Information about the Scheduled Instances.

Type: Array of ScheduledInstance objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeSecondaryInterfaces

Describes one or more of your secondary interfaces.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `attachment.attachment-id` - The ID of the secondary interface attachment.
- `attachment.instance-id` - The ID of the instance to which the secondary interface is attached.
- `attachment.instance-owner-id` - The ID of the AWS account that owns the instance to which the secondary interface is attached.
- `attachment.status` - The attachment status (`attaching` | `attached` | `detaching` | `detached`).
- `private-ipv4-addresses.private-ip-address` - The private IPv4 address associated with the secondary interface.
- `owner-id` - The ID of the AWS account that owns the secondary interface.
- `secondary-interface-arn` - The ARN of the secondary interface.
- `secondary-interface-id` - The ID of the secondary interface.
- `secondary-interface-type` - The type of secondary interface (`secondary`).
- `secondary-network-id` - The ID of the secondary network.
- `secondary-network-type` - The type of the secondary network (`rdma`).

- `secondary-subnet-id` - The ID of the secondary subnet.
- `status` - The status of the secondary interface (`available` | `in-use`).
- `tag`:<key> - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

SecondaryInterfaceId.N

The IDs of the secondary interfaces.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

secondaryInterfaceSet

Information about the secondary interfaces.

Type: Array of SecondaryInterface objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example describes all secondary interfaces in the current Region.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeSecondaryInterfaces
&AUTHPARAMS
```

Sample Response

```
<DescribeSecondaryInterfacesResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <secondaryInterfaceSet>
      <item>

            </item>
         </tagSet>
      </item>
   </secondaryInterfaceSet>
</DescribeSecondaryInterfacesResponse>
```

Example 2

This example uses filters to describe secondary interfaces attached to a specific instance.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeSecondaryInterfaces
&Filter.1.Name=attachment.instance-id
```

```
&Filter.1.Value.1=i-1234567890abcdef0
&AUTHPARAMS
```

DescribeSecondaryNetworks

Describes one or more secondary networks.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters. The following are the possible values:

- `ipv4-cidr-block-association.association-id` - The association ID for an IPv4 CIDR block associated with the secondary network.
- `ipv4-cidr-block-association.cidr-block` - An IPv4 CIDR block associated with the secondary network.
- `ipv4-cidr-block-association.state` - The state of an IPv4 CIDR block associated with the secondary network.
- `owner-id` - The ID of the AWS account that owns the secondary network.
- `secondary-network-id` - The ID of the secondary network.
- `secondary-network-arn` - The ARN of the secondary network.
- `state` - The state of the secondary network (`create-in-progress` | `create-complete` | `create-failed` | `delete-in-progress` | `delete-complete` | `delete-failed`).
- `tag`:<key> - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.

- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.
- `type` - The type of the secondary network (`rdma`).

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

SecondaryNetworkId.N

The IDs of the secondary networks.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

secondaryNetworkSet

Information about the secondary networks.

Type: Array of SecondaryNetwork objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example describes the specified secondary networks.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeSecondaryNetworks
   &SecondaryNetworkId.1=sn-0123456789abcdef0
   &SecondaryNetworkId.2=sn-0987654321fedcba0
   &AUTHPARAMS
```

Sample Response

```
<DescribeSecondaryNetworksResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>

            </item>
         </tagSet>
      </item>
      <item>
         <secondaryNetworkId>sn-0987654321fedcba0</secondaryNetworkId>
         <secondaryNetworkArn>arn:aws:ec2:us-east-2:123456789012:secondary-network/
sn-0987654321fedcba0</secondaryNetworkArn>
         <ownerId>123456789012</ownerId>
         <type>rdma</type>
         <state>create-complete</state>
         <ipv4CidrBlockAssociations>
            <item>
               <associationId>sn-cidr-assoc-09876543210fedcba0</associationId>
               <cidrBlock>10.1.0.0/16</cidrBlock>
               <state>associated</state>
            </item>
         </ipv4CidrBlockAssociations>
         <tagSet>
            <item>
               <key>Name</key>
               <value>Dev Secondary Network</value>
            </item>
         </tagSet>
      </item>
   </secondaryNetworkSet>
</DescribeSecondaryNetworksResponse>
```

Example 2

This example uses filters to describe any secondary network you own that has a tag with the key Environment and the value Production and whose state is create-complete.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeSecondaryNetworks
   &Filter.1.Name=tag:Environment
   &Filter.1.Value.1=Production
   &Filter.2.Name=state
   &Filter.2.Value.1=create-complete
   &AUTHPARAMS
```

DescribeSecondarySubnets

Describes one or more of your secondary subnets.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `ipv4-cidr-block-association.association-id` - The association ID for an IPv4 CIDR block associated with the secondary subnet.
- `ipv4-cidr-block-association.cidr-block` - An IPv4 CIDR block associated with the secondary subnet.
- `ipv4-cidr-block-association.state` - The state of an IPv4 CIDR block associated with the secondary subnet.
- `owner-id` - The ID of the AWS account that owns the secondary subnet.
- `secondary-network-id` - The ID of the secondary network.
- `secondary-network-type` - The type of the secondary network (`rdma`).
- `secondary-subnet-id` - The ID of the secondary subnet.
- `secondary-subnet-arn` - The ARN of the secondary subnet.
- `state` - The state of the secondary subnet (`create-in-progress` | `create-complete` | `create-failed` | `delete-in-progress` | `delete-complete` | `delete-failed`).
- `tag:<key>` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that

have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.

- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

SecondarySubnetId.N

The IDs of the secondary subnets.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

secondarySubnetSet

Information about the secondary subnets.

Type: Array of SecondarySubnet objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes the specified secondary subnets.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeSecondarySubnets
&SecondarySubnetId.1=ss-0123456789abcdef0
&SecondarySubnetId.2=ss-0987654321fedcba0
&AUTHPARAMS

DescribeSecurityGroupReferences

Describes the VPCs on the other side of a VPC peering or Transit Gateway connection that are referencing the security groups you've specified in this request.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

GroupId.N

The IDs of the security groups in your account.

Type: Array of strings

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

securityGroupReferenceSet

Information about the VPCs with the referencing security groups.

Type: Array of SecurityGroupReference objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example describes the security group references for sg-11aa22bb. The response indicates that this security group is referenced by a security group in VPC vpc-1a2b3c4d.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeSecurityGroupReferences
&GroupId.1=sg-11aa22bb
&AUTHPARAMS
```

Sample Response

```
<DescribeSecurityGroupReferencesResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>19744c88-baa2-45df-905f-example</requestId>
    <securityGroupReferenceSet>
        <item>
            <referencingVpcId>vpc-1a2b3c4d</referencingVpcId>
            <vpcPeeringConnectionId>pcx-b04deed9</vpcPeeringConnectionId>
            <groupId>sg-11aa22bb</groupId>
        </item>
    </securityGroupReferenceSet>
</DescribeSecurityGroupReferencesResponse>
```

Example 2

This example describes the security group references for sg-11aa22bb and sg-1111aaaa.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeSecurityGroupReferences
&GroupId.1=sg-11aa22bb
&GroupId.2=sg-1111aaaa
&AUTHPARAMS
```

Sample Response

```
<DescribeSecurityGroupReferencesResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>d1835dca-61c1-459d-99cb-example</requestId>
    <securityGroupReferenceSet>
        <item>
            <referencingVpcId>vpc-81326ae4</referencingVpcId>
            <vpcPeeringConnectionId>pcx-b04deed9</vpcPeeringConnectionId>
            <groupId>sg-11aa22bb</groupId>
        </item>
        <item>
            <referencingVpcId>vpc-1a2b3c4d</referencingVpcId>
            <vpcPeeringConnectionId>pcx-aabbccdd</vpcPeeringConnectionId>
            <groupId>sg-1111aaaa</groupId>
        </item>
    </securityGroupReferenceSet>
</DescribeSecurityGroupReferencesResponse>
```

DescribeSecurityGroupRules

Describes one or more of your security group rules.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `group-id` - The ID of the security group.
- `security-group-rule-id` - The ID of the security group rule.
- `tag`:<key> - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. This value can be between 5 and 1000. If this parameter is not specified, then all items are returned. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

SecurityGroupRuleId.N

The IDs of the security group rules.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

securityGroupRuleSet

Information about security group rules.

Type: Array of SecurityGroupRule objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeSecurityGroups

Describes the specified security groups or all of your security groups.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters. If using multiple filters for rules, the results include security groups for which any combination of rules - not necessarily a single rule - match all filters.

- `description` - The description of the security group.
- `egress.ip-permission.cidr` - An IPv4 CIDR block for an outbound security group rule.
- `egress.ip-permission.from-port` - For an outbound rule, the start of port range for the TCP and UDP protocols, or an ICMP type number.
- `egress.ip-permission.group-id` - The ID of a security group that has been referenced in an outbound security group rule.
- `egress.ip-permission.group-name` - The name of a security group that is referenced in an outbound security group rule.
- `egress.ip-permission.ipv6-cidr` - An IPv6 CIDR block for an outbound security group rule.
- `egress.ip-permission.prefix-list-id` - The ID of a prefix list to which a security group rule allows outbound access.
- `egress.ip-permission.protocol` - The IP protocol for an outbound security group rule (`tcp` | udp | `icmp`, a protocol number, or -1 for all protocols).

- `egress.ip-permission.to-port` - For an outbound rule, the end of port range for the TCP and UDP protocols, or an ICMP code.
- `egress.ip-permission.user-id` - The ID of an AWS account that has been referenced in an outbound security group rule.
- `group-id` - The ID of the security group.
- `group-name` - The name of the security group.
- `ip-permission.cidr` - An IPv4 CIDR block for an inbound security group rule.
- `ip-permission.from-port` - For an inbound rule, the start of port range for the TCP and UDP protocols, or an ICMP type number.
- `ip-permission.group-id` - The ID of a security group that has been referenced in an inbound security group rule.
- `ip-permission.group-name` - The name of a security group that is referenced in an inbound security group rule.
- `ip-permission.ipv6-cidr` - An IPv6 CIDR block for an inbound security group rule.
- `ip-permission.prefix-list-id` - The ID of a prefix list from which a security group rule allows inbound access.
- `ip-permission.protocol` - The IP protocol for an inbound security group rule (`tcp` | `udp` | `icmp`, a protocol number, or -1 for all protocols).
- `ip-permission.to-port` - For an inbound rule, the end of port range for the TCP and UDP protocols, or an ICMP code.
- `ip-permission.user-id` - The ID of an AWS account that has been referenced in an inbound security group rule.
- `owner-id` - The AWS account ID of the owner of the security group.
- `tag`:<key> - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.
- `vpc-id` - The ID of the VPC specified when the security group was created.

Type: Array of Filter objects

Required: No

GroupId.N

The IDs of the security groups. Required for security groups in a nondefault VPC.

Default: Describes all of your security groups.

Type: Array of strings

Required: No

GroupName.N

[Default VPC] The names of the security groups. You can specify either the security group name or the security group ID.

Default: Describes all of your security groups.

Type: Array of strings

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. This value can be between 5 and 1000. If this parameter is not specified, then all items are returned. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

securityGroupInfo

Information about the security groups.

Type: Array of SecurityGroup objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example describes the specified security group. The response indicates that this security group references another security group. The referenced group can be in a different VPC if used through a VPC peering connection. If the referenced security group or the VPC peering connection is deleted, the rule becomes stale but is not automatically removed from the security group.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeSecurityGroups
&GroupId.1=sg-1a2b3c4d
&AUTHPARAMS
```

Sample Response

```
<DescribeSecurityGroupsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>edb7c570-be05-4192-bd1b-example</requestId>
    <securityGroupInfo>
        <item>

        </item>
    </securityGroupInfo>
</DescribeSecurityGroupsResponse>
```

Example 2

This example describes all security groups that grant access over port 22 and that grant access from instances associated with `app_server_group` or `database_group`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeSecurityGroups
&Filter.1.Name=ip-permission.protocol
&Filter.1.Value.1=tcp
&Filter.2.Name=ip-permission.from-port
&Filter.2.Value.1=22
&Filter.3.Name=ip-permission.to-port
&Filter.3.Value.1=22
&Filter.4.Name=ip-permission.group-name
&Filter.4.Value.1=app_server_group
&Filter.4.Value.2=database_group
&AUTHPARAMS
```

Example 3

This example describes the specified security group. The security group has a rule that allows all outbound IPv6 traffic (this rule is added by default for security groups in an IPv6-enabled VPC) and a rule that allows inbound access over SSH for IPv6 traffic.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeSecurityGroups
&GroupId.1=sg-9bf6ceff
&AUTHPARAMS
```

Sample Response

```
<DescribeSecurityGroupsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>1d62eae0-acdd-481d-88c9-example</requestId>
    <securityGroupInfo>
        <item>
            <ownerId>123456789012</ownerId>
            <groupId>sg-9bf6ceff</groupId>
            <groupName>SSHAccess</groupName>
            <groupDescription>Security group for SSH access</groupDescription>
            <vpcId>vpc-31896b55</vpcId>
            <ipPermissions>
                <item>
                    <ipProtocol>tcp</ipProtocol>
                    <fromPort>22</fromPort>
                    <toPort>22</toPort>
                    <groups/>
                    <ipRanges>
                        <item>

DescribeSecurityGroupVpcAssociations

Describes security group VPC associations made with AssociateSecurityGroupVpc.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

Security group VPC association filters.

- `group-id`: The security group ID.
- `group-owner-id`: The group owner ID.
- `state`: The state of the association.
- `vpc-id`: The ID of the associated VPC.
- `vpc-owner-id`: The account ID of the VPC owner.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

securityGroupVpcAssociationSet

The security group VPC associations.

Type: Array of SecurityGroupVpcAssociation objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeServiceLinkVirtualInterfaces

Describes the Outpost service link virtual interfaces.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters to use for narrowing down the request. The following filters are supported:

- `outpost-lag-id` - The ID of the Outpost LAG.
- `outpost-arn` - The Outpost ARN.
- `owner-id` - The ID of the AWS account that owns the service link virtual interface.
- `state` - The state of the Outpost LAG.
- `vlan` - The ID of the address pool.
- `service-link-virtual-interface-id` - The ID of the service link virtual interface.
- `local-gateway-virtual-interface-id` - The ID of the local gateway virtual interface.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

ServiceLinkVirtualInterfaceId.N

The IDs of the service link virtual interfaces.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

serviceLinkVirtualInterfaceSet

Describes the service link virtual interfaces.

Type: Array of ServiceLinkVirtualInterface objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

DescribeSnapshotAttribute

Describes the specified attribute of the specified snapshot. You can specify only one attribute at a time.

For more information about EBS snapshots, see Amazon EBS snapshots in the *Amazon EBS User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Attribute

The snapshot attribute you would like to view.

Type: String

Valid Values: `productCodes | createVolumePermission`

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

SnapshotId

The ID of the EBS snapshot.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

createVolumePermission

The users and groups that have the permissions for creating volumes from the snapshot.

Type: Array of CreateVolumePermission objects

productCodes

The product codes.

Type: Array of ProductCode objects

requestId

The ID of the request.

Type: String

snapshotId

The ID of the EBS snapshot.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes the create volume permissions for the specified snapshot.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeSnapshotAttribute
&SnapshotId=snap-1234567890abcdef0
&Attribute=createVolumePermission
&AUTHPARAMS
```

Sample Response

```
<DescribeSnapshotAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
```

```
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <snapshotId>snap-1234567890abcdef0</snapshotId>
   <createVolumePermission>
      <item>
         <group>all</group>
      </item>
   </createVolumePermission>
</DescribeSnapshotAttributeResponse>
```

- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeSnapshots

Describes the specified EBS snapshots available to you or all of the EBS snapshots available to you.

The snapshots available to you include public snapshots, private snapshots that you own, and private snapshots owned by other AWS accounts for which you have explicit create volume permissions.

The create volume permissions fall into the following categories:

- *public*: The owner of the snapshot granted create volume permissions for the snapshot to the `all` group. All AWS accounts have create volume permissions for these snapshots.
- *explicit*: The owner of the snapshot granted create volume permissions to a specific AWS account.
- *implicit*: An AWS account has implicit create volume permissions for all snapshots it owns.

The list of snapshots returned can be filtered by specifying snapshot IDs, snapshot owners, or AWS accounts with create volume permissions. If no options are specified, Amazon EC2 returns all snapshots for which you have create volume permissions.

If you specify one or more snapshot IDs, only snapshots that have the specified IDs are returned. If you specify an invalid snapshot ID, an error is returned. If you specify a snapshot ID for which you do not have access, it is not included in the returned results.

If you specify one or more snapshot owners using the `OwnerIds` option, only snapshots from the specified owners and for which you have access are returned. The results can include the AWS account IDs of the specified owners, `amazon` for snapshots owned by Amazon, or `self` for snapshots that you own.

If you specify a list of restorable users, only snapshots with create snapshot permissions for those users are returned. You can specify AWS account IDs (if you own the snapshots), `self` for snapshots for which you own or have explicit permissions, or `all` for public snapshots.

If you are describing a long list of snapshots, we recommend that you paginate the output to make the list more manageable. For more information, see Pagination.

To get the state of fast snapshot restores for a snapshot, use DescribeFastSnapshotRestores.

For more information about EBS snapshots, see Amazon EBS snapshots in the *Amazon EBS User Guide*.

> **Important**
>
> We strongly recommend using only paginated requests. Unpaginated requests are susceptible to throttling and timeouts.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `description` - A description of the snapshot.
- `encrypted` - Indicates whether the snapshot is encrypted (`true` | `false`)
- `owner-alias` - The owner alias, from an Amazon-maintained list (`amazon`). This is not the user-configured AWS account alias set using the IAM console. We recommend that you use the related parameter instead of this filter.
- `owner-id` - The AWS account ID of the owner. We recommend that you use the related parameter instead of this filter.
- `progress` - The progress of the snapshot, as a percentage (for example, 80%).
- `snapshot-id` - The snapshot ID.
- `start-time` - The time stamp when the snapshot was initiated.
- `status` - The status of the snapshot (`pending` | `completed` | `error`).
- `storage-tier` - The storage tier of the snapshot (`archive` | `standard`).

- `transfer-type` - The type of operation used to create the snapshot (`time-based` | `standard`).
- `tag`:<key> - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.
- `volume-id` - The ID of the volume the snapshot is for.
- `volume-size` - The size of the volume, in GiB.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Owner.N

Scopes the results to snapshots with the specified owners. You can specify a combination of AWS account IDs, `self`, and `amazon`.

Type: Array of strings

Required: No

RestorableBy.N

The IDs of the AWS accounts that can create volumes from the snapshot.

Type: Array of strings

Required: No

SnapshotId.N

The snapshot IDs.

Default: Describes the snapshots for which you have create volume permissions.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

snapshotSet

Information about the snapshots.

Type: Array of Snapshot objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes a snapshot with an ID of `snap-1234567890abcdef0`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeSnapshots
&SnapshotId=snap-1234567890abcdef0
&AUTHPARAMS
```

Sample Response

```
<DescribeSnapshotsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>12345678-1234-1234-1234-3755ba4b9fa6</requestId>
  <snapshotSet>
    <item>
      <snapshotId>snap-0abcdef1234567890</snapshotId>
      <volumeId>vol-01234567890abcdef</volumeId>
      <status>completed</status>
      <startTime>2025-02-03T23:53:18.195Z</startTime>
      <progress>100%</progress>
      <ownerId>123456789012</ownerId>
      <volumeSize>8</volumeSize>
      <description>My root volume snapshot</description>
      <tagSet>
        <item>
          <key>purpose</key>
          <value>production_backup</value>
        </item>
      </tagSet>
      <encrypted>true</encrypted>
      <kmsKeyId>arn:aws:kms:us-east-1:123456789012:key/12345678-abcd-9876-ab12-
cd56f438c90b</kmsKeyId>
      <storageTier>standard</storageTier>
      <transferType>standard</transferType>
      <completionTime>2025-02-03T23:56:27.864Z</completionTime>
      <fullSnapshotSizeInBytes>1770520576</fullSnapshotSizeInBytes>
    </item>
  </snapshotSet>
</DescribeSnapshotsResponse>
```

Example

This example filters the response to include only snapshots with the `pending` status, and a tag with the key `Owner` and the value `DbAdmin`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeSnapshots
&Filter.1.Name=status
&Filter.1.Value.1=pending
&Filter.2.Name=tag:Owner
&Filter.2.Value.1=DbAdmin
&AUTHPARAMS
```

DescribeSnapshotTierStatus

Describes the storage tier status of one or more Amazon EBS snapshots.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `snapshot-id` - The snapshot ID.
- `volume-id` - The ID of the volume the snapshot is for.
- `last-tiering-operation` - The state of the last archive or restore action. (`archival-in-progress` | `archival-completed` | `archival-failed` | `permanent-restore-in-progress` | `permanent-restore-completed` | `permanent-restore-failed` | `temporary-restore-in-progress` | `temporary-restore-completed` | `temporary-restore-failed`)

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

snapshotTierStatusSet

Information about the snapshot's storage tier.

Type: Array of SnapshotTierStatus objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for Ruby V3

DescribeSpotDatafeedSubscription

Describes the data feed for Spot Instances. For more information, see Spot Instance data feed in the *Amazon EC2 User Guide*.

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

spotDatafeedSubscription

The Spot Instance data feed subscription.

Type: SpotDatafeedSubscription object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes the data feed for the account.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeSpotDatafeedSubscription
&AUTHPARAMS
```

Sample Response

```
<DescribeSpotDatafeedSubscriptionResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <spotDatafeedSubscription>
      <ownerId>123456789012</ownerId>
      <bucket>amzn-s3-demo-bucket</bucket>
      <prefix>spotdata_</prefix>
      <state>Active</state>
   </spotDatafeedSubscription>
</DescribeSpotDatafeedSubscriptionResponse>
```

DescribeSpotFleetInstances

Describes the running instances for the specified Spot Fleet.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 1000.

Required: No

NextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

Required: No

SpotFleetRequestId

The ID of the Spot Fleet request.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

activeInstanceSet

The running instances. This list is refreshed periodically and might be out of date.

Type: Array of ActiveInstance objects

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

spotFleetRequestId

The ID of the Spot Fleet request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes the running instances for Spot Fleet request sfr-123f8fc2-cb31-425e-abcd-example2710.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeSpotFleetInstances
&SpotFleetRequestId=sfr-123f8fc2-cb31-425e-abcd-example2710
```

```
&AUTHPARAMS
```

Sample Response

```
<DescribeSpotFleetInstancesResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>cfb09950-45e2-472d-a6a9-example</requestId>
    <spotFleetRequestId>sfr-123f8fc2-cb31-425e-abcd-example2710</spotFleetRequestId>
    <activeInstanceSet>
        <item>
            <instanceId>i-1234567890abcdef0</instanceId>
            <spotInstanceRequestId>sir-1a1a1a1a</spotInstanceRequestId>
            <instanceType>m3.medium</instanceType>
        </item>
        <item>
            <instanceId>i-1234567890abcdef1</instanceId>
            <spotInstanceRequestId>sir-2b2b2b2b</spotInstanceRequestId>
            <instanceType>m3.medium</instanceType>
        </item>
        <item>
            <instanceId>i-1234567890abcdef2</instanceId>

DescribeSpotFleetRequestHistory

Describes the events for the specified Spot Fleet request during the specified time.

Spot Fleet events are delayed by up to 30 seconds before they can be described. This ensures that you can query by the last evaluated time and not miss a recorded event. Spot Fleet events are available for 48 hours.

For more information, see Monitor fleet events using Amazon EventBridge in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

EventType

The type of events to describe. By default, all events are described.

Type: String

Valid Values: `instanceChange | fleetRequestChange | error | information`

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 1000.

Required: No

NextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

Required: No

SpotFleetRequestId

The ID of the Spot Fleet request.

Type: String

Required: Yes

StartTime

The starting date and time for the events, in UTC format (for example, *YYYY*-*MM*-*DD*T*HH*:*MM*:*SS*Z).

Type: Timestamp

Required: Yes

Response Elements

The following elements are returned by the service.

historyRecordSet

Information about the events in the history of the Spot Fleet request.

Type: Array of HistoryRecord objects

lastEvaluatedTime

The last date and time for the events, in UTC format (for example, *YYYY*-*MM*-*DD*T*HH*:*MM*:*SS*Z). All records up to this time were retrieved.

If `nextToken` indicates that there are more items, this value is not present.

Type: Timestamp

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

spotFleetRequestId

The ID of the Spot Fleet request.

Type: String

startTime

The starting date and time for the events, in UTC format (for example, *YYYY-MM-DD*T*HH*:*MM*:*SS*Z).

Type: Timestamp

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes the events for Spot Fleet request sfr-123f8fc2-cb31-425e-abcd-example2710 from the specified start time.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeSpotFleetRequestHistory
&SpotFleetRequestId=sfr-123f8fc2-cb31-425e-abcd-example2710

DescribeSpotFleetRequests

Describes your Spot Fleet requests.

Spot Fleet requests are deleted 48 hours after they are canceled and their instances are terminated.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Required: No

NextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

Required: No

SpotFleetRequestId.N

The IDs of the Spot Fleet requests.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

spotFleetRequestConfigSet

Information about the configuration of your Spot Fleet.

Type: Array of SpotFleetRequestConfig objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes all of your Spot Fleet requests.

DescribeSpotInstanceRequests

Describes the specified Spot Instance requests.

You can use `DescribeSpotInstanceRequests` to find a running Spot Instance by examining the response. If the status of the Spot Instance is `fulfilled`, the instance ID appears in the response and contains the identifier of the instance. Alternatively, you can use DescribeInstances with a filter to look for instances where the instance lifecycle is `spot`.

We recommend that you set `MaxResults` to a value between 5 and 1000 to limit the number of items returned. This paginates the output, which makes the list more manageable and returns the items faster. If the list of items exceeds your `MaxResults` value, then that number of items is returned along with a `NextToken` value that can be passed to a subsequent `DescribeSpotInstanceRequests` request to retrieve the remaining items.

Spot Instance requests are deleted four hours after they are canceled and their instances are terminated.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `availability-zone-group` - The Availability Zone group.
- `create-time` - The time stamp when the Spot Instance request was created.
- `fault-code` - The fault code related to the request.

- `fault-message` - The fault message related to the request.
- `instance-id` - The ID of the instance that fulfilled the request.
- `launch-group` - The Spot Instance launch group.
- `launch.block-device-mapping.delete-on-termination` - Indicates whether the EBS volume is deleted on instance termination.
- `launch.block-device-mapping.device-name` - The device name for the volume in the block device mapping (for example, `/dev/sdh` or `xvdh`).
- `launch.block-device-mapping.snapshot-id` - The ID of the snapshot for the EBS volume.
- `launch.block-device-mapping.volume-size` - The size of the EBS volume, in GiB.
- `launch.block-device-mapping.volume-type` - The type of EBS volume: `gp2` or `gp3` for General Purpose SSD, `io1` or `io2` for Provisioned IOPS SSD, `st1` for Throughput Optimized HDD, `sc1` for Cold HDD, or `standard` for Magnetic.
- `launch.group-id` - The ID of the security group for the instance.
- `launch.group-name` - The name of the security group for the instance.
- `launch.image-id` - The ID of the AMI.
- `launch.instance-type` - The type of instance (for example, `m3.medium`).
- `launch.kernel-id` - The kernel ID.
- `launch.key-name` - The name of the key pair the instance launched with.
- `launch.monitoring-enabled` - Whether detailed monitoring is enabled for the Spot Instance.
- `launch.ramdisk-id` - The RAM disk ID.
- `launched-availability-zone` - The Availability Zone in which the request is launched.
- `launched-availability-zone-id` - The ID of the Availability Zone in which the request is launched.
- `network-interface.addresses.primary` - Indicates whether the IP address is the primary private IP address.
- `network-interface.delete-on-termination` - Indicates whether the network interface is deleted when the instance is terminated.
- `network-interface.description` - A description of the network interface.
- `network-interface.device-index` - The index of the device for the network interface attachment on the instance.

- `network-interface.group-id` - The ID of the security group associated with the network interface.
- `network-interface.network-interface-id` - The ID of the network interface.
- `network-interface.private-ip-address` - The primary private IP address of the network interface.
- `network-interface.subnet-id` - The ID of the subnet for the instance.
- `product-description` - The product description associated with the instance (`Linux/UNIX` | `Windows`).
- `spot-instance-request-id` - The Spot Instance request ID.
- `spot-price` - The maximum hourly price for any Spot Instance launched to fulfill the request.
- `state` - The state of the Spot Instance request (`open` | `active` | `closed` | `cancelled` | `failed`). Spot request status information can help you track your Amazon EC2 Spot Instance requests. For more information, see Spot request status in the *Amazon EC2 User Guide*.
- `status-code` - The short code describing the most recent evaluation of your Spot Instance request.
- `status-message` - The message explaining the status of the Spot Instance request.
- `tag:<key>` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.
- `type` - The type of Spot Instance request (`one-time` | `persistent`).
- `valid-from` - The start date of the request.
- `valid-until` - The end date of the request.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

SpotInstanceRequestId.N

The IDs of the Spot Instance requests.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

spotInstanceRequestSet

The Spot Instance requests.

Type: Array of SpotInstanceRequest objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example for DescribeSpotInstanceRequests

This example returns information about current Spot Instance requests. In the response, if the status of the Spot Instance is `fulfilled`, the instance ID appears in the response and contains the identifier of the instance.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeSpotInstanceRequests
&AUTHPARAMS
```

Sample Response

```
<DescribeSpotInstanceRequestsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <spotInstanceRequestSet>
    <item>
      <spotInstanceRequestId>sir-1a2b3c4d</spotInstanceRequestId>
      <spotPrice>0.09</spotPrice>
      <type>one-time</type>
      <state>active</state>
      <status>
        <code>fulfilled</code>
        <updateTime>YYYY-MM-DDTHH:MM:SS.000Z</updateTime>
        <message>Your Spot request is fulfilled.</message>
      </status>
      <launchSpecification>
        <imageId>ami-1a2b3c4d</imageId>
        <keyName>my-key-pair</keyName>
        <groupSet>
          <item>
            <groupId>sg-1a2b3c4d</groupId>
            <groupName>websrv</groupName>
          </item>
        </groupSet>
        <instanceType>m3.medium</instanceType>
```

```
        <monitoring>
          <enabled>false</enabled>
        </monitoring>
        <ebsOptimized>false</ebsOptimized>
      </launchSpecification>
      <instanceId>i-1234567890abcdef0</instanceId>
      <createTime>YYYY-MM-DDTHH:MM:SS.000Z</createTime>
      <productDescription>Linux/UNIX</productDescription>
      <launchedAvailabilityZone>us-west-2a</launchedAvailabilityZone>
    </item>
  <spotInstanceRequestSet/>
<DescribeSpotInstanceRequestsResponse>
```

Example for DescribeSpotInstanceRequests

This example describes all persistent Spot Instance requests that have resulted in the launch of at least one instance, that has been fulfilled in the us-west-2a Availability Zone, and that also has monitoring enabled.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeSpotInstanceRequests
&Filter.1.Name=type
&Filter.1.Value.1=persistent
&Filter.2.Name=instance-type
&Filter.2.Value.1=m3.medium
&Filter.3.Name=monitoring-enabled
&Filter.3.Value.1=true
&Filter.4.Name=launched-availability-zone
&Filter.4.Value.1=us-west-2a
&AUTHPARAMS
```

Example for DescribeInstances

Alternatively, you can use DescribeInstances and use a filter to look for instances where the instance lifecycle contains `spot`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeInstances
&Filter.1.Name=instance-lifecycle
&Filter.1.Value.1=spot
```

```
&AUTHPARAMS
```

DescribeSpotPriceHistory

Describes the Spot price history. For more information, see Spot Instance pricing history in the *Amazon EC2 User Guide*.

When you specify a start and end time, the operation returns the prices of the instance types within that time range. It also returns the last price change before the start time, which is the effective price as of the start time.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AvailabilityZone

Filters the results by the specified Availability Zone.

Either `AvailabilityZone` or `AvailabilityZoneId` can be specified, but not both

Type: String

Required: No

AvailabilityZoneId

Filters the results by the specified ID of the Availability Zone.

Either `AvailabilityZone` or `AvailabilityZoneId` can be specified, but not both

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

EndTime

The date and time, up to the current date, from which to stop retrieving the price history data, in UTC format (for example, *YYYY-MM-DD*T*HH*:*MM*:*SS*Z).

Type: Timestamp

Required: No

Filter.N

The filters.

- `availability-zone` - The Availability Zone for which prices should be returned.
- `availability-zone-id` - The ID of the Availability Zone for which prices should be returned.
- `instance-type` - The type of instance (for example, `m3.medium`).
- `product-description` - The product description for the Spot price (`Linux/UNIX` | `Red Hat Enterprise Linux` | `SUSE Linux` | `Windows` | `Linux/UNIX (Amazon VPC)` | `Red Hat Enterprise Linux (Amazon VPC)` | `SUSE Linux (Amazon VPC)` | `Windows (Amazon VPC)`).
- `spot-price` - The Spot price. The value must match exactly (or use wildcards; greater than or less than comparison is not supported).
- `timestamp` - The time stamp of the Spot price history, in UTC format (for example, *ddd MMM dd HH*:*mm*:*ss* UTC *YYYY*). You can use wildcards (* and ?). Greater than or less than comparison is not supported.

Type: Array of Filter objects

Required: No

InstanceType.N

Filters the results by the specified instance types.

Type: Array of strings

Valid Values: `a1.medium | a1.large | a1.xlarge | a1.2xlarge | a1.4xlarge | a1.metal | c1.medium | c1.xlarge | c3.large | c3.xlarge | c3.2xlarge | c3.4xlarge | c3.8xlarge | c4.large | c4.xlarge | c4.2xlarge | c4.4xlarge | c4.8xlarge | c5.large | c5.xlarge | c5.2xlarge | c5.4xlarge | c5.9xlarge | c5.12xlarge | c5.18xlarge | c5.24xlarge | c5.metal |`

c5a.large | c5a.xlarge | c5a.2xlarge | c5a.4xlarge | c5a.8xlarge | c5a.12xlarge | c5a.16xlarge | c5a.24xlarge | c5ad.large | c5ad.xlarge | c5ad.2xlarge | c5ad.4xlarge | c5ad.8xlarge | c5ad.12xlarge | c5ad.16xlarge | c5ad.24xlarge | c5d.large | c5d.xlarge | c5d.2xlarge | c5d.4xlarge | c5d.9xlarge | c5d.12xlarge | c5d.18xlarge | c5d.24xlarge | c5d.metal | c5n.large | c5n.xlarge | c5n.2xlarge | c5n.4xlarge | c5n.9xlarge | c5n.18xlarge | c5n.metal | c6g.medium | c6g.large | c6g.xlarge | c6g.2xlarge | c6g.4xlarge | c6g.8xlarge | c6g.12xlarge | c6g.16xlarge | c6g.metal | c6gd.medium | c6gd.large | c6gd.xlarge | c6gd.2xlarge | c6gd.4xlarge | c6gd.8xlarge | c6gd.12xlarge | c6gd.16xlarge | c6gd.metal | c6gn.medium | c6gn.large | c6gn.xlarge | c6gn.2xlarge | c6gn.4xlarge | c6gn.8xlarge | c6gn.12xlarge | c6gn.16xlarge | c6i.large | c6i.xlarge | c6i.2xlarge | c6i.4xlarge | c6i.8xlarge | c6i.12xlarge | c6i.16xlarge | c6i.24xlarge | c6i.32xlarge | c6i.metal | cc1.4xlarge | cc2.8xlarge | cg1.4xlarge | cr1.8xlarge | d2.xlarge | d2.2xlarge | d2.4xlarge | d2.8xlarge | d3.xlarge | d3.2xlarge | d3.4xlarge | d3.8xlarge | d3en.xlarge | d3en.2xlarge | d3en.4xlarge | d3en.6xlarge | d3en.8xlarge | d3en.12xlarge | dl1.24xlarge | f1.2xlarge | f1.4xlarge | f1.16xlarge | g2.2xlarge | g2.8xlarge | g3.4xlarge | g3.8xlarge | g3.16xlarge | g3s.xlarge | g4ad.xlarge | g4ad.2xlarge | g4ad.4xlarge | g4ad.8xlarge | g4ad.16xlarge | g4dn.xlarge | g4dn.2xlarge | g4dn.4xlarge | g4dn.8xlarge | g4dn.12xlarge | g4dn.16xlarge | g4dn.metal | g5.xlarge | g5.2xlarge | g5.4xlarge | g5.8xlarge | g5.12xlarge | g5.16xlarge | g5.24xlarge | g5.48xlarge | g5g.xlarge | g5g.2xlarge | g5g.4xlarge | g5g.8xlarge | g5g.16xlarge | g5g.metal | hi1.4xlarge | hpc6a.48xlarge | hs1.8xlarge | h1.2xlarge | h1.4xlarge | h1.8xlarge | h1.16xlarge | i2.xlarge | i2.2xlarge | i2.4xlarge | i2.8xlarge | i3.large | i3.xlarge | i3.2xlarge | i3.4xlarge | i3.8xlarge | i3.16xlarge | i3.metal | i3en.large | i3en.xlarge | i3en.2xlarge | i3en.3xlarge | i3en.6xlarge | i3en.12xlarge | i3en.24xlarge | i3en.metal | im4gn.large | im4gn.xlarge | im4gn.2xlarge | im4gn.4xlarge | im4gn.8xlarge | im4gn.16xlarge | inf1.xlarge | inf1.2xlarge | inf1.6xlarge | inf1.24xlarge | is4gen.medium | is4gen.large | is4gen.xlarge | is4gen.2xlarge | is4gen.4xlarge | is4gen.8xlarge | m1.small | m1.medium | m1.large | m1.xlarge | m2.xlarge | m2.2xlarge | m2.4xlarge | m3.medium |

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

ProductDescription.N

Filters the results by the specified basic product descriptions.

Type: Array of strings

Required: No

StartTime

The date and time, up to the past 90 days, from which to start retrieving the price history data, in UTC format (for example, *YYYY*-*MM*-*DD*T*HH*:*MM*:*SS*Z).

Type: Timestamp

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to include in another request to get the next page of items. This value is an empty string ("") or `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

spotPriceHistorySet

The historical Spot prices.

Type: Array of SpotPrice objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example gets the Spot price history for the first day in November 2016 for the specified Availability Zone.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeSpotPriceHistory
&StartTime=2016-11-01T00:00:00.000Z
&EndTime=2016-11-01T23:59:59.000Z
&AvailabilityZone=us-west-2a
&AUTHPARAMS
```

Sample Response

```
<DescribeSpotPriceHistoryResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <spotPriceHistorySet>
    <item>
      <instanceType>m3.medium</instanceType>
      <productDescription>Linux/UNIX</productDescription>
      <spotPrice>0.287</spotPrice>
      <timestamp>2016-11-01T20:56:05.000Z</timestamp>
      <availabilityZone>us-west-2a</availabilityZone>
    </item>
    <item>
      <instanceType>m3.medium</instanceType>
      <productDescription>Windows</productDescription>
      <spotPrice>0.033</spotPrice>
      <timestamp>2016-11-01T22:33:47.000Z</timestamp>
      <availabilityZone>us-west-2a</availabilityZone>
    </item>
  </spotPriceHistorySet>
```

```
  <nextToken/>
</DescribeSpotPriceHistoryResponse>
```

Example with Filters

This example uses filters to get the same results as the previous example.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeSpotPriceHistory
&Filter.1.Name=timestamp
&Filter.1.Value.1='Tue Nov 01 01* UTC 2016'
&Filter.2.Name=availability-zone
&Filter.2.Value.1=us-west-2a
&AUTHPARAMS
```

- AWS SDK for Ruby V3

DescribeStaleSecurityGroups

Describes the stale security group rules for security groups referenced across a VPC peering connection, transit gateway connection, or with a security group VPC association. Rules are stale when they reference a deleted security group. Rules can also be stale if they reference a security group in a peer VPC for which the VPC peering connection has been deleted, across a transit gateway where the transit gateway has been deleted (or the transit gateway security group referencing feature has been disabled), or if a security group VPC association has been disassociated.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 255.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1024.

Required: No

VpcId

The ID of the VPC.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

staleSecurityGroupSet

Information about the stale security groups.

Type: Array of StaleSecurityGroup objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes stale security group rules for vpc-11223344. The response shows that sg-5fa68d3a in your account has a stale ingress SSH rule that references sg-279ab042 in the peer

VPC, and sg-fe6fba9a in your account has a stale egress SSH rule that references sg-ef6fba8b in the peer VPC.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeStaleSecurityGroups
&VpcId=vpc-11223344
&AUTHPARAMS
```

Sample Response

```

DescribeStoreImageTasks

Describes the progress of the AMI store tasks. You can describe the store tasks for specified AMIs. If you don't specify the AMIs, you get a paginated list of store tasks from the last 31 days.

For each AMI task, the response indicates if the task is `InProgress`, `Completed`, or `Failed`. For tasks `InProgress`, the response shows the estimated progress as a percentage.

Tasks are listed in reverse chronological order. Currently, only tasks from the past 31 days can be viewed.

To use this API, you must have the required permissions. For more information, see Permissions for storing and restoring AMIs using S3 in the *Amazon EC2 User Guide*.

For more information, see Store and restore an AMI using S3 in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `task-state` - Returns tasks in a certain state (`InProgress` | `Completed` | `Failed`)
- `bucket` - Returns task information for tasks that targeted a specific bucket. For the filter value, specify the bucket name.

> **Note**
>
> When you specify the `ImageIds` parameter, any filters that you specify are ignored. To use the filters, you must remove the `ImageIds` parameter.

Type: Array of Filter objects

Required: No

ImageId.N

The AMI IDs for which to show progress. Up to 20 AMI IDs can be included in a request.

Type: Array of strings

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

You cannot specify this parameter and the `ImageIds` parameter in the same call.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 200.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

storeImageTaskResultSet

The information about the AMI store tasks.

Type: Array of StoreImageTaskResult objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for Ruby V3

DescribeSubnets

Describes your subnets. The default is to describe all your subnets. Alternatively, you can specify specific subnet IDs or filter the results to include only the subnets that match specific criteria.

For more information, see Subnets in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `availability-zone` - The Availability Zone for the subnet. You can also use `availabilityZone` as the filter name.
- `availability-zone-id` - The ID of the Availability Zone for the subnet. You can also use `availabilityZoneId` as the filter name.
- `available-ip-address-count` - The number of IPv4 addresses in the subnet that are available.
- `cidr-block` - The IPv4 CIDR block of the subnet. The CIDR block you specify must exactly match the subnet's CIDR block for information to be returned for the subnet. You can also use `cidr` or `cidrBlock` as the filter names.
- `customer-owned-ipv4-pool` - The customer-owned IPv4 address pool associated with the subnet.
- `default-for-az` - Indicates whether this is the default subnet for the Availability Zone (`true` | `false`). You can also use `defaultForAz` as the filter name.

- `enable-dns64` - Indicates whether DNS queries made to the Amazon-provided DNS Resolver in this subnet should return synthetic IPv6 addresses for IPv4-only destinations.
- `enable-lni-at-device-index` - Indicates the device position for local network interfaces in this subnet. For example, 1 indicates local network interfaces in this subnet are the secondary network interface (eth1).
- `ipv6-cidr-block-association.ipv6-cidr-block` - An IPv6 CIDR block associated with the subnet.
- `ipv6-cidr-block-association.association-id` - An association ID for an IPv6 CIDR block associated with the subnet.
- `ipv6-cidr-block-association.state` - The state of an IPv6 CIDR block associated with the subnet.
- `ipv6-native` - Indicates whether this is an IPv6 only subnet (`true` | `false`).
- `map-customer-owned-ip-on-launch` - Indicates whether a network interface created in this subnet (including a network interface created by RunInstances) receives a customer-owned IPv4 address.
- `map-public-ip-on-launch` - Indicates whether instances launched in this subnet receive a public IPv4 address.
- `outpost-arn` - The Amazon Resource Name (ARN) of the Outpost.
- `owner-id` - The ID of the AWS account that owns the subnet.
- `private-dns-name-options-on-launch.hostname-type` - The type of hostname to assign to instances in the subnet at launch. For IPv4-only and dual-stack (IPv4 and IPv6) subnets, an instance DNS name can be based on the instance IPv4 address (ip-name) or the instance ID (resource-name). For IPv6 only subnets, an instance DNS name must be based on the instance ID (resource-name).
- `private-dns-name-options-on-launch.enable-resource-name-dns-a-record` - Indicates whether to respond to DNS queries for instance hostnames with DNS A records.
- `private-dns-name-options-on-launch.enable-resource-name-dns-aaaa-record` - Indicates whether to respond to DNS queries for instance hostnames with DNS AAAA records.
- `state` - The state of the subnet (`pending` | `available`).
- `subnet-arn` - The Amazon Resource Name (ARN) of the subnet.
- `subnet-id` - The ID of the subnet.

- `tag` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.
- `vpc-id` - The ID of the VPC for the subnet.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

SubnetId.N

The IDs of the subnets.

Default: Describes all your subnets.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

subnetSet

Information about the subnets.

Type: Array of Subnet objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example describes the subnets.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeSubnets
&AUTHPARAMS
```

Sample Response

```
<DescribeSubnetsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>1927e20c-0ed0-4a02-a6d7-d955fbd2d13c</requestId>
    <subnetSet>
        <item>
```

```
            <subnetId>subnet-0bb1c79de301436ee</subnetId>
            <subnetArn>arn:aws:ec2:us-east-2:111122223333:subnet/
subnet-0bb1c79de3EXAMPLE</subnetArn>
            <state>available</state>
            <ownerId>111122223333</ownerId>
            <vpcId>vpc-0ee975135dEXAMPLE</vpcId>
            <cidrBlock>10.0.2.0/24</cidrBlock>
            <ipv6CidrBlockAssociationSet/>
            <availableIpAddressCount>251</availableIpAddressCount>
            <availabilityZone>us-east-2c</availabilityZone>
            <availabilityZoneId>use2-az3</availabilityZoneId>
            <defaultForAz>false</defaultForAz>
            <mapPublicIpOnLaunch>false</mapPublicIpOnLaunch>
            <assignIpv6AddressOnCreation>false</assignIpv6AddressOnCreation>
        </item>
        <item>
            <subnetId>subnet-02bf4c428bf44ebce</subnetId>
            <subnetArn>arn:aws:ec2:us-east-2:111122223333:subnet/
subnet-02bf4c428bEXAMPLE</subnetArn>
            <state>available</state>
            <ownerId>111122223333</ownerId>
            <vpcId>vpc-07e8ffd50fEXAMPLE</vpcId>
            <cidrBlock>10.0.0.0/24</cidrBlock>
            <ipv6CidrBlockAssociationSet>
                <item>
                    <ipv6CidrBlock>2600:1f16:115:200::/64</ipv6CidrBlock>
                    <associationId>subnet-cidr-assoc-002afb9f3cEXAMPLE</associationId>
                    <ipv6CidrBlockState>
                        <state>associated</state>
                    </ipv6CidrBlockState>
                </item>
            </ipv6CidrBlockAssociationSet>
            <availableIpAddressCount>251</availableIpAddressCount>
            <availabilityZone>us-east-2b</availabilityZone>
            <availabilityZoneId>use2-az2</availabilityZoneId>
            <defaultForAz>false</defaultForAz>
            <mapPublicIpOnLaunch>false</mapPublicIpOnLaunch>
            <assignIpv6AddressOnCreation>false</assignIpv6AddressOnCreation>
        </item>
    </subnetSet>
</DescribeSubnetsResponse>
```

Example 2

This example uses filters to describe any subnet you own that is in the VPC with the ID `vpc-0056ae9ffdEXAMPLE` or `vpc-0096ae9ffdEXAMPLE`, and whose state is `available`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeSubnets
&Filter.1.Name=vpc-id
&Filter.1.Value.1=vpc-0056ae9ffdEXAMPLE
&Filter.1.Value.2=vpc-0096ae9ffdEXAMPLE
&Filter.2.Name=state
&Filter.2.Value.1=available
&AUTHPARAMS
```

Sample Response

```
<DescribeSubnetsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>43e9cb52-0e10-40fe-b457-988c8fbfea26</requestId>
    <subnetSet>
        <item>
            <subnetId>subnet-0f8c6c2f37EXAMPLE</subnetId>
            <subnetArn>arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-0f8c6c2f37903e9dc</subnetArn>
            <state>available</state>
            <ownerId>123456789012</ownerId>
            <vpcId>vpc-0056ae9ffdEXAMPLE</vpcId>
            <cidrBlock>172.168.0.0/16</cidrBlock>
            <ipv6CidrBlockAssociationSet/>
            <availableIpAddressCount>65531</availableIpAddressCount>
            <availabilityZone>us-west-2b</availabilityZone>
            <availabilityZoneId>usw2-az2</availabilityZoneId>
            <defaultForAz>false</defaultForAz>
            <mapPublicIpOnLaunch>false</mapPublicIpOnLaunch>
            <assignIpv6AddressOnCreation>false</assignIpv6AddressOnCreation>
        </item>
    </subnetSet>
</DescribeSubnetsResponse>
```

DescribeTags

Describes the specified tags for your EC2 resources.

For more information about tags, see Tag your Amazon EC2 resources in the *Amazon Elastic Compute Cloud User Guide*.

Important

We strongly recommend using only paginated requests. Unpaginated requests are susceptible to throttling and timeouts.

Note

The order of the elements in the response, including those within nested structures, might vary. Applications should not assume the elements appear in a particular order.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `key` - The tag key.
- `resource-id` - The ID of the resource.
- `resource-type` - The resource type. For a list of possible values, see TagSpecification.

- `tag`:<key> - The key/value combination of the tag. For example, specify "tag:Owner" for the filter name and "TeamA" for the filter value to find resources with the tag "Owner=TeamA".
- `value` - The tag value.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. This value can be between 5 and 1000. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

tagSet

The tags.

Type: Array of TagDescription objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes all the tags in your account.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeTags
&AUTHPARAMS
```

Sample Response

```
<DescribeTagsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/"/">
   <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
   <tagSet>
      <item>
         <resourceId>ami-1a2b3c4d</resourceId>
         <resourceType>image</resourceType>
         <key>webserver</key>
         <value/>
      </item>
       <item>
         <resourceId>ami-1a2b3c4d</resourceId>
         <resourceType>image</resourceType>
         <key>stack</key>
         <value>Production</value>
      </item>
      <item>
         <resourceId>i-1234567890abcdef0</resourceId>
         <resourceType>instance</resourceType>
         <key>webserver</key>
```

```
         <value/>
      </item>
       <item>
         <resourceId>i-1234567890abcdef0</resourceId>
         <resourceType>instance</resourceType>
         <key>stack</key>
         <value>Production</value>
      </item>
      <item>
         <resourceId>i-0598c7d356eba48d7</resourceId>
         <resourceType>instance</resourceType>
         <key>database_server</key>
         <value/>
      </item>
       <item>
         <resourceId>i-0598c7d356eba48d7</resourceId>
         <resourceType>instance</resourceType>
         <key>stack</key>
         <value>Test</value>
      </item>
    </tagSet>
</DescribeTagsResponse>
```

Example

This example describes only the tags for the AMI with ID ami-1a2b3c4d.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeTags
&Filter.1.Name=resource-id
&Filter.1.Value.1=ami-1a2b3c4d
&AUTHPARAMS
```

Sample Response

```
<DescribeTagsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/"/">
   <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
   <tagSet>
      <item>
         <resourceId>ami-1a2b3c4d</resourceId>
         <resourceType>image</resourceType>
         <key>webserver</key>
```

```
         <value/>
      </item>
      <item>
         <resourceId>ami-1a2b3c4d</resourceId>
         <resourceType>image</resourceType>
         <key>stack</key>
         <value>Production</value>
      </item>
    </tagSet>
</DescribeTagsResponse>
```

Example

This example describes the tags for all your instances.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeTags
&Filter.1.Name=resource-type
&Filter.1.Value.1=instance
&AUTHPARAMS
```

Sample Response

```
<DescribeTagsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/"/">
   <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
   <tagSet>
       <item>
         <resourceId>i-0598c7d356eba48d7</resourceId>
         <resourceType>instance</resourceType>
         <key>webserver</key>
         <value/>
      </item>
       <item>
         <resourceId>i-0598c7d356eba48d7</resourceId>
         <resourceType>instance</resourceType>
         <key>stack</key>
         <value>Production</value>
      </item>
      <item>
         <resourceId>i-1234567890abcdef0</resourceId>
         <resourceType>instance</resourceType>
         <key>database_server</key>
```

```
          <value/>
       </item>
        <item>
          <resourceId>i-1234567890abcdef0</resourceId>
          <resourceType>instance</resourceType>
          <key>stack</key>
          <value>Test</value>
       </item>
     </tagSet>
</DescribeTagsResponse>
```

Example

This example describes the tags for all your instances tagged with the key *webserver*. You can use wildcards with filters, so you could specify the value as `?ebserver` to find tags with the key *webserver* or *Webserver*.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeTags
&Filter.1.Name=key
&Filter.1.Value.1=webserver
&AUTHPARAMS
```

Sample Response

```
<DescribeTagsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/"/">
   <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
   <tagSet>
       <item>
         <resourceId>i-1234567890abcdef0</resourceId>
         <resourceType>instance</resourceType>
         <key>webserver</key>
         <value/>
       </item>
     </tagSet>
</DescribeTagsResponse>
```

Example

This example describes the tags for all your instances tagged with either stack=Test or stack=Production.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeTags
&Filter.1.Name=resource-type
&Filter.1.Value.1=instance
&Filter.2.Name=key
&Filter.2.Value.1=stack
&Filter.3.Name=value
&Filter.3.Value.1=Test
&Filter.3.Value.2=Production
&AUTHPARAMS
```

Sample Response

```
<DescribeTagsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/"/">
   <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
   <tagSet>
       <item>
         <resourceId>i-1234567890abcdef0</resourceId>
         <resourceType>instance</resourceType>
         <key>stack</key>
         <value>Production</value>
      </item>
       <item>
         <resourceId>i-0598c7d356eba48d7</resourceId>
         <resourceType>instance</resourceType>
         <key>stack</key>
         <value>Test</value>
      </item>
    </tagSet>
</DescribeTagsResponse>
```

Example

This example describes the tags for all your instances tagged with Purpose=[empty string].

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeTags
&Filter.1.Name=resource-type
&Filter.1.Value.1=instance
&Filter.2.Name=key
```

```
&Filter.2.Value.1=Purpose
&Filter.3.Name=value
&Filter.3.Value.1=
&AUTHPARAMS
```

DescribeTrafficMirrorFilterRules

Describe traffic mirror filters that determine the traffic that is mirrored.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

Traffic mirror filters.

- `traffic-mirror-filter-rule-id`: The ID of the Traffic Mirror rule.
- `traffic-mirror-filter-id`: The ID of the filter that this rule is associated with.
- `rule-number`: The number of the Traffic Mirror rule.
- `rule-action`: The action taken on the filtered traffic. Possible actions are `accept` and `reject`.
- `traffic-direction`: The traffic direction. Possible directions are `ingress` and `egress`.
- `protocol`: The protocol, for example UDP, assigned to the Traffic Mirror rule.
- `source-cidr-block`: The source CIDR block assigned to the Traffic Mirror rule.
- `destination-cidr-block`: The destination CIDR block assigned to the Traffic Mirror rule.
- `description`: The description of the Traffic Mirror rule.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

TrafficMirrorFilterId

Traffic filter ID.

Type: String

Required: No

TrafficMirrorFilterRuleId.N

Traffic filter rule IDs.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. The value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

trafficMirrorFilterRuleSet

Traffic mirror rules.

Type: Array of TrafficMirrorFilterRule objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

DescribeTrafficMirrorFilters

Describes one or more Traffic Mirror filters.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters. The possible values are:

- `description`: The Traffic Mirror filter description.
- `traffic-mirror-filter-id`: The ID of the Traffic Mirror filter.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

TrafficMirrorFilterId.N

The ID of the Traffic Mirror filter.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. The value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

trafficMirrorFilterSet

Information about one or more Traffic Mirror filters.

Type: Array of TrafficMirrorFilter objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeTrafficMirrorSessions

Describes one or more Traffic Mirror sessions. By default, all Traffic Mirror sessions are described. Alternatively, you can filter the results.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters. The possible values are:

- `description`: The Traffic Mirror session description.
- `network-interface-id`: The ID of the Traffic Mirror session network interface.
- `owner-id`: The ID of the account that owns the Traffic Mirror session.
- `packet-length`: The assigned number of packets to mirror.
- `session-number`: The assigned session number.
- `traffic-mirror-filter-id`: The ID of the Traffic Mirror filter.
- `traffic-mirror-session-id`: The ID of the Traffic Mirror session.
- `traffic-mirror-target-id`: The ID of the Traffic Mirror target.
- `virtual-network-id`: The virtual network ID of the Traffic Mirror session.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

TrafficMirrorSessionId.N

The ID of the Traffic Mirror session.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. The value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

trafficMirrorSessionSet

Describes one or more Traffic Mirror sessions. By default, all Traffic Mirror sessions are described. Alternatively, you can filter the results.

Type: Array of TrafficMirrorSession objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeTrafficMirrorTargets

Information about one or more Traffic Mirror targets.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters. The possible values are:

- `description`: The Traffic Mirror target description.
- `network-interface-id`: The ID of the Traffic Mirror session network interface.
- `network-load-balancer-arn`: The Amazon Resource Name (ARN) of the Network Load Balancer that is associated with the session.
- `owner-id`: The ID of the account that owns the Traffic Mirror session.
- `traffic-mirror-target-id`: The ID of the Traffic Mirror target.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

TrafficMirrorTargetId.N

The ID of the Traffic Mirror targets.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. The value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

trafficMirrorTargetSet

Information about one or more Traffic Mirror targets.

Type: Array of TrafficMirrorTarget objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeTransitGatewayAttachments

Describes one or more attachments between resources and transit gateways. By default, all attachments are described. Alternatively, you can filter the results by attachment ID, attachment state, resource ID, or resource owner.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters. The possible values are:

- `association.state` - The state of the association (`associating` | `associated` | `disassociating`).
- `association.transit-gateway-route-table-id` - The ID of the route table for the transit gateway.
- `resource-id` - The ID of the resource.
- `resource-owner-id` - The ID of the AWS account that owns the resource.
- `resource-type` - The resource type. Valid values are `vpc` | `vpn` | `direct-connect-gateway` | `peering` | `connect`.
- `state` - The state of the attachment. Valid values are `available` | `deleted` | `deleting` | `failed` | `failing` | `initiatingRequest` | `modifying` | `pendingAcceptance` | `pending` | `rollingBack` | `rejected` | `rejecting`.
- `transit-gateway-attachment-id` - The ID of the attachment.
- `transit-gateway-id` - The ID of the transit gateway.
- `transit-gateway-owner-id` - The ID of the AWS account that owns the transit gateway.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

TransitGatewayAttachmentIds.N

The IDs of the attachments.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

transitGatewayAttachments

Information about the attachments.

Type: Array of TransitGatewayAttachment objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeTransitGatewayConnectPeers

Describes one or more Connect peers.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters. The possible values are:

- `state` - The state of the Connect peer (`pending` | `available` | `deleting` | `deleted`).
- `transit-gateway-attachment-id` - The ID of the attachment.
- `transit-gateway-connect-peer-id` - The ID of the Connect peer.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

TransitGatewayConnectPeerIds.N

The IDs of the Connect peers.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

transitGatewayConnectPeerSet

Information about the Connect peers.

Type: Array of TransitGatewayConnectPeer objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeTransitGatewayConnects

Describes one or more Connect attachments.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters. The possible values are:

- `options.protocol` - The tunnel protocol (`gre`).
- `state` - The state of the attachment (`initiating` | `initiatingRequest` | `pendingAcceptance` | `rollingBack` | `pending` | `available` | `modifying` | `deleting` | `deleted` | `failed` | `rejected` | `rejecting` | `failing`).
- `transit-gateway-attachment-id` - The ID of the Connect attachment.
- `transit-gateway-id` - The ID of the transit gateway.
- `transport-transit-gateway-attachment-id` - The ID of the transit gateway attachment from which the Connect attachment was created.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

TransitGatewayAttachmentIds.N

The IDs of the attachments.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

transitGatewayConnectSet

Information about the Connect attachments.

Type: Array of TransitGatewayConnect objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeTransitGatewayMeteringPolicies

Describes one or more transit gateway metering policies.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters to apply when describing transit gateway metering policies.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

TransitGatewayMeteringPolicyIds.N

The IDs of the transit gateway metering policies to describe.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

transitGatewayMeteringPolicies

Information about the transit gateway metering policies.

Type: Array of TransitGatewayMeteringPolicy objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

DescribeTransitGatewayMulticastDomains

Describes one or more transit gateway multicast domains.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters. The possible values are:

- `state` - The state of the transit gateway multicast domain. Valid values are `pending` | `available` | `deleting` | `deleted`.
- `transit-gateway-id` - The ID of the transit gateway.
- `transit-gateway-multicast-domain-id` - The ID of the transit gateway multicast domain.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

TransitGatewayMulticastDomainIds.N

The ID of the transit gateway multicast domain.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

transitGatewayMulticastDomains

Information about the transit gateway multicast domains.

Type: Array of TransitGatewayMulticastDomain objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example describes your multicast domains.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeTransitGatewayMulticastDomains
&AUTHPARAMS
```

Sample Response

```
<DescribeTransitGatewayMulticastDomainsResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>e19ec53b-f3f5-4eae-97c3-a9605EXAMPLE</requestId>
    <transitGatewayMulticastDomains>
        <item>
            <creationTime>2019-11-19T22:05:50.000Z</creationTime>
            <state>available</state>
            <tagSet/>
            <transitGatewayId>tgw-06150e5ae0EXAMPLE</transitGatewayId>
            <transitGatewayMulticastDomainId>tgw-mcast-domain-0c4905cef7EXAMPLE</
transitGatewayMulticastDomainId>
        </item>
    </transitGatewayMulticastDomains>
</DescribeTransitGatewayMulticastDomainsResponse>
```

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2

- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeTransitGatewayPeeringAttachments

Describes your transit gateway peering attachments.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters. The possible values are:

- `transit-gateway-attachment-id` - The ID of the transit gateway attachment.
- `local-owner-id` - The ID of your AWS account.
- `remote-owner-id` - The ID of the AWS account in the remote Region that owns the transit gateway.
- `state` - The state of the peering attachment. Valid values are `available` | `deleted` | `deleting` | `failed` | `failing` | `initiatingRequest` | `modifying` | `pendingAcceptance` | `pending` | `rollingBack` | `rejected` | `rejecting`).
- `tag`:<key> - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources that have a tag with a specific key, regardless of the tag value.
- `transit-gateway-id` - The ID of the transit gateway.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

TransitGatewayAttachmentIds.N

One or more IDs of the transit gateway peering attachments.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

transitGatewayPeeringAttachments

The transit gateway peering attachments.

Type: Array of TransitGatewayPeeringAttachment objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes your peering attachment.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeTransitGatewayPeeringAttachments
&AUTHPARAMS
```

Sample Response

```
<DescribeTransitGatewayPeeringAttachmentsResponse xmlns="http://ec2.amazonaws.com/

DescribeTransitGatewayPolicyTables

Describes one or more transit gateway route policy tables.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters associated with the transit gateway policy table.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

TransitGatewayPolicyTableIds.N

The IDs of the transit gateway policy tables.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token for the next page of results.

Type: String

requestId

The ID of the request.

Type: String

transitGatewayPolicyTables

Describes the transit gateway policy tables.

Type: Array of TransitGatewayPolicyTable objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

DescribeTransitGatewayRouteTableAnnouncements

Describes one or more transit gateway route table advertisements.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters associated with the transit gateway policy table.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

TransitGatewayRouteTableAnnouncementIds.N

The IDs of the transit gateway route tables that are being advertised.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token for the next page of results.

Type: String

requestId

The ID of the request.

Type: String

transitGatewayRouteTableAnnouncements

Describes the transit gateway route table announcement.

Type: Array of TransitGatewayRouteTableAnnouncement objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4

- AWS SDK for Ruby V3

DescribeTransitGatewayRouteTables

Describes one or more transit gateway route tables. By default, all transit gateway route tables are described. Alternatively, you can filter the results.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters. The possible values are:

- `default-association-route-table` - Indicates whether this is the default association route table for the transit gateway (`true` | `false`).
- `default-propagation-route-table` - Indicates whether this is the default propagation route table for the transit gateway (`true` | `false`).
- `state` - The state of the route table (`available` | `deleting` | `deleted` | `pending`).
- `transit-gateway-id` - The ID of the transit gateway.
- `transit-gateway-route-table-id` - The ID of the transit gateway route table.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

TransitGatewayRouteTableIds.N

The IDs of the transit gateway route tables.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

transitGatewayRouteTables

Information about the transit gateway route tables.

Type: Array of TransitGatewayRouteTable objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for Ruby V3

DescribeTransitGateways

Describes one or more transit gateways. By default, all transit gateways are described. Alternatively, you can filter the results.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters. The possible values are:

- `options.propagation-default-route-table-id` - The ID of the default propagation route table.
- `options.amazon-side-asn` - The private ASN for the Amazon side of a BGP session.
- `options.association-default-route-table-id` - The ID of the default association route table.
- `options.auto-accept-shared-attachments` - Indicates whether there is automatic acceptance of attachment requests (`enable` | `disable`).
- `options.default-route-table-association` - Indicates whether resource attachments are automatically associated with the default association route table (`enable` | `disable`).
- `options.default-route-table-propagation` - Indicates whether resource attachments automatically propagate routes to the default propagation route table (`enable` | `disable`).
- `options.dns-support` - Indicates whether DNS support is enabled (`enable` | `disable`).
- `options.vpn-ecmp-support` - Indicates whether Equal Cost Multipath Protocol support is enabled (`enable` | `disable`).
- `owner-id` - The ID of the AWS account that owns the transit gateway.

- `state` - The state of the transit gateway (`available` | `deleted` | `deleting` | `modifying` | `pending`).
- `transit-gateway-id` - The ID of the transit gateway.
- `tag-key` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

TransitGatewayIds.N

The IDs of the transit gateways.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

transitGatewaySet

Information about the transit gateways.

Type: Array of TransitGateway objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes your transit gateways.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeTransitGateways
&AUTHPARAMS
```

Sample Response

```
<DescribeTransitGatewaysResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>151283df-f7dc-4317-89b4-01c9888b1d45</requestId>
    <transitGatewaySet>

DescribeTransitGatewayVpcAttachments

Describes one or more VPC attachments. By default, all VPC attachments are described. Alternatively, you can filter the results.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters. The possible values are:

- `state` - The state of the attachment. Valid values are `available` | `deleted` | `deleting` | `failed` | `failing` | `initiatingRequest` | `modifying` | `pendingAcceptance` | `pending` | `rollingBack` | `rejected` | `rejecting`.
- `transit-gateway-attachment-id` - The ID of the attachment.
- `transit-gateway-id` - The ID of the transit gateway.
- `vpc-id` - The ID of the VPC.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

TransitGatewayAttachmentIds.N

The IDs of the attachments.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

transitGatewayVpcAttachments

Information about the VPC attachments.

Type: Array of TransitGatewayVpcAttachment objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes your transit gateway VPC attachments.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeTransitGatewayVpcAttachment
&AUTHPARAMS
```

Sample Response

```
<DescribeTransitGatewayVpcAttachmentsResponse xmlns="http://ec2.amazonaws.com/

DescribeTrunkInterfaceAssociations

Describes one or more network interface trunk associations.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AssociationId.N

The IDs of the associations.

Type: Array of strings

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `gre-key` - The ID of a trunk interface association.
- `interface-protocol` - The interface protocol. Valid values are `VLAN` and `GRE`.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 255.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

interfaceAssociationSet

Information about the trunk associations.

Type: Array of TrunkInterfaceAssociation objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

DescribeVerifiedAccessEndpoints

Describes the specified AWS Verified Access endpoints.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters. Filter names and values are case-sensitive.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

VerifiedAccessEndpointId.N

The ID of the Verified Access endpoint.

Type: Array of strings

Required: No

VerifiedAccessGroupId

The ID of the Verified Access group.

Type: String

Required: No

VerifiedAccessInstanceId

The ID of the Verified Access instance.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

verifiedAccessEndpointSet

Details about the Verified Access endpoints.

Type: Array of VerifiedAccessEndpoint objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeVerifiedAccessGroups

Describes the specified Verified Access groups.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters. Filter names and values are case-sensitive.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

VerifiedAccessGroupId.N

The ID of the Verified Access groups.

Type: Array of strings

Required: No

VerifiedAccessInstanceId

The ID of the Verified Access instance.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

verifiedAccessGroupSet

Details about the Verified Access groups.

Type: Array of VerifiedAccessGroup objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

DescribeVerifiedAccessInstanceLoggingConfigurations

Describes the specified AWS Verified Access instances.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters. Filter names and values are case-sensitive.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 10.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

VerifiedAccessInstanceId.N

The IDs of the Verified Access instances.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

loggingConfigurationSet

The logging configuration for the Verified Access instances.

Type: Array of VerifiedAccessInstanceLoggingConfiguration objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

DescribeVerifiedAccessInstances

Describes the specified AWS Verified Access instances.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters. Filter names and values are case-sensitive.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 200.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

VerifiedAccessInstanceId.N

The IDs of the Verified Access instances.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

verifiedAccessInstanceSet

Details about the Verified Access instances.

Type: Array of VerifiedAccessInstance objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

DescribeVerifiedAccessTrustProviders

Describes the specified AWS Verified Access trust providers.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters. Filter names and values are case-sensitive.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 200.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

VerifiedAccessTrustProviderId.N

The IDs of the Verified Access trust providers.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

verifiedAccessTrustProviderSet

Details about the Verified Access trust providers.

Type: Array of VerifiedAccessTrustProvider objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeVolumeAttribute

Describes the specified attribute of the specified volume. You can specify only one attribute at a time.

For more information about EBS volumes, see Amazon EBS volumes in the *Amazon EBS User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Attribute

The attribute of the volume. This parameter is required.

Type: String

Valid Values: `autoEnableIO | productCodes`

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

VolumeId

The ID of the volume.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

autoEnableIO

The state of `autoEnableIO` attribute.

Type: AttributeBooleanValue object

productCodes

A list of product codes.

Type: Array of ProductCode objects

requestId

The ID of the request.

Type: String

volumeId

The ID of the volume.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes the `autoEnableIO` attribute of the volume vol-1234567890abcdef0.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeVolumeAttribute
&Attribute=autoEnableIO
&VolumeId=vol-1234567890abcdef0
&AUTHPARAMS
```

Sample Response

```
<DescribeVolumeAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
```

```
  <requestId>5jkdf074-37ed-4004-8671-a78ee82bf1cbEXAMPLE</requestId>
  <volumeId>vol-1234567890abcdef0</volumeId>
  <autoEnableIO>
    <value>false</value>
  </autoEnableIO>
</DescribeVolumeAttributeResponse>
```

Example

This example describes the `productCodes` attribute of the volume vol-1234567890abcdef0.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeVolumeAttribute
&Attribute=productCodes
&VolumeId=vol-1234567890abcdef0
&AUTHPARAMS
```

Sample Response

```
<DescribeVolumeAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>5jkdf074-37ed-4004-8671-a78ee82bf1cbEXAMPLE</requestId>
  <volumeId>vol-1234567890abcdef0</volumeId>
  <productCodes>
      <item>
          <productCode>a1b2c3d4e5f6g7h8i9j10k11</productCode>
          <type>marketplace</type>
        </item>
  </productCodes>
</DescribeVolumeAttributeResponse>
```

- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeVolumes

Describes the specified EBS volumes or all of your EBS volumes.

If you are describing a long list of volumes, we recommend that you paginate the output to make the list more manageable. For more information, see Pagination.

For more information about EBS volumes, see Amazon EBS volumes in the *Amazon EBS User Guide*.

Important

We strongly recommend using only paginated requests. Unpaginated requests are susceptible to throttling and timeouts.

Note

The order of the elements in the response, including those within nested structures, might vary. Applications should not assume the elements appear in a particular order.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `attachment.attach-time` - The time stamp when the attachment initiated.

- `attachment.delete-on-termination` - Whether the volume is deleted on instance termination.
- `attachment.device` - The device name specified in the block device mapping (for example, `/dev/sda1`).
- `attachment.instance-id` - The ID of the instance the volume is attached to.
- `attachment.status` - The attachment state (`attaching` | `attached` | `detaching`).
- `availability-zone` - The Availability Zone in which the volume was created.
- `availability-zone-id` - The ID of the Availability Zone in which the volume was created.
- `create-time` - The time stamp when the volume was created.
- `encrypted` - Indicates whether the volume is encrypted (`true` | `false`)
- `fast-restored` - Indicates whether the volume was created from a snapshot that is enabled for fast snapshot restore (`true` | `false`).
- `multi-attach-enabled` - Indicates whether the volume is enabled for Multi-Attach (`true` | `false`)
- `operator.managed` - A Boolean that indicates whether this is a managed volume.
- `operator.principal` - The principal that manages the volume. Only valid for managed volumes, where `managed` is `true`.
- `size` - The size of the volume, in GiB.
- `snapshot-id` - The snapshot from which the volume was created.
- `status` - The state of the volume (`creating` | `available` | `in-use` | `deleting` | `deleted` | `error`).
- `tag:<key>` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.
- `volume-id` - The volume ID.
- `volume-type` - The Amazon EBS volume type (`gp2` | `gp3` | `io1` | `io2` | `st1` | `sc1`| `standard`)

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

VolumeId.N

The volume IDs. If not specified, then all volumes are included in the response.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

volumeSet

Information about the volumes.

Type: Array of Volume objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes all volumes associated with your account.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeVolumes
&AUTHPARAMS
```

Sample Response

```
<DescribeVolumesResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <volumeSet>
      <item>
         <volumeId>vol-1234567890abcdef0</volumeId>
         <size>80</size>
         <snapshotId/>
         <availabilityZone>us-east-1a</availabilityZone>
         <status>in-use</status>
         <createTime>YYYY-MM-DDTHH:MM:SS.SSSZ</createTime>
         <attachmentSet>
            <item>
               <volumeId>vol-1234567890abcdef0</volumeId>
               <instanceId>i-1234567890abcdef0</instanceId>
               <device>/dev/sdh</device>
               <status>attached</status>
               <attachTime>YYYY-MM-DDTHH:MM:SS.SSSZ</attachTime>
               <deleteOnTermination>false</deleteOnTermination>
            </item>
         </attachmentSet>
         <volumeType>standard</volumeType>
         <encrypted>true</encrypted>
```

```
         <multiAttachEnabled>false</multiAttachEnabled>
      </item>
   </volumeSet>
</DescribeVolumesResponse>
```

DescribeVolumesModifications

Describes the most recent volume modification request for the specified EBS volumes.

For more information, see Monitor the progress of volume modifications in the *Amazon EBS User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `modification-state` - The current modification state (modifying | optimizing | completed | failed).
- `original-iops` - The original IOPS rate of the volume.
- `original-size` - The original size of the volume, in GiB.
- `original-volume-type` - The original volume type of the volume (standard | io1 | io2 | gp2 | sc1 | st1).
- `originalMultiAttachEnabled` - Indicates whether Multi-Attach support was enabled (true | false).
- `start-time` - The modification start time.
- `target-iops` - The target IOPS rate of the volume.
- `target-size` - The target size of the volume, in GiB.
- `target-volume-type` - The target volume type of the volume (standard | io1 | io2 | gp2 | sc1 | st1).

- `targetMultiAttachEnabled` - Indicates whether Multi-Attach support is to be enabled (true | false).
- `volume-id` - The ID of the volume.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results (up to a limit of 500) to be returned in a paginated request. For more information, see Pagination.

Type: Integer

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

VolumeId.N

The IDs of the volumes.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

volumeModificationSet

Information about the volume modifications.

Type: Array of VolumeModification objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example displays volume status after modifications to size, type, IOPS provisioning, and Multi-Attach support.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeVolumesModifications
&VolumeId.1=vol-0123456789EXAMPLE
&Version=2016-11-15
```

Sample Response

```
<DescribeVolumesModificationsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <volumeModificationSet>

DescribeVolumeStatus

Describes the status of the specified volumes. Volume status provides the result of the checks performed on your volumes to determine events that can impair the performance of your volumes. The performance of a volume can be affected if an issue occurs on the volume's underlying host. If the volume's underlying host experiences a power outage or system issue, after the system is restored, there could be data inconsistencies on the volume. Volume events notify you if this occurs. Volume actions notify you if any action needs to be taken in response to the event.

The `DescribeVolumeStatus` operation provides the following information about the specified volumes:

Status: Reflects the current status of the volume. The possible values are ok, `impaired` , `warning`, or `insufficient-data`. If all checks pass, the overall status of the volume is ok. If the check fails, the overall status is `impaired`. If the status is `insufficient-data`, then the checks might still be taking place on your volume at the time. We recommend that you retry the request. For more information about volume status, see Monitor the status of your volumes in the *Amazon EBS User Guide*.

Events: Reflect the cause of a volume status and might require you to take action. For example, if your volume returns an `impaired` status, then the volume event might be `potential-data-inconsistency`. This means that your volume has been affected by an issue with the underlying host, has all I/O operations disabled, and might have inconsistent data.

Actions: Reflect the actions you might have to take in response to an event. For example, if the status of the volume is `impaired` and the volume event shows `potential-data-inconsistency`, then the action shows `enable-volume-io`. This means that you may want to enable the I/O operations for the volume and then check the volume for data consistency. For more information, see Work with an impaired EBS volume.

Volume status is based on the volume status checks, and does not reflect the volume state. Therefore, volume status does not indicate volumes in the `error` state (for example, when a volume is incapable of accepting I/O.)

Note

The order of the elements in the response, including those within nested structures, might vary. Applications should not assume the elements appear in a particular order.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `action.code` - The action code for the event (for example, `enable-volume-io`).
- `action.description` - A description of the action.
- `action.event-id` - The event ID associated with the action.
- `availability-zone` - The Availability Zone of the instance.
- `event.description` - A description of the event.
- `event.event-id` - The event ID.
- `event.event-type` - The event type (for `io-enabled`: `passed` | `failed`; for `io-performance`: `io-performance:degraded` | `io-performance:severely-degraded` | `io-performance:stalled`).
- `event.not-after` - The latest end time for the event.
- `event.not-before` - The earliest start time for the event.
- `volume-status.details-name` - The cause for `volume-status.status` (`io-enabled` | `io-performance`).
- `volume-status.details-status` - The status of `volume-status.details-name` (for `io-enabled`: `passed` | `failed`; for `io-performance`: `normal` | `degraded` | `severely-degraded` | `stalled`).
- `volume-status.status` - The status of the volume (ok | `impaired` | `warning` | `insufficient-data`).

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

VolumeId.N

The IDs of the volumes.

Default: Describes all your volumes.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

volumeStatusSet

Information about the status of the volumes.

Type: Array of VolumeStatusItem objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes the status of all the volumes associated with your account.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeVolumeStatus
&AUTHPARAMS
```

Sample Response

```
<DescribeVolumeStatus xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">

</DescribeVolumesStatusResponse>
```

Example

This example describes all the volumes in the `us-east-1d` Availability Zone with `failed` `io-enabled` status.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeVolumeStatus
&Filter.1.Name=availability-zone
&Filter.1.Value.1=us-east-1d
&Filter.2.Name=volume-status.details-name
```

```
&Filter.2.Value.1=io-enabled
&Filter.3.Name=volume-status.details-status
&Filter.3.Value.1=failed
&AUTHPARAMS
```

DescribeVpcAttribute

Describes the specified attribute of the specified VPC. You can specify only one attribute at a time.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Attribute

The VPC attribute.

Type: String

Valid Values: `enableDnsSupport | enableDnsHostnames | enableNetworkAddressUsageMetrics`

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

VpcId

The ID of the VPC.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

enableDnsHostnames

Indicates whether the instances launched in the VPC get DNS hostnames. If this attribute is `true`, instances in the VPC get DNS hostnames; otherwise, they do not.

Type: AttributeBooleanValue object

enableDnsSupport

Indicates whether DNS resolution is enabled for the VPC. If this attribute is `true`, the Amazon DNS server resolves DNS hostnames for your instances to their corresponding IP addresses; otherwise, it does not.

Type: AttributeBooleanValue object

enableNetworkAddressUsageMetrics

Indicates whether Network Address Usage metrics are enabled for your VPC.

Type: AttributeBooleanValue object

requestId

The ID of the request.

Type: String

vpcId

The ID of the VPC.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example describes the `enableDnsSupport` attribute of the specified VPC. The sample response indicates that DNS resolution is supported.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeVpcAttribute
&VpcId=vpc-1a2b3c4d
&Attribute=enableDnsSupport
&AUTHPARAMS
```

Sample Response

```
<DescribeVpcAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
  <vpcId>vpc-1a2b3c4d</vpcId>
  <enableDnsSupport>
    <value>true</value>
  </enableDnsSupport>
</DescribeVpcAttributeResponse>
```

Example 2

This request describes the `enableDnsHostnames` attribute of the specified VPC. The sample response indicates that DNS hostnames are supported.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeVpcAttribute
&VpcId=vpc-1a2b3c4d
&Attribute=enableDnsHostnames
&AUTHPARAMS
```

Sample Response

```
<DescribeVpcAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
  <vpcId>vpc-1a2b3c4d</vpcId>
   <enableDnsHostnames>
    <value>true</value>
   </enableDnsHostnames>
</DescribeVpcAttributeResponse>
```

- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeVpcBlockPublicAccessExclusions

Describe VPC Block Public Access (BPA) exclusions. A VPC BPA exclusion is a mode that can be applied to a single VPC or subnet that exempts it from the account's BPA mode and will allow bidirectional or egress-only access. You can create BPA exclusions for VPCs and subnets even when BPA is not enabled on the account to ensure that there is no traffic disruption to the exclusions when VPC BPA is turned on. To learn more about VPC BPA, see Block public access to VPCs and subnets in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ExclusionId.N

IDs of exclusions.

Type: Array of strings

Required: No

Filter.N

Filters for the request:

- `resource-arn` - The Amazon Resource Name (ARN) of a exclusion.
- `internet-gateway-exclusion-mode` - The mode of a VPC BPA exclusion. Possible values: `allow-bidirectional | allow-egress`.
- `state` - The state of VPC BPA. Possible values: `create-in-progress | create-complete | update-in-progress | update-complete | delete-in-progress | deleted-complete | disable-in-progress | disable-complete`

- `tag` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.
- `tag-value`: The value of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific value, regardless of the tag key.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

vpcBlockPublicAccessExclusionSet

Details related to the exclusions.

Type: Array of VpcBlockPublicAccessExclusion objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++

- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeVpcBlockPublicAccessOptions

Describe VPC Block Public Access (BPA) options. VPC Block Public Access (BPA) enables you to block resources in VPCs and subnets that you own in a Region from reaching or being reached from the internet through internet gateways and egress-only internet gateways. To learn more about VPC BPA, see Block public access to VPCs and subnets in the *Amazon VPC User Guide*.

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

vpcBlockPublicAccessOptions

Details related to the options.

Type: VpcBlockPublicAccessOptions object

Errors

For information about the errors that are common to all actions, see Common client error codes.

DescribeVpcClassicLink

> **Note**
>
> This action is deprecated.

Describes the ClassicLink status of the specified VPCs.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `is-classic-link-enabled` - Whether the VPC is enabled for ClassicLink (`true` | `false`).
- `tag` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.

Type: Array of Filter objects

Required: No

VpcId.N

The VPCs for which you want to describe the ClassicLink status.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

vpcSet

The ClassicLink status of the VPCs.

Type: Array of VpcClassicLink objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for JavaScript V3

- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeVpcClassicLinkDnsSupport

> **Note**
>
> This action is deprecated.

Describes the ClassicLink DNS support status of one or more VPCs. If enabled, the DNS hostname of a linked EC2-Classic instance resolves to its private IP address when addressed from an instance in the VPC to which it's linked. Similarly, the DNS hostname of an instance in a VPC resolves to its private IP address when addressed from a linked EC2-Classic instance.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 255.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1024.

Required: No

VpcIds.N

The IDs of the VPCs.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1024.

requestId

The ID of the request.

Type: String

vpcs

Information about the ClassicLink DNS support status of the VPCs.

Type: Array of ClassicLinkDnsSupport objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeVpcEncryptionControls

Describes one or more VPC Encryption Control configurations. VPC Encryption Control enables you to enforce encryption for all data in transit within and between VPCs to meet compliance requirements You can filter the results to return information about specific encryption controls or VPCs.

For more information, see Enforce VPC encryption in transit in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters to apply to the request.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

VpcEncryptionControlId.N

The IDs of the VPC Encryption Control configurations to describe.

Type: Array of strings

Required: No

VpcId.N

The IDs of the VPCs to describe encryption control configurations for.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

vpcEncryptionControlSet

Information about the VPC Encryption Control configurations.

Type: Array of VpcEncryptionControl objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeVpcEndpointAssociations

Describes the VPC resources, VPC endpoint services, Amazon Lattice services, or service networks associated with the VPC endpoint.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `vpc-endpoint-id` - The ID of the VPC endpoint.
- `associated-resource-accessibility` - The association state. When the state is `accessible`, it returns `AVAILABLE`. When the state is `inaccessible`, it returns `PENDING` or `FAILED`.
- `association-id` - The ID of the VPC endpoint association.
- `associated-resource-id` - The ID of the associated resource configuration.
- `service-network-arn` - The Amazon Resource Name (ARN) of the associated service network. Only VPC endpoints of type service network will be returned.
- `resource-configuration-group-arn` - The Amazon Resource Name (ARN) of the resource configuration of type GROUP.

Type: Array of Filter objects

Required: No

MaxResults

The maximum page size.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 100.

Required: No

NextToken

The pagination token.

Type: String

Required: No

VpcEndpointId.N

The IDs of the VPC endpoints.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The pagination token.

Type: String

requestId

The ID of the request.

Type: String

vpcEndpointAssociationSet

Details of the endpoint associations.

Type: Array of VpcEndpointAssociation objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DescribeVpcEndpointConnectionNotifications

Describes the connection notifications for VPC endpoints and VPC endpoint services.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ConnectionNotificationId

The ID of the notification.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `connection-notification-arn` - The ARN of the SNS topic for the notification.
- `connection-notification-id` - The ID of the notification.
- `connection-notification-state` - The state of the notification (`Enabled` | `Disabled`).
- `connection-notification-type` - The type of notification (`Topic`).
- `service-id` - The ID of the endpoint service.
- `vpc-endpoint-id` - The ID of the VPC endpoint.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return in a single call. To retrieve the remaining results, make another request with the returned `NextToken` value.

Type: Integer

Required: No

NextToken

The token to request the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

connectionNotificationSet

The notifications.

Type: Array of ConnectionNotification objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes all of your connection notifications.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeVpcEndpointConnectionNotifications
&AUTHPARAMS
```

Sample Response

```
<DescribeVpcEndpointConnectionNotificationsResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>48541e40-9b6f-488e-8da7-a52a7example</requestId>
    <connectionNotificationSet>
        <item>
            <connectionNotificationArn>arn:aws:sns:us-
east-1:123456789012:EndpointNotification</connectionNotificationArn>
            <connectionEvents>
                <item>Accept</item>
                <item>Connect</item>
                <item>Delete</item>
                <item>Reject</item>
            </connectionEvents>
            <connectionNotificationType>Topic</connectionNotificationType>
            <connectionNotificationState>Enabled</connectionNotificationState>
            <connectionNotificationId>vpce-nfn-123cb952bc8af7123</
connectionNotificationId>
            <vpcEndpointId>vpce-1234151a02f327123</vpcEndpointId>
        </item>
    </connectionNotificationSet>
</DescribeVpcEndpointConnectionNotificationsResponse>
```

See Also

DescribeVpcEndpointConnections

Describes the VPC endpoint connections to your VPC endpoint services, including any endpoints that are pending your acceptance.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `ip-address-type` - The IP address type (`ipv4` | `ipv6`).
- `service-id` - The ID of the service.
- `vpc-endpoint-owner` - The ID of the AWS account ID that owns the endpoint.
- `vpc-endpoint-region` - The Region of the endpoint or `cross-region` to find endpoints for other Regions.
- `vpc-endpoint-state` - The state of the endpoint (`pendingAcceptance` | `pending` | `available` | `deleting` | `deleted` | `rejected` | `failed`).
- `vpc-endpoint-id` - The ID of the endpoint.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return for the request in a single page. The remaining results of the initial request can be seen by sending another request with the returned

`NextToken` value. This value can be between 5 and 1,000; if `MaxResults` is given a value larger than 1,000, only 1,000 results are returned.

Type: Integer

Required: No

NextToken

The token to retrieve the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

vpcEndpointConnectionSet

Information about the VPC endpoint connections.

Type: Array of VpcEndpointConnection objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes all of the VPC endpoint connections for all of your services.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeVpcEndpointConnections
&AUTHPARAMS
```

Sample Response

```
<DescribeVpcEndpointConnectionsResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>ed2d237f-426b-4927-981b-980example</requestId>
    <vpcEndpointConnectionSet>
        <item>
            <vpcEndpointOwner>123456789012</vpcEndpointOwner>
            <creationTimestamp>2017-10-19T12:36:10.939Z</creationTimestamp>
            <vpcEndpointState>available</vpcEndpointState>
            <serviceId>vpce-svc-0127881c0d25a3123</serviceId>

- AWS SDK for Ruby V3

DescribeVpcEndpoints

Describes your VPC endpoints. The default is to describe all your VPC endpoints. Alternatively, you can specify specific VPC endpoint IDs or filter the results to include only the VPC endpoints that match specific criteria.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `ip-address-type` - The IP address type (`ipv4` | `ipv6`).
- `service-name` - The name of the service.
- `service-region` - The Region of the service.
- `tag`:<key> - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.
- `vpc-id` - The ID of the VPC in which the endpoint resides.
- `vpc-endpoint-id` - The ID of the endpoint.
- `vpc-endpoint-state` - The state of the endpoint (`pendingAcceptance` | `pending` | `available` | `deleting` | `deleted` | `rejected` | `failed`).

- `vpc-endpoint-type` - The type of VPC endpoint (`Interface` | `Gateway` | `GatewayLoadBalancer` | `Resource` | `ServiceNetwork`).

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. The request returns a token that you can specify in a subsequent call to get the next set of results.

Constraint: If the value is greater than 1,000, we return only 1,000 items.

Type: Integer

Required: No

NextToken

The token for the next set of items to return. (You received this token from a prior call.)

Type: String

Required: No

VpcEndpointId.N

The IDs of the VPC endpoints.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use when requesting the next set of items. If there are no additional items to return, the string is empty.

Type: String

requestId

The ID of the request.

Type: String

vpcEndpointSet

Information about the VPC endpoints.

Type: Array of VpcEndpoint objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes all of your endpoints.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeVpcEndpoints
&AUTHPARAMS
```

Sample Response

```
<DescribeVpcEndpointsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">

DescribeVpcEndpointServiceConfigurations

Describes the VPC endpoint service configurations in your account (your services).

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `service-name` - The name of the service.
- `service-id` - The ID of the service.
- `service-state` - The state of the service (`Pending` | `Available` | `Deleting` | `Deleted` | `Failed`).
- `supported-ip-address-types` - The IP address type (`ipv4` | `ipv6`).
- `tag:<key>` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return for the request in a single page. The remaining results of the initial request can be seen by sending another request with the returned `NextToken` value. This value can be between 5 and 1,000; if `MaxResults` is given a value larger than 1,000, only 1,000 results are returned.

Type: Integer

Required: No

NextToken

The token to retrieve the next page of results.

Type: String

Required: No

ServiceId.N

The IDs of the endpoint services.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

serviceConfigurationSet

Information about the services.

Type: Array of ServiceConfiguration objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes all of your VPC endpoint service configurations.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeVpcEndpointServiceConfigurations
&AUTHPARAMS
```

Sample Response

```
<DescribeVpcEndpointServiceConfigurationsResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>d5bad480-0167-4a7f-a1c6-2651example</requestId>

DescribeVpcEndpointServicePermissions

Describes the principals (service consumers) that are permitted to discover your VPC endpoint service. Principal ARNs with path components aren't supported.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `principal` - The ARN of the principal.
- `principal-type` - The principal type (`All` | `Service` | `OrganizationUnit` | `Account` | `User` | `Role`).

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return for the request in a single page. The remaining results of the initial request can be seen by sending another request with the returned `NextToken` value. This value can be between 5 and 1,000; if `MaxResults` is given a value larger than 1,000, only 1,000 results are returned.

Type: Integer

Required: No

NextToken

The token to retrieve the next page of results.

Type: String

Required: No

ServiceId

The ID of the service.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

allowedPrincipals

Information about the allowed principals.

Type: Array of AllowedPrincipal objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes the permissions for service `vpce-svc-03d5ebb7d9579a123`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeVpcEndpointServicePermissions
&ServiceId=vpce-svc-03d5ebb7d9579a123
&AUTHPARAMS
```

Sample Response

```
<DescribeVpcEndpointServicePermissionsResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>5359c8a3-9151-4964-abed-b4422example</requestId>
    <allowedPrincipals>
        <item>
            <principal>arn:aws:iam::123456789012:root</principal>
            <principalType>Account</principalType>
        </item>
    </allowedPrincipals>
</DescribeVpcEndpointServicePermissionsResponse>
```

DescribeVpcEndpointServices

Describes available services to which you can create a VPC endpoint.

When the service provider and the consumer have different accounts in multiple Availability Zones, and the consumer views the VPC endpoint service information, the response only includes the common Availability Zones. For example, when the service provider account uses `us-east-1a` and `us-east-1c` and the consumer uses `us-east-1a` and `us-east-1b`, the response includes the VPC endpoint services in the common Availability Zone, `us-east-1a`.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `owner` - The ID or alias of the AWS account that owns the service.
- `service-name` - The name of the service.
- `service-region` - The Region of the service.
- `service-type` - The type of service (`Interface` | `Gateway` | `GatewayLoadBalancer`).
- `supported-ip-address-types` - The IP address type (`ipv4` | `ipv6`).
- `tag:<key>` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. The request returns a token that you can specify in a subsequent call to get the next set of results.

Constraint: If the value is greater than 1,000, we return only 1,000 items.

Type: Integer

Required: No

NextToken

The token for the next set of items to return. (You received this token from a prior call.)

Type: String

Required: No

ServiceName.N

The service names.

Type: Array of strings

Required: No

ServiceRegion.N

The service Regions.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use when requesting the next set of items. If there are no additional items to return, the string is empty.

Type: String

requestId

The ID of the request.

Type: String

serviceDetailSet

Information about the service.

Type: Array of ServiceDetail objects

serviceNameSet

The supported services.

Type: Array of strings

Errors

For information about the errors that are common to all actions, see Common client error codes.

DescribeVpcPeeringConnections

Describes your VPC peering connections. The default is to describe all your VPC peering connections. Alternatively, you can specify specific VPC peering connection IDs or filter the results to include only the VPC peering connections that match specific criteria.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `accepter-vpc-info.cidr-block` - The IPv4 CIDR block of the accepter VPC.
- `accepter-vpc-info.owner-id` - The ID of the AWS account that owns the accepter VPC.
- `accepter-vpc-info.vpc-id` - The ID of the accepter VPC.
- `expiration-time` - The expiration date and time for the VPC peering connection.
- `requester-vpc-info.cidr-block` - The IPv4 CIDR block of the requester's VPC.
- `requester-vpc-info.owner-id` - The ID of the AWS account that owns the requester VPC.
- `requester-vpc-info.vpc-id` - The ID of the requester VPC.
- `status-code` - The status of the VPC peering connection (`pending-acceptance` | `failed` | `expired` | `provisioning` | `active` | `deleting` | `deleted` | `rejected`).
- `status-message` - A message that provides more information about the status of the VPC peering connection, if applicable.
- `tag` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have

a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.

- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.
- `vpc-peering-connection-id` - The ID of the VPC peering connection.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

VpcPeeringConnectionId.N

The IDs of the VPC peering connections.

Default: Describes all your VPC peering connections.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

vpcPeeringConnectionSet

Information about the VPC peering connections.

Type: Array of VpcPeeringConnection objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example describes all of your VPC peering connections.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeVpcPeeringConnections
&AUTHPARAMS
```

Sample Response

```
<DescribeVpcPeeringConnectionsResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
<requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
 <vpcPeeringConnectionSet>
 <item>
  <vpcPeeringConnectionId>pcx-111aaa22</vpcPeeringConnectionId>
```

```
    <requesterVpcInfo>
     <ownerId>777788889999</ownerId>
     <vpcId>vpc-1a2b3c4d</vpcId>
     <cidrBlock>172.31.0.0/16</cidrBlock>
    </requesterVpcInfo>
    <accepterVpcInfo>
     <ownerId>123456789012</ownerId>
     <vpcId>vpc-aa22cc33</vpcId>
     <cidrBlock>10.0.0.0/16</cidrBlock>
     <peeringOptions>
        <allowEgressFromLocalClassicLinkToRemoteVpc>false</
allowEgressFromLocalClassicLinkToRemoteVpc>
        <allowEgressFromLocalVpcToRemoteClassicLink>true</
allowEgressFromLocalVpcToRemoteClassicLink>
        <allowDnsResolutionFromRemoteVpc>false</allowDnsResolutionFromRemoteVpc>
     </peeringOptions>
    </accepterVpcInfo>
     <status>
      <code>active</code>
      <message>Active</message>
     </status>
     <tagSet/>
     </item>
   </vpcPeeringConnectionSet>
</DescribeVpcPeeringConnectionsResponse>
```

Example 2

This example describes all of your VPC peering connections that are in the `pending-acceptance` state.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeVpcPeeringConnections
&Filter.1.Name=status-code
&Filter.1.Value=pending-acceptance
&AUTHPARAMS
```

Example 3

This example describes all of your VPC peering connections that have the tag `Name=Finance` or `Name=Accounts`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeVpcPeeringConnections
&Filter.1.Name=tag:Name
&Filter.1.Value.1=Finance
&Filter.1.Value.2=Accounts
&AUTHPARAMS
```

Example 4

This example describes all of the VPC peering connections for your specified VPC, `vpc-1a2b3c4d`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeVpcPeeringConnections
&Filter.1.Name=requester-vpc-info.vpc-id
&Filter.1.Value=vpc-1a2b3c4d
&AUTHPARAMS
```

DescribeVpcs

Describes your VPCs. The default is to describe all your VPCs. Alternatively, you can specify specific VPC IDs or filter the results to include only the VPCs that match specific criteria.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

The filters.

- `cidr` - The primary IPv4 CIDR block of the VPC. The CIDR block you specify must exactly match the VPC's CIDR block for information to be returned for the VPC. Must contain the slash followed by one or two digits (for example, `/28`).
- `cidr-block-association.cidr-block` - An IPv4 CIDR block associated with the VPC.
- `cidr-block-association.association-id` - The association ID for an IPv4 CIDR block associated with the VPC.
- `cidr-block-association.state` - The state of an IPv4 CIDR block associated with the VPC.
- `dhcp-options-id` - The ID of a set of DHCP options.
- `ipv6-cidr-block-association.ipv6-cidr-block` - An IPv6 CIDR block associated with the VPC.
- `ipv6-cidr-block-association.ipv6-pool` - The ID of the IPv6 address pool from which the IPv6 CIDR block is allocated.
- `ipv6-cidr-block-association.association-id` - The association ID for an IPv6 CIDR block associated with the VPC.

- `ipv6-cidr-block-association.state` - The state of an IPv6 CIDR block associated with the VPC.
- `is-default` - Indicates whether the VPC is the default VPC.
- `owner-id` - The ID of the AWS account that owns the VPC.
- `state` - The state of the VPC (`pending` | `available`).
- `tag` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.
- `vpc-id` - The ID of the VPC.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

VpcId.N

The IDs of the VPCs.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

vpcSet

Information about the VPCs.

Type: Array of Vpc objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example describes the specified VPC.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeVpcs
&VpcId.1=vpc-081ec835f3EXAMPLE
&vpcId.2=vpc-0ee975135dEXAMPLE
&VpcId.3=vpc-06e4ab6c6cEXAMPLE
&AUTHPARAMS
```

Sample Response

```

</DescribeVpcsResponse>
```

Example 2

This example uses filters to describe any VPC you own that uses the set of DHCP options with the ID `dopt-7a8b9c2d` or `dopt-2b2a3d3c` and whose state is `available`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeVpcs
&Filter.1.Name=dhcp-options-id
&Filter.1.Value.1=dopt-7a8b9c2d
&Filter.1.Value.2=dopt-2b2a3d3c
&Filter.2.Name=state
&Filter.2.Value.1=available
```

```
&AUTHPARAMS
```

DescribeVpnConcentrators

Describes one or more of your VPN concentrators.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters to limit the results.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 200. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

VpnConcentratorId.N

One or more VPN concentrator IDs.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

vpnConcentratorSet

Information about the VPN concentrators.

Type: Array of VpnConcentrator objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example describes all VPN Concentrators.

Sample Request

```
https://ec2.us-east-1.amazonaws.com/?Version=2016-11-15&Action=DescribeVpnConcentrators
```

Sample Response

```
<DescribeVpnConcentratorsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>e1d4832f-cef7-4809-b9d4-3e54e50aff7a</requestId>
    <vpnConcentratorSet>
        <item>
            <state>available</state>
            <tagSet />
            <transitGatewayAttachmentId>tgw-attach-04a445da95a6814cc</
transitGatewayAttachmentId>
            <transitGatewayId>tgw-0eae06e326d7c27d8</transitGatewayId>
            <type>ipsec.1</type>
            <vpnConcentratorId>vcn-0767cb7521c5c4945</vpnConcentratorId>
        </item>
    </vpnConcentratorSet>
</DescribeVpnConcentratorsResponse>
```

DescribeVpnConnections

Describes one or more of your VPN connections.

For more information, see AWS Site-to-Site VPN in the *AWS Site-to-Site VPN User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `customer-gateway-configuration` - The configuration information for the customer gateway.
- `customer-gateway-id` - The ID of a customer gateway associated with the VPN connection.
- `state` - The state of the VPN connection (`pending` | `available` | `deleting` | `deleted`).
- `option.static-routes-only` - Indicates whether the connection has static routes only. Used for devices that do not support Border Gateway Protocol (BGP).
- `route.destination-cidr-block` - The destination CIDR block. This corresponds to the subnet used in a customer data center.
- `bgp-asn` - The BGP Autonomous System Number (ASN) associated with a BGP device.
- `tag`:<key> - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.

- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.
- `type` - The type of VPN connection. Currently the only supported type is `ipsec.1`.
- `vpn-connection-id` - The ID of the VPN connection.
- `vpn-gateway-id` - The ID of a virtual private gateway associated with the VPN connection.
- `transit-gateway-id` - The ID of a transit gateway associated with the VPN connection.

Type: Array of Filter objects

Required: No

VpnConnectionId.N

One or more VPN connection IDs.

Default: Describes your VPN connections.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

vpnConnectionSet

Information about one or more VPN connections.

Type: Array of VpnConnection objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example describes the specified VPN connection. The response includes the customer gateway device configuration information. Because it's a long set of information, we haven't displayed it here. To see an example of the configuration information, see the Your customer gateway device.

Sample Request

```

</DescribeVpnConnectionsResponse>
```

Example 2

This example describes any VPN connection you own that is associated with the customer gateway with ID cgw-b4dc3961, and whose state is either `pending` or `available`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeVpnConnections
&Filter.1.Name=customer-gateway-id
&Filter.1.Value.1=cgw-b4dc3961
&Filter.2.Name=state
&Filter.2.Value.1=pending
&Filter.2.Value.2=available
&AUTHPARAMS
```

DescribeVpnGateways

Describes one or more of your virtual private gateways.

For more information, see AWS Site-to-Site VPN in the *AWS Site-to-Site VPN User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `amazon-side-asn` - The Autonomous System Number (ASN) for the Amazon side of the gateway.
- `attachment.state` - The current state of the attachment between the gateway and the VPC (`attaching` | `attached` | `detaching` | `detached`).
- `attachment.vpc-id` - The ID of an attached VPC.
- `availability-zone` - The Availability Zone for the virtual private gateway (if applicable).
- `state` - The state of the virtual private gateway (`pending` | `available` | `deleting` | `deleted`).
- `tag`:<key> - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.

- `type` - The type of virtual private gateway. Currently the only supported type is `ipsec.1`.
- `vpn-gateway-id` - The ID of the virtual private gateway.

Type: Array of Filter objects

Required: No

VpnGatewayId.N

One or more virtual private gateway IDs.

Default: Describes all your virtual private gateways.

Type: Array of strings

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

vpnGatewaySet

Information about one or more virtual private gateways.

Type: Array of VpnGateway objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example describes the specified virtual private gateway.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeVpnGateways
&VpnGatewayId.1=vgw-8db04f81
&AUTHPARAMS
```

Sample Response

```
<DescribeVpnGatewaysResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
  <vpnGatewaySet>
        <item>
            <vpnGatewayId>vgw-8db04f81</vpnGatewayId>
            <state>available</state>
            <type>ipsec.1</type>
            <attachments>
                <item>
                    <vpcId>vpc-4c090c2a</vpcId>
                    <state>attached</state>
                </item>
            </attachments>
            <amazonSideAsn>65001</amazonSideAsn>
            <tagSet>
                <item>
                    <key>Name</key>
                    <value>NYOffice</value>
                </item>
            </tagSet>
        </item>
    </vpnGatewaySet>
</DescribeVpnGatewaysResponse>
```

Example 2

This example uses filters to describe any virtual private gateway you own whose state is either `pending` or `available`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DescribeVpnGateways
&Filter.1.Name=state
&Filter.1.Value.1=pending
```

```
&Filter.1.Value.2=available
&AUTHPARAMS
```

DetachClassicLinkVpc

> **Note**
>
> This action is deprecated.

Unlinks (detaches) a linked EC2-Classic instance from a VPC. After the instance has been unlinked, the VPC security groups are no longer associated with it. An instance is automatically unlinked from a VPC when it's stopped.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InstanceId

The ID of the instance to unlink from the VPC.

Type: String

Required: Yes

VpcId

The ID of the VPC to which the instance is linked.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DetachInternetGateway

Detaches an internet gateway from a VPC, disabling connectivity between the internet and the VPC. The VPC must not contain any running instances with Elastic IP addresses or public IPv4 addresses.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InternetGatewayId

The ID of the internet gateway.

Type: String

Required: Yes

VpcId

The ID of the VPC.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

The example detaches the specified internet gateway from the specified VPC.

Sample Request

```
https://ec2.amazonaws.com/?Action=DetachInternetGateway
&InternetGatewayId=igw-eaad4883
&VpcId=vpc-11ad4878
&AUTHPARAMS
```

Sample Response

```
<DetachInternetGatewayResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <return>true</return>
</DetachInternetGatewayResponse>
```

- AWS SDK for Ruby V3

DetachNetworkInterface

Detaches a network interface from an instance.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AttachmentId

The ID of the attachment.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Force

Specifies whether to force a detachment.

> **Note**
>
> - Use the `Force` parameter only as a last resort to detach a network interface from a failed instance.
> - If you use the `Force` parameter to detach a network interface, you might not be able to attach a different network interface to the same index on the instance without first stopping and starting the instance.
> - If you force the detachment of a network interface, the instance metadata might not get updated. This means that the attributes associated with the detached network

interface might still be visible. The instance metadata will get updated when you stop and start the instance.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example detaches the specified elastic network interface (ENI).

Sample Request

```
https://ec2.amazonaws.com/?Action=DetachNetworkInterface
&AttachmentId=eni-attach-d94b09b0
&AUTHPARAMS
```

Sample Response

```
<DetachNetworkInterfaceResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>ce540707-0635-46bc-97da-33a8a362a0e8</requestId>
    <return>true</return>
</DetachNetworkInterfaceResponse>
```

- AWS SDK for Ruby V3

DetachVerifiedAccessTrustProvider

Detaches the specified AWS Verified Access trust provider from the specified AWS Verified Access instance.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

A unique, case-sensitive token that you provide to ensure idempotency of your modification request. For more information, see Ensuring idempotency.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

VerifiedAccessInstanceId

The ID of the Verified Access instance.

Type: String

Required: Yes

VerifiedAccessTrustProviderId

The ID of the Verified Access trust provider.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

verifiedAccessInstance

Details about the Verified Access instance.

Type: VerifiedAccessInstance object

verifiedAccessTrustProvider

Details about the Verified Access trust provider.

Type: VerifiedAccessTrustProvider object

Errors

For information about the errors that are common to all actions, see Common client error codes.

DetachVolume

Detaches an EBS volume from an instance. Make sure to unmount any file systems on the device within your operating system before detaching the volume. Failure to do so can result in the volume becoming stuck in the `busy` state while detaching. If this happens, detachment can be delayed indefinitely until you unmount the volume, force detachment, reboot the instance, or all three. If an EBS volume is the root device of an instance, it can't be detached while the instance is running. To detach the root volume, stop the instance first.

When a volume with an AWS Marketplace product code is detached from an instance, the product code is no longer associated with the instance.

You can't detach or force detach volumes that are attached to AWS-managed resources. Attempting to do this results in the `UnsupportedOperationException` exception.

For more information, see Detach an Amazon EBS volume in the *Amazon EBS User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Device

The device name.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Force

Forces detachment if the previous detachment attempt did not occur cleanly (for example, logging into an instance, unmounting the volume, and detaching normally). This option can

lead to data loss or a corrupted file system. Use this option only as a last resort to detach a volume from a failed instance. The instance won't have an opportunity to flush file system caches or file system metadata. If you use this option, you must perform file system check and repair procedures.

Type: Boolean

Required: No

InstanceId

The ID of the instance. If you are detaching a Multi-Attach enabled volume, you must specify an instance ID.

Type: String

Required: No

VolumeId

The ID of the volume.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

associatedResource

The ARN of the AWS-managed resource to which the volume is attached.

Type: String

attachTime

The time stamp when the attachment initiated.

Type: Timestamp

deleteOnTermination

Indicates whether the EBS volume is deleted on instance termination.

Type: Boolean

device

The device name.

If the volume is attached to an AWS-managed resource, this parameter returns `null`.

Type: String

ebsCardIndex

The index of the EBS card. Some instance types support multiple EBS cards. The default EBS card index is 0.

Type: Integer

instanceId

The ID of the instance.

If the volume is attached to an AWS-managed resource, this parameter returns `null`.

Type: String

instanceOwningService

The service principal of the AWS service that owns the underlying resource to which the volume is attached.

This parameter is returned only for volumes that are attached to AWS-managed resources.

Type: String

requestId

The ID of the request.

Type: String

status

The attachment state of the volume.

Type: String

Valid Values: `attaching | attached | detaching | detached | busy`

volumeId

The ID of the volume.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example detaches volume `vol-1234567890abcdef0`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DetachVolume
&VolumeId=vol-1234567890abcdef0
&AUTHPARAMS
```

Sample Response

```
<DetachVolumeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <volumeId>vol-1234567890abcdef0</volumeId>
   <instanceId>i-1234567890abcdef0</instanceId>
   <device>/dev/sdh</device>
   <status>detaching</status>
   <attachTime>YYYY-MM-DDTHH:MM:SS.000Z</attachTime>
</DetachVolumeResponse>
```

DetachVpnGateway

Detaches a virtual private gateway from a VPC. You do this if you're planning to turn off the VPC and not use it anymore. You can confirm a virtual private gateway has been completely detached from a VPC by describing the virtual private gateway (any attachments to the virtual private gateway are also described).

You must wait for the attachment's state to switch to `detached` before you can delete the VPC or attach a different VPC to the virtual private gateway.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

VpcId

The ID of the VPC.

Type: String

Required: Yes

VpnGatewayId

The ID of the virtual private gateway.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example detaches the specified virtual private gateway from the specified VPC.

Sample Request

```
https://ec2.amazonaws.com/?Action=DetachVpnGateway
&VpnGatewayId=vgw-8db04f81
&VpcId=vpc-1a2b3c4d
&AUTHPARAMS
```

Sample Response

```
<DetachVpnGatewayResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
   <return>true</return>
</DetachVpnGatewayResponse>
```

DisableAddressTransfer

Disables Elastic IP address transfer. For more information, see Transfer Elastic IP addresses in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AllocationId

The allocation ID of an Elastic IP address.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

addressTransfer

An Elastic IP address transfer.

Type: AddressTransfer object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for Python
- AWS SDK for Ruby V3

DisableAllowedImagesSettings

Disables Allowed AMIs for your account in the specified AWS Region. When set to `disabled`, the image criteria in your Allowed AMIs settings do not apply, and no restrictions are placed on AMI discoverability or usage. Users in your account can launch instances using any public AMI or AMI shared with your account.

> **Note**
>
> The Allowed AMIs feature does not restrict the AMIs owned by your account. Regardless of the criteria you set, the AMIs created by your account will always be discoverable and usable by users in your account.

For more information, see Control the discovery and use of AMIs in Amazon EC2 with Allowed AMIs in *Amazon EC2 User Guide*.

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

allowedImagesSettingsState

Returns `disabled` if the request succeeds; otherwise, it returns an error.

Type: String

Valid Values: `disabled`

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DisableAwsNetworkPerformanceMetricSubscription

Disables Infrastructure Performance metric subscriptions.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Destination

The target Region or Availability Zone that the metric subscription is disabled for. For example, `eu-north-1`.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Metric

The metric used for the disabled subscription.

Type: String

Valid Values: `aggregate-latency`

Required: No

Source

The source Region or Availability Zone that the metric subscription is disabled for. For example, `us-east-1`.

Type: String

Required: No

Statistic

The statistic used for the disabled subscription.

Type: String

Valid Values: p50

Required: No

Response Elements

The following elements are returned by the service.

output

Indicates whether the unsubscribe action was successful.

Type: Boolean

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DisableCapacityManager

Disables EC2 Capacity Manager for your account. This stops data ingestion and removes access to capacity analytics and optimization recommendations. Previously collected data is retained but no new data will be processed.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

capacityManagerStatus

The current status of Capacity Manager after the disable operation.

Type: String

Valid Values: `enabled | disabled`

organizationsAccess

Indicates whether Organizations access is enabled. This will be `false` after disabling Capacity Manager.

Type: Boolean

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DisableEbsEncryptionByDefault

Disables EBS encryption by default for your account in the current Region.

After you disable encryption by default, you can still create encrypted volumes by enabling encryption when you create each volume.

Disabling encryption by default does not change the encryption status of your existing volumes.

For more information, see Amazon EBS encryption in the *Amazon EBS User Guide*.

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

ebsEncryptionByDefault

The updated status of encryption by default.

Type: Boolean

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

DisableFastLaunch

Discontinue Windows fast launch for a Windows AMI, and clean up existing pre-provisioned snapshots. After you disable Windows fast launch, the AMI uses the standard launch process for each new instance. Amazon EC2 must remove all pre-provisioned snapshots before you can enable Windows fast launch again.

> **Note**
>
> You can only change these settings for Windows AMIs that you own or that have been shared with you.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Force

Forces the image settings to turn off Windows fast launch for your Windows AMI. This parameter overrides any errors that are encountered while cleaning up resources in your account.

Type: Boolean

Required: No

ImageId

Specify the ID of the image for which to disable Windows fast launch.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

imageId

The ID of the image for which Windows fast launch was disabled.

Type: String

launchTemplate

The launch template that was used to launch Windows instances from pre-provisioned snapshots.

Type: FastLaunchLaunchTemplateSpecificationResponse object

maxParallelLaunches

The maximum number of instances that Amazon EC2 can launch at the same time to create pre-provisioned snapshots for Windows fast launch.

Type: Integer

ownerId

The owner of the Windows AMI for which Windows fast launch was disabled.

Type: String

requestId

The ID of the request.

Type: String

resourceType

The pre-provisioning resource type that must be cleaned after turning off Windows fast launch for the Windows AMI. Supported values include: `snapshot`.

Type: String

Valid Values: `snapshot`

snapshotConfiguration

Parameters that were used for Windows fast launch for the Windows AMI before Windows fast launch was disabled. This informs the clean-up process.

Type: FastLaunchSnapshotConfigurationResponse object

state

The current state of Windows fast launch for the specified Windows AMI.

Type: String

Valid Values: `enabling | enabling-failed | enabled | enabled-failed | disabling | disabling-failed`

stateTransitionReason

The reason that the state changed for Windows fast launch for the Windows AMI.

Type: String

stateTransitionTime

The time that the state changed for Windows fast launch for the Windows AMI.

Type: Timestamp

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DisableFastSnapshotRestores

Disables fast snapshot restores for the specified snapshots in the specified Availability Zones.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AvailabilityZone.N

One or more Availability Zones. For example, `us-east-2a`.

Either `AvailabilityZone` or `AvailabilityZoneId` must be specified in the request, but not both.

Type: Array of strings

Required: No

AvailabilityZoneId.N

One or more Availability Zone IDs. For example, `use2-az1`.

Either `AvailabilityZone` or `AvailabilityZoneId` must be specified in the request, but not both.

Type: Array of strings

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

SourceSnapshotId.N

The IDs of one or more snapshots. For example, `snap-1234567890abcdef0`.

Type: Array of strings

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

successful

Information about the snapshots for which fast snapshot restores were successfully disabled.

Type: Array of DisableFastSnapshotRestoreSuccessItem objects

unsuccessful

Information about the snapshots for which fast snapshot restores could not be disabled.

Type: Array of DisableFastSnapshotRestoreErrorItem objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DisableImage

Sets the AMI state to `disabled` and removes all launch permissions from the AMI. A disabled AMI can't be used for instance launches.

A disabled AMI can't be shared. If an AMI was public or previously shared, it is made private. If an AMI was shared with an AWS account, organization, or Organizational Unit, they lose access to the disabled AMI.

A disabled AMI does not appear in DescribeImages API calls by default.

Only the AMI owner can disable an AMI.

You can re-enable a disabled AMI using EnableImage.

For more information, see Disable an AMI in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ImageId

The ID of the AMI.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example disables the specified AMI.

Sample Request

```
https://ec2.amazonaws.com/?Action=DisableImage
&ImageId=ami-0123456789EXAMPLE
&AUTHPARAMS
```

Sample Response

```
<DisableImageResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>11aabb229-4eac-35bd-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</DisableImageResponse>
```

- AWS SDK for Python
- AWS SDK for Ruby V3

DisableImageBlockPublicAccess

Disables *block public access for AMIs* at the account level in the specified AWS Region. This removes the *block public access* restriction from your account. With the restriction removed, you can publicly share your AMIs in the specified AWS Region.

For more information, see Block public access to your AMIs in the *Amazon EC2 User Guide*.

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

imageBlockPublicAccessState

Returns `unblocked` if the request succeeds; otherwise, it returns an error.

Type: String

Valid Values: `unblocked`

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example disables *block public access for AMIs* at the account level in the specified Region to allow users in your account to publicly share your AMIs in the specified Region.

Sample Request

```
https://ec2.amazonaws.com/?Action=DisableImageBlockPublicAccess
&Region=us-east-1
&AUTHPARAMS
```

Sample Response

```
<DisableImageBlockPublicAccessResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
  <requestId>11aabb229-4eac-35bd-99ed-be587EXAMPLE</requestId>
  <return>unblocked</return>
</DisableImageBlockPublicAccessResponse>
```

- AWS SDK for Ruby V3

DisableImageDeprecation

Cancels the deprecation of the specified AMI.

For more information, see Deprecate an Amazon EC2 AMI in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ImageId

The ID of the AMI.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example cancels the planned deprecation of the specified AMI.

Sample Request

```
https://ec2.amazonaws.com/?Action=DisableImageDeprecation
&ImageId=ami-0123456789EXAMPLE
&AUTHPARAMS
```

Sample Response

```
<DisableImageDeprecationResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>11aabb229-4eac-35bd-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</DisableImageDeprecationResponse>
```

DisableImageDeregistrationProtection

Disables deregistration protection for an AMI. When deregistration protection is disabled, the AMI can be deregistered.

If you chose to include a 24-hour cooldown period when you enabled deregistration protection for the AMI, then, when you disable deregistration protection, you won't immediately be able to deregister the AMI.

For more information, see Protect an Amazon EC2 AMI from deregistration in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ImageId

The ID of the AMI.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DisableInstanceSqlHaStandbyDetections

Disable Amazon EC2 instances running in an SQL Server High Availability cluster from SQL Server High Availability instance standby detection monitoring. Once disabled, AWS no longer monitors the metadata for the instances to determine whether they are active or standby nodes in the SQL Server High Availability cluster.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InstanceId.N

The IDs of the instances to disable from SQL Server High Availability standby detection monitoring.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 30 items.

Required: Yes

Response Elements

The following elements are returned by the service.

instanceSet

Information about the instances that were disabled from SQL Server High Availability standby detection monitoring.

Type: Array of RegisteredInstance objects

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DisableIpamOrganizationAdminAccount

Disable the IPAM account. For more information, see Enable integration with AWS Organizations in the *Amazon VPC IPAM User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DelegatedAdminAccountId

The AWS Organizations member account ID that you want to disable as IPAM account.

Type: String

Required: Yes

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

success

The result of disabling the IPAM account.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DisableIpamPolicy

Disables an IPAM policy.

An IPAM policy is a set of rules that define how public IPv4 addresses from IPAM pools are allocated to AWS resources. Each rule maps an AWS service to IPAM pools that the service will use to get IP addresses. A single policy can have multiple rules and be applied to multiple AWS Regions. If the IPAM pool run out of addresses then the services fallback to Amazon-provided IP addresses. A policy can be applied to an individual AWS account or an entity within AWS Organizations.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

IpamPolicyId

The ID of the IPAM policy to disable.

Type: String

Required: Yes

OrganizationTargetId

The ID of the AWS Organizations target for which to disable the IPAM policy. This parameter is required only when IPAM is integrated with AWS Organizations. When IPAM is not integrated with AWS Organizations, omit this parameter and the policy will be disabled for the current account.

A target can be an individual AWS account or an entity within an AWS Organization to which an IPAM policy can be applied.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Returns true if the IPAM policy was successfully disabled.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python

- AWS SDK for Ruby V3

DisableRouteServerPropagation

Disables route propagation from a route server to a specified route table.

When enabled, route server propagation installs the routes in the FIB on the route table you've specified. Route server supports IPv4 and IPv6 route propagation.

Amazon VPC Route Server simplifies routing for traffic between workloads that are deployed within a VPC and its internet gateways. With this feature, VPC Route Server dynamically updates VPC and internet gateway route tables with your preferred IPv4 or IPv6 routes to achieve routing fault tolerance for those workloads. This enables you to automatically reroute traffic within a VPC, which increases the manageability of VPC routing and interoperability with third-party workloads.

Route server supports the follow route table types:

- VPC route tables not associated with subnets
- Subnet route tables
- Internet gateway route tables

Route server does not support route tables associated with virtual private gateways. To propagate routes into a transit gateway route table, use Transit Gateway Connect.

For more information see Dynamic routing in your VPC with VPC Route Server in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

RouteServerId

The ID of the route server for which to disable propagation.

Type: String

Required: Yes

RouteTableId

The ID of the route table for which to disable route server propagation.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

routeServerPropagation

Information about the disabled route server propagation.

Type: RouteServerPropagation object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2

- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DisableSerialConsoleAccess

Disables access to the EC2 serial console of all instances for your account. By default, access to the EC2 serial console is disabled for your account. For more information, see Manage account access to the EC2 serial console in the *Amazon EC2 User Guide*.

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

serialConsoleAccessEnabled

If `true`, access to the EC2 serial console of all instances is enabled for your account. If `false`, access to the EC2 serial console of all instances is disabled for your account.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DisableSnapshotBlockPublicAccess

Disables the *block public access for snapshots* setting at the account level for the specified AWS Region. After you disable block public access for snapshots in a Region, users can publicly share snapshots in that Region.

Important

Enabling block public access for snapshots in *block-all-sharing* mode does not change the permissions for snapshots that are already publicly shared. Instead, it prevents these snapshots from be publicly visible and publicly accessible. Therefore, the attributes for these snapshots still indicate that they are publicly shared, even though they are not publicly available.
If you disable block public access , these snapshots will become publicly available again.

For more information, see Block public access for snapshots in the *Amazon EBS User Guide* .

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

state

Returns `unblocked` if the request succeeds.

Type: String

Valid Values: `block-all-sharing | block-new-sharing | unblocked`

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DisableTransitGatewayRouteTablePropagation

Disables the specified resource attachment from propagating routes to the specified propagation route table.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TransitGatewayAttachmentId

The ID of the attachment.

Type: String

Required: No

TransitGatewayRouteTableAnnouncementId

The ID of the route table announcement.

Type: String

Required: No

TransitGatewayRouteTableId

The ID of the propagation route table.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

propagation

Information about route propagation.

Type: TransitGatewayPropagation object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for Python
- AWS SDK for Ruby V3

DisableVgwRoutePropagation

Disables a virtual private gateway (VGW) from propagating routes to a specified route table of a VPC.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

GatewayId

The ID of the virtual private gateway.

Type: String

Required: Yes

RouteTableId

The ID of the route table.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example disables the virtual private gateway `vgw-d8e09e8a` from automatically propagating routes to the route table with ID `rtb-c98a35a0`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DisableVgwRoutePropagationResponse
&RouteTableId=rtb-c98a35a0
&GatewayId=vgw-d8e09e8a
&AUTHPARAMS
```

Sample Response

```
<DisableVgwRoutePropagationResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>4f35a1b2-c2c3-4093-b51f-abb9d7311990</requestId>
    <return>true</return>
</DisableVgwRoutePropagationResponse>
```

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DisableVpcClassicLink

> **Note**
>
> This action is deprecated.

Disables ClassicLink for a VPC. You cannot disable ClassicLink for a VPC that has EC2-Classic instances linked to it.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

VpcId

The ID of the VPC.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DisableVpcClassicLinkDnsSupport

> **Note**
>
> This action is deprecated.

Disables ClassicLink DNS support for a VPC. If disabled, DNS hostnames resolve to public IP addresses when addressed between a linked EC2-Classic instance and instances in the VPC to which it's linked.

You must specify a VPC ID in the request.

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

VpcId

The ID of the VPC.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example disables ClassicLink DNS support for vpc-8888888.

Sample Request

```
https://ec2.amazonaws.com/?Action=DisableVpcClassicLinkDnsSupport
&VpcId=vpc-8888888
&AUTHPARAMS
```

Sample Response

```
<DisableVpcClassicLinkDnsSupportResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</DisableVpcClassicLinkDnsSupportResponse>
```

DisassociateAddress

Disassociates an Elastic IP address from the instance or network interface it's associated with.

This is an idempotent operation. If you perform the operation more than once, Amazon EC2 doesn't return an error.

An address cannot be disassociated if the all of the following conditions are met:

- Network interface has a `publicDualStackDnsName` publicDnsName
- Public IPv4 address is the primary public IPv4 address
- Network interface only has one remaining public IPv4 address

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AssociationId

The association ID. This parameter is required.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

PublicIp

Deprecated.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example disassociates the specified Elastic IP address from the instance to which it is associated.

Sample Request

```
https://ec2.amazonaws.com/?Action=DisassociateAddress
&AssociationId=eipassoc-aa7486c3
&AUTHPARAMS
```

DisassociateCapacityReservationBillingOwner

Cancels a pending request to assign billing of the unused capacity of a Capacity Reservation to a consumer account, or revokes a request that has already been accepted. For more information, see Billing assignment for shared Amazon EC2 Capacity Reservations.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CapacityReservationId

The ID of the Capacity Reservation.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

UnusedReservationBillingOwnerId

The ID of the consumer account to which the request was sent.

Type: String

Length Constraints: Fixed length of 12.

Pattern: `[0-9]{12}`

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

DisassociateClientVpnTargetNetwork

Disassociates a target network from the specified Client VPN endpoint. When you disassociate the last target network from a Client VPN, the following happens:

- The route that was automatically added for the VPC is deleted
- All active client connections are terminated
- New client connections are disallowed
- The Client VPN endpoint's status changes to `pending-associate`

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AssociationId

The ID of the target network association.

Type: String

Required: Yes

ClientVpnEndpointId

The ID of the Client VPN endpoint from which to disassociate the target network.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

associationId

The ID of the target network association.

Type: String

requestId

The ID of the request.

Type: String

status

The current state of the target network association.

Type: AssociationStatus object

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example disassociates a target network from a Client VPN endpoint.

Sample Request

```
https://ec2.amazonaws.com/?Action=DisassociateClientVpnTargetNetwork
&ClientVpnEndpointId=cvpn-endpoint-00c5d11fc4EXAMPLE
&AssociationId=cvpn-assoc-0bc4bd8cecEXAMPLE
&AUTHPARAMS
```

Sample Response

```
<DisassociateClientVpnTargetNetworkResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
```

```
    <requestId>61312648-93ec-4a86-a1d1-098c9EXAMPLE</requestId>
    <status>
        <code>disassociating</code>
    </status>
    <associationId>cvpn-assoc-0bc4bd8cecEXAMPLE</associationId>
</DisassociateClientVpnTargetNetworkResponse>
```

DisassociateEnclaveCertificateIamRole

Disassociates an IAM role from an AWS Certificate Manager (ACM) certificate. Disassociating an IAM role from an ACM certificate removes the Amazon S3 object that contains the certificate, certificate chain, and encrypted private key from the Amazon S3 bucket. It also revokes the IAM role's permission to use the KMS key used to encrypt the private key. This effectively revokes the role's permission to use the certificate.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CertificateArn

The ARN of the ACM certificate from which to disassociate the IAM role.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

RoleArn

The ARN of the IAM role to disassociate.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

DisassociateIamInstanceProfile

Disassociates an IAM instance profile from a running or stopped instance.

Use DescribeIamInstanceProfileAssociations to get the association ID.

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AssociationId

The ID of the IAM instance profile association.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

iamInstanceProfileAssociation

Information about the IAM instance profile association.

Type: IamInstanceProfileAssociation object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example disassociates the specified IAM instance profile association.

Sample Request

```
https://ec2.amazonaws.com/?Action=DisassociateIamInstanceProfile
&AssociationId=iip-assoc-08049da59357d598c
&AUTHPARAMS
```

Sample Response

```
<DisassociateIamInstanceProfileResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>4840f938-fc84-4791-8ae5-example</requestId>
    <iamInstanceProfileAssociation>
        <associationId>iip-assoc-08049da59357d598c</associationId>
        <iamInstanceProfile>
            <arn>arn:aws:iam::123456789012:instance-profile/AdminProfile</arn>
            <id>AIPAI5IVIHMFFYY2DKV5Y</id>
        </iamInstanceProfile>
        <instanceId>i-1234567890abcdef0</instanceId>
        <state>disassociating</state>
    </iamInstanceProfileAssociation>
</DisassociateIamInstanceProfileResponse>
```

DisassociateInstanceEventWindow

Disassociates one or more targets from an event window.

For more information, see Define event windows for scheduled events in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AssociationTarget

One or more targets to disassociate from the specified event window.

Type: InstanceEventWindowDisassociationRequest object

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InstanceEventWindowId

The ID of the event window.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

instanceEventWindow

Information about the event window.

Type: InstanceEventWindow object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

DisassociateIpamByoasn

Remove the association between your Autonomous System Number (ASN) and your BYOIP CIDR. You may want to use this action to disassociate an ASN from a CIDR or if you want to swap ASNs. For more information, see Tutorial: Bring your ASN to IPAM in the *Amazon VPC IPAM guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Asn

A public 2-byte or 4-byte ASN.

Type: String

Required: Yes

Cidr

A BYOIP CIDR.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

asnAssociation

An ASN and BYOIP CIDR association.

Type: AsnAssociation object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

DisassociateIpamResourceDiscovery

Disassociates a resource discovery from an Amazon VPC IPAM. A resource discovery is an IPAM component that enables IPAM to manage and monitor resources that belong to the owning account.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

IpamResourceDiscoveryAssociationId

A resource discovery association ID.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

ipamResourceDiscoveryAssociation

A resource discovery association.

Type: IpamResourceDiscoveryAssociation object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for Ruby V3

DisassociateNatGatewayAddress

Disassociates secondary Elastic IP addresses (EIPs) from a public NAT gateway. You cannot disassociate your primary EIP. For more information, see Edit secondary IP address associations in the *Amazon VPC User Guide*.

While disassociating is in progress, you cannot associate/disassociate additional EIPs while the connections are being drained. You are, however, allowed to delete the NAT gateway.

An EIP is released only at the end of MaxDrainDurationSeconds. It stays associated and supports the existing connections but does not support any new connections (new connections are distributed across the remaining associated EIPs). As the existing connections drain out, the EIPs (and the corresponding private IP addresses mapped to them) are released.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AssociationId.N

The association IDs of EIPs that have been associated with the NAT gateway.

Type: Array of strings

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

MaxDrainDurationSeconds

The maximum amount of time to wait (in seconds) before forcibly releasing the IP addresses if connections are still in progress. Default value is 350 seconds.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 4000.

Required: No

NatGatewayId

The ID of the NAT gateway.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

natGatewayAddressSet

Information about the NAT gateway IP addresses.

Type: Array of NatGatewayAddress objects

natGatewayId

The ID of the NAT gateway.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

DisassociateRouteServer

Disassociates a route server from a VPC.

A route server association is the connection established between a route server and a VPC.

For more information see Dynamic routing in your VPC with VPC Route Server in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

RouteServerId

The ID of the route server to disassociate.

Type: String

Required: Yes

VpcId

The ID of the VPC to disassociate from the route server.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

routeServerAssociation

Information about the disassociated route server.

Type: RouteServerAssociation object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

DisassociateRouteTable

Disassociates a subnet or gateway from a route table.

After you perform this action, the subnet no longer uses the routes in the route table. Instead, it uses the routes in the VPC's main route table. For more information about route tables, see Route tables in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AssociationId

The association ID representing the current association between the route table and subnet or gateway.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example disassociates the specified route table from the subnet it's associated to.

Sample Request

```
https://ec2.amazonaws.com/?Action=DisassociateRouteTable
&AssociationId=rtbassoc-0531ae3257956bdfb
&AUTHPARAMS
```

Sample Response

```
<DisassociateRouteTableResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <return>true</return>
</DisassociateRouteTableResponse>
```

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

DisassociateSecurityGroupVpc

Disassociates a security group from a VPC. You cannot disassociate the security group if any Elastic network interfaces in the associated VPC are still associated with the security group. Note that the disassociation is asynchronous and you can check the status of the request with DescribeSecurityGroupVpcAssociations.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

GroupId

A security group ID.

Type: String

Required: Yes

VpcId

A VPC ID.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

state

The state of the disassociation.

Type: String

Valid Values: `associating | associated | association-failed | disassociating | disassociated | disassociation-failed`

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

DisassociateSubnetCidrBlock

Disassociates a CIDR block from a subnet. Currently, you can disassociate an IPv6 CIDR block only. You must detach or delete all gateways and resources that are associated with the CIDR block before you can disassociate it.

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AssociationId

The association ID for the CIDR block.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

ipv6CidrBlockAssociation

Information about the IPv6 CIDR block association.

Type: SubnetIpv6CidrBlockAssociation object

requestId

The ID of the request.

Type: String

subnetId

The ID of the subnet.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example disassociates the IPv6 CIDR block from the subnet.

Sample Request

```
https://ec2.amazonaws.com/?Action=DisassociateSubnetCidrBlock
&AssociationId=subnet-cidr-assoc-3aa54053
&AUTHPARAMS
```

Sample Response

```
<DisassociateSubnetCidrBlockResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <subnetId>subnet-5f46ec3b</subnetId>
    <ipv6CidrBlockAssociation>
        <ipv6CidrBlock>2001:db8:1234:1a00::/64</ipv6CidrBlock>
        <ipv6CidrBlockState>
            <state>disassociating</state>
        </ipv6CidrBlockState>
        <associationId>subnet-cidr-assoc-3aa54053</associationId>
    </ipv6CidrBlockAssociation>
</DisassociateSubnetCidrBlockResponse>
```

DisassociateTransitGatewayMulticastDomain

Disassociates the specified subnets from the transit gateway multicast domain.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

SubnetIds.N

The IDs of the subnets;

Type: Array of strings

Required: Yes

TransitGatewayAttachmentId

The ID of the attachment.

Type: String

Required: Yes

TransitGatewayMulticastDomainId

The ID of the transit gateway multicast domain.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

associations

Information about the association.

Type: TransitGatewayMulticastDomainAssociations object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example disassociates the subnet `subnet-000de86e3bEXAMPLE` from the multicast domain `tgw-mcast-domain-0c4905cef7EXAMPLE`.

Sample Request

```
https://ec2.amazonaws.com/?Action=DisassociateTransitGatewayMulticastDomain
&TransitGatewayAttachmentId=tgw-attach-070e571cd1EXAMPLE
&SubnetId=subnet-000de86e3bEXAMPLE
&TransitGatewayMulticastDomainId=tgw-mcast-domain-0c4905cef7EXAMPLE
&AUTHPARAMS
```

Sample Response

```
<DisassociateTransitGatewayMulticastDomainResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>0008db4a-b98a-46f7-b047-e262aEXAMPLE</requestId>
    <associations>
```

```
        <resourceId>vpc-7EXAMPLE</resourceId>
        <resourceType>vpc</resourceType>
        <subnets>
            <item>
                <state>disassociating</state>
                <subnetId>subnet-000de86e3bEXAMPLE</subnetId>
            </item>
        </subnets>
        <transitGatewayAttachmentId>tgw-attach-070e571cd1EXAMPLE</
transitGatewayAttachmentId>
        <transitGatewayMulticastDomainId>tgw-mcast-domain-0c4905cef7EXAMPLE</
transitGatewayMulticastDomainId>
    </associations>
</DisassociateTransitGatewayMulticastDomainResponse>
```

DisassociateTransitGatewayPolicyTable

Removes the association between an an attachment and a policy table.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TransitGatewayAttachmentId

The ID of the transit gateway attachment to disassociate from the policy table.

Type: String

Required: Yes

TransitGatewayPolicyTableId

The ID of the disassociated policy table.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

association

Returns details about the transit gateway policy table disassociation.

Type: TransitGatewayPolicyTableAssociation object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

DisassociateTransitGatewayRouteTable

Disassociates a resource attachment from a transit gateway route table.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TransitGatewayAttachmentId

The ID of the attachment.

Type: String

Required: Yes

TransitGatewayRouteTableId

The ID of the transit gateway route table.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

association

Information about the association.

Type: TransitGatewayAssociation object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for Ruby V3

DisassociateTrunkInterface

Removes an association between a branch network interface with a trunk network interface.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AssociationId

The ID of the association

Type: String

Required: Yes

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring idempotency.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

clientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring idempotency.

Type: String

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for Python
- AWS SDK for Ruby V3

DisassociateVpcCidrBlock

Disassociates a CIDR block from a VPC. To disassociate the CIDR block, you must specify its association ID. You can get the association ID by using DescribeVpcs. You must detach or delete all gateways and resources that are associated with the CIDR block before you can disassociate it.

You cannot disassociate the CIDR block with which you originally created the VPC (the primary CIDR block).

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AssociationId

The association ID for the CIDR block.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

cidrBlockAssociation

Information about the IPv4 CIDR block association.

Type: VpcCidrBlockAssociation object

ipv6CidrBlockAssociation

Information about the IPv6 CIDR block association.

Type: VpcIpv6CidrBlockAssociation object

requestId

The ID of the request.

Type: String

vpcId

The ID of the VPC.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example disassociates the IPv6 CIDR block from the VPC.

Sample Request

```
https://ec2.amazonaws.com/?Action=DisassociateVpcCidrBlock
&AssociationId=vpc-cidr-assoc-e2a5408b
&AUTHPARAMS
```

Sample Response

```
<DisassociateVpcCidrBlockResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <ipv6CidrBlockAssociation>
        <ipv6CidrBlock>2001:db8:1234:1a00::/56</ipv6CidrBlock>
        <ipv6CidrBlockState>
            <state>disassociating</state>
        </ipv6CidrBlockState>
        <associationId>vpc-cidr-assoc-e2a5408b</associationId>
    </ipv6CidrBlockAssociation>
    <vpcId>vpc-a034d6c4</vpcId>
</DisassociateVpcCidrBlockResponse>
```

EnableAddressTransfer

Enables Elastic IP address transfer. For more information, see Transfer Elastic IP addresses in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AllocationId

The allocation ID of an Elastic IP address.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TransferAccountId

The ID of the account that you want to transfer the Elastic IP address to.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

addressTransfer

An Elastic IP address transfer.

Type: AddressTransfer object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

EnableAllowedImagesSettings

Enables Allowed AMIs for your account in the specified AWS Region. Two values are accepted:

- `enabled`: The image criteria in your Allowed AMIs settings are applied. As a result, only AMIs matching these criteria are discoverable and can be used by your account to launch instances.
- `audit-mode`: The image criteria in your Allowed AMIs settings are not applied. No restrictions are placed on AMI discoverability or usage. Users in your account can launch instances using any public AMI or AMI shared with your account.

  The purpose of `audit-mode` is to indicate which AMIs will be affected when Allowed AMIs is `enabled`. In `audit-mode`, each AMI displays either `"ImageAllowed": true` or `"ImageAllowed": false` to indicate whether the AMI will be discoverable and available to users in the account when Allowed AMIs is enabled.

> **Note**
>
> The Allowed AMIs feature does not restrict the AMIs owned by your account. Regardless of the criteria you set, the AMIs created by your account will always be discoverable and usable by users in your account.

For more information, see Control the discovery and use of AMIs in Amazon EC2 with Allowed AMIs in *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AllowedImagesSettingsState

Specify `enabled` to apply the image criteria specified by the Allowed AMIs settings. Specify `audit-mode` so that you can check which AMIs will be allowed or not allowed by the image criteria.

Type: String

Valid Values: `enabled | audit-mode`

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

allowedImagesSettingsState

Returns `enabled` or `audit-mode` if the request succeeds; otherwise, it returns an error.

Type: String

Valid Values: `enabled | audit-mode`

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

EnableAwsNetworkPerformanceMetricSubscription

Enables Infrastructure Performance subscriptions.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Destination

The target Region (like `us-east-2`) or Availability Zone ID (like `use2-az2`) that the metric subscription is enabled for. If you use Availability Zone IDs, the Source and Destination Availability Zones must be in the same Region.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Metric

The metric used for the enabled subscription.

Type: String

Valid Values: `aggregate-latency`

Required: No

Source

The source Region (like `us-east-1`) or Availability Zone ID (like `use1-az1`) that the metric subscription is enabled for. If you use Availability Zone IDs, the Source and Destination Availability Zones must be in the same Region.

Type: String

Required: No

Statistic

The statistic used for the enabled subscription.

Type: String

Valid Values: `p50`

Required: No

Response Elements

The following elements are returned by the service.

output

Indicates whether the subscribe action was successful.

Type: Boolean

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

EnableCapacityManager

Enables EC2 Capacity Manager for your account. This starts data ingestion for your EC2 capacity usage across On-Demand, Spot, and Capacity Reservations. Initial data processing may take several hours to complete.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

OrganizationsAccess

Specifies whether to enable cross-account access for AWS Organizations. When enabled, Capacity Manager can aggregate data from all accounts in your organization. Default is false.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

capacityManagerStatus

The current status of Capacity Manager after the enable operation.

Type: String

Valid Values: `enabled | disabled`

organizationsAccess

Indicates whether Organizations access is enabled for cross-account data aggregation.

Type: Boolean

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

EnableEbsEncryptionByDefault

Enables EBS encryption by default for your account in the current Region.

After you enable encryption by default, the EBS volumes that you create are always encrypted, either using the default KMS key or the KMS key that you specified when you created each volume. For more information, see Amazon EBS encryption in the *Amazon EBS User Guide*.

You can specify the default KMS key for encryption by default using ModifyEbsDefaultKmsKeyId or ResetEbsDefaultKmsKeyId.

Enabling encryption by default has no effect on the encryption status of your existing volumes.

After you enable encryption by default, you can no longer launch instances using instance types that do not support encryption. For more information, see Supported instance types.

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

ebsEncryptionByDefault

The updated status of encryption by default.

Type: Boolean

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

EnableFastLaunch

When you enable Windows fast launch for a Windows AMI, images are pre-provisioned, using snapshots to launch instances up to 65% faster. To create the optimized Windows image, Amazon EC2 launches an instance and runs through Sysprep steps, rebooting as required. Then it creates a set of reserved snapshots that are used for subsequent launches. The reserved snapshots are automatically replenished as they are used, depending on your settings for launch frequency.

> **Note**
>
> You can only change these settings for Windows AMIs that you own or that have been shared with you.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ImageId

Specify the ID of the image for which to enable Windows fast launch.

Type: String

Required: Yes

LaunchTemplate

The launch template to use when launching Windows instances from pre-provisioned snapshots. Launch template parameters can include either the name or ID of the launch template, but not both.

Type: FastLaunchLaunchTemplateSpecificationRequest object

Required: No

MaxParallelLaunches

The maximum number of instances that Amazon EC2 can launch at the same time to create pre-provisioned snapshots for Windows fast launch. Value must be 6 or greater.

Type: Integer

Required: No

ResourceType

The type of resource to use for pre-provisioning the AMI for Windows fast launch. Supported values include: `snapshot`, which is the default value.

Type: String

Required: No

SnapshotConfiguration

Configuration settings for creating and managing the snapshots that are used for pre-provisioning the AMI for Windows fast launch. The associated `ResourceType` must be `snapshot`.

Type: FastLaunchSnapshotConfigurationRequest object

Required: No

Response Elements

The following elements are returned by the service.

imageId

The image ID that identifies the AMI for which Windows fast launch was enabled.

Type: String

launchTemplate

The launch template that is used when launching Windows instances from pre-provisioned snapshots.

Type: FastLaunchLaunchTemplateSpecificationResponse object

maxParallelLaunches

The maximum number of instances that Amazon EC2 can launch at the same time to create pre-provisioned snapshots for Windows fast launch.

Type: Integer

ownerId

The owner ID for the AMI for which Windows fast launch was enabled.

Type: String

requestId

The ID of the request.

Type: String

resourceType

The type of resource that was defined for pre-provisioning the AMI for Windows fast launch.

Type: String

Valid Values: `snapshot`

snapshotConfiguration

Settings to create and manage the pre-provisioned snapshots that Amazon EC2 uses for faster launches from the Windows AMI. This property is returned when the associated `resourceType` is `snapshot`.

Type: FastLaunchSnapshotConfigurationResponse object

state

The current state of Windows fast launch for the specified AMI.

Type: String

Valid Values: `enabling | enabling-failed | enabled | enabled-failed | disabling | disabling-failed`

stateTransitionReason

The reason that the state changed for Windows fast launch for the AMI.

Type: String

stateTransitionTime

The time that the state changed for Windows fast launch for the AMI.

Type: Timestamp

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4

- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

EnableFastSnapshotRestores

Enables fast snapshot restores for the specified snapshots in the specified Availability Zones.

You get the full benefit of fast snapshot restores after they enter the `enabled` state.

To get the current state of fast snapshot restores, use DescribeFastSnapshotRestores. To disable fast snapshot restores, use DisableFastSnapshotRestores.

For more information, see Amazon EBS fast snapshot restore in the *Amazon EBS User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AvailabilityZone.N

One or more Availability Zones. For example, `us-east-2a`.

Either `AvailabilityZone` or `AvailabilityZoneId` must be specified in the request, but not both.

Type: Array of strings

Required: No

AvailabilityZoneId.N

One or more Availability Zone IDs. For example, `use2-az1`.

Either `AvailabilityZone` or `AvailabilityZoneId` must be specified in the request, but not both.

Type: Array of strings

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

SourceSnapshotId.N

The IDs of one or more snapshots. For example, `snap-1234567890abcdef0`. You can specify a snapshot that was shared with you from another AWS account.

Type: Array of strings

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

successful

Information about the snapshots for which fast snapshot restores were successfully enabled.

Type: Array of EnableFastSnapshotRestoreSuccessItem objects

unsuccessful

Information about the snapshots for which fast snapshot restores could not be enabled.

Type: Array of EnableFastSnapshotRestoreErrorItem objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

EnableImage

Re-enables a disabled AMI. The re-enabled AMI is marked as `available` and can be used for instance launches, appears in describe operations, and can be shared. AWS accounts, organizations, and Organizational Units that lost access to the AMI when it was disabled do not regain access automatically. Once the AMI is available, it can be shared with them again.

Only the AMI owner can re-enable a disabled AMI.

For more information, see Disable an Amazon EC2 AMI in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ImageId

The ID of the AMI.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example enables the specified AMI.

Sample Request

```
https://ec2.amazonaws.com/?Action=EnableImage
&ImageId=ami-0123456789EXAMPLE
&AUTHPARAMS
```

Sample Response

```
<EnableImageResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>11aabb229-4eac-35bd-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</EnableImageResponse>
```

See Also

- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

EnableImageBlockPublicAccess

Enables *block public access for AMIs* at the account level in the specified AWS Region. This prevents the public sharing of your AMIs. However, if you already have public AMIs, they will remain publicly available.

The API can take up to 10 minutes to configure this setting. During this time, if you run GetImageBlockPublicAccessState, the response will be `unblocked`. When the API has completed the configuration, the response will be `block-new-sharing`.

For more information, see Block public access to your AMIs in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ImageBlockPublicAccessState

Specify `block-new-sharing` to enable block public access for AMIs at the account level in the specified Region. This will block any attempt to publicly share your AMIs in the specified Region.

Type: String

Valid Values: `block-new-sharing`

Required: Yes

Response Elements

The following elements are returned by the service.

imageBlockPublicAccessState

Returns `block-new-sharing` if the request succeeds; otherwise, it returns an error.

Type: String

Valid Values: `block-new-sharing`

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example enables *block public access for AMIs* at the account level in the specified Region to prevent users in your account from publicly sharing your AMIs in the specified Region. If you already have public AMIs, they will remain publicly available.

Sample Request

```
https://ec2.amazonaws.com/?Action=EnableImageBlockPublicAccess
&Region=us-east-1
&ImageBlockPublicAccessState=block-new-sharing
&AUTHPARAMS
```

Sample Response

```
<EnableImageBlockPublicAccessResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>11aabb229-4eac-35bd-99ed-be587EXAMPLE</requestId>
  <return>block-new-sharing</return>
</EnableImageBlockPublicAccessResponse>
```

- AWS SDK for Python
- AWS SDK for Ruby V3

EnableImageDeprecation

Enables deprecation of the specified AMI at the specified date and time.

For more information, see Deprecate an AMI in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DeprecateAt

The date and time to deprecate the AMI, in UTC, in the following format: *YYYY-MM-DD*T*HH*:*MM*:*SS*Z. If you specify a value for seconds, Amazon EC2 rounds the seconds to the nearest minute.

You can't specify a date in the past. The upper limit for `DeprecateAt` is 10 years from now, except for public AMIs, where the upper limit is 2 years from the creation date.

Type: Timestamp

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ImageId

The ID of the AMI.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example deprecates the specified AMI at the specified date and time. If you specify a value for seconds, Amazon EC2 rounds the seconds to the nearest minute.

Sample Request

```
https://ec2.amazonaws.com/?Action=EnableImageDeprecation
&ImageId=ami-0123456789EXAMPLE
&DeprecateAt="2022-06-15T13:17:00.000Z"
&AUTHPARAMS
```

Sample Response

```
<EnableImageDeprecationResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</EnableImageDeprecationResponse>
```

- AWS SDK for Ruby V3

EnableImageDeregistrationProtection

Enables deregistration protection for an AMI. When deregistration protection is enabled, the AMI can't be deregistered.

To allow the AMI to be deregistered, you must first disable deregistration protection.

For more information, see Protect an Amazon EC2 AMI from deregistration in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ImageId

The ID of the AMI.

Type: String

Required: Yes

WithCooldown

If `true`, enforces deregistration protection for 24 hours after deregistration protection is disabled.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

EnableInstanceSqlHaStandbyDetections

Enable Amazon EC2 instances running in an SQL Server High Availability cluster for SQL Server High Availability instance standby detection monitoring. Once enabled, AWS monitors the metadata for the instances to determine whether they are active or standby nodes in the SQL Server High Availability cluster. If the instances are determined to be standby failover nodes, AWS automatically applies SQL Server licensing fee waiver for those instances.

To register an instance, it must be running a Windows SQL Server license-included AMI and have the AWS Systems Manager agent installed and running. Only Windows Server 2019 and later and SQL Server (Standard and Enterprise editions) 2017 and later are supported. For more information, see Prerequisites for using SQL Server High Availability instance standby detection.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InstanceId.N

The IDs of the instances to enable for SQL Server High Availability standby detection monitoring.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 30 items.

Required: Yes

SqlServerCredentials

The ARN of the AWS Secrets Manager secret containing the SQL Server access credentials. The specified secret must contain valid SQL Server credentials for the specified instances. If not

specified, deafult local user credentials will be used by the AWS Systems Manager agent. To enable instances with different credentials, you must make separate requests.

Type: String

Pattern: `^(?=.{20,2048}$)arn:aws[a-z-]*:secretsmanager:[a-z0-9-]+:\d{12}:secret:[a-zA-Z0-9/_+=.@-]+`

Required: No

Response Elements

The following elements are returned by the service.

instanceSet

Information about the instances that were enabled for SQL Server High Availability standby detection monitoring.

Type: Array of RegisteredInstance objects

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

EnableIpamOrganizationAdminAccount

Enable an AWS Organizations member account as the IPAM admin account. You cannot select the AWS Organizations management account as the IPAM admin account. For more information, see Enable integration with AWS Organizations in the *Amazon VPC IPAM User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DelegatedAdminAccountId

The AWS Organizations member account ID that you want to enable as the IPAM account.

Type: String

Required: Yes

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

success

The result of enabling the IPAM account.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4

- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

EnableIpamPolicy

Enables an IPAM policy.

An IPAM policy is a set of rules that define how public IPv4 addresses from IPAM pools are allocated to AWS resources. Each rule maps an AWS service to IPAM pools that the service will use to get IP addresses. A single policy can have multiple rules and be applied to multiple AWS Regions. If the IPAM pool run out of addresses then the services fallback to Amazon-provided IP addresses. A policy can be applied to an individual AWS account or an entity within AWS Organizations.

For more information, see Define public IPv4 allocation strategy with IPAM policies in the *Amazon VPC IPAM User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

IpamPolicyId

The ID of the IPAM policy to enable.

Type: String

Required: Yes

OrganizationTargetId

The ID of the AWS Organizations target for which to enable the IPAM policy. This parameter is required only when IPAM is integrated with AWS Organizations. When IPAM is not integrated with AWS Organizations, omit this parameter and the policy will apply to the current account.

A target can be an individual AWS account or an entity within an AWS Organization to which an IPAM policy can be applied.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

ipamPolicyId

The ID of the IPAM policy that was enabled.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin

- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

EnableReachabilityAnalyzerOrganizationSharing

Establishes a trust relationship between Reachability Analyzer and AWS Organizations. This operation must be performed by the management account for the organization.

After you establish a trust relationship, a user in the management account or a delegated administrator account can run a cross-account analysis using resources from the member accounts.

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

returnValue

Returns `true` if the request succeeds; otherwise, returns an error.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

EnableRouteServerPropagation

Defines which route tables the route server can update with routes.

When enabled, route server propagation installs the routes in the FIB on the route table you've specified. Route server supports IPv4 and IPv6 route propagation.

For more information see Dynamic routing in your VPC with VPC Route Server in the *Amazon VPC User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

RouteServerId

The ID of the route server for which to enable propagation.

Type: String

Required: Yes

RouteTableId

The ID of the route table to which route server will propagate routes.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

routeServerPropagation

Information about the enabled route server propagation.

Type: RouteServerPropagation object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

EnableSerialConsoleAccess

Enables access to the EC2 serial console of all instances for your account. By default, access to the EC2 serial console is disabled for your account. For more information, see Manage account access to the EC2 serial console in the *Amazon EC2 User Guide*.

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

serialConsoleAccessEnabled

If `true`, access to the EC2 serial console of all instances is enabled for your account. If `false`, access to the EC2 serial console of all instances is disabled for your account.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

EnableSnapshotBlockPublicAccess

Enables or modifies the *block public access for snapshots* setting at the account level for the specified AWS Region. After you enable block public access for snapshots in a Region, users can no longer request public sharing for snapshots in that Region. Snapshots that are already publicly shared are either treated as private or they remain publicly shared, depending on the **State** that you specify.

Important

Enabling block public access for snapshots in *block all sharing* mode does not change the permissions for snapshots that are already publicly shared. Instead, it prevents these snapshots from be publicly visible and publicly accessible. Therefore, the attributes for these snapshots still indicate that they are publicly shared, even though they are not publicly available.
If you later disable block public access or change the mode to *block new sharing*, these snapshots will become publicly available again.

For more information, see Block public access for snapshots in the *Amazon EBS User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

State

The mode in which to enable block public access for snapshots for the Region. Specify one of the following values:

- `block-all-sharing` - Prevents all public sharing of snapshots in the Region. Users in the account will no longer be able to request new public sharing. Additionally, snapshots that are already publicly shared are treated as private and they are no longer publicly available.
- `block-new-sharing` - Prevents only new public sharing of snapshots in the Region. Users in the account will no longer be able to request new public sharing. However, snapshots that are already publicly shared, remain publicly available.

`unblocked` is not a valid value for **EnableSnapshotBlockPublicAccess**.

Type: String

Valid Values: `block-all-sharing | block-new-sharing | unblocked`

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

state

The state of block public access for snapshots for the account and Region. Returns either `block-all-sharing` or `block-new-sharing` if the request succeeds.

Type: String

Valid Values: `block-all-sharing | block-new-sharing | unblocked`

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

EnableTransitGatewayRouteTablePropagation

Enables the specified attachment to propagate routes to the specified propagation route table.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

TransitGatewayAttachmentId

The ID of the attachment.

Type: String

Required: No

TransitGatewayRouteTableAnnouncementId

The ID of the transit gateway route table announcement.

Type: String

Required: No

TransitGatewayRouteTableId

The ID of the propagation route table.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

propagation

Information about route propagation.

Type: TransitGatewayPropagation object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

EnableVgwRoutePropagation

Enables a virtual private gateway (VGW) to propagate routes to the specified route table of a VPC.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

GatewayId

The ID of the virtual private gateway that is attached to a VPC. The virtual private gateway must be attached to the same VPC that the routing tables are associated with.

Type: String

Required: Yes

RouteTableId

The ID of the route table. The routing table must be associated with the same VPC that the virtual private gateway is attached to.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example enables the specified virtual private gateway to propagate routes automatically to the route table with the ID `rtb-c98a35a0`.

Sample Request

```
https://ec2.amazonaws.com/?Action=EnableVgwRoutePropagation
&RouteTableID=rtb-c98a35a0
&GatewayId=vgw-d8e09e8a
&AUTHPARAMS
```

Sample Response

```
<EnableVgwRoutePropagation xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>4f35a1b2-c2c3-4093-b51f-abb9d7311990</requestId>
    <return>true</return>
</EnableVgwRoutePropagation>
```

- AWS SDK for Python
- AWS SDK for Ruby V3

EnableVolumeIO

Enables I/O operations for a volume that had I/O operations disabled because the data on the volume was potentially inconsistent.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

VolumeId

The ID of the volume.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example enables the I/O operations of the volume vol-8888888.

Sample Request

```
https://ec2.amazonaws.com/?Action=EnableVolumeIO
&VolumeId= vol-8888888
&AUTHPARAMS
```

Sample Response

```
<EnableVolumeIOResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <return>true</return>
</EnableVolumeIOResponse>
```

EnableVpcClassicLink

Note

This action is deprecated.

Enables a VPC for ClassicLink. You can then link EC2-Classic instances to your ClassicLink-enabled VPC to allow communication over private IP addresses. You cannot enable your VPC for ClassicLink if any of your VPC route tables have existing routes for address ranges within the `10.0.0.0/8` IP address range, excluding local routes for VPCs in the `10.0.0.0/16` and `10.1.0.0/16` IP address ranges.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

VpcId

The ID of the VPC.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

EnableVpcClassicLinkDnsSupport

> **Note**
>
> This action is deprecated.

Enables a VPC to support DNS hostname resolution for ClassicLink. If enabled, the DNS hostname of a linked EC2-Classic instance resolves to its private IP address when addressed from an instance in the VPC to which it's linked. Similarly, the DNS hostname of an instance in a VPC resolves to its private IP address when addressed from a linked EC2-Classic instance.

You must specify a VPC ID in the request.

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

VpcId

The ID of the VPC.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

return

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

ExportClientVpnClientCertificateRevocationList

Downloads the client certificate revocation list for the specified Client VPN endpoint.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientVpnEndpointId

The ID of the Client VPN endpoint.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

certificateRevocationList

Information about the client certificate revocation list.

Type: String

requestId

The ID of the request.

Type: String

status

The current state of the client certificate revocation list.

Type: ClientCertificateRevocationListStatus object

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for Python
- AWS SDK for Ruby V3

ExportClientVpnClientConfiguration

Downloads the contents of the Client VPN endpoint configuration file for the specified Client VPN endpoint. The Client VPN endpoint configuration file includes the Client VPN endpoint and certificate information clients need to establish a connection with the Client VPN endpoint.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientVpnEndpointId

The ID of the Client VPN endpoint.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

clientConfiguration

The contents of the Client VPN endpoint configuration file.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example downloads a Client VPN endpoint configuration file.

Sample Request

```
https://ec2.amazonaws.com/?Action=ExportClientVpnClientConfiguration
&ClientVpnEndpointId=cvpn-endpoint-00c5d11fc4EXAMPLE
&AUTHPARAMS
```

Sample Response

```
<ExportClientVpnClientConfigurationResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>44e88bf8-d460-4c43-80b8-a27e4EXAMPLE</requestId>

ExportImage

Exports an Amazon Machine Image (AMI) to a VM file. For more information, see Exporting a VM directly from an Amazon Machine Image (AMI) in the *VM Import/Export User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ClientToken

Token to enable idempotency for export image requests.

Type: String

Required: No

Description

A description of the image being exported. The maximum length is 255 characters.

Type: String

Required: No

DiskImageFormat

The disk image format.

Type: String

Valid Values: `VMDK | RAW | VHD`

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ImageId

The ID of the image.

Type: String

Required: Yes

RoleName

The name of the role that grants VM Import/Export permission to export images to your Amazon S3 bucket. If this parameter is not specified, the default role is named 'vmimport'.

Type: String

Required: No

S3ExportLocation

The Amazon S3 bucket for the destination image. The destination bucket must exist.

Type: ExportTaskS3LocationRequest object

Required: Yes

TagSpecification.N

The tags to apply to the export image task during creation.

Type: Array of TagSpecification objects

Required: No

Response Elements

The following elements are returned by the service.

description

A description of the image being exported.

Type: String

diskImageFormat

The disk image format for the exported image.

Type: String

Valid Values: `VMDK` | `RAW` | `VHD`

exportImageTaskId

The ID of the export image task.

Type: String

imageId

The ID of the image.

Type: String

progress

The percent complete of the export image task.

Type: String

requestId

The ID of the request.

Type: String

roleName

The name of the role that grants VM Import/Export permission to export images to your Amazon S3 bucket.

Type: String

s3ExportLocation

Information about the destination Amazon S3 bucket.

Type: ExportTaskS3Location object

status

The status of the export image task. The possible values are `active`, `completed`, `deleting`, and `deleted`.

Type: String

statusMessage

The status message for the export image task.

Type: String

tagSet

Any tags assigned to the export image task.

Type: Array of Tag objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

ExportTransitGatewayRoutes

Exports routes from the specified transit gateway route table to the specified S3 bucket. By default, all routes are exported. Alternatively, you can filter by CIDR range.

The routes are saved to the specified bucket in a JSON file. For more information, see Export route tables to Amazon S3 in the *AWS Transit Gateways Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters. The possible values are:

- `attachment.transit-gateway-attachment-id` - The id of the transit gateway attachment.
- `attachment.resource-id` - The resource id of the transit gateway attachment.
- `route-search.exact-match` - The exact match of the specified filter.
- `route-search.longest-prefix-match` - The longest prefix that matches the route.
- `route-search.subnet-of-match` - The routes with a subnet that match the specified CIDR filter.
- `route-search.supernet-of-match` - The routes with a CIDR that encompass the CIDR filter. For example, if you have 10.0.1.0/29 and 10.0.1.0/31 routes in your route table and you specify supernet-of-match as 10.0.1.0/30, then the result returns 10.0.1.0/29.
- `state` - The state of the route (`active` | `blackhole`).
- `transit-gateway-route-destination-cidr-block` - The CIDR range.

- `type` - The type of route (`propagated` | `static`).

Type: Array of Filter objects

Required: No

S3Bucket

The name of the S3 bucket.

Type: String

Required: Yes

TransitGatewayRouteTableId

The ID of the route table.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

s3Location

The URL of the exported file in Amazon S3. For example, s3://*bucket_name*/VPCTransitGateway/TransitGatewayRouteTables/*file_name*.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

ExportVerifiedAccessInstanceClientConfiguration

Exports the client configuration for a Verified Access instance.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

VerifiedAccessInstanceId

The ID of the Verified Access instance.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

deviceTrustProviderSet

The device trust providers.

Type: Array of strings

Valid Values: `jamf | crowdstrike | jumpcloud`

openVpnConfigurationSet

The Open VPN configuration.

Type: Array of VerifiedAccessInstanceOpenVpnClientConfiguration objects

region

The Region.

Type: String

requestId

The ID of the request.

Type: String

userTrustProvider

The user identity trust provider.

Type: VerifiedAccessInstanceUserTrustProviderClientConfiguration object

verifiedAccessInstanceId

The ID of the Verified Access instance.

Type: String

version

The version.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

GetActiveVpnTunnelStatus

Returns the currently negotiated security parameters for an active VPN tunnel, including IKE version, DH groups, encryption algorithms, and integrity algorithms.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request.

Type: Boolean

Required: No

VpnConnectionId

The ID of the VPN connection for which to retrieve the active tunnel status.

Type: String

Required: Yes

VpnTunnelOutsideIpAddress

The external IP address of the VPN tunnel for which to retrieve the active status.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

activeVpnTunnelStatus

Information about the current security configuration of the VPN tunnel.

Type: ActiveVpnTunnelStatus object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

GetAllowedImagesSettings

Gets the current state of the Allowed AMIs setting and the list of Allowed AMIs criteria at the account level in the specified Region.

> **Note**
>
> The Allowed AMIs feature does not restrict the AMIs owned by your account. Regardless of the criteria you set, the AMIs created by your account will always be discoverable and usable by users in your account.

For more information, see Control the discovery and use of AMIs in Amazon EC2 with Allowed AMIs in *Amazon EC2 User Guide*.

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

imageCriterionSet

The list of criteria for images that are discoverable and usable in the account in the specified AWS Region.

Type: Array of ImageCriterion objects

managedBy

The entity that manages the Allowed AMIs settings. Possible values include:

- `account` - The Allowed AMIs settings is managed by the account.
- `declarative-policy` - The Allowed AMIs settings is managed by a declarative policy and can't be modified by the account.

Type: String

Valid Values: `account | declarative-policy`

requestId

The ID of the request.

Type: String

state

The current state of the Allowed AMIs setting at the account level in the specified AWS Region.

Possible values:

- `disabled`: All AMIs are allowed.
- `audit-mode`: All AMIs are allowed, but the `ImageAllowed` field is set to `true` if the AMI would be allowed with the current list of criteria if allowed AMIs was enabled.
- `enabled`: Only AMIs matching the image criteria are discoverable and available for use.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

GetAssociatedEnclaveCertificateIamRoles

Returns the IAM roles that are associated with the specified ACM (ACM) certificate. It also returns the name of the Amazon S3 bucket and the Amazon S3 object key where the certificate, certificate chain, and encrypted private key bundle are stored, and the ARN of the KMS key that's used to encrypt the private key.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CertificateArn

The ARN of the ACM certificate for which to view the associated IAM roles, encryption keys, and Amazon S3 object information.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

associatedRoleSet

Information about the associated IAM roles.

Type: Array of AssociatedRole objects

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

GetAssociatedIpv6PoolCidrs

Gets information about the IPv6 CIDR block associations for a specified IPv6 address pool.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

PoolId

The ID of the IPv6 address pool.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

ipv6CidrAssociationSet

Information about the IPv6 CIDR block associations.

Type: Array of Ipv6CidrAssociation objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++

- AWS SDK for JavaScript V3

- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

GetAwsNetworkPerformanceData

Gets network performance data.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DataQuery.N

A list of network performance data queries.

Type: Array of DataQuery objects

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

EndTime

The ending time for the performance data request. The end time must be formatted as `yyyy-mm-ddThh:mm:ss`. For example, `2022-06-12T12:00:00.000Z`.

Type: Timestamp

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

StartTime

The starting time for the performance data request. The starting time must be formatted as `yyyy-mm-ddThh:mm:ss`. For example, `2022-06-10T12:00:00.000Z`.

Type: Timestamp

Required: No

Response Elements

The following elements are returned by the service.

dataResponseSet

The list of data responses.

Type: Array of DataResponse objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

GetCapacityManagerAttributes

Retrieves the current configuration and status of EC2 Capacity Manager for your account, including enablement status, Organizations access settings, and data ingestion status.

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

capacityManagerStatus

The current status of Capacity Manager.

Type: String

Valid Values: `enabled | disabled`

dataExportCount

The number of active data export configurations for this account. This count includes all data exports regardless of their current delivery status.

Type: Integer

earliestDatapointTimestamp

The timestamp of the earliest data point available in Capacity Manager, in milliseconds since epoch. This indicates how far back historical data is available for queries.

Type: Timestamp

ingestionStatus

The current data ingestion status. Initial ingestion may take several hours after enabling Capacity Manager.

Type: String

Valid Values: `initial-ingestion-in-progress | ingestion-complete | ingestion-failed`

ingestionStatusMessage

A descriptive message providing additional details about the current ingestion status. This may include error information if ingestion has failed or progress details during initial setup.

Type: String

latestDatapointTimestamp

The timestamp of the most recent data point ingested by Capacity Manager, in milliseconds since epoch. This indicates how current your capacity data is.

Type: Timestamp

organizationsAccess

Indicates whether Organizations access is enabled for cross-account data aggregation.

Type: Boolean

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

GetCapacityManagerMetricData

Retrieves capacity usage metrics for your EC2 resources. Returns time-series data for metrics like unused capacity, utilization rates, and costs across On-Demand, Spot, and Capacity Reservations. Data can be grouped and filtered by various dimensions such as region, account, and instance family.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

EndTime

The end time for the metric data query, in ISO 8601 format. If the end time is beyond the latest ingested data, it will be automatically adjusted to the latest available data point.

Type: Timestamp

Required: Yes

FilterBy.N

Conditions to filter the metric data. Each filter specifies a dimension, comparison operator ('equals', 'in'), and values to match against.

Type: Array of CapacityManagerCondition objects

Array Members: Minimum number of 0 items. Maximum number of 20 items.

Required: No

GroupBy.N

The dimensions by which to group the metric data. This determines how the data is aggregated and returned.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 20 items.

Valid Values: `resource-region | availability-zone-id | account-id | instance-family | instance-type | instance-platform | reservation-arn | reservation-id | reservation-type | reservation-create-timestamp | reservation-start-timestamp | reservation-end-timestamp | reservation-end-date-type | tenancy | reservation-state | reservation-instance-match-criteria | reservation-unused-financial-owner`

Required: No

MaxResults

The maximum number of data points to return. Valid range is 1 to 100,000. Use with NextToken for pagination of large result sets.

Type: Integer

Required: No

MetricName.N

The names of the metrics to retrieve. Maximum of 10 metrics per request.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 40 items.

Valid Values: `reservation-total-capacity-hrs-vcpu | reservation-total-capacity-hrs-inst | reservation-max-size-vcpu | reservation-max-size-inst | reservation-min-size-vcpu | reservation-min-size-inst | reservation-unused-total-capacity-hrs-vcpu | reservation-unused-total-capacity-hrs-inst | reservation-unused-total-estimated-cost | reservation-max-unused-size-vcpu | reservation-max-unused-size-inst | reservation-min-unused-size-vcpu | reservation-min-unused-`

```
size-inst | reservation-max-utilization | reservation-min-utilization
| reservation-avg-utilization-vcpu | reservation-avg-utilization-
inst | reservation-total-count | reservation-total-estimated-cost |
reservation-avg-future-size-vcpu | reservation-avg-future-size-inst |
reservation-min-future-size-vcpu | reservation-min-future-size-inst |
reservation-max-future-size-vcpu | reservation-max-future-size-inst |
reservation-avg-committed-size-vcpu | reservation-avg-committed-size-
inst | reservation-max-committed-size-vcpu | reservation-max-committed-
size-inst | reservation-min-committed-size-vcpu | reservation-min-
committed-size-inst | reserved-total-usage-hrs-vcpu | reserved-total-
usage-hrs-inst | reserved-total-estimated-cost | unreserved-total-usage-
hrs-vcpu | unreserved-total-usage-hrs-inst | unreserved-total-estimated-
cost | spot-total-usage-hrs-vcpu | spot-total-usage-hrs-inst | spot-
total-estimated-cost | spot-avg-run-time-before-interruption-inst |
spot-max-run-time-before-interruption-inst | spot-min-run-time-before-
interruption-inst
```

Required: Yes

NextToken

The token for the next page of results. Use this value in a subsequent call to retrieve additional data points.

Type: String

Required: No

Period

The granularity, in seconds, of the returned data points.

Type: Integer

Valid Range: Minimum value of 3600.

Required: Yes

StartTime

The start time for the metric data query, in ISO 8601 format. The time range (end time - start time) must be a multiple of the specified period.

Type: Timestamp

Required: Yes

Response Elements

The following elements are returned by the service.

metricDataResultSet

The metric data points returned by the query. Each result contains dimension values, timestamp, and metric values with their associated statistics.

Type: Array of MetricDataResult objects

nextToken

The token to use to retrieve the next page of results. This value is null when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2

- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

GetCapacityManagerMetricDimensions

Retrieves the available dimension values for capacity metrics within a specified time range. This is useful for discovering what accounts, regions, instance families, and other dimensions have data available for filtering and grouping.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

EndTime

The end time for the dimension query, in ISO 8601 format. Only dimensions with data in this time range will be returned.

Type: Timestamp

Required: Yes

FilterBy.N

Conditions to filter which dimension values are returned. Each filter specifies a dimension, comparison operator, and values to match against.

Type: Array of CapacityManagerCondition objects

Array Members: Minimum number of 0 items. Maximum number of 20 items.

Required: No

GroupBy.N

The dimensions to group by when retrieving available dimension values. This determines which dimension combinations are returned. Required parameter.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 20 items.

Valid Values: `resource-region | availability-zone-id | account-id | instance-family | instance-type | instance-platform | reservation-arn | reservation-id | reservation-type | reservation-create-timestamp | reservation-start-timestamp | reservation-end-timestamp | reservation-end-date-type | tenancy | reservation-state | reservation-instance-match-criteria | reservation-unused-financial-owner`

Required: Yes

MaxResults

The maximum number of dimension combinations to return. Valid range is 1 to 1000. Use with NextToken for pagination.

Type: Integer

Required: No

MetricName.N

The metric names to use as an additional filter when retrieving dimensions. Only dimensions that have data for these metrics will be returned. Required parameter with maximum size of 1 for v1.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 40 items.

Valid Values: `reservation-total-capacity-hrs-vcpu | reservation-total-capacity-hrs-inst | reservation-max-size-vcpu | reservation-max-size-inst | reservation-min-size-vcpu | reservation-min-size-inst | reservation-unused-total-capacity-hrs-vcpu | reservation-unused-total-capacity-hrs-inst | reservation-unused-total-estimated-cost | reservation-max-unused-size-vcpu | reservation-max-unused-size-inst | reservation-min-unused-size-vcpu | reservation-min-unused-size-inst | reservation-max-utilization | reservation-min-utilization | reservation-avg-utilization-vcpu | reservation-avg-utilization-inst | reservation-total-count | reservation-total-estimated-cost |`

```
reservation-avg-future-size-vcpu | reservation-avg-future-size-inst |
reservation-min-future-size-vcpu | reservation-min-future-size-inst |
reservation-max-future-size-vcpu | reservation-max-future-size-inst |
reservation-avg-committed-size-vcpu | reservation-avg-committed-size-
inst | reservation-max-committed-size-vcpu | reservation-max-committed-
size-inst | reservation-min-committed-size-vcpu | reservation-min-
committed-size-inst | reserved-total-usage-hrs-vcpu | reserved-total-
usage-hrs-inst | reserved-total-estimated-cost | unreserved-total-usage-
hrs-vcpu | unreserved-total-usage-hrs-inst | unreserved-total-estimated-
cost | spot-total-usage-hrs-vcpu | spot-total-usage-hrs-inst | spot-
total-estimated-cost | spot-avg-run-time-before-interruption-inst |
spot-max-run-time-before-interruption-inst | spot-min-run-time-before-
interruption-inst
```

Required: Yes

NextToken

The token for the next page of results. Use this value in a subsequent call to retrieve additional dimension values.

Type: String

Required: No

StartTime

The start time for the dimension query, in ISO 8601 format. Only dimensions with data in this time range will be returned.

Type: Timestamp

Required: Yes

Response Elements

The following elements are returned by the service.

metricDimensionResultSet

The available dimension combinations that have data within the specified time range and filters.

Type: Array of CapacityManagerDimension objects

nextToken

The token to use to retrieve the next page of results. This value is null when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

GetCapacityReservationUsage

Gets usage information about a Capacity Reservation. If the Capacity Reservation is shared, it shows usage information for the Capacity Reservation owner and each AWS account that is currently using the shared capacity. If the Capacity Reservation is not shared, it shows only the Capacity Reservation owner's usage.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CapacityReservationId

The ID of the Capacity Reservation.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 1000.

Required: No

NextToken

The token to use to retrieve the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

availableInstanceCount

The remaining capacity. Indicates the number of instances that can be launched in the Capacity Reservation.

Type: Integer

capacityReservationId

The ID of the Capacity Reservation.

Type: String

instanceType

The type of instance for which the Capacity Reservation reserves capacity.

Type: String

instanceUsageSet

Information about the Capacity Reservation usage.

Type: Array of InstanceUsage objects

interruptible

Indicates whether the Capacity Reservation is interruptible, meaning instances may be terminated when the owner reclaims capacity.

Type: Boolean

interruptibleCapacityAllocation

Information about the capacity allocated to the interruptible Capacity Reservation, including instance counts and allocation status.

Type: InterruptibleCapacityAllocation object

interruptionInfo

Details about the interruption configuration and source reservation for interruptible Capacity Reservations.

Type: InterruptionInfo object

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

state

The current state of the Capacity Reservation. A Capacity Reservation can be in one of the following states:

- `active` - The capacity is available for use.
- `expired` - The Capacity Reservation expired automatically at the date and time specified in your reservation request. The reserved capacity is no longer available for your use.
- `cancelled` - The Capacity Reservation was canceled. The reserved capacity is no longer available for your use.
- `pending` - The Capacity Reservation request was successful but the capacity provisioning is still pending.
- `failed` - The Capacity Reservation request has failed. A request can fail due to request parameters that are not valid, capacity constraints, or instance limit constraints. You can view a failed request for 60 minutes.
- `scheduled` - (*Future-dated Capacity Reservations*) The future-dated Capacity Reservation request was approved and the Capacity Reservation is scheduled for delivery on the requested start date.
- `payment-pending` - (*Capacity Blocks*) The upfront payment has not been processed yet.
- `payment-failed` - (*Capacity Blocks*) The upfront payment was not processed in the 12-hour time frame. Your Capacity Block was released.

- `assessing` - (*Future-dated Capacity Reservations*) Amazon EC2 is assessing your request for a future-dated Capacity Reservation.
- `delayed` - (*Future-dated Capacity Reservations*) Amazon EC2 encountered a delay in provisioning the requested future-dated Capacity Reservation. Amazon EC2 is unable to deliver the requested capacity by the requested start date and time.
- `unsupported` - (*Future-dated Capacity Reservations*) Amazon EC2 can't support the future-dated Capacity Reservation request due to capacity constraints. You can view unsupported requests for 30 days. The Capacity Reservation will not be delivered.

Type: String

Valid Values: `active | expired | cancelled | pending | failed | scheduled | payment-pending | payment-failed | assessing | delayed | unsupported | unavailable`

totalInstanceCount

The number of instances for which the Capacity Reservation reserves capacity.

Type: Integer

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin

- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

GetCoipPoolUsage

Describes the allocations from the specified customer-owned address pool.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters.

- `coip-address-usage.allocation-id` - The allocation ID of the address.
- `coip-address-usage.aws-account-id` - The ID of the AWS account that is using the customer-owned IP address.
- `coip-address-usage.aws-service` - The AWS service that is using the customer-owned IP address.
- `coip-address-usage.co-ip` - The customer-owned IP address.

Type: Array of Filter objects

Required: No

MaxResults

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

PoolId

The ID of the address pool.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

coipAddressUsageSet

Information about the address usage.

Type: Array of CoipAddressUsage objects

coipPoolId

The ID of the customer-owned address pool.

Type: String

localGatewayRouteTableId

The ID of the local gateway route table.

Type: String

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

GetConsoleOutput

Gets the console output for the specified instance. For Linux instances, the instance console output displays the exact console output that would normally be displayed on a physical monitor attached to a computer. For Windows instances, the instance console output includes the last three system event log errors.

For more information, see Instance console output in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InstanceId

The ID of the instance.

Type: String

Required: Yes

Latest

When enabled, retrieves the latest console output for the instance.

Default: disabled (`false`)

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

instanceId

The ID of the instance.

Type: String

output

The console output, base64-encoded. If you are using a command line tool, the tool decodes the output for you.

Type: String

requestId

The ID of the request.

Type: String

timestamp

The time at which the output was last updated.

Type: Timestamp

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example 1

This example retrieves the console output for the specified instance.

Sample Request

```
https://ec2.amazonaws.com/?Action=GetConsoleOutput
&InstanceId=i-1234567890abcdef0
```

```
&AUTHPARAMS
```

Sample Response

```
<GetConsoleOutputResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <instanceId>i-1234567890abcdef0</instanceId>
  <timestamp>2022-10-14T01:12:41.000Z</timestamp>
  <output>TGludXggdmVyc2lvbiAyLjYuMTYteGVuVSAoYnVpbGRlckBwYXRjaGJhdC5hbWF6b25zYSkgKGdj
YyB2ZXJzaW9uIDQuMC4xIDIwMDUwNzI3IChSZWQgSGF0IDQuMC4xLTUpKSAjMSBTTVAgVGh1IE9j

bmFibGluZyBmYXN0IEZQVSBzYXZlIGFuZCByZXN0b3JlLi4uIGRvbmUuCg==</output>
</GetConsoleOutputResponse>
```

Example 2

This example retrieves the latest console output for the specified instance.

Sample Request

```
https://ec2.amazonaws.com/?Action=GetConsoleOutput
&InstanceId=i-1234567890abcdef0
&Latest=true
&AUTHPARAMS
```

GetConsoleScreenshot

Retrieve a JPG-format screenshot of a running instance to help with troubleshooting.

The returned content is Base64-encoded.

For more information, see Instance console output in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InstanceId

The ID of the instance.

Type: String

Required: Yes

WakeUp

When set to `true`, acts as keystroke input and wakes up an instance that's in standby or "sleep" mode.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

imageData

The data that comprises the image.

Type: String

instanceId

The ID of the instance.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example returns the image data of a successful request.

Sample Request

```
https://ec2.amazonaws.com/?Action=GetConsoleScreenshot
&InstanceId=i-0598c7d356eba48d7
&AUTHPARAMS
```

Sample Response

```
<GetConsoleScreenshotResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
<requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <imageData>997987/8kgj49ikjhewkwwe0008084EXAMPLE</imageData>
  <instanceId>i-765950</instanceId>
</GetConsoleScreenshotResponse>
```

GetDeclarativePoliciesReportSummary

Retrieves a summary of the account status report.

To view the full report, download it from the Amazon S3 bucket where it was saved. Reports are accessible only when they have the `complete` status. Reports with other statuses (`running`, `cancelled`, or `error`) are not available in the S3 bucket. For more information about downloading objects from an S3 bucket, see Downloading objects in the *Amazon Simple Storage Service User Guide*.

For more information, see Generating the account status report for declarative policies in the *AWS Organizations User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ReportId

The ID of the report.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

attributeSummarySet

The attributes described in the report.

Type: Array of AttributeSummary objects

endTime

The time when the report generation ended.

Type: Timestamp

numberOfAccounts

The total number of accounts associated with the specified `targetId`.

Type: Integer

numberOfFailedAccounts

The number of accounts where attributes could not be retrieved in any Region.

Type: Integer

reportId

The ID of the report.

Type: String

requestId

The ID of the request.

Type: String

s3Bucket

The name of the Amazon S3 bucket where the report is located.

Type: String

s3Prefix

The prefix for your S3 object.

Type: String

startTime

The time when the report generation started.

Type: Timestamp

targetId

The root ID, organizational unit ID, or account ID.

Format:

- For root: `r-ab12`
- For OU: `ou-ab12-cdef1234`
- For account: `123456789012`

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

- AWS SDK for Python
- AWS SDK for Ruby V3

GetDefaultCreditSpecification

Describes the default credit option for CPU usage of a burstable performance instance family.

For more information, see Burstable performance instances in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InstanceFamily

The instance family.

Type: String

Valid Values: `t2 | t3 | t3a | t4g`

Required: Yes

Response Elements

The following elements are returned by the service.

instanceFamilyCreditSpecification

The default credit option for CPU usage of the instance family.

Type: InstanceFamilyCreditSpecification object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example gets the default credit option for CPU usage of instances in the T2 instance family in the specified Region.

Sample Request

```
https://ec2.amazonaws.com/?Action=GetDefaultCreditSpecification
&Region=us-east-1
&InstanceFamily=t2
&AUTHPARAMS
```

Sample Response

```
<GetDefaultCreditSpecificationResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>11111111-2222-3333-4444-5555EXAMPLE</requestId>
    <instanceFamilyCreditSpecification>
        <cpuCredits>unlimited</cpuCredits>
        <instanceFamily>t2</instanceFamily>
    </instanceFamilyCreditSpecification>
</GetDefaultCreditSpecificationResponse>
```

GetEbsDefaultKmsKeyId

Describes the default AWS KMS key for EBS encryption by default for your account in this Region.

For more information, see Amazon EBS encryption in the *Amazon EBS User Guide*.

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

kmsKeyId

The Amazon Resource Name (ARN) of the default KMS key for encryption by default.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

GetEbsEncryptionByDefault

Describes whether EBS encryption by default is enabled for your account in the current Region.

For more information, see Amazon EBS encryption in the *Amazon EBS User Guide*.

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

ebsEncryptionByDefault

Indicates whether encryption by default is enabled.

Type: Boolean

requestId

The ID of the request.

Type: String

sseType

Reserved for future use.

Type: String

Valid Values: `sse-ebs | sse-kms | none`

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

GetEnabledIpamPolicy

Gets the enabled IPAM policy.

An IPAM policy is a set of rules that define how public IPv4 addresses from IPAM pools are allocated to AWS resources. Each rule maps an AWS service to IPAM pools that the service will use to get IP addresses. A single policy can have multiple rules and be applied to multiple AWS Regions. If the IPAM pool run out of addresses then the services fallback to Amazon-provided IP addresses. A policy can be applied to an individual AWS account or an entity within AWS Organizations.

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

ipamPolicyEnabled

Indicates whether the IPAM policy is enabled.

Type: Boolean

ipamPolicyId

The ID of the enabled IPAM policy.

Type: String

managedBy

The entity that manages the IPAM policy.

Type: String

Valid Values: `account | delegated-administrator-for-ipam`

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

GetFlowLogsIntegrationTemplate

Generates a CloudFormation template that streamlines and automates the integration of VPC flow logs with Amazon Athena. This make it easier for you to query and gain insights from VPC flow logs data. Based on the information that you provide, we configure resources in the template to do the following:

- Create a table in Athena that maps fields to a custom log format
- Create a Lambda function that updates the table with new partitions on a daily, weekly, or monthly basis
- Create a table partitioned between two timestamps in the past
- Create a set of named queries in Athena that you can use to get started quickly

> **Note**
>
> `GetFlowLogsIntegrationTemplate` does not support integration between AWS Transit Gateway Flow Logs and Amazon Athena.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ConfigDeliveryS3DestinationArn

To store the CloudFormation template in Amazon S3, specify the location in Amazon S3.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

FlowLogId

The ID of the flow log.

Type: String

Required: Yes

IntegrateService

Information about the service integration.

Type: IntegrateServices object

Required: Yes

Response Elements

The following elements are returned by the service.

requestId

The ID of the request.

Type: String

result

The generated CloudFormation template.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

GetGroupsForCapacityReservation

Lists the resource groups to which a Capacity Reservation has been added.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

CapacityReservationId

The ID of the Capacity Reservation. If you specify a Capacity Reservation that is shared with you, the operation returns only Capacity Reservation groups that you own.

Type: String

Required: Yes

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 1000.

Required: No

NextToken

The token to use to retrieve the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

capacityReservationGroupSet

Information about the resource groups to which the Capacity Reservation has been added.

Type: Array of CapacityReservationGroup objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for JavaScript V3

- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

GetHostReservationPurchasePreview

Preview a reservation purchase with configurations that match those of your Dedicated Host. You must have active Dedicated Hosts in your account before you purchase a reservation.

This is a preview of the PurchaseHostReservation action and does not result in the offering being purchased.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

HostIdSet.N

The IDs of the Dedicated Hosts with which the reservation is associated.

Type: Array of strings

Required: Yes

OfferingId

The offering ID of the reservation.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

currencyCode

The currency in which the `totalUpfrontPrice` and `totalHourlyPrice` amounts are specified. At this time, the only supported currency is USD.

Type: String

Valid Values: USD

purchase

The purchase information of the Dedicated Host reservation and the Dedicated Hosts associated with it.

Type: Array of Purchase objects

requestId

The ID of the request.

Type: String

totalHourlyPrice

The potential total hourly price of the reservation per hour.

Type: String

totalUpfrontPrice

The potential total upfront price. This is billed immediately.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example is a preview of the reservation to be purchased.

Sample Request

```
https://ec2.amazonaws.com/?Action=GetHostReservationPurchasePreview
&OfferingId=hro-0eb3541dght849c2d
&HostIdSet=h-0fgr9ddb0ecd0a1cd
&AUTHPARAMS
```

Sample Response

```
<GetHostReservationPurchasePreviewResult xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>d4904fd9-84c3-4967-gtyk-a9983EXAMPLE</requestId>
        <purchase>
            <item>
                <duration>31536000</duration>
                <upfrontPrice>7453.000</upfrontPrice>
                <paymentOption>PartialUpfront</paymentOption>
                <instanceFamily>m4</instanceFamily>
                <hourlyPrice>0.850</hourlyPrice>
                <hostIdSet>
                    <item>h-0fgr9ddb0ecd0a1cd</item>
                </hostIdSet>
            </item>
       </purchase>
       <totalHourlyPrice>0.850<totalHourlyPrice>
       <totalUpfrontPrice>7453.000<totalUpfrontPrice>
</GetHostReservationPurchasePreviewResult>
```

GetImageAncestry

Retrieves the ancestry chain of the specified AMI, tracing its lineage back to the root AMI. For more information, see AMI ancestry in *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

ImageId

The ID of the AMI whose ancestry you want to trace.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

imageAncestryEntrySet

A list of entries in the AMI ancestry chain, from the specified AMI to the root AMI.

Type: Array of ImageAncestryEntry objects

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for Python
- AWS SDK for Ruby V3

GetImageBlockPublicAccessState

Gets the current state of *block public access for AMIs* at the account level in the specified AWS Region.

For more information, see Block public access to your AMIs in the *Amazon EC2 User Guide*.

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

imageBlockPublicAccessState

The current state of block public access for AMIs at the account level in the specified AWS Region.

Possible values:

- `block-new-sharing` - Any attempt to publicly share your AMIs in the specified Region is blocked.
- `unblocked` - Your AMIs in the specified Region can be publicly shared.

Type: String

managedBy

The entity that manages the state for block public access for AMIs. Possible values include:

- `account` - The state is managed by the account.
- `declarative-policy` - The state is managed by a declarative policy and can't be modified by the account.

Type: String

Valid Values: `account | declarative-policy`

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

Examples

Example

This example gets the state of *block public access for AMIs* at the account level in the specified Region to see whether the public sharing of your AMIs is blocked in your account. The value for the response is either `block-new-sharing` or `unblocked`.

Sample Request

```
https://ec2.amazonaws.com/?Action=GetImageBlockPublicAccessState
&Region=us-east-1
&AUTHPARAMS
```

Sample Response

```
<GetImageBlockPublicAccessStateResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
  <requestId>11aabb229-4eac-35bd-99ed-be587EXAMPLE</requestId>
  <return>block-new-sharing</return>
</GetImageBlockPublicAccessStateResponse>
```

GetInstanceMetadataDefaults

Gets the default instance metadata service (IMDS) settings that are set at the account level in the specified AWS
Region.

For more information, see Order of precedence for instance metadata options in the *Amazon EC2 User Guide*.

Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

accountLevel

The account-level default IMDS settings.

Type: InstanceMetadataDefaultsResponse object

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

GetInstanceTpmEkPub

Gets the public endorsement key associated with the Nitro Trusted Platform Module (NitroTPM) for the specified instance.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Specify this parameter to verify whether the request will succeed, without actually making the request. If the request will succeed, the response is `DryRunOperation`. Otherwise, the response is `UnauthorizedOperation`.

Type: Boolean

Required: No

InstanceId

The ID of the instance for which to get the public endorsement key.

Type: String

Required: Yes

KeyFormat

The required public endorsement key format. Specify `der` for a DER-encoded public key that is compatible with OpenSSL. Specify `tpmt` for a TPM 2.0 format that is compatible with tpm2-tools. The returned key is base64 encoded.

Type: String

Valid Values: `der | tpmt`

Required: Yes

KeyType

The required public endorsement key type.

Type: String

Valid Values: `rsa-2048 | ecc-sec-p384`

Required: Yes

Response Elements

The following elements are returned by the service.

instanceId

The ID of the instance.

Type: String

keyFormat

The public endorsement key format.

Type: String

Valid Values: `der | tpmt`

keyType

The public endorsement key type.

Type: String

Valid Values: `rsa-2048 | ecc-sec-p384`

keyValue

The public endorsement key material.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

GetInstanceTypesFromInstanceRequirements

Returns a list of instance types with the specified instance attributes. You can use the response to preview the instance types without launching instances. Note that the response does not consider capacity.

When you specify multiple parameters, you get instance types that satisfy all of the specified parameters. If you specify multiple values for a parameter, you get instance types that satisfy any of the specified values.

For more information, see Preview instance types with specified attributes, Specify attributes for instance type selection for EC2 Fleet or Spot Fleet, and Spot placement score in the *Amazon EC2 User Guide*, and Creating mixed instance groups using attribute-based instance type selection in the *Amazon EC2 Auto Scaling User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

ArchitectureType.N

The processor architecture type.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 3 items.

Valid Values: `i386 | x86_64 | arm64 | x86_64_mac | arm64_mac`

Required: Yes

Context

Reserved.

Type: String

Required: No

DryRun

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InstanceRequirements

The attributes required for the instance types.

Type: InstanceRequirementsRequest object

Required: Yes

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Required: No

NextToken

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

VirtualizationType.N

The virtualization type.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 2 items.

Valid Values: `hvm | paravirtual`

Required: Yes

Response Elements

The following elements are returned by the service.

instanceTypeSet

The instance types with the specified instance attributes.

Type: Array of InstanceTypeInfoFromInstanceRequirements objects

nextToken

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

GetInstanceUefiData

A binary representation of the UEFI variable store. Only non-volatile variables are stored. This is a base64 encoded and zlib compressed binary value that must be properly encoded.

When you use register-image to create an AMI, you can create an exact copy of your variable store by passing the UEFI data in the `UefiData` parameter. You can modify the UEFI data by using the python-uefivars tool on GitHub. You can use the tool to convert the UEFI data into a human-readable format (JSON), which you can inspect and modify, and then convert back into the binary format to use with register-image.

For more information, see UEFI Secure Boot in the *Amazon EC2 User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

InstanceId

The ID of the instance from which to retrieve the UEFI data.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

instanceId

The ID of the instance from which to retrieve the UEFI data.

Type: String

requestId

The ID of the request.

Type: String

uefiData

Base64 representation of the non-volatile UEFI variable store.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

GetIpamAddressHistory

Retrieve historical information about a CIDR within an IPAM scope. For more information, see View the history of IP addresses in the *Amazon VPC IPAM User Guide*.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

Cidr

The CIDR you want the history of. The CIDR can be an IPv4 or IPv6 IP address range. If you enter a /16 IPv4 CIDR, you will get records that match it exactly. You will not get records for any subnets within the /16 CIDR.

Type: String

Required: Yes

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

EndTime

The end of the time period for which you are looking for history. If you omit this option, it will default to the current time.

Type: Timestamp

Required: No

IpamScopeId

The ID of the IPAM scope that the CIDR is in.

Type: String

Required: Yes

MaxResults

The maximum number of historical results you would like returned per page. Defaults to 100.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

StartTime

The start of the time period for which you are looking for history. If you omit this option, it will default to the value of EndTime.

Type: Timestamp

Required: No

VpcId

The ID of the VPC you want your history records filtered by.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

historyRecordSet

A historical record for a CIDR within an IPAM scope. If the CIDR is associated with an EC2 instance, you will see an object in the response for the instance and one for the network interface.

Type: Array of IpamAddressHistoryRecord objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

GetIpamDiscoveredAccounts

Gets IPAM discovered accounts. A discovered account is an AWS account that is monitored under a resource discovery. If you have integrated IPAM with AWS Organizations, all accounts in the organization are discovered accounts. Only the IPAM account can get all discovered accounts in the organization.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DiscoveryRegion

The AWS Region that the account information is returned from.

Type: String

Required: Yes

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

Discovered account filters.

Type: Array of Filter objects

Required: No

IpamResourceDiscoveryId

A resource discovery ID.

Type: String

Required: Yes

MaxResults

The maximum number of discovered accounts to return in one page of results.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

Specify the pagination token from a previous request to retrieve the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

ipamDiscoveredAccountSet

Discovered accounts.

Type: Array of IpamDiscoveredAccount objects

nextToken

Specify the pagination token from a previous request to retrieve the next page of results.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

GetIpamDiscoveredPublicAddresses

Gets the public IP addresses that have been discovered by IPAM.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

AddressRegion

The AWS Region for the IP address.

Type: String

Required: Yes

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

Filters.

Type: Array of Filter objects

Required: No

IpamResourceDiscoveryId

An IPAM resource discovery ID.

Type: String

Required: Yes

MaxResults

The maximum number of IPAM discovered public addresses to return in one page of results.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

ipamDiscoveredPublicAddressSet

IPAM discovered public addresses.

Type: Array of IpamDiscoveredPublicAddress objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

oldestSampleTime

The oldest successful resource discovery time.

Type: Timestamp

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

GetIpamDiscoveredResourceCidrs

Returns the resource CIDRs that are monitored as part of a resource discovery. A discovered resource is a resource CIDR monitored under a resource discovery. The following resources can be discovered: VPCs, Public IPv4 pools, VPC subnets, and Elastic IP addresses.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

Filters.

Type: Array of Filter objects

Required: No

IpamResourceDiscoveryId

A resource discovery ID.

Type: String

Required: Yes

MaxResults

The maximum number of discovered resource CIDRs to return in one page of results.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

Specify the pagination token from a previous request to retrieve the next page of results.

Type: String

Required: No

ResourceRegion

A resource Region.

Type: String

Required: Yes

Response Elements

The following elements are returned by the service.

ipamDiscoveredResourceCidrSet

Discovered resource CIDRs.

Type: Array of IpamDiscoveredResourceCidr objects

nextToken

Specify the pagination token from a previous request to retrieve the next page of results.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for Ruby V3

GetIpamPolicyAllocationRules

Gets the allocation rules for an IPAM policy.

An IPAM policy is a set of rules that define how public IPv4 addresses from IPAM pools are allocated to AWS resources. Each rule maps an AWS service to IPAM pools that the service will use to get IP addresses. A single policy can have multiple rules and be applied to multiple AWS Regions. If the IPAM pool run out of addresses then the services fallback to Amazon-provided IP addresses. A policy can be applied to an individual AWS account or an entity within AWS Organizations.

Allocation rules are optional configurations within an IPAM policy that map AWS resource types to specific IPAM pools. If no rules are defined, the resource types default to using Amazon-provided IP addresses.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters for the allocation rules.

Type: Array of Filter objects

Required: No

IpamPolicyId

The ID of the IPAM policy for which to get allocation rules.

Type: String

Required: Yes

Locale

The locale for which to get the allocation rules.

Type: String

Required: No

MaxResults

The maximum number of results to return in a single call.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

ResourceType

The resource type for which to get the allocation rules.

The AWS service or resource type that can use IP addresses through IPAM policies. Supported services and resource types include:

- Elastic IP addresses

Type: String

Valid Values: `alb | eip | rds | rnat`

Required: No

Response Elements

The following elements are returned by the service.

ipamPolicyDocumentSet

The IPAM policy documents containing the allocation rules.

Allocation rules are optional configurations within an IPAM policy that map AWS resource types to specific IPAM pools. If no rules are defined, the resource types default to using Amazon-provided IP addresses.

Type: Array of IpamPolicyDocument objects

nextToken

The token to use to retrieve the next page of results.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python

- AWS SDK for Ruby V3

GetIpamPolicyOrganizationTargets

Gets the AWS Organizations targets for an IPAM policy.

An IPAM policy is a set of rules that define how public IPv4 addresses from IPAM pools are allocated to AWS resources. Each rule maps an AWS service to IPAM pools that the service will use to get IP addresses. A single policy can have multiple rules and be applied to multiple AWS Regions. If the IPAM pool run out of addresses then the services fallback to Amazon-provided IP addresses. A policy can be applied to an individual AWS account or an entity within AWS Organizations.

A target can be an individual AWS account or an entity within an AWS Organization to which an IPAM policy can be applied.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters for the AWS Organizations targets.

Type: Array of Filter objects

Required: No

IpamPolicyId

The ID of the IPAM policy for which to get AWS Organizations targets.

Type: String

Required: Yes

MaxResults

The maximum number of results to return in a single call.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results.

Type: String

organizationTargetSet

The IDs of the AWS Organizations targets.

A target can be an individual AWS account or an entity within an AWS Organization to which an IPAM policy can be applied.

Type: Array of IpamPolicyOrganizationTarget objects

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

GetIpamPoolAllocations

Get a list of all the CIDR allocations in an IPAM pool. The Region you use should be the IPAM pool locale. The locale is the AWS Region where this IPAM pool is available for allocations.

> **Note**
>
> If you use this action after AllocateIpamPoolCidr or ReleaseIpamPoolAllocation, note that all EC2 API actions follow an eventual consistency model.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters for the request. For more information about filtering, see Filtering CLI output.

Type: Array of Filter objects

Required: No

IpamPoolAllocationId

The ID of the allocation.

Type: String

Required: No

IpamPoolId

The ID of the IPAM pool you want to see the allocations for.

Type: String

Required: Yes

MaxResults

The maximum number of results you would like returned per page.

Type: Integer

Valid Range: Minimum value of 1000. Maximum value of 100000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

ipamPoolAllocationSet

The IPAM pool allocations you want information on.

Type: Array of IpamPoolAllocation objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

GetIpamPoolCidrs

Get the CIDRs provisioned to an IPAM pool.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters for the request. For more information about filtering, see Filtering CLI output.

Type: Array of Filter objects

Required: No

IpamPoolId

The ID of the IPAM pool you want the CIDR for.

Type: String

Required: Yes

MaxResults

The maximum number of results to return in the request.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

ipamPoolCidrSet

Information about the CIDRs provisioned to an IPAM pool.

Type: Array of IpamPoolCidr objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2

- AWS SDK for .NET V4

- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

GetIpamPrefixListResolverRules

Retrieves the CIDR selection rules for an IPAM prefix list resolver. Use this operation to view the business logic that determines which CIDRs are selected for synchronization with prefix lists.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters to limit the results.

Type: Array of Filter objects

Required: No

IpamPrefixListResolverId

The ID of the IPAM prefix list resolver whose rules you want to retrieve.

Type: String

Required: Yes

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

ruleSet

The CIDR selection rules for the IPAM prefix list resolver.

Type: Array of IpamPrefixListResolverRule objects

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2

- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

GetIpamPrefixListResolverVersionEntries

Retrieves the CIDR entries for a specific version of an IPAM prefix list resolver. This shows the actual CIDRs that were selected and synchronized at a particular point in time.

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

IpamPrefixListResolverId

The ID of the IPAM prefix list resolver whose version entries you want to retrieve.

Type: String

Required: Yes

IpamPrefixListResolverVersion

The version number of the resolver for which to retrieve CIDR entries. If not specified, the latest version is used.

Type: Long

Required: Yes

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

entrySet

The CIDR entries for the specified resolver version.

Type: Array of IpamPrefixListResolverVersionEntry objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

GetIpamPrefixListResolverVersions

Retrieves version information for an IPAM prefix list resolver.

Each version is a snapshot of what CIDRs matched your rules at that moment in time. The version number increments every time the CIDR list changes due to infrastructure changes.

Version example:

Initial State (Version 1)

Production environment:

- vpc-prod-web (10.1.0.0/16) - tagged env=prod
- vpc-prod-db (10.2.0.0/16) - tagged env=prod

Resolver rule: Include all VPCs tagged env=prod

Version 1 CIDRs: 10.1.0.0/16, 10.2.0.0/16

Infrastructure Change (Version 2)

New VPC added:

- vpc-prod-api (10.3.0.0/16) - tagged env=prod

IPAM automatically detects the change and creates a new version.

Version 2 CIDRs: 10.1.0.0/16, 10.2.0.0/16, 10.3.0.0/16

Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

DryRun

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

Filter.N

One or more filters to limit the results.

Type: Array of Filter objects

Required: No

IpamPrefixListResolverId

The ID of the IPAM prefix list resolver whose versions you want to retrieve.

Type: String

Required: Yes

IpamPrefixListResolverVersion.N

Specific version numbers to retrieve. If not specified, all versions are returned.

Type: Array of longs

Required: No

MaxResults

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

NextToken

The token for the next page of results.

Type: String

Required: No

Response Elements

The following elements are returned by the service.

ipamPrefixListResolverVersionSet

Information about the IPAM prefix list resolver versions.

Type: Array of IpamPrefixListResolverVersion objects

nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

requestId

The ID of the request.

Type: String

Errors

For information about the errors that are common to all actions, see Common client error codes.
