CloudWatch pipelines configuration for Microsoft 365

Collects log data from Microsoft Office 365 Management API using OAuth2 authentication.

Configure the Microsoft Office 365 source with the following parameters:

```
source:
  microsoft_office365:
    tenant_id: "<example-tenant-ID>"
    authentication:
      oauth2:
        client_id: "${{aws_secrets:<secret-name>:client_id}}"
        client_secret: "${{aws_secrets:<secret-name>:client_secret}}"
```

Parameters

`tenant_id` (required)

The Microsoft Entra ID tenant ID for your Office 365 organization.

`authentication.oauth2.client_id` (required)

OAuth2 client ID for Microsoft Office 365 Management API authentication. Can reference AWS Secrets Manager using `${{aws_secrets:secret-name:key}}` syntax.

`authentication.oauth2.client_secret` (required)

OAuth2 client secret for Microsoft Office 365 Management API authentication. Can reference AWS Secrets Manager using `${{aws_secrets:secret-name:key}}` syntax.

> **Note**
>
> Store sensitive credentials like client IDs and secrets in AWS Secrets Manager and reference them using the `${{aws_secrets:secret-name:key}}` syntax in your configuration.

Custom log data from CloudWatch Logs or an Amazon S3 bucket

You can create pipelines for custom data sources using the following approaches:

1. **CloudWatch Custom Logs** – Define pipelines on your existing CloudWatch custom log groups by providing:

- A data source name
- A data source type

For more information on data source name and type, see the CloudWatch Logs User Guide.

2. **S3 Custom Sources** – Process arbitrary logs stored in S3 buckets by configuring source for the pipeline:

```
source:
  s3:
    aws:
      region: "us-east-1"
      sts_role_arn: "arn:aws:iam::<account>:role/<role-name>"
    compression: "gzip"
    codec:
      ndjson:
    data_source_name: "my_custom_logs"
    default_bucket_owner: "123456789012"
    bucket_owners:
      my-bucket: "123456789012"
    disable_bucket_ownership_validation: false
    notification_type: "sqs"
    sqs:
      queue_url: "https://sqs.region.amazonaws.com/<account>/<queue-name>"
    on_error: "retain_messages"
```

> **Note**
>
> The CSV processor can't be used with S3 custom sources. Instead, use the CSV codec in the S3 source.

Parameters

`notification_type` (required)

Specifies the notification mechanism. Must be "sqs" to use SQS for S3 event notifications.

`data_source_name`

Identifies the data source. This can be any string value that represents your data source. Example: "my_custom_logs".

`aws.region` (required)

The AWS region where the S3 bucket and SQS queue are located.

`aws.sts_role_arn` (required)

The ARN of the IAM role to assume for accessing S3 and SQS resources.

`codec` (required)

Codec configuration for parsing S3 objects. Supports `csv`, `json`, `ndjson` codecs.

`compression` (optional)

Compression type of the S3 objects. Valid values are "none", "gzip", "automatic". Defaults to "none".

`sqs.queue_url` (required for SQS)

The complete SQS queue URL that receives S3 bucket notifications when new objects are created.

`on_error` (optional)

Determines how to handle errors in Amazon SQS. Can be either `retain_messages` or `delete_messages`. Default is `retain_messages`.

Custom source configuration

When creating a pipeline for custom sources:

- A parser must be the first processor in the pipeline if the data source is CloudWatch Logs
- You can specify any supported processor for custom log pipelines

Configuring Custom S3 Bucket Sources

With CloudWatch pipelines, you can process arbitrary logs stored in S3 buckets.

Prerequisites

To use Amazon S3 as the source for a pipeline, first create an S3 bucket. For instructions, see Creating a general purpose bucketin the *Amazon S3 User Guide*.

Note

If the S3 bucket used as a source in the pipeline is in a different AWS account, you also need to enable cross-account read permissions on the bucket. This allows the pipeline to read and process the data. To enable cross-account permissions, see Bucket owner granting cross-account bucket permissions in the *Amazon S3 User Guide*.
If your S3 buckets are in multiple accounts, use a `bucket_owners` map. For an example, see Cross-account S3 access in the *OpenSearch* documentation.

To set up S3-SQS processing, you also need to perform the following steps:

- Create an Amazon SQS queue.
- Enable event notifications on the S3 bucket with the SQS queue as a destination.

Configure the pipeline role

Unlike other source plugins that push data to a pipeline, the S3 source plugin has a read-based architecture in which the pipeline pulls data from the source. Therefore, in order for a pipeline to read from S3, you must specify a role within the pipeline's S3 source configuration that has access to both the S3 bucket and the Amazon SQS queue. The pipeline will assume this role in order to read data from the queue.

You can find example role permissions in Source-specific IAM policies. Note that this role must have a trust relationship with the CloudWatch pipelines service principle. You can find an example trust policy configuration for your pipeline role in Trust relationships.

Create the pipeline

After you've set up your permissions, you can configure a pipeline depending on your Amazon S3 use case.

Select **Create pipeline** in the **Pipelines** tab under **Ingestion** in the CloudWatch Console. Follow the pipeline wizard steps and provide the SQS queue ARN and required pipeline IAM role when prompted. Optionally provide a data source name and type to attach to the log group destination in CloudWatch Logs.

Be sure to configure a CloudWatch Logs resource policy if one isn't already configured to the destination log group and then select **Create pipeline** in the **Review and create** step. The pipeline will be created and data will begin to flow within 5 minutes if successful.

Amazon S3 cross account as a source

You can grant access across accounts with Amazon S3 so that CloudWatch pipelines can access S3 buckets in another account as a source. To enable cross-account access, see Bucket owner granting cross-account bucket permissions in the *Amazon S3 User Guide*. After you have granted access, ensure that your pipeline role has the required permissions.

Then, you can create a pipeline using `bucket_owners` to enable cross-account access to an Amazon S3 bucket as a source.

Custom source configuration

When creating a pipeline for custom sources:

- A parser must be the first processor in the pipeline
- You can specify any supported processor for custom log pipelines

AWS service logs from CloudWatch Logs

Intercepts log events from CloudWatch Logs that match the log event metadata configuration.

> **Important**
>
> Pipelines with processors mutate the log events in the original CloudWatch log group they are intercepted from for logs from AWS services.

Configuration

Configure the CloudWatch Logs source with the following parameters:

```
source:
  cloudwatch_logs:
    aws:
```

```
      sts_role_arn: "arn:aws:iam::123456789012:role/MyCloudWatchLogsRole"
    log_event_metadata:
      data_source_name: "<data_source_name>"
      data_source_type: "<data_source_type>"
```

Parameters

`aws.sts_role_arn` (required)

The ARN of the IAM role to assume for CloudWatch Logs interception.

`log_event_metadata.data_source_name` (required)

Identifies the specific AWS service that generated the log events or a custom log source name. For custom logs, this can be any string up to 15 characters when `data_source_type` is "default".

`log_event_metadata.data_source_type` (required)

Specifies the category or type of logs within the AWS service, or "default" for custom logs. Set to "default" to enable custom log source names.

For more information on data source name and type, see the CloudWatch Logs User Guide.

Restrictions

The following restrictions apply to CloudWatch Logs sources:

- No two pipelines can use the `cloudwatch_logs` source with identical `data_source_name` and `data_source_type` metadata criteria.
- When `data_source_name` is `aws_cloudtrail`, only empty processors (`[]`) or the `ocsf` processor are allowed.

CloudWatch pipelines processors

CloudWatch pipelines processors transform, parse, and enrich log data as it flows through the pipeline. A pipeline can have up to 20 processors that are applied sequentially in the order they are defined.

Processor categories

Category	Description
Parsers	Convert raw log data into structured formats, such as Open Cybersecurity Schema Framework (OCSF), CSV, JSON, and so on
Transformers	Modify log data structure; add, copy, move, or delete fields
String Processors	Manipulate string values; case conversion, trimming, substitution

Topics

- Parser processors
- Transformation processors
- String manipulation processors
- Common processor use cases
- Processor compatibility and restrictions

Parser processors

Parser processors convert raw or semi-structured log data into structured formats. Each pipeline can have at most one parser processor, which must be the first processor in the pipeline.

OCSF processor

Parses and transforms log data according to Open Cybersecurity Schema Framework (OCSF) standards.

Configuration

Configure the OCSF processor with the following parameters:

```
processor:
  - ocsf:
      version: "1.5"
      mapping_version: 1.5.0
      schema:
          microsoft_office365_management_activity:
```

Parameters

`version` (required)

The OCSF schema version to use for transformation. Must be 1.5

`mapping_version` (required)

The OCSF mapping version for transformation. Must be 1.5.0.

`schema` (required)

Schema object specifying the data source type. The supported schemas depend on the pipeline source type - each source type has its own set of compatible OCSF schemas. You must use a schema that matches your pipeline's source type.

This table lists the supported schema combinations.

Pipeline Source Type	Supported Schemas	Version	Mapping Version
`cloudwatch_logs`	`cloud_trail:`	`1.5`	Not required
`cloudwatch_logs`	`route53_resolver:`	`1.5`	Not required
`cloudwatch_logs`	`vpc_flow:`	`1.5`	Not required
`cloudwatch_logs`	`eks_audit:`	`1.5`	Not required
`cloudwatch_logs`	`aws_waf:`	`1.5`	Not required
`s3`	Any OCSF schema	Any	Any
`microsoft_office365`	`microsoft_office365:`	`1.5`	`1.5.0`
`microsoft_entraid`	`microsoft_entraid:`	`1.5`	`1.5.0`
`microsoft_windows_event`	`microsoft_windows_event:`	`1.5`	`1.5.0`

Pipeline Source Type	Supported Schemas	Version	Mapping Version
paloaltonetworks_nextgenerationfirewall	paloaltonetworks_nextgenerationfirewall:	1.5	1.5.0
okta_auth0	okta_auth0:	1.5	1.5.0
okta_sso	okta_sso:	1.5	1.5.0
crowdstrike_falcon	crowdstrike_falcon:	1.5	1.5.0
github_auditlogs	github_auditlogs:	1.5	1.5.0
sentinelone_endpointsecurity	sentinelone_endpointsecurity:	1.5	1.5.0
servicenow_cmdb	servicenow_cmdb:	1.5	1.5.0
wiz_cnapp	wiz_cnapp:	1.5	1.5.0
zscaler_internetaccess	zscaler_internetaccess:	1.5	1.5.0

CSV processor

Parses CSV formatted data into structured fields.

Configuration

Configure the CSV processor with the following parameters:

```
processor:
  - csv:
      column_names: ["col1", "col2", "col3"]
```

```
      delimiter: ","
      quote_character: '"'
```

Parameters

`column_names` (optional)

Array of column names for parsed fields. Maximum 100 columns, each name up to 128 characters. If not provided, defaults to column_1, column_2, and so on.

`delimiter` (optional)

Character used to separate CSV fields. Must be a single character. Defaults to comma (,).

`quote_character` (optional)

Character used to quote CSV fields containing delimiters. Must be a single character. Defaults to double quote (").

To use the processor without specifying additional parameters, use the following command:

```
processor:
  - csv: {}
```

Grok processor

Parses unstructured data using Grok patterns. At most 1 Grok is supported per pipeline. For details on the Grok transformer in CloudWatch Logs see Processors that you can use in the *CloudWatch Logs User Guide*.

Configuration

Configure the Grok processor with the following parameters:

When the data source is a dictionary, you can use this configuration:

```
processor:
  - grok:
      match:
       source_key: ["%{WORD:level} %{GREEDYDATA:msg}"]
```

When the data source is CloudWatch Logs, you can use this configuration:

```
processor:
  - grok:
      match:
       source_key: ["%{WORD:level} %{GREEDYDATA:msg}"]
```

Parameters

`match` (required)

Field mapping with Grok patterns. Only one field mapping allowed.

`match.<field>` (required)

Array with single Grok pattern. Maximum 512 characters per pattern.

VPC processor

Parses VPC Flow Log data into structured fields.

Configuration

Configure the VPC processor with the following parameters:

```
processor:
  - parse_vpc: {}
```

JSON processor

Parses JSON data into structured fields.

Configuration

Configure the JSON processor with the following parameters:

```
processor:
  - parse_json:
      source: "message"
      destination: "parsed_json"
```

Parameters

`source` (optional)

The field containing the JSON data to parse. If omitted, the entire log message is processed

`destination` (optional)

The field where the parsed JSON will be stored. If omitted, parsed fields are added to the root level

Route 53 processor

Parses Route 53 resolver log data into structured fields.

Configuration

Configure the Route 53 processor with the following parameters:

```
processor:
  - parse_route53: {}
```

Key-value processor

Parses key-value pair formatted data into structured fields.

Configuration

Configure the key-value processor with the following parameters:

```
processor:
  - key_value:
      source: "message"
      destination: "parsed_kv"
      field_delimiter: "&"
      key_value_delimiter: "="
```

Parameters

`source` (optional)

Field containing key-value data. Maximum 128 characters.

`destination` (optional)

Target field for parsed key-value pairs. Maximum 128 characters.

`field_delimiter` (optional)

Pattern to split key-value pairs. Maximum 10 characters.

`key_value_delimiter` (optional)

Pattern to split keys from values. Maximum 10 characters.

`overwrite_if_destination_exists` (optional)

Whether to overwrite existing destination field.

`prefix` (optional)

Prefix to add to extracted keys. Maximum 128 characters.

non_match_value (optional)

Value for keys without matches. Maximum 128 characters.

To use the processor without specifying additional parameters, use the following command:

```
processor:
  - key_value: {}
```

Transformation processors

Transformation processors modify the structure of log events by adding, copying, moving, or removing fields.

add_entries processor

Adds static key-value pairs to log events. At most 1 `add_entries` processor can be added to a pipeline.

Configuration

Configure the add_entries processor with the following parameters:

```
processor:
  - add_entries:
```

```
      entries:
        - key: "environment"
          value: "production"
          overwrite_if_key_exists: false
```

Parameters

`entries` (required)

Array of key-value pairs to add to each log event.

`entries[].key` (required)

The field name to add to the log event. Supports nested fields using dot notation.

`entries[].value` (required)

The static value to assign to the key.

`entries[].overwrite_if_key_exists` (optional)

Boolean flag that determines behavior when the key already exists. Defaults to false.

copy_values processor

Copies values from one field to another. At most 1 `copy_values` processor can be added to a pipeline.

Configuration

Configure the copy_values processor with the following parameters:

```
processor:
  - copy_values:
      entries:
        - from_key: "user_id"
          to_key: "backup_user"
          overwrite_if_to_key_exists: false
```

Parameters

`entries` (required)

Array of copy operations to perform on each log event.

`entries[].from_key` (required)

The field name to copy the value from. Uses dot notation for nested fields.

`entries[].to_key` (required)

The field name to copy the value to. Will create nested structures if using dot notation.

`entries[].overwrite_if_to_key_exists` (optional)

Boolean flag controlling behavior when target field already exists. Defaults to false.

delete_entries processor

Removes specified fields from log events.

Configuration

Configure the delete_entries processor with the following parameters:

```
processor:
  - delete_entries:
      with_keys: ["temp_field", "debug_info"]
```

Parameters

`with_keys` (required)

Array of field names to remove from each log event. Supports nested field deletion using dot notation.

move_keys processor

Moves fields from one location to another.

Configuration

Configure the move_keys processor with the following parameters:

```
processor:
  - move_keys:
```

```
      entries:
        - from_key: "old_field"
          to_key: "new_field"
          overwrite_if_to_key_exists: true
```

Parameters

`entries` (required)

Array of move operations. Maximum 5 entries.

`entries[].from_key` (required)

Source field name. Maximum 128 characters.

`entries[].to_key` (required)

Target field name. Maximum 128 characters.

`entries[].overwrite_if_to_key_exists` (optional)

Whether to overwrite existing target field.

flatten processor

Flattens nested object structures.

Configuration

Configure the flatten processor with the following parameters:

```
processor:
  - flatten:
      source: "metadata"
      target: "flattened"
      remove_processed_fields: true
      exclude_keys: ["sensitive_data"]
```

Parameters

`source` (required)

Field containing nested object to flatten.

`target` (required)

Target field prefix for flattened keys.

`remove_processed_fields` (optional)

Whether to remove the original nested field after flattening.

`exclude_keys` (optional)

Array of keys to exclude from flattening. Maximum 20 keys, each up to 128 characters.

String manipulation processors

String processors modify text values within log events through operations like case conversion, trimming, and pattern matching.

lowercase_string processor

Converts specified fields to lowercase.

Configuration

Configure the lowercase_string processor with the following parameters:

```
processor:
  - lowercase_string:
      with_keys: ["status", "method"]
```

Parameters

`with_keys` (required)

Array of field names to convert to lowercase. Only processes string values.

uppercase_string processor

Converts specified fields to uppercase.

Configuration

Configure the uppercase_string processor with the following parameters:

```
processor:
  - uppercase_string:
      with_keys: ["status_code", "method"]
```

Parameters

`with_keys` (required)

Array of field names to convert to uppercase. Only processes string values.

trim_string processor

Removes leading and trailing whitespace from specified fields.

Configuration

Configure the trim_string processor with the following parameters:

```
processor:
  - trim_string:
      with_keys: ["message", "user_input"]
```

Parameters

`with_keys` (required)

Array of field names to trim whitespace from. Only processes string values.

substitute_string processor

Performs string substitution using regular expressions.

Configuration

Configure the substitute_string processor with the following parameters:

```
processor:
```

```
  - substitute_string:
      entries:
        - source: "message"
          from: "ERROR"
          to: "WARN"
```

Parameters

`entries` (required)

Array of substitution operations to perform on each log event.

`entries[].source` (required)

The field to perform string substitution on.

`entries[].from` (required)

The regular expression pattern to match and replace.

`entries[].to` (required)

The replacement string for matched patterns.

truncate processor

Truncates field values to specified length.

Configuration

Configure the truncate processor with the following parameters:

```
processor:
  - truncate:
      source_keys: ["message", "description"]
      length: 100
      start_at: 0
```

Parameters

`source_keys` (required)

Array of field names to truncate. Each field name maximum 128 characters.

`length` (optional)

Maximum length after truncation. Range: 1-8192.

`start_at` (optional)

Starting position for truncation. Range: 0-8192. Defaults to 0.

extract_value processor

Extracts values using regular expressions.

Configuration

Configure the extract_value processor with the following parameters:

```
processor:
  - extract_value:
      entries:
        - source: "message"
          target: "extracted_data"
          from: "user=(?<user>\\w+)"
          to: "${user}"
          target_type: "string"
```

Parameters

`entries` (required)

Array of extraction operations. Maximum 20 entries.

`entries[].source` (required)

Field to extract from. Maximum 128 characters.

`entries[].target` (required)

Target field for extracted value. Maximum 128 characters.

`entries[].from` (required)

Regular expression pattern. Maximum 128 characters.

`entries[].to` (required)

Replacement pattern with capture groups. Maximum 128 characters.

`entries[].target_type` (optional)

Target data type ("integer", "double", "string", "boolean").

convert_entry_type processor

Converts field values between different data types.

Configuration

Configure the convert_entry_type processor with the following parameters:

```
processor:
  - convert_entry_type:
      key: "count"
      type: "integer"
```

Parameters

`key` (required)

Single field name to convert.

`type` (required)

Target data type. Options: "integer", "double", "string", "boolean".

date processor

Parses and formats date/time fields.

Configuration

Configure the date processor with the following parameters:

```
processor:
  - date:
      match:
        - key: "timestamp"
          patterns: ["yyyy-MM-dd'T'HH:mm:ss.SSSSSS'Z'"]
      destination: "@timestamp"
```

```
      source_timezone: "UTC"
      destination_timezone: "America/New_York"
```

Parameters

`match` (required)

Array of date matching configurations. Maximum 10 entries.

`match[].key` (required)

Field containing the date string. Maximum 128 characters.

`match[].patterns` (required)

Array of date format patterns to try. Maximum 5 patterns, each up to 256 characters.

`destination` (optional)

Single target field for all parsed dates. Maximum 128 characters.

`source_timezone` (optional)

Source timezone for parsing.

`destination_timezone` (optional)

Target timezone for output.

`output_format` (optional)

Output date format. Maximum 64 characters.

`destination_type` (optional)

Output type - "timestampz", "long", or "string".

dissect processor

Extracts structured data using pattern matching.

Configuration

Configure the dissect processor with the following parameters:

```
processor:
```

```
  - dissect:
      map:
        message: "%{timestamp} %{level}"
```

Parameters

`map` (required)

Field mapping with dissect patterns.

list_to_map processor

Converts array fields to map structures.

Configuration

Configure the list_to_map processor with the following parameters:

```
processor:
  - list_to_map:
      source: "tags"
      key: "name"
      value_key: "value"
      target: "tag_map"
```

Parameters

`source` (required)

Field containing array data. Maximum 128 characters.

`key` (required)

Field name to use as map key. Maximum 128 characters.

`value_key` (optional)

Field name to use as map value. Maximum 128 characters.

`target` (optional)

Target field for map structure. Maximum 128 characters.

`flatten` (optional)

Whether to flatten the resulting map.

`flattened_element` (optional)

Which element to use when flattening ("first" or "last").

rename_keys processor

Renames fields in log events.

Configuration

Configure the rename_keys processor with the following parameters:

```
processor:
  - rename_keys:
      entries:
        - from_key: "old_name"
          to_key: "new_name"
          overwrite_if_to_key_exists: true
```

Parameters

`entries` (required)

Array of rename operations. Maximum 5 entries.

`entries[].from_key` (required)

Current field name. Maximum 128 characters.

`entries[].to_key` (required)

New field name. Maximum 128 characters.

`entries[].overwrite_if_to_key_exists` (optional)

Whether to overwrite existing target field.

select_entries processor

Selects only specified fields from events.

Configuration

Configure the select_entries processor with the following parameters:

```
processor:
  - select_entries:
      include_keys: ["timestamp", "level", "message"]
```

Parameters

`include_keys` (required)

Array of field names to keep. Maximum 50 keys, each up to 128 characters.

translate processor

Translates field values using lookup tables.

Configuration

Configure the translate processor with the following parameters:

```
processor:
  - translate:
      mappings:
        - source: "status_code"
          targets:
            - target: "status_text"
              map:
                "200": "OK"
                "404": "Not Found"
```

Parameters

`mappings` (required)

Array of translation configurations. Maximum 10 mappings.

`mappings[].source` (required)

Field to translate. Maximum 128 characters.

`mappings[].targets` (required)

Array of target configurations. Maximum 10 targets.

`mappings[].targets[].target` (required)

Target field name. Maximum 128 characters.

`mappings[].targets[].map` (required)

Translation mapping. Maximum 100 entries, each value up to 512 characters.

Common processor use cases

Here are common scenarios and example configurations for combining processors:

Example Standardize log formats and add metadata

Parse JSON logs, standardize field names, and add environment information:

```
processor:
  - parse_json: {}
  - rename_keys:
      entries:
        - from_key: "timestamp"
          to_key: "@timestamp"
        - from_key: "log_level"
          to_key: "level"
  - add_entries:
      entries:
        - key: "environment"
          value: "production"
        - key: "application"
          value: "payment-service"
```

Example Clean and normalize field values

Standardize status codes and remove sensitive data:

```
processor:
  - uppercase_string:
      with_keys: ["status", "method"]
```

```
  - delete_entries:
      with_keys: ["credit_card", "password"]
  - substitute_string:
      entries:
        - source: "status"
          from: "SUCCESS"
          to: "OK"
```

Example Extract and transform specific fields

Extract user information and format for analysis:

```
processor:
  - extract_value:
      entries:
        - source: "user_agent"
          target: "browser"
          from: "(?<browser>Chrome|Firefox|Safari)"
          to: "${browser}"
  - lowercase_string:
      with_keys: ["browser"]
  - move_keys:
      entries:
        - from_key: "browser"
          to_key: "user_data.browser"
```

Processor compatibility and restrictions

General processor rules

Maximum count

A pipeline can have at most 20 processors.

Parser placement

Parser processors (OCSF, CSV, Grok, etc.), if used, must be the first processor in a pipeline.

Unique processors

The following processors can appear only once per pipeline:

- `add_entries`

- `copy_values`

Processor Type	CloudWatch Logs Source	S3 Source	API-based Sources
OCSF	Must be first processor	Must be first processor	Must be first processor
parse_vpc	Must be first processor	Not applicable	Not applicable
parse_route53	Must be first processor	Not applicable	Not applicable
parse_json	Must be first processor	Must be first processor	Must be first processor
grok	Must be first processor	Must be first processor	Must be first processor
csv	Must be first processor	Not compatible	Not compatible
key_value	Must be first processor	Must be first processor	Must be first processor
add_entries	Must be first processor	Must be first processor	Must be first processor
copy_values	Must be first processor	Must be first processor	Must be first processor
String processors (lowercase, uppercase, trim)	Must be first processor	Must be first processor	Must be first processor
Field processors (move_keys, rename_keys)	Must be first processor	Must be first processor	Must be first processor

Processor Type	CloudWatch Logs Source	S3 Source	API-based Sources
Data transformation (date, flatten)	Must be first processor	Must be first processor	Must be first processor

Compatibility definitions

Must be first processor

When used, must be the first processor in the pipeline configuration

Not compatible

Cannot be used with this source type

Not applicable

Processor is not relevant for this source type

Processor-specific restrictions

Processor restrictions by source type

Processor	Source Type	Restrictions
OCSF	CloudWatch Logs with CloudTrail	• Only allowed when `data_source_name` is `aws_cloudtrail` • Must use CloudTrail-specific schema version • Cannot be combined with other processors
OCSF	API-based Sources	• Must use source-specific schema (e.g., microsoft_office365_management_activity for Office 365) • Requires specific mapping version for each source type • Must be first processor in pipeline

Processor	Source Type	Restrictions
parse_vpc	CloudWatch Logs	• Only valid for VPC Flow Logs • Must be first processor • Input must contain raw VPC Flow Log format
parse_route53	CloudWatch Logs	• Only valid for Route 53 Resolver Query Logs • Must be first processor • Input must contain Route 53 Resolver query log format
add_entries	All Sources	• Maximum one instance per pipeline • Key names must be valid according to field naming rules
copy_values	All Sources	• Maximum one instance per pipeline • Source fields must exist in the event

Important

When using processors with restrictions:

- Always validate your pipeline configuration using the `ValidateTelemetryPipelineConfiguration` API before deployment
- Test the pipeline with sample data using the `TestTelemetryPipeline` API to ensure proper processing
- Monitor pipeline metrics after deployment to ensure events are being processed as expected

Sinks

Sinks define the destination where processed log data is sent. Each pipeline must have exactly one sink. Currently, only CloudWatch Logs sink is supported.

Sink behavior by source type

Source Type	Log Group Configuration	Behavior
CloudWatch Logs	Must use `@original`	Events are sent back to their original log group
S3	Custom log group path	Events are sent to the specified log group
Third-party APIs	Custom log group path	Events are sent to the specified log group

Configuration

Configure the sink with the following parameters:

Example Non-CloudWatch Logs source configuration

```
sink:
  cloudwatch_logs:
    log_group: "/aws/my-application/logs"
```

Example CloudWatch Logs source configuration

```
sink:
  cloudwatch_logs:
    log_group: "@original"
```

Parameters

`log_group` (required)

The name of the CloudWatch Logs log group where processed events will be sent. For pipelines with non-`cloudwatch_logs` sources, this must be an existing log group name. For pipelines using the `cloudwatch_logs` source, the ONLY allowed value is `@original`.

Requirements and limitations

Log group existence

If created using the AWS Management Console, CloudWatch will attempt to create the specified log group and appropriate resource policy if it does not exist when using a non-CloudWatch logs source. Otherwise, the specified log group must exist before creating the pipeline.

Event size

Each log event cannot exceed 256 KB in size after processing.

Log group retention

The pipeline uses the retention settings configured on the destination log group.

Log group resource policy

CloudWatch Logs resource policies are required for pipelines that write to log groups, except for pipelines using the `cloudwatch_logs` source. When you use the AWS Management Console to configure the pipeline, CloudWatch will attempt to add the resource policy if needed. If you are creating the pipeline using the AWS CLI or an API, you must create the policy manually and add it using the `logs:PutResourcePolicy` request. For more information, see Resource policies.

Cross-Region support

The destination log group must be in the same Region as the pipeline.

Important

For pipelines using the `cloudwatch_logs` source type:

- You must use `@original` as the log group value.
- Events are always sent back to their original log group.
- The original log group must exist throughout the pipeline's lifecycle.
- Pipelines with processors mutate the log events in the original CloudWatch log group they are intercepted from for logs from AWS services.

> **Note**
>
> Log events are subject to CloudWatch Logs quotas and limitations.

CloudWatch pipelines IAM policies and permissions

This section provides detailed IAM requirements for CloudWatch pipelines, including permissions for API callers, source-specific policies, trust relationships, and resource policies.

API caller permissions

Any role specified in the pipeline configuration that calls the `CreateTelemetryPipeline` API (such as S3 source roles, Secrets Manager access roles, or CloudWatch Logs source roles) must have specific permissions to pass roles.

PassRole permissions

Required for any roles specified in the pipeline configuration (S3 source roles, Secrets Manager access roles, or CloudWatch Logs source roles).

Example IAM policy for S3 sources

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "PassRoleForS3Source",
            "Effect": "Allow",
            "Action": "iam:PassRole",
            "Resource": "arn:aws:iam::your-account-id:role/your-s3-source-role"
        }
    ]
}
```

Example IAM policy for Secrets Manager sources

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
```

```
            "Sid": "PassRoleForSecretsManagerSource",
            "Effect": "Allow",
            "Action": "iam:PassRole",
            "Resource": "arn:aws:iam::your-account-id:role/your-secrets-manager-role"
        }
    ]
}
```

Example IAM Policy for CloudWatch Logs Sources

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "PassRoleForCloudWatchLogsSource",
            "Effect": "Allow",
            "Action": "iam:PassRole",
            "Resource": "arn:aws:iam::your-account-id:role/your-cloudwatch-logs-role""
        }
  ]
}
```

Pipeline rule permissions

When using `cloudwatch_logs` source for Create/Update operations (`logs:PutPipelineRule`) and Delete operations (`logs:DeletePipelineRule`) the role must also have permissions to perform those operations.

Example IAM policy for CloudWatch Logs pipeline rules

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "PipelineRuleForCloudWatchLogs",
            "Effect": "Allow",
            "Action": [
                "logs:PutPipelineRule",
                "logs:DeletePipelineRule"
            ],
            "Resource": "*"
        }
```

```
    ]
}
```

Reducing scope with condition keys

To scope down the permission policy to telemetry pipelines, you can specify Condition Keys as shown in the following examples:

Example IAM policy for S3 sources (basic)

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "PassRoleForS3Source",
            "Effect": "Allow",
            "Action": "iam:PassRole",
            "Resource": "arn:aws:iam::your-account-id:role/your-s3-source-role"
        }
    ]
}
```

Example IAM policy for S3 sources (scoped down with condition keys)

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "PassRoleForS3Source",
            "Effect": "Allow",
            "Action": "iam:PassRole",
            "Resource": "arn:aws:iam::your-account-id:role/your-s3-source-role",
            "Condition": {
              "StringEquals": {
                "iam:PassedToService": [
                  "telemetry-pipelines.observabilityadmin.amazonaws.com"
                ],
                "iam:AssociatedResourceARN": [
                  "arn:aws:observabilityadmin:your-region:your-account-id:telemetry-
pipeline/*"
                ]
              }
            }
```

```
        }
    ]
}
```

Example IAM policy for Secrets Manager sources (basic)

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "PassRoleForSecretsManagerSource",
            "Effect": "Allow",
            "Action": "iam:PassRole",
            "Resource": "arn:aws:iam::your-account-id:role/your-secrets-manager-role"
        }
    ]
}
```

Example IAM policy for Secrets Manager sources (scoped down with condition keys)

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
          "Sid": "PassRoleForSecretsManagerSource",
          "Effect": "Allow",
          "Action": "iam:PassRole",
          "Resource": "arn:aws:iam::your-account-id:role/your-secrets-manager-role",
          "Condition": {
            "StringEquals": {
              "iam:PassedToService": [
                "telemetry-pipelines.observabilityadmin.amazonaws.com"
              ],
              "iam:AssociatedResourceARN": [
                "arn:aws:observabilityadmin:your-region:your-account-id:telemetry-
pipeline/*"
              ]
            }
          }
        }
    ]
}
```

Example IAM policy for CloudWatch Logs sources (scoped down with condition keys)

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
          "Sid": "PassRoleForCloudWatchLogsSource",
          "Effect": "Allow",
          "Action": "iam:PassRole",
          "Resource": "arn:aws:iam::your-account-id:role/your-cloudwatch-logs-role",
          "Condition": {
            "StringEquals": {
              "iam:PassedToService": [
                "logs.amazonaws.com"
              ],
              "iam:AssociatedResourceARN": [
                "arn:aws:observabilityadmin:your-region:your-account-id:telemetry-
pipeline/*"
              ]
            }
          }
        }
    ]
}
```

Source-specific IAM policies

Different source types require specific IAM permissions to access their respective data sources.

CloudWatch Logs sources

For CloudWatch Logs sources, any IAM role specified in the pipeline configuration must have a trust relationship with `logs.amazonaws.com`.

Example IAM role trust policy for CloudWatch Logs sources (basic)

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            ""Effect": "Allow",
            "Principal": {
                "Service": "logs.amazonaws.com"
```

```
            },
            "Action": "sts:AssumeRole"
        }
    ]
}
```

S3 sources

For S3 sources, customers must provide an IAM role with permissions to access S3 objects and SQS queues.

Example IAM policy for S3 sources

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "s3-access",
            "Effect": "Allow",
            "Action": [
                "s3:GetObject"
            ],
            "Resource": "arn:aws:s3:::your-bucket-name/*"
        },
        {
            "Sid": "sqs-access",
            "Effect": "Allow",
            "Action": [
                "sqs:ReceiveMessage",
                "sqs:DeleteMessage",
                "sqs:ChangeMessageVisibility"
            ],
            "Resource": "arn:aws:sqs:your-region:your-account-id:your-queue-name"
        },
        {
            "Sid": "kms-access",
            "Effect": "Allow",
            "Action": "kms:Decrypt",
            "Resource": "arn:aws:kms:your-region:your-account-id:key/your-key-id",
            "Condition": {
                "Comment": "Only required if S3 buckets and/or SQS queue uses KMS
 encryption"
            }
        }
```

```
    ]
}
```

Sources using AWS Secrets Manager

For sources that reference AWS Secrets Manager (Microsoft Office 365, Microsoft Entra ID, Palo Alto NGFW), customers must provide an IAM role with Secrets Manager access.

Example IAM policy for Secrets Manager sources

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "secrets-manager-access",
            "Effect": "Allow",
            "Action": [
                "secretsmanager:GetSecretValue"
            ],
            "Resource": "arn:aws:secretsmanager:your-region:your-account-
id:secret:your-secret-name*"
        },
        {
            "Sid": "kms-access",
            "Effect": "Allow",
            "Action": "kms:Decrypt",
            "Resource": "arn:aws:kms:your-region:your-account-id:key/your-key-id",
            "Condition": {
                "Comment": "Only required if Secrets Manager uses KMS encryption"
            }
        }
    ]
}
```

Trust relationships

Any IAM role specified in the pipeline configuration must have a trust relationship with the CloudWatch pipelines service principal.

Pipeline role trust policy

All pipeline roles must trust the `telemetry-pipelines.observabilityadmin.amazonaws.com` service principal.

Example Trust policy for pipeline roles

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "Service": "telemetry-pipelines.observabilityadmin.amazonaws.com"
            },
            "Action": "sts:AssumeRole"
        }
    ]
}
```

Resource policies

CloudWatch Logs resource policies are required for pipelines that write to log groups, except for pipelines using the `cloudwatch_logs` source.

CloudWatch Logs resource policy

After calling `CreateTelemetryPipeline` API, you will receive a pipeline ARN. For pipelines where the source is not `cloudwatch_logs`, customers must call `logs:PutResourcePolicy` to allow the CloudWatch pipelines service principal to write to the configured log group.

> **Timing constraint**
>
> You have a limited time window (less than 5 minutes) to create the resource policy after receiving the pipeline ARN. If the pipeline becomes active before the policy is in place, data will be dropped.

Example logs:PutResourcePolicy request

```
{
    "policyName": "resourceArn=arn:aws:logs:your-region:your-account-id:log-group:your-log-group-name:*",
    "policyDocument": {
        "Version": "2012-10-17",
        "Statement": [
```

```
            {
                "Effect": "Allow",
                "Principal": {
                    "Service": "telemetry-pipelines.observabilityadmin.amazonaws.com"
                },
                "Action": [
                    "logs:CreateLogStream",
                    "logs:PutLogEvents"
                ],

                "Condition": {
                    "StringEquals": {
                        "aws:SourceArn": "arn:aws:observabilityadmin:your-region:your-
account-id:telemetry-pipeline/your-pipeline-id"
                    }
                }
            }
        ]
    }
}
```

Managing resource policies

This guide provides steps for creating or updating a CloudWatch Logs resource policy for telemetry pipelines using the AWS CLI.

Check for existing policies:

```
aws logs describe-resource-policies --resource-arn arn:aws:logs:your-region:your-
account-id:log-group:your-log-group-name:*
```

This returns all existing resource policies attached to the log group. Look for any policy that might already be associated with your log group.

If no resource policy exists, create a new one:

```
aws logs put-resource-policy \
        --region <YOUR-REGION> \
        --policy-name  "resourceArn": "arn:aws:logs:your-region:your-account-id:log-
group:your-log-group-name:*"\
        --policy-document '{
    "Version": "2012-10-17",
    "Statement": [
```

```
        {
            "Effect": "Allow",
            "Principal": {
                "Service": "telemetry-pipelines.observabilityadmin.amazonaws.com"
            },
            "Action": [
                "logs:CreateLogStream",
                "logs:PutLogEvents"
            ],
            "Condition": {
                "StringEquals": {
                    "aws:SourceArn": "arn:aws:observabilityadmin:your-region:your-
account-id:telemetry-pipeline/your-pipeline-id"
                }
            }
        }
    ]
}'
```

Replace the following placeholders:

- *your-region* - Your AWS region (e.g., us-east-1)
- *your-account-id* - Your 12-digit AWS account ID
- *your-log-group-name* - Your CloudWatch Logs log group name
- *your-pipeline-id* - Your telemetry pipeline ID

If a resource policy already exists, merge the new statement with it:

1. Retrieve the existing policy:

```
aws logs describe-resource-policies --resource-arn arn:aws:logs:your-region:your-
account-id:log-group:your-log-group-name:*
```

2. Open `existing-policy.json` and add the new statement to the existing `Statement` array:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
```

```
                "Service": "existing-service.amazonaws.com"
            },
            "Action": [
                "logs:SomeAction"
            ]
        },
        {
            "Effect": "Allow",
            "Principal": {
                "Service": "telemetry-pipelines.observabilityadmin.amazonaws.com"
            },
            "Action": [
                "logs:CreateLogStream",
                "logs:PutLogEvents"
            ],

            "Condition": {
                "StringEquals": {
                    "aws:SourceArn": "arn:aws:observabilityadmin:your-region:your-
account-id:telemetry-pipeline/your-pipeline-id"
                }
            }
        }
    ]
}
```

3. Update the policy:

```
aws logs put-resource-policy \
        --region your-region \
        --policy-name resourceArn=arn:aws:logs:your-region:your-account-id:log-
group:your-log-group-name:* \
        --policy-document file://existing-policy.json
```

Confirm the policy was created or updated successfully:

```
aws logs describe-resource-policies --resource-arn arn:aws:logs:your-region:your-
account-id:log-group:your-log-group-name:*
```

CloudWatch pipelines extensions

CloudWatch pipelines extensions provide additional functionality to the pipeline. You can use the AWS Secrets Manager integration for credential management.

AWS Secrets Manager extension

Configures access to AWS Secrets Manager for retrieving credentials and sensitive configuration values. This extension is only supported for third-party sources that require authentication credentials.

Configuration

Configure the AWS Secrets Manager extension with the following parameters:

```
extension:
  aws:
    secrets:
      <secret-name>:
        secret_id: "<secret arn>"
        region: "<secret region>"
        sts_role_arn: "arn:aws:iam::123456789012:role/Example-Role"
        refresh_interval: PT1H
        disable_refresh: false
```

Parameters

`aws.secrets.<secret-name>.secret_id` (required)

The ARN of the AWS Secrets Manager secret containing the credentials.

`aws.secrets.<secret-name>.region` (required)

The AWS region where the secret is stored.

`aws.secrets.<secret-name>.sts_role_arn` (required)

The ARN of the IAM role to assume for accessing the AWS Secrets Manager secret.

`aws.secrets.<secret-name>.refresh_interval` (optional)

How often to refresh the secret from AWS Secrets Manager. Uses ISO 8601 duration format. Defaults to PT1H (1 hour).

`aws.secrets.<secret-name>.disable_refresh` (optional)

Whether to disable automatic secret refresh. Defaults to false.

Secret reference syntax

Reference secrets in your pipeline configuration using the following syntax:

```
${{aws_secrets:<secret-name>:<key>}}
```

For example, to reference a client ID and secret:

```
source:
  microsoft_office365:
    authentication:
      oauth2:
        client_id: "${{aws_secrets:office365-creds:client_id}}"
        client_secret: "${{aws_secrets:office365-creds:client_secret}}"
```

Requirements and limitations

Secret format

Secrets must be stored as JSON key-value pairs in AWS Secrets Manager.

Cross-Region access

Secrets can be accessed from any Region where AWS Secrets Manager is available.

Refresh interval limits

Minimum refresh interval is 5 minutes (PT5M). Maximum is 24 hours (PT24H).

Maximum secrets

A pipeline can reference up to 10 different secrets.

Important

Consider the following when using secrets:

- Ensure the IAM role has appropriate permissions to access the secrets
- Monitor secret access using AWS CloudTrail

- Use separate secrets for different environments (development, production)

Monitoring Pipelines Using CloudWatch Metrics

CloudWatch pipelines publishes metrics to Amazon CloudWatch in the `AWS/Observability Admin` namespace. You can use these metrics to monitor your pipelines' health, performance, and data flow.

Available metrics

The following tables list the available metrics for CloudWatch pipelines.

> **Note**
>
> Pipelines metrics are only emitted when the value is non-zero.

Core metrics

Metric	Description	Dimension	Unit
`PipelineBytesIn`	Volume of log records going into pipeline in uncompressed bytes	PipelineName	Bytes
`PipelineBytesInByDataSource`	Volume of incoming data with source/type breakdown	PipelineName, DataSource, DataType	Bytes
`PipelineBytesOut`	Volume of data routed to destination	PipelineName	Bytes
`PipelineBytesOutByDataSource`	Volume of outgoing data with source/type breakdown	PipelineName, DataSource, DataType	Bytes

Metric	Description	Dimension	Unit
PipelineRecordsIn	Number of records entering the pipeline	PipelineName	Count
PipelineRecordsInByDataSource	Number of incoming records with source/type breakdown	PipelineName, DataSource, DataType	Count
PipelineRecordsOut	Number of records exiting the pipeline	PipelineName	Count
PipelineRecordsOutByDataSource	Number of outgoing records with source/type breakdown	PipelineName, DataSource, DataType	Count

Error and warning metrics

Metric	Description	Dimension	Unit
PipelineErrors	Aggregate count of errors in pipeline	PipelineName	Count
PipelineErrorsByErrorType	Detailed error counts by type	PipelineName, ErrorSource, ErrorComponent, ErrorType	Count
PipelineWarnings	Number of warnings encountered	PipelineName	Count
PipelineWarningsByWarningType	Detailed warnings by type	PipelineName, WarningSource, WarningComponent, WarningType	Count

Metric	Description	Dimension	Unit
`PipelineRecordsUnprocessed`	Number of records that couldn't be processed	PipelineName, DataSource, DataType	Count
`PipelineRecordsDropped`	Number of records dropped (third-party sources only)	PipelineName, DataSource, DataType	Count

Dimensions

CloudWatch pipelines metrics use the following dimensions:

PipelineName

Name of the pipeline

DataSource

Source of the data (AWS service name or third-party source)

DataType

Type of data being processed

ErrorSource

Origin of the error (s3, aws.secrets, cloudwatch_logs)

ErrorComponent

Component where error occurred (source, sink, extension)

ErrorType

Type of error encountered

Error types

The following error types are tracked in `PipelineErrorsByErrorType`:

ACCESS_DENIED

Permission-related failures

ALL

The total count of all errors on the pipeline

RESOURCE_NOT_FOUND

Specified resource doesn't exist

SOURCE_READ_FAILURE

Failures reading from source

PARSE_FAILURE

Data parsing errors

PROCESSOR_ERRORS

Processing operation failures

PAYLOAD_SIZE_EXCEEDED

Data size limit exceeded

Warning types

The following warning type can occur on a pipeline:

THROTTLED

Indicates that the volume of data being sent has exceeded existing rate limits, causing some data points or events to be dropped or delayed to protect the system and ensure stability.

Viewing metrics

You can view CloudWatch pipelines metrics using the following methods:

Using the CloudWatch console

1. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/
2. In the navigation pane, choose **Metrics**

3. Choose the **AWS/Observability Admin** namespace
4. Select the metric dimension to view

Using the AWS CLI

```
aws cloudwatch get-metric-statistics \
  --namespace "AWS/Observability Admin" \
  --metric-name "PipelineBytesIn" \
  --dimensions Name=PipelineName,Value=my-pipeline \
  --start-time "2025-10-29T00:00:00" \
  --end-time "2025-10-29T23:59:59" \
  --period 300 \
  --statistics Sum
```

Creating alarms

You can create CloudWatch alarms based on any of these metrics. Here's an example of creating an alarm for pipeline errors:

```
aws cloudwatch put-metric-alarm \
  --alarm-name "HighPipelineErrors" \
  --alarm-description "Alert on high error rate" \
  --metric-name "PipelineErrors" \
  --namespace "AWS/Observability Admin" \
  --dimensions Name=PipelineName,Value=my-pipeline \
  --period 300 \
  --evaluation-periods 2 \
  --threshold 10 \
  --comparison-operator GreaterThanThreshold \
  --statistic Sum \
  --alarm-actions arn:aws:sns:region:account-id:topic-name
```

Best practices for CloudWatch pipelines metrics

Monitor data flow

- Use `PipelineBytesIn` and `PipelineBytesOut` to track data volume
- Monitor `PipelineRecordsIn` and `PipelineRecordsOut` to track record counts
- Watch for unexpected changes in throughput patterns

Track errors and warnings

- Create alarms for `PipelineErrors` to detect issues quickly
- Use `PipelineErrorsByErrorType` to diagnose specific problems
- Monitor `PipelineWarnings` to identify potential issues early

Configure appropriate thresholds

- Base thresholds on your expected data patterns
- Account for normal variations in data volume
- Consider peak usage periods when setting alarm thresholds

Troubleshooting

This section covers common issues you might encounter when working with CloudWatch pipelines and their solutions.

Pipeline creation failures

- **Issue:** Pipeline creation fails with permission errors

  Solution: Verify that your IAM role has the required PassRole permissions for any roles specified in the pipeline configuration
- **Issue:** Configuration validation errors

  Solution: Use the ValidateTelemetryPipeline API to check your configuration syntax before creating the pipeline
- **Issue:** Log source not available to select

  Possible reason: There is already a log source with the same data source name and type. Duplicate combinations are greyed out since you can only create one of each.

Data processing issues

- **Issue:** No data flowing through pipeline

Solution: Check that your data source is properly configured and generating data, and verify that CloudWatch Logs resource policies are correctly set

- **Issue:** Processor errors in pipeline

  Solution: Review processor configuration and ensure input data format matches processor expectations

Monitor across accounts and Regions

To enable unified monitoring across accounts, CloudWatch offers the following features:

- **CloudWatch cross-account observability**– facilitate observability within a single Region with the Observability Access Manager (OAM) service. You can link accounts and easily view metrics, logs, traces, and other telemetry between accounts. This helps you to unify observability in central monitoring accounts that view telemetry shared from source accounts, and operate on this shared telemetry as if it were native to the monitoring account.
- **Cross-account cross-Region CloudWatch console**– delivers a console experience that allows you to view dashboards, metrics, and alarms consoles of other accounts across Regions by toggling between accounts. After you set up the necessary permissions, you use an account selector integrated into the alarms, dashboards, and metrics consoles to view metrics, dashboards, and alarms in other accounts without having to log in and out of the accounts. By enabling this feature, you can also set up dashboards that contain cross-account cross-Region metrics for centralized visibility within an account.
- **Cross-account cross-Region log centralization**– collects copies of log data from multiple member accounts into one data repository using cross-account and cross-region centralization rules. You define the rules that automatically replicate log data from multiple accounts and AWS Regions into a centralized account within your organization. This capability streamlines log consolidation for improved centralized monitoring, analysis, and compliance across your entire AWSinfrastructure.

These three features are complementary to each other and can be used independently or together. See the following table for a comparison of the features. We recommend that you use CloudWatch cross-account observability for the richest cross-account observability and discovery experience within a Region for your metrics, logs, and traces.

	CloudWatch cross-account observability	Cross-account cross-Region CloudWatch console	Cross-account cross-Region log centralization
What is it?	Unified access to underlying telemetry and other observability resources across	A designated monitoring account assume a **CrossAccountSharingRole** defined in source	Amazon CloudWatch Logs data centralization capability streamlines log consolidation for

	CloudWatch cross-account observability	Cross-account cross-Region CloudWatch console	Cross-account cross-Region log centralization
	multiple accounts. After this is configured, observability resources are seamlessly viewable between accounts, eliminating the need for role assumptions. The central monitoring account gains direct access to the telemetry data and resources from source accounts, streamlining the monitoring and observability process.	accounts from the CloudWatch console. By assuming this role, the monitoring account can invoke operations such as dashboard viewing on behalf of source accounts, directly from its console.	improved centralized monitoring, analysis, and compliance across your entire AWS infrastructure.

	CloudWatch cross-account observability	Cross-account cross-Region CloudWatch console	Cross-account cross-Region log centralization
How does it work?	A monitoring account, using the Observability Access Monitoring service, creates a *sink* and attaches a sink policy to it. The sink policy defines which resources they would like to view and which source accounts should share them. Then source accounts can create a link to the monitoring account sink, establishing what they actually want to share. After the link is created, the specified resources are visible in the monitoring account.	A source account initiates the configuration by setting up a **CrossAccountSharingRole**, allowing a monitoring account to run operations in the source account. Then, a monitoring account enables the cross-account cross-Region selector in the console by specifying the source account ID. This enables the monitoring account to be able to switch into the source account. When switching, the CloudWatch console checks for the existence of a service-linked role that allows CloudWatch to assume the **CrossAccountSharingRole** that was created in the source account.	Amazon CloudWatch Logs data centralization works with AWS Organizations to copy log data from multiple member accounts into one data repository using cross-account and cross-region centralization rules. You define the rules that automatically replicate log data from multiple accounts and AWS Regions into a centralized account within your organization.
What telemetry is supported?	• Metrics • Traces • Logs	• Metrics • Traces	• Logs

	CloudWatch cross-account observability	Cross-account cross-Region CloudWatch console	Cross-account cross-Region log centralization
What functionality is supported?	• Dashboarding • Alarms • Metrics Insights • Anomaly Detection • CloudWatch Logs insights • Application Insights • Other functionalities. For more details see CloudWatch cross-account observability.	• Console switching between accounts and Regions in metrics, alarms, and traces consoles. • Custom dashboards with metrics and alarms from other accounts and Regions For more details, see Cross-account cross-Region CloudWatch console.	CloudWatch Logs Insights Subscription filters Metric filters
How many accounts can I use it with?	A monitoring account can see resources from as many as 100,000 source accounts at the same time. A source account can share their resources with as many as five different monitoring accounts.	By using the cross-account cross-Region selector in the console, a monitoring account can switch to one other account at a time but there is no limit on the number of accounts that can be linked. When defining cross-account dashboards and alarms, many source accounts can be referenced.	Works with AWS Organizations supported number of accounts

	CloudWatch cross-account observability	Cross-account cross-Region CloudWatch console	Cross-account cross-Region log centralization
Does it move telemetry data?	No. Resources are shared between accounts with the exception of copied traces.	No. An IAM policy is configured to allow embedded account switching for cross-account cross-Region resource visibility.	Yes
How much does it cost?	No extra charges for shared logs and metrics, and the first trace copy is free. For more information about pricing, see Amazon CloudWatch pricing.	No additional charges for cross-account or cross-Region actions.	You can centralize one copy of logs for free. Additional copies are charged at $0.05/GB of logs centralized (the backup region feature is considered an additional copy). For information about storage cost pricing in the destination account and other value-added experiences see Amazon CloudWatch Pricing.
Does it support observability across Regions?	No	Yes	Yes, you can centralize data across Regions.
Does it support programmatic access?	Yes. the AWS CLI, AWS Cloud Development Kit (AWS CDK), and APIs are supported.	No	Yes

	CloudWatch cross-account observability	Cross-account cross-Region CloudWatch console	Cross-account cross-Region log centralization
Does it support programmatic setup?	Yes	Yes	Yes
Does it support AWS Organizations?	Yes	Yes	Yes. AWS Organizations is required to use this feature.

Topics

- CloudWatch cross-account observability
- Cross-account cross-Region CloudWatch console

CloudWatch cross-account observability

With Amazon CloudWatch cross-account observability, you can monitor and troubleshoot applications that span multiple accounts within a Region. Seamlessly search, visualize, and analyze your metrics, logs, traces, Application Signals services and service level objectives (SLOs), Application Insights applications, and internet monitors in any of the linked accounts without account boundaries.

Set up one or more AWS accounts as *monitoring accounts* and link them with multiple *source accounts*. A monitoring account is a central AWS account that can view and interact with observability data generated from source accounts. A source account is an individual AWS account that generates observability data for the resources that reside in it. Source accounts share their observability data with the monitoring account. The shared observability data can include the following types of telemetry:

- Metrics in Amazon CloudWatch. You can choose to share the metrics from all namespaces with the monitoring account, or filter to a subset of namespaces.

- Log groups in Amazon CloudWatch Logs. You can choose to share all log groups with the monitoring account, or filter to a subset of log groups.
- Traces in AWS X-Ray
- Services and Service level objectives (SLOs) in Application Signals
- Applications in Amazon CloudWatch Application Insights
- Monitors in CloudWatch Internet Monitor

To create links between monitoring accounts and source accounts, you can use the CloudWatch console. Alternatively, use the *Observability Access Manager* commands in the AWS CLI and API. For more information, see Observability Access Manager API Reference.

A *sink* is a resource that represents an attachment point in a monitoring account. Source accounts can link to the sink to share observability data. Each account can have one sink per Region. Each sink is managed by the monitoring account where it is located. An *observability link* is a resource that represents the link established between a source account and a monitoring account. Links are managed by the source account.

For a video demonstration of setting up CloudWatch cross-account observability, see the following video.

The next topic explains how to set up CloudWatch cross-account observability in both monitoring accounts and source accounts. For information about the cross-account cross-Region CloudWatch dashboard, see Cross-account cross-Region CloudWatch console.

Use Organizations for source accounts

There are two options for linking source accounts to your monitoring account. You can use one or both options.

- Use AWS Organizations to link accounts in an organization or organizational unit to the monitoring account.
- Connect individual AWS accounts to the monitoring account.

We recommend that you use Organizations so that new AWS accounts created later in the organization are automatically onboarded to cross-account observability as source accounts.

Details about linking monitoring accounts and source accounts

- Each monitoring account can be linked to as many as 100,000 source accounts.
- Each source account can share data with as many as five monitoring accounts.
- You can set up a single account as both a monitoring account and a source account. If you do, this account sends only the observability data from itself to its linked monitoring account. It does not relay the data from its source accounts.
- A monitoring account specifies which telemetry types can be shared with it. A source account specifies which telemetry types it wants to share.
  - If there are more telemetry types selected in the *monitoring account* than in the source account, the accounts are linked. Only the data types that are selected in both accounts are shared.
  - If there are more telemetry types selected in the *source account* than in the monitoring account, the link creation fails and nothing is shared.
  - A metric name doesn't appear in the monitoring account console until that metric emits new data points after the link is created.
- To remove a link between accounts, do so from the source account.
- To delete a sink in a monitoring account, you must first remove all links to that sink the monitoring account.

Pricing

Cross-account observability in CloudWatch comes with no extra cost for logs and metrics, Application Signals, and the first trace copy is free. For more information about pricing, see Amazon CloudWatch Pricing.

Contents

- Link monitoring accounts with source accounts
  - Necessary permissions
    - Permissions needed to create links
    - Permissions needed to monitor across accounts
  - Setup overview
  - Step 1: Set up a monitoring account
  - Step 2: (Optional) Download an CloudFormation template or URL

- Step 3: Link the source accounts
  - Use an CloudFormation template to set up all accounts in an organization or an organizational unit as source accounts
  - Use an CloudFormation template to set up individual source accounts
  - Use a URL to set up individual source accounts
- Manage monitoring accounts and source accounts
  - Link more source accounts to an existing monitoring account
  - Remove the link between a monitoring account and source account
  - View information about a monitoring account

Link monitoring accounts with source accounts

The topics in this section explain how to set up links between monitoring accounts and source accounts.

We recommend that you create a new AWS account to serve as the monitoring account for your organization.

Contents

- Necessary permissions
  - Permissions needed to create links
  - Permissions needed to monitor across accounts
- Setup overview
- Step 1: Set up a monitoring account
- Step 2: (Optional) Download an CloudFormation template or URL
- Step 3: Link the source accounts
  - Use an CloudFormation template to set up all accounts in an organization or an organizational unit as source accounts
  - Use an CloudFormation template to set up individual source accounts
  - Use a URL to set up individual source accounts

Necessary permissions

Permissions needed to create links

To create links between a monitoring account and a source account, you must be signed in with certain permissions.

- **To set up a monitoring account** – You must have either full administrator access in the monitoring account, or you must sign in to that account with the following permissions:

  JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "AllowSinkModification",
            "Effect": "Allow",
            "Action": [
                "oam:CreateSink",
                "oam:DeleteSink",
                "oam:PutSinkPolicy",
                "oam:TagResource"
            ],
            "Resource": "*"
        },
        {
            "Sid": "AllowReadOnly",
            "Effect": "Allow",
            "Action": ["oam:Get*", "oam:List*"],
            "Resource": "*"
        }
    ]
}
```

- **Source account, scoped to a specific monitoring account** – To create, update, and manage links for just one specified monitoring account, you must sign in to account with at least the following permissions. In this example, the monitoring account is 999999999999.

  If the link isn't going to share all seven resource types (metrics, logs, traces, Application Insights applications, Application Signals services and service level objectives (SLOs), and Internet Monitor monitors), you can omit `cloudwatch:Link`, `logs:Link`, `xray:Link`,

`applicationinsights:Link`, `application-signals:Link`, or `internetmonitor:Link` as needed.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Action": [
                "oam:CreateLink",
                "oam:UpdateLink",
                "oam:DeleteLink",
                "oam:GetLink",
                "oam:TagResource"
            ],
            "Effect": "Allow",
            "Resource": "arn:*:oam:*:*:link/*"
        },
        {
            "Action": [
                "oam:CreateLink",
                "oam:UpdateLink"
            ],
            "Effect": "Allow",
            "Resource": "arn:*:oam:*:*:sink/*",
            "Condition": {
                "StringEquals": {
                    "aws:ResourceAccount": [
                        "999999999999"
                    ]
                }
            }
        },
        {
            "Action": "oam:ListLinks",
            "Effect": "Allow",
            "Resource": "*"
        },
        {
            "Action": "cloudwatch:Link",
            "Effect": "Allow",
            "Resource": "*"
        },
```

```
        {
            "Action": "logs:Link",
            "Effect": "Allow",
            "Resource": "*"
        },
        {
            "Action": "xray:Link",
            "Effect": "Allow",
            "Resource": "*"
        },
        {
             "Action": "applicationinsights:Link",
             "Effect": "Allow",
             "Resource": "*"
         },
        {
             "Action": "internetmonitor:Link",
             "Effect": "Allow",
             "Resource": "*"
        },
        {
             "Action": "application-signals:Link",
             "Effect": "Allow",
             "Resource": "*"
        }
    ]
}
```

- **Source account, with permissions to link to any monitoring account** – To create a link to any existing monitoring account sink and share metrics, log groups, traces, Application Insights applications, and Internet Monitor monitors, you must sign in to the source account with full administrator permissions or sign in there with the following permissions

  If the link isn't going to share all seven resource types (metrics, logs, traces, Application Insights applications, Application Signals services and service level objectives (SLOs), and Internet Monitor monitors), you can omit `cloudwatch:Link`, `logs:Link`, `xray:Link`, `applicationinsights:Link`, `application-signals:Link`, or `internetmonitor:Link` as needed.

  JSON

```
{
    "Version":"2012-10-17",
```

```
    "Statement": [{
            "Effect": "Allow",
            "Action": [
                "oam:CreateLink",
                "oam:UpdateLink"
            ],
            "Resource": [
                "arn:aws:oam:*:*:link/*",
                "arn:aws:oam:*:*:sink/*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "oam:List*",
                "oam:Get*"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [

                "oam:GetLink",
                "oam:TagResource"
            ],
            "Resource": "arn:aws:oam:*:*:link/*"
        },
        {
            "Action": "cloudwatch:Link",
            "Effect": "Allow",
            "Resource": "*"
        },
        {
            "Action": "xray:Link",
            "Effect": "Allow",
            "Resource": "*"
        },
        {
            "Action": "logs:Link",
            "Effect": "Allow",
            "Resource": "*"
        },
        {
```

```
            "Action": "applicationinsights:Link",
            "Effect": "Allow",
            "Resource": "*"
        },
        {
            "Action": "internetmonitor:Link",
            "Effect": "Allow",
            "Resource": "*"
        },
        {
            "Action": "application-signals:Link",
            "Effect": "Allow",
            "Resource": "*"
        }
    ]
}
```

Permissions needed to monitor across accounts

After a link has been created, to view source account information from a monitoring account, you must be signed in to an account with one of the following:

- Full administrator access in the monitoring account
- The following cross-account permissions, in addition to permissions to view the specific types of resources that you will be monitoring

```
{
   "Sid": "AllowReadOnly",
   "Effect": "Allow",
   "Action": [
     "oam:Get*",
     "oam:List*"
   ],
   "Resource": "*"
 }
```

Setup overview

The following high-level steps show you how to set up CloudWatch cross-account observability.

> **Note**
>
> We recommend creating a new AWS account to use as your organization's monitoring account.

1. Set up a dedicated monitoring account.
2. (Optional) Download an CloudFormation template or copy a URL to link source accounts.
3. Link source accounts to the monitoring account.

After completing these steps, you can use the monitoring account to view the observability data of the source accounts.

Step 1: Set up a monitoring account

Follow the steps in this section to set up an AWS account as a monitoring account for CloudWatch cross-account observability.

Prerequisites

- **If you're setting up accounts in an AWS Organizations organization as the source accounts** – Get the organization path or organization ID.
- **If you're not using Organizations for the source accounts** – Get the account IDs of the source accounts.

To set up an account as a monitoring account, you must have certain permissions. For more information, see Necessary permissions.

To set up a monitoring account

1. Sign in to the account that you want to use as a monitoring account.
2. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.
3. In the left navigation pane, choose **Settings**.
4. By **Monitoring account configuration**, choose **Configure**.
5. For **Select data**, choose whether this monitoring account will be able to view **Logs**, **Metrics**, **Traces**, **Application Insights - Applications**, **Internet Monitor - Monitors**, and **Application**

Signals - Services, Service Level Objectives (SLOs) data from the source accounts it is linked to.

6. For **List source accounts**, enter the source accounts that this monitoring account will view. To identify the source accounts, enter individual account IDs, organization paths, or organization IDs. If you enter an organization path or organization ID, this monitoring account is allowed to view observability data from all linked accounts in that organization.

   Separate the entries in this list with commas.

   > **Important**
   >
   > When you enter an organization path, follow the exact format. The ou-id must end with a / (a slash character). For example: `o-a1b2c3d4e5/r-f6g7h8i9j0example/ou-def0-awsbbbb/`

7. For **Define a label to use to identify your source account**, you can define alabel that is used to create a CloudFormation template. The label is then applied to source accounts when that template is used to link the source accounts to this monitoring account.

   You can specify whether to use account names or email addresses in this label, and also use variables such as `$AccountName`, `$AcccountEmail`, and `$AcccountEmailNoDomain`.

   > **Note**
   >
   > In the AWS GovCloud (US-East) and AWS GovCloud (US-West) Regions, the only supported option is to use custom labels, and the `$AccountName`, `$AcccountEmail`, and `$AcccountEmailNoDomain` variables all resolve as *`account-id`* instead of the specified variable.

8. Choose **Configure**.

> **Important**
>
> The link between the monitoring and source accounts is not complete until you configure the source accounts. For more information, see the following sections.

Step 2: (Optional) Download an CloudFormation template or URL

To link source accounts to a monitoring account, we recommend using an AWS CloudFormation template or a URL.

- **If you are linking an entire organization** – CloudWatch provides an CloudFormation template.
- **If you are linking individual accounts** – Use either an CloudFormation template or a URL that CloudWatch provides.

To use an CloudFormation template, you must download it during these steps. After you link the monitoring account with at least one source account, the CloudFormation template is no longer available to download.

To download an CloudFormation template or copy a URL for linking source accounts to the monitoring account

1. Sign in to the account that you want to use as a monitoring account.
2. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.
3. In the left navigation pane, choose **Settings**.
4. By **Monitoring account configuration**, choose **Resources to link accounts**.
5. Do one of the following:
   - Choose **AWS organization** to get a template to use to link accounts in an organization to this monitoring account.
   - Choose **Any account** to get a template or URL for setting up individual accounts as source accounts.
6. Do one of the following:
   - If you chose **AWS organization**, choose **Download CloudFormation template**.
   - If you chose **Any account**, choose either **Download CloudFormation template** or **Copy URL**.
7. (Optional) Repeat steps 5-6 to download both the CloudFormation template and the URL.

Step 3: Link the source accounts

Use the steps in these sections to link source accounts to a monitoring account.

To link monitoring accounts with source accounts, you must have certain permissions. For more information, see Necessary permissions.

Use an CloudFormation template to set up all accounts in an organization or an organizational unit as source accounts

These steps assume that you already downloaded the necessary CloudFormation template by performing the steps in Step 2: (Optional) Download an CloudFormation template or URL.

To use an CloudFormation template to link accounts in an organization or organizational unit to the monitoring account

1. Sign in to the organization's management account.
2. Open the CloudFormation console at https://console.aws.amazon.com/cloudformation.
3. In the left navigation bar, choose **StackSets**.
4. Check that you are signed in to the Region that you want, then choose **Create StackSet**.
5. Choose **Next**.
6. Choose **Template is ready** and choose **Upload a template file**.
7. Choose **Choose file**, choose the template that you downloaded from the monitoring account, and choose **Open**.
8. Choose **Next**.
9. For **Specify StackSet details**, enter a name for the StackSet and choose **Next**.
10. For **Add stacks to stack set**, choose **Deploy new stacks**.
11. For **Deployment targets**, choose whether to deploy to the entire organization or to specified organizational units.
12. For **Specify regions**, choose which Regions to deploy CloudWatch cross-account observability to.
13. Choose **Next**.
14. On the **Review** page, confirm your selected options and choose **Submit**.
15. In the **Stack instances** tab, refresh the screen until you see that your stack instances have the status **CREATE_COMPLETE**.

Use an CloudFormation template to set up individual source accounts

These steps assume that you already downloaded the necessary CloudFormation template by performing the steps in Step 2: (Optional) Download an CloudFormation template or URL.

To use an CloudFormation template to set up individual source accounts for CloudWatch cross-account observability

1. Sign in to the source account.
2. Open the CloudFormation console at https://console.aws.amazon.com/cloudformation.
3. In the left navigation bar, choose **Stacks**.
4. Check that you are signed in to the Region that you want, then choose **Create stack**, **With new resources (standard)**.
5. Choose **Next**.
6. Choose **Upload a template file**.
7. Choose **Choose file**, choose the template that you downloaded from the monitoring account, and choose **Open**.
8. Choose **Next**.
9. For **Specify stack details**, enter a name for the stack and choose **Next**.
10. On the **Configure stack options** page, choose **Next**.
11. On the **Review** page, choose **Submit**.
12. On the status page for your stack, refresh the screen until you see that your stack has the status **CREATE_COMPLETE**.
13. To use this same template to link more source accounts to this monitoring account, sign out of this account and sign in to the next source account. Then repeat steps 2-12.

Use a URL to set up individual source accounts

These steps assume that you already copied the necessary URL by performing the steps in Step 2: (Optional) Download an CloudFormation template or URL.

To use a URL to link individual source accounts to the monitoring account

1. Sign in to the account that you want to use as a source account.
2. Enter the URL that you copied from the monitoring account.

You see the CloudWatch settings page, with some information filled in.

3. For **Select data**, choose whether this source account will share **Logs**, **Metrics**, **Traces**, **Application Insights - Applications**, and **Internet Monitor - Monitors** data to this monitoring account.

   For both **Logs** and **Metrics**, you can choose whether to share all resources or a subset with the monitoring account.

   a. (Optional) To share a subset of this account's log groups with the monitoring account, select **Logs** and choose **Filter Logs**. Then use the **Filter Logs** box to construct a query to find the log groups that you want to share. The query will use the term `LogGroupName` and one or more of the following operands.

      - = and `!=`
      - `AND`
      - `OR`
      - `^` indicates LIKE and `!^` indicates NOT LIKE. These can be used only as prefix searches. Include a `%` at the end of the string that you want to search for and include.
      - `IN` and `NOT IN`, using parentheses (`(  )`)

      The complete query must be no more than 2000 characters and is limited to five conditional operands. Conditional operands are `AND` and `OR`. There isn't a limit on the number of other operands.

      > **Tip**
      >
      > Choose **View sample queries** to see the correct syntax for common query formats.

   b. (Optional) To share a subset of this account's metric namespaces with the monitoring account, select **Metrics** and choose **Filter Metrics**. Then use the **Filter Metrics** box to construct a query to find the metric namespaces that you want to share. Use the term `Namespace` and one or more of the following operands.

      - = and `!=`
      - `AND`
      - `OR`

- `LIKE` and `NOT LIKE`. These can be used only as prefix searches. Include a `%` at the end of the string that you want to search for and include.
- `IN` and `NOT IN`, using parentheses `(  )`

The complete query must be no more than 2000 characters and is limited to five conditional operands. Conditional operands are `AND` and `OR`. There isn't a limit on the number of other operands.

> **Tip**
>
> Choose **View sample queries** to see the correct syntax for common query formats.

4. Do not change the ARN in **Enter monitoring account configuration ARN**.
5. The **Define a label to identify your source account** section is pre-filled with the label choice from the monitoring account, if there is one. Optionally, choose **Edit** to change it.

> **Note**
>
> In the AWS GovCloud (US-East) and AWS GovCloud (US-West) Regions, the only supported option is to use custom labels, and the `$AccountName`, `$AcccountEmail`, and `$AcccountEmailNoDomain` variables all resolve as *`account-id`* instead of the specified variable.

6. Choose **Link**.
7. Enter **`Confirm`** in the box and choose **Confirm**.
8. To use this same URL to link more source accounts to this monitoring account, sign out of this account and sign in to the next source account. Then repeat steps 2-7.

Manage monitoring accounts and source accounts

After you set up your monitoring accounts and source accounts, you can use the steps in these sections to manage them.

Contents

- Link more source accounts to an existing monitoring account

- Remove the link between a monitoring account and source account
- View information about a monitoring account

Link more source accounts to an existing monitoring account

Follow the steps in this section to add links from additional source accounts to an existing monitoring account.

Each source account can be linked to as many as five monitoring accounts. Each monitoring account can be linked to as many as 100,000 source accounts.

To manage a source account, you must have certain permissions. For more information, see Necessary permissions.

To add more source accounts to a monitoring account

1. Sign in to the monitoring account.
2. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.
3. In the left navigation pane, choose **Settings**.
4. By **Monitoring account configuration**, choose **Manage source accounts**.
5. Choose the **Configuration policy** tab.
6. In the **Configuration policy** box, add the new source account ID in the **Principal** line.

   For example, suppose the **Principal** line is currently the following:

   ```
   "Principal": {"AWS": ["111111111111", "222222222222"]}
   ```

   To add 999999999999 as a third source account, edit the line to the following:

   ```
   "Principal": {"AWS": ["111111111111", "222222222222", "999999999999"]}
   ```
7. Choose **Update**.
8. Choose the **Configuration details** tab.
9. Choose the copy icon that is next to the monitoring account's sink ARN.
10. Sign in to the account that you want to use as a new source account.
11. Paste the monitoring account's sink ARN that you copied in Step 9.

You see the CloudWatch settings page, with some information filled in.

12. For **Select data**, choose whether this source account will send **Logs**, **Metrics**, **Traces**, and **Application Insights - Applications**, **Internet Monitor - Monitors**, and **Application Signals - Services, Service Level Objectives (SLOs)** data to the monitoring accounts it is linked to.
13. Do not change the ARN in **Enter monitoring account configuration ARN**.
14. The **Define a label to identify your source account** section is pre-filled with the label choice from the monitoring account, if there is one. Optionally, choose **Edit** to change it.

> **Note**
>
> In the AWS GovCloud (US-East) and AWS GovCloud (US-West) Regions, the only supported option is to use custom labels, and the `$AccountName`, `$AcccountEmail`, and `$AcccountEmailNoDomain` variables all resolve as *`account-id`* instead of the specified variable.

15. Choose **Link**.
16. Enter **`Confirm`** in the box and choose **Confirm**.

Remove the link between a monitoring account and source account

Follow the steps in this section to stop sending data from one source account to a monitoring account.

> **Note**
>
> After the source account stops sharing the metrics with the *Monitoring* account, the *Source* account metrics data is not accessible to the monitoring account. Source metric names can be visible to the monitoring account for upto 14 days.

You must have the permissions required to manage a source account to complete this task. For more information, see Necessary permissions.

To remove the link between a source account and a monitoring account

1. Sign in to the source account.

2. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.
3. In the left navigation pane, choose **Settings**.
4. By **Source account configuration**, choose **View linked monitoring accounts**.
5. Select the check box next to the monitoring account that you want to stop sharing data with.
6. Choose **Remove monitoring account**, **Confirm**.
7. Sign in to the monitoring account.
8. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.
9. Choose **Settings**.
10. By **Monitoring account configuration**, choose **Manage monitoring account**.
11. In the **Configuration policy** box, delete the source account ID from the **Principal** line and choose **Update**.

View information about a monitoring account

Follow the steps in this section to view the cross-account settings for a monitoring account.

To manage a monitoring account, you must have certain permissions. For more information, see Necessary permissions.

To manage a monitoring account

1. Sign in to the monitoring account.
2. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.
3. In the left navigation pane, choose **Settings**.
4. By **Monitoring account configuration**, choose **Manage monitoring accounts**.
5. To view the Observability Access Manager policy that enables this account to be a monitoring account, choose the **Configuration policy** tab.
6. To view the source accounts that are linked to this monitoring account, choose the **Linked source accounts** tab.
7. To view the monitoring account sink ARN, and the types of data that this monitoring account can view in linked source accounts, choose the **Linked source accounts** tab.

Cross-account cross-Region CloudWatch console

> **Note**
>
> We recommend that you use CloudWatch cross-account observability to get the richest cross-account observability and discovery experience for your metrics, logs, and traces within a Region. For more information, see CloudWatch cross-account observability.

The cross-account, cross-Region CloudWatch console allows you to easily switch between different accounts and Region by using selectors in the console to view the dashboards, alarms, and metrics in other accounts and Regions. This feature also allows you to create cross-account, cross-Region dashboards which summarize your CloudWatch metrics from multiple AWS accounts and multiple Regions into a single dashboard, making them accessible without having to switch accounts or Regions.

Many organizations have their AWS resources deployed in multiple accounts, to provide billing and security boundaries. In this case, we recommend that you designate one or more of your accounts as your *monitoring accounts*, and build your cross-account cross-Region dashboards in these accounts. Cross-account cross-Region console functionality is integrated with AWS Organizations, to help you efficiently build your cross-account cross-Region dashboards.

The cross-account, cross-region CloudWatch console experience does not provide cross-account cross-Region visibility for logs. Additionally, it does not support the creation of alarms on metrics in other accounts or Regions from within a monitoring account.

Topics

- Enabling cross-account cross-Region functionality in CloudWatch
- (Optional) Integrate with AWS Organizations
- Troubleshooting your CloudWatch cross-account setup
- Monitoring account permissions for cross-account access
- Disabling and cleaning up after using cross-account

Enabling cross-account cross-Region functionality in CloudWatch

To set up cross-account cross-Region functionality in your CloudWatch console, use the CloudWatch console to set up your sharing accounts and monitoring accounts.

Set up a sharing account

You must enable sharing in each account that will make data available to the monitoring account.

This will grant the read-only permissions that you choose in step 5 to all users that view a cross account dashboard in the account that you share with, if the user has corresponding permissions in the account that you share with.

To enable your account to share CloudWatch data with other accounts

1. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.
2. In the navigation pane, choose **Settings**.
3. For **Share your CloudWatch data**, choose **Configure**.
4. For **Sharing**, choose **Specific accounts** and enter the IDs of the accounts that you want to share data with.

   Any accounts that you specify here can view your account's CloudWatch data. Specify the IDs only of accounts that you know and trust.
5. For **Permissions**, specify how to share your data with one of the following options:

   - **Provide read-only access to your CloudWatch metrics, dashboards, and alarms**. This option enables the monitoring accounts to create cross-account dashboards that include widgets that contain CloudWatch data from your account.
   - **Include CloudWatch automatic dashboards**. If you select this option, users in the monitoring account can also view the information in this account's automatic dashboards. For more information, see Getting started with CloudWatch automatic dashboards.
   - **Include X-Ray read-only access for the X-Ray Trace Map**. If you select this option, users in the monitoring account can also view the X-Ray trace map and X-Ray trace information in this account. For more information, see Using the X-Ray Trace Map.
   - **Include read-only access for Database Insights**. If you select this option, users in the monitoring account can also view Database Insights telemetry in this account. For more information, see Set up cross-account cross-region monitoring for CloudWatch Database Insights.
   - **Full read-only access to everything in your account**. This option enables the accounts that you use for sharing to create cross-account dashboards that include widgets that contain CloudWatch data from your account. It also enables those accounts to look deeper into your account and view your account's data in the consoles of other AWS services.

6. Choose **Launch CloudFormation template**.

   In the confirmation screen, type **`Confirm`**, and choose **Launch template**.

7. Select the **I acknowledge...** check box, and choose **Create stack**.

Sharing with an entire organization

Completing the preceding procedure creates an IAM role which enables your account to share data with one account. You can create or edit an IAM role that shares your data with all accounts in an organization. Do this only if you know and trust all accounts in the organization.

This will grant the read-only permissions listed in the policies shown in step 5 of the previous procedure to all users that view a cross-account dashboard in the account that you share with, if the user has corresponding permissions in the account that you share with.

To share your CloudWatch account data with all accounts in an organization

1. If you haven't already, complete the preceding procedure to share your data with one AWS account.
2. Sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.
3. In the navigation pane, choose **Roles**.
4. In the list of roles, choose **CloudWatch-CrossAccountSharingRole**.
5. Choose **Trust relationships**, **Edit trust relationship**.

   You see a policy like this:

   JSON

```
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "AWS": "arn:aws:iam::123456789012:root"
      },
      "Action": "sts:AssumeRole"
```

```
    }
  ]
}
```

6. Change the policy to the following, replacing *org-id* with the ID of your organization.

   JSON

```
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "AWS": "*"
      },
      "Action": "sts:AssumeRole",
      "Condition": {
        "StringEquals": {
          "aws:PrincipalOrgID": "org-id"
        }
      }

    }
  ]
}
```

7. Choose **Update Trust Policy**.

Set up a monitoring account

Enable each monitoring account if you want to view cross-account CloudWatch data.

When you complete the following procedure, CloudWatch creates a service-linked role that CloudWatch uses in the monitoring account to access data shared from your other accounts. This service-linked role is called **AWSServiceRoleForCloudWatchCrossAccount**. For more information, see Using service-linked roles for CloudWatch.

To enable your account to view cross-account CloudWatch data

1. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.

2. In the navigation pane, choose **Settings**, and then, in the **Cross-account cross-region** section, choose **Configure**.
3. Under the **View cross-account cross-region** section, choose **Enable**, and then select the **Show selector in the console** checkbox to enable an account selector to appear in the CloudWatch console when you're graphing a metric or creating an alarm.
4. Under **View cross-account cross-region**, choose one of the following options:

   - **Account Id Input**. This option prompts you to manually input an account ID each time that you want to switch accounts when you view cross-account data.
   - **AWS Organization account selector**. This option causes the accounts that you specified when you completed your cross-account integration with Organizations to appear. When you next use the console, CloudWatch displays a dropdown list of these accounts for you to select from when you are viewing cross-account data.

     To do this, you must have first used your organization management account to allow CloudWatch to see a list of accounts in your organization. For more information, see (Optional) Integrate with AWS Organizations.
   - **Custom account selector**. This option prompts you to enter a list of account IDs. When you next use the console, CloudWatch displays a dropdown list of these accounts for you to select from when you are viewing cross-account data.

     You can also enter a label for each of these accounts to help you identify them when choosing accounts to view.

     The account selector settings that a user makes here are retained only for that user, not for all other users in the monitoring account.
5. Choose **Enable**.

After you complete this setup, you can create cross-account dashboards. For more information, see Creating a customized CloudWatch dashboard.

Cross-Region functionality

Cross-Region functionality is built in to this feature automatically. You do not need to take any extra steps to be able to display metrics from different Regions in a single account on the same graph or the same dashboard. Cross-Region functionality is not supported for alarms, so you can't create an alarm in one Region that watches a metric in a different Region.

(Optional) Integrate with AWS Organizations

If you want to integrate cross-account functionality with AWS Organizations, you must make a list of all accounts in the organization available to the monitoring accounts.

To enable cross-account CloudWatch functionality to access a list of all accounts in your organization

1. Sign in to your organization's management account.
2. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.
3. In the navigation pane, choose **Settings**, then choose **Configure**.
4. For **Grant permission to view the list of accounts in the organization**, choose **Specific accounts** to be prompted to enter a list of account IDs. The list of accounts in your organization are shared with only the accounts that you specify here.
5. Choose **Share organization account list**.
6. Choose **Launch CloudFormation template**.

   In the confirmation screen, type **`Confirm`**, and choose **Launch template**.

Troubleshooting your CloudWatch cross-account setup

This section contains troubleshooting tips for cross-account, console deployment in CloudWatch.

I am getting access denied errors displaying cross-account data

Check the following:

- Your monitoring account should have a role named **AWSServiceRoleForCloudWatchCrossAccount**. If it does not, you need to create this role. For more information, see Set Up a Monitoring Account.
- Each sharing account should have a role named **CloudWatch-CrossAccountSharingRole**. If it does not, you need to create this role. For more information, see Set Up A Sharing Account.
- The sharing role must trust the monitoring account.

To confirm that your roles are set up properly for the CloudWatch cross-account console

1. Sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.

2. In the navigation pane, choose **Roles**.
3. In the list of roles, make sure the needed role exists. In a sharing account, look for **CloudWatch-CrossAccountSharingRole**. In a monitoring account, look for **AWSServiceRoleForCloudWatchCrossAccount**.
4. If you are in a sharing account and **CloudWatch-CrossAccountSharingRole** already exists, choose **CloudWatch-CrossAccountSharingRole**.
5. Choose **Trust relationships**, **Edit trust relationship**.
6. Confirm that the policy lists either the account ID of the monitoring account, or the organization ID of an organization that contains the monitoring account.

I don't see an account dropdown in the console

First, check that you have created the correct IAM roles, as discussed in the preceding troubleshooting section. If those are set up correctly, make sure that you have enabled this account to view cross-account data, as described in Enable Your Account to View Cross-Account Data.

Monitoring account permissions for cross-account access

To access an action in source accounts successfully, the user in the monitoring account must have the equivalent permission for all resources (*) for that action in the monitoring account. This is a local permission requirement in the monitoring account and is unrelated to permissions in the cross-account sharing role in source accounts.

Example

To start a Logs query in a source account, you must have wildcard (*) access to StartQuery in the monitoring account. The source account's cross-account role can still restrict access to specific log groups.

Supported - wildcard resource:

```
{
  "Effect": "Allow",
  "Action": "logs:StartQuery",
  "Resource": "*"
}
```

Not supported - specific ARN:

```
{
  "Effect": "Allow",
  "Action": "logs:StartQuery",
  "Resource": "arn:aws:logs:us-east-1:123456789012:log-group:/aws/lambda/my-function:*"
}
```

Disabling and cleaning up after using cross-account

To disable cross-account functionality for CloudWatch, follow these steps.

Step 1: Remove the cross-account stacks or roles

The best method is to remove the CloudFormation stacks that were used to enable cross-account functionality.

- In each of the sharing accounts, remove the **CloudWatch-CrossAccountSharingRole** stack.
- If you used AWS Organizations to enable cross-account functionality with all accounts in an organization, remove the **CloudWatch-CrossAccountListAccountsRole** stack in the organization's management account.

If you didn't use the CloudFormation stacks to enable cross-account functionality, do the following:

- In each of the sharing accounts, delete the **CloudWatch-CrossAccountSharingRole** IAM role.
- If you used AWS Organizations to enable cross-account functionality with all accounts in an organization, delete the **CloudWatch-CrossAccountSharing-ListAccountsRole** IAM role in the organization's management account.

Step 2: Remove the service-linked role

In the monitoring account, delete the **AWSServiceRoleForCloudWatchCrossAccount** service-linked IAM role.

Explore related telemetry

Computer systems can generate a large amount of telemetry, including both metrics and logs, and complex systems even more so. When looking at a specific set of telemetry, it can be a challenge to find other telemetry related to your initial set. It can take advanced training to gain the skills needed to find issues and troubleshoot them. Because systems are complex, understanding what is going on can involve viewing metrics and logs from many different services and resources, requiring context switching and navigating between systems.

The Amazon CloudWatch **Explore related** feature offers access to AWS resource relationships, related metrics, and logs across service consoles, enhancing observability and efficiency for operators of all skill levels. When viewing alarms or anomalies in CloudWatch dashboards, or metrics in AWS, users can quickly find and view metrics and logs for related resources in your system.

CloudWatch provides visibility into metrics and logs tied to specific resources, and the **Explore related** pane extends that by allowing you to correlate your infrastructure resources to your workloads with all of their associated telemetry. This gives you quick access to the information you need to troubleshoot infrastructure-related issues. You view the relationship between resources, and their related telemetry in the **Explore related** pane. The **Explore related** pane is accessed from CloudWatch or from other AWS consoles showing resources or telemetry.

> **Note**
>
> **Explore related** is currently limited in accounts set up as monitoring accounts in CloudWatch cross-account observability. You should access **Explore related** from the source accounts where the resources are originally created and managed. In source accounts, you can navigate between connected resources, and view related logs and metrics.

The following topics discuss the details of exploring related telemetry.

Topics

- What is related telemetry?
- How to access the Explore related pane
- Navigating related telemetry

- Using the topology map
- Finding a specific resource
- Permissions and prerequisites needed to view and explore related telemetry
- How does CloudWatch find related telemetry?
- AWS services that support related telemetry
- How to add related information to custom telemetry sent to CloudWatch

What is related telemetry?

Related telemetry is metrics and log data from resources that are related to the current resource or service. Traditionally, you might look at the metrics and logs that are related to a single load balancer, or all telemetry related to Amazon EC2. The **Explore related** feature in Amazon CloudWatch adds an interactive *topology map*. The map is a resource-centric view where you can find metrics and logs for a specific resource, but you can also see how that resource is connected to other resources.

For example, if you are looking at the telemetry for a load balancer in the **Explore related** pane, besides the metrics and logs associated with that load balancer, the maps shows you the target groups for that load balancer. Selecting one of the target groups will then show you the Amazon EC2 instances associated with that target group. At each step in this process, the telemetry, including metrics and logs, for the selected resources are shown, making it easy to quickly find the telemetry you are looking for, or to explore the telemetry, looking for the cause of a specific issue.

How to access the Explore related pane

Within the CloudWatch console, there are multiple ways to access telemetry related to your current view. For example, if you are looking at a graph on a dashboard, and you want to view telemetry related to that graph or an aspect of the graph, you can choose to explore related data directly from that graph. From many places in the console, you can choose an **Explore related** menu item, or select a compass icon () to show the **Explore related** pane.

You can access the exploring experience from entry points throughout the CloudWatch console (and other AWS consoles), including:

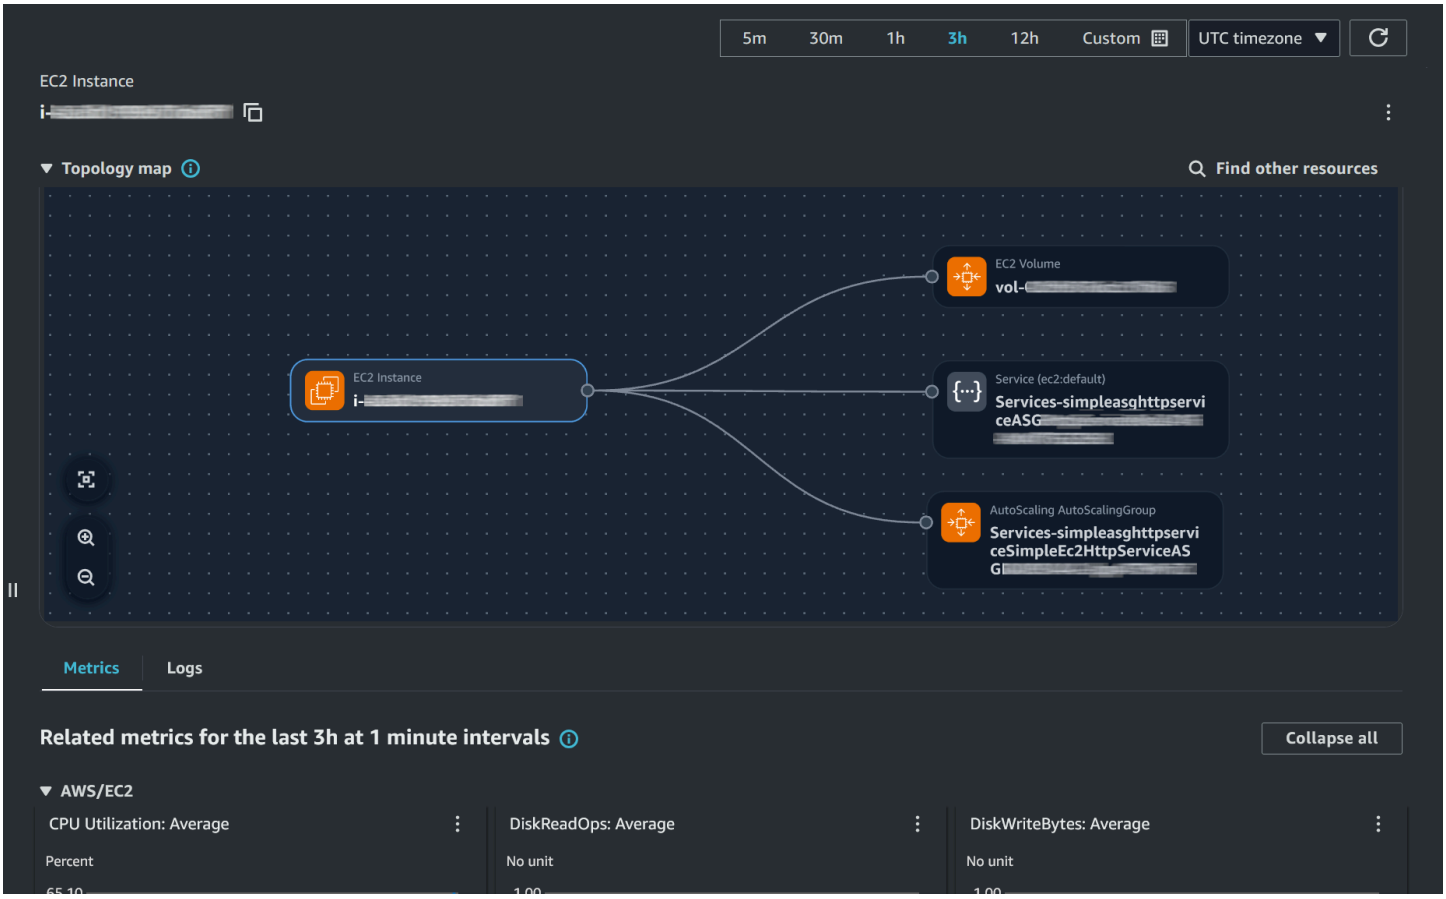
- **Metrics navigation** – When you choose **Metrics** then **All metrics** from the CloudWatch console left hand menu, the tile for any supported service or metric source will show the compass icon that brings up related telemetry in the bottom right corner.
- **Metric legend** – When viewing any metric graph (in CloudWatch or other AWS consoles), hovering over the legend of the graph shows information about the data, as well as an **Explore related** button that brings up the related telemetry.
- **Metric datapoints** – When viewing any metric graph, hovering over a datapoint in the graph shows information about the metric, as well as a compass icon, to bring up the related telemetry.
- **Metric search** – When searching for metrics in CloudWatch, if you choose a found metric name, you can select **Explore related** from the menu that pops up, which will bring up the related telemetry.
- **Console toolbar** – In many AWS console pages, the console toolbar (usually in the upper right of the console) includes a CloudWatch service icon, which will bring up CloudWatch tools, including the **Explore related** pane.

Depending on where you access the pane from, the default context of the pane will show an appropriate filter, if possible.

Navigating related telemetry

When you select any of the entry points to the **Explore related** pane, it appears on the right side of the CloudWatch console. This pane gives you access to view and find telemetry related to *entities*, in your system. An entity is a resource, such as an Amazon EC2 instance, or a service, such as an application that you have built. You can work within this pane without interrupting your current workflow, because it opens to the side of your initial page.

The following image shows the **Explore related** pane focused on a single Amazon EC2 instance, and the associated entities.



The top of the **Explore related** pane is a visual *topology map* (map) of the current entity and other related entities. The currently selected entity sets the focus for the pane. There are two ways to select an entity.

- Topology map – The *map* is a visual display of the current entity with focus. It also displays any related entities, allowing you to navigate around the set of resources and services that are related to each other.
- Find other resources – You can use the **Find other resources** button to filter and search for entities to use as the focus.

The bottom part of the pane shows you an automated search of metrics and logs for the current focal entity.

By default, the focus is set to an entity matching the location from which you accessed the **Explore related** pane. For example, if you accessed it by clicking the compass icon associated with a metric from a specific Amazon EC2 instance, then the focus will be set to that Amazon EC2 instance.

When you select an AWS resource for the focus in the **Explore related** pane, you can navigate to the resource-specific console for the selected resource. For example, if you have selected an Amazon EC2 instance, you can select the **View in EC2 console** link to open the Amazon EC2 console with that instance selected.

When you set a focus, the metrics and logs are automatically filtered to show the telemetry related to your focus.

- **Metrics** – Each metric is shown as a graph for the time period that you have chosen.

  Much like any dashboard graph in CloudWatch, you can hover over or select a graph to get more information about the metric graph, and to see options including viewing in CloudWatch metrics. Choosing to view in CloudWatch will open the metrics view with the same viewing context as the **Explore related** pane, including resource and time range.

- **Log patterns** – CloudWatch analyzes the log groups associated with the focal resource and shows common patterns in those logs. For more information about log patterns, see Pattern analysis in the *Amazon CloudWatch Logs User Guide*.

  You can select **Compare timerange** to choose another time range and compare logs across the two time ranges.

  You can select **View in Logs Insights** to analyze the logs in CloudWatch Logs Insights with the same options as your current view, including resource, log group, and time range. For more information, see Analyzing log data with CloudWatch Logs Insights in the *Amazon CloudWatch Logs User Guide*.

- **Log groups** – The log groups that contain the logs are shown.

  You can select the log groups and then perform one of the following actions:

  - Choose **Start tailing in Live Tail** to view a streaming list of new log events as they are ingested for the selected log groups. The Live Tail session is started in the CloudWatch console. For more information on Live Tail, see Troubleshoot with CloudWatch Logs LiveTail in the *Amazon CloudWatch Logs User Guide*.
  - Choose **Query in Logs Insights** to open Logs Insights with a query scoped to just those log groups, applying your current context, including resources and time range.

Using the topology map

The *topology map* (map) is a visual display of the current focal entity and its related resources or services. You can use this interactive visualization to see the connections between different resources and services, and explore the relationships between components in your system. For example, if you are viewing *load balancer* resource, the map will show connected *target group* resources. Selecting a target group will display the associated instances. The visualization of connectivity helps operators understand and explore the relationships between different resources and services in your system.

You can drag the map, and zoom in and out, to see more of the associated entities, or to focus on fewer entities.

When you select an associated entity, like a target group, the pane's focus shifts to show telemetry for that entity. The map updates to center on the selected target group, displaying its connections to other entities, such as the load balancer and and any Amazon EC2 instances that are specified in that target group. As you navigate through different entities in the map, the metrics and logs at the bottom of the pane dynamically update, providing you with relevant telemetry for the newly selected resources.

Finding a specific resource

If a resource doesn't appear on the topology map, you can use the **Find other resources** feature to locate it. You can filter resources by tag or type, then select the ones you are looking for. After you have found resources to focus on, you are returned to the topology map, with those resources selected, to browse associated entities and telemetry.

Note

There are many reasons why you might not see your resources on the topology map. For example:

- It's not related to the current focal entity.
- You don't have permissions to access associated entities or telemetry.
- The resource or service may not support telemetry or associated entities.

By using **Find other resources**, you can discover and visualize resources that may not be directly connected or visible in the current map. This ensures that you can access and analyze all relevant components of your infrastructure.

Select a resource with Find resources.

1. Open the **Explore related** pane from any of the entry points in the CloudWatch console.
2. Choose **Find resources**.
3. Choose the time frame for which you want to view logs or metrics.
4. Choose **Resource types**, then select the type of the resource you want to focus on from the drop down list, for example, **EC2 instances**.
5. Optionally, filter the set of resources by providing a tag to filter on. You can do this by selecting the **Filter resources by tags** filter, or by choosing the label that says **5 tags found** (the number will depend on the tags in your system). This gives you a list of tags to choose from.

   After you have selected the tags, the list of resources is automatically filtered to only those that are associated with those tags.
6. Optionally, choose one or more specific resources from the ones found that match your filters.
7. Choose **Show on map** to return to the **Topology map** with your resources selected.

Your list of **Metrics** and **Logs** is now filtered to just logs and metrics that are associated with that resource type. You can choose the **Metrics** or **Logs** tab to view the kind of telemetry that you want to view.

Permissions and prerequisites needed to view and explore related telemetry

To explore related telemetry, you must be getting entity information with the telemetry from your workloads, and you must have the proper permissions to view that data.

Many services send entity information automatically. For workloads that use the CloudWatch agent, you must have at least version `1.300049.1` of the agent, and you must configure it correctly. For information about configuring the agent, see How to add related information to custom telemetry sent to CloudWatch. For workloads running on Amazon EKS, you must have at

least version `v2.3.1-eksbuild.1` of the Amazon CloudWatch Observability EKS add-on. For more information about this add-on, see Quick start with the Amazon CloudWatch Observability EKS add-on.

To explore related telemetry you must be signed in with certain permissions. Exploring related telemetry is a read-only activity, and requires at least read-only access to CloudWatch.

The permissions needed for viewing associations between telemetry and entities are: `logs:ListLogGroupsForEntity`, `logs:ListEntitiesForLogGroup`, `cloudwatch:ListEntitiesForMetric`, and `application-signals:ListObservedEntities`.

Each of the following AWS managed policies will provide the CloudWatch permissions needed to access related telemetry in the CloudWatch console:

- CloudWatchFullAccessV2 – Provides full access to CloudWatch.
- CloudWatchReadOnlyAccess – Provides read-only access to CloudWatch.
- ReadOnlyAccess – Provides read-only access to AWS services and resources.

Additionally, you must have at least read-only access (`Describe*` and `Get*`) to any resources in the topology map, in order for CloudWatch to discover and display relationships.

For more details about using policies to control access, see Managing access using policies.

How does CloudWatch find related telemetry?

The CloudWatch **Explore related** pane shows you metrics and logs that are related to each other, but how does that work?

Metrics and logs that are sent to CloudWatch can include an optional *entity* to which they are related. Typically, the entity will be a representation of what the telemetry is about. For example, a metric about CPU usage is about an Amazon EC2 instance, and will use that instance as its entity. When you view that metric in the **Explore related** pane, it shows you other telemetry for that same instance.

The *topology map* (map) in the **Explore related** pane displays the currently selected resource, along with *related resources*. For AWS resources, CloudWatch automatically displays other resources that

it knows are related. For example, if you are viewing an Amazon EC2 instance, the map will also display any Amazon EBS volumes that are attached to the instance. Selecting a volume shows telemetry for the volume, and the map is updated to display resources related to the volume. It also displays resources that are part of the same *service*.

The entity information associated with your telemetry defines the resource that the telemetry is associated with, such as the Amazon EC2 instance. However, it can also include contextual data about the resource. For example, if you have a website application that includes resources such as an Amazon EC2 instance and a database, the entity information can include the website application as a service. In this case, the topology map shows the service as a related entity, and when you select it, it displays the instances and database. This can make finding all the telemetry for a service simpler.

> **Note**
>
> CloudWatch must have received telemetry with entity information within the last three hours in order to find related resources and telemetry.

Where does the entity data come from?

There are different ways that CloudWatch gets entities for telemetry:

- Most telemetry sent to CloudWatch from AWS services are associated with resources automatically. For a complete list of supported resources, see AWS services that support related telemetry.
- The CloudWatch agent automatically adds entity information to the telemetry that it sends to CloudWatch.

  > **Note**
  >
  > You may need to update your CloudWatch agent to the latest version to include entity data. For more information, see Collect metrics, logs, and traces using the CloudWatch agent, and Configure CloudWatch agent service and environment names for related entities.

- When you are submitting your own telemetry, you can add entity information to the data. For more information, see How to add related information to custom telemetry sent to CloudWatch.

- CloudWatch makes a best effort to recognize the entity information associated with other telemetry (for example, custom telemetry that you send to CloudWatch without any entity information).

Where does service data come from?

Besides recognizing the natural connections between resources, such as an instance resource and an attached volume resource, CloudWatch can also group resources by *service*. For example, a service might be a website application. An Amazon EC2 instance with a web server, and another with a database might both be part of the same service, and are connected on the topology map based on that service.

There are different ways that CloudWatch gets a service name for telemetry, including:

- Application signals or otel instrumented telemetry use the `OTEL_SERVICE_NAME` environment variable used by supported OpenTelemetry instrumentation libraries to set the service name.
- The CloudWatch agent configuration allows configuring a service name. For more information, see Configure CloudWatch agent service and environment names for related entities.
- Kubernetes workloads use a corresponding name from the cluster, such as the Deployment, ReplicaSet, Pod, or Container, for the service name.
- For Amazon EC2 workloads, the service can come from tags (the `service`, `application`, or app tags).

> **Note**
>
> To use tags to generate service names, you must first set up instance metadata for the Amazon EC2 instance.

- When you are submitting your own telemetry, you can add service information to the data. For more information, see How to add related information to custom telemetry sent to CloudWatch.
- When it cannot use the above, CloudWatch uses the name of the IAM role that sends the metrics as the service name. This, for example, can provide a service name for Amazon ECS telemetry.

AWS services that support related telemetry

The following table lists the AWS services that support related entity information in their CloudWatch telemetry. Services or resources that are not listed in the table do not have related entity information exposed in CloudWatch.

> **Note**
>
> For services that use the CloudWatch agent, you may need to update the agent to the latest version to get related telemetry. For information about sending related entity information with your own custom metrics, see How to add related information to custom telemetry sent to CloudWatch.

AWS Service	Resource	Metrics	Logs
Amazon API Gateway	`AWS::ApiGateway::Method`	Yes	No

How to add related information to custom telemetry sent to CloudWatch

When you publish your own metrics and logs to CloudWatch, the entity information needed for related telemetry is not there by default. When you send metrics to CloudWatch or logs to CloudWatch Logs (with the PutMetricData or PutLogEvents operations), you can add entity information to those logs or metrics. The entity information is associated with the telemetry, and used in the **Explore related** feature to find related telemetry that is associated with the same entity.

The entity sent with telemetry represents a resource or service that the telemetry is associated with. For example, a metric about a service, or that comes from an AWS resource. To identify the entity associated in your code, you create a set of `KeyAttributes` and optional `Attributes` of the entity.

> **Note**
>
> CloudWatch can only find related resources for entities that have had telemetry sent within the previous three hours. If your resource only emits sparse telemetry (less than once every

3 hours), you may want to send additional *heartbeat* telemetry, to keep the entity active within CloudWatch.

For information on how to add entity information, see Entity information in EMF format.

The following sections describe how to create the `KeyAttributes` and `Attributes` so that CloudWatch can identify the resources and services associated with the telemetry.

Identifying the entity with the KeyAttributes object

The `KeyAttributes` property of the Entity objects (in CloudWatch or in CloudWatch logs) uniquely identifies the entity for CloudWatch. It is a list of key-value pairs. Entities with the same `KeyAttributes` are considered to be the same entity. Telemetry associated with the same entity are considered related, and can be easily found in the **Explore related** pane.

> **Note**
>
> In the CloudWatch API, the property is called `KeyAttributes`. In the CloudWatch Logs API, the property is called `keyAttributes`. Here they are treated as the same property.

There are five possible types of object that an `Entity` can represent.

- **AWS::Resource** – The entity represents an AWS resource, such as a DynamoDB table or Amazon EC2 instance.
- **AWS::Service** – The entity represent an AWS service, such as Amazon S3. This might be used, for example, when calling the `ListBuckets` operation, which is not associated with a specific Amazon S3 resource.
- **Service** – The entity represents a workload running in your account. For example, an application or service that you manage.
- **Resource** – The entity represents a resource that is not managed by AWS, for example, operating system resources, such as processes or file volumes.
- **RemoteService** – The entity represents an external service in a remote call. For example, a remote call to a database, external cache, or an external endpoint.

Depending on which of the above types you are trying to represent, you must provide the correct key-value pairs for the `KeyAttributes`. The following describes each type.

AWS::Resource

To specify an AWS Resource, you must include the following three key value pairs:

- `"Type": "AWS::Resource"` – This key-value pair identifies the entity as an AWS resource.
- `"ResourceType": "<resource-type>"` – The string value of the `ResourceType` is the CloudFormation resource type string. For example, `AWS::DynamoDB::Table`.
- `"Identifier": "<resource-id>"` – The primary identifier for the resource. For more information, see primaryIdentifier in the *Extension Development for CloudFormation User Guide*.

AWS::Service

To specify an AWS Service, you must include the following two key value pairs:

- `"Type": "AWS::Service"` – This key-value pair identifies the entity as an AWS service.
- `"Name": "<service-name>"` – The value of the `Name` is the CloudFormation service name string. For example, `AWS::DynamoDB`.

Service

To specify a service that is not operated by AWS, you must include the following three key value pairs:

- `"Type": "Service"` – This key-value pair identifies the entity as a service.
- `"Name": "<service-name>"` – This represents the name of the service that is sending the metrics. For example, `my-service-frontend` or `api.myservice.com`.
- `"Environment": "<environment-name>"` – This attribute specifies where the service is hosted, or the environment to which it belongs. For example `us-west-2`, or `myservice.production`.

Resource

To specify a resource that is not provided by AWS, you must include the following three key value pairs:

- `"Type": "Resource"` – This key-value pair identifies the entity as a resource.
- `"ResourceType": "<resource-type>"` – A string specifying the type of resource. For example, `K8s::Pod` for a Kubernetes Pod.
- `"Identifier": "<resource-id>"` – A string identifier for the resource. Can contain multiple names, separated by pipes. For example, a Kubernetes Pod might be represented by it's cluster name, namespace, and pod name, such as `MyCluster|MyNamespace|MyPod`.

RemoteService

To specify a remote service, you must include the following two key value pairs:

- `"Type": "RemoteService"` – This key-value pair identifies the entity as a remote service.
- `"Name": "<remote-service-name>"` – Specifies how the application refers to the external service in a remote call. For example, `api.test.myservice.com`.

Providing additional details about the entity with the Attributes object

You can provide additional details about the `Entity` that you provide with your telemetry. This can include details about the platform, resource, application, or telemetry provider. The following tables describes the key words that you can use for each of these types of data.

> **Note**
>
> In the CloudWatch API, the property is called `Attributes`. In the CloudWatch Logs API, the property is called `attributes`. Here they are treated as the same property.

Platform details

Keyword	Usage	Domain of Values	Examples
`PlatformType`	Defines the hosted-in platform.	AWS::EKS, AWS::ECS, AWS::EC2,	`AWS::EC2`

Keyword	Usage	Domain of Values	Examples
		AWS::Lambda, K8s, Generic	
`EKS.Cluster`	Name of the Amazon EKS cluster.	Alphanumeric string with basic delimiters.	`FlyingSquad`
`K8s.Cluster`	Name of the self-hosted Kubernetes cluster.	Alphanumeric string with basic delimiters.	`minicube`
`K8s.Namespace`	Name of Kubernetes namespace in Amazon EKS or K8s clusters.	Alphanumeric string with basic delimiters.	`default`, `pet-clinic`
`K8s.Workload`	Name of Kubernetes workload in Amazon EKS and K8s clusters.	Alphanumeric string with basic delimiters.	`frontend`
`K8s.Node`	Identity of Kubernetes node in Amazon EKS and K8s clusters.	K8s node name (for example, Amazon EC2 instance DNS name).	`ip-11-22-33-44.ec2.internal`
`K8s.Pod`	Identity of Kubernetes pod in Amazon EKS and K8s clusters.	K8s pod identifier.	`frontend-1234abcd56-ef7890`
`EC2.AutoScalingGroup`	Name of the Amazon EC2 AutoScaling Group.	Alphanumeric string with basic delimiters.	`my-asg-name-1`
`EC2.InstanceId`	Identity of the Amazon EC2 instance.	Amazon EC2 instance identifier.	`i-1234abcd5678ef90`
`ECS.Cluster`	Identity of the Amazon ECS cluster.	Amazon ECS cluster name.	`MyCluster`

Keyword	Usage	Domain of Values	Examples
`ECS.Service`	Identity of the Amazon ECS service.	Amazon ECS service name.	`MyService`
`ECS.Task`	Identity of the Amazon ECS task.	Amazon ECS task ID.	`task-123abc`
`Lambda.Function`	Identity of the Lambda function.	Lambda function name.	`MyFunction`
`Host`	Name of the host for all platform types.	Sub-domain format.	`ip-111-22-33-44.example.com`

Resource details

Keyword	Usage	Domain of Values	Examples
`AWS.Resource.ARN`	ARN for the AWS resource.	Alphanumeric string with basic delimiters.	`arn:aws:dynamodb:us-east-1:123456789012:table/myDynamoDBTable`

Application details

Keyword	Usage	Domain of Values	Examples
`AWS.Application`	Name of the application in AppRegistry.	Alphanumeric string with basic delimiters.	`PetClinicApp`
`AWS.Application.ARN`	ARN of the application in AppRegistry.	Alphanumeric string with basic delimiters.	`arn:aws:servicecatalog:us-e`

Keyword	Usage	Domain of Values	Examples
			`ast-1:123 4567890:/ applicati ons/...`

Telemetry provider details

Keyword	Usage	Domain of Values	Examples
`Telemetry.SDK`	The fingerprint of OTEL SDK version for instrumented services.	Alphanumeric string with basic delimiters.	`opentelem etry,1.32.0- aws-SNAPSHOT,ja va,Auto`
`Telemetry.Agent`	The fingerprint of the Agent used to collect and send telemetry data.	Alphanumeric string with basic delimiters.	`CWAgent/1 .300026.3 , ADOTColle ctor/1.x`
`Telemetry .Source`	Specifies the point of application where the telemetry was collected or what was used for the source of telemetry data.	ServerSpan, ClientSpan, ProducerSpan, ConsumerSpan, LocalRoot Span, JMX, OS.	`ClientSpan, JMX`

Query metrics from other data sources

You can use CloudWatch to query, visualize, and create alarms for metrics from other data sources. To do so, you connect CloudWatch to the other data sources. This gives you a single, consolidated monitoring experience within the CloudWatch console. You can have a unified view of your infrastructure and application metrics regardless of where the data is stored, helping you identify and resolve issues faster.

After you connect to a data source using a CloudWatch wizard, CloudWatch creates an AWS CloudFormation stack that deploys and configures an AWS Lambda function. This Lambda function runs on demand every time you query the data source. The CloudWatch query builder shows you in real time a list of elements that can be queried, such as metrics, tables, fields, or labels. As you make choices, the query builder pre-populates a query in the native language of the selected source.

CloudWatch provides guided wizards for you to connect to the following data sources. For these data sources, you provide basic information to identify the data source and credentials. You can also manually create connectors to other data sources by creating your own Lambda functions.

- Amazon OpenSearch Service– Derive metrics from your OpenSearch Service logs and traces.
- Amazon Managed Service for Prometheus– Query these metrics using PromQL.
- Amazon RDS for MySQL – Use SQL to convert data stored in your Amazon RDS tables into metrics.
- Amazon RDS for PostgreSQL– Use SQL to convert data stored in your Amazon RDS tables into metrics.
- Amazon S3 CSV files– Display metrics data from a CSV file stored in an Amazon S3 bucket.
- Microsoft Azure Monitor– Query metrics from your Microsoft Azure Monitor account.
- Prometheus– Query these metrics using PromQL.

After you create connectors to data sources, see Creating a graph of metrics from another data source for information about graphing a metric from a data source. For information about setting an alarm on a metric from a data source, see Create an alarm based on a connected data source.

Topics

- Managing access to data sources

- Connect to a prebuilt data source with a wizard
- Create a custom connector to a data source
- Use your custom data source
- Delete a connector to a data source

Managing access to data sources

CloudWatch uses CloudFormation to create the required resources in your account. We recommend that you use the `cloudformation:TemplateUrl` condition to control access to CloudFormation templates when you grant `CreateStack` permissions to IAM users.

> **Warning**
>
> Any user that you grant data source invoke permission to can query metrics from that data source even if that user does not have direct IAM permissions to the data source. For example, if you grant `lambda:InvokeFunction` permissions on a Amazon Managed Service for Prometheus data source Lambda function to a user, that user will be able to query metrics from the corresponding Amazon Managed Service for Prometheus workspace even if you didn't grant them direct IAM access to that workspace.

You can find template URLs for data sources on the **Create stack** page in the CloudWatch Settings Console.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "AllowCloudFormationCreateStack",
            "Effect": "Allow",
            "Action": [
                "cloudformation:CreateStack"
            ],
            "Resource": "*",
            "Condition": {
```

```
                "StringEquals": {
                    "cloudformation:TemplateUrl": [
                        "https://s3.us-east-1.amazonaws.com/amzn-s3-demo-bucket/
template.json"
                    ]
                }
            }
        }
    ]
}
```

For more information about controlling CloudFormation access, see Controlling access with AWS Identity and Access Management

Connect to a prebuilt data source with a wizard

This topic provides instructions for using the wizard to connect CloudWatch to the following data sources.

- Amazon OpenSearch Service
- Amazon Managed Service for Prometheus
- Amazon RDS for MySQL
- Amazon RDS for PostgreSQL
- Amazon S3 CSV files
- Microsoft Azure Monitor
- Prometheus

The subsections in this topic include notes about managing and querying with each of these data sources.

To create a connector to a data source

1. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.
2. In the navigation pane, choose **Settings**.
3. Choose the **Metrics data sources** tab.
4. Choose **Create data source**.

5. Select the source that you want, then choose **Next**.
6. Enter a name for the data source.
7. Enter the other required information, depending on the data source that you chose. This can include credentials to access the data source and data source identifying information such as Prometheus workspace name, database name, or Amazon S3 bucket name. For AWS services, the wizard discovers the resources and populates them into the selection dropdown.

   For more notes about the data source you are using, see the sections after this procedure.
8. To have CloudWatch connect to the data source in a VPC, choose **Use a VPC** and select the VPC to use. Then select the subnet and security group.
9. Choose **I acknowledge that CloudFormation will create IAM resources**. This resource is the Lambda function execution role.
10. Choose **Create data source**.

    The new source that you just added doesn't appear until the CloudFormation stack is done creating it. To check progress, you can choose **View the status of my CloudFormation stack**. Or you can choose the refresh icon to update this list.

    When your new data source appears in this list, it is ready to use. You can choose **Query from CloudWatch metrics** to begin querying with it. For more information, see Creating a graph of metrics from another data source.

Amazon Managed Service for Prometheus

Updating the data source configuration

- You can update your data source manually by doing the following:
  - To update the Amazon Managed Service for Prometheus workspace ID, update the `AMAZON_PROMETHEUS_WORKSPACE_ID` environment variable for the data source connector Lambda function.
  - To update the VPC configuration, see Configuring VPC access (console) for more information.

Querying the data source

- When querying Amazon Managed Service for Prometheus, after you select the data source in the **Multi source query** tab and select an Amazon Managed Service for Prometheus connector, you

can use the **Query helper** to discover metrics and labels and provide simple PromQL queries. You can also use the PromQL query editor to build a PromQL query.

- Multi-line queries are not supported by the CloudWatch data source connectors. Every line feed is replaced with a space when the query is executed, or when you create an alarm or a dashboard widget with the query. In some cases, this might make your query not valid. For example, if your query contains a single line comment it will not be valid. If you try to create a dashboard or alarm with a multi-line query from the command line or Infrastructure as Code, the API will reject the action with a parse error.

Amazon OpenSearch Service

Creating the data source

If the OpenSearch domain is enabled for FGAC, you must map the execution role of the connector Lambda function to a user in OpenSearch Service. For more information, see the **Mapping users to roles** section in Managing permissions in the OpenSearch Service documentation.

If your OpenSearch domain is only accessible within a Virtual Private Cloud (VPC), you need to manually include a new environment variable in the Lambda function called `AMAZON_OPENSEARCH_ENDPOINT`. The value for this variable should be the root domain of the OpenSearch endpoint. You can obtain this root domain by removing `https://` and `<region>.es.amazonaws.com` from the domain endpoint listed in the OpenSearch Service console. For example, if your domain endpoint is `https://sample-domain.us-east-1.es.amazonaws.com`, the root domain would be `sample-domain`.

Updating the data source

- You can update your data source manually by doing the following:
  - To update the OpenSearch Service domain, update the `AMAZON_OPENSEARCH_DOMAIN_NAME` environment variable for the data source connector Lambda function.
  - To update the VPC configuration, see Configuring VPC access (console) for more information.

Querying the data source

- When querying OpenSearch Service, after you select the data source in the **Multi source query** tab, do the following:
  - Select the Index to query.

- Select the Metric name (Any numeric field in the document) and Stat.
- Select the Time axis (Any date field in the document).
- Select Filters to apply (Any String field in the document).
- Choose **Graph query**.

Amazon RDS for PostgreSQL and Amazon RDS for MySQL

Creating the data source

- If your data source is only accessible in a VPC, you must include the VPC configuration for the connector, as described in Connect to a prebuilt data source with a wizard. If the data source is to connect to the VPC for credentials, the endpoint must be configured in the VPC. For more information, see Using an AWS Secrets Manager VPC endpoint.

  Additionally, you must create a VPC endpoint for the Amazon RDS service. For more information, see Amazon RDS API and interface VPC endpoints (AWS PrivateLink).

Updating the data source

- You can update your data source manually by doing the following:
  - To update the database instance, update the `RDS_INSTANCE` environment variable for the data source connector Lambda function.
  - To update the username and password used to connect to Amazon RDS, use AWS Secrets Manager. You can find the ARN of the secret used for the data source in the environment variable `RDS_SECRET` on the data source Lambda function. For more information about updating the secret in AWS Secrets Manager, see Modify an AWS Secrets Manager secret.
  - To update the VPC configuration, see Configuring VPC access (console) for more information.

Querying the data source

- When querying Amazon RDS, after you select the data source in the **Multi source query** tab and select an Amazon RDS connector, you can use the database discoverer to view available databases, tables, and columns. You can also use the SQL editor to create an SQL query.

  You can use the following variables in the query:

  - `$start.iso` – The start time in ISO date format

- `$end.iso` – The end time in ISO date format
- `$period` – The selected period in seconds

  For example, you can query `SELECT value, timestamp FROM table WHERE timestamp BETWEEN $start.iso and $end.iso`

- Multi-line queries are not supported by the CloudWatch data source connectors. Every line feed is replaced with a space when the query is executed, or when you create an alarm or a dashboard widget with the query. In some cases, this might make your query not valid. For example, if your query contains a single line comment it will not be valid. If you try to create a dashboard or alarm with a multi-line query from the command line or Infrastructure as Code, the API will reject the action with a parse error.

> **Note**
>
> If no date field is found in the results, the values for each numeric field are summed to single values and plotted across the provided time range. If the timestamps don't align with the selected period in CloudWatch, the data is automatically aggregated using `SUM` and aligned with the period in CloudWatch.

Amazon S3 CSV files

Querying the data source

- When querying Amazon S3 CSV files, after you select the data source in the **Multi source query** tab and select an Amazon S3 connector, you select the Amazon S3 bucket and key.

  The CSV file must be formatted in the following ways:

  - The time stamp must be the first column.
  - The table must have a header row. The headers are used to name your metrics. The title of the time stamp column will be ignored, only the titles of the metrics columns are used.
  - The time stamps must be in ISO date format.
  - The metrics must be numeric fields.

```
Timestamp, Metric-1, Metric-2, ...
```

The following is an example:

timestamp	CPU (%)	Memory (%)	Storage (%)
2023-11-23T17:09:41+00:00	1	2	3
2023-11-23T17:04:41+00:00	4	5	6
2023-11-23T16:59:41+00:00	7	8	9
2023-11-23T16:54:41+00:00	10	11	12

Note

If no timestamp is provided, the values for each metric are summed to single values and plotted across the provided time range. If the timestamps don't align with the selected period in CloudWatch, the data is automatically aggregated using `SUM` and aligned with the period in CloudWatch.

Microsoft Azure Monitor

Creating the data source

- You must provide your tenant ID, client ID, and client secret to connect to Microsoft Azure Monitor. The credentials will be stored in AWS Secrets Manager. For more information, see Create a Microsoft Entra application and service principal that can access resources in the Microsoft documentation.

Updating the data source

- You can update your data source manually by doing the following:

- To update the tenant ID, client ID, and client secret used to connect to Azure Monitor, you can find the ARN of the secret used for the data source as the `AZURE_CLIENT_SECRET` environment variable on the data source Lambda function. For more information about updating the secret in AWS Secrets Manager, see Modify an AWS Secrets Manager secret.

Querying the data source

- When querying Azure Monitor, after you select the data source in the **Multi source query** tab and select an Azure Monitor connector, you specify the Azure subscription, and the resource group and resource. You can then select the metric namespace, metric, and aggregation, and filter by dimensions.

Prometheus

Creating the data source

- You must provide the Prometheus endpoint and the user and password required to query Prometheus. The credentials will be stored in AWS Secrets Manager.
- If your data source is only accessible in a VPC, you must include the VPC configuration for the connector, as described in Connect to a prebuilt data source with a wizard. If the data source is to connect to for credentials, the endpoint must be configured in the VPC. For more information, see Using an AWS Secrets Manager VPC endpoint.

Updating data source configuration

- You can update your data source manually by doing the following:
  - To update the Prometheus endpoint, specify the new endpoint as the `PROMETHEUS_API_ENDPOINT` environment variable on the data source Lambda function.
  - To update the username and password used to connect to Prometheus, you can find the ARN of the secret used for the data source as the `PROMETHEUS_API_SECRET` environment variable on the data source Lambda function. For more information about updating the secret in AWS Secrets Manager, see Modify an AWS Secrets Manager secret.
  - To update the VPC configuration, see Configuring VPC access (console) for more information.

Querying the data source

Important

Prometheus metric types are different than CloudWatch metrics and many metrics available through Prometheus are cumulative by design. When you query Prometheus metrics, CloudWatch doesn't apply any additional transformation to the data: if you specify only the metric name or label, the displayed value will be cumulative. For more information, see Metric types in the Prometheus documentation.
To see Prometheus metrics data as discrete values, like CloudWatch metrics, you need to edit the query before you run it. For example, you might need to add a call to the rate function over your Prometheus metric name. For documentation about the rate function and other Prometheus functions, see rate() in the Prometheus documentation.

Multi-line queries are not supported by the CloudWatch data source connectors. Every line feed is replaced with a space when the query is executed, or when you create an alarm or a dashboard widget with the query. In some cases, this might make your query not valid. For example, if your query contains a single line comment it will not be valid. If you try to create a dashboard or alarm with a multi-line query from the command line or Infrastructure as Code, the API will reject the action with a parse error.

Notification of Available Updates

From time to time, Amazon might notify you that we recommend that you update your connectors with a newer available version and will provide instructions for how to do so.

Create a custom connector to a data source

This topic describes how to connect a custom data source to CloudWatch. You can connect a custom data source to CloudWatch in two ways:

- Using a sample template that CloudWatch provides. You can use either JavaScript or Python with this template. These templates include sample Lambda code that will be useful to you when you create your Lambda function. You can then modify the Lambda function from the template to connect to your custom data source.
- Creating an AWS Lambda function from scratch that implements the data source connector, the data query, and the preparation of the time series for use by CloudWatch. This function must pre-aggregate or merge datapoints if needed, and also align the period and timestamps to be compatible with CloudWatch.

Contents

- Use a template
- Create a custom data source from scratch
  - Step 1: Create the function
    - GetMetricData event
    - DescribeGetMetricData event
    - Important considerations for CloudWatch alarms
    - (Optional) Use AWS Secrets Manager to store credentials
    - (Optional) Connect to a data source in a VPC
  - Step 2: Create a Lambda permissions policy
  - Step 3: Attach a resource tag to the Lambda function

Use a template

Using a template creates a sample Lambda function, and can help you get your custom connector built faster. These sample functions provide sample code for many common scenarios involved with building a custom connector. You can examine the Lambda code after you create a connector with a template, then modify it to use to connect to your data source.

Additionally, if you use the template, CloudWatch takes care of creating the Lambda permissions policy and attaching resource tags to the Lambda function.

To use the template to create a connector to a custom data source

1. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.
2. In the navigation pane, choose **Settings**.
3. Choose the **Metrics data sources** tab.
4. Choose **Create data source**.
5. Choose the radio button for **Custom - getting started template** and then choose **Next**.
6. Enter a name for the data source.
7. Select the one of the listed templates.
8. Select either Node.js or Python.
9. Choose **Create data source**.

The new custom source that you just added doesn't appear until the CloudFormation stack finishes creating it. To check progress, you can choose **View the status of my CloudFormation stack**. Or you can choose the refresh icon to update this list.

When your new data source appears in this list, it is ready for you to test in the console and modify.

10. (Optional) To query the test data from this source in the console, follow the instructions in Creating a graph of metrics from another data source.
11. Modify the Lambda function for your needs.

    a. In the navigation pane, choose **Settings**.

    b. Choose the **Metrics data sources** tab.

    c. Choose **View in Lambda console** for the source that you want to modify.

    You can now modify the function to access your data source. For more information, see Step 1: Create the function.

    > **Note**
    >
    > By using the template, when you write your Lambda function you don't need to follow the instructions in Step 2: Create a Lambda permissions policy or Step 3: Attach a resource tag to the Lambda function. These steps were performed by CloudWatch because you used the template.

Create a custom data source from scratch

Follow the steps in this section to create a Lambda function that connects CloudWatch to a data source.

Step 1: Create the function

A custom data source connector must support `GetMetricData` events from CloudWatch. Optionally, you can also implement a `DescribeGetMetricData` event to provide documentation to users in the CloudWatch console for how to use the connector. The `DescribeGetMetricData` response can also be used to set defaults that are used in the CloudWatch custom query builder.

CloudWatch provides code snippets as samples to help you get started. For more information, see the samples repository at https://github.com/aws-samples/cloudwatch-data-source-samples.

Constraints

- The response from Lambda must be smaller than 6 Mb. If the response exceeds 6 Mb, the `GetMetricData` response marks the Lambda function as `InternalError` and no data is returned.
- The Lambda function must complete its execution within 10 seconds for visualization and dashboarding purposes, or within 4.5 seconds for alarms usage. If the execution time exceeds that time, the `GetMetricData` response marks the Lambda function as `InternalError` and no data is returned.
- The Lambda function must send its output using epoch timestamps in seconds.
- If the Lambda function doesn't resample the data and instead returns data that doesn't correspond to the start time and period length that was requested by the CloudWatch user, that data is ignored by CloudWatch. The extra data is discarded from any visualization or alarming. Any data that is not between the start time and end time is also discarded.

  For example, if a user asks for data from 10:00 to 11:00 with a period of 5 min, then "10:00:00 to 10:04:59" and "10:05:00 to 10:09:59" are the valid time ranges for data to be returned. You must return a time series that includes `10:00 value1`, `10:05 value2`, and so on. If the function returns `10:03 valueX`, for example, it gets dropped because 10:03 does not correspond to the requested start time and period.
- Multi-line queries are not supported by the CloudWatch data source connectors. Every line feed is replaced with a space when the query is executed, or when you create an alarm or a dashboard widget with the query. In some cases, this might make your query not valid.

GetMetricData event

Request payload

The following is an example of a `GetMetricData` request payload sent as input to the Lambda function.

```
{
  "EventType": "GetMetricData",
  "GetMetricDataRequest": {
    "StartTime": 1697060700,
```

```
    "EndTime": 1697061600,
    "Period": 300,
    "Arguments": ["serviceregistry_external_http_requests{host_cluster!=\"prod\"}"]
  }
}
```

- **StartTime**– The timestamp specifying the earliest data to return. The **Type** is timestamp epoch seconds.
- **EndTime**– The timestamp specifying the latest data to return. The **Type** is timestamp epoch seconds.
- **Period**– The number of seconds that each aggregation of the metrics data represents. The minimum is 60 seconds. The **Type** is Seconds.
- **Arguments**– An array of arguments to pass to the Lambda metric math expression. For more information about passing arguments, see How to pass arguments to your Lambda function.

Response payload

The following is an example of a `GetMetricData` response payload returned by the Lambda function.

```
{
   "MetricDataResults": [
      {
         "StatusCode": "Complete",
         "Label": "CPUUtilization",
         "Timestamps": [ 1697060700, 1697061000, 1697061300 ],
         "Values": [ 15000, 14000, 16000 ]
      }
   ]
}
```

The response payload will contain either a `MetricDataResults` field or an `Error` field, but not both.

A `MetricDataResults` field is a list of time-series fields of type `MetricDataResult`. Each of those time-series fields can include the following fields.

- **StatusCode**– (Optional) `Complete` indicates that all data points in the requested time range were returned. `PartialData` means that an incomplete set of data points were returned. If this is omitted, the default is `Complete`.

  Valid Values: `Complete` | `InternalError` | `PartialData` | `Forbidden`
- **Messages**– Optional list of messages with additional information about the data returned.

  Type: Array of MessageData objects with `Code` and `Value` strings.
- **Label**– The human-readable label associated with the data.

  Type: String
- **Timestamps**– The timestamps for the data points, formatted in epoch time. The number of timestamps always matches the number of values and the value for `Timestamps[x]` is `Values[x]`.

  Type: Array of timestamps
- **Values**– The data point values for the metric, corresponding to `Timestamps`. The number of values always matches the number of timestamps and the value for `Timestamps[x]` is `Values[x]`.

  Type: Array of doubles

For more information about `Error` objects, see the following sections.

Error response formats

You can optionally use the error response to provide more information about errors. We recommend that you return an error with Code Validation when a validation error occurs, such as when a parameter is missing or is the wrong type.

The following is an example of the response when the Lambda function wants to raise a `GetMetricData` validation exception.

```
{
   "Error": {
      "Code": "Validation",
      "Value": "Invalid Prometheus cluster"
   }
}
```

The following is an example of the response when the Lambda function indicates that it's unable to return data because of an access issue. The response is translated into a single time series with a status code of `Forbidden`.

```
{
   "Error": {
      "Code": "Forbidden",
      "Value": "Unable to access ..."
   }
}
```

The following is an example of when the Lambda function raises an overall `InternalError` exception, which is translated into a single time series with a status code of `InternalError` and a message. Whenever an error code has a value other than `Validation` or `Forbidden`, CloudWatch assumes that it's a generic internal error.

```
{
   "Error": {
      "Code": "PrometheusClusterUnreachable",
      "Value": "Unable to communicate with the cluster"
   }
}
```

DescribeGetMetricData event

Request payload

The following is an example of a `DescribeGetMetricData` request payload.

```
{
  "EventType": "DescribeGetMetricData"
}
```

Response payload

The following is an example of a `DescribeGetMetricData` response payload.

```
{
    "Description": "Data source connector",
    "ArgumentDefaults": [{
        Value: "default value"
```

```
    }]
}
```

- **Description**– A description of how to use the data source connector. This description will appear in the CloudWatch console. Markdown is supported.

  Type: String

- **ArgumentDefaults**– Optional array of argument default values used pre-populate the custom data source builder.

  If `[{ Value: "default value 1"}, { Value: 10}]`, is returned, the query builder in the CloudWatch console displays two inputs, the first with “default value 1” and the second with 10.

  If `ArgumentDefaults` is not provided, a single input is displayed with type default set to `String`.

  Type: Array of objects containing Value and Type.

- **Error**– (Optional) An error field can be included in any response. You can see examples in GetMetricData event.

Important considerations for CloudWatch alarms

If you are going to use the data source to set CloudWatch alarms, you should set it up to report data with timestamps every minute to CloudWatch. For more information and other considerations for creating alarms on metrics from connected data sources, see Create an alarm based on a connected data source.

(Optional) Use AWS Secrets Manager to store credentials

If your Lambda function needs to use credentials to access the data source, we recommend using AWS Secrets Manager to store these credentials instead of hardcoding them into your Lambda function. For more information about using AWS Secrets Manager with Lambda, see Use AWS Secrets Manager secrets in AWS Lambda functions.

(Optional) Connect to a data source in a VPC

If your data source is in a VPC managed by Amazon Virtual Private Cloud, you must configure your Lambda function to access it. For more information, see Connecting outbound networking to resources in a VPC.

You might also need to configure VPC service endpoints to access services such as AWS Secrets Manager. For more information, see Access an AWS service using an interface VPC endpoint.

Step 2: Create a Lambda permissions policy

You must use create a policy statement that grants CloudWatch permission to use the Lambda function that you created. You can use the AWS CLI or the Lambda console to create the policy statement.

To use the AWS CLI to create the policy statement

- Enter the following command. Replace *123456789012* with your account ID, replace *my-data-source-function* with the name of your Lambda function, and replace *MyDataSource-DataSourcePermission1234* with an arbitrary unique value.

```
aws lambda add-permission --function-name my-data-source-function --statement-
id MyDataSource-DataSourcePermission1234 --action lambda:InvokeFunction --principal
 lambda.datasource.cloudwatch.amazonaws.com --source-account 123456789012
```

Step 3: Attach a resource tag to the Lambda function

The CloudWatch console determines which of your Lambda functions are data source connectors by using a tag. When you create a data source using one of the wizards, the tag is automatically applied by the CloudFormation stack that configures it. When you create a data source yourself, you can use the following tag for your Lambda function. This makes your connector appear in the **Data source** dropdown in the CloudWatch console when you query metrics.

- A tag with `cloudwatch:datasource` as the key and `custom` as the value.

Use your custom data source

After you create a data source, you can use it to query and visualize data from that source, as well as to set alarms. If you used a template to create your custom data source connector or you added the tag listed in Step 3: Attach a resource tag to the Lambda function, you can follow the steps in Creating a graph of metrics from another data source to query it. You can also use the metric math function `LAMBDA` to query it, as explained in the following section. For information about creating alarms on metrics from your data source, see Create an alarm based on a connected data source. This topic describes how to pass arguments to your Lambda function to your custom data source.

How to pass arguments to your Lambda function

The recommended way for you to pass arguments to your custom data source is to use the query builder in the CloudWatch console when you query the data source.

You can also use your Lambda function to retrieve data from your data source by using the new LAMBDA expression in CloudWatch metric math.

```
LAMBDA("LambdaFunctionName" [, optional-arg]*)
```

`optional-arg` is up to 20 strings, numbers, or Booleans. For example, `param`, `3.14`, or `true`.

> **Note**
>
> Multi-line strings are not supported by the CloudWatch data source connectors. Every line feed is replaced with a space when the query is executed, or when you create an alarm or a dashboard widget with the query. In some cases, this might make your query not valid.

When you use the LAMBDA metric math function, you can provide the function name (`"MyFunction"`). If your resource policy allows, you can also use a specific version of the function (`"MyFunction:22"`), or a Lambda function alias (`"MyFunction:MyAlias"`). You can't use *

The following are some examples of calling the LAMBDA function.

```
LAMBDA("AmazonOpenSearchDataSource", "MyDomain", "some-query")
```

```
LAMBDA("MyCustomDataSource", true, "fuzzy", 99.9)
```

The LAMBDA metric math function returns a list of time series that can be returned to the requester or combined with other metric math functions. The following is an example of combining LAMBDA with other metric math functions.

```
FILL(LAMBDA("AmazonOpenSearchDataSource", "MyDomain", "some-query"), 0)
```

Delete a connector to a data source

The instructions in this section describe how to delete a connector to a data source.

To delete a connector to a data source

1. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.
2. In the navigation pane, choose **Settings**.
3. Choose the **Metrics data sources** tab.
4. Choose **Manage in CloudFormation** in the row of the data source that you want to delete.

   You are taken to the CloudFormation console.
5. In the section with the name of your data source, choose **Delete**.
6. In the confirmation pop-up, choose **Delete**.

Collect metrics, logs, and traces using the CloudWatch agent

CloudWatch agent is a software component that collects metrics, logs, and traces from your Amazon EC2 instances, on-premises servers, and containerized applications. It enables you to monitor your infrastructure and applications more comprehensively than the basic monitoring provided by default.

Key benefits

- Collect system-level metrics (CPU, memory, disk, network)
- Gather custom metrics from your applications
- Collect and centralize logs from various sources
- Monitor both AWS and on-premises environments with a single tool
- Set up alarms and notifications based on collected data

The CloudWatch agent enables you to do the following:

- Collect internal system-level metrics from Amazon EC2 instances across operating systems. The metrics can include in-guest metrics, in addition to the metrics for EC2 instances. The additional metrics that can be collected are listed in Metrics collected by the CloudWatch agent.
- Collect system-level metrics from on-premises servers. These can include servers in a hybrid environment as well as servers not managed by AWS.
- Retrieve custom metrics from your applications or services using the `StatsD` and `collectd` protocols. `StatsD` is supported on both Linux servers and servers running Windows Server. `collectd` is supported only on Linux servers.
- Collect logs from Amazon EC2 instances and on-premises servers, running either Linux or Windows Server.

> **Note**
>
> The CloudWatch agent does not support collecting logs from FIFO pipes.

- Send the metrics to either CloudWatch or Amazon Managed Service for Prometheus, or to both. The CloudWatch agent configuration file contains a `metrics_destinations` parameter in the `metrics` section. You can specify `cloudwatch`, `amp`, or both in this parameter.
- Version 1.300031.0 and later can be used to enable CloudWatch Application Signals. For more information, see Application Signals.
- Version 1.300025.0 and later can collect traces from OpenTelemetry or X-Ray client SDKs, and send them to X-Ray.

  Using the CloudWatch agent allows you to collect traces without needing to run a separate trace collection daemon, helping to reduce the number of agents that you run and manage.

Metrics sent to CloudWatch can be viewed in CloudWatch just as any other CloudWatch metrics. The default CloudWatch namespace for metrics collected by the CloudWatch agent is `CWAgent`, although you can specify a different namespace when you configure the agent.

The logs collected by the CloudWatch agent are processed and stored in Amazon CloudWatch Logs, just like logs collected by the older CloudWatch Logs agent. For information about CloudWatch Logs pricing, see Amazon CloudWatch Pricing.

Metrics collected by the CloudWatch agent are billed as custom metrics. For more information about CloudWatch metrics pricing, see Amazon CloudWatch Pricing.

The CloudWatch agent is open-source under the MIT license, and is hosted on GitHub. If you would like to build, customize or contribute to the CloudWatch agent, see the GitHub repository for the latest instructions. If you think you've found a potential security issue, do not post it on GitHub or any public forum. Instead, please follow the instructions at Vulnerability Reporting or email AWS security directly.

You can download and install the CloudWatch agent manually using the command line, or you can integrate it with AWS Systems Manager. The general flow of installing the CloudWatch agent is as follows:

1. Create IAM roles or users that enable the agent to collect metrics from the server and optionally to integrate with AWS Systems Manager.
2. Download the agent package.
3. Modify the CloudWatch agent configuration file and specify the metrics that you want to collect.
4. Install and start the agent on your servers.

Contents

- Supported operating systems
- Prerequisites
- Download the CloudWatch agent package
- Verifying the signature of the CloudWatch agent package
- Installing the CloudWatch agent
- Set up the CloudWatch agent with security-enhanced Linux (SELinux)
- Create the CloudWatch agent configuration file
- Starting the CloudWatch agent
- Metrics collected by the CloudWatch agent
- Using the CloudWatch agent with related telemetry
- Common scenarios with the CloudWatch agent
- CloudWatch agent credentials preference
- Troubleshooting the CloudWatch agent

Supported operating systems

The CloudWatch agent is supported on the following operating systems:

x86-64 architecture

- Amazon Linux 2023
- Amazon Linux 2
- Ubuntu Server versions 25.04, 24.04, and 22.04
- Red Hat Enterprise Linux (RHEL) versions 10, 9, and 8
- Debian version 12
- SUSE Linux Enterprise Server (SLES) version 15
- Oracle Linux versions 9 and 8
- AlmaLinux versions 10, 9, and 8
- Rocky Linux versions 10, 9, and 8
- macOS computers: EC2 M1 Mac1 instances, and computers running macOS 14 (Sonoma), macOS 13 (Ventura), and macOS 12 (Monterey)

- Windows Server 2025, Windows Server 2022, Windows Server 2019, and Windows Server 2016
- Windows 11
- 64-bit Windows 10

ARM64 architecture

- Amazon Linux 2023
- Amazon Linux 2
- Ubuntu Server version 22.04
- Red Hat Enterprise Linux (RHEL) versions 9 and 8
- Debian version 12
- SUSE Linux Enterprise Server 15
- macOS computers: macOS 14 (Sonoma), macOS 13 (Ventura), and macOS 12 (Monterey)

Prerequisites

Make sure the following prerequisites are completed before installing the CloudWatch agent for the first time.

IAM roles and users for CloudWatch agent

Access to AWS resources requires permissions. You create an IAM role, an IAM user, or both to grant permissions that the CloudWatch agent needs to write metrics to CloudWatch.

Create an IAM role for Amazon EC2 instances

If you're going to run the CloudWatch agent on Amazon EC2 instances, create an IAM role with the necessary permissions.

1. Sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.
2. In the navigation pane, choose **Roles** and then **Create role**.
3. Make sure that **AWS service** is selected under **Trusted entity type**.
4. For **Use case**, choose **EC2** under **Common use cases**.

5. Choose **Next**.
6. In the list of policies, select the check box next to **CloudWatchAgentServerPolicy**. If necessary, use the search box to find the policy.
7. Choose **Next**.
8. In **Role name**, enter a name for the role, such as `CloudWatchAgentServerRole`. Optionally give it a description. Then choose **Create role**.

(Optional) If the agent is going to send logs to CloudWatch Logs and you want the agent to be able to set retention policies for these log groups, you need to add the `logs:PutRetentionPolicy` permission to the role.

Create IAM user for on-premises servers

If you're going to run the CloudWatch agent on on-premises servers, create an IAM user with the necessary permissions.

> **Note**
>
> This scenario requires IAM users with programmatic access and long-term credentials, which presents a security risk. To help mitigate this risk, we recommend that you provide these users with only the permissions they require to perform the task and that you remove these users when they are no longer needed.

1. Sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.
2. In the navigation pane, choose **Users** and then **Add users**.
3. Enter the user name for the new user.
4. Select **Access key - Programmatic access** and choose **Next: Permissions**.
5. Choose **Attach existing policies directly**.
6. In the list of policies, select the check box next to **CloudWatchAgentServerPolicy**. If necessary, use the search box to find the policy.
7. Choose **Next: Tags**.
8. Optionally create tags for the new IAM, and then choose **Next: Review**.

9. Confirm that the correct policy is listed, and choose **Create user**.
10. Next to the name of the new user, choose **Show**. Copy the access key and secret key to a file so that you can use them when installing the agent. Choose **Close**.

Attaching an IAM role to an Amazon EC2 instance

To enable the CloudWatch agent to send data from an Amazon EC2 instance, you must attach the IAM role you created to the instance.

For more information on attaching an IAM role to an instance, see Attaching an IAM Role to an Instance in the Amazon Elastic Compute Cloud User Guide.

Allowing the CloudWatch agent to set log retention policy

You can configure the CloudWatch agent to set the retention policy for log groups that it sends log events to. If you do this, you must grant the `logs:PutRetentionPolicy` to the IAM role or user that the agent uses. The agent uses an IAM role to run on Amazon EC2 instances, and uses an IAM user for on-premises servers.

To grant the CloudWatch agent's IAM role permission to set log retention policies

1. Sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.
2. In the left navigation pane, choose **Roles**.
3. In the search box, Type the beginning of the name of the CloudWatch agent's IAM role. You chose this name when you created the role. It might be named `CloudWatchAgentServerRole`.

   When you see the role, choose the name of the role.
4. In the **Permissions** tab, choose **Add permissions**, **Create inline policy**.
5. Choose the **JSON** tab and copy the following policy into the box, replacing the default JSON in the box:

   JSON

```
{
  "Version":"2012-10-17",
  "Statement": [
```

```
    {
      "Effect": "Allow",
      "Action": "logs:PutRetentionPolicy",
      "Resource": "*"
    }
  ]
}
```

6. Choose **Review policy**.
7. For **Name**, enter **`CloudWatchAgentPutLogsRetention`** or something similar, and choose **Create policy**.

To grant the CloudWatch agent's IAM user permission to set log retention policies

1. Sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.
2. In the left navigation pane, choose **Users**.
3. In the search box, Type the beginning of the name of the CloudWatch agent's IAM user. You chose this name when you created the user.

   When you see the user, choose the name of the user.
4. In the **Permissions** tab, choose **Add inline policy**.
5. Choose the **JSON** tab and copy the following policy into the box, replacing the default JSON in the box:

   JSON

```
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "logs:PutRetentionPolicy",
      "Resource": "*"
    }
  ]
}
```

6. Choose **Review policy**.

7. For **Name**, enter **`CloudWatchAgentPutLogsRetention`** or something similar, and choose **Create policy**.

Network requirements

> **Note**
>
> When the server is in a public subnet make sure there is access to an internet gateway. When the server is in a private subnet, access is through the NAT gateways or VPC Endpoint. For more information on NAT gateways, see https://docs.aws.amazon.com/vpc/latest/userguide/vpc-nat-gateway.html.

Your Amazon EC2 instances must have outbound internet access to send data to CloudWatch or CloudWatch Logs. For more information about how to configure internet access, see Internet Gateways in the Amazon VPC User Guide.

Using VPC endpoints

If you're using a VPC and want to use CloudWatch agent without public internet access, you can configure VPC endpoints for CloudWatch and CloudWatch Logs.

The endpoints and ports to configure on your proxy are as follows:

- If you're using the agent to collect metrics, you must add the CloudWatch endpoints for the appropriate Regions to the allow list. These endpoints are listed in Amazon CloudWatch endpoints and quotas.
- If you're using the agent to collect logs, you must add the CloudWatch Logs endpoints for the appropriate Regions to the allow list. These endpoints are listed in Amazon CloudWatch Logs endpoints and quotas.
- If you're using Systems Manager to install the agent or Parameter Store to store your configuration file, you must add the Systems Manager endpoints for the appropriate Regions to the allow list. These endpoints are listed in AWS Systems Manager endpoints and quotas.

Download the CloudWatch agent package

> **Note**
>
> To download the CloudWatch agent, your connection must use TLS 1.2 or later.

The CloudWatch agent is available as a package in Amazon Linux 2023 and Amazon Linux 2. If you are using this operating system, you can install the package by entering the following command. You must also make sure that the IAM role attached to the instance has the **CloudWatchAgentServerPolicy** attached.

```
sudo yum install amazon-cloudwatch-agent
```

On all supported operating systems, you can download and install the CloudWatch agent using the command line.

For each download link, there is a general link as well as links for each AWS Region.

If you use the Region-specific links, replace the default Region (*us-east-1*) with the appropriate Region for your account. For example, for Amazon Linux 2023 and Amazon Linux 2 and the x86-64 architecture, three of the valid download links are:

- `https://amazoncloudwatch-agent.s3.amazonaws.com/amazon_linux/amd64/latest/amazon-cloudwatch-agent.rpm`
- `https://amazoncloudwatch-agent-us-east-1.s3.us-east-1.amazonaws.com/amazon_linux/amd64/latest/amazon-cloudwatch-agent.rpm`
- `https://amazoncloudwatch-agent-eu-central-1.s3.eu-central-1.amazonaws.com/amazon_linux/amd64/latest/amazon-cloudwatch-agent.rpm`

You can also download a README file about the latest changes to the agent, and a file that indicates the version number that is available for download. These files are in the following locations:

> **Note**
>
> If you use the Region-specific links, replace the default Region (*us-east-1*) with the appropriate Region for your account.

- `https://amazoncloudwatch-agent.s3.amazonaws.com/info/latest/RELEASE_NOTES` or `https://amazoncloudwatch-agent-us-east-1.s3.us-east-1.amazonaws.com/info/latest/RELEASE_NOTES`
- `https://amazoncloudwatch-agent.s3.amazonaws.com/info/latest/CWAGENT_VERSION` or `https://amazoncloudwatch-agent-us-east-1.s3.us-east-1.amazonaws.com/info/latest/CWAGENT_VERSION`

Verifying the signature of the CloudWatch agent package

GPG signature files are included for CloudWatch agent packages on Linux servers. You can use a public key to verify the agent download file is original and unmodified.

For Windows Server, you can use the MSI to verify the signature. For macOS computers, the signature is included in the agent download package.

To find the correct signature file, use the following table. For each architecture and operating system, you can see a general link and links for each Region.

If you use the Region-specific links, replace the default Region (*us-east-1*) with the appropriate Region for your account. For example, for Amazon Linux 2023 and Amazon Linux 2 and the x86-64 architecture, three of the valid links are:

- `https://amazoncloudwatch-agent.s3.amazonaws.com/amazon_linux/amd64/latest/amazon-cloudwatch-agent.rpm.sig`
- `https://amazoncloudwatch-agent-us-east-1.s3.us-east-1.amazonaws.com/amazon_linux/amd64/latest/amazon-cloudwatch-agent.rpm`
- `https://amazoncloudwatch-agent-eu-central-1.s3.eu-central-1.amazonaws.com/amazon_linux/amd64/latest/amazon-cloudwatch-agent.rpm`

Note

To download the CloudWatch agent, your connection must use TLS 1.2 or later.

To verify the CloudWatch agent package on a Linux server

1. Download the public key.

```
shell$ wget https://amazoncloudwatch-agent.s3.amazonaws.com/assets/amazon-
cloudwatch-agent.gpg
```

2. Import the public key into your keyring.

```
shell$  gpg --import amazon-cloudwatch-agent.gpg
gpg: key 3B789C72: public key "Amazon CloudWatch Agent" imported
gpg: Total number processed: 1
gpg: imported: 1 (RSA: 1)
```

   Make a note of the key value, as you need it in the next step. In the preceding example, the key value is 3B789C72.

3. Verify the fingerprint by running the following command, replacing *key-value* with the value from the preceding step:

```
shell$  gpg --fingerprint key-value
pub   2048R/3B789C72 2017-11-14
      Key fingerprint = 9376 16F3 450B 7D80 6CBD  9725 D581 6730 3B78 9C72
uid                  Amazon CloudWatch Agent
```

   The fingerprint string should be equal to the following:

```
9376 16F3 450B 7D80 6CBD 9725 D581 6730 3B78 9C72
```

If the fingerprint string doesn't match, don't install the agent. Contact Amazon Web Services.

After you have verified the fingerprint, you can use it to verify the signature of the CloudWatch agent package.

4. Download the package signature file using **wget**. To determine the correct signature file, see the preceding table.

```
wget Signature File Link
```

5. To verify the signature, run **gpg --verify**.

```
shell$ gpg --verify signature-filename agent-download-filename
gpg: Signature made Wed 29 Nov 2017 03:00:59 PM PST using RSA key ID 3B789C72
gpg: Good signature from "Amazon CloudWatch Agent"
gpg: WARNING: This key is not certified with a trusted signature!
gpg:          There is no indication that the signature belongs to the owner.
Primary key fingerprint: 9376 16F3 450B 7D80 6CBD  9725 D581 6730 3B78 9C72
```

If the output includes the phrase BAD `signature`, check whether you performed the procedure correctly. If you continue to get this response, contact Amazon Web Services and avoid using the downloaded file.

Note the warning about trust. A key is trusted only if you or someone who you trust has signed it. This doesn't mean that the signature is invalid, only that you have not verified the public key.

To verify the CloudWatch agent package on a server running Windows Server

1. Download and install GnuPG for Windows from https://gnupg.org/download/. When installing, include the **Shell Extension (GpgEx)** option.

   You can perform the remaining steps in Windows PowerShell.

2. Download the public key.

```
PS> wget https://amazoncloudwatch-agent.s3.amazonaws.com/assets/amazon-cloudwatch-
agent.gpg -OutFile amazon-cloudwatch-agent.gpg
```

3. Import the public key into your keyring.

```
PS>  gpg --import amazon-cloudwatch-agent.gpg
gpg: key 3B789C72: public key "Amazon CloudWatch Agent" imported
gpg: Total number processed: 1
gpg: imported: 1 (RSA: 1)
```

   Make a note of the key value because you need it in the next step. In the preceding example, the key value is 3B789C72.

4. Verify the fingerprint by running the following command, replacing *key-value* with the value from the preceding step:

```
PS>  gpg --fingerprint key-value
pub   rsa2048 2017-11-14 [SC]
      9376 16F3 450B 7D80 6CBD  9725 D581 6730 3B78 9C72
uid           [ unknown] Amazon CloudWatch Agent
```

   The fingerprint string should be equal to the following:

   `9376 16F3 450B 7D80 6CBD 9725 D581 6730 3B78 9C72`

   If the fingerprint string doesn't match, don't install the agent. Contact Amazon Web Services.

   After you have verified the fingerprint, you can use it to verify the signature of the CloudWatch agent package.

5. Download the package signature file using wget. To determine the correct signature file, see CloudWatch Agent Download Links.

6. To verify the signature, run **gpg --verify**.

```
PS> gpg --verify sig-filename agent-download-filename
gpg: Signature made 11/29/17 23:00:45 Coordinated Universal Time
gpg:                using RSA key D58167303B789C72
gpg: Good signature from "Amazon CloudWatch Agent" [unknown]
gpg: WARNING: This key is not certified with a trusted signature!
gpg:          There is no indication that the signature belongs to the owner.
Primary key fingerprint: 9376 16F3 450B 7D80 6CBD  9725 D581 6730 3B78 9C72
```

If the output includes the phrase `BAD signature`, check whether you performed the procedure correctly. If you continue to get this response, contact Amazon Web Services and avoid using the downloaded file.

Note the warning about trust. A key is trusted only if you or someone who you trust has signed it. This doesn't mean that the signature is invalid, only that you have not verified the public key.

To verify the CloudWatch agent package on a macOS computer

- There are two methods for signature verification on macOS.
  - Verify the fingerprint by running the following command.

```
pkgutil --check-signature amazon-cloudwatch-agent.pkg
```

You should see a result similar to the following.

```
Package "amazon-cloudwatch-agent.pkg":
        Status: signed by a developer certificate issued by Apple for
 distribution
        Signed with a trusted timestamp on: 2020-10-02 18:13:24 +0000
        Certificate Chain:
        1. Developer ID Installer: AMZN Mobile LLC (94KV3E626L)
        Expires: 2024-10-18 22:31:30 +0000
        SHA256 Fingerprint:
        81 B4 6F AF 1C CA E1 E8 3C 6F FB 9E 52 5E 84 02 6E 7F 17 21 8E FB
        0C 40 79 13 66 8D 9F 1F 10 1C

 ------------------------------------------------------------------------
        2. Developer ID Certification Authority
        Expires: 2027-02-01 22:12:15 +0000
        SHA256 Fingerprint:
        7A FC 9D 01 A6 2F 03 A2 DE 96 37 93 6D 4A FE 68 09 0D 2D E1 8D 03
        F2 9C 88 CF B0 B1 BA 63 58 7F

 ------------------------------------------------------------------------
        3. Apple Root CA
        Expires: 2035-02-09 21:40:36 +0000
        SHA256 Fingerprint:
        B0 B1 73 0E CB C7 FF 45 05 14 2C 49 F1 29 5E 6E DA 6B CA ED 7E 2C
```

```
        68 C5 BE 91 B5 A1 10 01 F0 24
```

- Or, download and use the .sig file To use this method, follow these steps.
  - Install the GPG application to your macOS host by entering the following command.

    ```
    brew install GnuPG
    ```

- Download the package signature file using curl. To determine the correct signature file, see CloudWatch Agent Download Links.
- To verify the signature, run **gpg --verify**.

  ```
  PS> gpg --verify sig-filename agent-download-filename
  gpg: Signature made 11/29/17 23:00:45 Coordinated Universal Time
  gpg:                using RSA key D58167303B789C72
  gpg: Good signature from "Amazon CloudWatch Agent" [unknown]
  gpg: WARNING: This key is not certified with a trusted signature!
  gpg:          There is no indication that the signature belongs to the owner.
  Primary key fingerprint: 9376 16F3 450B 7D80 6CBD  9725 D581 6730 3B78 9C72
  ```

  If the output includes the phrase BAD `signature`, check whether you performed the procedure correctly. If you continue to get this response, contact Amazon Web Services and avoid using the downloaded file.

  Note the warning about trust. A key is trusted only if you or someone who you trust has signed it. This doesn't mean that the signature is invalid, only that you have not verified the public key.

Installing the CloudWatch agent

You can install the CloudWatch agent on your Amazon EC2 instances, on-premises servers, and in containerized environments to collect metrics, logs, and traces. The agent supports Linux, Windows, and macOS operating systems. There are several ways to install the agent, including using Systems Manager, from the CloudWatch console, installing from the command line, or installing using a configuration file. Before installing, make sure you have the required IAM permissions and network access configured.

Topics

- Install and Configure Amazon CloudWatch Agent with Workload Detection in the CloudWatch console
- Manual installation on Amazon EC2
- Install the CloudWatch agent using AWS Systems Manager
- Install the CloudWatch agent on on-premises servers
- Install the CloudWatch agent on new instances using CloudFormation
- Install the CloudWatch agent with the Amazon CloudWatch Observability EKS add-on or the Helm chart

Install and Configure Amazon CloudWatch Agent with Workload Detection in the CloudWatch console

Introduction

You can use the CloudWatch Getting Started console to install and configure the CloudWatch agent on Amazon EC2 instances. The Amazon CloudWatch agent is a lightweight software component that collects system-level metrics, logs, and traces from your Amazon EC2 instances. By automating the collection and delivery of monitoring data to CloudWatch, the agent enables you to gain actionable insights, optimize resource utilization, and ensure your applications are running smoothly with minimal configuration effort.

Configure the CloudWatch agent with pre-defined, workload-specific configurations that leverage automatic workload detection to identify running applications and services on your instances. You can customize data collection with specific metrics, logs, and traces, enabling you to monitor application performance and troubleshoot issues effectively.

How it Works

The CloudWatch agent detects workloads running on your Amazon EC2 instances through automatic workload detection capabilities. This feature identifies running applications and services on your instances, enabling intelligent monitoring without manual configuration.

Observability solutions provide pre-defined, workload-specific configurations tailored to common applications such as Apache Kafka, Apache Tomcat, Java Virtual Machines (JVM), NGINX, and NVIDIA GPU workloads. These solutions streamline the monitoring setup by automatically collecting the right metrics, logs, and traces specific to each detected workload, eliminating the need for manual instrumentation and configuration.

When workload detection is enabled, the agent analyzes your instance environment and automatically selects relevant pre-configured monitoring templates. These configurations are optimized by AWS subject-matter experts to capture the most important telemetry data for each workload type, ensuring you have comprehensive observability from the start.

Prerequisites

SSM Agent Installation (Required)

You must have AWS Systems Manager (SSM) agent installed on your Amazon EC2 instances. SSM agent comes pre-installed on most AWS-supplied Amazon Machine Images (AMIs), If you need to manually install or update the SSM agent, refer to the Systems Manager documentation.

> **Note**
>
> Default Host Management Configuration (DHMC) is a Systems Manager feature that automatically grants Amazon EC2 instances permissions to connect to Systems Manager without requiring you to manually attach an IAM instance profile to each instance. If your Amazon EC2 instances are using DHMC and the CloudWatch agent installation process attaches the CloudWatch policy to your instances, it can take up to 30 minutes for the new policy to take effect. This delay can postpone the publication of metrics, logs, and traces to CloudWatch. To mitigate, you can create your Amazon EC2 instances with an IAM role that contains the AmazonSSMManagedInstanceCore policy.

Workload Detection (Recommended)

Workload detection is an opt-in feature that automatically identifies running applications and services on your instances. We recommend turning on workload detection to take advantage of pre-configured, workload-specific monitoring templates. You can enable workload detection in the CloudWatch console settings.

Getting started

Open the Getting Started with Amazon CloudWatch agent page in the Amazon CloudWatch console: https://console.aws.amazon.com/cloudwatch/home#cloudwatch-agent

Manual instance deployment for CloudWatch Agent

Manually select up to 50 instances for CloudWatch agent installation and configuration. This targeted approach allows you to enhance monitoring for specific Amazon EC2 instances.

Tag-based deployment for CloudWatch Agent

Use tag-based deployment to install and configure the CloudWatch agent on fleets of Amazon EC2 instances. This method applies to all current and future instances with matching tags.

Tag-based configuration

Tag-based configurations allow you to efficiently organize, view, and modify configurations, helping you to manage CloudWatch agent and its configuration across fleets of Amazon EC2 instances.

CloudWatch agent installation

Install the CloudWatch agent to collect metrics, logs, and traces from Amazon EC2 instances and on-premises hosts. This telemetry provides important health and performance data about your infrastructure and applications.

CloudWatch agent configuration

Configure the CloudWatch agent with pre-defined, workload-specific configurations. You can customize data collection with specific metrics, logs, and traces, enabling you to monitor application performance and troubleshoot issues effectively.

Costs

Additional metrics that you add during this process are billed as custom metrics. For more information about CloudWatch metrics pricing, see Amazon CloudWatch Pricing.

Manual installation on Amazon EC2

> **Note**
>
> Make sure the prerequisites are completed before installing the CloudWatch agent for the first time.

Topics

- Installing on Amazon Linux using the package manager

- Installing on Amazon Linux using the command line
- Installing on Windows
- Installing on macOS

Installing on Amazon Linux using the package manager

The CloudWatch agent is available as a package in Amazon Linux 2023 and Amazon Linux 2. If you are using one of these operating systems, you can install the package by entering the following command:

```
sudo yum install amazon-cloudwatch-agent
```

You must also make sure that the IAM role attached to the instance has the **CloudWatchAgentServerPolicy** attached.

Installing on Amazon Linux using the command line

On all supported Linux operating systems, you can download and install the CloudWatch agent using the command line.

1. Download the CloudWatch agent. For a Linux server, enter the following command. For `download-link`, use the appropriate download link from the table below.

   ```
   wget download-link
   ```

Architecture	Platform	Download link
x86-64	Amazon Linux 2023 and Amazon Linux 2	https://amazoncloudwatch-agent.s3.amazonaws.com/amazon_linux/amd64/latest/amazon-cloudwatch-agent.rpm
ARM64	Amazon Linux 2023 and Amazon Linux 2	https://amazoncloudwatch-agent.s3.amazonaws.com/amazon_linux/arm64/latest/

Architecture	Platform	Download link
		amazon-cloudwatch-agent.rpm

2. After you have downloaded the package, you can optionally verify the package signature. For more information, see Verifying the signature of the CloudWatch agent package.
3. Install the package. If you downloaded an RPM package on a Linux server, change to the directory containing the package and enter the following:

```
sudo rpm -U ./amazon-cloudwatch-agent.rpm
```

If you downloaded a DEB package on a Linux server, change to the directory containing the package and enter the following:

```
sudo dpkg -i -E ./amazon-cloudwatch-agent.deb
```

Installing on Windows

On Windows Server, you can download and install the CloudWatch agent using the command line.

1. Download the following file:

```
https://amazoncloudwatch-agent.s3.amazonaws.com/windows/amd64/latest/amazon-cloudwatch-agent.msi
```

2. After you have downloaded the package, you can optionally verify the package signature. For more information, see Verifying the signature of the CloudWatch agent package.
3. Install the package. Change to the directory containing the package and enter the following:

```
msiexec /i amazon-cloudwatch-agent.msi
```

This command also works from within PowerShell. For more information about MSI command options, see Command-Line Options in the Microsoft Windows documentation.

Installing on macOS

On macOS computers, you can download and install the CloudWatch agent using the command line.

1. Download the appropriate package for your architecture:

   ```
   https://amazoncloudwatch-agent.s3.amazonaws.com/darwin/amd64/latest/amazon-cloudwatch-agent.pkg
   ```

   For ARM64 architecture:

   ```
   https://amazoncloudwatch-agent.s3.amazonaws.com/darwin/arm64/latest/amazon-cloudwatch-agent.pkg
   ```

2. After you have downloaded the package, you can optionally verify the package signature. For more information, see Verifying the signature of the CloudWatch agent package.
3. Install the package. Change to the directory containing the package and enter the following:

   ```
   sudo installer -pkg ./amazon-cloudwatch-agent.pkg -target /
   ```

Install the CloudWatch agent using AWS Systems Manager

Using AWS Systems Manager makes it easier to install the CloudWatch agent on a fleet of Amazon EC2 instances. You can download the agent into one server and create your CloudWatch agent configuration file for all servers in the fleet. Then you can use Systems Manager to install the agent on the other servers, using the configuration file that you created. Use the following topics to install and run the CloudWatch agent using AWS Systems Manager.

Topics

- Install or update the SSM Agent
- Verify Systems Manager prerequisites
- Verify internet access
- Download the CloudWatch agent package to your first instance
- Create and modify the agent configuration file

- Install and start the CloudWatch agent on additional EC2 instances using your agent configuration
- Install the CloudWatch agent on additional EC2 instances using your agent configuration
- (Optional) Modify the common configuration and named profile for CloudWatch agent

Install or update the SSM Agent

On an Amazon EC2 instance, the CloudWatch agent requires that the instance is running version 2.2.93.0 or later of the SSM Agent. Before you install the CloudWatch agent, update or install SSM Agent on the instance if you haven't already done so.

For information about installing or updating SSM Agent on an instance running Linux, see Installing and Configuring SSM Agent on Linux Instances in the *AWS Systems Manager User Guide*.

For information about installing or updating the SSM Agent, see Working with SSM Agent in the *AWS Systems Manager User Guide*.

Verify Systems Manager prerequisites

Before you use Systems Manager Run Command to install and configure the CloudWatch agent, verify that your instances meet the minimum Systems Manager requirements. For more information, see Systems Manager Prerequisites in the *AWS Systems Manager User Guide*.

Verify internet access

Your Amazon EC2 instances must be able to connect to CloudWatch endpoints. This can be by Internet Gateway, NAT gateway, or CloudWatch Interface VPC endpoints. For more information about how to configure internet access, see Internet Gateways in the *Amazon VPC User Guide*.

The endpoints and ports to configure on your proxy are as follows:

- If you're using the agent to collect metrics, you must allow list the CloudWatch endpoints for the appropriate Regions. These endpoints are listed in Amazon CloudWatch in the *Amazon Web Services General Reference*.
- If you're using the agent to collect logs, you must allow list the CloudWatch Logs endpoints for the appropriate Regions. These endpoints are listed in Amazon CloudWatch Logs in the *Amazon Web Services General Reference*.
- If you're using Systems Manager to install the agent or Parameter Store to store your configuration file, you must allow list the Systems Manager endpoints for the appropriate

Regions. These endpoints are listed in AWS Systems Manager in the *Amazon Web Services General Reference*.

Download the CloudWatch agent package to your first instance

Use the following steps to download the CloudWatch agent package using Systems Manager.

To download the CloudWatch agent using Systems Manager

1. Open the Systems Manager console at https://console.aws.amazon.com/systems-manager/.
2. In the navigation pane, choose **Run Command**.

   -or-

   If the AWS Systems Manager home page opens, scroll down and choose **Explore Run Command**.
3. Choose **Run command**.
4. In the **Command document** list, choose **AWS-ConfigureAWSPackage**.
5. In the **Targets** area, choose the instance to install the CloudWatch agent on. If you don't see a specific instance, it might not be configured as a managed instance for use with Systems Manager. For more information, see Setting Up AWS Systems Manager for Hybrid Environments in the *AWS Systems Manager User Guide*.
6. In the **Action** list, choose **Install**.
7. In the **Name** field, enter `AmazonCloudWatchAgent`.
8. Keep **Version** set to **latest** to install the latest version of the agent.
9. Choose **Run**.
10. Optionally, in the **Targets and outputs** areas, select the button next to an instance name and choose **View output**. Systems Manager should show that the agent was successfully installed.

Create and modify the agent configuration file

After you have downloaded the CloudWatch agent, you must create the configuration file before you start the agent on any servers.

If you're going to save your agent configuration file in the Systems Manager Parameter Store, you must use an EC2 instance to save to the Parameter Store. Additionally, you must first attach to that

instance the `CloudWatchAgentAdminRole` IAM role. For more information about attaching roles, see Attaching an IAM Role to an Instance in the *Amazon EC2 User Guide*.

For more information about creating the CloudWatch agent configuration file, see Create the CloudWatch agent configuration file.

Install and start the CloudWatch agent on additional EC2 instances using your agent configuration

After you have a CloudWatch agent configuration saved in Parameter Store, you can use it when you install the agent on other servers.

For each of these servers, follow the steps listed previously in this section to verify the Systems Manager prerequisites, the version of the SSM Agent, and internet access. Then use the following instructions to install the CloudWatch agent on the additional instances, using the CloudWatch agent configuration file that you have created.

Step 1: Download and install the CloudWatch agent

To be able to send the CloudWatch data to a different Region, make sure that the IAM role that you attached to this instance has permissions to write the CloudWatch data in that Region.

Following is an example of using the `aws configure` command to create a named profile for the CloudWatch agent. This example assumes that you are using the default profile name of `AmazonCloudWatchAgent`.

To create the AmazonCloudWatchAgent profile for the CloudWatch agent

- On Linux servers, type the following command and follow the prompts:

  ```
  sudo aws configure --profile AmazonCloudWatchAgent
  ```

  On Windows Server, open PowerShell as an administrator, type the following command and follow the prompts.

  ```
  aws configure --profile AmazonCloudWatchAgent
  ```

Install the CloudWatch agent on additional EC2 instances using your agent configuration

After you have a CloudWatch agent configuration saved in Parameter Store, you can use it when you install the agent on other servers.

For each of these servers, follow the steps listed previously in this section to verify the Systems Manager prerequisites, the version of the SSM Agent, and internet access. Then use the following instructions to install the CloudWatch agent on the additional instances, using the CloudWatch agent configuration file that you have created.

Step 1: Download and install the CloudWatch agent

You need to install the agent on each server where you will run the agent. The CloudWatch agent is available as a package in Amazon Linux 2023 and Amazon Linux 2. If you are using this operating system, you can use Systems Manager to install the package by using the following steps.

> **Note**
>
> You must also make sure that the IAM role attached to the instance has the **CloudWatchAgentServerPolicy** attached. For more information, see Prerequisites.

To use Systems Manager to install the CloudWatch agent package

1. Open the Systems Manager console at https://console.aws.amazon.com/systems-manager/.
2. In the navigation pane, choose **Run Command**.

   -or-

   If the AWS Systems Manager home page opens, scroll down and choose **Explore Run Command**.
3. Choose **Run command**.
4. In the **Command document** list, select **AWS-RunShellScript**. Then paste the following into **Command parameters**.

   ```
   sudo yum install amazon-cloudwatch-agent
   ```
5. Choose **Run**

On all supported operating systems, you can download the CloudWatch agent package using either Systems Manager Run Command or an Amazon S3 download link.

> **Note**
>
> When you install or update the CloudWatch agent, only the **Uninstall and reinstall** option is supported. You can't use the **In-place update** option.

Systems Manager Run Command enables you to manage the configuration of your instances. You specify a Systems Manager document, specify parameters, and execute the command on one or more instances. SSM Agent on the instance processes the command and configures the instance as specified.

To download the CloudWatch agent using Run Command

1. Open the Systems Manager console at https://console.aws.amazon.com/systems-manager/.
2. In the navigation pane, choose **Run Command**.

   -or-

   If the AWS Systems Manager home page opens, scroll down and choose **Explore Run Command**.
3. Choose **Run command**.
4. In the **Command document** list, choose **AWS-ConfigureAWSPackage**.
5. In the **Targets** area, choose the instance on which to install the CloudWatch agent. If you do not see a specific instance, it might not be configured for Run Command. For more information, see Setting Up AWS Systems Manager for Hybrid Environments in the *AWS Systems Manager User Guide*.
6. In the **Action** list, choose **Install**.
7. In the **Name** box, enter `AmazonCloudWatchAgent`.
8. Keep **Version** set to **latest** to install the latest version of the agent.
9. Choose **Run**.
10. Optionally, in the **Targets and outputs** areas, select the button next to an instance name and choose **View output**. Systems Manager should show that the agent was successfully installed.

Step 2: Start the CloudWatch agent using your agent configuration file

Follow these steps to start the agent using Systems Manager Run Command.

For information about setting up the agent on a system that has security-enhanced Linux (SELinux) enabled, see Set up the CloudWatch agent with security-enhanced Linux (SELinux).

To start the CloudWatch agent using Run Command

1. Open the Systems Manager console at https://console.aws.amazon.com/systems-manager/.
2. In the navigation pane, choose **Run Command**.

   -or-

   If the AWS Systems Manager home page opens, scroll down and choose **Explore Run Command**.
3. Choose **Run command**.
4. In the **Command document** list, choose **AmazonCloudWatch-ManageAgent**.
5. In the **Targets** area, choose the instance where you installed the CloudWatch agent.
6. In the **Action** list, choose **configure**.
7. In the **Optional Configuration Source** list, choose **ssm**.
8. In the **Optional Configuration Location** box, enter the name of the Systems Manager parameter name of the agent configuration file that you created and saved to Systems Manager Parameter Store, as explained in Create the CloudWatch agent configuration file.
9. In the **Optional Restart** list, choose **yes** to start the agent after you have finished these steps.
10. Choose **Run**.
11. Optionally, in the **Targets and outputs** areas, select the button next to an instance name and choose **View output**. Systems Manager should show that the agent was successfully started.

(Optional) Modify the common configuration and named profile for CloudWatch agent

The CloudWatch agent includes a configuration file called `common-config.toml`. You can use this file to optionally specify proxy and Region information.

On a server running Linux, this file is in the /opt/aws/amazon-cloudwatch-agent/etc directory. On a server running Windows Server, this file is in the C:\ProgramData\Amazon\AmazonCloudWatchAgent directory.

The default common-config.toml is as follows:

```
# This common-config is used to configure items used for both ssm and cloudwatch access

## Configuration for shared credential.
## Default credential strategy will be used if it is absent here:
##            Instance role is used for EC2 case by default.
##            AmazonCloudWatchAgent profile is used for onPremise case by default.
# [credentials]
#    shared_credential_profile = "{profile_name}"
#    shared_credential_file= "{file_name}"

## Configuration for proxy.
## System-wide environment-variable will be read if it is absent here.
## i.e. HTTP_PROXY/http_proxy; HTTPS_PROXY/https_proxy; NO_PROXY/no_proxy
## Note: system-wide environment-variable is not accessible when using ssm run-command.
## Absent in both here and environment-variable means no proxy will be used.
# [proxy]
#    http_proxy = "{http_url}"
#    https_proxy = "{https_url}"
#    no_proxy = "{domain}"
```

All lines are commented out initially. To set the credential profile or proxy settings, remove the # from that line and specify a value. You can edit this file manually, or by using the RunShellScript Run Command in Systems Manager:

- shared_credential_profile – For on-premises servers, this line specifies the IAM user credential profile to use to send data to CloudWatch. If you keep this line commented out, AmazonCloudWatchAgent is used.

  On an EC2 instance, you can use this line to have the CloudWatch agent send data from this instance to CloudWatch in a different AWS Region. To do so, specify a named profile that includes a region field specifying the name of the Region to send to.

  If you specify a shared_credential_profile, you must also remove the # from the beginning of the [credentials] line.

- `shared_credential_file` – To have the agent look for credentials in a file located in a path other than the default path, specify that complete path and file name here. The default path is `/root/.aws` on Linux and is `C:\\Users\\Administrator\\.aws` on Windows Server.

  The first example below shows the syntax of a valid `shared_credential_file` line for Linux servers, and the second example is valid for Windows Server. On Windows Server, you must escape the \ characters.

  ```
  shared_credential_file= "/usr/username/credentials"
  ```

  ```
  shared_credential_file= "C:\\Documents and Settings\\username\\.aws\\credentials"
  ```

  If you specify a `shared_credential_file`, you must also remove the # from the beginning of the `[credentials]` line.
- Proxy settings – If your servers use HTTP or HTTPS proxies to contact AWS services, specify those proxies in the `http_proxy` and `https_proxy` fields. If there are URLs that should be excluded from proxying, specify them in the `no_proxy` field, separated by commas.

Install the CloudWatch agent on on-premises servers

If you downloaded the CloudWatch agent on a computer and created your agent configuration file, you can use that configuration file to install the agent in other on-premises servers.

Download the CloudWatch agent on an on-premises server

You can download the CloudWatch agent package using either Systems Manager Run Command or an Amazon S3 download link.

Download using Systems Manager

To use Systems Manager Run Command, you must register your on-premises server with Amazon EC2 Systems Manager. For more information, see Setting Up Systems Manager in Hybrid Environments in the *AWS Systems Manager User Guide*.

If you have already registered your server, update SSM Agent to the latest version.

For information about updating SSM Agent on a server running Linux, see Install SSM Agent for a Hybrid Environment (Linux) in the *AWS Systems Manager User Guide*.

For information about updating the SSM Agent on a server running Windows Server, see Install SSM Agent for a Hybrid Environment (Windows) in the *AWS Systems Manager User Guide*.

To use the SSM Agent to download the CloudWatch agent package on an on-premises server

1. Open the Systems Manager console at https://console.aws.amazon.com/systems-manager/.
2. In the navigation pane, choose **Run Command**.

   -or-

   If the AWS Systems Manager home page opens, scroll down and choose **Explore Run Command**.
3. Choose **Run command**.
4. In the **Command document** list, select the button next to **AWS-ConfigureAWSPackage**.
5. In the **Targets** area, select the server to install the CloudWatch agent on. If you don't see a specific server, it might not be configured for Run Command. For more information, see Setting Up AWS Systems Manager for Hybrid Environments in the *AWS Systems Manager User Guide*.
6. In the **Action** list, choose **Install**.
7. In the **Name** box, enter *AmazonCloudWatchAgent*.
8. Keep **Version** blank to install the latest version of the agent.
9. Choose **Run**.

   The agent package is downloaded, and the next steps are to configure and start it.

(Installing on an on-premises server) Specify IAM credentials and AWS Region

To enable the CloudWatch agent to send data from an on-premises server, you must specify the access key and secret key of the IAM user that you created earlier.

You also must specify the AWS Region to send the metrics to, using the `region` field.

Following is an example of this file.

```
[AmazonCloudWatchAgent]
aws_access_key_id=my_access_key
aws_secret_access_key=my_secret_key
```

```
region = us-west-1
```

For *my_access_key* and *my_secret_key*, use the keys from the IAM user that doesn't have the permissions to write to Systems Manager Parameter Store.

If you name this profile `AmazonCloudWatchAgent`, you don't need to do anything more. Optionally, you can give it a different name and specify that name as the value for `shared_credential_profile` in the `common-config.toml` file, which is explained in the following section.

Following is an example of using the **aws configure** command to create a named profile for the CloudWatch agent. This example assumes that you're using the default profile name of `AmazonCloudWatchAgent`.

To create the AmazonCloudWatchAgent profile for the CloudWatch agent

1. If you haven't already done so, install the AWS Command Line Interface on the server. For more information, see Installing the AWS CLI.
2. On Linux servers, enter the following command and follow the prompts:

   ```
   sudo aws configure --profile AmazonCloudWatchAgent
   ```

   On Windows Server, open PowerShell as an administrator, enter the following command, and follow the prompts.

   ```
   aws configure --profile AmazonCloudWatchAgent
   ```

(Optional) Modifying the common configuration and named profile for CloudWatch agent

The CloudWatch agent includes a configuration file called `common-config.toml`. You can optionally use this file to specify proxy and Region information.

On a server running Linux, this file is in the `/opt/aws/amazon-cloudwatch-agent/etc` directory. On a server running Windows Server, this file is in the `C:\ProgramData\Amazon\AmazonCloudWatchAgent` directory.

The default `common-config.toml` is as follows:

```
# This common-config is used to configure items used for both ssm and cloudwatch access

## Configuration for shared credential.
## Default credential strategy will be used if it is absent here:
##            Instance role is used for EC2 case by default.
##            AmazonCloudWatchAgent profile is used for onPremise case by default.
# [credentials]
#    shared_credential_profile = "{profile_name}"
#    shared_credential_file= "{file_name}"

## Configuration for proxy.
## System-wide environment-variable will be read if it is absent here.
## i.e. HTTP_PROXY/http_proxy; HTTPS_PROXY/https_proxy; NO_PROXY/no_proxy
## Note: system-wide environment-variable is not accessible when using ssm run-command.
## Absent in both here and environment-variable means no proxy will be used.
# [proxy]
#    http_proxy = "{http_url}"
#    https_proxy = "{https_url}"
#    no_proxy = "{domain}"
```

All lines are commented out initially. To set the credential profile or proxy settings, remove the # from that line and specify a value. You can edit this file manually, or by using the `RunShellScript` Run Command in Systems Manager:

- `shared_credential_profile` – For on-premises servers, this line specifies the IAM user credential profile to use to send data to CloudWatch. If you keep this line commented out, `AmazonCloudWatchAgent` is used. For more information about creating this profile, see (Installing on an on-premises server) Specify IAM credentials and AWS Region.

  On an EC2 instance, you can use this line to have the CloudWatch agent send data from this instance to CloudWatch in a different AWS Region. To do so, specify a named profile that includes a `region` field specifying the name of the Region to send to.

  If you specify a `shared_credential_profile`, you must also remove the # from the beginning of the `[credentials]` line.

- `shared_credential_file` – To have the agent look for credentials in a file located in a path other than the default path, specify that complete path and file name here. The default path is `/root/.aws` on Linux and is `C:\\Users\\Administrator\\.aws` on Windows Server.

The first example below shows the syntax of a valid `shared_credential_file` line for Linux servers, and the second example is valid for Windows Server. On Windows Server, you must escape the \ characters.

```
shared_credential_file= "/usr/username/credentials"
```

```
shared_credential_file= "C:\\Documents and Settings\\username\\.aws\\credentials"
```

If you specify a `shared_credential_file`, you must also remove the # from the beginning of the `[credentials]` line.

- Proxy settings – If your servers use HTTP or HTTPS proxies to contact AWS services, specify those proxies in the `http_proxy` and `https_proxy` fields. If there are URLs that should be excluded from proxying, specify them in the `no_proxy` field, separated by commas.

Install the CloudWatch agent on new instances using CloudFormation

This section describes how to install the CloudWatch agent on new Amazon EC2 instances using AWS CloudFormation.

> **Note**
>
> Amazon uploaded several CloudFormation templates to GitHub that can help you install and update the CloudWatch agent on new Amazon EC2 instances. For more information about using CloudFormation, see What is AWS CloudFormation?.

The template location is Deploy the Amazon CloudWatch agent to EC2 instances using CloudFormation. This location includes both `inline` and `ssm` directories. Each of these directories contains templates for both Linux and Windows instances.

- The templates in the `inline` directory have the CloudWatch agent configuration embedded into the CloudFormation template. By default, the Linux templates collect the metrics `mem_used_percent` and `swap_used_percent`, and the Windows templates collect `Memory % Committed Bytes In Use` and `Paging File % Usage`.

To modify these templates to collect different metrics, modify the following section of the template. The following example is from the template for Linux servers. Follow the format and syntax of the agent configuration file to make these changes. For more information, see Manually create or edit the CloudWatch agent configuration file.

```
{
   "metrics":{
      "append_dimensions":{
         "AutoScalingGroupName":"${!aws:AutoScalingGroupName}",
         "ImageId":"${!aws:ImageId}",
         "InstanceId":"${!aws:InstanceId}",
         "InstanceType":"${!aws:InstanceType}"
      },
      "metrics_collected":{
         "mem":{
            "measurement":[
               "mem_used_percent"
            ]
         },
         "swap":{
            "measurement":[
               "swap_used_percent"
            ]
         }
      }
   }
}
```

Note

In the inline templates, all placeholder variables must have an exclamation mark (!) before them as an escape character. You can see this in the example template. If you add other placeholder variables, be sure to add an exclamation mark before the name.

- The templates in the `ssm` directory load an agent configuration file from Parameter Store. To use these templates, you must first create a configuration file and upload it to Parameter Store. You then provide the Parameter Store name of the file in the template. You can create the configuration file manually or by using the wizard. For more information, see Create the CloudWatch agent configuration file.

You can use both types of templates for installing the CloudWatch agent and for updating the agent configuration.

For information about setting up the agent on a system that has security-enhanced Linux (SELinux) enabled, see Set up the CloudWatch agent with security-enhanced Linux (SELinux).

Tutorial: Install and configure the CloudWatch agent using an CloudFormation inline template

This tutorial walks you through using CloudFormation to install the CloudWatch agent on a new Amazon EC2 instance. This tutorial installs on a new instance running Amazon Linux 2 using the inline templates, which don't require the use of the JSON configuration file or Parameter Store. The inline template includes the agent configuration in the template. In this tutorial, you use the default agent configuration contained in the template.

After the procedure for installing the agent, the tutorial continues with how to update the agent.

To use CloudFormation to install the CloudWatch agent on a new instance

1. Download the template from GitHub. In this tutorial, download the inline template for Amazon Linux 2 as follows:

   ```
   curl -O https://raw.githubusercontent.com/aws-cloudformation/aws-cloudformation-templates/main/Solutions/AmazonCloudWatchAgent/inline/amazon_linux.yaml
   ```

2. Open the CloudFormation console at https://console.aws.amazon.com/cloudformation.
3. Choose **Create stack**.
4. For **Choose a template**, select **Upload a template to Amazon S3**, choose the downloaded template, and choose **Next**.
5. On the **Specify Details** page, fill out the following parameters and choose **Next**:

   - **Stack name**: Choose a stack name for your CloudFormation stack.
   - **IAMRole**: Choose an IAM role that has permissions to write CloudWatch metrics, logs, and traces. For more information, see Prerequisites.
   - **InstanceAMI**: Choose an AMI that is valid in the Region where you're going to launch your stack.
   - **InstanceType**: Choose a valid instance type.

- **KeyName**: To enable SSH access to the new instance, choose an existing Amazon EC2 key pair. If you don't already have an Amazon EC2 key pair, you can create one in the AWS Management Console. For more information, see Amazon EC2 Key Pairs in the *Amazon EC2 User Guide*.
- **SSHLocation**: Specifies the IP address range that can be used to connect to the instance using SSH. The default allows access from any IP address.

6. On the **Options** page, you can choose to tag your stack resources. Choose **Next**.
7. On the **Review** page, review your information, acknowledge that the stack might create IAM resources, and then choose **Create**.

   If you refresh the console, you see that the new stack has the `CREATE_IN_PROGRESS` status.
8. When the instance is created, you can see it in the Amazon EC2 console. Optionally, you can connect to the host and check the progress.

   Use the following command to confirm that the agent is installed:

   ```
   rpm -qa amazon-cloudwatch-agent
   ```

   Use the following command to confirm that the agent is running:

   ```
   ps aux | grep amazon-cloudwatch-agent
   ```

The next procedure demonstrates using CloudFormation to update the CloudWatch agent using an inline template. The default inline template collects the `mem_used_percent` metric. In this tutorial, you change the agent configuration to stop collecting that metric.

To use CloudFormation to update the CloudWatch agent

1. In the template that you downloaded in the previous procedure, remove the following lines and then save the template:

   ```
   "mem": {

        "measurement": [
            "mem_used_percent"
          ]
   ```

```
},
```

2. Open the CloudFormation console at https://console.aws.amazon.com/cloudformation.
3. On the CloudFormation dashboard, select the stack that you created and choose **Update Stack**.
4. For **Select Template**, select **Upload a template to Amazon S3**, choose the template that you modified, and choose **Next**.
5. On the **Options** page, choose **Next** and then **Next**.
6. On the **Review** page, review your information and choose **Update**.

   After some time, you see `UPDATE_COMPLETE`.

Tutorial: Install the CloudWatch agent using CloudFormation and Parameter Store

This tutorial walks you through using CloudFormation to install the CloudWatch agent on a new Amazon EC2 instance. This tutorial installs on a new instance running Amazon Linux 2 using an agent configuration file that you create and save in Parameter Store.

After the procedure for installing the agent, the tutorial continues with how to update the agent.

To use CloudFormation to install the CloudWatch agent on a new instance using a configuration from Parameter Store

1. If you haven't done so already, download the CloudWatch agent package to one of your computers so that you can create the agent configuration file. For more information and downloading the agent using Parameter Store, see Download the CloudWatch agent package.
2. Create the agent configuration file and save it in Parameter Store. For more information, see Create the CloudWatch agent configuration file.
3. Download the template from GitHub as follows:

   ```
   curl -O https://raw.githubusercontent.com/awslabs/aws-cloudformation-templates/
   master/aws/solutions/AmazonCloudWatchAgent/ssm/amazon_linux.template
   ```

4. Open the CloudFormation console at https://console.aws.amazon.com/cloudformation.
5. Choose **Create stack**.

6. For **Choose a template**, select **Upload a template to Amazon S3**, choose the template that you downloaded, and choose **Next**.
7. On the **Specify Details** page, fill out the following parameters accordingly and choose **Next**:
   - **Stack name**: Choose a stack name for your CloudFormation stack.
   - **IAMRole**: Choose an IAM role that has permissions to write CloudWatch metrics, logs, and traces. For more information, see Prerequisites.
   - **InstanceAMI**: Choose an AMI that is valid in the Region where you're going to launch your stack.
   - **InstanceType**: Choose a valid instance type.
   - **KeyName**: To enable SSH access to the new instance, choose an existing Amazon EC2 key pair. If you don't already have an Amazon EC2 key pair, you can create one in the AWS Management Console. For more information, see Amazon EC2 Key Pairs in the *Amazon EC2 User Guide*.
   - **SSHLocation**: Specifies the IP address range that can be used to connect to the instance using SSH. The default allows access from any IP address.
   - **SSMKey**: Specifies the agent configuration file that you created and saved in Parameter Store.
8. On the **Options** page, you can choose to tag your stack resources. Choose **Next**.
9. On the **Review** page, review your information, acknowledge that the stack might create IAM resources, and then choose **Create**.

   If you refresh the console, you see that the new stack has the `CREATE_IN_PROGRESS` status.
10. When the instance is created, you can see it in the Amazon EC2 console. Optionally, you can connect to the host and check the progress.

    Use the following command to confirm that the agent is installed:

    ```
    rpm -qa amazon-cloudwatch-agent
    ```

    Use the following command to confirm that the agent is running:

    ```
    ps aux | grep amazon-cloudwatch-agent
    ```

The next procedure demonstrates using CloudFormation to update the CloudWatch agent, using an agent configuration that you saved in Parameter Store.

To use CloudFormation to update the CloudWatch agent using a configuration in Parameter Store

1. Change the agent configuration file stored in Parameter Store to the new configuration that you want.
2. In the CloudFormation template that you downloaded in the the section called “Tutorial: Install the CloudWatch agent using CloudFormation and Parameter Store” topic, change the version number. For example, you might change `VERSION=1.0` to `VERSION=2.0`.
3. Open the CloudFormation console at https://console.aws.amazon.com/cloudformation.
4. On the CloudFormation dashboard, select the stack that you created and choose **Update Stack**.
5. For **Select Template**, select **Upload a template to Amazon S3**, select the template that you just modified, and choose **Next**.
6. On the **Options** page, choose **Next** and then **Next**.
7. On the **Review** page, review your information and choose **Update**.

   After some time, you see `UPDATE_COMPLETE`.

Troubleshooting installation of the CloudWatch agent with CloudFormation

This section helps you troubleshoot issues with installing and updating the CloudWatch agent using CloudFormation.

Detecting when an update fails

If you use CloudFormation to update your CloudWatch agent configuration, and use an invalid configuration, the agent stops sending any metrics to CloudWatch. A quick way to check whether an agent configuration update succeeded is to look at the `cfn-init-cmd.log` file. On a Linux server, the file is located at `/var/log/cfn-init-cmd.log`. On a Windows instance, the file is located at `C:\cfn\log\cfn-init-cmd.log`.

Metrics are missing

If you don't see metrics that you expect to see after installing or updating the agent, confirm that the agent is configured to collect that metric. To do this, check the `amazon-cloudwatch-`

`agent.json` file to make sure that the metric is listed, and check that you are looking in the correct metric namespace. For more information, see CloudWatch agent files and locations.

Install the CloudWatch agent with the Amazon CloudWatch Observability EKS add-on or the Helm chart

You can use either the Amazon CloudWatch Observability EKS add-on or the Amazon CloudWatch Observability Helm chart to install the CloudWatch Agent and the Fluent-bit agent on an Amazon EKS cluster. You can also use the Helm chart to install the CloudWatch Agent and the Fluent-bit agent on a Kubernetes cluster that is not hosted on Amazon EKS.

Using either method on an Amazon EKS cluster enables both Container Insights with enhanced observability for Amazon EKS and CloudWatch Application Signals by default. Both features help you to collect infrastructure metrics, application performance telemetry, and container logs from the cluster.

With Container Insights with enhanced observability for Amazon EKS, Container Insights metrics are charged per observation instead of being charged per metric stored or log ingested. For Application Signals, billing is based on inbound requests to your applications, outbound requests from your applications, and each configured service level objective (SLO). Each inbound request received generates one application signal, and each outbound request made generates one application signal. Every SLO creates two application signals per measurement period. For more information about CloudWatch pricing, see Amazon CloudWatch Pricing.

Both methods enable Container Insights on both Linux and Windows worker nodes in the Amazon EKS cluster. To enable Container Insights on Windows, you must use version 1.5.0 or later of the Amazon EKS add-on or the Helm chart. Application Signals is not supported on Windows in Amazon EKS clusters.

The Amazon CloudWatch Observability EKS add-on is supported on Amazon EKS clusters running with Kubernetes version 1.23 or later.

When you install the add-on or the Helm chart, you must also grant IAM permissions to enable the CloudWatch agent to send metrics, logs, and traces to CloudWatch. There are two ways to do this:

- Attach a policy to the IAM role of your worker nodes. This option grants permissions to worker nodes to send telemetry to CloudWatch.

- Use an IAM role for service accounts for the agent pods, and attach the policy to this role. This works only for Amazon EKS clusters. This option gives CloudWatch access only to the appropriate agent pods.

Topics

- Option 1: Install using EKS Pod Identity
- Option 2: Install with IAM permissions on worker nodes
- Option 3: Install using IAM service account role (applies only to using the add-on)
- Considerations for Amazon EKS Hybrid Nodes
- (Optional) Additional configuration
- Collect Java Management Extensions (JMX) metrics
- Enable Kueue metrics
- Appending OpenTelemetry collector configuration files
- Enabling APM through Application Signals for your Amazon EKS cluster
- Troubleshooting the Amazon CloudWatch Observability EKS add-on or the Helm chart
- Opt out of Application Signals

Option 1: Install using EKS Pod Identity

If you use version 3.1.0 or later of the add-on, you can use EKS Pod Identity to grant the required permissions to the add-on. EKS Pod Identity is the recommended option and provides benefits such as least privilege, credential rotation, and auditability. Additionally, using EKS Pod Identity allows you to install the EKS add-on as part of the cluster creation itself.

To use this method, first follow the EKS Pod Identity association steps to create the IAM role and set up the EKS Pod Identity agent.

Then install the Amazon CloudWatch Observability EKS add-on. To install the add-on, you can use the AWS CLI, the Amazon EKS console, CloudFormation, or Terraform.

AWS CLI

To use the AWS CLI to install the Amazon CloudWatch Observability EKS add-on

Enter the following commands. Replace *my-cluster-name* with the name of your cluster and replace *111122223333* with your account ID. Replace *my-role* with the IAM role that you created in the EKS Pod Identity association step.

```
aws iam attach-role-policy \
--role-name my-role \
--policy-arn arn:aws:iam::aws:policy/CloudWatchAgentServerPolicy

aws eks create-addon \
--addon-name amazon-cloudwatch-observability \
--cluster-name my-cluster-name \
--pod-identity-associations serviceAccount=cloudwatch-
agent,roleArn=arn:aws:iam::111122223333:role/my-role
```

Amazon EKS console

To use the Amazon EKS console to add the Amazon CloudWatch Observability EKS add-on

1. Open the Amazon EKS console at https://console.aws.amazon.com/eks/home#/clusters.
2. In the left navigation pane, choose **Clusters**.
3. Choose the name of the cluster that you want to configure the Amazon CloudWatch Observability EKS add-on for.
4. Choose the **Add-ons** tab.
5. Choose **Get more add-ons**.
6. On the **Select add-ons** page, do the following:
   a. In the **Amazon EKS-addons** section, select the **Amazon CloudWatch Observability** check box.
   b. Choose **Next**.
7. On the **Configure selected add-ons settings** page, do the following:
   a. Select the **Version** you'd like to use.
   b. For **Add-on access**, select **EKS Pod Identity**
   c. If you don't have an IAM role configured, choose **Create recommended role**, then choose **Next** until you are at **Step 3 Name, review, and create**. You can change your role name if desired, otherwise, choose **Create Role**, and then return to the Add-on page and select the IAM role that you just created.

d. (Optional) You can expand the **Optional configuration settings**. If you select **Override** for the **Conflict resolution method**, one or more of the settings for the existing add-on can be overwritten with the Amazon EKS add-on settings. If you don't enable this option and there's a conflict with your existing settings, the operation fails. You can use the resulting error message to troubleshoot the conflict. Before selecting this option, make sure that the Amazon EKS add-on doesn't manage settings that you need to self-manage.

e. Choose **Next**.

8. On the **Review and add** page, choose **Create**. After the add-on installation is complete, you see your installed add-on.

CloudFormation

To use CloudFormation to install the Amazon CloudWatch Observability EKS add-on

1. First, run the following AWS CLI command to attach the necessary IAM policy to your IAM role. Replace *my-role* with the role that you created in the EKS Pod Identity association step.

```
aws iam attach-role-policy \
--role-name my-role \
--policy-arn arn:aws:iam::aws:policy/CloudWatchAgentServerPolicy
```

2. Then create the following resource. Replace *my-cluster-name* with the name of your cluster, replace *111122223333* with your account ID, and replace *my-role* with the IAM role created in EKS Pod Identity association step. For more information, see AWS::EKS::Addon.

```
{
    "Resources": {
        "EKSAddOn": {
            "Type": "AWS::EKS::Addon",
            "Properties": {
                "AddonName": "amazon-cloudwatch-observability",
                "ClusterName": "my-cluster-name",
                "PodIdentityAssociations": [
                    {
                        "ServiceAccount": "cloudwatch-agent",
                        "RoleArn": "arn:aws:iam::111122223333:role/my-role"
```

```
                    }
                ]
            }
        }
    }
}
```

Terraform

To use Terraform to install the Amazon CloudWatch Observability EKS add-on

1. Use the following. Replace *my-cluster-name* with the name of your cluster, replace *111122223333* with your account ID, and replace *my-service-account-role* with the IAM role created in EKS Pod Identity association step.

   For more information, see Resource: aws_eks_addon in the Terraform documentation.

2.
```
resource "aws_iam_role_policy_attachment" "CloudWatchAgentServerPolicy" {
  policy_arn = "arn:aws:iam::aws:policy/CloudWatchAgentServerPolicy"
  role       = "my-role"
}

resource "aws_eks_addon" "example" {
  cluster_name = "my-cluster-name"
  addon_name   = "amazon-cloudwatch-observability"
  pod_identity_associations {
      roleArn = "arn:aws:iam::111122223333:role/my-role"
      serviceAccount = "cloudwatch-agent"
  }
}
```

Option 2: Install with IAM permissions on worker nodes

To use this method, first attach the **CloudWatchAgentServerPolicy** IAM policy to your worker nodes by entering the following command. In this command, replace *my-worker-node-role* with the IAM role used by your Kubernetes worker nodes.

```
aws iam attach-role-policy \
--role-name my-worker-node-role \
--policy-arn arn:aws:iam::aws:policy/CloudWatchAgentServerPolicy
```

Then install the Amazon CloudWatch Observability EKS add-on. To install the add-on, you can use the AWS CLI, the console, CloudFormation, or Terraform.

AWS CLI

To use the AWS CLI to install the Amazon CloudWatch Observability EKS add-on

Enter the following command. Replace *my-cluster-name* with the name of your cluster.

```
aws eks create-addon --addon-name amazon-cloudwatch-observability --cluster-name my-cluster-name
```

Amazon EKS console

To use the Amazon EKS console to add the Amazon CloudWatch Observability EKS add-on

1. Open the Amazon EKS console at https://console.aws.amazon.com/eks/home#/clusters.
2. In the left navigation pane, choose **Clusters**.
3. Choose the name of the cluster that you want to configure the Amazon CloudWatch Observability EKS add-on for.
4. Choose the **Add-ons** tab.
5. Choose **Get more add-ons**.
6. On the **Select add-ons** page, do the following:
   a. In the **Amazon EKS-addons** section, select the **Amazon CloudWatch Observability** check box.
   b. Choose **Next**.
7. On the **Configure selected add-ons settings** page, do the following:
   a. Select the **Version** you'd like to use.
   b. (Optional) You can expand the **Optional configuration settings**. If you select **Override** for the **Conflict resolution method**, one or more of the settings for the existing add-on can be overwritten with the Amazon EKS add-on settings. If you don't enable this option and there's a conflict with your existing settings, the operation fails. You can use the resulting error message to troubleshoot the conflict. Before selecting this option, make sure that the Amazon EKS add-on doesn't manage settings that you need to self-manage.

c. Choose **Next**.

8. On the **Review and add** page, choose **Create**. After the add-on installation is complete, you see your installed add-on.

CloudFormation

To use CloudFormation to install the Amazon CloudWatch Observability EKS add-on

Replace *my-cluster-name* with the name of your cluster. For more information, see AWS::EKS::Addon.

```
{
    "Resources": {
        "EKSAddOn": {
            "Type": "AWS::EKS::Addon",
            "Properties": {
                "AddonName": "amazon-cloudwatch-observability",
                "ClusterName": "my-cluster-name"
            }
        }
    }
}
```

Helm chart

To use the `amazon-cloudwatch-observability` Helm chart

1. You must have Helm installed to use this chart. For more information about installing Helm, see the Helm documentation.
2. After you have installed Helm, enter the following commands. Replace *my-cluster-name* with the name of your cluster, and replace *my-cluster-region* with the Region that the cluster runs in.

```
helm repo add aws-observability https://aws-observability.github.io/helm-charts
helm repo update aws-observability
helm install --wait --create-namespace --namespace amazon-cloudwatch amazon-
cloudwatch-observability aws-observability/amazon-cloudwatch-observability --set
 clusterName=my-cluster-name --set region=my-cluster-region
```

Terraform

To use Terraform to install the Amazon CloudWatch Observability EKS add-on

Replace *my-cluster-name* with the name of your cluster. For more information, see Resource: aws_eks_addon.

```
resource "aws_eks_addon" "example" {
  addon_name   = "amazon-cloudwatch-observability"
  cluster_name = "my-cluster-name"
}
```

Option 3: Install using IAM service account role (applies only to using the add-on)

This method is valid only if you are using the Amazon CloudWatch Observability EKS add-on. Before using this method, verify the following prerequisites:

- You have a functional Amazon EKS cluster with nodes attached in one of the AWS Regions that supports Container Insights. For the list of supported Regions, see Container Insights.
- You have `kubectl` installed and configured for the cluster. For more information, see Installing `kubectl` in the *Amazon EKS User Guide*.
- You have `eksctl` installed. For more information, see Installing or updating `eksctl` in the *Amazon EKS User Guide*.

AWS CLI

To use the AWS CLI to install the Amazon CloudWatch Observability EKS add-on using the IAM service account role

1. Enter the following command to create an OpenID Connect (OIDC) provider, if the cluster doesn't have one already. For more information, see Configuring a Kubernetes service account to assume an IAM role in the *Amazon EKS User Guide*.

   ```
   eksctl utils associate-iam-oidc-provider --cluster my-cluster-name --approve
   ```

2. Enter the following command to create the IAM role with the **CloudWatchAgentServerPolicy** policy attached, and configure the agent service account to assume that role using OIDC. Replace *my-cluster-name* with the name of your cluster,

and replace *my-service-account-role* with the name of the role that you want to associate the service account with. If the role doesn't already exist, `eksctl` creates it for you.

```
eksctl create iamserviceaccount \
  --name cloudwatch-agent \
  --namespace amazon-cloudwatch --cluster my-cluster-name \
  --role-name my-service-account-role \
  --attach-policy-arn arn:aws:iam::aws:policy/CloudWatchAgentServerPolicy \
  --role-only \
  --approve
```

3. Install the add-on by entering the following command. Replace *my-cluster-name* with the name of your cluster, replace *111122223333* with your account ID, and replace *my-service-account-role* with the IAM role created in the previous step.

```
aws eks create-addon --addon-name amazon-cloudwatch-observability
 --cluster-name my-cluster-name --service-account-role-arn
 arn:aws:iam::111122223333:role/my-service-account-role
```

Amazon EKS console

To use the console to install the Amazon CloudWatch Observability EKS add-on using the IAM service account role

1. Open the Amazon EKS console at https://console.aws.amazon.com/eks/home#/clusters.
2. In the left navigation pane, choose **Clusters**.
3. Choose the name of the cluster that you want to configure the Amazon CloudWatch Observability EKS add-on for.
4. Choose the **Add-ons** tab.
5. Choose **Get more add-ons**.
6. On the **Select add-ons** page, do the following:
   a. In the **Amazon EKS-addons** section, select the **Amazon CloudWatch Observability** check box.
   b. Choose **Next**.
7. On the **Configure selected add-ons settings** page, do the following:

a. Select the **Version** you'd like to use.

b. For **Add-on access**, select **IAM roles for service accounts (IRSA)**

c. Select the IAM role in the **Add-on access** box.

d. (Optional) You can expand the **Optional configuration settings**. If you select **Override** for the **Conflict resolution method**, one or more of the settings for the existing add-on can be overwritten with the Amazon EKS add-on settings. If you don't enable this option and there's a conflict with your existing settings, the operation fails. You can use the resulting error message to troubleshoot the conflict. Before selecting this option, make sure that the Amazon EKS add-on doesn't manage settings that you need to self-manage.

e. Choose **Next**.

8. On the **Review and add** page, choose **Create**. After the add-on installation is complete, you see your installed add-on.

Considerations for Amazon EKS Hybrid Nodes

Node-level metrics aren't available for hybrid nodes because Container Insights depends on the availability of the EC2 Instance Metadata Service (IMDS) for node-level metrics. Cluster, workload, Pod, and container-level metrics are available for hybrid nodes.

After you install the add-on by following the steps in the previous sections, you must update the add-on manifest so that the agent can run successfully on hybrid nodes. Edit the `amazoncloudwatchagents` resource in the cluster to add the `RUN_WITH_IRSA` environment variable to match the following.

```
kubectl edit amazoncloudwatchagents -n amazon-cloudwatch cloudwatch-agent
```

```
apiVersion: v1
       items:
       - apiVersion: cloudwatch.aws.amazon.com/v1alpha1
         kind: AmazonCloudWatchAgent
         metadata:
           ...
           name: cloudwatch-agent
           namespace: amazon-cloudwatch
           ...
         spec:
```

```
          ...
          env:
          - name: RUN_WITH_IRSA # <-- Add this
            value: "True" # <-- Add this
          - name: K8S_NODE_NAME
            valueFrom:
              fieldRef:
                fieldPath: spec.nodeName
                ...
```

(Optional) Additional configuration

Topics

- Opt out of collecting container logs
- Use a custom Fluent Bit configuration
- Manage Kubernetes tolerations for the installed pod workloads
- Opt out of accelerated compute metrics collection
- Use a custom CloudWatch agent configuration
- Manage admission webhook TLS certificates
- Collect Amazon EBS volume IDs

Opt out of collecting container logs

By default, the add-on uses Fluent Bit to collect container logs from all pods and then sends the logs to CloudWatch Logs. For information about which logs are collected, see Setting up Fluent Bit.

> **Note**
>
> Neither the add-on or the Helm chart manage existing Fluentd or Fluent Bit resources in a cluster. You can delete the existing Fluentd or Fluent Bit resources before installing the add-on or Helm chart. Alternatively, to keep your existing setup and avoid having the add-on or the Helm chart from also installing Fluent Bit, you can disable it by following the instructions in this section.

To opt out of the collection of container logs if you are using the Amazon CloudWatch Observability EKS add-on, pass the following option when you create or update the add-on:

```
--configuration-values '{ "containerLogs": { "enabled": false } }'
```

To opt out of the collection of container logs if you are using the Helm chart, pass the following option when you create or update the add-on:

```
--set containerLogs.enabled=false
```

Use a custom Fluent Bit configuration

Starting with version 1.7.0 of the Amazon CloudWatch Observability EKS add-on, you can modify the Fluent Bit configuration when you create or update the add-on or Helm chart. You supply the custom Fluent Bit configuration in the `containerLogs` root level section of the advanced configuration of the add-on or the value overrides in the Helm chart. Within this section, you supply the custom Fluent Bit configuration in the `config` section (for Linux) or `configWindows` section (for Windows). The `config` is further broken down into the following sub-sections:

- `service`– This section represents the SERVICE config to define the global behavior of the Fluent Bit engine.
- `customParsers`– This section represents any global PARSERs that you want to include that are capable of taking unstructured log entries and giving them a structure to make it easier for processing and further filtering.
- `extraFiles`– This section can be used to provide additional Fluent Bit `conf` files to be included. By default, the following 3 `conf` files are included:.
  - `application-log.conf`– A `conf` file for sending application logs from your cluster to the log group `/aws/containerinsights/`*`my-cluster-name`*`/application` in CloudWatch Logs.
  - `dataplane-log.conf`– A `conf` file for sending logs corresponding to your cluster's data plane components including the CRI logs, kubelet logs, kube-proxy logs and Amazon VPC CNI logs to the log group `/aws/containerinsights/`*`my-cluster-name`*`/dataplane` in CloudWatch Logs.
  - `host-log.conf`– A `conf` for sending logs from `/var/log/dmesg`, `/var/log/messages`, and `/var/log/secure` on Linux, and System `winlogs` on Windows, to the log group `/aws/containerinsights/`*`my-cluster-name`*`/host` in CloudWatch.

> **Note**
>
> Provide the full configuration for each of these individual sections even if you are modifying only one field within a sub-section. We recommend that you use the default configuration provided below as a baseline and then modify it accordingly so that you don't disable functionality that is enabled by default. You can use the following YAML configuration when modifying the advanced config for the Amazon EKS add-on or when you supply value overrides for the Helm chart.

To find the `config` section for your cluster, see aws-observability / helm-charts on GitHub and find the release corresponding to the version of the add-on or Helm chart that you are installing. Then navigate to `/charts/amazon-cloudwatch-observability/values.yaml` to find the `config` section (for Linux) and `configWindows` section (for Windows) within the `fluentBit` section under `containerLogs`.

As an example, the default Fluent Bit configuration for version 1.7.0 can be found here.

We recommend that you provide the `config` as YAML when you supply it using the Amazon EKS add-on's advanced config or when you supply it as value overrides for your Helm installation. Be sure that the YAML conforms to the following structure.

```
containerLogs:
  fluentBit:
    config:
      service: |
        ...
      customParsers: |
        ...
      extraFiles:
        application-log.conf: |
          ...
        dataplane-log.conf: |
          ...
        host-log.conf: |
          ...
```

The following example `config` changes the global setting for the flush interval to be 45 seconds. Even though the only modification is to the `Flush` field, you must still provide the full `SERVICE`

definition for the service sub-section. Because this example didn't specify overrides for the other sub-sections, the defaults are used for them.

```
containerLogs:
  fluentBit:
    config:
      service: |
        [SERVICE]
          Flush                     45
          Grace                     30
          Log_Level                 error
          Daemon                    off
          Parsers_File              parsers.conf
          storage.path              /var/fluent-bit/state/flb-storage/
          storage.sync              normal
          storage.checksum          off
          storage.backlog.mem_limit 5M
```

The following example configuration includes an extra Fluent bit `conf` file. In this example, we are adding a custom `my-service.conf` under `extraFiles` and it will be included in addition to the three default `extraFiles`.

```
containerLogs:
  fluentBit:
    config:
      extraFiles:
        my-service.conf: |
          [INPUT]
            Name              tail
            Tag               myservice.*
            Path              /var/log/containers/*myservice*.log
            DB                /var/fluent-bit/state/flb_myservice.db
            Mem_Buf_Limit     5MB
            Skip_Long_Lines   On
            Ignore_Older      1d
            Refresh_Interval  10

          [OUTPUT]
            Name                cloudwatch_logs
            Match               myservice.*
            region              ${AWS_REGION}
            log_group_name      /aws/containerinsights/${CLUSTER_NAME}/myservice
```

```
            log_stream_prefix   ${HOST_NAME}-
            auto_create_group   true
```

The next example removes an existing `conf` file entirely from `extraFiles`. This excludes the `application-log.conf` entirely by overriding it with an empty string. Simply omitting `application-log.conf` from `extraFiles` would instead imply to use the default, which is not what we are trying to achieve in this example. The same applies to removing any custom `conf` file that you might have previously added to `extraFiles`.

```
containerLogs:
  fluentBit:
    config:
      extraFiles:
        application-log.conf: ""
```

Manage Kubernetes tolerations for the installed pod workloads

Starting with version 1.7.0 of the Amazon CloudWatch Observability EKS add-on, the add-on and the Helm chart by default set Kubernetes *tolerations* to tolerate all taints on the pod workloads that are installed by the add-on or the Helm chart. This ensures that daemonsets such as the CloudWatch agent and Fluent Bit can schedule pods on all nodes in your cluster by default. For more information about tolerations and taints, see Taints and Tolerations in the Kubernetes documentation.

The default tolerations set by the add-on or the Helm chart are as follows:

```
tolerations:
- operator: Exists
```

You can override the default tolerations by setting the `tolerations` field at the root level when using the add-on advanced config or when you install or upgrade the Helm chart with value overrides. An example would look like the following:

```
tolerations:
- key: "key1"
  operator: "Exists"
  effect: "NoSchedule"
```

To omit tolerations completely, you can use a config that looks like the following:

```
tolerations: []
```

Any changes to tolerations apply to all pod workloads that are installed by the add-on or the Helm chart.

Opt out of accelerated compute metrics collection

By default, Container Insights with enhanced observability collects metrics for Accelerated Compute monitoring, including NVIDIA GPU metrics, AWS Neuron metrics for AWS Trainium and AWS Inferentia, and AWS Elastic Fabric Adapter (EFA) metrics.

NVIDIA GPU metrics from Amazon EKS workloads are collected by default beginning with version `v1.3.0-eksbuild.1` of the EKS add-on or the Helm chart and version `1.300034.0` of the CloudWatch agent. For a list of metrics collected and prerequisites, see NVIDIA GPU metrics.

AWS Neuron metrics for AWS Trainium and AWS Inferentia accelerators are collected by default beginning with version `v1.5.0-eksbuild.1` of the EKS add-on or the Helm chart, and version `1.300036.0` of the CloudWatch agent. For a list of metrics collected and prerequisites, see AWS Neuron metrics for AWS Trainium and AWS Inferentia.

AWS Elastic Fabric Adapter (EFA) metrics from Linux nodes on Amazon EKS clusters are collected by default beginning with version `v1.5.2-eksbuild.1` of the EKS add-on or the Helm chart and version `1.300037.0` of the CloudWatch agent. For a list of metrics collected and prerequisites, see AWS Elastic Fabric Adapter (EFA) metrics.

You can opt out of collecting these metrics by setting the `accelerated_compute_metrics` field in the CloudWatch agent configuration file to `false`. This field is in the `kubernetes` section of the `metrics_collected` section in the CloudWatch configuration file. The following is an example of an opt-out configuration. For more information about how to use custom CloudWatch agent configurations, see the following section, Use a custom CloudWatch agent configuration.

```
{
  "logs": {
    "metrics_collected": {
      "kubernetes": {
        "enhanced_container_insights": true,
        "accelerated_compute_metrics": false
      }
    }
```

```
  }
}
```

Use a custom CloudWatch agent configuration

To collect other metrics, logs or traces using the CloudWatch agent, you can specify a custom configuration while also keeping Container Insights and CloudWatch Application Signals enabled. To do so, embed the CloudWatch agent configuration file within the config key under the agent key of the advanced configuration that you can use when creating or updating the EKS add-on or the Helm chart. The following represents the default agent configuration when you do not provide any additional configuration.

> **Important**
>
> Any custom configuration that you provide using additional configuration settings overrides the default configuration used by the agent. Be cautious not to unintentionally disable functionality that is enabled by default, such as Container Insights with enhanced observability and CloudWatch Application Signals. In the scenario that you are required to provide a custom agent configuration, we recommend using the following default configuration as a baseline and then modifying it accordingly.

- For using the Amazon CloudWatch observability EKS add-on

```
--configuration-values '{
  "agent": {
    "config": {
      "logs": {
        "metrics_collected": {
          "application_signals": {},
          "kubernetes": {
            "enhanced_container_insights": true
          }
        }
      },
      "traces": {
        "traces_collected": {
          "application_signals": {}
        }
      }
    }
```

```
  }
}'
```

- For using the Helm chart

```
--set agent.config='{
  "logs": {
    "metrics_collected": {
      "application_signals": {},
      "kubernetes": {
        "enhanced_container_insights": true
      }
    }
  },
  "traces": {
    "traces_collected": {
      "application_signals": {}
    }
  }
}'
```

The following example shows the default agent configuration for the CloudWatch agent on Windows. The CloudWatch agent on Windows does not support custom configuration.

```
{
  "logs": {
    "metrics_collected": {
      "kubernetes": {
        "enhanced_container_insights": true
      },
    }
  }
}
```

Manage admission webhook TLS certificates

The Amazon CloudWatch Observability EKS add-on and the Helm chart leverage Kubernetes admission webhooks to validate and mutate `AmazonCloudWatchAgent` and `Instrumentation` custom resource (CR) requests, and optionally Kubernetes pod requests on the cluster if CloudWatch Application Signals is enabled. In Kubernetes, webhooks require a TLS certificate that the API server is configured to trust in order to ensure secure communication.

By default, the Amazon CloudWatch Observability EKS add-on and the Helm chart auto-generate a self-signed CA and a TLS certificate signed by this CA for securing the communication between the API server and the webhook server. This auto-generated certificate has a default expiry of 10 years and is not auto-renewed upon expiry. In addition, the CA bundle and the certificate are re-generated every time the add-on or Helm chart is upgraded or re-installed, thus resetting the expiry. If you want to change the default expiry of the auto-generated certificate, you can use the following additional configurations when creating or updating the add-on. Replace *expiry-in-days* with your desired expiry duration in days.

- Use this for the Amazon CloudWatch Observability EKS add-on

```
--configuration-values '{ "admissionWebhooks": { "autoGenerateCert":
 { "expiryDays": expiry-in-days } } }'
```

- Use this for the Helm chart

```
--set admissionWebhooks.autoGenerateCert.expiryDays=expiry-in-days
```

For a more secure and feature-rich certificate authority solution, the add-on has opt-in support for cert-manager, a widely-adopted solution for TLS certificate management in Kubernetes that simplifies the process of obtaining, renewing, managing and using those certificates. It ensures that certificates are valid and up to date, and attempts to renew certificates at a configured time before expiry. cert-manager also facilitates issuing certificates from a variety of supported sources, including AWS Certificate Manager Private Certificate Authority.

We recommend that you review best practices for management of TLS certificates on your clusters and advise you to opt in to cert-manager for production environments. Note that if you opt-in to enabling cert-manager for managing the admission webhook TLS certificates, you are required to pre-install cert-manager on your Amazon EKS cluster before you install the Amazon CloudWatch Observability EKS add-on or the Helm chart. For more information about available installation options, see cert-manager documentation. After you install it, you can opt in to using cert-manager for managing the admission webhook TLS certificates using the following additional configuration.

- If you are using the Amazon CloudWatch Observability EKS add-on

```
--configuration-values '{ "admissionWebhooks": { "certManager": { "enabled":
 true } } }'
```

- If you are using the Helm chart

```
--set admissionWebhooks.certManager.enabled=true
```

```
--configuration-values '{ "admissionWebhooks": { "certManager": { "enabled":
 true } } }'
```

The advanced configuration discussed in this section will by default use a SelfSigned issuer.

Collect Amazon EBS volume IDs

If you want to collect Amazon EBS volume IDs in the performance logs, you must add another policy to the IAM role that is attached to the worker nodes or to the service account. Add the following as an inline policy. For more information, see Adding and Removing IAM Identity Permissions.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Action": [
                "ec2:DescribeVolumes"
            ],
            "Resource": "*",
            "Effect": "Allow"
        }
    ]
}
```

Collect Java Management Extensions (JMX) metrics

The CloudWatch agent supports Java Management Extensions (JMX) metrics collection on Amazon EKS. This allows you to collect additional metrics from Java applications running on Amazon EKS clusters enabling insight into performance, memory usage, traffic, and other critical metrics. For more information, see Collect Java Management Extensions (JMX) metrics.

Enable Kueue metrics

Beginning with version `v2.4.0-eksbuild.1` of the the CloudWatch Observability EKS add-on, Container Insights for Amazon EKS supports collecting Kueue metrics from Amazon EKS clusters. For more information about these metrics, see Kueue metrics.

If you are using the Amazon SageMaker AI Hyperpod Task Governance EKS add-on, you can skip the steps in the **Prerequisites** section and just follow the steps in Enable the configuration flag.

Prerequisites

Before you install Kueue in your Amazon EKS cluster, make the following updates in the manifest file:

1. Enable the optional cluster queue resource metrics for Kueue. To do this, modify the in-line `controller_manager_config.yaml` in the `kueue-system` ConfigMap. In the `metrics` section, add or uncomment the line `enableClusterQueueResources: true`.

```
apiVersion: v1
data:
  controller_manager_config.yaml: |
    apiVersion: config.kueue.x-k8s.io/v1beta1
    kind: Configuration
    health:
      healthProbeBindAddress: :8081
    metrics:
      bindAddress: :8080
      enableClusterQueueResources: true  <-- ADD/UNCOMMENT THIS LINE
```

2. By default, all `k8s` services are available cluster-wide. Kueue creates a service `kueue-controller-manager-metrics-service` for exposing metrics. To prevent duplicate observations for metrics, modify this service to allow access only to the metrics service from the same node. To do this, add the line `internalTrafficPolicy: Local` to the `kueue-controller-manager-metrics-service` definition.

```
apiVersion: v1
kind: Service
metadata:
  labels:
    ...
  name: kueue-controller-manager-metrics-service
  namespace: kueue-system
spec:
  ports:
  - name: https
    port: 8443
    protocol: TCP
    targetPort: https
  internalTrafficPolicy: Local   <-- ADD THIS LINE
  selector:
    control-plane: controller-manager
```

3. Lastly, the `kueue-controller-manager` pod creates a `kube-rbac-proxy` container. This container currently has a high level of logging verbosity, which causes the cluster's bearer token to be logged by that container when the metrics scraper accesses the `kueue-controller-manager-metrics-service`. We recommend that you decrease this logging verbosity. The default value in the manifest distributed by Kueue is 10, we recommend to change it to 0.

```
apiVersion: apps/v1
kind: Deployment
metadata:
  labels:
    ...
  name: kueue-controller-manager
  namespace: kueue-system
spec:
  ...
  template:
    ...
    spec:
      containers:
      ...
      - args:
        - --secure-listen-address=0.0.0.0:8443
        - --upstream=http://127.0.0.1:8080/
        - --logtostderr=true
        - --v=0  <-- CHANGE v=10 TO v=0
```

```
        image: gcr.io/kubebuilder/kube-rbac-proxy:v0.8.0
        name: kube-rbac-proxy
        ...
```

Enable the configuration flag

To enable the Kueue metrics, you must enable `kueue_container_insights` in the add-on additional configuration. You can do this either by using the AWS CLI to set up the EKS Observability add-on, or by using the Amazon EKS console.

After you have successfully installed the EKS Observability add-on with one of the following methods, you can view your Amazon EKS cluster metrics under the HyperPod console **Dashboard** tab.

AWS CLI

To enable Kueue metrics using the AWS CLI

- Enter the following AWS CLI command to install the add-on.

```
aws eks create-addon --cluster-name cluster-name --addon-name amazon-cloudwatch-observability --configuration-values "configuration_json_file"
```

The following is an example of the JSON file with the configuration values.

```
{
    "agent": {
        "config": {
            "logs": {
                "metrics_collected": {
                    "kubernetes": {
                        "kueue_container_insights": true,
                        "enhanced_container_insights": true
                    },
                    "application_signals": { }
                }
            },
            "traces": {
                "traces_collected": {
                    "application_signals": { }
                }
```

```
            }
        },
    },
}
```

Amazon EKS console

To enable Kueue metrics using the Amazon EKS console

1. Open the Amazon EKS console at https://console.aws.amazon.com/eks/home#/clusters.
2. Choose the name of your cluster.
3. Choose **Add-ons**.
4. Find the **Amazon CloudWatch Observability** add-on in the list, and install it. When you do so, choose **Optional configuration** and include the following JSON configuration values.

```
{
    "agent": {
        "config": {
            "logs": {
                "metrics_collected": {
                    "kubernetes": {
                        "kueue_container_insights": true,
                        "enhanced_container_insights": true
                    },
                    "application_signals": { }
                }
            },
            "traces": {
                "traces_collected": {
                    "application_signals": { }
                }
            }
        },
    },
}
```

Appending OpenTelemetry collector configuration files

The CloudWatch agent supports supplemental OpenTelemetry collector configuration files alongside its own configuration files. This feature allows you to use CloudWatch agent features such as CloudWatch Application Signals or Container Insights through the CloudWatch agent configuration and bring in your existing OpenTelemetry collector configuration with a single agent.

To prevent merge conflicts with pipelines automatically created by CloudWatch agent, we recommend that you add a custom suffix to each of the components and pipelines in your OpenTelemetry collector configuration. This will prevent clashing and merge conflicts.

- If you are using the Amazon CloudWatch Observability EKS add-on

```
--configuration-values file://values.yaml
```

  or

```
--configuration-values '
  agent:
    otelConfig:
      receivers:
        otlp/custom-suffix:
          protocols:
            http: {}
      exporters:
        awscloudwatchlogs/custom-suffix:
          log_group_name: "test-group"
          log_stream_name: "test-stream"
      service:
        pipelines:
          logs/custom-suffix:
            receivers: [otlp/custom-suffix]
            exporters: [awscloudwatchlogs/custom-suffix]
'
```

- If you are using the Helm chart

```
--set agent.otelConfig='
  receivers:
    otlp/custom-suffix:
      protocols:
        http: {}
```

```
  exporters:
    awscloudwatchlogs/custom-suffix:
      log_group_name: "test-group"
      log_stream_name: "test-stream"
  service:
    pipelines:
      logs/custom-suffix:
        receivers: [otlp/custom-suffix]
        exporters: [awscloudwatchlogs/custom-suffix]
'
```

Enabling APM through Application Signals for your Amazon EKS cluster

By default, OpenTelemetry (OTEL) based Application Performance Monitoring (APM) is enabled through Application Signals when installing either the CloudWatch Observability EKS add-on (V5.0.0 or greater) or the Helm chart. You can further customize specific settings using the advanced configuration for the Amazon EKS add-on or by overriding values with the Helm chart.

> **Note**
>
> If you use any OpenTelemetry (OTEL) based APM solution, enabling Application Signals affects your existing observability setup. Review your current implementation before proceeding. To maintain your existing APM setup after upgrading to V5.0.0 or later, see Opt out of Application Signals.

Application Signals Auto monitor

Version 5.0.0 of the CloudWatch Observability Amazon EKS add-on and Helm chart introduces new functionality. You can now automatically enable Application Signals for all or specific service workloads in your EKS cluster through the Auto monitor configuration. The following `autoMonitor` settings can be specified within the `applicationSignals` section under the `manager` section of the advanced configuration.

- *monitorAllServices* – A boolean flag to enable (true) or disable (false) monitoring of all service workloads by Auto monitor. Defaults to true. Enabling this flag will ensure that all Kubernetes workloads (Deployments, DaemonSets, and StatefulSets) in the cluster that are mapped to a Kubernetes Service will be in scope for automatic enablement of Application Signals when they

are brought up for the first time (or when restarted for existing workloads). The system excludes workloads in the `kube-system` and `amazon-cloudwatch` namespaces by default.

- *languages* – A list of strings specifying the set of languages that Application Signals will try to automatically instrument your services with, when `monitorAllServices` is enabled. Defaults to all the supported languages.
- *restartPods* – A boolean flag controls whether workloads restart after configuration changes. Defaults to false. Enabling this flag to `true` controls whether Kubernetes workloads within Auto monitor scope restart automatically when saving configuration changes. Any settings on your Kubernetes workloads that influence the restart of the pods such as `updateStrategy` will be considered. Consider that restarting may cause service downtime.
- *customSelector* – Settings to select specific Kubernetes namespaces or workloads for Auto monitor.
  - *java* – Specify workloads to automatically instrument with Java
  - *python* – Specify workloads to automatically instrument with Python
  - *nodejs* – Specify workloads to automatically instrument with Node.js
  - *dotnet* – Specify workloads to automatically instrument with .NET

  For each of the languages above, the following fields can be configured.
  - *namespaces* – A list of strings specifying the namespaces to be selected. Defaults to an empty list, that is []
  - *deployments* – A list of strings specifying the deployments to be selected. Specify in `namespace/deployment`format. Defaults to an empty list, that is []
  - *daemonsets* – A list of strings specifying the daemonsets to be selected. Specify in `namespace/daemonset` format. Defaults to an empty list, that is []
  - *statefulsets* – A list of strings specifying the statefulsets to be selected. Specify in `namespace/statefulset` format. Defaults to an empty list, that is []
- *exclude* – Settings to exclude specific Kubernetes namespaces or workloads from Auto monitor. Excluding a workload takes precedence when the same workload is also within scope of `monitorAllServices` or `customSelector`.
  - *java* – Specify workloads to exclude from being automatically instrumented with Java
  - *python* – Specify workloads to exclude from being automatically instrumented with Python
  - *nodejs* – Specify workloads to exclude from being automatically instrumented with Node.js
  - *dotnet* – Specify workloads to exclude from being automatically instrumented with .NET

For each of the languages above, the following fields can be configured.

- *namespaces* – A list of strings specifying the namespaces to be excluded. Defaults to an empty list, that is []
- *deployments* – A list of strings specifying the deployments to be excluded. Specify in `namespace/deployment`format. Defaults to an empty list, that is []
- *daemonsets* – A list of strings specifying the daemonsets to be excluded. Specify in `namespace/daemonset` format. Defaults to an empty list, that is []
- *statefulsets* – A list of strings specifying the statefulsets to be excluded. Specify in `namespace/statefulset` format. Defaults to an empty list, that is []

The following is an example configuration that automatically enables Application Signals for all existing and new service workloads on the cluster.

```
manager:
  applicationSignals:
    autoMonitor:
      monitorAllServices: true
      restartPods: true
```

The following is an example configuration that automatically enables Application Signals for any new service workload that is brought up and for any existing service workload that is explicitly restarted on the cluster.

```
manager:
  applicationSignals:
    autoMonitor:
      monitorAllServices: true
```

The following is an example configuration that automatically enables Application Signals with Java for all existing and new pods corresponding to a workload in the `pet-warehouse` namespace.

```
manager:
  applicationSignals:
    autoMonitor:
      restartPods: true
      customSelector:
        java:
```

```
          namespaces: ["pet-warehouse"]
```

The following is an example configuration that automatically enables Application Signals with Python for all existing and new service workloads in the cluster excluding the `pet-clinic` deployment.

```
manager:
  applicationSignals:
    autoMonitor:
      monitorAllServices: true
      languages: ["python"]
      restartPods: true
      exclude:
        python:
          deployments: ["pet-warehouse/pet-clinic"]
```

The following is an example configuration that automatically enables Application Signals with Java for all service workloads in the cluster except for the ones in the `python-apps` namespace and further enables Application Signals with Python specifically for the `sample-python-app` deployment in the `python-apps` namespace.

```
manager:
  applicationSignals:
    autoMonitor:
      monitorAllServices: true
      languages: ["java"]
      restartPods: true
      customSelector:
        python:
          deployments: ["python-apps/sample-python-app"]
      exclude:
        java:
          namespaces: ["python-apps"]
```

Troubleshooting the Amazon CloudWatch Observability EKS add-on or the Helm chart

Use the following information to help troubleshoot problems with the Amazon CloudWatch Observability EKS add-on or the Helm chart

Topics

- Updating and deleting the Amazon CloudWatch Observability EKS add-on or the Helm chart
- Verify the version of the CloudWatch agent used by the Amazon CloudWatch Observability EKS add-on or the Helm chart
- Handling a ConfigurationConflict when managing the add-on or the Helm chart

Updating and deleting the Amazon CloudWatch Observability EKS add-on or the Helm chart

For instructions about updating or deleting the Amazon CloudWatch Observability EKS add-on, see Managing Amazon EKS add-ons. Use `amazon-cloudwatch-observability` as the name of the add-on.

To delete the Helm chart in a cluster, enter the following command.

```
helm delete amazon-cloudwatch-observability -n amazon-cloudwatch --wait
```

Verify the version of the CloudWatch agent used by the Amazon CloudWatch Observability EKS add-on or the Helm chart

The Amazon CloudWatch Observability EKS add-on and the Helm chart installs a custom resource of kind `AmazonCloudWatchAgent` that controls the behavior of the CloudWatch agent daemonset on the cluster, including the version of the CloudWatch agent being used. You can get a list of all the `AmazonCloudWatchAgent` custom resources installed on your cluster u by entering the following command:

```
kubectl get amazoncloudwatchagent -A
```

In the output of this command, you should be able to check the version of the CloudWatch agent. Alternatively, you can also describe the `amazoncloudwatchagent` resource or one of the `cloudwatch-agent-*` pods running on your cluster to inspect the image being used.

Handling a ConfigurationConflict when managing the add-on or the Helm chart

When you install or update the Amazon CloudWatch Observability EKS add-on or the Helm chart, if you notice a failure caused by existing resources, it is likely because you already have the CloudWatch agent and its associated components such as the ServiceAccount, the ClusterRole and the ClusterRoleBinding installed on the cluster.

The error displayed by the add-on will include `Conflicts found when trying to apply. Will not continue due to resolve conflicts mode`,

The error displayed by the Helm chart will be similar to `Error: INSTALLATION FAILED: Unable to continue with install and invalid ownership metadata.`.

When the add-on or the Helm chart tries to install the CloudWatch agent and its associated components, if it detects any change in the contents, it by default fails the installation or update to avoid overwriting the state of the resources on the cluster.

If you are trying to onboard to the Amazon CloudWatch Observability EKS add-on and you see this failure, we recommend deleting an existing CloudWatch agent setup that you had previously installed on the cluster and then installing the EKS add-on or Helm chart. Be sure to back up any customizations you might have made to the original CloudWatch agent setup such as a custom agent configuration, and provide these to the add-on or Helm chart when you next install or update it. If you had previously installed the CloudWatch agent for onboarding to Container Insights, see Deleting the CloudWatch agent and Fluent Bit for Container Insights for more information.

Alternatively, the add-on supports a conflict resolution configuration option that has the capability to specify `OVERWRITE`. You can use this option to proceed with installing or updating the add-on by overwriting the conflicts on the cluster. If you are using the Amazon EKS console, you'll find the **Conflict resolution method** when you choose the **Optional configuration settings** when you create or update the add-on. If you are using the AWS CLI, you can supply the `--resolve-conflicts OVERWRITE` to your command to create or update the add-on.

Opt out of Application Signals

Fine-tune your service monitoring preferences in the CloudWatch console or with the SDK.

For versions before 5.0.0, to disable Application Signals auto-monitoring, follow the procedure below:

Using CLI or SDK

The following configuration can be applied either as an advanced configuration to the EKS add-on or as a values override when using the helm chart.

```
{
  "manager": {
    "applicationSignals": {
      "autoMonitor": {
        "monitorAllServices": false
      }
```

```
    }
  }
}
```

Restart your services for the changes to take effect.

Using the console

Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.

1. In the navigation pane, under **Application Signals (APM)**, choose **Services**.
2. Choose **Enable Application Signals** to view the enablement page.
3. Clear the **Auto-Monitor** checkbox for each service you don't want to monitor.
4. Restart your services for the changes to take effect.

Set up the CloudWatch agent with security-enhanced Linux (SELinux)

If your system has security-enhanced Linux (SELinux) enabled, you must apply the appropriate security policies to ensure that the CloudWatch agent runs in a confined domain.

Prerequisites

Before you can configure SELinux for the agent, check the following **prerequisites**:

To complete the prerequisites for using the CloudWatch agent with SELinux

1. If you haven't done so, install the following SELinux policy development packages:

   ```
   sudo yum update
   sudo yum install -y selinux-policy-devel policycoreutils-devel rpm-build git
   ```

2. Run the following command to check your system's SELinux status:

   ```
   sestatus
   ```

   Example output:

   ```
   SELinux status:                 enabled
   ```

```
SELinuxfs mount:                /sys/fs/selinux
SELinux root directory:         /etc/selinux
Loaded policy name:             targeted
Current mode:                   permissive
Mode from config file:          permissive
Policy MLS status:              enabled
Policy deny_unknown status:     allowed
Memory protection checking:     actual (secure)
Max kernel policy version:      33
```

If you find that SELinux is currently disabled, do the following:

a. Open the SELinux file by entering the following command:

```
sudo vi /etc/selinux/config
```

b. Set the `SELINUX` parameter to either `permissive` or `enforcing`. For example:

```
SELINUX=enforcing
```

c. Save the file and reboot the system to apply the changes.

```
sudo reboot
```

3. Ensure that the CloudWatch agent is running as a `systemd` service. This is required to use it within a confined SELinux domain.

```
sudo systemctl status amazon-cloudwatch-agent
```

If the agent is correctly configured, the output should indicate that it is `active (running)` and `enabled` at startup.

Configure SELinux for the agent

After you complete the prerequisites, you can configure SELinux.

To configure SELinux for the CloudWatch agent

1. Clone the SELinux policy for the CloudWatch agent by entering the following command:

```
git clone https://github.com/aws/amazon-cloudwatch-agent-selinux.git
```

2. Navigate to the cloned repository and then update the script permissions by entering the following commands:

```
cd amazon-cloudwatch-agent-selinux
chmod +x amazon_cloudwatch_agent.sh
```

3. Use sudo to run the SELinux policy installation script by entering the following command. During execution, the script prompts you to enter y or n to allow automatic restart. This restart ensures that the agent transitions into the correct SELinux domain.

```
sudo ./amazon_cloudwatch_agent.sh
```

4. If the CloudWatch agent hasn't been restarted yet, restart it to ensure that it transitions to the correct SELinux domain:

```
sudo systemctl restart amazon-cloudwatch-agent
```

5. Verify that CloudWatch Agent is running in the confined domain by entering the following command:

```
ps -efZ | grep amazon-cloudwatch-agent
```

   If the agent is correctly confined, the output should indicate a SELinux-confined domain instead of `unconfined_service_t`.

   The following is an example of output when the agent is correctly confined.

```
system_u:system_r:confined_t:s0 root 1234 1 0 12:00 ? 00:00:10 /opt/aws/amazon-
cloudwatch-agent/bin/amazon-cloudwatch-agent
```

After SELinux is configured, you can proceed to configure the agent to collect metrics, logs, and traces. For more information, see Manually create or edit the CloudWatch agent configuration file.

Create the CloudWatch agent configuration file

Before running the CloudWatch agent on any servers, you must create one or more CloudWatch agent configuration files.

The agent configuration file is a JSON file that specifies the metrics, logs, and traces that the agent is to collect, including custom metrics. You can create it by using the wizard or by creating it yourself from scratch. You could also use the wizard to initially create the configuration file and then modify it manually. If you create or modify the file manually, the process is more complex, but you have more control over the metrics collected and can specify metrics not available through the wizard.

Any time you change the agent configuration file, you must then restart the agent to have the changes take effect. To restart the agent, follow the instructions in (Optional) Modify the common configuration and named profile for CloudWatch agent.

After you have created a configuration file, you can save it manually as a JSON file and then use this file when installing the agent on your servers. Alternatively, you can store it in Systems Manager Parameter Store if you're going to use Systems Manager when you install the agent on servers.

The CloudWatch agent supports using multiple configuration files. For more information, see Creating multiple CloudWatch agent configuration files.

Metrics, logs, and traces collected by the CloudWatch agent incur charges. For more information about pricing, see Amazon CloudWatch Pricing.

Contents

- Create the CloudWatch agent configuration file with the wizard
- Creating multiple CloudWatch agent configuration files
- Manually create or edit the CloudWatch agent configuration file

Create the CloudWatch agent configuration file with the wizard

The agent configuration file wizard, `amazon-cloudwatch-agent-config-wizard`, asks a series of questions to help you configure the CloudWatch agent for your needs. This section describes the credentials required for the configuration file. It describes how to run the CloudWatch agent configuration wizard. It also describes the metrics that are predefined in the wizard.

Required credentials

The wizard can autodetect the credentials and AWS Region to use if you have the AWS credentials and configuration files in place before you start the wizard. For more information about these files, see Configuration and Credential Files in the *AWS Systems Manager User Guide*.

In the AWS credentials file, the wizard checks for default credentials and also looks for an `AmazonCloudWatchAgent` section such as the following:

```
[AmazonCloudWatchAgent]
aws_access_key_id = my_access_key
aws_secret_access_key = my_secret_key
```

The wizard displays the default credentials, the credentials from the `AmazonCloudWatchAgent`, and an `Others` option. You can select which credentials to use. If you choose `Others`, you can input credentials.

For *my_access_key* and *my_secret_key*, use the keys from the IAM user that has the permissions to write to Systems Manager Parameter Store.

In the AWS configuration file, you can specify the Region that the agent sends metrics to if it's different than the `[default]` section. The default is to publish the metrics to the Region where the Amazon EC2 instance is located. If the metrics should be published to a different Region, specify the Region here. In the following example, the metrics are published to the `us-west-1` Region.

```
[AmazonCloudWatchAgent]
region = us-west-1
```

Run the CloudWatch agent configuration wizard

To create the CloudWatch agent configuration file

1. Start the CloudWatch agent configuration wizard by entering the following:

   ```
   sudo /opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-config-wizard
   ```

   On a server running Windows Server, run the following commands to launch the wizard:

```
cd "C:\Program Files\Amazon\AmazonCloudWatchAgent"
```

```
.\amazon-cloudwatch-agent-config-wizard.exe
```

2. Answer the questions to customize the configuration file for your server.
3. If you're storing the configuration file locally, the configuration file `config.json` is stored in `/opt/aws/amazon-cloudwatch-agent/bin/` on Linux servers, and is stored in `C:\Program Files\Amazon\AmazonCloudWatchAgent` on Windows Server. You can then copy this file to other servers where you want to install the agent.

   If you're going to use Systems Manager to install and configure the agent, be sure to answer **Yes** when prompted whether to store the file in Systems Manager Parameter Store. You can also choose to store the file in Parameter Store even if you aren't using the SSM Agent to install the CloudWatch agent. To be able to store the file in Parameter Store, you must use an IAM role with sufficient permissions.

CloudWatch agent predefined metric sets

The wizard is configured with predefined sets of metrics, with different detail levels. These sets of metrics are shown in the following tables. For more information about these metrics, see Metrics collected by the CloudWatch agent.

> **Note**
>
> Parameter Store supports parameters in Standard and Advanced tiers. These parameter tiers are not related to the Basic, Standard, and Advanced levels of metric details that are described in these tables.

Amazon EC2 instances running Linux

Detail level	Metrics included
Basic	**Mem:** mem_used_percent **Disk:** disk_used_percent

Detail level	Metrics included
	The `disk` metrics such as `disk_used_percent` have a dimension for `Partition`, which means that the number of custom metrics generated is dependent on the number of partitions associated with your instance. The number of disk partitions you have depends on which AMI you are using and the number of Amazon EBS volumes you attach to the server.
Standard	**CPU:** `cpu_usage_idle`, `cpu_usage_iowait`, `cpu_usage_user`, `cpu_usage_system` **Disk:** `disk_used_percent`, `disk_inodes_free` **Diskio:** `diskio_io_time` **Mem:** `mem_used_percent` **Swap:** `swap_used_percent`
Advanced	**CPU:** `cpu_usage_idle`, `cpu_usage_iowait`, `cpu_usage_user`, `cpu_usage_system` **Disk:** `disk_used_percent`, `disk_inodes_free` **Diskio:** `diskio_io_time`, `diskio_write_bytes`, `diskio_read_bytes`, `diskio_writes`, `diskio_reads` **Mem:** `mem_used_percent` **Netstat:** `netstat_tcp_established`, `netstat_tcp_time_wait` **Swap:** `swap_used_percent`

On-premises servers running Linux

Detail level	Metrics included
Basic	**Disk:** `disk_used_percent`

Detail level	Metrics included
	Diskio: `diskio_write_bytes ,diskio_read_bytes ,diskio_writes ,diskio_reads` **Mem:** `mem_used_percent` **Net:** `net_bytes_sent ,net_bytes_recv ,net_packets_sent ,net_packets_recv` **Swap:** `swap_used_percent`
Standard	**CPU:** `cpu_usage_idle ,cpu_usage_iowait` **Disk:** `disk_used_percent ,disk_inodes_free` **Diskio:** `diskio_io_time ,diskio_write_bytes ,diskio_read_bytes ,diskio_writes ,diskio_reads` **Mem:** `mem_used_percent` **Net:** `net_bytes_sent ,net_bytes_recv ,net_packets_sent ,net_packets_recv` **Swap:** `swap_used_percent`

Detail level	Metrics included
Advanced	**CPU:** `cpu_usage_guest` , `cpu_usage_idle` , `cpu_usage_iowait` , `cpu_usage_steal` , `cpu_usage_user` , `cpu_usage_system` **Disk:** `disk_used_percent` , `disk_inodes_free` **Diskio:** `diskio_io_time` , `diskio_write_bytes` , `diskio_read_bytes` , `diskio_writes` , `diskio_reads` **Mem:** `mem_used_percent` **Net:** `net_bytes_sent` , `net_bytes_recv` , `net_packets_sent` , `net_packets_recv` **Netstat:** `netstat_tcp_established` , `netstat_tcp_time_wait` **Swap:** `swap_used_percent`

Amazon EC2 instances running Windows Server

> **Note**
>
> The metric names listed in this table display how the metric appears when viewed in the console. The actual metric name might not include the first word. For example, the actual metric name for `LogicalDisk % Free Space` is just `% Free Space`.

Detail level	Metrics included
Basic	**Memory:** `Memory % Committed Bytes In Use` **LogicalDisk:** `LogicalDisk % Free Space`
Standard	**Memory:** `Memory % Committed Bytes In Use` **Paging:** `Paging File % Usage`

Detail level	Metrics included
	Processor: `Processor % Idle Time`, `Processor % Interrupt Time`, `Processor % User Time` **PhysicalDisk:** `PhysicalDisk % Disk Time` **LogicalDisk:** `LogicalDisk % Free Space`
Advanced	**Memory:** `Memory % Committed Bytes In Use` **Paging:** `Paging File % Usage` **Processor:** `Processor % Idle Time`, `Processor % Interrupt Time`, `Processor % User Time` **LogicalDisk:** `LogicalDisk % Free Space` **PhysicalDisk:** `PhysicalDisk % Disk Time` , `PhysicalDisk Disk Write Bytes/sec` , `PhysicalDisk Disk Read Bytes/sec` , `PhysicalDisk Disk Writes/sec` , `PhysicalDisk Disk Reads/sec` **TCP:** `TCPv4 Connections Established` , `TCPv6 Connections Established`

On-premises server running Windows Server

> **Note**
>
> The metric names listed in this table display how the metric appears when viewed in the console. The actual metric name might not include the first word. For example, the actual metric name for `LogicalDisk % Free Space` is just `% Free Space`.

Detail level	Metrics included
Basic	**Paging:** `Paging File % Usage`

Detail level	Metrics included
	Processor: Processor % Processor Time **LogicalDisk:**LogicalDisk % Free Space **PhysicalDisk:** PhysicalDisk Disk Write Bytes/sec ,PhysicalDisk Disk Read Bytes/sec ,PhysicalDisk Disk Writes/sec , PhysicalDisk Disk Reads/sec **Memory:** Memory % Committed Bytes In Use **Network Interface:** Network Interface Bytes Sent/sec, Network Interface Bytes Received/sec ,Network Interface Packets Sent/sec, Network Interface Packets Received/sec
Standard	**Paging:** Paging File % Usage **Processor:** Processor % Processor Time, Processor % Idle Time, Processor % Interrupt Time **LogicalDisk:** LogicalDisk % Free Space **PhysicalDisk:** PhysicalDisk % Disk Time ,PhysicalDisk Disk Write Bytes/sec ,PhysicalDisk Disk Read Bytes/sec , PhysicalDisk Disk Writes/sec ,PhysicalDisk Disk Reads/sec **Memory:** Memory % Committed Bytes In Use **Network Interface:** Network Interface Bytes Sent/sec, Network Interface Bytes Received/sec ,Network Interface Packets Sent/sec, Network Interface Packets Received/sec

Advanced	**Paging:**`Paging File % Usage` **Processor:** `Processor % Processor Time`, `Processor % Idle Time`, `Processor % Interrupt Time`, `Processor % User Time` **LogicalDisk:** `LogicalDisk % Free Space` **PhysicalDisk:** `PhysicalDisk % Disk Time` , `PhysicalDisk Disk Write Bytes/sec` , `PhysicalDisk Disk Read Bytes/sec` , `PhysicalDisk Disk Writes/sec` , `PhysicalDisk Disk Reads/sec` **Memory:** `Memory % Committed Bytes In Use` **Network Interface:** `Network Interface Bytes Sent/sec`, `Network Interface Bytes Received/sec` , `Network Interface Packets Sent/sec`, `Network Interface Packets Received/sec` **TCP:** `TCPv4 Connections Established` , `TCPv6 Connections Established`

Examples of configuration files

Basic system metrics configuration

```
{
  "agent": {
    "metrics_collection_interval": 60,
    "region": "us-east-1"
  },
  "metrics": {
    "namespace": "MySystem",
    "metrics_collected": {
      "cpu": {
        "resources": ["*"],
        "measurement": ["usage_active", "usage_system", "usage_user"]
      },
      "mem": {
```

```
        "measurement": ["used_percent"]
      },
      "disk": {
        "resources": ["/"],
        "measurement": ["used_percent"]
      }
    },
    "append_dimensions": {
      "InstanceId": "${aws:InstanceId}"
    }
  }
}
```

Web server monitoring configuration

```
{
  "agent": {
    "metrics_collection_interval": 60,
    "region": "us-east-1"
  },
  "metrics": {
    "namespace": "WebServer",
    "metrics_collected": {
      "cpu": {
        "resources": ["*"],
        "measurement": ["usage_active"]
      },
      "mem": {
        "measurement": ["used_percent"]
      },
      "net": {
        "resources": ["eth0"],
        "measurement": ["bytes_sent", "bytes_recv"]
      }
    }
  },
  "logs": {
    "logs_collected": {
      "files": {
        "collect_list": [
          {
            "file_path": "/var/log/apache2/access.log",
            "log_group_name": "apache-access-logs",
```

```
            "log_stream_name": "{instance_id}-access"
          },
          {
            "file_path": "/var/log/apache2/error.log",
            "log_group_name": "apache-error-logs",
            "log_stream_name": "{instance_id}-error"
          }
        ]
      }
    }
  }
}
```

Database server configuration

```
{
  "agent": {
    "metrics_collection_interval": 30,
    "region": "us-east-1"
  },
  "metrics": {
    "namespace": "DatabaseServer",
    "metrics_collected": {
      "cpu": {
        "resources": ["*"],
        "measurement": ["usage_active", "usage_iowait"]
      },
      "mem": {
        "measurement": ["used_percent", "available_percent"]
      },
      "disk": {
        "resources": ["/", "/data"],
        "measurement": ["used_percent", "inodes_free"]
      },
      "diskio": {
        "resources": ["*"],
        "measurement": ["read_bytes", "write_bytes", "io_time"]
      }
    },
    "append_dimensions": {
      "InstanceId": "${aws:InstanceId}",
      "InstanceType": "${aws:InstanceType}",
```

```
      "AutoScalingGroupName": "${aws:AutoScalingGroupName}"
    }
  }
}
```

Creating multiple CloudWatch agent configuration files

On both Linux servers and Windows servers, you can set up the CloudWatch agent to use multiple configuration files. For example, you can use a common configuration file that collects a set of metrics, logs, and traces that you always want to collect from all servers in your infrastructure. You can then use additional configuration files that collect metrics from certain applications or in certain situations.

To set this up, first create the configuration files that you want to use. Any configuration files that will be used together on the same server must have different file names. You can store the configuration files on servers or in Parameter Store.

Start the CloudWatch agent using the `fetch-config` option and specify the first configuration file. To append the second configuration file to the running agent, use the same command but with the `append-config` option. All metrics, logs, and traces listed in either configuration file are collected. The following example commands illustrate this scenario using configurations stores as files. The first line starts the agent using the `infrastructure.json` configuration file, and the second line appends the `app.json` configuration file.

The following example commands are for Linux.

```
/opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-ctl -a fetch-config -m ec2
 -s -c file:/tmp/infrastructure.json
```

```
/opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-ctl -a append-config -m
 ec2 -s -c file:/tmp/app.json
```

The following example commands are for Windows Server.

```
& "C:\Program Files\Amazon\AmazonCloudWatchAgent\amazon-cloudwatch-agent-ctl.ps1"
 -a fetch-config -m ec2 -s -c file:"C:\Program Files\Amazon\AmazonCloudWatchAgent
\infrastructure.json"
```

```
& "C:\Program Files\Amazon\AmazonCloudWatchAgent\amazon-cloudwatch-agent-ctl.ps1"
 -a append-config -m ec2 -s -c file:"C:\Program Files\Amazon\AmazonCloudWatchAgent
\app.json"
```

The following example configuration files illustrate a use for this feature. The first configuration file is used for all servers in the infrastructure, and the second collects only logs from a certain application and is appended to servers running that application.

infrastructure.json

```
{
  "metrics": {
    "metrics_collected": {
      "cpu": {
        "resources": [
          "*"
        ],
        "measurement": [
          "usage_active"
        ],
        "totalcpu": true
      },
      "mem": {
         "measurement": [
           "used_percent"
        ]
      }
    }
  },
  "logs": {
    "logs_collected": {
      "files": {
        "collect_list": [
          {
            "file_path": "/opt/aws/amazon-cloudwatch-agent/logs/amazon-cloudwatch-
agent.log",
            "log_group_name": "amazon-cloudwatch-agent.log"
          },
          {
            "file_path": "/var/log/messages",
            "log_group_name": "/var/log/messages"
          }
        ]
```

```
      }
    }
  }
}
```

app.json

```
{
    "logs": {
        "logs_collected": {
            "files": {
                "collect_list": [
                    {
                        "file_path": "/app/app.log*",
                        "log_group_name": "/app/app.log"
                    }
                ]
            }
        }
    }
}
```

Any configuration files appended to the configuration must have different file names from each other and from the initial configuration file. If you use `append-config` with a configuration file with the same file name as a configuration file that the agent is already using, the append command overwrites the information from the first configuration file instead of appending to it. This is true even if the two configuration files with the same file name are on different file paths.

The preceding example shows the use of two configuration files, but there is no limit to the number of configuration files that you can append to the agent configuration. You can also mix the use of configuration files located on servers and configurations located in Parameter Store.

Manually create or edit the CloudWatch agent configuration file

The CloudWatch agent configuration file is a JSON file with four sections: `agent`, `metrics`, `logs`, and `traces`.

- The `agent` section includes fields for the overall configuration of the agent.
- The `metrics` section specifies the custom metrics for collection and publishing to CloudWatch. If you're using the agent only to collect logs, you can omit the `metrics` section from the file.

- The `logs` section specifies what log files are published to CloudWatch Logs. This can include events from the Windows Event Log if the server runs Windows Server.
- The `traces` section specifies the sources for traces that are collected and sent to AWS X-Ray.

This section explains the structure and fields of the CloudWatch agent configuration file. You can view the schema definition for this configuration file. The schema definition is located at *`installation-directory`*`/doc/amazon-cloudwatch-agent-schema.json` on Linux servers and at *`installation-directory`*`/amazon-cloudwatch-agent-schema.json` on servers running Windows Server.

If you create or edit the agent configuration file manually, you can give it any name. For simplicity in troubleshooting, we recommend that you name it `/opt/aws/amazon-cloudwatch-agent/etc/cloudwatch-agent.json` on a Linux server and `$Env:ProgramData\Amazon\AmazonCloudWatchAgent\amazon-cloudwatch-agent.json` on servers running Windows Server. After you have created the file, you can copy it to other servers where you want to install the agent.

When the agent is started, it creates a copy of each configuration file in `/opt/aws/amazon-cloudwatch/etc/amazon-cloudwatch-agent.d` directory, with the filename prefixed with either `file_` (for local file sources) or `ssm_` (for Systems Manager parameter store sources) to indicate the configuration origin.

> **Note**
>
> Metrics, logs, and traces collected by the CloudWatch agent incur charges. For more information about pricing, see Amazon CloudWatch Pricing.

CloudWatch agent configuration file: Agent section

The `agent` section can include the following fields. The wizard doesn't create an `agent` section. Instead, the wizard omits it and uses the default values for all fields in this section.

- `metrics_collection_interval` – Optional. Specifies how often all metrics specified in this configuration file are to be collected. You can override this value for specific types of metrics.

  This value is specified in seconds. For example, specifying 10 causes metrics to be collected every 10 seconds, and setting it to 300 specifies metrics to be collected every 5 minutes.

If you set this value below 60 seconds, each metric is collected as a high-resolution metric. For more information about high-resolution metrics, see High-resolution metrics.

The default value is 60.

- `region` – Specifies the Region to use for the CloudWatch endpoint when an Amazon EC2 instance is being monitored. The metrics collected are sent to this Region, such as `us-west-1`. If you omit this field, the agent sends metrics to the Region where the Amazon EC2 instance is located.

  If you are monitoring an on-premises server, this field isn't used, and the agent reads the Region from the `AmazonCloudWatchAgent` profile of the AWS configuration file.
- `credentials` – Specifies an IAM role to use when sending metrics, logs, and traces to a different AWS account. If specified, this field contains one parameter, `role_arn`.
  - `role_arn` – Specifies the Amazon Resource Name (ARN) of an IAM role to use for authentication when sending metrics, logs, and traces to a different AWS account. For more information, see Sending metrics, logs, and traces to a different account.
- `debug` – Optional. Specifies running the CloudWatch agent with debug log messages. The default value is `false`.
- `aws_sdk_log_level` – Optional. Supported only in versions 1.247350.0 and later of the CloudWatch agent.

  You can specify this field to have the agent perform logging for AWS SDK endpoints. The value for this field can include one or more of the following options. Separate multiple options with the `|` character.
  - `LogDebug`
  - `LogDebugWithSigning`
  - `LogDebugWithHTTPBody`
  - `LogDebugRequestRetries`
  - `LogDebugWithEventStreamBody`

  For more information about these options, see LogLevelType.
- `logfile` – Specifies the location where the CloudWatch agent writes log messages. If you specify an empty string, the log goes to stderr. If you don't specify this option, the default locations are the following:
  - Linux: `/opt/aws/amazon-cloudwatch-agent/logs/amazon-cloudwatch-agent.log`

- Windows Server: `c:\\ProgramData\\Amazon\\CloudWatchAgent\\Logs\\amazon-cloudwatch-agent.log`

  The CloudWatch agent automatically rotates the log file that it creates. A log file is rotated out when it reaches 100 MB in size. The agent keeps the rotated log files for up to seven days, and it keeps as many as five backup log files that have been rotated out. Backup log files have a timestamp appended to their filename. The timestamp shows the date and time that the file was rotated out: for example, `amazon-cloudwatch-agent-2018-06-08T21-01-50.247.log.gz`.

- `omit_hostname` – Optional. By default, the hostname is published as a dimension of metrics that are collected by the agent, unless you are using the `append_dimensions` field in the `metrics` section. Set `omit_hostname` to `true` to prevent the hostname from being published as a dimension even if you are not using `append_dimensions`. The default value is `false`.
- `run_as_user` – Optional. Specifies a user to use to run the CloudWatch agent. If you don't specify this parameter, the root user is used. This option is valid only on Linux servers.

  If you specify this option, the user must exist before you start the CloudWatch agent. For more information, see Running the CloudWatch agent as a different user.
- `user_agent` – Optional. Specifies the `user-agent` string that is used by the CloudWatch agent when it makes API calls to the CloudWatch backend. The default value is a string consisting of the agent version, the version of the Go programming language that was used to compile the agent, the runtime operating system and architecture, the build time, and the plugins enabled.
- `usage_data` – Optional. By default, the CloudWatch agent sends health and performance data about itself to CloudWatch whenever it publishes metrics or logs to CloudWatch. This data incurs no costs to you. You can prevent the agent from sending this data by specifying `false` for `usage_data`. If you omit this parameter, the default of `true` is used and the agent sends the health and performance data.

  If you set this value to `false`, you must stop and restart the agent for it to take effect.
- `service.name` – Optional. Specifies the service name to be used to populate the entity for finding related telemetry.
- `deployment.environment` – Optional. Specifies the environment name to be used to populate the entity for finding related telemetry.
- `use_dualstack_endpoint` – Optional. If this is `true`, the CloudWatch agent will use dual stack endpoints for all API calls.

The following is an example of an `agent` section.

```
"agent": {
   "metrics_collection_interval": 60,
   "region": "us-west-1",
   "logfile": "/opt/aws/amazon-cloudwatch-agent/logs/amazon-cloudwatch-agent.log",
   "debug": false,
   "run_as_user": "cwagent"
  }
```

CloudWatch agent configuration file: Metrics section

Fields common to Linux and Windows

On servers running either Linux or Windows Server, the `metrics` section includes the following fields:

- `namespace` – Optional. The namespace to use for the metrics collected by the agent. The default value is `CWAgent`. The maximum length is 255 characters. The following is an example:

  ```
  {
    "metrics": {
      "namespace": "Development/Product1Metrics",
     ......
     },
  }
  ```

- `append_dimensions` – Optional. Adds Amazon EC2 metric dimensions to all metrics collected by the agent. This also causes the agent to not publish the hostname as a dimension.

  The only supported key-value pairs for `append_dimensions` are shown in the following list. Any other key-value pairs are ignored. The agent supports these key-value pairs exactly as they are shown in the following list. You can't change the key values to publish different dimension names for them.

  - `"ImageId":"${aws:ImageId}"` sets the instance's AMI ID as the value of the `ImageId` dimension.
  - `"InstanceId":"${aws:InstanceId}"` sets the instance's instance ID as the value of the `InstanceId` dimension.
  - `"InstanceType":"${aws:InstanceType}"` sets the instance's instance type as the value of the `InstanceType` dimension.

- `"AutoScalingGroupName":"${aws:AutoScalingGroupName}"` sets the instance's Auto Scaling group name as the value of the `AutoScalingGroupName` dimension.

If you want to append dimensions to metrics with arbitrary key-value pairs, use the `append_dimensions` parameter in the field for that particular type of metric.

If you specify a value that depends on Amazon EC2 metadata and you use proxies, you must make sure that the server can access the endpoint for Amazon EC2. For more information about these endpoints, see Amazon Elastic Compute Cloud (Amazon EC2) in the *Amazon Web Services General Reference*.

- `aggregation_dimensions` – Optional. Specifies the dimensions that collected metrics are to be aggregated on. For example, if you roll up metrics on the `AutoScalingGroupName` dimension, the metrics from all instances in each Auto Scaling group are aggregated and can be viewed as a whole.

  You can roll up metrics along single or multiple dimensions. For example, specifying `[["InstanceId"], ["InstanceType"], ["InstanceId","InstanceType"]]` aggregates metrics for instance ID singly, instance type singly, and for the combination of the two dimensions.

  You can also specify `[]` to roll up all metrics into one collection, disregarding all dimensions.

- `endpoint_override` – Specifies a FIPS endpoint or private link to use as the endpoint where the agent sends metrics. Specifying this and setting a private link enables you to send the metrics to an Amazon VPC endpoint. For more information, see What Is Amazon VPC?.

  The value of `endpoint_override` must be a string that is a URL.

  For example, the following part of the metrics section of the configuration file sets the agent to use a VPC Endpoint when sending metrics.

```
{
  "metrics": {
    "endpoint_override": "vpce-XXXXXXXXXXXXXXXXXXXXXXXX.monitoring.us-
east-1.vpce.amazonaws.com",
   ......
   },
}
```

- `metrics_collected` – Required. Specifies which metrics are to be collected, including custom metrics collected through `StatsD` or `collectd`. This section includes several subsections.

  The contents of the `metrics_collected` section depend on whether this configuration file is for a server running Linux or Windows Server.

- `metrics_destinations` – Optional. Specifies one or more destinations for all metrics defined in `metrics_collected`. If specified here, it overrides the default destination of `cloudwatch`.
  - `cloudwatch` – Amazon CloudWatch.
  - amp – Amazon Managed Service for Prometheus.
    - `workspace_id` – The ID corresponding to the Amazon Managed Service for Prometheus workspace.

```
{
  "metrics": {
    "metrics_destinations": {
      "cloudwatch": {},
      "amp": {
        "workspace_id": "ws-abcd1234-ef56-7890-ab12-example"
      }
    }
  }
}
```

- `force_flush_interval` – Specifies in seconds the maximum amount of time that metrics remain in the memory buffer before being sent to the server. No matter the setting for this, if the size of the metrics in the buffer reaches 1 MB or 1000 different metrics, the metrics are immediately sent to the server.

  The default value is 60.

- `credentials` – Specifies an IAM role to use when sending metrics to a different account. If specified, this field contains one parameter, `role_arn`.
  - `role_arn` – Specifies the ARN of an IAM role to use for authentication when sending metrics to a different account. For more information, see Sending metrics, logs, and traces to a different account. If specified here, this value overrides the `role_arn` specified in the `agent` section of the configuration file, if any.
  - `service.name` – Optional. Specifies the service name to be used to populate the entity for finding related telemetry.

- `deployment.environment` – Optional. Specifies the environment name to be used to populate the entity for finding related telemetry.

Linux section

On servers running Linux, the `metrics_collected` section of the configuration file can also contain the following fields.

Many of these fields can include a `measurement` sections that lists the metrics you want to collect for that resource. These `measurement` sections can either specify the complete metric name such as `swap_used`, or just the part of the metric name that will be appended to the type of resource. For example, specifying `reads` in the `measurement` section of the `diskio` section causes the `diskio_reads` metric to be collected.

- `collectd` – Optional. Specifies that you want to retrieve custom metrics using the `collectd` protocol. You use `collectd` software to send the metrics to the CloudWatch agent. For more information about the configuration options available for collectd, see Retrieve custom metrics with collectd.
- `cpu` – Optional. Specifies that CPU metrics are to be collected. This section is valid only for Linux instances. You must include at least one of the `resources` and `totalcpu` fields for any CPU metrics to be collected. This section can include the following fields:
  - `drop_original_metrics` – Optional. If you are using the `aggregation_dimensions` field in the `metrics` section to roll up metrics into aggregated results, then by default the agent sends both the aggregated metrics and the original metrics that are separated for each value of the dimension. If you don't want the original metrics to be sent to CloudWatch, you can specify this parameter with a list of metrics. The metrics specified along with this parameter don't have their metrics by dimension reported to CloudWatch. Instead, only the aggregated metrics are reported. This reduces the number of metrics that the agent collects, reducing your costs.
  - `resources` – Optional. Specify this field with a value of `*` to cause per-cpu metrics to be collected. The only allowed value is `*`.
  - `totalcpu` – Optional. Specifies whether to report cpu metrics aggregated across all cpu cores. The default is true.
  - `measurement` – Specifies the array of cpu metrics to be collected. Possible values are `time_active`, `time_guest`, `time_guest_nice`, `time_idle`, `time_iowait`, `time_irq`, `time_nice`, `time_softirq`, `time_steal`, `time_system`, `time_user`, `usage_active`,

`usage_guest`, `usage_guest_nice`, `usage_idle`, `usage_iowait`, `usage_irq`, `usage_nice`, `usage_softirq`, `usage_steal`, `usage_system`, and `usage_user`. This field is required if you include `cpu`.

By default, the unit for `cpu_usage_*` metrics is `Percent`, and `cpu_time_*` metrics don't have a unit.

Within the entry for each individual metric, you might optionally specify one or both of the following:

- `rename` – Specifies a different name for this metric.
- `unit` – Specifies the unit to use for this metric, overriding the default unit of `None` for the metric. The unit that you specify must be a valid CloudWatch metric unit, as listed in the `Unit` description in MetricDatum.

- `metrics_collection_interval` – Optional. Specifies how often to collect the cpu metrics, overriding the global `metrics_collection_interval` specified in the `agent` section of the configuration file.

  This value is specified in seconds. For example, specifying 10 causes metrics to be collected every 10 seconds, and setting it to 300 specifies metrics to be collected every 5 minutes.

  If you set this value below 60 seconds, each metric is collected as a high-resolution metric. For more information about high-resolution metrics, see High-resolution metrics.

- `append_dimensions` – Optional. Additional dimensions to use for only the cpu metrics. If you specify this field, it's used in addition to dimensions specified in the global `append_dimensions` field that is used for all types of metrics that the agent collects.

- `disk` – Optional. Specifies that disk metrics are to be collected. Collects metrics only for mounted volumes. This section is valid only for Linux instances. This section can include the following fields:

  - `drop_original_metrics` – Optional. If you are using the `aggregation_dimensions` field in the `metrics` section to roll up metrics into aggregated results, then by default the agent sends both the aggregated metrics and the original metrics that are separated for each value of the dimension. If you don't want the original metrics to be sent to CloudWatch, you can specify this parameter with a list of metrics. The metrics specified along with this parameter don't have their metrics by dimension reported to CloudWatch. Instead, only the aggregated metrics are reported. This reduces the number of metrics that the agent collects, reducing your costs.

- `resources` – Optional. Specifies an array of disk mount points. This field limits CloudWatch to collect metrics from only the listed mount points. You can specify `*` as the value to collect metrics from all mount points. The default value is to collect metrics from all mount points.
- `measurement` – Specifies the array of disk metrics to be collected. Possible values are `free`, `total`, `used`, `used_percent`, `inodes_free`, `inodes_used`, and `inodes_total`. This field is required if you include `disk`.

  > **Note**
  >
  > The `disk` metrics have a dimension for `Partition`, which means that the number of custom metrics generated is dependent on the number of partitions associated with your instance. The number of disk partitions you have depends on which AMI you are using and the number of Amazon EBS volumes you attach to the server.

  To see the default units for each `disk` metric, see Metrics collected by the CloudWatch agent on Linux and macOS instances.

  Within the entry for each individual metric, you might optionally specify one or both of the following:

  - `rename` – Specifies a different name for this metric.
  - `unit` – Specifies the unit to use for this metric, overriding the default unit of `None` of `None` for the metric. The unit that you specify must be a valid CloudWatch metric unit, as listed in the `Unit` description in MetricDatum.
- `ignore_file_system_types` – Specifies file system types to exclude when collecting disk metrics. Valid values include `sysfs`, `devtmpfs`, and so on.
- `drop_device` – Setting this to `true` causes `Device` to not be included as a dimension for disk metrics.

  Preventing `Device` from being used as a dimension can be useful on instances that use the Nitro system because on those instances the device names change for each disk mount when the instance is rebooted. This can cause inconsistent data in your metrics and cause alarms based on these metrics to go to `INSUFFICIENT DATA` state.

  The default is `false`.

- `metrics_collection_interval` – Optional. Specifies how often to collect the disk metrics, overriding the global `metrics_collection_interval` specified in the `agent` section of the configuration file.

  This value is specified in seconds.

  If you set this value below 60 seconds, each metric is collected as a high-resolution metric. For more information, see High-resolution metrics.

- `append_dimensions` – Optional. Specify key-value pairs to use as additional dimensions for only the disk metrics. If you specify this field, it is used in addition to dimensions specified in the `append_dimensions` field that is used for all types of metrics collected by the agent.

  One key-value pair that you can use is the following. You can also specify other custom key-value pairs.

  - `"VolumeId":"${aws:VolumeId}"` adds a `VolumeId` dimension to your block device disk metrics. For Amazon EBS volumes, this will be the Amazon EBS Volume ID. For EC2 instance store, this will be the device serial. Using this requires the `drop_device` parameter to be set to `false`.

- `diskio` – Optional. Specifies that disk i/o metrics are to be collected. This section is valid only for Linux instances. This section can include the following fields:

  - `drop_original_metrics` – Optional. If you are using the `aggregation_dimensions` field in the `metrics` section to roll up metrics into aggregated results, then by default the agent sends both the aggregated metrics and the original metrics that are separated for each value of the dimension. If you don't want the original metrics to be sent to CloudWatch, you can specify this parameter with a list of metrics. The metrics specified along with this parameter don't have their metrics by dimension reported to CloudWatch. Instead, only the aggregated metrics are reported. This reduces the number of metrics that the agent collects, reducing your costs.

  - `resources` – Optional. If you specify an array of devices, CloudWatch collects metrics from only those devices. Otherwise, metrics for all devices are collected. You can also specify * as the value to collect metrics from all devices.

  - `measurement` – Specifies the array of diskio and AWS NVMe driver metrics to be collected for Amazon EBS volumes and instance store volumes attached to Amazon EC2 instances. Possible diskio values are `reads`, `writes`, `read_bytes`, `write_bytes`, `read_time`, `write_time`, `io_time`, and `iops_in_progress`. For a list of the NVMe driver metrics for Amazon EBS volumes and Amazon EC2 instance store volumes, see Collect Amazon EBS NVMe driver

metrics and Collect Amazon EC2 instance store volume NVMe driver metrics. This field is required if you include `diskio`.

Within the entry for each individual metric, you might optionally specify one or both of the following:

- `rename` – Specifies a different name for this metric.
- `unit` – Specifies the unit to use for this metric, overriding the default unit of None of None for the metric. The unit that you specify must be a valid CloudWatch metric unit, as listed in the `Unit` description in MetricDatum.

For information on default units and description of the metrics, see Collect Amazon EBS NVMe driver metrics.

- `metrics_collection_interval` – Optional. Specifies how often to collect the diskio metrics, overriding the global `metrics_collection_interval` specified in the `agent` section of the configuration file.

  This value is specified in seconds.

  If you set this value below 60 seconds, each metric is collected as a high-resolution metric. For more information about high-resolution metrics, see High-resolution metrics.

- `append_dimensions` – Optional. Additional dimensions to use for only the diskio metrics. If you specify this field, it is used in addition to dimensions specified in the `append_dimensions` field that is used for all types of metrics collected by the agent.

- `swap` – Optional. Specifies that swap memory metrics are to be collected. This section is valid only for Linux instances. This section can include the following fields:
  - `drop_original_metrics` – Optional. If you are using the `aggregation_dimensions` field in the `metrics` section to roll up metrics into aggregated results, then by default the agent sends both the aggregated metrics and the original metrics that are separated for each value of the dimension. If you don't want the original metrics to be sent to CloudWatch, you can specify this parameter with a list of metrics. The metrics specified along with this parameter don't have their metrics by dimension reported to CloudWatch. Instead, only the aggregated metrics are reported. This reduces the number of metrics that the agent collects, reducing your costs.
  - `measurement` – Specifies the array of swap metrics to be collected. Possible values are `free`, `used`, and `used_percent`. This field is required if you include `swap`.

To see the default units for each `swap` metric, see Metrics collected by the CloudWatch agent on Linux and macOS instances.

Within the entry for each individual metric, you might optionally specify one or both of the following:

- `rename` – Specifies a different name for this metric.
- `unit` – Specifies the unit to use for this metric, overriding the default unit of None of None for the metric. The unit that you specify must be a valid CloudWatch metric unit, as listed in the `Unit` description in MetricDatum.

- `metrics_collection_interval` – Optional. Specifies how often to collect the swap metrics, overriding the global `metrics_collection_interval` specified in the `agent` section of the configuration file.

  This value is specified in seconds.

  If you set this value below 60 seconds, each metric is collected as a high-resolution metric. For more information about high-resolution metrics, see High-resolution metrics.

- `append_dimensions` – Optional. Additional dimensions to use for only the swap metrics. If you specify this field, it is used in addition to dimensions specified in the global `append_dimensions` field that is used for all types of metrics collected by the agent. It's collected as a high-resolution metric.

- `mem` – Optional. Specifies that memory metrics are to be collected. This section is valid only for Linux instances. This section can include the following fields:

  - `drop_original_metrics` – Optional. If you are using the `aggregation_dimensions` field in the `metrics` section to roll up metrics into aggregated results, then by default the agent sends both the aggregated metrics and the original metrics that are separated for each value of the dimension. If you don't want the original metrics to be sent to CloudWatch, you can specify this parameter with a list of metrics. The metrics specified along with this parameter don't have their metrics by dimension reported to CloudWatch. Instead, only the aggregated metrics are reported. This reduces the number of metrics that the agent collects, reducing your costs.

  - `measurement` – Specifies the array of memory metrics to be collected. Possible values are `active`, `available`, `available_percent`, `buffered`, `cached`, `free`, `inactive`, `shared`, `total`, `used`, and `used_percent`. This field is required if you include `mem`.

To see the default units for each `mem` metric, see Metrics collected by the CloudWatch agent on Linux and macOS instances.

Within the entry for each individual metric, you might optionally specify one or both of the following:

- `rename` – Specifies a different name for this metric.
- `unit` – Specifies the unit to use for this metric, overriding the default unit of `None` for the metric. The unit that you specify must be a valid CloudWatch metric unit, as listed in the `Unit` description in MetricDatum.

- `metrics_collection_interval` – Optional. Specifies how often to collect the mem metrics, overriding the global `metrics_collection_interval` specified in the `agent` section of the configuration file.

  This value is specified in seconds.

  If you set this value below 60 seconds, each metric is collected as a high-resolution metric. For more information about high-resolution metrics, see High-resolution metrics.

- `append_dimensions` – Optional. Additional dimensions to use for only the mem metrics. If you specify this field, it's used in addition to dimensions specified in the `append_dimensions` field that is used for all types of metrics that the agent collects.

- `net` – Optional. Specifies that networking metrics are to be collected. This section is valid only for Linux instances. This section can include the following fields:
  - `drop_original_metrics` – Optional. If you are using the `aggregation_dimensions` field in the `metrics` section to roll up metrics into aggregated results, then by default the agent sends both the aggregated metrics and the original metrics that are separated for each value of the dimension. If you don't want the original metrics to be sent to CloudWatch, you can specify this parameter with a list of metrics. The metrics specified along with this parameter don't have their metrics by dimension reported to CloudWatch. Instead, only the aggregated metrics are reported. This reduces the number of metrics that the agent collects, reducing your costs.
  - `resources` – Optional. If you specify an array of network interfaces, CloudWatch collects metrics from only those interfaces. Otherwise, metrics for all devices are collected. You can also specify `*` as the value to collect metrics from all interfaces.

- `measurement` – Specifies the array of networking metrics to be collected. Possible values are `bytes_sent`, `bytes_recv`, `drop_in`, `drop_out`, `err_in`, `err_out`, `packets_sent`, and `packets_recv`. This field is required if you include `net`.

  To see the default units for each `net` metric, see Metrics collected by the CloudWatch agent on Linux and macOS instances.

  Within the entry for each individual metric, you might optionally specify one or both of the following:

  - `rename` – Specifies a different name for this metric.
  - `unit` – Specifies the unit to use for this metric, overriding the default unit of None for the metric. The unit that you specify must be a valid CloudWatch metric unit, as listed in the `Unit` description in MetricDatum.

- `metrics_collection_interval` – Optional. Specifies how often to collect the net metrics, overriding the global `metrics_collection_interval` specified in the `agent` section of the configuration file.

  This value is specified in seconds. For example, specifying 10 causes metrics to be collected every 10 seconds, and setting it to 300 specifies metrics to be collected every 5 minutes.

  If you set this value below 60 seconds, each metric is collected as a high-resolution metric. For more information about high-resolution metrics, see High-resolution metrics.

- `append_dimensions` – Optional. Additional dimensions to use for only the net metrics. If you specify this field, it's used in addition to dimensions specified in the `append_dimensions` field that is used for all types of metrics collected by the agent.

- `netstat` – Optional. Specifies that TCP connection state and UDP connection metrics are to be collected. This section is valid only for Linux instances. This section can include the following fields:

  - `drop_original_metrics` – Optional. If you are using the `aggregation_dimensions` field in the `metrics` section to roll up metrics into aggregated results, then by default the agent sends both the aggregated metrics and the original metrics that are separated for each value of the dimension. If you don't want the original metrics to be sent to CloudWatch, you can specify this parameter with a list of metrics. The metrics specified along with this parameter don't have their metrics by dimension reported to CloudWatch. Instead, only the aggregated metrics are reported. This reduces the number of metrics that the agent collects, reducing your costs.

- `measurement` – Specifies the array of netstat metrics to be collected. Possible values are `tcp_close`, `tcp_close_wait`, `tcp_closing`, `tcp_established`, `tcp_fin_wait1`, `tcp_fin_wait2`, `tcp_last_ack`, `tcp_listen`, `tcp_none`, `tcp_syn_sent`, `tcp_syn_recv`, `tcp_time_wait`, and `udp_socket`. This field is required if you include `netstat`.

  To see the default units for each `netstat` metric, see Metrics collected by the CloudWatch agent on Linux and macOS instances.

  Within the entry for each individual metric, you might optionally specify one or both of the following:

  - `rename` – Specifies a different name for this metric.
  - `unit` – Specifies the unit to use for this metric, overriding the default unit of `None` for the metric. The unit that you specify must be a valid CloudWatch metric unit, as listed in the `Unit` description in MetricDatum.

- `metrics_collection_interval` – Optional. Specifies how often to collect the netstat metrics, overriding the global `metrics_collection_interval` specified in the `agent` section of the configuration file.

  This value is specified in seconds.

  If you set this value below 60 seconds, each metric is collected as a high-resolution metric. For more information about high-resolution metrics, see High-resolution metrics.

- `append_dimensions` – Optional. Additional dimensions to use for only the netstat metrics. If you specify this field, it's used in addition to dimensions specified in the `append_dimensions` field that is used for all types of metrics collected by the agent.

- `processes` – Optional. Specifies that process metrics are to be collected. This section is valid only for Linux instances. This section can include the following fields:

  - `drop_original_metrics` – Optional. If you are using the `aggregation_dimensions` field in the `metrics` section to roll up metrics into aggregated results, then by default the agent sends both the aggregated metrics and the original metrics that are separated for each value of the dimension. If you don't want the original metrics to be sent to CloudWatch, you can specify this parameter with a list of metrics. The metrics specified along with this parameter don't have their metrics by dimension reported to CloudWatch. Instead, only the aggregated metrics are reported. This reduces the number of metrics that the agent collects, reducing your costs.

- `measurement` – Specifies the array of processes metrics to be collected. Possible values are `blocked`, `dead`, `idle`, `paging`, `running`, `sleeping`, `stopped`, `total`, `total_threads`, `wait`, and `zombies`. This field is required if you include `processes`.

  For all `processes` metrics, the default unit is `None`.

  Within the entry for each individual metric, you might optionally specify one or both of the following:

  - `rename` – Specifies a different name for this metric.
  - `unit` – Specifies the unit to use for this metric, overriding the default unit of `None` for the metric. The unit that you specify must be a valid CloudWatch metric unit, as listed in the `Unit` description in MetricDatum.

- `metrics_collection_interval` – Optional. Specifies how often to collect the processes metrics, overriding the global `metrics_collection_interval` specified in the `agent` section of the configuration file.

  This value is specified in seconds. For example, specifying 10 causes metrics to be collected every 10 seconds, and setting it to 300 specifies metrics to be collected every 5 minutes.

  If you set this value below 60 seconds, each metric is collected as a high-resolution metric. For more information, see High-resolution metrics.

- `append_dimensions` – Optional. Additional dimensions to use for only the process metrics. If you specify this field, it's used in addition to dimensions specified in the `append_dimensions` field that is used for all types of metrics collected by the agent.

- `nvidia_gpu` – Optional. Specifies that NVIDIA GPU metrics are to be collected. This section is valid only for Linux instances on hosts that are configured with a NVIDIA GPU accelerator and have the NVIDIA System Management Interface (nvidia-smi) installed.

  The NVIDIA GPU metrics that are collected are prefixed with the string `nvidia_smi_` to distinguish them from the metrics collected for other accelerator types. This section can include the following fields:

  - `drop_original_metrics` – Optional. If you are using the `aggregation_dimensions` field in the `metrics` section to roll up metrics into aggregated results, then by default the agent sends both the aggregated metrics and the original metrics that are separated for each value of the dimension. If you don't want the original metrics to be sent to CloudWatch, you can specify this parameter with a list of metrics. The metrics specified along with this parameter don't have their metrics by dimension reported to CloudWatch. Instead, only the aggregated

metrics are reported. This reduces the number of metrics that the agent collects, reducing your costs.

- `measurement` – Specifies the array of NVIDIA GPU metrics to be collected. For a list of the possible values to use here, see the **Metric** column in the table in Collect NVIDIA GPU metrics.

  Within the entry for each individual metric, you can optionally specify one or both of the following:

  - `rename` – Specifies a different name for this metric.
  - `unit` – Specifies the unit to use for this metric, overriding the default unit of `None` for the metric. The unit that you specify must be a valid CloudWatch metric unit, as listed in the `Unit` description in MetricDatum.

- `metrics_collection_interval` – Optional. Specifies how often to collect the NVIDIA GPU metrics, overriding the global `metrics_collection_interval` specified in the `agent` section of the configuration file.

- `jmx` – Optional. Specifies that you want to retrieve Java Management Extensions (JMX) metrics from the instance. For more information about the parameters that you can use in this section and the metrics that you can collect, see Collect Java Management Extensions (JMX) metrics.
- `otlp` – Optional. Specifies that you want to collect metrics from the OpenTelemetry SDK. For more information about the fields that you can use in this section, see Collect metrics and traces with OpenTelemetry.
- `procstat` – Optional. Specifies that you want to retrieve metrics from individual processes. For more information about the configuration options available for procstat, see Collect process metrics with the procstat plugin.
- `statsd` – Optional. Specifies that you want to retrieve custom metrics using the `StatsD` protocol. The CloudWatch agent acts as a daemon for the protocol. You use any standard `StatsD` client to send the metrics to the CloudWatch agent. For more information about the configuration options available for StatsD, see Retrieve custom metrics with StatsD.
- `ethtool` – Optional. Specifies that you want to retrieve network metrics using the `ethtool` plugin. This plugin can import both the metrics collected by the standard ethtool utility, as well as network performance metrics from Amazon EC2 instances. For more information about the configuration options available for ethtool, see Collect network performance metrics.

The following is an example of a `metrics` section for a Linux server. In this example, three CPU metrics, three netstat metrics, three process metrics, and one disk metric are collected, and the agent is set up to receive additional metrics from a `collectd` client.

```
"metrics": {
    "aggregation_dimensions" : [["AutoScalingGroupName"], ["InstanceId",
 "InstanceType"],[]],
    "metrics_collected": {
      "collectd": {},
      "cpu": {
        "resources": [
          "*"
        ],
        "measurement": [
          {"name": "cpu_usage_idle", "rename": "CPU_USAGE_IDLE", "unit": "Percent"},
          {"name": "cpu_usage_nice", "unit": "Percent"},
          "cpu_usage_guest"
        ],
        "totalcpu": false,
        "drop_original_metrics": [ "cpu_usage_guest" ],
        "metrics_collection_interval": 10,
        "append_dimensions": {
          "test": "test1",
          "date": "2017-10-01"
        }
      },
      "netstat": {
        "measurement": [
          "tcp_established",
          "tcp_syn_sent",
          "tcp_close"
        ],
        "metrics_collection_interval": 60
      },
       "disk": {
        "measurement": [
          "used_percent"
        ],
        "resources": [
          "*"
        ],
        "drop_device": true
      },
```

```
      "processes": {
        "measurement": [
          "running",
          "sleeping",
          "dead"
        ]
      }
    },
    "append_dimensions": {
      "ImageId": "${aws:ImageId}",
      "InstanceId": "${aws:InstanceId}",
      "InstanceType": "${aws:InstanceType}",
      "AutoScalingGroupName": "${aws:AutoScalingGroupName}"
    }
  }
```

Windows Server

In the `metrics_collected` section for Windows Server, you can have subsections for each Windows performance object, such as `Memory`, `Processor`, and `LogicalDisk`. For information about what objects and counters are available, see Performance Counters in the Microsoft Windows documentation.

Within the subsection for each object, you specify a `measurement` array of the counters to collect. The `measurement` array is required for each object that you specify in the configuration file. You can also specify a `resources` field to name the instances to collect metrics from. You can also specify `*` for `resources` to collect separate metrics for every instance. If you omit `resources` for counters that have instances, the data for all instances is aggregated into one set. If you omit `resources` for counters that don't have instances, the counters are not collected by the CloudWatch agent. To determine whether counters have instances, you can use one of the following commands.

Powershell:

```
Get-Counter -ListSet *
```

Command line (not Powershell):

```
TypePerf.exe -q
```

Within each object section, you can also specify the following optional fields:

- `metrics_collection_interval` – Optional. Specifies how often to collect the metrics for this object, overriding the global `metrics_collection_interval` specified in the `agent` section of the configuration file.

  This value is specified in seconds. For example, specifying 10 causes metrics to be collected every 10 seconds, and setting it to 300 specifies metrics to be collected every 5 minutes.

  If you set this value below 60 seconds, each metric is collected as a high-resolution metric. For more information, see High-resolution metrics.
- `append_dimensions` – Optional. Specifies additional dimensions to use for only the metrics for this object. If you specify this field, it's used in addition to dimensions specified in the global `append_dimensions` field that is used for all types of metrics collected by the agent.
- `drop_original_metrics` – Optional. If you are using the `aggregation_dimensions` field in the `metrics` section to roll up metrics into aggregated results, then by default the agent sends both the aggregated metrics and the original metrics that are separated for each value of the dimension. If you don't want the original metrics to be sent to CloudWatch, you can specify this parameter with a list of metrics. The metrics specified along with this parameter don't have their metrics by dimension reported to CloudWatch. Instead, only the aggregated metrics are reported. This reduces the number of metrics that the agent collects, reducing your costs.

Within each counter section, you can also specify the following optional fields:

- `rename` – Specifies a different name to be used in CloudWatch for this metric.
- `unit` – Specifies the unit to use for this metric. The unit that you specify must be a valid CloudWatch metric unit, as listed in the `Unit` description in MetricDatum.

There are other optional sections that you can include in `metrics_collected`:

- `statsd` – Enables you to retrieve custom metrics using the `StatsD` protocol. The CloudWatch agent acts as a daemon for the protocol. You use any standard `StatsD` client to send the metrics to the CloudWatch agent. For more information, see Retrieve custom metrics with StatsD.
- `procstat` – Enables you to retrieve metrics from individual processes. For more information, see Collect process metrics with the procstat plugin.
- `jmx` – Optional. Specifies that you want to retrieve Java Management Extensions (JMX) metrics from the instance. For more information about the fields that you can use in this section and the metrics that you can collect, see Collect Java Management Extensions (JMX) metrics.

- `otlp` – Optional. Specifies that you want to collect metrics from the OpenTelemetry SDK. For more information about the fields that you can use in this section, see Collect metrics and traces with OpenTelemetry.

The following is an example `metrics` section for use on Windows Server. In this example, many Windows metrics are collected, and the computer is also set to receive additional metrics from a `StatsD` client.

```
"metrics": {
    "metrics_collected": {
      "statsd": {},
      "Processor": {
        "measurement": [
          {"name": "% Idle Time", "rename": "CPU_IDLE", "unit": "Percent"},
          "% Interrupt Time",
          "% User Time",
          "% Processor Time"
        ],
        "resources": [
          "*"
        ],
        "append_dimensions": {
          "d1": "win_foo",
          "d2": "win_bar"
        }
      },
      "LogicalDisk": {
        "measurement": [
          {"name": "% Idle Time", "unit": "Percent"},
          {"name": "% Disk Read Time", "rename": "DISK_READ"},
          "% Disk Write Time"
        ],
        "resources": [
          "*"
        ]
      },
      "Memory": {
        "metrics_collection_interval": 5,
        "measurement": [
          "Available Bytes",
          "Cache Faults/sec",
          "Page Faults/sec",
```

```
          "Pages/sec"
        ],
        "append_dimensions": {
          "d3": "win_bo"
        }
      },
      "Network Interface": {
        "metrics_collection_interval": 5,
        "measurement": [
          "Bytes Received/sec",
          "Bytes Sent/sec",
          "Packets Received/sec",
          "Packets Sent/sec"
        ],
        "resources": [
          "*"
        ],
        "append_dimensions": {
          "d3": "win_bo"
        }
      },
      "System": {
        "measurement": [
          "Context Switches/sec",
          "System Calls/sec",
          "Processor Queue Length"
        ],
        "append_dimensions": {
          "d1": "win_foo",
          "d2": "win_bar"
        }
      }
    },
    "append_dimensions": {
      "ImageId": "${aws:ImageId}",
      "InstanceId": "${aws:InstanceId}",
      "InstanceType": "${aws:InstanceType}",
      "AutoScalingGroupName": "${aws:AutoScalingGroupName}"
    },
    "aggregation_dimensions" : [["ImageId"], ["InstanceId", "InstanceType"], ["d1"],[]]
    }
  }
```

CloudWatch agent configuration file: Logs section

The `logs` section includes the following fields:

- `service.name` – Optional. Specifies the service name to be used to populate the entity for finding related telemetry.
- `deployment.environment` – Optional. Specifies the environment name to be used to populate the entity for finding related telemetry.
- `backpressure_mode` – Optional. Specifies the behavior when the CloudWatch agent is ingesting logs faster than it can send to CloudWatch Logs, resulting in backpressure. Backpressure can happen from network issues, API throttling, or high log volume.

  The agent supports the following values:

  - `fd_release` – Releases file descriptors for deleted files during backpressure conditions. This option can help prevent disk space exhaustion when external log rotation or cleanup processes remove files while the agent maintains open file descriptors. The `auto_removal` option takes precedence over the `backpressure_mode` option being set to `fd_release`. When `auto_removal` is enabled, the CloudWatch agent processes the file to completion without releasing the file descriptor.

    > **Important**
    >
    > Using `fd_release` can result in the CloudWatch agent being unable to read log files to completion, causing log loss.

- `concurrency` – Optional. Specifies the number of shared log publishers used to concurrently publish log files to CloudWatch Logs.

  If you omit this field, each log file destination (log group, stream combination) has a single shared log publisher, which can lead to bottlenecks for large files or when writing multiple files to the same destination. Enabling concurrency can help with throughput.

- `logs_collected` – Required if the `logs` section is included. Specifies which log files and Windows event logs are to be collected from the server. It can include two fields, `files` and `windows_events`.
  - `files` – Specifies which regular log files the CloudWatch agent is to collect. It contains one field, `collect_list`, which further defines these files.

- `collect_list` – Required if `files` is included. Contains an array of entries, each of which specifies one log file to collect. Each of these entries can include the following fields:
  - `file_path` – Specifies the path of the log file to upload to CloudWatch Logs. Standard Unix glob matching rules are accepted, with the addition of `**` as a *super asterisk*. For example, specifying `/var/log/**.log` causes all `.log` files in the `/var/log` directory tree to be collected. For more examples, see Glob Library.

    You can also use the standard asterisk as a standard wildcard. For example, `/var/log/system.log*` matches files such as `system.log_1111`, `system.log_2222`, and so on in `/var/log`.

    Only the latest file is pushed to CloudWatch Logs based on file modification time. We recommend that you use wildcards to specify a series of files of the same type, such as `access_log.2018-06-01-01` and `access_log.2018-06-01-02`, but not multiple kinds of files, such as `access_log_80` and `access_log_443`. To specify multiple kinds of files, add another log stream entry to the agent configuration file so that each kind of log file goes to a different log stream.
  - `auto_removal` – Optional. If this is `true`, the CloudWatch agent automatically deletes this log file after reading it and it has been rotated. Usually the log files are deleted after their entire contents are uploaded to CloudWatch Logs, but if the agent reaches the EOF (end of file) and also detects another newer log file that matches the same `file_path`, the agent deletes the OLD file, so you must make sure that you are done writing to the OLD file before creating the NEW file. The RUST tracing library has a known incompatibility because it will potentially create a NEW log file and then still attempt to write to the OLD log file.

    The agent only removes complete files from logs that create multiple files, such as logs that create separate files for each date. If a log continuously writes to a single file, it is not removed.

    If you already have a log file rotation or removal method in place, we recommend that you omit this field or set it to `false`.

    If you omit this field, the default value of `false` is used.
  - `log_group_name` – Optional. Specifies what to use as the log group name in CloudWatch Logs.

We recommend that you use this field to specify a log group name to prevent confusion. If you omit `log_group_name`, the value of `file_path` up to the final dot is used as the log group name. For example, if the file path is `/tmp/TestLogFile.log.2017-07-11-14`, the log group name is `/tmp/TestLogFile.log`.

If you specify a log group name, you can use `{instance_id}`, `{hostname}`, `{local_hostname}`, and `{ip_address}` as variables within the name. `{hostname}` retrieves the hostname from the EC2 metadata, and `{local_hostname}` uses the hostname from the network configuration file.

If you use these variables to create many different log groups, keep in mind the limit of 1,000,000 log groups per Region per account.

Allowed characters include a–z, A–Z, 0–9, '_' (underscore), '-' (hyphen), '/' (forward slash), and '.' (period).

- `log_group_class` – Optional. Specifies which log group class to use for the new log group. For more information about log group classes, see Log classes.

  Valid values are `STANDARD` and `INFREQUENT_ACCESS`. If you omit this field, the default of `STANDARD` is used.

  > **Important**
  >
  > After a log group is created, its class can't be changed.

- `log_stream_name` – Optional. Specifies what to use as the log stream name in CloudWatch Logs. As part of the name, you can use `{instance_id}`, `{hostname}`, `{local_hostname}`, and `{ip_address}` as variables within the name. `{hostname}` retrieves the hostname from the EC2 metadata, and `{local_hostname}` uses the hostname from the network configuration file.

  If you omit this field, the value of the `log_stream_name` parameter in the global `logs` section is used. If that is also omitted, the default value of `{instance_id}` is used.

  If a log stream doesn't already exist, it's created automatically.

- `retention_in_days` – Optional. Specifies the number of days to retain the log events in the specified log group.

- If the agent is creating this log group now, and you omit this field, the retention of this new log group is set to never expire.
- If this log group already exists and you specify this field, the new retention that you specify is used. If you omit this field for a log group that already exists, the log group's retention is not changed.

  The CloudWatch agent wizard uses `-1` as the default value for this field when it is used to create the agent configuration file and you don't specify a value for log retention. This `-1` value set by the wizard specifies that the events in the log group will never expire. However, manually editing this value to `-1` has no effect.

Valid values are 1, 3, 5, 7, 14, 30, 60, 90, 120, 150, 180, 365, 400, 545, 731, 1827, 2192, 2557, 2922, 3288, and 3653.

If you configure the agent to write multiple log streams to the same log group, specifying the `retention_in_days` in one place will set the log retention for the entire log group. If you specify `retention_in_days` for the same log group in multiple places, the retention is set if all of those values are equal. However, if different `retention_in_days` values are specified for the same log group in multiple places, the log retention will not be set and the agent will stop, returning an error.

> **Note**
>
> The agent's IAM role or IAM user must have the `logs:PutRetentionPolicy` for it to be able to set retention policies.

> **Warning**
>
> If you set `retention_in_days` for a log group that already exists, all logs in that log group that were published before the number of days that you specify are deleted. For example, setting it to 3 would cause all logs from 3 days ago and before to be deleted.

- `filters` – Optional. Can contain an array of entries, each of which specifies a regular expression and a filter type to specify whether to publish or drop log entries that match the filter. If you omit this field, all logs in the log file are published to CloudWatch Logs. If

you include this field, the agent processes each log message with all of the filters that you specify, and only the log events that pass all of the filters are published to CloudWatch Logs. The log entries that don't pass all of the filters will still remain in the host's log file, but will not be sent to CloudWatch Logs.

Each entry in the filters array can include the following fields:

- `type`– Denotes the type of filter. Valid values are `include` and `exclude`. With `include`, the log entry must match the expression to be published to CloudWatch Logs. With `exclude`, each log entry that matches the filter is not sent to CloudWatch Logs.
- `expression`– A regular expression string that follows the RE2 Syntax.

> **Note**
>
> The CloudWatch agent doesn't check the performance of any regular expression that you supply, or restrict the run time of the evaluation of the regular expressions. We recommend that you are careful not to write an expression that is expensive to evaluate. For more information about possible issues, see Regular expression Denial of Service - ReDoS

For example, the following excerpt of the CloudWatch agent configuration file publishes logs that are PUT and POST requests to CloudWatch Logs, but excluding logs that come from Firefox.

```
"collect_list": [
  {
    "file_path": "/opt/aws/amazon-cloudwatch-agent/logs/test.log",
    "log_group_name": "test.log",
    "log_stream_name": "test.log",
    "filters": [
      {
        "type": "exclude",
        "expression": "Firefox"
      },
      {
        "type": "include",
        "expression": "P(UT|OST)"
      }
    ]
  },
```

```
  .....
]
```

> **Note**
>
> The order of the filters in the configuration file matters for performance. In the preceding example, the agent drops all the logs that match `Firefox` before it starts evaluating the second filter. To cause fewer log entries to be evaluated by more than one filter, put the filter that you expect to rule out more logs first in the configuration file.

- `timezone` – Optional. Specifies the time zone to use when putting timestamps on log events. The valid values are `UTC` and `Local`. The default value is `Local`.

  This parameter is ignored if you don't specify a value for `timestamp_format`.

- `timestamp_format` – Optional. Specifies the timestamp format, using plaintext and special symbols that start with %. If you omit this field, the current time is used. If you use this field, you can use the symbols in the following list as part of the format.

  > **Note**
  >
  > This parameter is not considered when the `file_path` is set to `amazon-cloudwatch-agent.log`

  If a single log entry contains two time stamps that match the format, the first time stamp is used.

  This list of symbols is different than the list used by the older CloudWatch Logs agent. For a summary of these differences, see Timestamp differences between the CloudWatch agent and the earlier CloudWatch Logs agent

  %y

  Year without century as a zero-padded decimal number. For example, 19 to represent 2019.

  %Y

  Year with century as a decimal number. For example, 2019.

`%b`

Month as the locale's abbreviated name

`%B`

Month as the locale's full name

`%m`

Month as a zero-padded decimal number

`%-m`

Month as a decimal number (not zero-padded)

`%d`

Day of the month as a zero-padded decimal number

`%-d`

Day of the month as a decimal number (not zero-padded)

`%A`

Full name of weekday, such as `Monday`

`%a`

Abbreviation of weekday, such as `Mon`

`%H`

Hour (in a 24-hour clock) as a zero-padded decimal number

`%I`

Hour (in a 12-hour clock) as a zero-padded decimal number

`%-I`

Hour (in a 12-hour clock) as a decimal number (not zero-padded)

`%p`

AM or PM

`%M`

Minutes as a zero-padded decimal number

`%-M`

Minutes as a decimal number (not zero-padded)

`%S`

Seconds as a zero-padded decimal number

`%-S`

Seconds as a decimal number (not zero padded)

`%f`

Fractional seconds as a decimal number (1-9 digits), zero-padded on the left.

`%Z`

Time zone, for example `PST`

`%z`

Time zone, expressed as the offset between the local time zone and UTC. For example, `-0700`. Only this format is supported. For example, `-07:00` isn't a valid format.

- `multi_line_start_pattern` – Specifies the pattern for identifying the start of a log message. A log message is made of a line that matches the pattern and any subsequent lines that don't match the pattern.

  If you omit this field, multi-line mode is disabled, and any line that begins with a non-whitespace character closes the previous log message and starts a new log message.

  If you include this field, you can specify `{timestamp_format}` to use the same regular expression as your timestamp format. Otherwise, you can specify a different regular expression for CloudWatch Logs to use to determine the start lines of multi-line entries.

- `encoding` – Specified the encoding of the log file so that it can be read correctly. If you specify an incorrect coding, there might be data loss because characters that can't be decoded are replaced with other characters.

  The default value is `utf-8`. The following are all possible values:

`ascii, big5, euc-jp, euc-kr, gbk, gb18030, ibm866, iso2022-jp, iso8859-2, iso8859-3, iso8859-4, iso8859-5, iso8859-6, iso8859-7, iso8859-8, iso8859-8-i, iso8859-10, iso8859-13, iso8859-14, iso8859-15, iso8859-16, koi8-r, koi8-u, macintosh, shift_jis, utf-8, utf-16, utf-16le, UTF-16, UTF-16LE, windows-874, windows-1250, windows-1251, windows-1252, windows-1253, windows-1254, windows-1255, windows-1256, windows-1257, windows-1258, x-mac-cyrillic`

- `service.name` – Optional. Specifies the service name to be used to populate the entity for finding related telemetry.
- `deployment.environment` – Optional. Specifies the environment name to be used to populate the entity for finding related telemetry.
- `trim_timestamp` – Optional. If this is true, the CloudWatch agent will remove the timestamp matched by `timestamp_format` from the line before sending it to CloudWatch Logs. The LogEvent will still contain the `timestamp` field.

  If you omit this field, the default value of `false` is used.

- The `windows_events` section specifies the type of Windows events to collect from servers running Windows Server. It includes the following fields:
  - `collect_list` – Required if `windows_events` is included. Specifies the types and levels of Windows events to be collected. Each log to be collected has an entry in this section, which can include the following fields:
    - `event_name` – Specifies the type of Windows events to log. This is equivalent to the Windows event log channel name: for example, `System`, `Security`, `Application`, and so on. This field is required for each type of Windows event to log.

      > **Note**
      >
      > When CloudWatch retrieves messages from a Windows log channel, it looks up the log channel based on its `Full Name` property. Meanwhile, the Windows Event Viewer navigation pane displays the `Log Name` property of log channels. The `Full Name` and `Log Name` do not always match. To confirm the `Full Name` of a channel, right-click on it in the Windows Event viewer and open **Properties**.

- `event_levels` – Optional. Specifies the levels of event to log. You must specify each level to log. Possible values include `INFORMATION`, `WARNING`, `ERROR`, `CRITICAL`, and `VERBOSE`. This field is optional for each type of Windows event to log. and can be used with other filtering option like `event_ids` and `filters`.
- `event_ids` – Optional. Contains an array of Windows Event IDs to specify which events to collect from the Windows Event Log. When this field is excluded, all events from the specified event log are collected. When this field is included, the agent only collects events that match the specified Event IDs.

  Each entry in the `event_ids` array should be a numeric Event ID value and can be used with other filtering options. See the third entry in the config sample below.

  > **Note**
  >
  > Using `event_ids` for filtering is recommended over regex expressions when you need to filter by Event ID, as it provides better performance.

- `filters` – Optional. Contains an array of entries. Each entry specifies a regular expression and a filter type to specify whether to publish or drop the log entries that match the filter. When the field is included, the agent processes each log message with all of the filters that you specify, and only the log events that pass all filters are published to CloudWatch Logs. The windows event logs that doesn't pass all of the filters will be dropped and not sent to CloudWatch Logs. The filters section can also be used with other filtering mechanisms like event ids [4624, 4625] and system levels (Information, Error, or Critical) to effectively filter logs and push to CloudWatch.

  Each entry in the filters array can include the following fields:

  - `type` – Specifies the type of filter. Valid values are `include` and `exclude`. With include, the windows events entry must match the expression to be published to CloudWatch Logs. With exclude, each windows event log entry that matches the filter is not sent to CloudWatch Logs.
  - `expression` – A regular expression string that follows the RE2 Syntax.

  > **Note**
  >
  > The CloudWatch agent does not validate regular expressions that you provide. It also does not limit their evaluation time. Write your expressions carefully to avoid

performance issues. For more information on security ricks, see Regular expression Denial of Service - ReDoS .

In the example agent configuration below:

For the first entry, the agent pushes logs that contain database failure messages, any authentication related activities, and all login events (both successful and failed attempts) to CloudWatch. Any log that doesn't match this pattern is dropped.

In the second entry, initial filtering is done based on event ids for windows event subscription. The agent collects all logs that contain the string user, discarding logs that don't match these patterns. The agent then drops logs containing `successful` before sending the remaining logs to CloudWatch Logs. Every filter type is applied to each windows event log before sending to CloudWatch.

```
"collect_list": [
  {
        "event_name": "Application",
        "log_group_name": "ApplicationEvents",
        "log_stream_name": "ApplicationEvents",
        "filters": [
            {
                "type": "include",
                "expression": "Database.*failed|Authentication.*|login.*"
            }
        ]
    },
    {
        "event_name": "System",
        "log_group_name": "SystemEvents",
        "log_stream_name": "Logon-events",
        "event_ids": [
            4624,
            4625
         ],
        "filters": [
            {
                "type": "include",
                "expression": ".*user.*"
            },
```

```
            {
                "type": "exclude",
                "expression": ".*successful.*"
            }
        ]
    }
  .....
]
```

> **Note**
>
> The order of the filters in the configuration will impact the performance. In the second entry, the agent drops all the logs that does not match the user before it starts evaluating the second filter expression. For optimal performance, order filters from highest to lowest exclusion rate.

While you can filter out logs on event ids and system levels in the filter expression, it is recommended to use the `event_ids` and `log_level` as shown in the second entry for improved performance.

> **Warning**
>
> Even though all filtering mechanisms (event_levels, event_ids, filters) are optional, at least one is required during agent configuration to filter logs.

- `log_group_name` – Required. Specifies what to use as the log group name in CloudWatch Logs.
- `log_stream_name` – Optional. Specifies what to use as the log stream name in CloudWatch Logs. As part of the name, you can use `{instance_id}`, `{hostname}`, `{local_hostname}`, and `{ip_address}` as variables within the name. `{hostname}` retrieves the hostname from the EC2 metadata, and `{local_hostname}` uses the hostname from the network configuration file.

  If you omit this field, the value of the `log_stream_name` parameter in the global `logs` section is used. If that is also omitted, the default value of `{instance_id}` is used.

  If a log stream doesn't already exist, it's created automatically.

- `event_format` – Optional. Specifies the format to use when storing Windows events in CloudWatch Logs. `xml` uses the XML format as in Windows Event Viewer. `text` uses the legacy CloudWatch Logs agent format.
- `retention_in_days` – Optional. Specifies the number of days to retain the Windows events in the specified log group.
  - If the agent is creating this log group now, and you omit this field, the retention of this new log group is set to never expire.
  - If this log group already exists and you specify this field, the new retention that you specify is used. If you omit this field for a log group that already exists, the log group's retention is not changed.

    The CloudWatch agent wizard uses `-1` as the default value for this field when it is used to create the agent configuration file and you don't specify a value for log retention. This `-1` value specifies set by the wizard specifies that the events in the log group don't expire. However, manually editing this value to `-1` has no effect.

  Valid values are 1, 3, 5, 7, 14, 30, 60, 90, 120, 150, 180, 365, 400, 545, 731, 1827, 2192, 2557, 2922, 3288, and 3653.

  If you configure the agent to write multiple log streams to the same log group, specifying the `retention_in_days` in one place will set the log retention for the entire log group. If you specify `retention_in_days` for the same log group in multiple places, the retention is set if all of those values are equal. However, if different `retention_in_days` values are specified for the same log group in multiple places, the log retention will not be set and the agent will stop, returning an error.

  > **Note**
  >
  > The agent's IAM role or IAM user must have the `logs:PutRetentionPolicy` for it to be able to set retention policies.

  > **Warning**
  >
  > If you set `retention_in_days` for a log group that already exists, all logs in that log group that were published before the number of days that you specify

are deleted. For example, setting it to 3 would cause all logs from 3 days ago and before to be deleted.

- `log_stream_name` – Optional. Specifies the default log stream name to be used for any logs or Windows events that don't have individual log stream names defined in the `log_stream_name` parameter within their entry in `collect_list`.
- `endpoint_override` – Specifies a FIPS endpoint or private link to use as the endpoint where the agent sends logs. Specifying this field and setting a private link enables you to send the logs to an Amazon VPC endpoint. For more information, see What Is Amazon VPC?.

  The value of `endpoint_override` must be a string that is a URL.

  For example, the following part of the logs section of the configuration file sets the agent to use a VPC Endpoint when sending logs.

```
{
  "logs": {
    "endpoint_override": "vpce-XXXXXXXXXXXXXXXXXXXXXXXX.logs.us-
east-1.vpce.amazonaws.com",
   ......
   },
}
```

- `force_flush_interval` – Specifies in seconds the maximum amount of time that logs remain in the memory buffer before being sent to the server. No matter the setting for this field, if the size of the logs in the buffer reaches 1 MB, the logs are immediately sent to the server. The default value is 5.

  If you are using the agent to report high-resolution metrics in embedded metric format, and you are setting alarms on those metrics, keep this parameter set to the default value of 5. Otherwise, the metrics are reported with a delay that can cause alarming on partial or incomplete data.
- `credentials` – Specifies an IAM role to use when sending logs to a different AWS account. If specified, this field contains one parameter, `role_arn`.
  - `role_arn` – Specifies the ARN of an IAM role to use for authentication when sending logs to a different AWS account. For more information, see Sending metrics, logs, and traces to a different account. If specified here, this overrides the `role_arn` specified in the `agent` section of the configuration file, if any.

- `metrics_collected` – This field can contain sections to specify that the agent is to collect logs to enable use cases such as CloudWatch Application Signals and Container Insights with enhanced observability for Amazon EKS.
  - `application_signals` (Optional) Specifies that you want to enable CloudWatch Application Signals For more information about this configuration, see Enable CloudWatch Application Signals.
  - `kubernetes` – This field can contain an `enhanced_container_insights` parameter, which you can use to enable Container Insights with enhanced observability for Amazon EKS.
    - `enhanced_container_insights` – Set this to `true` to enable Container Insights with enhanced observability for Amazon EKS. For more information, see Container Insights with enhanced observability for Amazon EKS.
    - `accelerated_compute_metrics` – Set this to `false` to opt out of collecting Nvidia GPU metrics on Amazon EKS clusters. For more information, see NVIDIA GPU metrics.
  - `emf` – To collect metrics embedded in logs, it is no longer necessary to add this `emf` field. This is a legacy field that specified that the agent is to collect logs that are in embedded metric format. You can generate metric data from these logs. For more information, see Embedding metrics within logs.
  - `otlp` – Optional. Specifies that you want to collect metrics from the OpenTelemetry SDK. For more information about the fields that you can use in this section, see Collect metrics and traces with OpenTelemetry.

The following is an example of a `logs` section.

```
"logs":{
    "logs_collected": {
    "files": {
            "collect_list": [
                    {
                         "file_path": "c:\\ProgramData\\Amazon\\AmazonCloudWatchAgent\
\Logs\\amazon-cloudwatch-agent.log",
                        "log_group_name": "amazon-cloudwatch-agent.log",
                        "log_stream_name": "my_log_stream_name_1"
                    },
                    {
                        "file_path": "c:\\ProgramData\\Amazon\\AmazonCloudWatchAgent\
\Logs\\test.log",
                        "log_group_name": "test.log",
```

```
                    "log_stream_name": "my_log_stream_name_2"
                }
            ]
        },
    "windows_events": {
             "collect_list": [
                            {
                    "event_name": "System",
                    "event_ids": [
                        1001,
                        1008
                    ],
                    "log_group_name": "System",
                    "log_stream_name": "System"
                },
                {
                    "event_name": "CustomizedName",
                    "event_levels": [
                        "INFORMATION",
                        "ERROR"
                    ],
                    "log_group_name": "CustomizedLogGroup",
                    "log_stream_name": "CustomizedLogStream"
                },
                {
                    "event_name": "Application",
                    "event_levels": [
                        "INFORMATION",
                        "ERROR"
                    ],
                    "event_ids":[
                         7369,
                         5624
                    ],
                    "log_group_name": "CustomizedLogGroup",
                    "log_stream_name": "CustomizedLogStream"
                }
            ]
        }
     },
     "log_stream_name": "my_log_stream_name",
     "metrics_collected": {
      "kubernetes": {
      "enhanced_container_insights": true
```

```
      }
    }
  }
```

CloudWatch agent configuration file: Traces section

By adding a `traces` section to the CloudWatch agent configuration file, you can enable CloudWatch Application Signals or collect traces from X-Ray and from the OpenTelemetry instrumentation SDK and send them to X-Ray.

> **Important**
>
> The agent's IAM role or IAM user must have the **AWSXrayWriteOnlyAccess** policy to send trace data to X-Ray.

For a quick start for collecting traces, you can add just the following to the CloudWatch agent configuration file.

```
"traces_collected": {
        "xray": {
        },
        "otlp": {
        }
      }
```

If you add the previous section to the CloudWatch agent configuration file and restart the agent, this causes the agent to start collecting traces using the following default options and values. For more information about these parameters, see the parameter definitions later in this section.

```
"traces_collected": {
        "xray": {
            "bind_address": "127.0.0.1:2000",
            "tcp_proxy": {
              "bind_address": "127.0.0.1:2000"
            }
        },
        "otlp": {
            "grpc_endpoint": "127.0.0.1:4317",
            "http_endpoint": "127.0.0.1:4318"
```

```
        }
      }
```

The `traces` section can include the following fields:

- `traces_collected` – Required if the `traces` section is included. Specifies which SDKs to collect traces from. It can include the following fields:
  - `application_signals` – Optional. Specifies that you want to enable CloudWatch Application Signals For more information about this configuration, see Enable CloudWatch Application Signals.
  - `xray` – Optional. Specifies that you want to collect traces from the X-Ray SDK. This section can include the following fields:
    - `bind_address` – Optional. Specifies the UDP address for the CloudWatch agent to use to listen for X-Ray traces. The format is `ip:port`. This address must match the address set in the X-Ray SDK.

      If you omit this field, the default of `127.0.0.1:2000` is used.
    - `tcp_proxy` – Optional. Configures the address for a proxy used to support X-Ray remote sampling. For more information, see Configuring sampling rules in the X-Ray documentation.

      This section can contain the following field.
      - `bind_address` – Optional. Specifies the TCP address to which the CloudWatch agent should set up the proxy. The format is `ip:port`. This address must match the address set in the X-Ray SDK.

        If you omit this field, the default of `127.0.0.1:2000` is used.
  - `otlp` – Optional. Specifies that you want to collect traces from the OpenTelemetry SDK. For more information about the fields that you can use in this section, see Collect metrics and traces with OpenTelemetry). For more information about the AWS Distro for OpenTelemetry, see AWS Distro for OpenTelemetry. For more information about the AWS Distro for OpenTelemetry SDKs, see Introduction.

    This section can include the following fields:
    - `grpc_endpoint` – Optional. Specifies the address for the CloudWatch agent to use to listen for OpenTelemetry traces sent using gRPC Remote Procedure Calls. The format is `ip:port`. This address must match the address set for the gRPC exporter in the OpenTelemetry SDK.

If you omit this field, the default of `127.0.0.1:4317` is used.

- `http_endpoint` – Optional. Specifies the address for the CloudWatch agent to use to listen for OTLP traces sent over HTTP. The format is `ip:port`. This address must match the address set for the HTTP exporter in the OpenTelemetry SDK.

  If you omit this field, the default of `127.0.0.1:4318` is used.

- `concurrency` – Optional. Specifies the maximum number of concurrent calls to X-Ray that can be used to upload traces. The default value is 8
- `local_mode` – Optional. If `true`, the agent doesn't collect Amazon EC2 instance metadata. The default is `false`
- `endpoint_override` – Optional. Specifies a FIPS endpoint or private link to use as the endpoint where the CloudWatch agent sends traces. Specifying this field and setting a private link enables you to send the traces to an Amazon VPC endpoint. For more information, see What is Amazon VPC

  The value of `endpoint_override` must be a string that is a URL.
- `region_override` – Optional. Specifies the Region to use for the X-Ray endpoint. The CloudWatch agent sends the traces to X-Ray in the specified Region. If you omit this field, the agent sends the traces to the Region where the Amazon EC2 instance is located.

  If you specify a Region here, it takes precedence over the setting of the `region` parameter in the `agent` section of the configuration file.
- `proxy_override` – Optional. Specifies the proxy server address for the CloudWatch agent to use when sending requests to X-Ray. The proxy server's protocol must be specified as part of this address.
- `credentials` – Specifies an IAM role to use when sending traces to a different AWS account. If specified, this field contains one parameter, `role_arn`.
  - `role_arn` – Specifies the ARN of an IAM role to use for authentication when sending traces to a different AWS account. For more information, see Sending metrics, logs, and traces to a different account. If specified here, this overrides the `role_arn` specified in the `agent` section of the configuration file, if any.
- `transit_spans_in_otlp_format` – Optional. If `true`, sends traces to X-Ray in the OpenTelemetry Protocol format, which supports span events in Transaction Search. For more information, see Adding custom attributes. The default is `false`.

CloudWatch agent configuration file: Complete examples

The following is an example of a complete CloudWatch agent configuration file for a Linux server.

The items listed in the `measurement` sections for the metrics you want to collect can either specify the complete metric name such or just the part of the metric name that will be appended to the type of resource. For example, specifying either `reads` or `diskio_reads` in the `measurement` section of the `diskio` section will cause the `diskio_reads` metric to be collected.

This example includes both ways of specifying metrics in the `measurement` section.

```
   {
     "agent": {
       "metrics_collection_interval": 10,
       "logfile": "/opt/aws/amazon-cloudwatch-agent/logs/amazon-cloudwatch-agent.log"
     },
     "metrics": {
       "namespace": "MyCustomNamespace",
       "metrics_collected": {
         "cpu": {
           "resources": [
             "*"
           ],
           "measurement": [
             {"name": "cpu_usage_idle", "rename": "CPU_USAGE_IDLE", "unit":
"Percent"},
             {"name": "cpu_usage_nice", "unit": "Percent"},
             "cpu_usage_guest"
           ],
           "totalcpu": false,
           "metrics_collection_interval": 10,
           "append_dimensions": {
             "customized_dimension_key_1": "customized_dimension_value_1",
             "customized_dimension_key_2": "customized_dimension_value_2"
           }
         },
         "disk": {
           "resources": [
             "/",
             "/tmp"
           ],
           "measurement": [
             {"name": "free", "rename": "DISK_FREE", "unit": "Gigabytes"},
```

```
            "total",
            "used"
          ],
           "ignore_file_system_types": [
            "sysfs", "devtmpfs"
          ],
          "metrics_collection_interval": 60,
          "append_dimensions": {
            "customized_dimension_key_3": "customized_dimension_value_3",
            "customized_dimension_key_4": "customized_dimension_value_4"
          }
        },
        "diskio": {
          "resources": [
            "*"
          ],
          "measurement": [
            "reads",
            "writes",
            "read_time",
            "write_time",
            "io_time"
          ],
          "metrics_collection_interval": 60
        },
        "swap": {
          "measurement": [
            "swap_used",
            "swap_free",
            "swap_used_percent"
          ]
        },
        "mem": {
          "measurement": [
            "mem_used",
            "mem_cached",
            "mem_total"
          ],
          "metrics_collection_interval": 1
        },
        "net": {
          "resources": [
            "eth0"
          ],
```

```
            "measurement": [
              "bytes_sent",
              "bytes_recv",

              "tcp_close"
            ],
            "metrics_collection_interval": 60
          },
          "processes": {
            "measurement": [
              "running",
              "sleeping",
              "dead"
            ]
          }
        },
        "append_dimensions": {
          "ImageId": "${aws:ImageId}",
          "InstanceId": "${aws:InstanceId}",
          "InstanceType": "${aws:InstanceType}",
          "AutoScalingGroupName": "${aws:AutoScalingGroupName}"
        },
        "aggregation_dimensions" : [["ImageId"], ["InstanceId", "InstanceType"],
 ["d1"],[]],
        "force_flush_interval" : 30
      },
      "logs": {
        "logs_collected": {
          "files": {
            "collect_list": [
              {
                "file_path": "/opt/aws/amazon-cloudwatch-agent/logs/amazon-cloudwatch-
agent.log",
                "log_group_name": "amazon-cloudwatch-agent.log",
                "log_stream_name": "amazon-cloudwatch-agent.log",
                "timezone": "UTC"
              },
```

```
            {
              "file_path": "/opt/aws/amazon-cloudwatch-agent/logs/test.log",
              "log_group_name": "test.log",
              "log_stream_name": "test.log",
              "timezone": "Local"
            }
          ]
        }
      },
      "log_stream_name": "my_log_stream_name",
      "force_flush_interval" : 15,
      "metrics_collected": {
         "kubernetes": {
              "enhanced_container_insights": true
    }
  }
 }
}
```

The following is an example of a complete CloudWatch agent configuration file for a server running Windows Server.

```
{
      "agent": {
        "metrics_collection_interval": 60,
        "logfile": "c:\\ProgramData\\Amazon\\AmazonCloudWatchAgent\\Logs\\amazon-
cloudwatch-agent.log"
      },
      "metrics": {
        "namespace": "MyCustomNamespace",
        "metrics_collected": {
          "Processor": {
            "measurement": [
              {"name": "% Idle Time", "rename": "CPU_IDLE", "unit": "Percent"},
              "% Interrupt Time",
              "% User Time",
              "% Processor Time"
            ],
            "resources": [
              "*"
            ],
            "append_dimensions": {
              "customized_dimension_key_1": "customized_dimension_value_1",
```

```
            "customized_dimension_key_2": "customized_dimension_value_2"
          }
        },
        "LogicalDisk": {
          "measurement": [
            {"name": "% Idle Time", "unit": "Percent"},
            {"name": "% Disk Read Time", "rename": "DISK_READ"},
            "% Disk Write Time"
          ],
          "resources": [
            "*"
          ]
        },
        "customizedObjectName": {
          "metrics_collection_interval": 60,
          "customizedCounterName": [
            "metric1",
            "metric2"
          ],
          "resources": [
            "customizedInstances"
          ]
        },
        "Memory": {
          "metrics_collection_interval": 5,
          "measurement": [
            "Available Bytes",

              "timezone": "UTC"
            },
            {
              "file_path": "c:\\ProgramData\\Amazon\\AmazonCloudWatchAgent\\Logs\
\test.log",
              "log_group_name": "test.log",
              "timezone": "Local"
            }
          ]
        },
        "windows_events": {
          "collect_list": [
            {
              "event_name": "System",
              "event_levels": [
                "INFORMATION",
```

```
                "ERROR"
              ],
              "log_group_name": "System",
              "log_stream_name": "System",
              "event_format": "xml"
            },
            {
              "event_name": "CustomizedName",
              "event_levels": [
                "WARNING",
                "ERROR"
              ],
              "log_group_name": "CustomizedLogGroup",
              "log_stream_name": "CustomizedLogStream",
              "event_format": "xml"
            }
          ]
        }
      },
      "log_stream_name": "example_log_stream_name"
    }
  }
```

Save the CloudWatch agent configuration file manually

If you create or edit the CloudWatch agent configuration file manually, you can give it any name. After you have created the file, you can copy it to other servers where you want to run the agent.

Uploading the CloudWatch agent configuration file to Systems Manager Parameter Store

If you plan to use the SSM Agent to install the CloudWatch agent on servers, after you manually edit the CloudWatch agent configuration file, you can upload it to Systems Manager Parameter Store. To do so, use the Systems Manager `put-parameter` command.

To be able to store the file in Parameter Store, you must use an IAM role with sufficient permissions.

Use the following command, where *`parameter name`* is the name to be used for this file in Parameter Store and *`configuration_file_pathname`* is the path and file name of the configuration file that you edited.

```
aws ssm put-parameter --name "parameter name" --type "String" --value
 file://configuration_file_pathname
```

Enable CloudWatch Application Signals

Use CloudWatch Application Signals to automatically instrument your applications on AWS so that you can track application performance against your business objectives. Application Signals provides you a unified, application-centric view of your Java applications, their dependencies, and their edges. For more information, see Application Signals.

CloudWatch Application Signals leverages the CloudWatch agent to receive metrics and traces from your auto-instrumented applications, optionally apply rules to reduce high cardinality, and then publish the processed telemetry to CloudWatch. You can provide custom configuration to the CloudWatch agent specifically for Application Signals using the agent configuration file. To start with, the presence of an `application_signals` section under the `metrics_collected` section within the `logs` section of the agent configuration file specifies that the CloudWatch agent will receive metrics from your auto-instrumented applications. Similarly, the presence of an `application_signals` section under the `traces_collected` section within the `traces` section of the agent configuration file specifies that the CloudWatch agent is enabled to receive traces from your auto-instrumented applications. In addition, you can optionally pass in custom configuration rules to reduce publishing high-cardinality telemetry as outlined in this section.

- For Amazon EKS clusters, when you install the Amazon CloudWatch Observability EKS add-on, the CloudWatch agent is by default enabled to receive both metrics and traces from your auto-instrumented applications. If you would like to optionally pass in custom configuration rules, you can do so by passing in a custom agent configuration to the Amazon EKS add-on when you create or update it by using additional configuration, as outlined in (Optional) Additional configuration.
- For RedHat for OpenShift on AWS (ROSA), when you install the CloudWatch agent operator using helm charts, the CloudWatch agent is by default enabled to receive both metrics and traces from your auto-instrumented applications. If you would like to optionally pass in custom configuration rules, you can do so by passing in a custom agent configuration by using the Helm chart, as outlined in (Optional) Additional configuration.
- For other supported platforms including Amazon EC2, you must start the CloudWatch agent with an agent configuration that enables Application Signals by specifying the `application_signals` sections and optionally any custom configuration rules as outlined later in this section.

The following is an overview of the fields in the CloudWatch agent configuration file that are related to CloudWatch Application Signals.

- `logs`
  - `metrics_collected` – This field can contain sections to specify that the agent is to collect logs to enable use cases such as CloudWatch Application Signals and Container Insights with enhanced observability for Amazon EKS.

    > **Note**
    >
    > Previously this section was also used to specify that the agent is to collect logs that are in embedded metric format. Those settings are no longer needed.

    - `application_signals` (Optional) Specifies that you want to enable CloudWatch Application Signals to receive metrics from your auto-instrumented applications to facilitate CloudWatch Application Signals.
      - `rules` (Optional) An array of rules to conditionally select metrics and traces and apply actions to handle high-cardinality scenarios. Each rule can contain the following fields:
        - `rule_name` (Optional) The name of the rule.
        - `selectors` (Optional) An array of metrics and traces dimension matchers. Each selector must provide the following fields:
          - `dimension` Required if `selectors` is not empty. This specifies the dimension of metrics and traces to use as a filter.
          - `match` Required if `selectors` is not empty. A wildcard pattern used for matching values of the specified dimension.
        - `action` (Optional) The action to be applied to metrics and traces that match the specified selectors. The value of `action` must be one of the following keywords:
          - `keep` Specifies to send only the metrics and traces to CloudWatch if matched by the `selectors`.
          - `drop` Specifies to drop the metric and traces that match the `selectors`.
          - `replace` Specifies to replace the dimensions of the metrics and traces that match `selectors`. They are replaced according to the `replacements` section.

- `replacements` Required if `action` is `replace`. An array of dimension and value pairs that will be applied to metrics and traces that match the specified `selectors` when the `action` is `replace`. Each replacement must provide the following fields:
  - `target_dimension` Required if `replacements` is not empty. Specifies the dimension that needs to be replace.
  - `value` Required if `replacements` is not empty. The value to replace the original value of `target_dimension` with.
- `limiter` (Optional) Use this section to limit how many metrics and dimensions Application Signals sends to CloudWatch, to optimize your costs.
  - `disabled` (Optional) If `true`, the metric limiting feature is disabled. The default is `false`
  - `drop_threshold` (Optional) The maximum number of distinct metrics per service in one rotation interval that can be exported by one CloudWatch agent. The default is 500.
  - `rotation_interval` (Optional) The interval at which the limiter resets the metric records for distinction counting. This is expressed as a string with a sequence of numbers and a unit suffix. Fractions are supported. The supported unit suffixes are `s`, `m`, `h`, `ms`, `us`, and `ns`. The default is `1h` for one hour.
  - `log_dropped_metrics` (Optional) Specifies whether the agent should write logs to the CloudWatch agent logs when Application Signals metrics are dropped. The default is `false`.

    > **Note**
    >
    > To activate this logging, the `debug` parameter in the `agent` section must also be set to `true`.

- `traces`
  - `traces_collected`
    - `application_signals` Optional. Specify this to enable the CloudWatch agent to receive traces from your auto-instrumented applications for facilitating CloudWatch Application Signals.

> **Note**
>
> Even though the custom `application_signals` rules are specified under the `metrics_collected` section that is contained in the `logs` section, they also implicitly apply to the `traces_collected` section as well. The same set of rules will apply to both metrics and traces.

When there are multiple rules with different actions, they apply in the following sequence: `keep`, then `drop`, then `replace`.

The following is an example of a full CloudWatch agent configuration file that applies custom rules.

```
{
  "logs": {
    "metrics_collected": {
      "application_signals": {
        "rules": [
          {
            "rule_name": "keep01",
            "selectors": [
              {
                "dimension": "Service",
                "match": "pet-clinic-frontend"
              },
              {
                "dimension": "RemoteService",
                "match": "customers-service"
              }
            ],
            "action": "keep"
          },
          {
            "rule_name": "drop01",
            "selectors": [
              {
                "dimension": "Operation",
                "match": "GET /api/customer/owners/*"
              }
            ],
            "action": "drop"
```

```
          },
          {
            "rule_name": "replace01",
            "selectors": [
              {
                "dimension": "Operation",
                "match": "PUT /api/customer/owners/*/pets/*"
              },
              {
                "dimension": "RemoteOperation",
                "match": "PUT /owners"
              }
            ],
            "replacements": [
              {
                "target_dimension": "Operation",
                "value": "PUT /api/customer/owners/{ownerId}/pets{petId}"
              }
            ],
            "action": "replace"
          }
        ]
      }
    }
  },
  "traces": {
    "traces_collected": {
      "application_signals": {}
    }
  }
}
```

For the previous example configuration file, the `rules` are processed as follows:

1. Rule `keep01` ensures that any metrics and traces with the dimension `Service` as `pet-clinic-frontend` and the dimension `RemoteService` as `customers-service` are kept.
2. For the processed metrics and traces after applying `keep01`, the `drop01` rule ensures that metrics and traces with the dimension `Operation` as `GET /api/customer/owners/*` are dropped.
3. For the processed metrics and traces after applying `drop01`, the `replace01` rule updates metrics and traces that have the dimension `Operation` as `PUT /api/customer/owners/*/`

`pets/*` and the dimension `RemoteOperation` as `PUT /owners` such that their `Operation` dimension is now replaced to be `PUT /api/customer/owners/{ownerId}/pets{petId}`.

The following is a complete example of a CloudWatch configuration file that manages cardinality in Application Signals by changing the metric limit to 100, enabling the logging of dropped metrics, and setting the rotation interval to two hours.

```
{
    "logs": {
        "metrics_collected": {
            "application_signals": {
                "limiter": {
                    "disabled": false,
                    "drop_threshold": 100,
                    "rotation_interval": "2h",
                    "log_dropped_metrics": true
                }
            }
        },
        "traces": {
            "traces_collected": {
                "application_signals": {}
            }
        }
    }
}
```

Collect network performance metrics

EC2 instances running on Linux that use the Elastic Network Adapter (ENA) publish network performance metrics. Version 1.246396.0 and later of the CloudWatch agent enable you to import these network performance metrics into CloudWatch. When you import these network performance metrics into CloudWatch, they are charged as CloudWatch custom metrics.

For more information about the ENA driver, see Enabling enhanced networking with the Elastic Network Adapter (ENA) on Linux instances and Enabling enhanced networking with the Elastic Network Adapter (ENA) on Windows instances.

How you set up the collection of network performance metrics differs on Linux servers and Windows servers.

The following table lists these network performance metrics enabled by the ENA adapter. When the CloudWatch agent imports these metrics into CloudWatch from Linux instances, it prepends `ethtool_` at the beginning of each of these metric names.

Metric	Description
Name on Linux servers: **`bw_in_allowance_exceeded`** Name on Windows servers: **`Aggregate inbound BW allowance exceeded`**	The number of packets queued and/or dropped because the inbound aggregate bandwidth exceeded the maximum for the instance. This metric is collected only if you have listed it in the `ethtool` subsection of the `metrics_collected` section of the CloudWatch agent configuration file. For more information, see Collect network performance metrics Unit: None
Name on Linux servers: **`bw_out_allowance_exceeded`** Name on Windows servers: **`Aggregate outbound BW allowance exceeded`**	The number of packets queued and/or dropped because the outbound aggregate bandwidth exceeded the maximum for the instance. This metric is collected only if you have listed it in the `ethtool` subsection of the `metrics_collected` section of the CloudWatch agent configuration file. For more information, see Collect network performance metrics Unit: None
Name on Linux servers:**`conntrack_allowance_available`** Name on Windows servers: **`Available connection tracking allowance`**	Reports the number of tracked connections that can be established by the instance before hitting the Connections Tracked allowance of that instance type. This metric is available only on Nitro-based EC2 instances using the Linux driver for Elastic Network Adapter (ENA) starting from version 2.8.1, and on computers using the Windows driver for Elastic Network Adapter (ENA) starting from version 2.6.0.

Metric	Description
	This metric is collected only if you have listed it in the `ethtool` subsection of the `metrics_collected` section of the CloudWatch agent configuration file. For more information, see Collect network performance metrics Unit: None
Name on Linux servers:**`ena_srd_mode`** Name on Windows servers: **`ena srd mode`**	Describes which ENA Express features are enabled. For more information about ENA Express, see Improve network performance with ENA Express on Linux instances Values are as follows: • `0` = ENA Express off, UDP off • 1 = ENA Express on, UDP off • 2 = ENA Express off, UDP on **Note** This happens only when ENA Express was originally enabled, and UDP was configured to use it. The prior value is retained for UDP traffic. • 3 = ENA Express on, UDP on

Metric	Description
Name on Linux servers:**ena_srd_eligible_tx_pkts** Name on Windows servers: **ena srd eligible tx pkts**	The number of network packets sent within a given time period that meet AWS Scalable Reliable Datagram (SRD) requirements for eligibility, as follows: • Both sending and receiving instance types are supported. • Both sending and receiving instances must have ENA Express configured. • The sending and receiving instances must be on the same subnet. • The network path between the instances must not include middleware boxes. ENA Express doesn't currently support middleware boxes.
Name on Linux servers:**ena_srd_tx_pkts** Name on Windows servers: **ena srd tx pkts**	The number of SRD packets transmitted within a given time period.
Name on Linux servers:**ena_srd_rx_pkts** Name on Windows servers: **ena srd rx pkts**	The number of SRD packets received within a given time period.
Name on Linux servers:**ena_srd_resource_utilization** Name on Windows servers: **ena srd resource utilization**	The percentage of the maximum allowed memory utilization for concurrent SRD connections that the instance has consumed.

Metric	Description
Name on Linux servers: **`linklocal_allowance_exceeded`** Name on Windows servers: **`Link local packet rate allowance exceeded`**	The number of packets dropped because the PPS of the traffic to local proxy services exceeded the maximum for the network interface. This impacts traffic to the DNS service, the Instance Metadata Service, and the Amazon Time Sync Service, but does not impact traffic to custom DNS resolvers. This metric is collected only if you have listed it in the `ethtool` subsection of the `metrics_collected` section of the CloudWatch agent configuration file. For more information, see Collect network performance metrics Unit: None
Name on Linux servers: **`pps_allowance_exceeded`** Name on Windows servers: **`PPS allowance exceeded`**	The number of packets queued and/or dropped because the bidirectional PPS exceeded the maximum for the instance. This metric is collected only if you have listed it in the `ethtool` subsection of the `metrics_collected` section of the CloudWatch agent configuration file. For more information, see Collect network performance metrics Unit: None

Linux setup

On Linux servers, the *ethtool plugin* enables you to import the network performance metrics into CloudWatch.

ethtool is a standard Linux utility that can collect statistics about Ethernet devices on Linux servers. The statistics it collects depend on the network device and driver. Examples of these statistics include `tx_cnt`, `rx_bytes`, `tx_errors`, and `align_errors`. When you use the ethtool plugin

with the CloudWatch agent, you can also import these statistics into CloudWatch, along with the EC2 network performance metrics listed earlier in this section.

> **Tip**
>
> To find the statistics available on our operating system and network device, use the `ethtool -S` command.

When the CloudWatch agent imports metrics into CloudWatch, it adds an `ethtool_` prefix to the names of all imported metrics. So the standard ethtool statistic `rx_bytes` is called `ethtool_rx_bytes` in CloudWatch, and the EC2 network performance metric `bw_in_allowance_exceeded` is called `ethtool_bw_in_allowance_exceeded` in CloudWatch.

On Linux servers, to import ethtool metrics, add an `ethtool` section to the `metrics_collected` section of the CloudWatch agent configuration file. The `ethtool` section can include the following subsections:

- **interface_include**— Including this section causes the agent to collect metrics from only the interfaces that have names listed in this section. If you omit this section, metrics are collected from all Ethernet interfaces that aren't listed in `interface_exclude`.

  The default ethernet interface is `eth0`.
- **interface_exclude**— If you include this section, list the Ethernet interfaces that you don't want to collect metrics from.

  The ethtool plugin always ignores loopback interfaces.
- **metrics_include**— This section lists the metrics to import into CloudWatch. It can include both standard statistics collected by ethtool and Amazon EC2 high-resolution network metrics.

The following example displays part of the CloudWatch agent configuration file. This configuration collects the standard ethtool metrics `rx_packets` and `tx_packets`, and the Amazon EC2 network performance metrics from only the `eth1` interface.

For more information about the CloudWatch agent configuration file, see Manually create or edit the CloudWatch agent configuration file.

```
{
```

```
"metrics": {
    "append_dimensions": {
      "InstanceId": "${aws:InstanceId}"
    },
    "metrics_collected": {
      "ethtool": {
        "interface_include": [
          "eth1"
        ],
        "metrics_include": [
          "bw_in_allowance_exceeded",
          "bw_out_allowance_exceeded",
          "conntrack_allowance_exceeded",
          "linklocal_allowance_exceeded",
          "pps_allowance_exceeded"
         ]
      }
   }
}
}
```

Windows setup

On Windows servers, the network performance metrics are available through Windows Performance Counters, which the CloudWatch agent already collects metrics from. So you do not need a plugin to collect these metrics from Windows servers.

The following is a sample configuration file to collect network performance metrics from Windows. For more information about editing the CloudWatch agent configuration file, see Manually create or edit the CloudWatch agent configuration file.

```
{
    "metrics": {
        "append_dimensions": {
            "InstanceId": "${aws:InstanceId}"
        },
        "metrics_collected": {
            "ENA Packets Shaping": {
                "measurement": [
                    "Aggregate inbound BW allowance exceeded",
                    "Aggregate outbound BW allowance exceeded",
                    "Connection tracking allowance exceeded",
                    "Link local packet rate allowance exceeded",
```

```
                    "PPS allowance exceeded"
                ],
                "metrics_collection_interval": 60,
                "resources": [
                    "*"
                ]
            }
        }
    }
}
```

Viewing network performance metrics

After importing network performance metrics into CloudWatch, you can view these metrics as time series graphs, and create alarms that can watch these metrics and notify you if they breach a threshold that you specify. The following procedure shows how to view ethtool metrics as a time series graph. For more information about setting alarms, see Using Amazon CloudWatch alarms.

Because all of these metrics are aggregate counters, you can use CloudWatch metric math functions such as `RATE(METRICS())` to calculate the rate for these metrics in graphs or use them to set alarms. For more information about metric math functions, see Using math expressions with CloudWatch metrics.

To view network performance metrics in the CloudWatch console

1. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.
2. In the navigation pane, choose **Metrics**.
3. Choose the namespace for the metrics collected by the agent. By default, this is **CWAgent**, but you may have specified a different namespace in the CloudWatch agent configuration file.
4. Choose a metric dimension (for example, **Per-Instance Metrics**).
5. The **All metrics** tab displays all metrics for that dimension in the namespace. You can do the following:

    a. To graph a metric, select the check box next to the metric. To select all metrics, select the check box in the heading row of the table.

    b. To sort the table, use the column heading.

    c. To filter by resource, choose the resource ID, and then choose **Add to search**.

    d. To filter by metric, choose the metric name, and then choose **Add to search**.

6. (Optional) To add this graph to a CloudWatch dashboard, choose **Actions**, and then choose **Add to dashboard**.

Collect Amazon EBS NVMe driver metrics

For CloudWatch agent to collect AWS NVMe driver metrics for Amazon EBS volumes attached to an Amazon EC2 instance, add the `diskio` section inside the `metrics_collected` section of the CloudWatch agent configuration file.

Additionally, the CloudWatch agent binary requires `ioctl` permissions for NVMe driver devices to collect metrics from attached Amazon EBS volumes.

The following metrics can be collected.

Metric	Metric name in CloudWatch	Description
`ebs_total_read_ops`	`diskio_ebs_total_read_ops`	The total number of completed read operations.
`ebs_total_write_ops`	`diskio_ebs_total_write_ops`	The total number of completed write operations.
`ebs_total_read_bytes`	`diskio_ebs_total_read_bytes`	The total number of read bytes transferred.
`ebs_total_write_bytes`	`diskio_ebs_total_write_bytes`	The total number of write bytes transferred.
`ebs_total_read_time`	`diskio_ebs_total_read_time`	The total time spent, in microseconds, by all completed read operations.
`ebs_total_write_time`	`diskio_ebs_total_write_time`	The total time spent, in microseconds, by all completed write operations.

Metric	Metric name in CloudWatch	Description
ebs_volume_performance_exceeded_iops	diskio_ebs_volume_performance_exceeded_iops	The total time, in microseconds, that IOPS demand exceeded the volume's provisioned IOPS performance.
ebs_volume_performance_exceeded_tp	diskio_ebs_volume_performance_exceeded_tp	The total time, in microseconds, that throughput demand exceeded the volume's provisioned throughput performance.
ebs_ec2_instance_performance_exceeded_iops	diskio_ebs_ec2_instance_performance_exceeded_iops	The total time, in microseconds, that the EBS volume exceeded the attached Amazon EC2 instance's maximum IOPS performance.
ebs_ec2_instance_performance_exceeded_tp	diskio_ebs_ec2_instance_performance_exceeded_tp	The total time, in microseconds, that the EBS volume exceeded the attached Amazon EC2 instance's maximum throughput performance.
ebs_volume_queue_length	diskio_ebs_volume_queue_length	The number of read and write operations waiting to be completed.

Collect Amazon EC2 instance store volume NVMe driver metrics

For CloudWatch agent to collect AWS NVMe driver metrics for instance store volumes attached to an Amazon EC2 instance, add the `diskio` section inside the `metrics_collected` section of the CloudWatch agent configuration file.

Additionally, the CloudWatch agent binary requires `ioctl` permissions for NVMe driver devices to collect metrics from attached instance store volumes.

The following metrics can be collected.

Metric	Metric name in CloudWatch	Description
instance_store_total_read_ops	diskio_instance_store_total_read_ops	The total number of completed read operations.
instance_store_total_write_ops	diskio_instance_store_total_write_ops	The total number of completed write operations.
instance_store_total_read_bytes	diskio_instance_store_total_read_bytes	The total number of read bytes transferred.
instance_store_total_write_bytes	diskio_instance_store_total_write_bytes	The total number of write bytes transferred.
instance_store_total_read_time	diskio_instance_store_total_read_time	The total time spent, in microseconds, by all completed read operations.
instance_store_total_write_time	diskio_instance_store_total_write_time	The total time spent, in microseconds, by all completed write operations.
instance_store_performance_exceeded_iops	diskio_instance_store_performance_exceeded_iops	The total time, in microseconds, that IOPS demand exceeded the volume's IOPS maximum performance.

Metric	Metric name in CloudWatch	Description
instance_store_performance_exceeded_tp	diskio_instance_store_performance_exceeded_tp	The total time, in microseconds, that throughput demand exceeded the volume's maximum throughput performance.
instance_store_volume_queue_length	diskio_instance_store_volume_queue_length	The number of read and write operations waiting to be completed.

Collect NVIDIA GPU metrics

You can use the CloudWatch agent to collect NVIDIA GPU metrics from Linux servers. To set this up, add a `nvidia_gpu` section inside the `metrics_collected` section of the CloudWatch agent configuration file. For more information, see Linux section.

Additionally, the instance must have an NVIDIA driver installed. NVIDIA drivers on pre-installed on some Amazon Machine Images (AMIs). Otherwise, you can manually install the driver. For more information, see Install NVIDIA drivers on Linux instances.

The following metrics can be collected. All of these metrics are collected with no CloudWatch `Unit`, but you can specify a unit for each metric by adding a parameter to the CloudWatch agent configuration file. For more information, see Linux section.

Metric	Metric name in CloudWatch	Description
utilization_gpu	nvidia_smi_utilization_gpu	The percentage of time over the past sample period during which one or more kernals on the GPU was running.
temperature_gpu	nvidia_smi_temperature_gpu	The core GPU temperature in degrees Celsius.

Metric	Metric name in CloudWatch	Description
power_draw	nvidia_smi_power_draw	The last measured power draw for the entire board, in watts.
utilization_memory	nvidia_smi_utilization_memory	The percentage of time over the past sample period during which global (device) memory was being read or written.
fan_speed	nvidia_smi_fan_speed	The percentage of maximum fan speed that the device's fan is currently intended to run at.
memory_total	nvidia_smi_memory_total	Reported total memory, in MB.
memory_used	nvidia_smi_memory_used	Memory used, in MB.
memory_free	nvidia_smi_memory_free	Memory free, in MB.
pcie_link_gen_current	nvidia_smi_pcie_link_gen_current	The current link generation.
pcie_link_width_current	nvidia_smi_pcie_link_width_current	The current link width.
encoder_stats_session_count	nvidia_smi_encoder_stats_session_count	Current number of encoder sessions.
encoder_stats_average_fps	nvidia_smi_encoder_stats_average_fps	The moving average of the encode frames per second.

Metric	Metric name in CloudWatch	Description
encoder_stats_average_latency	nvidia_smi_encoder_stats_average_latency	The moving average of the encode latency in microseconds.
clocks_current_graphics	nvidia_smi_clocks_current_graphics	The current frequency of the graphics (shader) clock.
clocks_current_sm	nvidia_smi_clocks_current_sm	The current frequency of the Streaming Multiprocessor (SM) clock.
clocks_current_memory	nvidia_smi_clocks_current_memory	The current frequency of the memory clock.
clocks_current_video	nvidia_smi_clocks_current_video	The current frequency of the video (encoder plus decoder) clocks.

All of these metrics are collected with the following dimensions:

Dimension	Description
index	A unique identifier for the GPU on this server. Represents the NVIDIA Management Library (NVML) index of the device.

Dimension	Description
name	The type of GPU. For example, NVIDIA Tesla A100
arch	The server architecture.

Collect Java Management Extensions (JMX) metrics

You can use the CloudWatch agent to collect Java Management Extensions (JMX) metrics from your Java applications.

The CloudWatch agent supports collecting these metrics from the following versions:

- JVM 8 and later
- Kafka 0.8.2.x and later
- Tomcat 9, 10.1, and 11 (beta)

Amazon EC2

To enable JMX in your JVM instance

For the CloudWatch agent to be able to collect JMX metrics, your application's JVM must bind to a port using the `com.sun.management.jmxremote.port` system property.

```
java -Dcom.sun.management.jmxremote.port=port-number -jar example.jar
```

For more information and other configurations, see the JMX documentation.

Amazon EKS

To enable JMX on your Java application pods

When using the CloudWatch Observability EKS add-on, you can manage how JMX metrics are enabled with annotations. For more information, see Install the CloudWatch agent with

the Amazon CloudWatch Observability EKS add-on or the Helm chart. To enable JMX metrics collection from a workload, add the following annotations to the workload manifest file under the `PodTemplate` section:

- `instrumentation.opentelemetry.io/inject-java: "true"`
- One or more of the following:
  - For JVM metrics: `cloudwatch.aws.amazon.com/inject-jmx-jvm: "true"`
  - For Kafka broker metrics: `cloudwatch.aws.amazon.com/inject-jmx-kafka: "true"`
  - For Kafka consumer metrics: `cloudwatch.aws.amazon.com/inject-jmx-kafka-consumer: "true"`
  - For Kafka producer metrics: `cloudwatch.aws.amazon.com/inject-jmx-kafka-producer: "true"`
  - For Tomcat metrics: `cloudwatch.aws.amazon.com/inject-jmx-tomcat: "true"`

To start collecting JMX metrics, add a `jmx` section inside the `metrics_collected` section of the CloudWatch agent configuration file. The `jmx` section can contain the following fields.

- `jvm` – Optional. Specifies that you want to retrieve Java Virtual Machine (JVM) metrics from the instance. For more information, see Collect JVM metrics.

  This section can include the following fields:

  - `measurement` – Specifies the array of JVM metrics to be collected. For a list of the possible values to use here, see the **Metric** column in the table in Collect JVM metrics.

    Within the entry for each individual metric, you can optionally specify one or both of the following:

    - `rename` – Specifies a different name for this metric.
    - `unit` – Specifies the unit to use for this metric, overriding the default unit for the metric. The unit that you specify must be a valid CloudWatch metric unit, as listed in the `Unit` description in MetricDatum.
- `kafka` – Optional. Specifies that you want to retrieve Apache Kafka broker metrics from the instance. For more information, see Collect Kafka metrics.

  This section can include the following fields:

- `measurement` – Specifies the array of Kafka broker metrics to be collected. For a list of the possible values to use here, see the **Metric** column in the first table in Collect Kafka metrics.

  Within the entry for each individual metric, you can optionally specify one or both of the following:

  - `rename` – Specifies a different name for this metric.
  - `unit` – Specifies the unit to use for this metric, overriding the default unit for the metric. The unit that you specify must be a valid CloudWatch metric unit, as listed in the `Unit` description in MetricDatum.

- `kafka-consumer` – Optional. Specifies that you want to retrieve Apache Kafka consumer metrics from the instance. For more information, see Collect Kafka metrics.

  This section can include the following fields:

  - `measurement` – Specifies the array of Kafka broker metrics to be collected. For a list of the possible values to use here, see the **Metric** column in the second metrics table in Collect Kafka metrics.

    Within the entry for each individual metric, you can optionally specify one or both of the following:

    - `rename` – Specifies a different name for this metric.
    - `unit` – Specifies the unit to use for this metric, overriding the default unit for the metric. The unit that you specify must be a valid CloudWatch metric unit, as listed in the `Unit` description in MetricDatum.

- `kafka-producer` – Optional. Specifies that you want to retrieve Apache Kafka producer metrics from the instance. For more information, see Collect Kafka metrics.

  This section can include the following fields:

  - `measurement` – Specifies the array of Kafka broker metrics to be collected. For a list of the possible values to use here, see the **Metric** column in the third metrics table in Collect Kafka metrics.

    Within the entry for each individual metric, you can optionally specify one or both of the following:

    - `rename` – Specifies a different name for this metric.

    - `unit` – Specifies the unit to use for this metric, overriding the default unit for the metric. The unit that you specify must be a valid CloudWatch metric unit, as listed in the `Unit` description in MetricDatum.

- `tomcat` – Optional. Specifies that you want to retrieve Tomcat metrics from the instance. For more information, see Collect Tomcat metrics.

  This section can include the following fields:

  - `measurement` – Specifies the array of Tomcat metrics to be collected. For a list of the possible values to use here, see the **Metric** column in the table in Collect Tomcat metrics.

    Within the entry for each individual metric, you can optionally specify one or both of the following:

    - `rename` – Specifies a different name for this metric.
    - `unit` – Specifies the unit to use for this metric, overriding the default unit for the metric. The unit that you specify must be a valid CloudWatch metric unit, as listed in the `Unit` description in MetricDatum.

The `jmx` section can also include the optional `append_dimensions` field:

- `append_dimensions` – Optional. Additional dimensions to use for only the process metrics. If you specify this field, it's used in addition to dimensions specified in the `append_dimensions` field that is used for all types of metrics collected by the agent.

The following fields are for Amazon EC2 only.

- `endpoint` – The address for the JMX client to connect to. The format is `ip:port`. If the endpoint is not the localhost, and password authentication and SSL must be enabled.
- `metrics_collection_interval` – Optional. Specifies how often to collect the processes metrics, overriding the global `metrics_collection_interval` specified in the `agent` section of the configuration file.

  This value is specified in seconds. For example, specifying 10 causes metrics to be collected every 10 seconds, and setting it to 300 specifies metrics to be collected every 5 minutes.

  If you set this value below 60 seconds, each metric is collected as a high-resolution metric. For more information, see High-resolution metrics.

If JMX was enabled with password authentication or SSL for remote access, you can use the following fields.

- `password_file` – Optional. Specifies a Java properties file of keys to passwords. The file must be read-only and restricted to the user running the CloudWatch agent. If password authentication is enabled, this requires the same username and password pair as the entry in the JMX password file provided in the `com.sun.management.jmxremote.password.file` property. If SSL is enabled, it requires entries for `keystore` and `truststore` and corresponds to the `javax.net.ssl.keyStorePassword` and `javax.net.ssl.trustStorePassword` respectively.
- `username` – If password authentication is enabled, specify the username that matches the username in the provided password file.
- `keystore_path` – If SSL is enabled, specify the full path to the Java keystore, which consists of a private key and a certificate to the public key. Corresponds to the `javax.net.ssl.keyStore` property.
- `keystore_type` – If SSL is enabled, specify the type of keystore being used. Corresponds to the `javax.net.ssl.keyStoreType` property.
- `truststore_path` – If SSL is enabled, specify the full path to the Java truststore, which must contain the remote JMX server's public certificate. Corresponds to the `javax.net.ssl.trustStore` property.
- `truststore_type` – If SSL is enabled, specify the type of truststore being used. Corresponds to the `javax.net.ssl.trustStoreType` property.
- `remote_profile` – Optional. Supported JMX remote profiles are TLS in combination with SASL profiles: `SASL/PLAIN`, `SASL/DIGEST-MD5`, and `SASL/CRAM-MD5`. Should be one of:`SASL/PLAIN`, `SASL/DIGEST-MD5`, `SASL/CRAM-MD5`, `TLS SASL/PLAIN`, `TLS SASL/DIGEST-MD5`, or `TLS SASL/CRAM-MD5`
- `realm` – Optional. The realm as required by the remote profile `SASL/DIGEST-MD5`.
- `registry_ssl_enabled` – If RMI registry authentication is enabled. Set to true if the JVM was configured with `com.sun.management.jmxremote.registry.ssl=true`.
- `insecure` Set to `true` to opt out of the validation required if the agent is configured for a non-localhost endpoint.

The following is an example of the `jmx` section of the CloudWatch agent configuration file.

```
{
```

```
  "metrics": {
    "metrics_collected": {
      "jmx": [
        {
          "endpoint": "remotehost:1314",
          "jvm": {
            "measurement": [
              "jvm.memory.heap.init",
              "jvm.memory.nonheap.used"
            ]
          },
          "kafka": {
            "measurement": [
              "kafka.request.count",
              {

          },
          "append_dimensions": {
            "service.name": "kafka/1"
          }
        }
      ]
    }
  }
}
```

Collect JVM metrics

You can use the CloudWatch agent to collect Java Virtual Machine (JVM) metrics. To set this up, add a `jvm` section inside the `jmx`section of the CloudWatch agent configuration file.

The following metrics can be collected.

Metric	Dimensions	Description
`jvm.classes.loaded`	[DEFAULT]	The total number of loaded classes. **Unit:** None **Meaningful statistics:** Minimum, Maximum, Average
`jvm.gc.collections.count`	[DEFAULT], `name`	The total number of garbage collections that have occurred. **Unit:** None **Meaningful statistics:** Minimum, Maximum, Average
`jvm.gc.collections.elapsed`	[DEFAULT], `name`	The approximate accumulated garbage

Metric	Dimensions	Description
		collection elapsed time. **Unit:** Milliseconds **Meaningful statistics:** Minimum, Maximum, Average
`jvm.memory.heap.init`	[DEFAULT]	The initial amount of memory that the JVM requests from the operating system for the heap. **Unit:** Bytes **Meaningful statistics:** Minimum, Maximum, Average

Metric	Dimensions	Description
jvm.memory.heap.max	[DEFAULT]	The maximum amount of memory that can be used for the heap. **Unit:** Bytes **Meaningful statistics:** Maximum
jvm.memory.heap.used	[DEFAULT]	The current heap memory usage. **Unit:** Bytes **Meaningful statistics:** Minimum, Maximum, Average
jvm.memory.heap.committed	[DEFAULT]	The amount of memory that is guaranteed to be available for the heap. **Unit:** Bytes **Meaningful statistics:** Minimum, Maximum, Average

Metric	Dimensions	Description
jvm.memory.nonheap.init	[DEFAULT]	The initial amount of memory that the JVM requests from the operating system for non-heap purposes. **Unit:** Bytes **Meaningful statistics:** Minimum, Maximum, Average
jvm.memory.nonheap.max	[DEFAULT]	The maximum amount of memory that can be used for non-heap purposes. **Unit:** Bytes **Meaningful statistics:** Maximum

Metric	Dimensions	Description
jvm.memory.nonheap.used	[DEFAULT]	The current non-heap memory usage. **Unit:** Bytes **Meaningful statistics:** Minimum, Maximum, Average
jvm.memory.nonheap.committed	[DEFAULT]	The amount of memory that is guaranteed to be available for non-heap purposes. **Unit:** Bytes **Meaningful statistics:** Minimum, Maximum, Average

Metric	Dimensions	Description
`jvm.memory.pool.init`	[DEFAULT], `name`	The initial amount of memory that the JVM requests from the operating system for the memory pool. **Unit:** Bytes **Meaningful statistics:** Minimum, Maximum, Average
`jvm.memory.pool.max`	[DEFAULT], `name`	The maximum amount of memory that can be used for the memory pool. **Unit:** Bytes **Meaningful statistics:** Maximum

Metric	Dimensions	Description
jvm.memory.pool.used	[DEFAULT], name	The current memory pool memory usage. **Unit:** Bytes **Meaningful statistics:** Minimum, Maximum, Average
jvm.memory.pool.committed	[DEFAULT], name	The amount of memory that is guaranteed to be available for the memory pool. **Unit:** Bytes **Meaningful statistics:** Minimum, Maximum, Average

Metric	Dimensions	Description
`jvm.threads.count`	[DEFAULT]	The current number of threads. **Unit:** None **Meaningful statistics:** Minimum, Maximum, Average

The JVM metrics are collected with the following dimensions:

Dimension	Description
[DEFAULT]	On Amazon EC2 by default, the host is also published as a dimension of metrics that are collected by the CloudWatch agent, unless you are using the `append_dimensions` field in the `metrics` section. See `omit_hostname` in the agent section of Manually create or edit the CloudWatch agent configuration file for more information. On Amazon EKS by default, k8s related context is also published as dimensions of metrics (`k8s.container.name`, `k8s.deployment.name`, `k8s.namespace.name`, `k8s.node.name`, `k8s.pod.name`, and `k8s.replicaset.name`). These can be filtered down using the `aggregation_dimensions` field.

Dimension	Description
name	For jvm.gc.collections metrics, the value is the garbage collector name. For jvm.memory.pool metrics, the value is the memory pool name.

Collect Kafka metrics

You can use the CloudWatch agent to collect Apache Kafka metrics. To set this up, add one or more of the following subsections inside the jmx section of the CloudWatch agent configuration file.

- Use a kafka section to collect Kafka broker metrics.
- Use a kafka-consumer section to collect Kafka consumer metrics.
- Use a kafka-producer section to collect Kafka producer metrics.

Kafka broker metrics

The following metrics can be collected for Kafka brokers.

Metric	Dimensions	Description
kafka.message.count	[DEFAULT]	The number of messages received by the Kafka broker. **Unit:** None **Meaningful statistics:** Minimum, Maximum, Average

Metric	Dimensions	Description
kafka.request.count	[DEFAULT], type	The number of requests received by the Kafka broker. **Unit:** None **Meaningful statistics:** Minimum, Maximum, Average
kafka.request.failed	[DEFAULT], type	The number of requests to the Kafka broker that resulted in a failure. **Unit:** None **Meaningful statistics:** Minimum, Maximum, Average

Metric	Dimensions	Description
`kafka.request.time.total`	[DEFAULT], `type`	The total time that the Kafka broker has taken to service requests. **Unit:** Milliseconds **Meaningful statistics:** Minimum, Maximum, Average
`kafka.request.time.50p`	[DEFAULT], `type`	The 50th percentile time that the Kafka broker has taken to service requests. **Unit:** Milliseconds **Meaningful statistics:** Minimum, Maximum, Average

Metric	Dimensions	Description
`kafka.request.time.99p`	[DEFAULT], `type`	The 99th percentile time that the Kafka broker has taken to service requests. **Unit:** Milliseconds **Meaningful statistics:** Minimum, Maximum, Average
`kafka.request.time.avg`	[DEFAULT], `type`	The average time that the Kafka broker has taken to service requests. **Unit:** Milliseconds **Meaningful statistics:** Average

Metric	Dimensions	Description
`kafka.network.io`	[DEFAULT], `state`	The number of bytes received by or sent by the Kafka broker. **Unit:** Bytes **Meaningful statistics:** Minimum, Maximum, Average
`kafka.purgatory.size`	[DEFAULT], `type`	The number of requests waiting in purgatory. **Unit:** None **Meaningful statistics:** Minimum, Maximum, Average

Metric	Dimensions	Description
kafka.partition.count	[DEFAULT]	The number of partitions on the Kafka broker. **Unit:** None **Meaningful statistics:** Minimum, Maximum, Average
kafka.partition.offline	[DEFAULT]	The number of partitions that are offline. **Unit:** None **Meaningful statistics:** Minimum, Maximum, Average
kafka.partition.under_replicated	[DEFAULT]	The number of under-replicated partitions. **Unit:** None **Meaningful statistics:** Minimum, Maximum, Average

Metric	Dimensions	Description
`kafka.isr.operation.count`	[DEFAULT], `operation`	The number of in-sync replica shrink and expand operations. **Unit:** None **Meaningful statistics:** Minimum, Maximum, Average
`kafka.max.lag`	[DEFAULT]	The maximum lag in messages between follower and leader replicas. **Unit:** None **Meaningful statistics:** Maximum

Metric	Dimensions	Description
kafka.controller.active.count	[DEFAULT]	The number of active controllers on the broker. **Unit:** None **Meaningful statistics:** Minimum, Maximum, Average
kafka.leader.election.rate	[DEFAULT]	Leader election rate. If this increases, it indicates broker failures. **Unit:** None **Meaningful statistics:** Minimum, Maximum, Average

Metric	Dimensions	Description
kafka.unclean.election.rate	[DEFAULT]	Unclean leader election rate. If this increases, it indicates broker failures. **Unit:** None **Meaningful statistics:** Minimum, Maximum, Average
kafka.request.queue	[DEFAULT]	The size of the request queue. **Unit:** None **Meaningful statistics:** Minimum, Maximum, Average
kafka.logs.flush.time.count	[DEFAULT]	The logs flush count. **Unit:** Milliseconds **Meaningful statistics:** Minimum, Maximum, Average

Metric	Dimensions	Description
kafka.logs.flush.time.median	[DEFAULT]	The 50th percentile value of the logs flush count. **Unit:** Milliseconds **Meaningful statistics:** Minimum, Maximum, Average
kafka.logs.flush.time.99p	[DEFAULT]	The 99th percentile value of the logs flush count. **Unit:** Milliseconds **Meaningful statistics:** Minimum, Maximum, Average

The Kafka broker metrics are collected with the following dimensions:

Dimension	Description
[DEFAULT]	On Amazon EC2 by default, the host is also published as a dimension of metrics that are

Dimension	Description
	collected by the CloudWatch agent, unless you are using the `append_dimensions` field in the `metrics` section. See `omit_hostname` in the agent section of Manually create or edit the CloudWatch agent configuration file for more information. On Amazon EKS by default, k8s related context is also published as dimensions of metrics (`k8s.container.name`, `k8s.deployment.name`, `k8s.namespace.name`, `k8s.node.name`, `k8s.pod.name`, and `k8s.replicaset.name`). These can be filtered down using the `aggregation_dimensions` field.
`type`	The request type. Possible values are `produce`, `fetch`, `fetchconsumer`, and `fetchfollower`.
`state`	The direction of network traffic. Possible values are `in` and `out`.
`operation`	The operation type for the in-sync replica. Possible values are `shrink` and `expand`.

Kafka consumer metrics

The following metrics can be collected for Kafka consumers.

Metric	Dimensions	Description
`kafka.consumer.fetch-rate`	[DEFAULT], `client-id`	The number of fetch requests

Metric	Dimensions	Description
		for all topics per second. **Unit:** None **Meaningful statistics:** Minimum, Maximum, Average
`kafka.consumer.records-lag-max`	[DEFAULT], `client-id`	The number of messages that the consumer lags behind the producer. **Unit:** None **Meaningful statistics:** Minimum, Maximum, Average
`kafka.consumer.total.bytes-consumed-rate`	[DEFAULT], `client-id`	The average number of bytes consumed for all topics per second. **Unit:** Bytes **Meaningful statistics:** Average

Metric	Dimensions	Description
kafka.consumer.total.fetch-size-avg	[DEFAULT], client-id	The number of bytes fetched per request for all topics. **Unit:** Bytes **Meaningful statistics:** Minimum, Maximum, Average
kafka.consumer.total.records-consumed-rate	[DEFAULT], client-id	The average number of records consumed for all topics per second. **Unit:** None **Meaningful statistics:** Average
kafka.consumer.bytes-consumed-rate	[DEFAULT], client-id , topic	The average number of bytes consumed per second. **Unit:** Bytes **Meaningful statistics:** Average

Metric	Dimensions	Description
`kafka.consumer.fetch-size-avg`	[DEFAULT], `client-id` , `topic`	The number of bytes fetched per request. **Unit:** Bytes **Meaningful statistics:** Minimum, Maximum, Average
`kafka.consumer.records-consumed-rate`	[DEFAULT], `client-id` , `topic`	The average number of records consumed per second. **Unit:** None **Meaningful statistics:** Average

The Kafka consumer metrics are collected with the following dimensions:

Dimension	Description
[DEFAULT]	On Amazon EC2 by default, the host is also published as a dimension of metrics that are collected by the CloudWatch agent, unless you are using the `append_dimensions` field in the `metrics` section. See `omit_hostname` in the agent section of Manually create or edit the CloudWatch agent configuration file for more information.

Dimension	Description
	On Amazon EKS by default, k8s related context is also published as dimension s of metrics (`k8s.container.name` , `k8s.deployment.name` , `k8s.namespace.name` , `k8s.node.name` , `k8s.pod.name` , and `k8s.replicaset.name`). These can be filtered down using the `aggregation_dimensions` field.
`client-id`	The ID of the client.
`topic`	The Kafka topic.

Kafka producer metrics

The following metrics can be collected for Kafka producers.

Metric	Dimensions	Description
`kafka.producer.io-wait-time-ns-avg`	[DEFAULT], `client-id`	The average length of time the I/O thread spent waiting for a socket ready for reads or writes. **Unit:** None **Meaningful statistics:** Average
`kafka.producer.out`	[DEFAULT], `client-id`	The average number of

Metric	Dimensions	Description
`going-byte-rate`		outgoing bytes sent per second to all servers. **Unit:** Bytes **Meaningful statistics:** Average
`kafka.producer.request-latency-avg`	[DEFAULT], `client-id`	The average request latency. **Unit:** Milliseconds **Meaningful statistics:** Average
`kafka.producer.request-rate`	[DEFAULT], `client-id`	The average number of requests sent per second. **Unit:** None **Meaningful statistics:** Average

Metric	Dimensions	Description
kafka.producer.response-rate	[DEFAULT], client-id	The number of responses received per second. **Unit:** None **Meaningful statistics:** Minimum, Maximum, Average
kafka.producer.byte-rate	[DEFAULT], client-id , topic	The average number of bytes sent per second for a topic. **Unit:** Bytes **Meaningful statistics:** Average
kafka.producer.compression-rate	[DEFAULT], client-id , topic	The average compression rate of record batches for a topic. **Unit:** None **Meaningful statistics:** Average

Metric	Dimensions	Description
`kafka.producer.record-error-rate`	[DEFAULT], `client-id` , `topic`	The average per-second number of record sends that resulted in errors for a topic. **Unit:** None **Meaningful statistics:** Average
`kafka.producer.record-retry-rate`	[DEFAULT], `client-id` , `topic`	The average per-second number of retried record sends for a topic. **Unit:** None **Meaningful statistics:** Average

Metric	Dimensions	Description
`kafka.producer.record-send-rate`	[DEFAULT], `client-id` , `topic`	The average number of records sent per second for a topic. **Unit:** None **Meaningful statistics:** Average

Kafka producer metrics are collected with the following dimensions:

Dimension	Description
[DEFAULT]	On Amazon EC2 by default, the host is also published as a dimension of metrics that are collected by the CloudWatch agent, unless you are using the `append_dimensions` field in the `metrics` section. See `omit_hostname` in the agent section of Manually create or edit the CloudWatch agent configuration file for more information. On Amazon EKS by default, k8s related context is also published as dimensions of metrics (`k8s.container.name` , `k8s.deployment.name` , `k8s.namespace.name` , `k8s.node.name` , `k8s.pod.name` , and `k8s.replicaset.name`). These can be filtered down using the `aggregation_dimensions` field.

Dimension	Description
client-id	The ID of the client.
topic	The Kafka topic.

Collect Tomcat metrics

You can use the CloudWatch agent to collect Apache Tomcat metrics. To set this up, add a `tomcat` section inside the `metrics_collected` section of the CloudWatch agent configuration file.

The following metrics can be collected.

Metric	Dimensions	Description
tomcat.sessions	[DEFAULT]	The number of active sessions. **Unit:** None **Meaningful statistics:** Minimum, Maximum, Average
tomcat.errors	[DEFAULT], proto_handler	The number of errors encountered. **Unit:** None **Meaningful statistics:** Minimum, Maximum, Average

Metric	Dimensions	Description
`tomcat.processing_time`	[DEFAULT], `proto_handler`	The total processing time. **Unit:** Milliseconds **Meaningful statistics:** Minimum, Maximum, Average
`tomcat.traffic`	[DEFAULT], `proto_handler`	The number of bytes received and sent. **Unit:** Bytes **Meaningful statistics:** Minimum, Maximum, Average
`tomcat.threads`	[DEFAULT], `proto_handler`	The number of threads. **Unit:** None **Meaningful statistics:** Minimum, Maximum, Average

Metric	Dimensions	Description
`tomcat.max_time`	[DEFAULT], `proto_handler` , `direction`	Maximum time to process a request. **Unit:** Milliseconds **Meaningful statistics:** Maximum
`tomcat.request_count`	[DEFAULT], `proto_handler`	The total requests. **Unit:** None **Meaningful statistics:** Minimum, Maximum, Average

Tomcat metrics are collected with the following dimensions:

Dimension	Description
[DEFAULT]	On Amazon EC2 by default, the host is also published as a dimension of metrics that are collected by the CloudWatch agent, unless you are using the `append_dimensions` field in the `metrics` section. See `omit_hostname` in the agent section of Manually create or edit the CloudWatch agent configuration file for more information.

Dimension	Description
	On Amazon EKS by default, k8s related context is also published as dimension s of metrics (`k8s.container.name` , `k8s.deployment.name` , `k8s.namespace.name` , `k8s.node.name` , `k8s.pod.name` , and `k8s.replicaset.name`). These can be filtered down using the `aggregation_dimensions` field.
`proto_handler`	The `proto_handler` is an identifier for a connector, which is provided in the `<protocol>-<type>-<port>` format (for example, `http-nio-8080`).
`direction`	The traffic direction. Possible values are `received` and `sent`.

Collect metrics and traces with OpenTelemetry

You can collect metrics and traces from your applications or services using the CloudWatch agent with the OpenTelemetry Protocol (OTLP), which is a popular open source solution. You can use any OpenTelemetry SDK to send metrics and traces to the CloudWatch agent. For more information about the available OpenTelemetry SDKs, see OpenTelemetry Supported Language APIs & SDKs..

To collect OpenTelemetry metrics and traces, add an `otlp` section to the CloudWatch agent configuration file. The section has the following fields:

- `grpc_endpoint` – Optional. Specifies the address for the CloudWatch agent to use to listen for OpenTelemetry metrics or traces sent using gRPC Remote Procedure Calls. The format is `ip:port`. This address must match the address set for the gRPC exporter in the OpenTelemetry SDK. If you omit this field, the default of `127.0.0.1:4317` is used.
- `http_endpoint` – Optional. Specifies the address for the CloudWatch agent to use to listen for OpenTelemetry metrics or traces sent over HTTP. The format is `ip:port`. This address must

match the address set for the HTTP exporter in the OpenTelemetry SDK. If you omit this field, the default of `127.0.0.1:4318` is used.

- `tls` – Optional. Specifies that the server should be configured with TLS.
  - `cert_file` – Path to the TLS certificate to use for TLS required connections.
  - `key_file` – Path to the TLS key to use for TLS required connections.

The `otlp` section can be placed in multiple sections within the CloudWatch agent configuration file depending on how and where you want to send the metrics and traces.

> **Important**
>
> Each `otlp` section requires a unique endpoint and port. For detailed information about splitting the metrics and traces endpoints, see OTLP Exporter Configuration in the OpenTelemetry SDK documentation.

To send metrics to CloudWatch or Amazon Managed Service for Prometheus, add the `otlp` section under `metrics_collected` within the `metrics` section. For more information about sending metrics to different destinations, see Manually create or edit the CloudWatch agent configuration file. The following example shows a configuration that sends metrics to CloudWatch:

> **Note**
>
> If you are running the agent in containerized environments and sending telemetry from outside the agent container's network, make sure to specify the endpoint as `0.0.0.0` instead of the default endpoint `127.0.0.1`.

```
{
  "metrics": {
    "metrics_collected": {
      "otlp": {
        "grpc_endpoint": "127.0.0.1:4317",
        "http_endpoint": "127.0.0.1:4318"
      }
    }
  }
}
```

To send metrics to Amazon CloudWatch Logs using the Embedded metric format (EMF), add the `otlp` section under `metrics_collected` within the `logs` section. This sends the EMF logs by default to the `/aws/cwagent` log group and a generated log stream. The metrics are extracted into the `CWAgent` namespace by default. The following example shows a configuration that sends metrics as EMF logs to CloudWatch Logs:

```
{
  "logs": {
    "metrics_collected": {
      "otlp": {
        "grpc_endpoint": "127.0.0.1:4317",
        "http_endpoint": "127.0.0.1:4318"
      }
    }
  }
}
```

To send traces to AWS X-Ray, add the `otlp` section under `traces_collected` within the `traces` section. The following example shows a configuration that sends traces to X-Ray:

```
{
  "traces": {
    "traces_collected": {
      "otlp": {
        "grpc_endpoint": "127.0.0.1:4317",
        "http_endpoint": "127.0.0.1:4318"
      }
    }
  }
}
```

Collect process metrics with the procstat plugin

The *procstat* plugin enables you to collect metrics from individual processes. The plugin is supported on Linux servers and on servers running supported version of Windows Server. This section describes how to configure the CloudWatch agent for procstat and view metrics the CloudWatch agent imports. It also lists the metrics that procstat collects.

> **Note**
>
> The `procstat` plugin is not supported for the Fargate launch type in Amazon ECS environments.

Topics

- Configure the CloudWatch agent for procstat
- Metrics collected by procstat
- Viewing process metrics imported by the CloudWatch agent

Configure the CloudWatch agent for procstat

To use the procstat plugin, add a `procstat` section in the `metrics_collected` section of the CloudWatch agent configuration file. There are three ways to specify the processes to monitor. You can use only one of these methods, but you can use that method to specify one or more processes to monitor.

- `pid_file`: Selects processes by the names of the process identification number (PID) files they create.
- `exe`: Selects the processes that have process names that match the string that you specify, using regular expression matching rules. The match is a "contains" match, meaning that if you specify `agent` as the term to match, processes with names like `cloudwatchagent` match the term. For more information, see Syntax.
- `pattern`: Selects processes by the command lines used to start the processes. All processes are selected that have command lines matching the specified string using regular expression matching rules. The entire command line is checked, including parameters and options used with the command.

  The match is a "contains" match, meaning that if you specify `-c` as the term to match, processes with parameters like `-config` match the term.

The CloudWatch agent uses only one of these methods, even if you include more than one of the above sections. If you specify more than one section, the CloudWatch agent uses the `pid_file` section if it is present. If not, it uses the `exe` section.

On Linux servers, the strings that you specify in an `exe` or `pattern` section are evaluated as regular expressions. On servers running Windows Server, these strings are evaluated as WMI queries. An example would be `pattern: "%apache%"`. For more information, see LIKE Operator.

Whichever method you use, you can include an optional `metrics_collection_interval` parameter, which specifies how often in seconds to collect those metrics. If you omit this parameter, the default value of 60 seconds is used.

In the examples in the following sections, the `procstat` section is the only section included in the `metrics_collected` section of the agent configuration file. Actual configuration files can also include other sections in `metrics_collected`. For more information, see Manually create or edit the CloudWatch agent configuration file.

Configure with pid_file

The following example `procstat` section monitors the processes that create the PID files `example1.pid` and `example2.pid`. Different metrics are collected from each process. Metrics collected from the process that creates `example2.pid` are collected every 10 seconds, and the metrics collected from the `example1.pid` process are collected every 60 seconds, the default value.

```
{
    "metrics": {
        "metrics_collected": {
            "procstat": [
                {
                    "pid_file": "/var/run/example1.pid",
                    "measurement": [
                        "cpu_usage",
                        "memory_rss"
                    ]
                },
                {
                    "pid_file": "/var/run/example2.pid",
                    "measurement": [
                        "read_bytes",
                        "read_count",
                        "write_bytes"
                    ],
                    "metrics_collection_interval": 10
                }
            ]
```

```
        }
    }
}
```

Configuring with exe

The following example `procstat` section monitors all processes with names that match the strings `agent` or `plugin`. The same metrics are collected from each process.

```
{
    "metrics": {
        "metrics_collected": {
            "procstat": [
                {
                    "exe": "agent",
                    "measurement": [
                        "cpu_time",
                        "cpu_time_system",
                        "cpu_time_user"
                    ]
                },
                {
                    "exe": "plugin",
                    "measurement": [
                        "cpu_time",
                        "cpu_time_system",
                        "cpu_time_user"
                    ]
                }
            ]
        }
    }
}
```

Configuring with pattern

The following example `procstat` section monitors all processes with command lines that match the strings `config` or `-c`. The same metrics are collected from each process.

```
{
    "metrics": {
        "metrics_collected": {
```

```
            "procstat": [
                {
                    "pattern": "config",
                    "measurement": [
                        "rlimit_memory_data_hard",
                        "rlimit_memory_data_soft",
                        "rlimit_memory_stack_hard",
                        "rlimit_memory_stack_soft"
                    ]
                },
                {
                    "pattern": "-c",
                    "measurement": [
                        "rlimit_memory_data_hard",
                        "rlimit_memory_data_soft",
                        "rlimit_memory_stack_hard",
                        "rlimit_memory_stack_soft"
                    ]
                }
            ]
        }
    }
}
```

Metrics collected by procstat

The following table lists the metrics that you can collect with the `procstat` plugin.

The CloudWatch agent adds `procstat` to the beginning of the following metric names. There is a different syntax depending on whether it was collected from a Linux server or a server running Windows Server. For example, the `cpu_time` metric appears as `procstat_cpu_time` when collected from Linux and as `procstat cpu_time` when collected from Windows Server.

Metric name	Available on	Description
`cpu_time`	Linux	The amount of time that the process uses the CPU. This metric is measured in

Metric name	Available on	Description
		hundredths of a second. Unit: Count
cpu_time_guest	Linux	The amount of time that the process is in guest mode. This metric is measured in hundredths of a second. Type: Float Unit: None
cpu_time_guest_nice	Linux	The amount of time that the process is running in a nice guest. This metric is measured in hundredths of a second. Type: Float Unit: None

Metric name	Available on	Description
cpu_time_idle	Linux	The amount of time that the process is in idle mode. This metric is measured in hundredths of a second. Type: Float Unit: None
cpu_time_iowait	Linux	The amount of time that the process is waiting for I/O operations to complete. This metric is measured in hundredths of a second. Type: Float Unit: None

Metric name	Available on	Description
cpu_time_irq	Linux	The amount of time that the process is servicing interrupts. This metric is measured in hundredths of a second. Type: Float Unit: None
cpu_time_nice	Linux	The amount of time that the process is in nice mode. This metric is measured in hundredths of a second. Type: Float Unit: None

Metric name	Available on	Description
cpu_time_soft_irq	Linux	The amount of time that the process is servicing software interrupts. This metric is measured in hundredths of a second. Type: Float Unit: None
cpu_time_steal	Linux	The amount of time spent running in other operating systems when running in a virtualized environment. This metric is measured in hundredths of a second. Type: Float Unit: None

Metric name	Available on	Description
cpu_time_stolen	Linux, Windows Server	The amount of time that the process is in *stolen time*, which is time spent in other operating systems in a virtualized environment. This metric is measured in hundredths of a second. Type: Float Unit: None
cpu_time_system	Linux, Windows Server, macOS	The amount of time that the process is in system mode. This metric is measured in hundredths of a second. Type: Float Unit: Count

Metric name	Available on	Description
cpu_time_user	Linux, Windows Server, macOS	The amount of time that the process is in user mode. This metric is measured in hundredths of a second. Unit: Count
cpu_usage	Linux, Windows Server, macOS	The percentage of time that the process is active in any capacity. Unit: Percent
memory_data	Linux, macOS	The amount of memory that the process uses for data. Unit: Bytes
memory_locked	Linux, macOS	The amount of memory that the process has locked. Unit: Bytes

Metric name	Available on	Description
memory_rss	Linux, Windows Server, macOS	The amount of real memory (resident set) that the process is using. Unit: Bytes
memory_stack	Linux, macOS	The amount of stack memory that the process is using. Unit: Bytes
memory_swap	Linux, macOS	The amount of swap memory that the process is using. Unit: Bytes
memory_vms	Linux, Windows Server, macOS	The amount of virtual memory that the process is using. Unit: Bytes

Metric name	Available on	Description
num_fds	Linux	The number of file descriptors that this process has open. Unit: None
num_threads	Linux, Windows, macOS	The number of threads in this process. Unit: None
pid	Linux, Windows Server, macOS	Process identifier (ID). Unit: None

Metric name	Available on	Description
`pid_count`	Linux, Windows Server. macOS	The number of process IDs associated with the process. On Linux servers and macOS computers the full name of this metric is `procstat_lookup_pid_count` and on Windows Server it is `procstat_lookup pid_count` . Unit: None
`read_bytes`	Linux, Windows Server	The number of bytes that the process has read from disks. Unit: Bytes

Metric name	Available on	Description
write_bytes	Linux, Windows Server	The number of bytes that the process has written to disks. Unit: Bytes
read_count	Linux, Windows Server	The number of disk read operations that the process has executed. Unit: None
rlimit_realtime_priority_hard	Linux	The hard limit on the real-time priority that can be set for this process. Unit: None
rlimit_realtime_priority_soft	Linux	The soft limit on the real-time priority that can be set for this process. Unit: None

Metric name	Available on	Description
rlimit_signals_pending_hard	Linux	The hard limit on maximum number of signals that can be queued by this process. Unit: None
rlimit_signals_pending_soft	Linux	The soft limit on maximum number of signals that can be queued by this process. Unit: None
rlimit_nice_priority_hard	Linux	The hard limit on the maximum nice priority that can be set by this process. Unit: None

Metric name	Available on	Description
rlimit_nice_priority_soft	Linux	The soft limit on the maximum nice priority that can be set by this process. Unit: None
rlimit_num_fds_hard	Linux	The hard limit on the maximum number of file descriptors that this process can have open. Unit: None
rlimit_num_fds_soft	Linux	The soft limit on the maximum number of file descriptors that this process can have open. Unit: None

Metric name	Available on	Description
write_count	Linux, Windows Server	The number of disk write operations that the process has executed. Unit: None
involuntary_context_switches	Linux	The number of times that the process was involuntarily context-switched. Unit: None
voluntary_context_switches	Linux	The number of times that the process was context-switched voluntarily. Unit: None
realtime_priority	Linux	The current usage of real-time priority for the process. Unit: None

Metric name	Available on	Description
nice_priority	Linux	The current usage of nice priority for the process. Unit: None
signals_pending	Linux	The number of signals pending to be handled by the process. Unit: None
rlimit_cpu_time_hard	Linux	The hard CPU time resource limit for the process. Unit: None
rlimit_cpu_time_soft	Linux	The soft CPU time resource limit for the process. Unit: None
rlimit_file_locks_hard	Linux	The hard file locks resource limit for the process. Unit: None

Metric name	Available on	Description
rlimit_file_locks_soft	Linux	The soft file locks resource limit for the process. Unit: None
rlimit_memory_data_hard	Linux	The hard resource limit on the process for memory used for data. Unit: Bytes
rlimit_memory_data_soft	Linux	The soft resource limit on the process for memory used for data. Unit: Bytes
rlimit_memory_locked_hard	Linux	The hard resource limit on the process for locked memory. Unit: Bytes

Metric name	Available on	Description
rlimit_memory_locked_soft	Linux	The soft resource limit on the process for locked memory. Unit: Bytes
rlimit_memory_rss_hard	Linux	The hard resource limit on the process for physical memory. Unit: Bytes
rlimit_memory_rss_soft	Linux	The soft resource limit on the process for physical memory. Unit: Bytes
rlimit_memory_stack_hard	Linux	The hard resource limit on the process stack. Unit: Bytes
rlimit_memory_stack_soft	Linux	The soft resource limit on the process stack. Unit: Bytes

Metric name	Available on	Description
rlimit_memory_vms_hard	Linux	The hard resource limit on the process for virtual memory. Unit: Bytes
rlimit_memory_vms_soft	Linux	The soft resource limit on the process for virtual memory. Unit: Bytes

Viewing process metrics imported by the CloudWatch agent

After importing process metrics into CloudWatch, you can view these metrics as time series graphs, and create alarms that can watch these metrics and notify you if they breach a threshold that you specify. The following procedure shows how to view process metrics as a time series graph. For more information about setting alarms, see Using Amazon CloudWatch alarms.

To view process metrics in the CloudWatch console

1. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.
2. In the navigation pane, choose **Metrics**.
3. Choose the namespace for the metrics collected by the agent. By default, this is **CWAgent**, but you may have specified a different namespace in the CloudWatch agent configuration file.
4. Choose a metric dimension (for example, **Per-Instance Metrics**).
5. The **All metrics** tab displays all metrics for that dimension in the namespace. You can do the following:

    a. To graph a metric, select the check box next to the metric. To select all metrics, select the check box in the heading row of the table.

b. To sort the table, use the column heading.

c. To filter by resource, choose the resource ID and then choose **Add to search**.

d. To filter by metric, choose the metric name and then choose **Add to search**.

6. (Optional) To add this graph to a CloudWatch dashboard, choose **Actions**, **Add to dashboard**.

Retrieve custom metrics with StatsD

You can retrieve additional custom metrics from your applications or services using the CloudWatch agent with the `StatsD` protocol. StatsD is a popular open-source solution that can gather metrics from a wide variety of applications. StatsD is especially useful for instrumenting your own metrics. For an example of using the CloudWatch agent and StatsD together, see How to better monitor your custom application metrics using Amazon CloudWatch Agent.

`StatsD` is supported on both Linux servers and servers running Windows Server. CloudWatch supports the following `StatsD` format:

```
MetricName:value|type|@sample_rate|#tag1:
  value,tag1...
```

- `MetricName` – A string with no colons, bars, # characters, or @ characters.
- `value` – This can be either integer or float.
- `type` – Specify `c` for counter, `g` for gauge, `ms` for timer, `h` for histogram, or `s` for set.
- `sample_rate` – (Optional) A float between 0 and 1, inclusive. Use only for counter, histogram, and timer metrics. The default value is 1 (sampling 100% of the time).
- `tags` – (Optional) A comma-separated list of tags. `StatsD` tags are similar to dimensions in CloudWatch. Use colons for key/value tags, such as `env:prod`.

You can use any `StatsD` client that follows this format to send the metrics to the CloudWatch agent. For more information about some of the available `StatsD` clients, see the StatsD client page on GitHub.

To collect these custom metrics, add a `"statsd": {}` line to the `metrics_collected` section of the agent configuration file. You can add this line manually. If you use the wizard to create the configuration file, it's done for you. For more information, see Create the CloudWatch agent configuration file.

The `StatsD` default configuration works for most users. There are optional fields that you can add to the **statsd** section of the agent configuration file as needed:

- `service_address` – The service address to which the CloudWatch agent should listen. The format is *`ip`*`:`*`port`*. If you omit the IP address, the agent listens on all available interfaces. Only the UDP format is supported, so you don't need to specify a UDP prefix.

  The default value is `:8125`.
- `metrics_collection_interval` – How often in seconds that the `StatsD` plugin runs and collects metrics. The default value is 10 seconds. The range is 1–172,000.
- `metrics_aggregation_interval` – How often in seconds CloudWatch aggregates metrics into single data points. The default value is 60 seconds.

  For example, if `metrics_collection_interval` is 10 and `metrics_aggregation_interval` is 60, CloudWatch collects data every 10 seconds. After each minute, the six data readings from that minute are aggregated into a single data point, which is sent to CloudWatch.

  The range is 0–172,000. Setting `metrics_aggregation_interval` to 0 disables the aggregation of `StatsD` metrics.
- `allowed_pending_messages` – The number of UDP messages that are allowed to queue up. When the queue is full, the StatsD server starts dropping packets. The default value is 10000.
- `drop_original_metrics` – Optional. If you are using the `aggregation_dimensions` field in the `metrics` section to roll up metrics into aggregated results, then by default the agent sends both the aggregated metrics and the original metrics that are separated for each value of the dimension. If you don't want the original metrics to be sent to CloudWatch, you can specify this parameter with a list of metrics. The metrics specified along with this parameter don't have their metrics by dimension reported to CloudWatch. Instead, only the aggregated metrics are reported. This reduces the number of metrics that the agent collects, reducing your costs.

The following is an example of the **statsd** section of the agent configuration file, using the default port and custom collection and aggregation intervals.

```
{
   "metrics":{
      "metrics_collected":{
         "statsd":{
```

```
            "service_address":":8125",
            "metrics_collection_interval":60,
            "metrics_aggregation_interval":300
         }
      }
   }
}
```

Viewing StatsD metrics imported by the CloudWatch agent

After importing StatsD metrics into CloudWatch, you can view these metrics as time series graphs, and create alarms that can watch these metrics and notify you if they breach a threshold that you specify. The following procedure shows how to view StatsD metrics as a time series graph. For more information about setting alarms, see Using Amazon CloudWatch alarms.

To view StatsD metrics in the CloudWatch console

1. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.
2. In the navigation pane, choose **Metrics**.
3. Choose the namespace for the metrics collected by the agent. By default, this is **CWAgent**, but you may have specified a different namespace in the CloudWatch agent configuration file.
4. Choose a metric dimension (for example, **Per-Instance Metrics**).
5. The **All metrics** tab displays all metrics for that dimension in the namespace. You can do the following:

   a. To graph a metric, select the check box next to the metric. To select all metrics, select the check box in the heading row of the table.

   b. To sort the table, use the column heading.

   c. To filter by resource, choose the resource ID and then choose **Add to search**.

   d. To filter by metric, choose the metric name and then choose **Add to search**.
6. (Optional) To add this graph to a CloudWatch dashboard, choose **Actions**, **Add to dashboard**.

Retrieve custom metrics with collectd

You can retrieve additional metrics from your applications or services using the CloudWatch agent with the collectd protocol, which is supported only on Linux servers. collectd is a popular open-source solution with plugins that can gather system statistics for a wide variety of applications. By

combining the system metrics that the CloudWatch agent can already collect with the additional metrics from collectd, you can better monitor, analyze, and troubleshoot your systems and applications. For more information about collectd, see collectd - The system statistics collection daemon.

You use the collectd software to send the metrics to the CloudWatch agent. For the collectd metrics, the CloudWatch agent acts as the server while the collectd plugin acts as the client.

The collectd software is not installed automatically on every server. On a server running Amazon Linux 2, follow these steps to install collectd

```
sudo amazon-linux-extras install collectd
```

For information about installing collectd on other systems, see the Download page for collectd.

To collect these custom metrics, add a **"collectd": {}** line to the **metrics_collected** section of the agent configuration file. You can add this line manually. If you use the wizard to create the configuration file, it is done for you. For more information, see Create the CloudWatch agent configuration file.

Optional parameters are also available. If you are using collectd and you do not use `/etc/collectd/auth_file` as your **collectd_auth_file**, you must set some of these options.

- **service_address:** The service address to which the CloudWatch agent should listen. The format is `"udp://`*`ip`*`:`*`port`*. The default is `udp://127.0.0.1:25826`.
- **name_prefix:** A prefix to attach to the beginning of the name of each collectd metric. The default is `collectd_`. The maximum length is 255 characters.
- **collectd_security_level:** Sets the security level for network communication. The default is **encrypt**.

  encrypt specifies that only encrypted data is accepted. **sign** specifies that only signed and encrypted data is accepted. **none** specifies that all data is accepted. If you specify a value for **collectd_auth_file**, encrypted data is decrypted if possible.

  For more information, see Client setup and Possible interactions in the collectd Wiki.
- **collectd_auth_file** Sets a file in which user names are mapped to passwords. These passwords are used to verify signatures and to decrypt encrypted network packets. If given, signed data is verified and encrypted packets are decrypted. Otherwise, signed data is accepted without checking the signature and encrypted data cannot be decrypted.

The default is `/etc/collectd/auth_file`.

If **collectd_security_level** is set to **none**, this is optional. If you set **collectd_security_level** to `encrypt` or **sign**, you must specify **collectd_auth_file**.

For the format of the auth file, each line is a user name followed by a colon and any number of spaces followed by the password. For example:

```
user1: user1_password

user2: user2_password
```

- **collectd_typesdb:** A list of one or more files that contain the dataset descriptions. The list must be surrounded by brackets, even if there is just one entry in the list. Each entry in the list must be surrounded by double quotes. If there are multiple entries, separate them with commas. The default on Linux servers is `["/usr/share/collectd/types.db"]`. The default on macOs computers depends on the version of collectd. For example, `["/usr/local/Cellar/collectd/5.12.0/share/collectd/types.db"]`.

  For more information, see https://www.collectd.org/documentation/manpages/types.db.html.
- **metrics_aggregation_interval:** How often in seconds CloudWatch aggregates metrics into single data points. The default is 60 seconds. The range is 0 to 172,000. Setting it to 0 disables the aggregation of collectd metrics.

The following is an example of the collectd section of the agent configuration file.

```
{
   "metrics":{
      "metrics_collected":{
         "collectd":{
            "name_prefix":"My_collectd_metrics_",
            "metrics_aggregation_interval":120
         }
      }
   }
}
```

Viewing collected metrics imported by the CloudWatch agent

After importing collectd metrics into CloudWatch, you can view these metrics as time series graphs, and create alarms that can watch these metrics and notify you if they breach a threshold that you specify. The following procedure shows how to view collectd metrics as a time series graph. For more information about setting alarms, see Using Amazon CloudWatch alarms.

To view collectd metrics in the CloudWatch console

1. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.
2. In the navigation pane, choose **Metrics**.
3. Choose the namespace for the metrics collected by the agent. By default, this is **CWAgent**, but you may have specified a different namespace in the CloudWatch agent configuration file.
4. Choose a metric dimension (for example, **Per-Instance Metrics**).
5. The **All metrics** tab displays all metrics for that dimension in the namespace. You can do the following:
    a. To graph a metric, select the check box next to the metric. To select all metrics, select the check box in the heading row of the table.
    b. To sort the table, use the column heading.
    c. To filter by resource, choose the resource ID and then choose **Add to search**.
    d. To filter by metric, choose the metric name and then choose **Add to search**.
6. (Optional) To add this graph to a CloudWatch dashboard, choose **Actions**, **Add to dashboard**.

Set up and configure Prometheus metrics collection on Amazon EC2 instances

The following sections explain how to install the CloudWatch agent with Prometheus monitoring on EC2 instances, and how to configure the agent to scrape additional targets. It also provides tutorials for setting up sample workloads to use testing with Prometheus monitoring.

Both Linux and Windows instances are supported.

For information about the operating systems supported by the CloudWatch agent, see Collect metrics, logs, and traces using the CloudWatch agent

VPC security group requirements

If you are using a VPC, the following requirements apply.

- The ingress rules of the security groups for the Prometheus workloads must open the Prometheus ports to the CloudWatch agent for scraping the Prometheus metrics by the private IP.
- The egress rules of the security group for the CloudWatch agent must allow the CloudWatch agent to connect to the Prometheus workloads' port by private IP.

Topics

- Step 1: Install the CloudWatch agent
- Step 2: Scrape Prometheus sources and import metrics
- Example: Set up Java/JMX sample workloads for Prometheus metric testing

Step 1: Install the CloudWatch agent

The first step is to install the CloudWatch agent on the EC2 instance. For instructions, see Installing the CloudWatch agent.

Step 2: Scrape Prometheus sources and import metrics

The CloudWatch agent with Prometheus monitoring needs two configurations to scrape the Prometheus metrics. One is for the standard Prometheus configurations as documented in <scrape_config>in the Prometheus documentation. The other is for the CloudWatch agent configuration.

Prometheus scrape configuration

The CloudWatch agent supports the standard Prometheus scrape configurations as documented in <scrape_config> in the Prometheus documentation. You can edit this section to update the configurations that are already in this file, and add additional Prometheus scraping targets. A sample configuration file contains the following global configuration lines:

```
PS C:\ProgramData\Amazon\AmazonCloudWatchAgent> cat prometheus.yaml
global:
  scrape_interval: 1m
  scrape_timeout: 10s
scrape_configs:
- job_name: MY_JOB
  sample_limit: 10000
  file_sd_configs:
```

```
    - files: ["C:\\ProgramData\\Amazon\\AmazonCloudWatchAgent\\prometheus_sd_1.yaml",
"C:\\ProgramData\\Amazon\\AmazonCloudWatchAgent\\prometheus_sd_2.yaml"]
```

The `global` section specifies parameters that are valid in all configuration contexts. They also serve as defaults for other configuration sections. It contains the following parameters:

- `scrape_interval`— Defines how frequently to scrape targets.
- `scrape_timeout`— Defines how long to wait before a scrape request times out.

The `scrape_configs` section specifies a set of targets and parameters that define how to scrape them. It contains the following parameters:

- `job_name`— The job name assigned to scraped metrics by default.
- `sample_limit`— Per-scrape limit on the number of scraped samples that will be accepted.
- `file_sd_configs`— List of file service discovery configurations. It reads a set of files containing a list of zero or more static configs. The `file_sd_configs` section contains a `files` parameter which defines patterns for files from which target groups are extracted.

The CloudWatch agent supports the following service discovery configuration types.

`static_config` Allows specifying a list of targets and a common label set for them. It is the canonical way to specify static targets in a scrape configuration.

The following is a sample static config to scrape Prometheus metrics from a local host. Metrics can also be scraped from other servers if the Prometheus port is open to the server where the agent runs.

```
PS C:\ProgramData\Amazon\AmazonCloudWatchAgent> cat prometheus_sd_1.yaml
- targets:
    - 127.0.0.1:9404
  labels:
    key1: value1
    key2: value2
```

This example contains the following parameters:

- `targets`— The targets scraped by the static config.
- `labels`— Labels assigned to all metrics that are scraped from the targets.

`ec2_sd_config` Allows retrieving scrape targets from Amazon EC2 instances. The following is a sample `ec2_sd_config` to scrape Prometheus metrics from a list of EC2 instances. The Prometheus ports of these instances have to open to the server where the CloudWatch agent runs. The IAM role for the EC2 instance where the CloudWatch agent runs must include the `ec2:DescribeInstance` permission. For example, you could attach the managed policy **AmazonEC2ReadOnlyAccess** to the instance running the CloudWatch agent.

```
PS C:\ProgramData\Amazon\AmazonCloudWatchAgent> cat prometheus.yaml
global:
  scrape_interval: 1m
  scrape_timeout: 10s
scrape_configs:
  - job_name: MY_JOB
    sample_limit: 10000
    ec2_sd_configs:
      - region: us-east-1
        port: 9404
        filters:
          - name: instance-id
            values:
              - i-98765432109876543
              - i-12345678901234567
```

This example contains the following parameters:

- `region`— The AWS Region where the target EC2 instance is. If you leave this blank, the Region from the instance metadata is used.
- `port`— The port to scrape metrics from.
- `filters`— Optional filters to use to filter the instance list. This example filters based on EC2 instance IDs. For more criteria that you can filter on, see DescribeInstances.

CloudWatch agent configuration for Prometheus

The CloudWatch agent configuration file includes `prometheus` sections under both `logs` and `metrics_collected`. It includes the following parameters.

- **cluster_name**— specifies the cluster name to be added as a label in the log event. This field is optional.
- **log_group_name**— specifies the log group name for the scraped Prometheus metrics.

- **prometheus_config_path**— specifies the Prometheus scrape configuration file path.
- **emf_processor**— specifies the embedded metric format processor configuration. For more information about embedded metric format, see Embedding metrics within logs.

  The `emf_processor` section can contain the following parameters:

  - **metric_declaration_dedup**— It set to true, the de-duplication function for the embedded metric format metrics is enabled.
  - **metric_namespace**— Specifies the metric namespace for the emitted CloudWatch metrics.
  - **metric_unit**— Specifies the metric name:metric unit map. For information about supported metric units, see MetricDatum.
  - **metric_declaration**— are sections that specify the array of logs with embedded metric format to be generated. There are `metric_declaration` sections for each Prometheus source that the CloudWatch agent imports from by default. These sections each include the following fields:
    - `source_labels` specifies the value of the labels that are checked by the `label_matcher` line.
    - `label_matcher` is a regular expression that checks the value of the labels listed in `source_labels`. The metrics that match are enabled for inclusion in the embedded metric format sent to CloudWatch.
    - `metric_selectors` is a regular expression that specifies the metrics to be collected and sent to CloudWatch.
    - `dimensions` is the list of labels to be used as CloudWatch dimensions for each selected metric.

The following is an example CloudWatch agent configuration for Prometheus.

```
{
   "logs":{
      "metrics_collected":{
         "prometheus":{
            "cluster_name":"prometheus-cluster",
            "log_group_name":"Prometheus",
            "prometheus_config_path":"C:\\ProgramData\\Amazon\\AmazonCloudWatchAgent\
\prometheus.yaml",
            "emf_processor":{
               "metric_declaration_dedup":true,
               "metric_namespace":"CWAgent-Prometheus",
```

```
                "metric_unit":{
                   "jvm_threads_current": "Count",
                   "jvm_gc_collection_seconds_sum": "Milliseconds"
                },
                "metric_declaration":[
                   {
                      "source_labels":[
                         "job", "key2"
                      ],
                      "label_matcher":"MY_JOB;^value2",
                      "dimensions":[
                         [
                            "key1", "key2"
                         ],
                         [
                            "key2"
                         ]
                      ],
                      "metric_selectors":[
                         "^jvm_threads_current$",
                         "^jvm_gc_collection_seconds_sum$"
                      ]
                   }
                ]
             }
          }
       }
    }
}
```

The previous example configures an embedded metric format section to be sent as a log event if the following conditions are met:

- The value of the label `job` is `MY_JOB`
- The value of the label `key2` is `value2`
- The Prometheus metrics `jvm_threads_current` and `jvm_gc_collection_seconds_sum` contains both `job` and `key2` labels.

The log event that is sent includes the following highlighted section.

```
{
```

```
    "CloudWatchMetrics": [
        {
            "Metrics": [
                {
                    "Unit": "Count",
                    "Name": "jvm_threads_current"
                },
                {
                    "Unit": "Milliseconds",
                    "Name": "jvm_gc_collection_seconds_sum"
                }
            ],
            "Dimensions": [
                [
                    "key1",
                    "key2"
                ],
                [
                    "key2"
                ]
            ],
            "Namespace": "CWAgent-Prometheus"
        }
    ],
    "ClusterName": "prometheus-cluster",
    "InstanceId": "i-0e45bd06f196096c8",
    "Timestamp": "1607966368109",
    "Version": "0",
    "host": "EC2AMAZ-PDDOIUM",
    "instance": "127.0.0.1:9404",
    "jvm_threads_current": 2,
    "jvm_gc_collection_seconds_sum": 0.006000000000000002,
    "prom_metric_type": "gauge",
    ...
}
```

Example: Set up Java/JMX sample workloads for Prometheus metric testing

JMX Exporter is an official Prometheus exporter that can scrape and expose JMX mBeans as Prometheus metrics. For more information, see prometheus/jmx_exporter.

The CloudWatch agent can collect predefined Prometheus metrics from Java Virtual Machine (JVM), Hjava, and Tomcat (Catalina), from a JMX exporter on EC2 instances.

Step 1: Install the CloudWatch agent

The first step is to install the CloudWatch agent on the EC2 instance. For instructions, see Installing the CloudWatch agent.

Step 2: Start the Java/JMX workload

The next step is to start the Java/JMX workload.

First, download the latest JMX exporter jar file from the following location: prometheus/jmx_exporter.

Use the jar for your sample application

The example commands in the following sections use `SampleJavaApplication-1.0-SNAPSHOT.jar` as the jar file. Replace these parts of the commands with the jar for your application.

Prepare the JMX exporter configuration

The `config.yaml` file is the JMX exporter configuration file. For more information, see Configuration in the JMX exporter documentation.

Here is a sample configuration for Java and Tomcat.

```
---
lowercaseOutputName: true
lowercaseOutputLabelNames: true

rules:
- pattern: 'java.lang<type=OperatingSystem><>(FreePhysicalMemorySize|
TotalPhysicalMemorySize|FreeSwapSpaceSize|TotalSwapSpaceSize|SystemCpuLoad|
ProcessCpuLoad|OpenFileDescriptorCount|AvailableProcessors)'

  type: COUNTER

- pattern: ".*"
```

Start the Java application with the Prometheus exporter

Start the sample application. This will emit Prometheus metrics to port 9404. Be sure to replace the entry point `com.gubupt.sample.app.App` with the correct information for your sample java application.

On Linux, enter the following command.

```
$ nohup java -javaagent:./jmx_prometheus_javaagent-0.14.0.jar=9404:./config.yaml -cp
  ./SampleJavaApplication-1.0-SNAPSHOT.jar com.gubupt.sample.app.App &
```

On Windows, enter the following command.

```
PS C:\> java -javaagent:.\jmx_prometheus_javaagent-0.14.0.jar=9404:.\config.yaml -cp  .
\SampleJavaApplication-1.0-SNAPSHOT.jar com.gubupt.sample.app.App
```

Verify the Prometheus metrics emission

Verify that Prometheus metrics are being emitted.

On Linux, enter the following command.

```
$ curl localhost:9404
```

On Windows, enter the following command.

```
PS C:\> curl  http://localhost:9404
```

Sample output on Linux:

```
StatusCode        : 200
StatusDescription : OK
Content           : # HELP jvm_classes_loaded The number of classes that are currently
 loaded in the JVM

```

```
Links             : {}
ParsedHtml        : System.__ComObject
RawContentLength  : 71908
```

Step 3: Configure the CloudWatch agent to scrape Prometheus metrics

Next, set up the Prometheus scrape configuration in the CloudWatch agent configuration file.

To set up the Prometheus scrape configuration for the Java/JMX example

1. Set up the configuration for `file_sd_config` and `static_config`.

   On Linux, enter the following command.

   ```
   $ cat /opt/aws/amazon-cloudwatch-agent/var/prometheus.yaml
   global:
     scrape_interval: 1m
     scrape_timeout: 10s
   scrape_configs:
     - job_name: jmx
       sample_limit: 10000
       file_sd_configs:
         - files: [ "/opt/aws/amazon-cloudwatch-agent/var/prometheus_file_sd.yaml" ]
   ```

   On Windows, enter the following command.

   ```
   PS C:\ProgramData\Amazon\AmazonCloudWatchAgent> cat prometheus.yaml
   global:
     scrape_interval: 1m
     scrape_timeout: 10s
   scrape_configs:
     - job_name: jmx
       sample_limit: 10000
       file_sd_configs:
         - files: [ "C:\\ProgramData\\Amazon\\AmazonCloudWatchAgent\
   \prometheus_file_sd.yaml" ]
   ```

2. Set up the scrape targets configuration.

   On Linux, enter the following command.

   ```
   $ cat /opt/aws/amazon-cloudwatch-agent/var/prometheus_file_sd.yaml
   ```

```
- targets:
  - 127.0.0.1:9404
  labels:
    application: sample_java_app
    os: linux
```

On Windows, enter the following command.

```
PS C:\ProgramData\Amazon\AmazonCloudWatchAgent> cat prometheus_file_sd.yaml
- targets:
  - 127.0.0.1:9404
  labels:
    application: sample_java_app
    os: windows
```

3. Set up the Prometheus scrape configuration by `ec2_sc_config`. Replace *your-ec2-instance-id* with the correct EC2 instance ID.

   On Linux, enter the following command.

```
$ cat .\prometheus.yaml
global:
  scrape_interval: 1m
  scrape_timeout: 10s
scrape_configs:
  - job_name: jmx
    sample_limit: 10000
    ec2_sd_configs:
      - region: us-east-1
        port: 9404
        filters:
          - name: instance-id
            values:
              - your-ec2-instance-id
```

   On Windows, enter the following command.

```
PS C:\ProgramData\Amazon\AmazonCloudWatchAgent> cat prometheus_file_sd.yaml
- targets:
  - 127.0.0.1:9404
  labels:
    application: sample_java_app
```

```
    os: windows
```

4. Set up the CloudWatch agent configuration. First, navigate to the correct directory. On Linux, it is `/opt/aws/amazon-cloudwatch-agent/var/cwagent-config.json`. On Windows, it is `C:\ProgramData\Amazon\AmazonCloudWatchAgent\cwagent-config.json`.

   The following is a sample configuration with Java/JHX Prometheus metrics defined. Be sure to replace *`path-to-Prometheus-Scrape-Configuration-file`* with the correct path.

```
{
  "agent": {
    "region": "us-east-1"
  },
  "logs": {
    "metrics_collected": {
      "prometheus": {
        "cluster_name": "my-cluster",
        "log_group_name": "prometheus-test",
        "prometheus_config_path": "path-to-Prometheus-Scrape-Configuration-file",
        "emf_processor": {
          "metric_declaration_dedup": true,
          "metric_namespace": "PrometheusTest",
          "metric_unit":{
            "jvm_threads_current": "Count",
            "jvm_classes_loaded": "Count",
            "java_lang_operatingsystem_freephysicalmemorysize": "Bytes",
            "catalina_manager_activesessions": "Count",
            "jvm_gc_collection_seconds_sum": "Seconds",
            "catalina_globalrequestprocessor_bytesreceived": "Bytes",
            "jvm_memory_bytes_used": "Bytes",
            "jvm_memory_pool_bytes_used": "Bytes"
          },
          "metric_declaration": [
            {
              "source_labels": ["job"],
              "label_matcher": "^jmx$",
              "dimensions": [["instance"]],
              "metric_selectors": [
                "^jvm_threads_current$",
                "^jvm_classes_loaded$",
                "^java_lang_operatingsystem_freephysicalmemorysize$",
                "^catalina_manager_activesessions$",
                "^jvm_gc_collection_seconds_sum$",
```

```
                "^catalina_globalrequestprocessor_bytesreceived$"
              ]
            },
            {
              "source_labels": ["job"],
              "label_matcher": "^jmx$",
              "dimensions": [["area"]],
              "metric_selectors": [
                "^jvm_memory_bytes_used$"
              ]
            },
            {
              "source_labels": ["job"],
              "label_matcher": "^jmx$",
              "dimensions": [["pool"]],
              "metric_selectors": [
                "^jvm_memory_pool_bytes_used$"
              ]
            }
          ]
        }
      }
    },
    "force_flush_interval": 5
  }
}
```

5. Restart the CloudWatch agent by entering one of the following commands.

   On Linux, enter the following command.

   ```
   sudo /opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-ctl -a fetch-
   config -m ec2 -s -c file:/opt/aws/amazon-cloudwatch-agent/var/cwagent-config.json
   ```

   On Windows, enter the following command.

   ```
   & "C:\Program Files\Amazon\AmazonCloudWatchAgent\amazon-cloudwatch-agent-ctl.ps1"
    -a fetch-config -m ec2 -s -c file:C:\ProgramData\Amazon\AmazonCloudWatchAgent
   \cwagent-config.json
   ```

Viewing the Prometheus metrics and logs

You can now view the Java/JMX metrics being collected.

To view the metrics for your sample Java/JMX workload

1. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.
2. In the Region where your cluster is running, choose **Metrics** in the left navigation pane. Find the **PrometheusTest** namespace to see the metrics.
3. To see the CloudWatch Logs events, choose **Log groups** in the navigation pane. The events are in the log group **prometheus-test**.

Configure CloudWatch agent service and environment names for related entities

The CloudWatch agent can send metrics and logs with entity data to support the Explore related pane in the CloudWatch console. The service name or environment name can be configured by the CloudWatch Agent JSON configuration.

> **Note**
>
> The agent configuration may be overridden. For details about how the agent decides what data to send for related entities, see Using the CloudWatch agent with related telemetry.

For metrics, it can be configured at the agent, metrics, or plugin level. For logs it can be configured at the agent, logs, or file level. The most specific configuration is always used. For example if the configuration exists at the agent level and metrics level, then metrics will use the metric configuration, and anything else (logs) will use the agent configuration. The following example shows different ways to configure the service name and environment name.

```
{
  "agent": {
    "service.name": "agent-level-service",
    "deployment.environment": "agent-level-environment"
  },

  "metrics": {
    "service.name": "metric-level-service",
     "deployment.environment": "metric-level-environment",
```

```
    "metrics_collected": {
      "statsd": {
        "service.name": "statsd-level-service",
        "deployment.environment": "statsd-level-environment",
      },
      "collectd": {
        "service.name": "collectdd-level-service",
        "deployment.environment": "collectd-level-environment",
      }
    }

  },

  "logs": {
    "service.name": "log-level-service",
    "deployment.environment": "log-level-environment",

    "logs_collected": {
      "files": {
        "collect_list": [
          {
            "file_path": "/opt/aws/amazon-cloudwatch-agent/logs/amazon-cloudwatch-
agent.log",
            "log_group_name": "amazon-cloudwatch-agent.log",
            "log_stream_name": "amazon-cloudwatch-agent.log",

            "service.name": "file-level-service",
            "deployment.environment": "file-level-environment"
          }
        ]
      }
    }

  }
}
```

Starting the CloudWatch agent

You can start the CloudWatch agent using either Systems Manager Run Command or the command line.

For information about setting up the agent on a system that has security-enhanced Linux (SELinux) enabled, see Set up the CloudWatch agent with security-enhanced Linux (SELinux).

Start the CloudWatch agent using the command line on Amazon EC2

Follow these steps to use the command line to start the CloudWatch agent on on Amazon EC2.

For information about setting up the agent on a system that has security-enhanced Linux (SELinux) enabled, see Set up the CloudWatch agent with security-enhanced Linux (SELinux).

To use the command line to start the CloudWatch agent on on Amazon EC2

1. Copy the agent configuration file that you want to use to the server where you're going to run the agent. Note the pathname where you copy it to.
2. In this command, `-a fetch-config` causes the agent to load the latest version of the CloudWatch agent configuration file, and `-s` starts the agent.

   Enter one of the following commands. Replace *`configuration-file-path`* with the path to the agent configuration file. This file is called `config.json` if you created it with the wizard, and might be called `amazon-cloudwatch-agent.json` if you created it manually.

   On an EC2 instance running Linux, enter the following command.

   ```
   sudo /opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-ctl -a fetch-
   config -m ec2 -s -c file:configuration-file-path
   ```

   On an on-premises server running Linux, enter the following:

   ```
   sudo /opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-ctl -a fetch-
   config -m onPremise -s -c file:configuration-file-path
   ```

   On an EC2 instance running Windows Server, enter the following from the PowerShell console:

   ```
   & "C:\Program Files\Amazon\AmazonCloudWatchAgent\amazon-cloudwatch-agent-ctl.ps1" -
   a fetch-config -m ec2 -s -c file:configuration-file-path
   ```

   On an on-premises server running Windows Server, enter the following from the PowerShell console:

```
& "C:\Program Files\Amazon\AmazonCloudWatchAgent\amazon-cloudwatch-agent-ctl.ps1" -
a fetch-config -m onPremise -s -c file:configuration-file-path
```

Start the CloudWatch agent on an on-premises server

Follow these steps to start the CloudWatch agent on an on-premises server.

To use SSM Agent to start the CloudWatch agent on an on-premises server

1. Open the Systems Manager console at https://console.aws.amazon.com/systems-manager/.
2. In the navigation pane, choose **Run Command**.

   -or-

   If the AWS Systems Manager home page opens, scroll down and choose **Explore Run Command**.
3. Choose **Run command**.
4. In the **Command document** list, select the button next to **AmazonCloudWatch-ManageAgent**.
5. In the **Targets** area, select the instance where you installed the agent.
6. In the **Action** list, choose **configure**.
7. In the **Mode** list, choose **onPremise**.
8. In the **Optional Configuration Location** box, enter the name of the agent configuration file that you created with the wizard and stored in the Parameter Store.
9. Choose **Run**.

   The agent starts with the configuration you specified in the configuration file.

To use the command line to start the CloudWatch agent on an on-premises server

- In this command, `-a fetch-config` causes the agent to load the latest version of the CloudWatch agent configuration file, and `-s` starts the agent.

  Linux: If you saved the configuration file in the Systems Manager Parameter Store, enter the following:

```
sudo /opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-ctl -a fetch-
config -m onPremise -s -c ssm:configuration-parameter-store-name
```

Linux: If you saved the configuration file on the local computer, enter the following command. Replace *configuration-file-path* with the path to the agent configuration file. This file is called `config.json` if you created it with the wizard, and might be called `amazon-cloudwatch-agent.json` if you created it manually.

```
sudo /opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-ctl -a fetch-
config -m onPremise -s -c file:configuration-file-path
```

Windows Server: If you saved the agent configuration file in Systems Manager Parameter Store, enter the following from the PowerShell console:

```
& "C:\Program Files\Amazon\AmazonCloudWatchAgent\amazon-cloudwatch-agent-ctl.ps1" -
a fetch-config -m onPremise -s -c ssm:configuration-parameter-store-name
```

Windows Server: If you saved the agent configuration file on the local computer, enter the following from the PowerShell console. Replace *configuration-file-path* with the path to the agent configuration file. This file is called `config.json` if you created it with the wizard, and might be called `amazon-cloudwatch-agent.json` if you created it manually.

```
& "C:\Program Files\Amazon\AmazonCloudWatchAgent\amazon-cloudwatch-agent-ctl.ps1" -
a fetch-config -m onPremise -s -c file:configuration-file-path
```

Metrics collected by the CloudWatch agent

You can collect metrics from servers by installing the CloudWatch agent on the server. You can install the agent on both Amazon EC2 instances and on-premises servers. You can also install the agent on computers running Linux, Windows Server, or macOS. If you install the agent on an Amazon EC2 instance, the metrics the agent collects are in addition to the metrics enabled by default on Amazon EC2 instances. For information about installing the CloudWatch agent on an instance, see Collect metrics, logs, and traces using the CloudWatch agent. You can use this section to learn about metrics the CloudWatch agent collects.

Metrics collected by the CloudWatch agent on Windows Server instances

On a server running Windows Server, installing the CloudWatch agent enables you to collect the metrics associated with the counters in Windows Performance Monitor. The CloudWatch metric names for these counters are created by putting a space between the object name and the counter name. For example, the `% Interrupt Time` counter of the `Processor` object is given the metric name `Processor % Interrupt Time` in CloudWatch. For more information about Windows Performance Monitor counters, see the Microsoft Windows Server documentation.

The default namespace for metrics collected by the CloudWatch agent is `CWAgent`, although you can specify a different namespace when you configure the agent.

Metrics collected by the CloudWatch agent on Linux and macOS instances

The following table lists the metrics that you can collect with the CloudWatch agent on Linux servers and macOS computers.

Metric	Description
`cpu_time_active`	The amount of time that the CPU is active in any capacity. This metric is measured in hundredths of a second. Unit: None
`cpu_time_guest`	The amount of time that the CPU is running a virtual CPU for a guest operating system. This metric is measured in hundredths of a second. Unit: None
`cpu_time_guest_nice`	The amount of time that the CPU is running a virtual CPU for a guest operating system, which is low-priority and can be interrupted by other processes. This metric is measured in hundredths of a second.

Metric	Description
	Unit: None
cpu_time_idle	The amount of time that the CPU is idle. This metric is measured in hundredths of a second. Unit: None
cpu_time_iowait	The amount of time that the CPU is waiting for I/O operations to complete. This metric is measured in hundredths of a second. Unit: None
cpu_time_irq	The amount of time that the CPU is servicing interrupts. This metric is measured in hundredths of a second. Unit: None
cpu_time_nice	The amount of time that the CPU is in user mode with low-priority processes, which can easily be interrupted by higher-priority processes. This metric is measured in hundredths of a second. Unit: None
cpu_time_softirq	The amount of time that the CPU is servicing software interrupts. This metric is measured in hundredths of a second. Unit: None
cpu_time_steal	The amount of time that the CPU is in *stolen time*, which is time spent in other operating systems in a virtualized environment. This metric is measured in hundredths of a second. Unit: None

Metric	Description
cpu_time_system	The amount of time that the CPU is in system mode. This metric is measured in hundredths of a second. Unit: None
cpu_time_user	The amount of time that the CPU is in user mode. This metric is measured in hundredths of a second. Unit: None
cpu_usage_active	The percentage of time that the CPU is active in any capacity. Unit: Percent
cpu_usage_guest	The percentage of time that the CPU is running a virtual CPU for a guest operating system. Unit: Percent
cpu_usage_guest_nice	The percentage of time that the CPU is running a virtual CPU for a guest operating system, which is low-priority and can be interrupted by other processes. Unit: Percent
cpu_usage_idle	The percentage of time that the CPU is idle. Unit: Percent
cpu_usage_iowait	The percentage of time that the CPU is waiting for I/O operations to complete. Unit: Percent

Metric	Description
cpu_usage_irq	The percentage of time that the CPU is servicing interrupts. Unit: Percent
cpu_usage_nice	The percentage of time that the CPU is in user mode with low-priority processes, which higher-priority processes can easily interrupt. Unit: Percent
cpu_usage_softirq	The percentage of time that the CPU is servicing software interrupts. Unit: Percent
cpu_usage_steal	The percentage of time that the CPU is in *stolen time*, or time spent in other operating systems in a virtualized environment. Unit: Percent
cpu_usage_system	The percentage of time that the CPU is in system mode. Unit: Percent
cpu_usage_user	The percentage of time that the CPU is in user mode. Unit: Percent
disk_free	Free space on the disks. Unit: Bytes
disk_inodes_free	The number of available index nodes on the disk. Unit: Count

Metric	Description
`disk_inodes_total`	The total number of index nodes reserved on the disk. Unit: Count
`disk_inodes_used`	The number of used index nodes on the disk. Unit: Count
`disk_total`	Total space on the disks, including used and free. Unit: Bytes
`disk_used`	Used space on the disks. Unit: Bytes
`disk_used_percent`	The percentage of total disk space that is used. Unit: Percent
`diskio_iops_in_progress`	The number of I/O requests that have been issued to the device driver but have not yet completed. Unit: Count
`diskio_io_time`	The amount of time that the disk has had I/O requests queued. Unit: Milliseconds The only statistic that should be used for this metric is `Sum`. Do not use `Average`.
`diskio_reads`	The number of disk read operations. Unit: Count The only statistic that should be used for this metric is `Sum`. Do not use `Average`.

Metric	Description
diskio_read_bytes	The number of bytes read from the disks. Unit: Bytes The only statistic that should be used for this metric is Sum. Do not use Average.
diskio_read_time	The amount of time that read requests have waited on the disks. Multiple read requests waiting at the same time increase the number. For example, if 5 requests all wait for an average of 100 milliseconds, 500 is reported. Unit: Milliseconds The only statistic that should be used for this metric is Sum. Do not use Average.
diskio_writes	The number disk write operations. Unit: Count The only statistic that should be used for this metric is Sum. Do not use Average.
diskio_write_bytes	The number of bytes written to the disks. Unit: Bytes The only statistic that should be used for this metric is Sum. Do not use Average.

Metric	Description
diskio_write_time	The amount of time that write requests have waited on the disks. Multiple write requests waiting at the same time increase the number. For example, if 8 requests all wait for an average of 1000 milliseconds, 8000 is reported. Unit: Milliseconds The only statistic that should be used for this metric is Sum. Do not use Average.
ethtool_bw_in_allowance_exceeded	The number of packets queued and/or dropped because the inbound aggregate bandwidth exceeded the maximum for the instance. This metric is collected only if you have listed it in the ethtool subsection of the metrics_collected section of the CloudWatch agent configuration file. For more information, see Collect network performance metrics Unit: None
ethtool_bw_out_allowance_exceeded	The number of packets queued and/or dropped because the outbound aggregate bandwidth exceeded the maximum for the instance. This metric is collected only if you have listed it in the ethtool subsection of the metrics_collected section of the CloudWatch agent configuration file. For more information, see Collect network performance metrics Unit: None

Metric	Description
ethtool_conntrack_allowance_exceeded	The number of packets dropped because connection tracking exceeded the maximum for the instance and new connections could not be established. This can result in packet loss for traffic to or from the instance. This metric is collected only if you have listed it in the ethtool subsection of the metrics_collected section of the CloudWatch agent configuration file. For more information, see Collect network performance metrics Unit: None
ethtool_linklocal_allowance_exceeded	The number of packets dropped because the PPS of the traffic to local proxy services exceeded the maximum for the network interface. This impacts traffic to the DNS service, the Instance Metadata Service, and the Amazon Time Sync Service. This metric is collected only if you have listed it in the ethtool subsection of the metrics_collected section of the CloudWatch agent configuration file. For more information, see Collect network performance metrics Unit: None

Metric	Description
ethtool_pps_allowance_exceeded	The number of packets queued and/or dropped because the bidirectional PPS exceeded the maximum for the instance. This metric is collected only if you have listed it in the ethtool subsection of the metrics_collected section of the CloudWatch agent configuration file. For more information, see Collect network performance metrics. Unit: None
mem_active	The amount of memory that has been used in some way during the last sample period. Unit: Bytes
mem_available	The amount of memory that is available and can be given instantly to processes. Unit: Bytes
mem_available_percent	The percentage of memory that is available and can be given instantly to processes. Unit: Percent
mem_buffered	The amount of memory that is being used for buffers. Unit: Bytes
mem_cached	The amount of memory that is being used for file caches. Unit: Bytes

Metric	Description
mem_free	The amount of memory that isn't being used. Unit: Bytes
mem_inactive	The amount of memory that hasn't been used in some way during the last sample period Unit: Bytes
mem_shared	The amount of memory that is being shared between processes. Unit: Bytes
mem_total	The total amount of memory. Unit: Bytes
mem_used	The amount of memory currently in use. Unit: Bytes
mem_used_percent	The percentage of memory currently in use. Unit: Percent
net_bytes_recv	The number of bytes received by the network interface. Unit: Bytes The only statistic that should be used for this metric is Sum. Do not use Average.
net_bytes_sent	The number of bytes sent by the network interface. Unit: Bytes The only statistic that should be used for this metric is Sum. Do not use Average.

Metric	Description
net_drop_in	The number of packets received by this network interface that were dropped. Unit: Count The only statistic that should be used for this metric is Sum. Do not use Average.
net_drop_out	The number of packets transmitted by this network interface that were dropped. Unit: Count The only statistic that should be used for this metric is Sum. Do not use Average.
net_err_in	The number of receive errors detected by this network interface. Unit: Count The only statistic that should be used for this metric is Sum. Do not use Average.
net_err_out	The number of transmit errors detected by this network interface. Unit: Count The only statistic that should be used for this metric is Sum. Do not use Average.
net_packets_sent	The number of packets sent by this network interface. Unit: Count The only statistic that should be used for this metric is Sum. Do not use Average.

Metric	Description
net_packets_recv	The number of packets received by this network interface. Unit: Count The only statistic that should be used for this metric is Sum. Do not use Average.
netstat_tcp_close	The number of TCP connections with no state. Unit: Count
netstat_tcp_close_wait	The number of TCP connections waiting for a termination request from the client. Unit: Count
netstat_tcp_closing	The number of TCP connections that are waiting for a termination request with acknowledgment from the client. Unit: Count
netstat_tcp_established	The number of TCP connections established. Unit: Count
netstat_tcp_fin_wait1	The number of TCP connections in the FIN_WAIT1 state during the process of closing a connection. Unit: Count
netstat_tcp_fin_wait2	The number of TCP connections in the FIN_WAIT2 state during the process of closing a connection. Unit: Count

Metric	Description
netstat_tcp_last_ack	The number of TCP connections waiting for the client to send acknowledgment of the connectio n termination message. This is the last state right before the connection is closed down. Unit: Count
netstat_tcp_listen	The number of TCP ports currently listening for a connection request. Unit: Count
netstat_tcp_none	The number of TCP connections with inactive clients. Unit: Count
netstat_tcp_syn_sent	The number of TCP connections waiting for a matching connection request after having sent a connection request. Unit: Count
netstat_tcp_syn_recv	The number of TCP connections waiting for connection request acknowledgment after having sent and received a connection request. Unit: Count
netstat_tcp_time_wait	The number of TCP connections currently waiting to ensure that the client received the acknowledgment of its connection termination request. Unit: Count
netstat_udp_socket	The number of current UDP connections. Unit: Count

Metric	Description
processes_blocked	The number of processes that are blocked. Unit: Count
processes_dead	The number of processes that are dead, indicated by the X state code on Linux. This metric is not collected on macOS computers. Unit: Count
processes_idle	The number of processes that are idle (sleeping for more than 20 seconds). Available only on FreeBSD instances. Unit: Count
processes_paging	The number of processes that are paging, indicated by the W state code on Linux. This metric is not collected on macOS computers. Unit: Count
processes_running	The number of processes that are running, indicated by the R state code. Unit: Count
processes_sleeping	The number of processes that are sleeping, indicated by the S state code. Unit: Count
processes_stopped	The number of processes that are stopped, indicated by the T state code. Unit: Count

Metric	Description
processes_total	The total number of processes on the instance. Unit: Count
processes_total_threads	The total number of threads making up the processes. This metric is available only on Linux instances. This metric is not collected on macOS computers. Unit: Count
processes_wait	The number of processes that are paging, indicated by the W state code on FreeBSD instances. This metric is available only on FreeBSD instances, and is not available on Linux, Windows Server, or macOS instances. Unit: Count
processes_zombies	The number of zombie processes, indicated by the Z state code. Unit: Count
swap_free	The amount of swap space that isn't being used. Unit: Bytes
swap_used	The amount of swap space currently in use. Unit: Bytes
swap_used_percent	The percentage of swap space currently in use. Unit: Percent

Definitions of memory metrics collected by the CloudWatch agent

When the CloudWatch agent collects memory metrics, the source is the host's memory management subsystem. For example, the Linux kernel exposes OS-maintained data in `/proc`. For memory, the data is in `/proc/meminfo`.

Each different operating system and architecture has different calculations of the resources that are used by processes. For more information, see the following sections.

During each collection interval, the CloudWatch agent on each instance collects the instance resources and calculates the resources being used by all processes which are running in that instance. This information is reported back to CloudWatch metrics. You can configure the length of the collection interval in the CloudWatch agent configuration file. For more information, see CloudWatch agent configuration file: Agent section.

The following list explains how the memory metrics that the CloudWatch agent collects are defined.

- **Active Memory**– Memory that is being used by a process. In other words, the memory used by current running apps.
- **Available Memory**– The memory that can be instantly given to the processes without the system going into swap (also known as virtual memory).
- **Buffer Memory**– The data area shared by hardware devices or program processes that operate at different speeds and priorities.
- **Cached Memory**– Stores program instructions and data that are used repeatedly in the operation of programs that the CPU is likely to need next.
- **Free Memory**– Memory that is not being used at all and is readily available. It is completely free for the system to be used when needed.
- **Inactive Memory**– Pages that have not been accessed "recently".
- **Total Memory**– The size of the actual physical memory RAM.
- **Used Memory**– Memory that is currently in use by programs and processes.

Topics

- Linux: Metrics collected and calculations used
- macOS: Metrics collected and calculations used

- Windows: Metrics collected
- Example: Calculating memory metrics on Linux

Linux: Metrics collected and calculations used

Metrics collected and units:

- Active (Bytes)
- Available (Bytes)
- Available Percent (Percent)
- Buffered (Bytes)
- Cached (Bytes)
- Free (Bytes)
- Inactive (Bytes)
- Total (Bytes)
- Used (Bytes)
- Used Percent (Percent)

Used memory = Total Memory - Free Memory - Cached memory - Buffer memory

Total memory = Used Memory + Free Memory + Cached memory + Buffer memory

macOS: Metrics collected and calculations used

Metrics collected and units:

- Active (Bytes)
- Available (Bytes)
- Available Percent (Percent)
- Free (Bytes)
- Inactive (Bytes)
- Total (Bytes)
- Used (Bytes)

- Used Percent (Percent)

Available memory = Free Memory + Inactive memory

Used memory = Total Memory - Available memory

Total memory = Available Memory + Used Memory

Windows: Metrics collected

The metrics collected on Windows hosts are listed below. All of these metrics have None for `Unit`.

- Available bytes
- Cache Faults/sec
- Page Faults/sec
- Pages/sec

There are no calculations used for Windows metrics because the CloudWatch agent parses events from performance counters.

Example: Calculating memory metrics on Linux

As an example, suppose that entering the **`cat /proc/meminfo`** command on a Linux host shows the following results:

```
MemTotal:       3824388 kB
MemFree:         462704 kB
MemAvailable:   2157328 kB
Buffers:         126268 kB
Cached:         1560520 kB
SReclaimable:    289080 kB>
```

In this example, the CloudWatch agent will collect the following values. All the values that the CloudWatch agent collects and reports are in bytes.

- `mem_total`: 3916173312 bytes
- `mem_available`: 2209103872 bytes (MemFree + Cached)
- `mem_free`: 473808896 bytes
- `mem_cached`: 1893990400 bytes (`cached` + `SReclaimable`

- `mem_used`: 1419075584 bytes (`MemTotal` – (`MemFree` + `Buffers` + (`Cached` + `SReclaimable`)))
- `mem_buffered`: 129667072 bytes
- `mem_available_percent`: 56.41%
- `mem_used_percent`: 36.24% (`mem_used` / `mem_total`) * 100

Using the CloudWatch agent with related telemetry

Metrics and logs that are sent to CloudWatch can include an optional entity to correlate telemetry. Entities are used in the Explore related pane. The CloudWatch agent sends entities with a service name and environment name included.

The agent chooses the service name and environment name from the following data.

Service name

The agent chooses the service name from the following options, in priority order:

- **Application Signals instrumentation** – The agent sends the service name used by Application Signals. This can be overwritten by changing the `OTEL_SERVICE_NAME` environment variable used by supported OpenTelemetry instrumentation libraries.
- **CloudWatch agent configuration** – You can configure the agent to use a specific service name. This can be configured at the agent, plugin, metrics, logs, or log file level.
- **Kubernetes workload name** – For Kubernetes workloads, the agent sends the name of the workload for the corresponding pod, in the following priority order.
  - Deployment name
  - ReplicaSet name
  - StatefulSet name
  - DaemonSet name
  - CronJob name
  - Job name
  - Pod name
  - Container name
- **Resource tags from instance metadata** – For Amazon EC2 workloads, the agent sends the a name from tags, in the following order.

- service
- application
- app

You must setup instance metadata for the agent to be able to access tags.

- **Default** – If no other service name is found, the agent will send the name `Unknown`.

Environment name

The agent chooses the environment name from the following options, in priority order:

- **Application Signals instrumentation** – The agent sends the environment name used by Application Signals. This can be overwritten by setting a `deployment.environment` environment variable used by supported OpenTelemetry instrumentation libraries. For example, applications may set the environment variable `OTEL_RESOURCE_ATTRIBUTES=deployment.environment=MyEnvironment`.
- **CloudWatch agent configuration** – You can configure the agent to use a specific environment name. This can be configured at the agent, plugin, metrics, logs, or log file level.
- **Cluster name and workspace** – For Amazon EKS, `eks:`*`cluster-name`*`/`*`Namespace`*. For native Kubernetes running on Amazon EC2, `k8s:`*`cluster-name`*`/`*`Namespace`*.
- **Resource tags from instance metadata** – For Amazon EC2 workloads, the agent can will use the `AutoScalingGroup` tag.

  You must setup instance metadata for the agent to be able to access tags.
- By default, Amazon EC2 instances that aren't running Kubernetes will get the environment name `ec2:default`.

Common scenarios with the CloudWatch agent

This section provides you with different scenarios that outline how to complete common configuration and customization tasks for the CloudWatch agent.

Topics

- Running the CloudWatch agent as a different user
- How the CloudWatch agent handles sparse log files

- Adding custom dimensions to metrics collected by the CloudWatch agent
- Aggregating or rolling up metrics collected by the CloudWatch agent
- Collecting high-resolution metrics with the CloudWatch agent
- Sending metrics, logs, and traces to a different account
- Timestamp differences between the CloudWatch agent and the earlier CloudWatch Logs agent
- Appending OpenTelemetry collector configuration files

Running the CloudWatch agent as a different user

On Linux servers, the CloudWatch runs as the root user by default. To have the agent run as a different user, use the `run_as_user` parameter in the `agent` section in the CloudWatch agent configuration file. This option is available only on Linux servers.

If you're already running the agent with the root user and want to change to using a different user, use one of the following procedures.

To run the CloudWatch agent as a different user on an EC2 instance running Linux

1. Download and install a new CloudWatch agent package.
2. Create a new Linux user or use the default user named `cwagent` that the RPM or DEB file created.
3. Provide credentials for this user in one of these ways:
   - If the file `.aws/credentials` exists in the home directory of the root user, you must create a credentials file for the user you are going to use to run the CloudWatch agent. This credentials file will be /home/*username*/`.aws/credentials`. Then set the value of the `shared_credential_file` parameter in `common-config.toml` to the pathname of the credential file. For more information, see Install the CloudWatch agent using AWS Systems Manager.
   - If the file `.aws/credentials` does not exist in the home directory of the root user, you can do one of the following:
     - Create a credentials file for the user you are going to use to run the CloudWatch agent. This credentials file will be /home/*username*/`.aws/credentials`. Then set the value of the `shared_credential_file` parameter in `common-config.toml` to the pathname of the credential file. For more information, see Install the CloudWatch agent using AWS Systems Manager.

- Instead of creating a credentials file, attach an IAM role to the instance. The agent uses this role as the credential provider.

4. In the CloudWatch agent configuration file, add the following line in the `agent` section:

```
"run_as_user": "username"
```

   Make other modifications to the configuration file as needed. For more information, see Create the CloudWatch agent configuration file

5. Give the user the required permissions. The user must have Read (r) permissions for the log files to be collected, and must have Execute (x) permission on every directory in the log files' path.

6. Start the agent with the configuration file that you just modified.

```
sudo /opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-ctl -a fetch-
config -m ec2 -s -c file:configuration-file-path
```

To run the CloudWatch agent as a different user on an on-premises server running Linux

1. Download and install a new CloudWatch agent package.

2. Create a new Linux user or use the default user named `cwagent` that the RPM or DEB file created.

3. Store the credentials of this user to a path that the user can access, such as `/home/username/.aws/credentials`.

4. Set the value of the `shared_credential_file` parameter in `common-config.toml` to the pathname of the credential file. For more information, see Install the CloudWatch agent using AWS Systems Manager.

5. In the CloudWatch agent configuration file, add the following line in the `agent` section:

```
"run_as_user": "username"
```

   Make other modifications to the configuration file as needed. For more information, see Create the CloudWatch agent configuration file

6. Give the user required permissions. The user must have Read (r) permissions for the log files to be collected, and must have Execute (x) permission on every directory in the log files' path.

7. Start the agent with the configuration file that you just modified.

```
sudo /opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-ctl -a fetch-
config -m ec2 -s -c file:configuration-file-path
```

How the CloudWatch agent handles sparse log files

Sparse files are files with both empty blocks and real contents. A sparse file uses disk space more efficiently by writing brief information representing the empty blocks to disk instead of the actual null bytes which makes up the block. This makes the actual size of a sparse file usually much smaller than its apparent size.

However, the CloudWatch agent doesn't treat sparse files differently than it treats normal files. When the agent reads a sparse file, the empty blocks are treated as "real" blocks filled with null bytes. Because of this, the CloudWatch agent publishes as many bytes as the apparent size of a sparse file to CloudWatch.

Configuring the CloudWatch agent to publish a sparse file can cause higher than expected CloudWatch costs, so we recommend not to do so. For example, `/var/logs/lastlog` in Linux is usually a very sparse file, and we recommend that you don't publish it to CloudWatch.

Adding custom dimensions to metrics collected by the CloudWatch agent

To add custom dimensions such as tags to metrics collected by the agent, add the `append_dimensions` field to the section of the agent configuration file that lists those metrics.

For example, the following example section of the configuration file adds a custom dimension named `stackName` with a value of `Prod` to the `cpu` and `disk` metrics collected by the agent.

```
"cpu":{
  "resources":[
    "*"
  ],
  "measurement":[
    "cpu_usage_guest",
    "cpu_usage_nice",
    "cpu_usage_idle"
  ],
```

```
  "totalcpu":false,
  "append_dimensions":{
    "stackName":"Prod"
  }
},
"disk":{
  "resources":[
    "/",
    "/tmp"
  ],
  "measurement":[
    "total",
    "used"
  ],
  "append_dimensions":{
    "stackName":"Prod"
  }
}
```

Remember that any time you change the agent configuration file, you must restart the agent to have the changes take effect.

Aggregating or rolling up metrics collected by the CloudWatch agent

To aggregate or roll up metrics collected by the agent, add an `aggregation_dimensions` field to the section for that metric in the agent configuration file.

For example, the following configuration file snippet rolls up metrics on the `AutoScalingGroupName` dimension. The metrics from all instances in each Auto Scaling group are aggregated and can be viewed as a whole.

```
"metrics": {
  "cpu":{...}
  "disk":{...}
  "aggregation_dimensions" : [["AutoScalingGroupName"]]
}
```

To roll up along the combination of each `InstanceId` and `InstanceType` dimensions in addition to rolling up on the Auto Scaling group name, add the following.

```
"metrics": {
```

```
  "cpu":{...}
  "disk":{...}
  "aggregation_dimensions" : [["AutoScalingGroupName"], ["InstanceId", "InstanceType"]]
}
```

To roll up metrics into one collection instead, use `[]`.

```
"metrics": {
  "cpu":{...}
  "disk":{...}
  "aggregation_dimensions" : [[]]
}
```

Remember that any time you change the agent configuration file, you must restart the agent to have the changes take effect.

Collecting high-resolution metrics with the CloudWatch agent

The `metrics_collection_interval` field specifies the time interval for the metrics collected, in seconds. By specifying a value of less than 60 for this field, the metrics are collected as high-resolution metrics.

For example, if your metrics should all be high-resolution and collected every 10 seconds, specify 10 as the value for `metrics_collection_interval` under the `agent` section as a global metrics collection interval.

```
"agent": {
  "metrics_collection_interval": 10
}
```

Alternatively, the following example sets the `cpu` metrics to be collected every second, and all other metrics are collected every minute.

```
"agent":{
  "metrics_collection_interval": 60
},
"metrics":{
  "metrics_collected":{
    "cpu":{
      "resources":[
```

```
        "*"
      ],
      "measurement":[
        "cpu_usage_guest"
      ],
      "totalcpu":false,
      "metrics_collection_interval": 1
    },
    "disk":{
      "resources":[
        "/",
        "/tmp"
      ],
      "measurement":[
        "total",
        "used"
      ]
    }
  }
}
```

Remember that any time you change the agent configuration file, you must restart the agent to have the changes take effect.

Sending metrics, logs, and traces to a different account

To have the CloudWatch agent send the metrics, logs, or traces to a different account, specify a `role_arn` parameter in the agent configuration file on the sending server. The `role_arn` value specifies an IAM role in the target account that the agent uses when sending data to the target account. This role enables the sending account to assume a corresponding role in the target account when delivering the metrics or logs to the target account.

You can also specify separate `role_arn` strings in the agent configuration file: one to use when sending metrics, another for sending logs, and another for sending traces.

The following example of part of the `agent` section of the configuration file sets the agent to use `CrossAccountAgentRole` when sending data to a different account.

```
{
  "agent": {
    "credentials": {
```

```
      "role_arn": "arn:aws:iam::123456789012:role/CrossAccountAgentRole"
    }
  },
  .....
}
```

Alternatively, the following example sets different roles for the sending account to use for sending metrics, logs, and traces:

```
"metrics": {
    "credentials": {
     "role_arn": "RoleToSendMetrics"
    },
    "metrics_collected": {....
```

```
"logs": {
    "credentials": {
    "role_arn": "RoleToSendLogs"
    },
    ....
```

Policies needed

When you specify a `role_arn` in the agent configuration file, you must also make sure the IAM roles of the sending and target accounts have certain policies. The roles in both the sending and target accounts should have `CloudWatchAgentServerPolicy`. For more information about assigning this policy to a role, see Prerequisites.

The role in the sending account also must include the following policy. You add this policy on the **Permissions** tab in the IAM console when you edit the role.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
```

```
            "Action": [
                "sts:AssumeRole"
            ],
            "Resource": [
                "arn:aws:iam::111122223333:role/agent-role-in-target-account"
            ]
        }
    ]
}
```

The role in the target account must include the following policy so that it recognizes the IAM role used by the sending account. You add this policy on the **Trust relationships** tab in the IAM console when you edit the role. This role is the role specified in *agent-role-in-target-account* in the policy used by the sending account.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "AWS": [
                    "arn:aws:iam::111122223333:role/role-in-sender-account"
                ]
            },
            "Action": "sts:AssumeRole"
        }
    ]
}
```

Timestamp differences between the CloudWatch agent and the earlier CloudWatch Logs agent

The CloudWatch agent supports a different set of symbols for timestamp formats, compared to the earlier CloudWatch Logs agent. These differences are shown in the following table.

Symbols supported by both agents	Symbols supported only by CloudWatch agent	Symbols supported only by earlier CloudWatch Logs agent
%A, %a, %b, %B, %d, %f, %H, %l, %m, %M, %p, %S, %y, %Y, %Z, %z	%-d, %-l, %-m, %-M, %-S	%c,%j, %U, %W, %w

For more information about the meanings of the symbols supported by the new CloudWatch agent, see CloudWatch Agent Configuration File: Logs Section in the *Amazon CloudWatch User Guide*. For information about symbols supported by the CloudWatch Logs agent, see Agent Configuration File in the *Amazon CloudWatch Logs User Guide*.

Appending OpenTelemetry collector configuration files

The CloudWatch agent supports supplemental OpenTelemetry collector configuration files alongside its own configuration files. This feature allows you to use CloudWatch agent features such as CloudWatch Application Signals or Container Insights through the CloudWatch agent configuration and bring in your existing OpenTelemetry collector configuration with a single agent.

To prevent merge conflicts with pipelines automatically created by CloudWatch agent, we recommend that you add a custom suffix to each of the components and pipelines in your OpenTelemetry collector configuration.

```
receivers:
  otlp/custom-suffix:
    protocols:
      http:

exporters:
  awscloudwatchlogs/custom-suffix:
    log_group_name: "test-group"
    log_stream_name: "test-stream"

service:
  pipelines:
    logs/custom-suffix:
      receivers: [otlp/custom-suffix]
      exporters: [awscloudwatchlogs/custom-suffix]
```

To configure the CloudWatch agent, start the CloudWatch agent using the `fetch-config` option and specify the CloudWatch agent's configuration file. CloudWatch agent requires at least one CloudWatch agent configuration file.

```
/opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-ctl -a fetch-config -c
 file:/tmp/agent.json -s
```

Next, use the `append-config` option while specifying the OpenTelemetry collector configuration file.

```
/opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-ctl -a append-config -c
 file:/tmp/otel.yaml -s
```

The agent merges the two configuration files on start up and logs the resolved configuration.

CloudWatch agent credentials preference

This section outlines the credentials provider chain the CloudWatch agent uses to obtain credentials when communicating with other AWS services and APIs. The ordering is as follows:

> **Note**
>
> The preferences listed in numbers two through five are the same preference order as defined in the AWS SDK. For more information, see Specifying Credentials in the SDK documentation.

1. Shared config and credentials files as defined in the CloudWatch agent's `common-config.toml` file. For more information, see Install the CloudWatch agent using AWS Systems Manager.
2. AWS SDK environment variables

> **Important**
>
> On Linux, if you run the CloudWatch agent using the `amazon-cloudwatch-agent-ctl` script, the script starts the agent as a `systemd` service. In this case, environment

variables such as `HOME`, `AWS_ACCESS_KEY_ID`, and `AWS_SECRET_ACCESS_KEY` are not accessible by the agent.

3. Shared configuration and credentials files found in `$HOME/%USERPROFILE%`

> **Note**
>
> The CloudWatch agent looks for `.aws/credentials` in `$HOME` for Linux and MacOS and looks in `%USERPROFILE%` for Windows. Unlike the AWS SDK, the CloudWatch agent does not have fallback methods to determine the home directory if the environment variables are inaccessible. This difference in behavior is to maintain backwards compatibility with earlier implementations of the AWS SDK.
> Furthermore, unlike with the shared credentials found in `common-config.toml`, if the AWS SDK-derived shared credentials expire and are rotated, the renewed credentials are not automatically picked up by the CloudWatch agent and require a restart of the agent to do so.

4. An AWS Identity and Access Management role for tasks if an application is present that uses an Amazon Elastic Container Service task definition or a RunTask API operation.
5. An instance profile attached to an Amazon EC2 instance.

As a best practice, we recommend that you specify credentials in the following order when you use the CloudWatch agent.

1. Use IAM roles for tasks if your application uses an Amazon Elastic Container Service task definition or a RunTask API operation.
2. Use IAM roles if your application runs on an Amazon EC2 instance.
3. Use the CloudWatch agent `common-config.toml` file to specify the credentials file. This credentials file is the same one used by other AWS SDKs and the AWS CLI. If you're already using a shared credentials file, you can also use it for this purpose. If you provide it by using the CloudWatch agent's `common-config.toml` file, you ensure that the agent will consume rotated credentials when they expire and get replaced without requiring you to restart the agent.
4. Use environment variables. Setting environment variables is useful if you're doing development work on a computer other than an Amazon EC2 instance.

> **Note**
>
> If you send telemetry to a different account as explained in Sending metrics, logs, and traces to a different account, the CloudWatch agent uses the credentials provider chain described in this section to obtain the initial set of credentials. It then uses those credentials when assuming the IAM role specified by `role_arn` in the CloudWatch agent configuration file.

Troubleshooting the CloudWatch agent

You can use the information in this section to troubleshoot issues you might encounter with the CloudWatch agent.

When encountering issues with the CloudWatch agent, you can use the `AWSSupport-TroubleshootCloudWatchAgent` automation runbook. The AWS troubleshooting tool can:

- Verify IAM permissions and instance profiles
- Check agent status and analyze logs
- Test endpoint connectivity
- Automatically collect and upload relevant logs to Amazon S3

For detailed information on the AWS troubleshooting tool, see Support Automation Workflow (SAW) Runbook - Troubleshoot CloudWatch agent.

Topics

- CloudWatch agent command line parameters
- Install the CloudWatch agent using Run Command fails
- The CloudWatch agent won't start
- Verify that the CloudWatch agent is running
- The CloudWatch agent won't start, and the error mentions an Amazon EC2 Region
- The CloudWatch agent won't start on Windows Server
- Where are the metrics?
- The CloudWatch agent takes a long time to run in a container or logs a hop limit error

- I updated my agent configuration but don't see the new metrics or logs in the CloudWatch console
- CloudWatch agent files and locations
- Finding information about CloudWatch agent versions
- Logs generated by the CloudWatch agent
- Stopping and restarting the CloudWatch agent

CloudWatch agent command line parameters

To see the full list of parameters supported by the CloudWatch agent, enter the following at the command line at a computer where you have it installed:

```
amazon-cloudwatch-agent-ctl -help
```

Install the CloudWatch agent using Run Command fails

To install the CloudWatch agent using Systems Manager Run Command, the SSM Agent on the target server must be version 2.2.93.0 or later of the SSM Agent agent. If your SSM Agent isn't the correct version, you might see errors that include the following messages:

```
no latest version found for package AmazonCloudWatchAgent on platform linux
```

```
failed to download installation package reliably
```

For information about updating your SSM Agent version, see Installing and Configuring SSM Agent in the *AWS Systems Manager User Guide*.

The CloudWatch agent won't start

If the CloudWatch agent fails to start, there might be an issue in your configuration. Configuration information is logged in the `configuration-validation.log` file. This file is located in `/opt/aws/amazon-cloudwatch-agent/logs/configuration-validation.log` on Linux servers and in `$Env:ProgramData\Amazon\AmazonCloudWatchAgent\Logs\configuration-validation.log` on servers running Windows Server.

Verify that the CloudWatch agent is running

You can query the CloudWatch agent to find whether it's running or stopped. You can use AWS Systems Manager to do this remotely. You can also use the command line, but only to check the local server.

To query the status of the CloudWatch agent using Run Command

1. Open the Systems Manager console at https://console.aws.amazon.com/systems-manager/.
2. In the navigation pane, choose **Run Command**.

   -or-

   If the AWS Systems Manager home page opens, scroll down and choose **Explore Run Command**.
3. Choose **Run command**.
4. In the **Command document** list, choose the button next to **AmazonCloudWatch-ManageAgent**.
5. In the **Action** list, choose **status**.
6. For **Optional Configuration Source** choose **default** and keep **Optional Configuration Location** blank.
7. In the **Target** area, choose the instance to check.
8. Choose **Run**.

If the agent is running, the output resembles the following.

```
{
       "status": "running",
       "starttime": "2017-12-12T18:41:18",
       "version": "1.73.4"
}
```

If the agent is stopped, the `"status"` field displays `"stopped"`.

To query the status of the CloudWatch agent locally using the command line

- On a Linux server, enter the following:

```
sudo /opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-ctl -m ec2 -a
 status
```

On a server running Windows Server, enter the following in PowerShell as an administrator:

```
& $Env:ProgramFiles\Amazon\AmazonCloudWatchAgent\amazon-cloudwatch-agent-ctl.ps1 -m
 ec2 -a status
```

The CloudWatch agent won't start, and the error mentions an Amazon EC2 Region

If the agent doesn't start and the error message mentions an Amazon EC2 Region endpoint, you might have configured the agent to need access to the Amazon EC2 endpoint without granting that access.

For example, if you specify a value for the `append_dimensions` parameter in the agent configuration file that depends on Amazon EC2 metadata and you use proxies, you must make sure that the server can access the endpoint for Amazon EC2. For more information about these endpoints, see Amazon Elastic Compute Cloud (Amazon EC2) in the *Amazon Web Services General Reference*.

The CloudWatch agent won't start on Windows Server

On Windows Server, you might see the following error:

```
Start-Service : Service 'Amazon CloudWatch Agent (AmazonCloudWatchAgent)' cannot be
 started due to the following
error: Cannot start service AmazonCloudWatchAgent on computer '.'.
At C:\Program Files\Amazon\AmazonCloudWatchAgent\amazon-cloudwatch-agent-ctl.ps1:113
 char:12
+     $svc | Start-Service
+            ~~~~~~~~~~~~~
    + CategoryInfo          : OpenError:
 (System.ServiceProcess.ServiceController:ServiceController) [Start-Service],
   ServiceCommandException
    + FullyQualifiedErrorId :
 CouldNotStartService,Microsoft.PowerShell.Commands.StartServiceCommand
```

To fix this, first make sure that the server service is running. This error can be seen if the agent tries to start when the server service isn't running.

If the server service is already running, the following may be the issue. On some Windows Server installations, the CloudWatch agent takes more than 30 seconds to start. Because Windows Server, by default, allows only 30 seconds for services to start, this causes the agent to fail with an error similar to the following:

To fix this issue, increase the service timeout value. For more information, see A service does not start, and events 7000 and 7011 are logged in the Windows event log.

Where are the metrics?

If the CloudWatch agent has been running but you can't find metrics collected by it in the AWS Management Console or the AWS CLI, confirm that you're using the correct namespace. By default, the namespace for metrics collected by the agent is `CWAgent`. You can customize this namespace using the `namespace` field in the `metrics` section of the agent configuration file. If you don't see the metrics that you expect, check the configuration file to confirm the namespace being used.

When you first download the CloudWatch agent package, the agent configuration file is `amazon-cloudwatch-agent.json`. This file is in the directory where you ran the configuration wizard, or you might have moved it to a different directory. If you use the configuration wizard, the agent configuration file output from the wizard is named `config.json`. For more information about the configuration file, including the `namespace` field, see CloudWatch agent configuration file: Metrics section.

The CloudWatch agent takes a long time to run in a container or logs a hop limit error

When you run the CloudWatch agent as a container service and want to add Amazon EC2 metric dimensions to all metrics collected by the agent, you might see the following errors in version v1.247354.0 of the agent:

```
2022-06-07T03:36:11Z E! [processors.ec2tagger] ec2tagger: Unable to retrieve Instance
 Metadata Tags. This plugin must only be used on an EC2 instance.
2022-06-07T03:36:11Z E! [processors.ec2tagger] ec2tagger: Please increase hop limit
 to 2 by following this document https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/
configuring-instance-metadata-options.html#configuring-IMDS-existing-instances.
2022-06-07T03:36:11Z E! [telegraf] Error running agent: could not initialize processor
 ec2tagger: EC2MetadataRequestError: failed to get EC2 instance identity document
```

```
caused by: EC2MetadataError: failed to make EC2Metadata request
        status code: 401, request id:
caused by:
```

You might see this error if the agent tries to get metadata from IMDSv2 inside a container without an appropriate hop limit. In versions of the agent earlier than v1.247354.0, you can experience this issue without seeing the log message.

To solve this, increase the hop limit to 2 by following the instructions in Configure the instance metadata options.

I updated my agent configuration but don't see the new metrics or logs in the CloudWatch console

If you update your CloudWatch agent configuration file, the next time that you start the agent, you need to use the **`fetch-config`** option. For example, if you stored the updated file on the local computer, enter the following command:

```
sudo /opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-ctl -a fetch-config -s -m ec2 -c file:configuration-file-path
```

CloudWatch agent files and locations

The following table lists the files installed by and used with the CloudWatch agent, along with their locations on servers running Linux or Windows Server.

File	Linux location	Windows Server location
The control script that controls starting, stopping, and restarting the agent.	`/opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-ctl` or `/usr/bin/amazon-cloudwatch-agent-ctl`	`$Env:ProgramFiles\Amazon\AmazonCloudWatchAgent\amazon-cloudwatch-agent-ctl.ps1`
The log file the agent writes to. You might need to attach	`/opt/aws/amazon-cloudwatch-agent/logs/amazon-cloudwatc`	`$Env:ProgramData\Amazon\AmazonCloudWatchAgent\Logs\ama`

File	Linux location	Windows Server location
this when contacting AWS Support.	`h-agent.log` or `/var/log/amazon/amazon-cloudwatch-agent/amazon-cloudwatch-agent.log`	`zon-cloudwatch-agent.log`
Agent configuration validation file.	`/opt/aws/amazon-cloudwatch-agent/logs/configuration-validation.log` or `/var/log/amazon/amazon-cloudwatch-agent/configuration-validation.log`	`$Env:ProgramData\Amazon\AmazonCloudWatchAgent\Logs\configuration-validation.log`
The JSON file used to configure the agent immediately after the wizard creates it. For more information, see Create the CloudWatch agent configuration file.	`/opt/aws/amazon-cloudwatch-agent/bin/config.json`	`$Env:ProgramFiles\Amazon\AmazonCloudWatchAgent\config.json`
The JSON file used to configure the agent if this configuration file has been downloaded from Parameter Store.	`/opt/aws/amazon-cloudwatch-agent/etc/amazon-cloudwatch-agent.json` or `/etc/amazon/amazon-cloudwatch-agent/amazon-cloudwatch-agent.json`	`$Env:ProgramData\Amazon\AmazonCloudWatchAgent\amazon-cloudwatch-agent.json`

File	Linux location	Windows Server location
The TOML file used to specify Region and credential information to be used by the agent, overriding system defaults.	`/opt/aws/amazon-cloudwatch-agent/etc/common-config.toml` or `/etc/amazon/amazon-cloudwatch-agent/common-config.toml`	`$Env:ProgramData\Amazon\AmazonCloudWatchAgent\common-config.toml`
The TOML file that contains the converted contents of the JSON configuration file. The `amazon-cloudwatch-agent-ctl` script generates this file. Users should not directly modify this file. It can be useful for verifying that JSON to TOML translation was successful.	`/opt/aws/amazon-cloudwatch-agent/etc/amazon-cloudwatch-agent.toml` or `/etc/amazon/amazon-cloudwatch-agent/amazon-cloudwatch-agent.toml`	`$Env:ProgramData\Amazon\AmazonCloudWatchAgent\amazon-cloudwatch-agent.toml`
The YAML file that contains the converted contents of the JSON configuration file. The `amazon-cloudwatch-agent-ctl` script generates this file. You should not directly modify this file. This file can be useful for verifying that the JSON to YAML translation was successful.	`/opt/aws/amazon-cloudwatch-agent/etc/amazon-cloudwatch-agent.yaml` or `/etc/amazon/amazon-cloudwatch-agent/amazon-cloudwatch-agent.yaml`	`$Env:ProgramData\Amazon\AmazonCloudWatchAgent\amazon-cloudwatch-agent.yaml`

Finding information about CloudWatch agent versions

To find the version number of the CloudWatch agent on a Linux server, enter the following command:

```
sudo /opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-ctl -a status
```

To find the version number of the CloudWatch agent on Windows Server, enter the following command:

```
& $Env:ProgramFiles\Amazon\AmazonCloudWatchAgent\amazon-cloudwatch-agent-ctl.ps1 -m ec2
 -a status
```

> **Note**
>
> Using this command is the correct way to find the version of the CloudWatch agent. If you use **Programs and Features** in the Control Panel, you will see an incorrect version number.

You can also download a README file about the latest changes to the agent, and a file that indicates the version number that is currently available for download. These files are in the following locations:

- `https://amazoncloudwatch-agent.s3.amazonaws.com/info/latest/RELEASE_NOTES` or `https://amazoncloudwatch-agent-`*`us-east-1`*`.s3.`*`us-east-1`*`.amazonaws.com/info/latest/RELEASE_NOTES`
- `https://amazoncloudwatch-agent.s3.amazonaws.com/info/latest/CWAGENT_VERSION` or `https://amazoncloudwatch-agent-`*`us-east-1`*`.s3.`*`us-east-1`*`.amazonaws.com/info/latest/CWAGENT_VERSION`

Logs generated by the CloudWatch agent

The agent generates a log while it runs. This log includes troubleshooting information. This log is the `amazon-cloudwatch-agent.log` file. This file is located in `/opt/aws/amazon-cloudwatch-agent/logs/amazon-cloudwatch-agent.log` on Linux servers and in `$Env:ProgramData\Amazon\AmazonCloudWatchAgent\Logs\amazon-cloudwatch-agent.log` on servers running Windows Server.

You can configure the agent to log additional details in the `amazon-cloudwatch-agent.log` file. In the agent configuration file, in the `agent` section, set the `debug` field to `true`, then reconfigure and restart the CloudWatch agent. To disable the logging of this extra information, set the `debug` field to `false`. Then, reconfigure and restart the agent. For more information, see Manually create or edit the CloudWatch agent configuration file.

In versions 1.247350.0 and later of the CloudWatch agent, you can optionally set the `aws_sdk_log_level` field in the `agent` section of the agent configuration file to one or more of the following options. Separate multiple options with the `|` character.

- `LogDebug`
- `LogDebugWithSigning`
- `LogDebugWithHTTPBody`
- `LogDebugRequestRetries`
- `LogDebugWithEventStreamBody`

For more information about these options, see LogLevelType.

Stopping and restarting the CloudWatch agent

You can manually stop the CloudWatch agent using either AWS Systems Manager or the command line.

To stop the CloudWatch agent using Run Command

1. Open the Systems Manager console at https://console.aws.amazon.com/systems-manager/.
2. In the navigation pane, choose **Run Command**.

   -or-

   If the AWS Systems Manager home page opens, scroll down and choose **Explore Run Command**.
3. Choose **Run command**.
4. In the **Command document** list, choose **AmazonCloudWatch-ManageAgent**.
5. In the **Targets** area, choose the instance where you installed the CloudWatch agent.
6. In the **Action** list, choose **stop**.
7. Keep **Optional Configuration Source** and **Optional Configuration Location** blank.

8. Choose **Run**.

To stop the CloudWatch agent locally using the command line

- On a Linux server, enter the following:

```
sudo /opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-ctl -m ec2 -a
 stop
```

  On a server running Windows Server, enter the following in PowerShell as an administrator:

```
& $Env:ProgramFiles\Amazon\AmazonCloudWatchAgent\amazon-cloudwatch-agent-ctl.ps1 -m
 ec2 -a stop
```

To restart the agent, follow the instructions in (Optional) Modify the common configuration and named profile for CloudWatch agent.

Embedding metrics within logs

The CloudWatch embedded metric format allows you to generate custom metrics asynchronously in the form of logs written to CloudWatch Logs. You can embed custom metrics alongside detailed log event data, and CloudWatch automatically extracts the custom metrics so that you can visualize and alarm on them, for real-time incident detection. Additionally, the detailed log events associated with the extracted metrics can be queried using CloudWatch Logs Insights to provide deep insights into the root causes of operational events.

Embedded metric format helps you generate actionable custom metrics from ephemeral resources such as Lambda functions and containers. By using the embedded metric format to send logs from these ephemeral resources, you can now easily create custom metrics without having to instrument or maintain separate code, while gaining powerful analytical capabilities on your log data.

No setup is required to use the embedded metric format. Either structure your logs by following the Embedded metric format specification, or generate them using our client libraries and send them to CloudWatch Logs using the PutLogEvents API or the CloudWatch agent.

To generate metrics from logs with embedded metric format, you need the `logs:PutLogEvents` permission but you don't need to also have the `cloudwatch:PutMetricData` permission.

Charges are incurred for logs ingestion and archival, and custom metrics that are generated. For more information, see Amazon CloudWatch Pricing.

> **Note**
>
> Be careful when configuring your metric extraction as it impacts your custom metric usage and corresponding bill. If you unintentionally create metrics based on high-cardinality dimensions (such as `requestId`), the embedded metric format will by design create a custom metric corresponding to each unique dimension combination. For more information, see Dimensions.

The following topics describe how to publish logs using the embedded metric format, view your metrics and logs in the console, and set alarms on metrics created with the embedded metric format.

Topics

- Publishing logs with the embedded metric format
- Viewing your metrics and logs in the console
- Setting alarms on metrics created with the embedded metric format

Publishing logs with the embedded metric format

You can generate embedded metric format logs using the following methods:

- Generate and send the logs by using the open-sourced client libraries.
- Manually generate the logs using the embedded metric format specification, and then use the CloudWatch agent or the PutLogEvents API to send the logs.

The following topics provide more information about embedded metrics.

Topics

- Creating logs in embedded metric format using the client libraries
- Specification: Embedded metric format
- Using the PutLogEvents API to send manually-created embedded metric format logs
- Using the CloudWatch agent to send embedded metric format logs
- Using the embedded metric format with AWS Distro for OpenTelemetry

Creating logs in embedded metric format using the client libraries

You can use the open-sourced client libraries that Amazon provides to create embedded metric format logs. Full examples for different setups can be found in our client libraries under **/ examples**. The libraries and the instructions for how to use them are located on Github.

- Node.Js

> **Note**
>
> For Node.js, versions 4.1.1+, 3.0.2+, 2.0.7+ are required for use with the Lambda JSON log format. Using previous versions in such Lambda environments will lead to metric loss. For more information, see Accessing Amazon CloudWatch logs for AWS Lambda.

- Python
- Java
- C#

Client libraries are meant to work out of the box with the CloudWatch agent. Generated embedded metric format logs are sent to the CloudWatch agent, which then aggregates and publishes them to CloudWatch Logs for you.

> **Note**
>
> When using Lambda, no agent is required to send the logs to CloudWatch. Anything logged to STDOUT is sent to CloudWatch Logs via the Lambda Logging Agent.

Specification: Embedded metric format

The CloudWatch embedded metric format is a JSON specification used to instruct CloudWatch Logs to automatically extract metric values embedded in structured log events. You can use CloudWatch to graph and create alarms on the extracted metric values. This section describes embedded metric format specification conventions and the embedded metric format document structure.

Embedded metric format specification conventions

The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this format specification are to be interpreted as described in Key Words RFC2119.

The terms "JSON", "JSON text", "JSON value", "member", "element", "object", "array", "number", "string", "boolean", "true", "false", and "null" in this format specification are to be interpreted as defined in JavaScript Object Notation RFC8259.

> **Note**
>
> If you plan to create alarms on metrics created using embedded metric format, see Setting alarms on metrics created with the embedded metric format for recommendations.

Embedded metric format document structure

This section describes the structure of an embedded metric format document. Embedded metric format documents are defined in JavaScript Object Notation RFC8259.

Unless otherwise noted, objects defined by this specification MUST NOT contain any additional members. Members not recognized by this specification MUST be ignored. Members defined in this specification are case-sensitive.

The embedded metric format is subject to the same limits as standard CloudWatch Logs events and are limited to a maximum size of 1 MB.

With the embedded metric format, you can track the processing of your EMF logs by metrics that are published in the `AWS/Logs` namespace of your account. These can be used to track failed metric generation from EMF, as well as whether failures happen due to parsing or validation. For more details see Monitoring with CloudWatch metrics.

Root node

The LogEvent message MUST be a valid JSON object with no additional data at the beginning or end of the LogEvent message string. For more information about the LogEvent structure, see InputLogEvent.

Embedded metric format documents MUST contain the following top-level member on the root node. This is a Metadata object object.

```
{
 "_aws": {
    "CloudWatchMetrics": [ ... ]
  }
}
```

The root node MUST contain all Target members members defined by the references in the MetricDirective object.

The root node MAY contain any other members that are not included in the above requirements. The values of these members MUST be valid JSON types.

Metadata object

The _aws member can be used to represent metadata about the payload that informs downstream services how they should process the LogEvent. The value MUST be an object and MUST contain the following members:

- **CloudWatchMetrics**— An array of MetricDirective object used to instruct CloudWatch to extract metrics from the root node of the LogEvent.

```
{
  "_aws": {
    "CloudWatchMetrics": [ ... ]
  }
}
```

- **Timestamp**— A number representing the time stamp used for metrics extracted from the event. Values MUST be expressed as the number of milliseconds after Jan 1, 1970 00:00:00 UTC.

```
{
  "_aws": {
    "Timestamp": 1559748430481
  }
}
```

MetricDirective object

The MetricDirective object instructs downstream services that the LogEvent contains metrics that will be extracted and published to CloudWatch. MetricDirectives MUST contain the following members:

- **Namespace**— A string representing the CloudWatch namespace for the metric.
- **Dimensions**— A DimensionSet array.
- **Metrics**— An array of MetricDefinition objects. This array MUST NOT contain more than 100 MetricDefinition objects.

DimensionSet array

A DimensionSet is an array of strings containing the dimension keys that will be applied to all metrics in the document. The values within this array MUST also be members on the root-node—referred to as the Target members

A DimensionSet MUST NOT contain more than 30 dimension keys. A DimensionSet MAY be empty.

The target member MUST have a string value. This value MUST NOT contain more than 1024 characters. The target member defines a dimension that will be published as part of the metric identity. Every DimensionSet used creates a new metric in CloudWatch. For more information about dimensions, see Dimension and Dimensions.

```
{
 "_aws": {
   "CloudWatchMetrics": [
     {
       "Dimensions": [ [ "functionVersion" ] ],
       ...
     }
   ]
 },
 "functionVersion": "$LATEST"
}
```

> **Note**
>
> Be careful when configuring your metric extraction as it impacts your custom metric usage and corresponding bill. If you unintentionally create metrics based on high-cardinality dimensions (such as `requestId`), the embedded metric format will by design create a custom metric corresponding to each unique dimension combination. For more information, see Dimensions.

MetricDefinition object

A MetricDefinition is an object that MUST contain the following member:

- **Name**— A string Reference values to a metric Target members. Metric targets MUST be either a numeric value or an array of numeric values.

A MetricDefinition object MAY contain the following members:

- **Unit**— An OPTIONAL string value representing the unit of measure for the corresponding metric. Values SHOULD be valid CloudWatch metric units. For information about valid units, see MetricDatum. If a value is not provided, then a default value of NONE is assumed.
- **StorageResolution**— An OPTIONAL integer value representing the storage resolution for the corresponding metric. Setting this to 1 specifies this metric as a high-resolution metric, so that CloudWatch stores the metric with sub-minute resolution down to one second. Setting this to 60 specifies this metric as standard-resolution, which CloudWatch stores at 1-minute resolution. Values SHOULD be valid CloudWatch supported resolutions, 1 or 60. If a value is not provided, then a default value of 60 is assumed.

  For more information about high-resolution metrics, see High-resolution metrics.

> **Note**
>
> If you plan to create alarms on metrics created using embedded metric format, see Setting alarms on metrics created with the embedded metric format for recommendations.

```
{
  "_aws": {
    "CloudWatchMetrics": [
      {
        "Metrics": [
          {
            "Name": "Time",
            "Unit": "Milliseconds",
            "StorageResolution": 60
          }
        ],
        ...
      }
    ]
  },
  "Time": 1
}
```

Reference values

Reference values are string values that reference Target members members on the root node. These references should NOT be confused with the JSON Pointers described in RFC6901. Target values cannot be nested.

Target members

Valid targets MUST be members on the root node and cannot be nested objects. For example, a _reference_ value of `"A.a"` MUST match the following member:

```
{ "A.a" }
```

It MUST NOT match the nested member:

```
{ "A": { "a" } }
```

Valid values of target members depend on what is referencing them. A metric target MUST be a numeric value or an array of numeric values. Numeric array metric targets MUST NOT have more than 100 members. A dimension target MUST have a string value.

Embedded metric format example and JSON schema

The following is a valid example of embedded metric format.

```
{
  "_aws": {
    "Timestamp": 1574109732004,
    "CloudWatchMetrics": [
      {
        "Namespace": "lambda-function-metrics",
        "Dimensions": [["functionVersion"]],
        "Metrics": [
          {
            "Name": "time",
            "Unit": "Milliseconds",
            "StorageResolution": 60
          }
        ]
      }
    ]
```

```
  },
  "functionVersion": "$LATEST",
  "time": 100,
  "requestId": "989ffbf8-9ace-4817-a57c-e4dd734019ee"
}
```

You can use the following schema to validate embedded metric format documents.

```
{
    "type": "object",
    "title": "Root Node",
    "required": [
        "_aws"
    ],
    "properties": {
        "_aws": {
            "$id": "#/properties/_aws",
            "type": "object",
            "title": "Metadata",
            "required": [
                "Timestamp",
                "CloudWatchMetrics"
            ],
            "properties": {
                "Timestamp": {
                    "$id": "#/properties/_aws/properties/Timestamp",
                    "type": "integer",
                    "title": "The Timestamp Schema",
                    "examples": [
                        1565375354953
                    ]
                },
                "CloudWatchMetrics": {
                    "$id": "#/properties/_aws/properties/CloudWatchMetrics",
                    "type": "array",
                    "title": "MetricDirectives",
                    "items": {
                        "$id": "#/properties/_aws/properties/CloudWatchMetrics/items",
                        "type": "object",
                        "title": "MetricDirective",
                        "required": [
                            "Namespace",
                            "Dimensions",
```

```
                            "Metrics"
                        ],
                        "properties": {
                            "Namespace": {
                                "$id": "#/properties/_aws/properties/CloudWatchMetrics/
items/properties/Namespace",
                                "type": "string",
                                "title": "CloudWatch Metrics Namespace",
                                "examples": [
                                    "MyApp"
                                ],
                                "pattern": "^(.*)$",
                                "minLength": 1,
                                "maxLength": 1024
                            },
                            "Dimensions": {
                                "$id": "#/properties/_aws/properties/CloudWatchMetrics/
items/properties/Dimensions",
                                "type": "array",
                                "title": "The Dimensions Schema",
                                "minItems": 1,
                                "items": {
                                    "$id": "#/properties/_aws/properties/
CloudWatchMetrics/items/properties/Dimensions/items",
                                    "type": "array",
                                    "title": "DimensionSet",
                                    "minItems": 0,
                                    "maxItems": 30,
                                    "items": {
                                        "$id": "#/properties/_aws/properties/

                                        "type": "string",
                                        "title": "DimensionReference",
                                        "examples": [
                                            "Operation"
                                        ],
                                        "pattern": "^(.*)$",
                                        "minLength": 1,
                                        "maxLength": 250
}
                                    }
                            },
                            "Metrics": {
```

```
                                "$id": "#/properties/_aws/properties/CloudWatchMetrics/
items/properties/Metrics",
                                "type": "array",
                                "title": "MetricDefinitions",
                                "items": {
                                    "$id": "#/properties/_aws/properties/
CloudWatchMetrics/items/properties/Metrics/items",
                                    "type": "object",
                                    "title": "MetricDefinition",
                                    "required": [
                                        "Name"
                                    ],
                                    "properties": {
                                        "Name": {
                                            "$id": "#/properties/_aws/properties/
CloudWatchMetrics/items/properties/Metrics/items/properties/Name",
                                            "type": "string",
                                            "title": "MetricName",
                                            "examples": [
                                                "ProcessingLatency"
                                            ],
                                            "pattern": "^(.*)$",
                                            "minLength": 1,
                                            "maxLength": 1024
                                        },
                                        "Unit": {
                                            "$id": "#/properties/_aws/properties/
CloudWatchMetrics/items/properties/Metrics/items/properties/Unit",
                                            "type": "string",
                                            "title": "MetricUnit",
                                            "examples": [
                                                "Milliseconds"
                                            ],
                                            "pattern": "^(Seconds|Microseconds|
Milliseconds|Bytes|Kilobytes|Megabytes|Gigabytes|Terabytes|Bits|Kilobits|Megabits|
Gigabits|Terabits|Percent|Count|Bytes\\/Second|Kilobytes\\/Second|Megabytes\\/Second|
Gigabytes\\/Second|Terabytes\\/Second|Bits\\/Second|Kilobits\\/Second|Megabits\\/
Second|Gigabits\\/Second|Terabits\\/Second|Count\\/Second|None)$"
                                        },
                                        "StorageResolution": {
                                            "$id": "#/properties/_aws/properties/
CloudWatchMetrics/items/properties/Metrics/items/properties/StorageResolution",
                                            "type": "integer",
                                            "title": "StorageResolution",
```

```
                                        "examples": [
                                            60
                                        ]
                                    }
                                }
                            }
                        }
                    }
                }
            }
        }
    }
}
```

Entity information in EMF format

When you publish logs to Amazon CloudWatch using Embedded Metric Format (EMF), you can include entity information in the log event. This section describes how to specify entity information and how CloudWatch processes this information.

Entity types

When no Entity is specified with the `PutLogEvents` request, CloudWatch will look for entity information in the EMF log content:

- **Service-type entities**

  Required fields: `Service` and `Environment`
- **Resource-type entities**

  Required fields: `ResourceType` and `Identifier`

Platform attributes

CloudWatch automatically determines the platform type based on these attributes:

- **Kubernetes (K8s):**

  Required: `K8s.Cluster`

Optional: `K8s.Namespace`, `K8s.Workload`, `K8s.Node`, `K8s.Pod`, `EC2.InstanceId`, `EC2.AutoScalingGroup`

- **Amazon EKS**

  Required: `EKS.Cluster`

  Optional: `K8s.Namespace`, `K8s.Workload`, `K8s.Node`, `K8s.Pod`, `EC2.InstanceId`
- **Amazon ECS:**

  Required: `ECS.Cluster`

  Optional: `ECS.Service`, `ECS.Task`
- **Amazon EC2**

  Required: `EC2.InstanceId`

  Optional: `EC2.AutoScalingGroup`
- **Lambda:**

  Required: `Lambda.Function`
- **Generic hosts:**

  Required: `Host`

Example EMF log format

```
{
    "_aws": {
        "CloudWatchMetrics": [
            {
                "Metrics": [
                    {"Name": "RequestLatency", "Unit": "Milliseconds"}
                ],
                "Namespace": "MyApplication"
            }
        ]
    },
    "Service": "PaymentService",
    "Environment": "Production",
```

```
    "K8s.Cluster": "main-cluster",
    "K8s.Namespace": "payment-ns",
    "K8s.Pod": "payment-pod-123",
    "K8s.Node": "worker-node-1",
    "K8s.Workload": "payment-deployment",
    "RequestLatency": 135.5,
    "timestamp": 1622163600000
}
```

Generated Entity

The above EMF log will generate the following Entity:

```
{
    "KeyAttributes": {
        "Type": "Service",
        "Name": "PaymentService",
        "Environment": "Production"
    },
    "Attributes": {
        "PlatformType": "K8s",
        "K8s.Cluster": "main-cluster",
        "K8s.Namespace": "payment-ns",
        "K8s.Pod": "payment-pod-123",
        "K8s.Node": "worker-node-1",
        "K8s.Workload": "payment-deployment"
    }
}
```

Entity processing

CloudWatch processes the entity information as follows:

- **KeyAttributes:**
  - Determines entity type based on required fields
  - For Service-type, extracts Service name and Environment
  - These become the primary identifiers for the entity
- **Attributes:**
  - Sets PlatformType based on included platform attributes
  - Includes all relevant platform-specific information

- Maintains relationship context for the telemetry data

CloudWatch uses this entity information to establish relationships between different pieces of telemetry data, enabling enhanced observability and contextual analysis of your applications and infrastructure. For more information, see How to add related information to custom telemetry sent to CloudWatch .

> **Note**
>
> Entity information helps CloudWatch create a complete picture of your application's telemetry data and its relationships within your infrastructure.

Using the PutLogEvents API to send manually-created embedded metric format logs

You can send embedded metric format logs to CloudWatch Logs using the CloudWatch Logs PutLogEvents API. When calling PutLogEvents, you have the option to include the following HTTP header, which tells CloudWatch Logs the metrics should be extracted, but it's not required.

```
x-amzn-logs-format: json/emf
```

The following is a full example using the AWS SDK for Java 2.x:

```
package org.example.basicapp;

import software.amazon.awssdk.regions.Region;
import software.amazon.awssdk.services.cloudwatchlogs.CloudWatchLogsClient;
import software.amazon.awssdk.services.cloudwatchlogs.model.DescribeLogStreamsRequest;
import software.amazon.awssdk.services.cloudwatchlogs.model.DescribeLogStreamsResponse;
import software.amazon.awssdk.services.cloudwatchlogs.model.InputLogEvent;
import software.amazon.awssdk.services.cloudwatchlogs.model.PutLogEventsRequest;

import java.util.Collections;

public class EmbeddedMetricsExample {
        public static void main(String[] args) {
```

```
                final String usage = "To run this example, supply a Region code (eg.
 us-east-1), log group, and stream name as command line arguments"
                                + "Ex: PutLogEvents <region-id> <log-group-name>
 <stream-name>";

                if (args.length != 3) {
                        System.out.println(usage);
                        System.exit(1);
                }

                String regionId = args[0];
                String logGroupName = args[1];
                String logStreamName = args[2];

                CloudWatchLogsClient logsClient =
 CloudWatchLogsClient.builder().region(Region.of(regionId)).build();

                // Build a JSON log using the EmbeddedMetricFormat.
                long timestamp = System.currentTimeMillis();
                String message = "{" +
                                "  \"_aws\": {" +
                                "    \"Timestamp\": " + timestamp  + "," +
                                "    \"CloudWatchMetrics\": [" +
                                "      {" +
                                "        \"Namespace\": \"MyApp\"," +
                                "        \"Dimensions\": [[\"Operation\"], [\"Operation
\", \"Cell\"]]," +
                                "        \"Metrics\": [{ \"Name\": \"ProcessingLatency
\", \"Unit\": \"Milliseconds\", \"StorageResolution\": 60 }]" +
                                "      }" +
                                "    ]" +
                                "  }," +
                                "  \"Operation\": \"Aggregator\"," +
                                "  \"Cell\": \"001\"," +
                                "  \"ProcessingLatency\": 100" +
                                "}";
                InputLogEvent inputLogEvent = InputLogEvent.builder()
                        .message(message)
                        .timestamp(timestamp)
                        .build();

                // Specify the request parameters.
                PutLogEventsRequest putLogEventsRequest = PutLogEventsRequest.builder()
                        .logEvents(Collections.singletonList(inputLogEvent))
```

```
                        .logGroupName(logGroupName)
                        .logStreamName(logStreamName)
                        .build();

                logsClient.putLogEvents(putLogEventsRequest);

                System.out.println("Successfully put CloudWatch log event");
        }

}
```

Note

With the embedded metric format, you can track the processing of your EMF logs by metrics that are published in the `AWS/Logs` namespace of your account. These can be used to track failed metric generation from EMF, as well as whether failures happen due to parsing or validation. For more details see Monitoring with CloudWatch metrics.

Using the CloudWatch agent to send embedded metric format logs

This section describes how to install and use the CloudWatch agent. The first part of this section describes how to install the CloudWatch agent. The the second part of this section describes how to use the CloudWatch agent to send embedded metric format logs. If you want to use this method, you must install the CloudWatch agent for the AWS services you want to send embedded metric format logs from. Then you can begin sending the events. The CloudWatch agent must be version 1.230621.0 or later.

Note

You do not need to install the CloudWatch agent to send logs from Lambda functions. Lambda function timeouts are not handled automatically. This means that if your function times out before the metrics get flushed, then the metrics for that invocation will not be captured.

Installing the CloudWatch agent

Install the CloudWatch agent for each service which is to send embedded metric format logs.

Installing the CloudWatch agent on EC2

First, install the CloudWatch agent on the instance. For more information, see Installing the CloudWatch agent.

Once you have installed the agent, configure the agent to listen on a UDP or TCP port for the embedded metric format logs. The following is an example of this configuration that listens on the default socket `tcp:25888`. For more information about agent configuration, see Manually create or edit the CloudWatch agent configuration file.

```
{
  "logs": {
    "metrics_collected": {
      "emf": { }
    }
  }
}
```

Installing the CloudWatch agent on Amazon ECS

The easiest way to deploy the CloudWatch agent on Amazon ECS is to run it as a sidecar, defining it in the same task definition as your application.

Create agent configuration file

Create your CloudWatch agent configuration file locally. In this example, the relative file path will be `amazon-cloudwatch-agent.json`.

For more information about agent configuration, see Manually create or edit the CloudWatch agent configuration file.

```
{
  "logs": {
    "metrics_collected": {
      "emf": { }
    }
  }
}
```

Push configuration to SSM Parameter Store

Enter the following command to push the CloudWatch agent configuration file to the AWS Systems Manager (SSM) Parameter Store.

```
aws ssm put-parameter \
    --name "cwagentconfig" \
    --type "String" \
    --value "`cat amazon-cloudwatch-agent.json`" \
    --region "{{region}}"
```

Configure the task definition

Configure your task definition to use the CloudWatch Agent and expose the TCP or UDP port. The sample task definition that you should use depends on your networking mode.

Notice that the `webapp` specifies the `AWS_EMF_AGENT_ENDPOINT` environment variable. This is used by the library and should point to the endpoint that the agent is listening on. Additionally, the `cwagent` specifies the `CW_CONFIG_CONTENT` as a "valueFrom" parameter that points to the SSM configuration that you created in the previous step.

This section contains one example for bridge mode and one example for host or awsvpc mode. For more examples of how you can configure the CloudWatch agent on Amazon ECS, see the Github samples repository

The following is an example for bridge mode. When bridge mode networking is enabled, the agent needs to be linked to your application using the `links` parameter and must be addressed using the container name.

```
{
  "containerDefinitions": [
          {
              "name": "webapp",
              "links": [ "cwagent" ],
              "image": "my-org/web-app:latest",
              "memory": 256,
              "cpu": 256,
              "environment": [{
                "name": "AWS_EMF_AGENT_ENDPOINT",
                "value": "tcp://cwagent:25888"
              }],
          },
          {
```

```
            "name": "cwagent",
            "mountPoints": [],
            "image": "public.ecr.aws/cloudwatch-agent/cloudwatch-agent:latest",
            "memory": 256,
            "cpu": 256,
            "portMappings": [{
                "protocol": "tcp",
                "containerPort": 25888
            }],
            "environment": [{
              "name": "CW_CONFIG_CONTENT",
              "valueFrom": "cwagentconfig"
            }],
        }
    ],
}
```

The following is an example for host mode or awsvpc mode. When running on these network modes, the agent can be addressed over `localhost`.

```
{
  "containerDefinitions": [
          {
              "name": "webapp",
              "image": "my-org/web-app:latest",
              "memory": 256,
              "cpu": 256,
              "environment": [{
                "name": "AWS_EMF_AGENT_ENDPOINT",
                "value": "tcp://127.0.0.1:25888"
              }],
          },
          {
              "name": "cwagent",
              "mountPoints": [],
              "image": "public.ecr.aws/cloudwatch-agent/cloudwatch-agent:latest",
              "memory": 256,
              "cpu": 256,
              "portMappings": [{
                  "protocol": "tcp",
                  "containerPort": 25888
              }],
              "environment": [{
```

```
                "name": "CW_CONFIG_CONTENT",
                "valueFrom": "cwagentconfig"
            }],
        }
    ],
}
```

Note

In awsvpc mode, you must either give a public IP address to the VPC (Fargate only), set up a NAT gateway, or set up a CloudWatch Logs VPC endpoint. For more information about setting up a NAT, see NAT Gateways. For more information about setting up a CloudWatch Logs VPC endpoint, see Using CloudWatch Logs with Interface VPC Endpoints.
The following is an example of how to assign a public IP address to a task that uses the Fargate launch type.

```
aws ecs run-task \
--cluster {{cluster-name}} \
--task-definition cwagent-fargate \
--region {{region}} \
--launch-type FARGATE \
--network-configuration
 "awsvpcConfiguration={subnets=[{{subnetId}}],securityGroups=[{{sgId}}],assignPublicIp=ENA
```

Ensure permissions

Ensure the IAM role executing your tasks has permission to read from the SSM Parameter Store. You can add this permission by attaching the **AmazonSSMReadOnlyAccess** policy. To do so, enter the following command.

```
aws iam attach-role-policy --policy-arn arn:aws:iam::aws:policy/AmazonSSMReadOnlyAccess
 \
--role-name CWAgentECSExecutionRole
```

Installing the CloudWatch agent on Amazon EKS

Parts of this process can be skipped if you have already installed CloudWatch Container Insights on this cluster.

Permissions

If you have not already installed Container Insights, then first ensure that your Amazon EKS nodes have the appropriate IAM permissions. They should have the **CloudWatchAgentServerPolicy** attached. For more information, see Verifying prerequisites for Container Insights in CloudWatch.

Create ConfigMap

Create a ConfigMap for the agent. The ConfigMap also tells the agent to listen on a TCP or UDP port. Use the following ConfigMap.

```
# cwagent-emf-configmap.yaml
apiVersion: v1
data:
  # Any changes here must not break the JSON format
  cwagentconfig.json: |
    {
      "agent": {
        "omit_hostname": true
      },
      "logs": {
        "metrics_collected": {
          "emf": { }
        }
      }
    }
kind: ConfigMap
metadata:
  name: cwagentemfconfig
  namespace: default
```

If you have already installed Container Insights, add the following `"emf": { }` line to your existing ConfigMap.

Apply the ConfigMap

Enter the following command to apply the ConfigMap.

```
kubectl apply -f cwagent-emf-configmap.yaml
```

Deploy the agent

To deploy the CloudWatch agent as a sidecar, add the agent to your pod definition, as in the following example.

```
apiVersion: v1
kind: Pod
metadata:
  name: myapp
  namespace: default
spec:
  containers:
    # Your container definitions go here
    - name: web-app
      image: my-org/web-app:latest
    # CloudWatch Agent configuration
    - name: cloudwatch-agent
      image: public.ecr.aws/cloudwatch-agent/cloudwatch-agent:latest
      imagePullPolicy: Always
      resources:
        limits:
          cpu: 200m
          memory: 100Mi
        requests:
          cpu: 200m
          memory: 100Mi
      volumeMounts:
        - name: cwagentconfig
          mountPath: /etc/cwagentconfig
      ports:
  # this should match the port configured in the ConfigMap
        - protocol: TCP
          hostPort: 25888
          containerPort: 25888
  volumes:
    - name: cwagentconfig
      configMap:
        name: cwagentemfconfig
```

Using the CloudWatch agent to send embedded metric format logs

When you have the CloudWatch agent installed and running, you can send the embedded metric format logs over TCP or UDP. There are two requirements when sending the logs over the agent:

- The logs must contain a `LogGroupName` key that tells the agent which log group to use.

- Each log event must be on a single line. In other words, a log event cannot contain the newline (\n) character.

The log events must also follow the embedded metric format specification. For more information, see Specification: Embedded metric format.

If you plan to create alarms on metrics created using embedded metric format, see Setting alarms on metrics created with the embedded metric format for recommendations.

The following is an example of sending log events manually from a Linux bash shell. You can instead use the UDP socket interfaces provided by your programming language of choice.

```
echo '{"_aws":{"Timestamp":1574109732004,"LogGroupName":"Foo","CloudWatchMetrics":
[{"Namespace":"MyApp","Dimensions":[["Operation"]],"Metrics":
[{"Name":"ProcessingLatency","Unit":"Milliseconds","StorageResolution":60}]}]},"Operation":"Agg
 \
> /dev/udp/0.0.0.0/25888
```

Note

With the embedded metric format, you can track the processing of your EMF logs by metrics that are published in the AWS/Logs namespace of your account. These can be used to track failed metric generation from EMF, as well as whether failures happen due to parsing or validation. For more details see Monitoring with CloudWatch metrics.

Using the embedded metric format with AWS Distro for OpenTelemetry

OpenTelemetry is an open-source initiative that removes boundaries and restrictions between vendor-specific formats for tracing, logs, and metrics by offering a single set of specifications and APIs. For more information, see OpenTelemetry. You can use the embedded metric format as a part of the OpenTelemetry project. Using the embedded metric format with OpenTelemetry requires two components: an OpenTelemetry-compliant data source and the AWS Distro for OpenTelemetry Collector enabled for use with CloudWatch embedded metric format logs.

We have preconfigured redistributions of the OpenTelemetry components, which AWS maintains, to make onboarding as easy as possible. For more information about using OpenTelemetry with the embedded metric format, in addition to other AWS services, see AWS Distro for

OpenTelemetry. For additional information regarding language support and usage, see AWS Observability on Github.

Viewing your metrics and logs in the console

After you generate embedded metric format logs that extract metrics, you can use the CloudWatch console to view the metrics. Embedded metrics have the dimensions that you specified when you generated the logs. Also, the embedded metrics that you generated using the client libraries have the following default dimensions:

- ServiceType
- ServiceName
- LogGroup

This section describes how to view these metrics in the CloudWatch console and query your extracted metrics using CloudWatch Logs Insights.

To view metrics that were generated from embedded metric format logs

1. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.
2. In the navigation pane, choose **Metrics**.
3. Select a namespace that you specified for your embedded metrics when you generated them. If you used the client libraries to generate the metrics and did not specify a namespace, then select **aws-embedded-metrics**. This is the default namespace for embedded metrics generated using the client libraries.
4. Select a metric dimension (for example, **ServiceName**).
5. The **All metrics** tab displays all metrics for that dimension in the namespace. You can do the following:

    a. To sort the table, use the column heading.

    b. To graph a metric, select the check box next to the metric. To select all metrics, select the check box in the heading row of the table.

    c. To filter by resource, choose the resource ID and then choose **Add to search**.

    d. To filter by metric, choose the metric name and then choose **Add to search**.

Querying logs using CloudWatch Logs Insights

You can query the detailed log events associated with the extracted metrics by using CloudWatch Logs Insights to provide deep insights into the root causes of operational events. One of the benefits of extracting metrics from your logs is that you can filter your logs later by the unique metric (metric name plus unique dimension set) and metric values, to get context on the events that contributed to the aggregated metric value

For example, to get an impacted request id or x-ray trace id, you could run the following query in CloudWatch Logs Insights.

```
filter Latency > 1000 and Operation = "Aggregator"
| fields RequestId, TraceId
```

You can also perform query-time aggregation on high-cardinality keys, such as finding the customers impacted by an event. The following example illustrates this.

```
filter Latency > 1000 and Operation = "Aggregator"
| stats count() by CustomerId
```

For more information, see Analyzing Log Data with CloudWatch Logs Insights

Setting alarms on metrics created with the embedded metric format

In general, creating alarms on metrics generated by the embedded metric format follows the same pattern as creating alarms on any other metrics. For more information, see Using Amazon CloudWatch alarms. Embedded metric format metric generation depends on your log publishing flow because CloudWatch Logs needs to process logs so they can be transformed into metrics. It's important to publish logs in a timely manner, so that metric datapoints are created within the period of time that alarms are evaluated.

If you plan on using the embedded metric format to send high-resolution metrics and create alarms on these metrics, we recommended that you flush logs to CloudWatch Logs at an interval of 5 seconds or less to avoid introducing an additional delay, which can cause alarming on partial or missing data. If you are using the CloudWatch agent, you can adjust the flush interval by setting the `force_flush_interval` parameter in the CloudWatch agent configuration file. This value defaults to 5 seconds. If you are using Lambda on other platforms where you can't control the log flush interval, consider using "M out of N" alarms to control the number of datapoints used to alarm. For more information, see Alarm evaluation.

AWS services that publish CloudWatch metrics

You can use the following table to learn which AWS services publish metrics to CloudWatch. For information about the metrics and dimensions, see the specified documentation.

Service	Namespace	Documentation
AWS Amplify	`AWS/AmplifyHosting`	Monitoring
Amazon API Gateway	`AWS/ApiGateway`	Monitor API Execution with Amazon CloudWatch
Amazon AppFlow	`AWS/AppFlow`	Monitoring Amazon AppFlow with Amazon CloudWatch
AWS Application Migration Service	`AWS/MGN`	Monitoring Application Migration Service with Amazon CloudWatch
AWS App Runner	`AWS/AppRunner`	Viewing App Runner service metrics reported to CloudWatch
WorkSpaces Applications	`AWS/AppStream`	Monitoring Amazon AppStream 2.0 Resources
AWS AppSync	`AWS/AppSync`	CloudWatch Metrics
Amazon Athena	`AWS/Athena`	Monitoring Athena Queries with CloudWatch Metrics
Amazon Aurora	`AWS/RDS`	Amazon Aurora metrics
AWS Backup	`AWS/Backup`	Monitoring AWS Backup Metrics with CloudWatch
Amazon Bedrock Guardrails	`AWS/Bedrock/Guardrails`	Monitoring Amazon Bedrock Guardrails using CloudWatch Metrics

AWS usage metrics

CloudWatch collects metrics that track the usage of some AWS resources and APIs. These metrics are published in the `AWS/Usage` namespace. Usage metrics in CloudWatch allow you to proactively manage usage by visualizing metrics in the CloudWatch console, creating custom dashboards, detecting changes in activity with CloudWatch anomaly detection, and configuring alarms that alert you when usage approaches a threshold.

Some AWS services integrate these usage metrics with Service Quotas. For these services, you can use CloudWatch to manage your account's use of your service quotas. For more information, see Visualizing your service quotas and setting alarms.

Topics

- Visualizing your service quotas and setting alarms
- AWS API usage metrics
- CloudWatch usage metrics

Visualizing your service quotas and setting alarms

For some AWS services, you can use the usage metrics to visualize your current service usage on CloudWatch graphs and dashboards. You can use a CloudWatch metric math function to display the service quotas for those resources on your graphs. You can also configure alarms that alert you when your usage approaches a service quota. For more information about service quotas, see What Is Service Quotas in the *Service Quotas User Guide*.

If you are signed in to an account that is set up as a monitoring account in CloudWatch cross-account observability, you can use that monitoring account to visualize service quotas and set alarms for metrics in the source accounts that are linked to that monitoring account. For more information, see CloudWatch cross-account observability.

The following services integrate their usage metrics with Service Quotas:

- AWS CloudHSM
- Amazon Chime SDK
- Amazon CloudWatch

- Amazon CloudWatch Logs
- Amazon DynamoDB
- Amazon EC2
- Amazon Elastic Container Registry
- Elastic Load Balancing
- AWS Fargate
- AWS Fault Injection Service
- AWS Interactive Video Service
- AWS Key Management Service
- Amazon Data Firehose
- Amazon Location Service
- Amazon Managed Blockchain (AMB) Query
- Amazon SageMaker AI
- Multi-party approval

To visualize a service quota and optionally set an alarm

1. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.
2. In the navigation pane, choose **Metrics**.
3. On the **All metrics** tab, choose **Usage**, and then choose **By AWS Resource**.

   The list of service quota usage metrics appears.
4. Select the check box next to one of the metrics.

   The graph displays your current usage of that AWS resource.
5. To add your service quota to the graph, do the following:

   a. Choose the **Graphed metrics** tab.

   b. Choose **Math expression**, **Start with an empty expression**. In the new row, under **Details**, enter **`SERVICE_QUOTA(m1)`**.

      A new line is added to the graph, displaying the service quota for the resource represented in the metric.

6. To see your current usage as a percentage of the quota, add a new expression or change the current **SERVICE_QUOTA** expression. The new expression to use is **`m1/SERVICE_QUOTA(m1)*100`**.
7. (Optional) To set an alarm that notifies you if you approach the service quota, do the following:

   a. On the row with **`m1/SERVICE_QUOTA(m1)*100`**, under **Actions**, choose the alarm icon. It looks like a bell.

      The alarm creation page appears.

   b. Under **Conditions**, ensure that **Threshold type** is **Static** and **Whenever Expression1 is** is set to **Greater**. Under **than**, enter **`80`**. This creates an alarm that goes into ALARM state when your usage exceeds 80 percent of the quota.

   c. Choose **Next**.

   d. On the next page, select an Amazon SNS topic or create a new one, and then choose **Next**. The topic you select is notified when the alarm goes to ALARM state.

   e. On the next page, enter a name and description for the alarm, and then choose **Next**.

   f. Choose **Create alarm**.

AWS API usage metrics

Most APIs that support AWS CloudTrail logging also report usage metrics to CloudWatch. API usage metrics in CloudWatch allow you to proactively manage API usage by visualizing metrics in the CloudWatch console, creating custom dashboards, detecting changes in activity with CloudWatch anomaly detection, and configuring alarms that alert when usage approaches a threshold.

You can use the he following table to learn about services that report API usage metrics to CloudWatch. The table lists the values to use for the `Service` dimension, so you can see the usage metrics from that service. You can use the procedure in this section to view the list of a service's APIs that report usage metrics to CloudWatch.

Service	Value for the `Service` dimension
AWS Identity and Access Management Access Analyzer	`Access Analyzer`

Service	Value for the Service dimension
AWS Account Management	Account Management
Alexa for Business	A4B
Amazon API Gateway	API Gateway
AWS App Mesh	App Mesh
AWS AppConfig	AWS AppConfig
Amazon AppFlow	AppFlow
Application Auto Scaling	Application Auto Scaling
Application Discovery Service	Application Discovery Service
Amazon AppStream	AppStream
WorkSpaces Applications Image Builder	Image Builder
Amazon Athena	Athena
AWS Audit Manager	Audit Manager
AWS Backup	Backup
AWS Batch	Batch
Amazon Braket	Braket
AWS Budgets	Budgets
AWS Certificate Manager	Certificate Manager
Amazon Chime SDK	ChimeSDK
Amazon Cloud Directory	Cloud Directory
AWS Cloud Map	Cloud Map

Service	Value for the `Service` dimension
AWS CloudFormation	`CloudFormation`
AWS CloudHSM	`CloudHSM`
Amazon CloudSearch	`CloudSearch`
AWS CloudShell	`CloudShell`
AWS CloudTrail	`CloudTrail`
Amazon CloudWatch	`CloudWatch`

AWS Proton	Proton
Amazon Quantum Ledger Database (Amazon QLDB)	QLDB
Amazon RDS	RDS
Amazon Redshift	Redshift Data API
Amazon Rekognition	Rekognition
AWS Resource Access Manager	Resource Access Manager
AWS Resource Groups	Resource Groups
AWS Resource Groups Tagging API	Resource Groups Tagging API
Amazon Route 53 Domains	Route 53 Domains

Service	Value for the Service dimension
Amazon Route 53 Resolver	Route 53 Resolver
Amazon S3	S3
Amazon Glacier	Amazon S3 Glacier
Amazon SageMaker Runtime	Sagemaker
Savings Plans	Savings Plans
AWS Secrets Manager	Secrets Manager
AWS Security Hub CSPM	Security Hub
AWS Server Migration Service	AWS Server Migration Service
AWS Service Catalog AppRegistry	Service Catalog AppRegistry
Service Quotas	Service Quotas
AWS Shield	Shield
AWS Signer	Signer
Amazon Simple Notification Service	SNS
Amazon Simple Email Service	SES
Amazon Simple Queue Service	SQS
Identity Store	Identity Store
Storage Gateway	Storage Gateway
AWS Support	Support
Amazon Simple Workflow Service	SWF
Amazon Textract	Textract

Service	Value for the Service dimension
AWS IoT Things Graph	ThingsGraph
Amazon Timestream	Timestream
Amazon Transcribe	Transcribe
Amazon Translate	Translate
Amazon Transcribe streaming transcription	Transcribe Streaming
AWS Transfer Family	Transfer
AWS WAF	WAF
Amazon WorkLink	WorkLink
Amazon WorkMail	Amazon WorkMail
Amazon WorkSpaces	Workspaces
AWS X-Ray	X-Ray

Some services report usage metrics for additional APIs as well. To see whether an API reports usage metrics to CloudWatch, use the CloudWatch console to see the metrics reported by that service in the AWS/Usage namespace.

To see the list of a service's APIs that report usage metrics to CloudWatch

1. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.
2. In the navigation pane, choose **Metrics**.
3. On the **All metrics** tab, choose **Usage**, and then choose **By AWS Resource**.
4. In the search box near the list of metrics, enter the name of the service. The metrics are filtered by the service you entered.

CloudWatch usage metrics

CloudWatch collects metrics that track the usage of some AWS resources. These metrics correspond to AWS service quotas. Tracking these metrics can help you proactively manage your quotas. For more information, see Visualizing your service quotas and setting alarms. Service quota usage metrics are in the `AWS/Usage` namespace and are collected every minute.

The metrics that can be published in this namespace include `CallCount`, `ResourceCount`, and `ThrottleCount`. These metrics are published with the dimensions `Resource`, `Service`, and `Type`. The `Resource` dimension specifies the name of the API operation being tracked. For example, the `CallCount` metric with the dimensions `"Service": "CloudWatch"`, `"Type": "API"` and `"Resource": "PutMetricData"` indicates the number of times the CloudWatch `PutMetricData` API operation has been called in your account.

The `CallCount` metric does not have a specified unit. The most useful statistic for the metric is `SUM`, which represents the total operation count for the 1-minute period.

Metrics

Metric	Description
`CallCount`	The number of specified operations performed in your account.

Dimensions

Dimension	Description
`Service`	The name of the AWS service containing the resource. For CloudWatch usage metrics, the value for this dimension is `CloudWatch` .
`Class`	The class of resource being tracked. CloudWatch API usage metrics use this dimension with a value of `None`.
`Type`	The type of resource being tracked. When the `Service` dimension is `CloudWatch` , the only valid value for `Type` is `API`.
`Resource`	The name of the API operation. Valid values include the following:

Dimension	Description
	DeleteAlarms ,DeleteDashboards ,DescribeAlarmHistory ,DescribeAlarms ,GetDashboard ,GetMetricData , GetMetricStatistics ,ListMetrics ,PutDashboard ,and PutMetricData

Amazon CloudWatch tutorials

The following scenarios illustrate how you can use Amazon CloudWatch. In the first scenario, you use the CloudWatch console to create a billing alarm that tracks your AWS usage and lets you know when you have exceeded a certain spending threshold. In the second scenario, you use the AWS Command Line Interface (AWS CLI) to publish a single metric for a hypothetical application named *GetStarted*.

Scenarios

- Monitor your estimated charges
- Publish metrics

Scenario: Monitor your estimated charges using CloudWatch

In this scenario, you create an Amazon CloudWatch alarm to monitor your estimated charges. When you enable the monitoring of estimated charges for your AWS account, the estimated charges are calculated and sent several times daily to CloudWatch as metric data.

Billing metric data is stored in the US East (N. Virginia) Region and reflects worldwide charges. This data includes the estimated charges for every service in AWS that you use, as well as the estimated overall total of your AWS charges.

You can choose to receive alerts by email when charges have exceeded a certain threshold. These alerts are triggered by CloudWatch and messages are sent using Amazon Simple Notification Service (Amazon SNS).

> **Note**
>
> For information about analyzing CloudWatch charges that you have already been billed for, see Analyzing, optimizing, and reducing CloudWatch costs.

Tasks

- Step 1: Enable billing alerts
- Step 2: Create a billing alarm

- Step 3: Check the alarm status
- Step 4: Edit a billing alarm
- Step 5: Delete a billing alarm

Step 1: Enable billing alerts

Before you can create an alarm for your estimated charges, you must enable billing alerts, so that you can monitor your estimated AWS charges and create an alarm using billing metric data. After you enable billing alerts, you cannot disable data collection, but you can delete any billing alarms that you created.

After you enable billing alerts for the first time, it takes about 15 minutes before you can view billing data and set billing alarms.

Requirements

- You must be signed in using root user credentials or as a user who has been given permission to view billing information.
- For consolidated billing accounts, billing data for each linked account can be found by logging in as the paying account. You can view billing data for total estimated charges and estimated charges by service for each linked account, in addition to the consolidated account.
- In a consolidated billing account, member linked account metrics are captured only if the payer account enables the **Receive Billing Alerts** preference. If you change which account is your management/payer account, you must enable the billing alerts in the new management/payer account.
- The account must not be part of the Amazon Partner Network (APN) because billing metrics are not published to CloudWatch for APN accounts. For more information, see AWS Partner Network.

To enable the monitoring of estimated charges

1. Open the AWS Billing and Cost Management console at https://console.aws.amazon.com/costmanagement/.
2. In the navigation pane, choose **Billing Preferences**.
3. By **Alert preferences** choose **Edit**.
4. Choose **Receive CloudWatch Billing Alerts**.
5. Choose **Save preferences**.

Step 2: Create a billing alarm

> **Important**
>
> Before you create a billing alarm, you must set your Region to US East (N. Virginia). Billing metric data is stored in this Region and represents worldwide charges. You also must enable billing alerts for your account or in the management/payer account (if you are using consolidated billing). For more information, see Step 1: Enable billing alerts.

In this procedure, you create an alarm that sends a notification when your estimated charges for AWS exceed a defined threshold.

To create a billing alarm using the CloudWatch console

1. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.
2. In the navigation pane, choose **Alarms**, and then choose **All alarms**.
3. Choose **Create alarm**.
4. Choose **Select metric**. In the **Browse** tab, choose **Billing**, and then choose **Total Estimated Charge**.

   > **Note**
   >
   > If you don't see the **Billing/Total Estimated Charge** metric, enable billing alerts, and change your Region to US East (N. Virginia). For more information, see Enabling billing alerts.

5. Select the checkbox for the **EstimatedCharges** metric, and then choose **Select metric**.
6. For **Statistic**, choose **Maximum**.
7. For **Period**, choose **6 hours**.
8. For **Threshold type**, choose **Static**.
9. For **Whenever EstimatedCharges is . . .**, choose **Greater**.
10. For **than . . .**, define the value that you want to cause your alarm to trigger. For example, **200** USD.

    The **EstimatedCharges** metric values are only in US dollars (USD), and the currency conversion is provided by Amazon Services LLC. For more information, see What is AWS Billing?.

11. Choose **Additional Configuration** and do the following:

    - For **Datapoints to alarm**, specify **1 out of 1**.
    - For **Missing data treatment**, choose **Treat missing data as missing**.

12. Choose **Next**.
13. Under **Notification**, ensure that **In alarm** is selected. Then specify an Amazon SNS topic to be notified when your alarm is in the ALARM state. The Amazon SNS topic can include your email address so that you recieve email when the billing amount crosses the threshold that you specified.

    You can select an existing Amazon SNS topic, create a new Amazon SNS topic, or use a topic ARN to notify other account. If you want your alarm to send multiple notifications for the same alarm state or for different alarm states, choose **Add notification**.

14. Choose **Next**.
15. Under **Name and description**, enter a name for your alarm.

    - (Optional) Enter a description of your alarm.

16. Choose **Next**.
17. Under **Preview and create**, make sure that your configuration is correct, and then choose **Create alarm**.

Step 3: Check the alarm status

Now, check the status of the billing alarm that you just created.

To check the alarm status

1. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.
2. If necessary, change the Region to US East (N. Virginia). Billing metric data is stored in this Region and reflects worldwide charges.
3. In the navigation pane, choose **Alarms**, **All alarms**.
4. Find the row in the table for your new alarm. Until the subscription is confirmed, it is shown as "Pending confirmation". After the subscription is confirmed, refresh the console to show the updated status.

Step 4: Edit a billing alarm

For example, you may want to increase the amount of money you spend with AWS each month from $200 to $400. You can edit your existing billing alarm and increase the monetary amount that must be exceeded before the alarm is triggered.

To edit a billing alarm

1. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.
2. If necessary, change the Region to US East (N. Virginia). Billing metric data is stored in this Region and reflects worldwide charges.
3. In the navigation pane, choose **Alarms**, **All alarms**.
4. Select the checkbox next to the alarm and choose **Actions**, **Edit**.
5. For **than...**, specify the new amount that must be exceeded to trigger the alarm and send an email notification.
6. Choose **Save Changes**.

Step 5: Delete a billing alarm

If you no longer need your billing alarm, you can delete it.

To delete a billing alarm

1. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.
2. If necessary, change the Region to US East (N. Virginia). Billing metric data is stored in this Region and reflects worldwide charges.
3. In the navigation pane, choose **Alarms**, **All alarms**.
4. Select the checkbox next to the alarm and choose **Actions**, **Delete**.
5. When prompted for confirmation, choose **Yes, Delete**.

Scenario: Publish metrics to CloudWatch

In this scenario, you use the AWS Command Line Interface (AWS CLI) to publish a single metric for a hypothetical application named *GetStarted*. If you haven't already installed and configured the AWS CLI, see Getting Set Up with the AWS Command Line Interface in the *AWS Command Line Interface User Guide*.

Tasks

- Step 1: Define the data configuration
- Step 2: Add metrics to CloudWatch
- Step 3: Get statistics from CloudWatch
- Step 4: View graphs with the console

Step 1: Define the data configuration

In this scenario, you publish data points that track the request latency for the application. Choose names for your metric and namespace that make sense to you. For this example, name the metric *RequestLatency* and place all of the data points into the *GetStarted* namespace.

You publish several data points that collectively represent three hours of latency data. The raw data comprises 15 request latency readings distributed over three hours. Each reading is in milliseconds:

- Hour one: 87, 51, 125, 235
- Hour two: 121, 113, 189, 65, 89
- Hour three: 100, 47, 133, 98, 100, 328

You can publish data to CloudWatch as single data points or as an aggregated set of data points called a *statistic set*. You can aggregate metrics to a granularity as low as one minute. You can publish the aggregated data points to CloudWatch as a set of statistics with four predefined keys: `Sum`, `Minimum`, `Maximum`, and `SampleCount`.

You publish the data points from hour one as single data points. For the data from hours two and three, you aggregate the data points and publish a statistic set for each hour. The key values are shown in the following table.

Hour	Raw data	Sum	Minimum	Maximum	SampleCount
1	87				
1	51				

Hour	Raw data	Sum	Minimum	Maximum	SampleCount
1	125				
1	235				
2	121, 113, 189, 65, 89	577	65	189	5
3	100, 47, 133, 98, 100, 328	806	47	328	6

Step 2: Add metrics to CloudWatch

After you have defined your data configuration, you are ready to add data.

To publish data points to CloudWatch

1. At a command prompt, run the following put-metric-data commands to add data for the first hour. Replace the example timestamp with a timestamp that is two hours in the past, in Universal Coordinated Time (UTC).

```
aws cloudwatch put-metric-data --metric-name RequestLatency --namespace GetStarted
 \
--timestamp 2016-10-14T20:30:00Z --value 87 --unit Milliseconds
aws cloudwatch put-metric-data --metric-name RequestLatency --namespace GetStarted
 \
--timestamp 2016-10-14T20:30:00Z --value 51 --unit Milliseconds
aws cloudwatch put-metric-data --metric-name RequestLatency --namespace GetStarted
 \
--timestamp 2016-10-14T20:30:00Z --value 125 --unit Milliseconds
aws cloudwatch put-metric-data --metric-name RequestLatency --namespace GetStarted
 \
--timestamp 2016-10-14T20:30:00Z --value 235 --unit Milliseconds
```

2. Add data for the second hour, using a timestamp that is one hour later than the first hour.

```
aws cloudwatch put-metric-data --metric-name RequestLatency --namespace GetStarted
 \
```

```
--timestamp 2016-10-14T21:30:00Z --statistic-values
 Sum=577,Minimum=65,Maximum=189,SampleCount=5 --unit Milliseconds
```

3. Add data for the third hour, omitting the timestamp to default to the current time.

```
aws cloudwatch put-metric-data --metric-name RequestLatency --namespace GetStarted
 \
--statistic-values Sum=806,Minimum=47,Maximum=328,SampleCount=6 --unit Milliseconds
```

Step 3: Get statistics from CloudWatch

Now that you have published metrics to CloudWatch, you can retrieve statistics based on those metrics using the get-metric-statistics command as follows. Be sure to specify `--start-time` and `--end-time` far enough in the past to cover the earliest timestamp that you published.

```
aws cloudwatch get-metric-statistics --namespace GetStarted --metric-name
 RequestLatency --statistics Average \
--start-time 2016-10-14T00:00:00Z --end-time 2016-10-15T00:00:00Z --period 60
```

The following is example output:

```
{
 "Datapoints": [],
 "Label": "Request:Latency"
}
```

Step 4: View graphs with the console

After you have published metrics to CloudWatch, you can use the CloudWatch console to view statistical graphs.

To view graphs of your statistics on the console

1. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.
2. In the **Navigation** pane, choose **Metrics**.
3. On the **All metrics** tab, in the search box, type **RequestLatency** and press Enter.
4. Select the check box for the **RequestLatency** metric. A graph of the metric data is displayed in the upper pane.

For more information, see Graphing metrics.

FAQs on CloudWatch supported protocols

CloudWatch SDKs started using two additional protocols: AWS JSON 1.0 and Smithy RPC v2 CBOR. These protocols are more performant than AWS Query that was previously utilized by the CloudWatch SDKs and CLIs. AWS SDKs will prioritize the protocol that is the most performant for each language.

What is the AWS JSON protocol, and how does it differ from existing CloudWatch API requests and responses?

JSON is one of the most widely used and accepted data formats for communication between heterogeneous systems. CloudWatch uses JSON as a medium to communicate between an AWS SDK client (for example, Java, Python, Golang, JavaScript) and CloudWatch server. An HTTP request of an CloudWatch API operation accepts input in the form of JSON. The CloudWatch operation is executed and the response of execution is shared back to the SDK client in the form of JSON. Compared to AWS Query, JSON is more efficient at transporting data between client and server.

- CloudWatch AWS JSON protocol acts as a mediator between CloudWatch client and server.
- The CloudWatch AWS SDK handles the serialization (convert object to JSON format) and de-serialization (convert JSON format to object) between the CloudWatch client and server.

What is the Smithy RPC v2 CBOR protocol, and how does it differ from existing CloudWatch API requests and responses?

Smithy RPC v2 CBOR (Concise Binary Object Representation) is a protocol developed by Amazon for more efficient data transmission. It's a data format designed to keep message sizes compact, and allow the format to evolve without requiring version negotiation between systems. The key difference from JSON encoding is that JSON uses human-readable text (like "name": "John"), while CBOR uses a binary format (sequences of 1s and 0s). This binary approach creates smaller data packages that travel faster over the network and reduces serialization time since computers process binary data directly.

- CloudWatch RPC v2 CBOR protocol acts as a mediator between CloudWatch client and server.
- The CloudWatch SDK handles the serialization (convert object to CBOR format) and deserialization (convert CBOR format to object) between the CloudWatch client and server.

How do I get started with the newer protocols for CloudWatch?

To get started, use the latest AWS SDK/CLI version to use the latest supported protocol for CloudWatch. Upgrade your AWS SDK to the specified version or any subsequent version.

SDK Client Protocol Support

Language	Protocol	SDK versions
C++	RPC v2 CBOR	1.11.708
Golang 2.x	RPC v2 CBOR	1.53.0
Java 1.x	RPC v2 CBOR	1.12.795
Java 2.x	RPC v2 CBOR	2.40.6
JavaScript v3.x	AWS JSON 1.0	3.949.0
.NET v3	AWS JSON 1.0	3.7.1182.0
.NET v4	RPC v2 CBOR	4.0.150.0
PHP	AWS JSON 1.0	3.367.0
Python-boto3	AWS JSON 1.0	1.42.7
Python-botocore	AWS JSON 1.0	1.42.7
AWS CLI v1	AWS JSON 1.0	1.43.13
AWS CLI v2	AWS JSON 1.0	2.32.14
Ruby	AWS JSON 1.0	1.126.0
Powershell	AWS JSON 1.0	5.0.114
Rust	RPC v2 CBOR	1.100.0
Swift	RPC v2 CBOR	1.6.14
Kotlin	RPC v2 CBOR	1.5.100

What are the risks of enabling these new protocols for my CloudWatch workloads?

The migration into these new SDK versions is expected to be fully transparent and effortless for customers. There is one known behavioral change in between protocols related with how `null` values are treated within lists: CloudWatch API calls with list inputs that may contain `null` values will be handled differently in the AWS JSON and Smithy RPC v2 CBOR protocols as compared to the previous AWS Query protocol: In AWS Query protocol, null values within lists are removed, while in JSON/CBOR protocols will be propagated through the API calls.

Additionally, if you are using a custom implementation of AWS SDK or a combination of custom clients and AWS SDK to interact with CloudWatch that generates AWS Query based (aka XML-based) responses, it may be incompatible with AWS JSON or CBOR protocol. If you encounter any issues, contact AWS Support.

What if I am already on the latest AWS SDK version, but my open sourced solution does not support JSON or CBOR?

You must change your SDK version to a previous version. See the How do I get started with the newer protocols for CloudWatch? section and select a version lower than listed. If you change your AWS SDK to the previous version, your CloudWatch APIs will use the AWS Query protocol.

What regions are supported for AWS JSON and CBOR protocols used in CloudWatch APIs

CloudWatch supports AWS JSON and CBOR protocol in all AWS regions where CloudWatch is available.

What latency improvements can I expect when upgrading to the specified AWS SDK versions for CloudWatch using the newer protocols?

Both JSON and CBOR provide up to 80% lower latency and CPU usage when compared to the AWS Query. Both protocols are up to 20% more efficient in network bandwidth usage.

Will the AWS Query protocol be deprecated?

AWS Query protocol will continue to be supported. You can continue using the AWS Query protocol as long as your AWS SDK version is set any version before what is listed in How do I get started with the newer protocols for CloudWatch?.

Where can I find more information about AWS JSON and Smithy RPC v2 CBOR protocols?

You can find more information about JSON protocol at AWS JSON 1.0 protocol in the Smithy documentation, and about CBOR at AWS RPC v2 CBOR protocol in the Smithy documentation.

For more about CloudWatch API requests, see Making API Requests in the CloudWatch API Reference Guide.

Using CloudWatch with an AWS SDK

AWS software development kits (SDKs) are available for many popular programming languages. Each SDK provides an API, code examples, and documentation that make it easier for developers to build applications in their preferred language.

SDK documentation	Code examples
AWS SDK for C++	AWS SDK for C++ code examples
AWS CLI	AWS CLI code examples
AWS SDK for Go	AWS SDK for Go code examples
AWS SDK for Java	AWS SDK for Java code examples
AWS SDK for JavaScript	AWS SDK for JavaScript code examples
AWS SDK for Kotlin	AWS SDK for Kotlin code examples
AWS SDK for .NET	AWS SDK for .NET code examples
AWS SDK for PHP	AWS SDK for PHP code examples
AWS Tools for PowerShell	AWS Tools for PowerShell code examples
AWS SDK for Python (Boto3)	AWS SDK for Python (Boto3) code examples
AWS SDK for Ruby	AWS SDK for Ruby code examples
AWS SDK for Rust	AWS SDK for Rust code examples
AWS SDK for SAP ABAP	AWS SDK for SAP ABAP code examples
AWS SDK for Swift	AWS SDK for Swift code examples

For examples specific to CloudWatch, see Code examples for CloudWatch using AWS SDKs.

Code examples for CloudWatch using AWS SDKs

The following code examples show how to use CloudWatch with an AWS software development kit (SDK).

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

For a complete list of AWS SDK developer guides and code examples, see Using CloudWatch with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Hello CloudWatch

The following code examples show how to get started using CloudWatch.

.NET

SDK for .NET (v4)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
using Amazon.CloudWatch;
using Amazon.CloudWatch.Model;
using Microsoft.Extensions.DependencyInjection;
using Microsoft.Extensions.Hosting;

namespace CloudWatchActions;

public static class HelloCloudWatch
{
    static async Task Main(string[] args)
    {
        // Use the AWS .NET Core Setup package to set up dependency injection for
 the Amazon CloudWatch service.
        // Use your AWS profile name, or leave it blank to use the default
 profile.
```

```
        using var host = Host.CreateDefaultBuilder(args)
            .ConfigureServices((_, services) =>
                services.AddAWSService<IAmazonCloudWatch>()
            ).Build();

        // Now the client is available for injection.
        var cloudWatchClient =
 host.Services.GetRequiredService<IAmazonCloudWatch>();

        // You can use await and any of the async methods to get a response.
        var metricNamespace = "AWS/Billing";
        var response = await cloudWatchClient.ListMetricsAsync(new
 ListMetricsRequest
        {
            Namespace = metricNamespace
        });
        Console.WriteLine($"Hello Amazon CloudWatch! Following are some metrics
 available in the {metricNamespace} namespace:");
        Console.WriteLine();
        if (response.Metrics != null)
        {
            foreach (var metric in response.Metrics.Take(5))
            {
                Console.WriteLine($"\tMetric: {metric.MetricName}");
                Console.WriteLine($"\tNamespace: {metric.Namespace}");
                Console.WriteLine(
                    $"\tDimensions: {string.Join(", ", metric.Dimensions.Select(m
 => $"{m.Name}:{m.Value}"))}");
                Console.WriteLine();
            }
        }
    }
}
```

- For API details, see ListMetrics in *AWS SDK for .NET API Reference*.

Learn core operations for CloudWatch using an AWS SDK

The following code examples show how to:

- List CloudWatch namespaces and metrics.
- Get statistics for a metric and for estimated billing.
- Create and update a dashboard.
- Create and add data to a metric.
- Create and trigger an alarm, then view alarm history.
- Add an anomaly detector.
- Get a metric image, then clean up resources.

.NET

SDK for .NET (v4)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Run an interactive scenario at a command prompt.

```
public class CloudWatchScenario
{
    /*
    Before running this .NET code example, set up your development environment,
 including your credentials.

    To enable billing metrics and statistics for this example, make sure billing
 alerts are enabled for your account:
```

```
    https://docs.aws.amazon.com/AmazonCloudWatch/latest/monitoring/
monitor_estimated_charges_with_cloudwatch.html#turning_on_billing_metrics

    This .NET example performs the following tasks:
        1. List and select a CloudWatch namespace.
        2. List and select a CloudWatch metric.
        3. Get statistics for a CloudWatch metric.
        4. Get estimated billing statistics for the last week.
        5. Create a new CloudWatch dashboard with two metrics.
        6. List current CloudWatch dashboards.
        7. Create a CloudWatch custom metric and add metric data.
        8. Add the custom metric to the dashboard.
        9. Create a CloudWatch alarm for the custom metric.
       10. Describe current CloudWatch alarms.
       11. Get recent data for the custom metric.
       12. Add data to the custom metric to trigger the alarm.
       13. Wait for an alarm state.
       14. Get history for the CloudWatch alarm.
       15. Add an anomaly detector.
       16. Describe current anomaly detectors.
       17. Get and display a metric image.
       18. Clean up resources.
    */

/**
 * Before running this Java V2 code example, set up your development
 * environment, including your credentials.
 *
 * For more information, see the following documentation topic:
 *
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-
started.html
 *
 * To enable billing metrics and statistics for this example, make sure billing
 * alerts are enabled for your account:
 * https://docs.aws.amazon.com/AmazonCloudWatch/latest/monitoring/
monitor_estimated_charges_with_cloudwatch.html#turning_on_billing_metrics
 *
 * This Java code example performs the following tasks:
 *
 * 1. List available namespaces from Amazon CloudWatch.
 * 2. List available metrics within the selected Namespace.
 * 3. Get statistics for the selected metric over the last day.
 * 4. Get CloudWatch estimated billing for the last week.
 * 5. Create a new CloudWatch dashboard with metrics.
 * 6. List dashboards using a paginator.
 * 7. Create a new custom metric by adding data for it.
```

```
 * 8. Add the custom metric to the dashboard.
 * 9. Create an alarm for the custom metric.
 * 10. Describe current alarms.
 * 11. Get current data for the new custom metric.
 * 12. Push data into the custom metric to trigger the alarm.
 * 13. Check the alarm state using the action DescribeAlarmsForMetric.
 * 14. Get alarm history for the new alarm.
 * 15. Add an anomaly detector for the custom metric.
 * 16. Describe current anomaly detectors.
 * 17. Get a metric image for the custom metric.
 * 18. Clean up the Amazon CloudWatch resources.

            Amazon CloudWatch is a comprehensive monitoring and observability
service
            provided by Amazon Web Services (AWS). It is designed to help you
monitor your
            AWS resources, applications, and services, as well as on-premises
resources,
            in real-time.

            CloudWatch collects and tracks various types of data, including
metrics,
            logs, and events, from your AWS and on-premises resources. It allows
you to set
            alarms and automatically respond to changes in your environment,
            enabling you to quickly identify and address issues before they
impact your
            applications or services.

            With CloudWatch, you can gain visibility into your entire
infrastructure, from the cloud
            to the edge, and use this information to make informed decisions and
optimize your
            resource utilization.

            This scenario guides you through how to perform Amazon CloudWatch
tasks by using the
            AWS SDK for Java v2. Let's get started...

            An anomaly detector is a feature that automatically detects unusual
patterns or deviations in your
            monitored metrics. It uses machine learning algorithms to analyze the
historical behavior
            of your metrics and establish a baseline.

            The anomaly detector then compares the current metric values against
this baseline and
            identifies any anomalies or outliers that may indicate potential
issues or unexpected changes
            in your system's performance or behavior.

Kotlin

SDK for Kotlin

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Run an interactive scenario demonstrating CloudWatch features.

```
/**
 Before running this Kotlin code example, set up your development environment,
 including your credentials.

 For more information, see the following documentation topic:
 https://docs.aws.amazon.com/sdk-for-kotlin/latest/developer-guide/setup.html

 To enable billing metrics and statistics for this example, make sure billing
 alerts are enabled for your account:
 https://docs.aws.amazon.com/AmazonCloudWatch/latest/monitoring/
monitor_estimated_charges_with_cloudwatch.html#turning_on_billing_metrics

 This Kotlin code example performs the following tasks:

 1. List available namespaces from Amazon CloudWatch. Select a namespace from the
 list.
 2. List available metrics within the selected namespace.
 3. Get statistics for the selected metric over the last day.
 4. Get CloudWatch estimated billing for the last week.
 5. Create a new CloudWatch dashboard with metrics.
 6. List dashboards using a paginator.
 7. Create a new custom metric by adding data for it.
 8. Add the custom metric to the dashboard.
 9. Create an alarm for the custom metric.
 10. Describe current alarms.
 11. Get current data for the new custom metric.
 12. Push data into the custom metric to trigger the alarm.
 13. Check the alarm state using the action DescribeAlarmsForMetric.
 14. Get alarm history for the new alarm.
 15. Add an anomaly detector for the custom metric.
```

```
 16. Describe current anomaly detectors.
 17. Get a metric image for the custom metric.
 18. Clean up the Amazon CloudWatch resources.

Actions for CloudWatch using AWS SDKs

The following code examples demonstrate how to perform individual CloudWatch actions with AWS SDKs. Each example includes a link to GitHub, where you can find instructions for setting up and running the code.

These excerpts call the CloudWatch API and are code excerpts from larger programs that must be run in context. You can see actions in context in Scenarios for CloudWatch using AWS SDKs.

The following examples include only the most commonly used actions. For a complete list, see the Amazon CloudWatch API Reference.

Examples

- Use DeleteAlarms with an AWS SDK or CLI
- Use DeleteAnomalyDetector with an AWS SDK or CLI
- Use DeleteDashboards with an AWS SDK or CLI
- Use DescribeAlarmHistory with an AWS SDK or CLI
- Use DescribeAlarms with an AWS SDK or CLI
- Use DescribeAlarmsForMetric with an AWS SDK or CLI
- Use DescribeAnomalyDetectors with an AWS SDK or CLI
- Use DisableAlarmActions with an AWS SDK or CLI
- Use EnableAlarmActions with an AWS SDK or CLI
- Use GetDashboard with an AWS SDK or CLI
- Use GetMetricData with an AWS SDK or CLI
- Use GetMetricStatistics with an AWS SDK or CLI
- Use GetMetricWidgetImage with an AWS SDK or CLI
- Use ListDashboards with an AWS SDK or CLI
- Use ListMetrics with an AWS SDK or CLI
- Use PutAnomalyDetector with an AWS SDK or CLI
- Use PutDashboard with an AWS SDK or CLI
- Use PutMetricAlarm with an AWS SDK or CLI
- Use PutMetricData with an AWS SDK or CLI

Use `DeleteAlarms` with an AWS SDK or CLI

The following code examples show how to use `DeleteAlarms`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Learn the basics
- Get started with alarms
- Manage metrics and alarms

.NET

SDK for .NET (v4)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
/// <summary>
/// Delete a list of alarms from CloudWatch.
/// </summary>
/// <param name="alarmNames">A list of names of alarms to delete.</param>
/// <returns>True if successful.</returns>
public async Task<bool> DeleteAlarms(List<string> alarmNames)
{
    var deleteAlarmsResult = await _amazonCloudWatch.DeleteAlarmsAsync(
        new DeleteAlarmsRequest()
        {
            AlarmNames = alarmNames
        });

    return deleteAlarmsResult.HttpStatusCode == HttpStatusCode.OK;
}
```

- For API details, see DeleteAlarms in *AWS SDK for .NET API Reference*.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Include the required files.

```
#include <aws/core/Aws.h>
#include <aws/monitoring/CloudWatchClient.h>
#include <aws/monitoring/model/DeleteAlarmsRequest.h>
#include <iostream>
```

Delete the alarm.

```
        Aws::CloudWatch::CloudWatchClient cw;
        Aws::CloudWatch::Model::DeleteAlarmsRequest request;
        request.AddAlarmNames(alarm_name);

        auto outcome = cw.DeleteAlarms(request);
        if (!outcome.IsSuccess())
        {
            std::cout << "Failed to delete CloudWatch alarm:" <<
                outcome.GetError().GetMessage() << std::endl;
        }
        else
        {
            std::cout << "Successfully deleted CloudWatch alarm " << alarm_name
                << std::endl;
        }
```

- For API details, see DeleteAlarms in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To delete an alarm

The following example uses the `delete-alarms` command to delete the Amazon CloudWatch alarm named "myalarm":

```
aws cloudwatch delete-alarms --alarm-names myalarm
```

Output:

```
This command returns to the prompt if successful.
```

- For API details, see DeleteAlarms in *AWS CLI Command Reference*.

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   /**
    * Deletes a CloudWatch alarm.
    *
    * @param alarmName the name of the alarm to be deleted
    * @return a {@link CompletableFuture} representing the asynchronous
operation to delete the alarm
    * the {@link DeleteAlarmsResponse} is returned when the operation completes
successfully,
    * or a {@link RuntimeException} is thrown if the operation fails
    */
   public CompletableFuture<DeleteAlarmsResponse> deleteCWAlarmAsync(String
alarmName) {
       DeleteAlarmsRequest request = DeleteAlarmsRequest.builder()
           .alarmNames(alarmName)
           .build();

       return getAsyncClient().deleteAlarms(request)
           .whenComplete((response, exception) -> {
               if (exception != null) {
                   throw new RuntimeException("Failed to delete the alarm:{} " +
alarmName, exception);
               } else {
                   logger.info("Successfully deleted alarm {} ", alarmName);
               }
           });
   }
```

- For API details, see DeleteAlarms in *AWS SDK for Java 2.x API Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Import the SDK and client modules and call the API.

```
import { DeleteAlarmsCommand } from "@aws-sdk/client-cloudwatch";
import { client } from "../libs/client.js";

const run = async () => {
  const command = new DeleteAlarmsCommand({
    AlarmNames: [process.env.CLOUDWATCH_ALARM_NAME], // Set the value of
 CLOUDWATCH_ALARM_NAME to the name of an existing alarm.
  });

  try {
    return await client.send(command);
  } catch (err) {
    console.error(err);
  }
};

export default run();
```

Create the client in a separate module and export it.

```
import { CloudWatchClient } from "@aws-sdk/client-cloudwatch";

export const client = new CloudWatchClient({});
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see DeleteAlarms in *AWS SDK for JavaScript API Reference*.

SDK for JavaScript (v2)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Import the SDK and client modules and call the API.

```
// Load the AWS SDK for Node.js
var AWS = require("aws-sdk");
// Set the region
AWS.config.update({ region: "REGION" });

// Create CloudWatch service object
var cw = new AWS.CloudWatch({ apiVersion: "2010-08-01" });

var params = {
  AlarmNames: ["Web_Server_CPU_Utilization"],
};

cw.deleteAlarms(params, function (err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data);
  }
});
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see DeleteAlarms in *AWS SDK for JavaScript API Reference*.

Kotlin

SDK for Kotlin

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
suspend fun deleteAlarm(alarmNameVal: String) {
    val request =
        DeleteAlarmsRequest {
            alarmNames = listOf(alarmNameVal)
        }

    CloudWatchClient.fromEnvironment { region = "us-east-1" }.use { cwClient ->
        cwClient.deleteAlarms(request)
        println("Successfully deleted alarm $alarmNameVal")
    }
}
```

- For API details, see DeleteAlarms in *AWS SDK for Kotlin API reference*.

Python

SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
class CloudWatchWrapper:
    """Encapsulates Amazon CloudWatch functions."""

    def __init__(self, cloudwatch_resource):

                metric_name,
            )
            raise
```

- For API details, see DeleteAlarms in *AWS SDK for Python (Boto3) API Reference*.

SAP ABAP

SDK for SAP ABAP

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    TRY.
        lo_cwt->deletealarms(
          it_alarmnames = it_alarm_names ).
        MESSAGE 'Alarms deleted.' TYPE 'I'.
      CATCH /aws1/cx_cwtresourcenotfound.
        MESSAGE 'Resource being accessed is not found.' TYPE 'E'.
    ENDTRY.
```

- For API details, see DeleteAlarms in *AWS SDK for SAP ABAP API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using CloudWatch with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteAnomalyDetector` with an AWS SDK or CLI

The following code examples show how to use `DeleteAnomalyDetector`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

.NET

SDK for .NET (v4)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// Delete a single metric anomaly detector.
    /// </summary>
    /// <param name="anomalyDetector">The anomaly detector to delete.</param>
    /// <returns>True if successful.</returns>
```

```
    public async Task<bool> DeleteAnomalyDetector(SingleMetricAnomalyDetector
anomalyDetector)
    {
        var deleteAnomalyDetectorResponse = await
_amazonCloudWatch.DeleteAnomalyDetectorAsync(
            new DeleteAnomalyDetectorRequest()
            {
                SingleMetricAnomalyDetector = anomalyDetector
            });

        return deleteAnomalyDetectorResponse.HttpStatusCode == HttpStatusCode.OK;
    }
```

- For API details, see DeleteAnomalyDetector in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To delete a specified anomaly detection model

The following `delete-anomaly-detector` example deletes an anomaly detector model in the specified account.

```
aws cloudwatch delete-anomaly-detector \
    --namespace AWS/Logs \
    --metric-name IncomingBytes \
    --stat SampleCount
```

This command produces no output.

For more information, see Deleting an anomaly detection model in the *Amazon CloudWatch User Guide*.

- For API details, see DeleteAnomalyDetector in *AWS CLI Command Reference*.

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   /**

Use `DeleteDashboards` with an AWS SDK or CLI

The following code examples show how to use `DeleteDashboards`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

.NET

SDK for .NET (v4)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// Delete a list of CloudWatch dashboards.
    /// </summary>
    /// <param name="dashboardNames">List of dashboard names to delete.</param>
    /// <returns>True if successful.</returns>
    public async Task<bool> DeleteDashboards(List<string> dashboardNames)
    {
        var deleteDashboardsResponse = await
_amazonCloudWatch.DeleteDashboardsAsync(
            new DeleteDashboardsRequest()
            {
                DashboardNames = dashboardNames
            });

        return deleteDashboardsResponse.HttpStatusCode == HttpStatusCode.OK;
    }
```

- For API details, see DeleteDashboards in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To delete specified dashboards

The following `delete-dashboards` example deletes two dashboards named `Dashboard-A` and `Dashboard-B` in the specified account.

```
aws cloudwatch delete-dashboards \
    --dashboard-names Dashboard-A Dashboard-B
```

This command produces no output.

For more information, see Amazon CloudWatch dashboards in the *Amazon CloudWatch User Guide*.

- For API details, see DeleteDashboards in *AWS CLI Command Reference*.

CLI

AWS CLI

To retrieve history for an alarm

The following example uses the `describe-alarm-history` command to retrieve history for the Amazon CloudWatch alarm named "myalarm":

```
aws cloudwatch describe-alarm-history --alarm-name "myalarm" --history-item-
type StateUpdate
```

Output:

```
{
    "AlarmHistoryItems": [
        {
            "Timestamp": "2014-04-09T18:59:06.442Z",
            "HistoryItemType": "StateUpdate",
            "AlarmName": "myalarm",
```

```
            "HistoryData": "{\"version\":\"1.0\",\"oldState\":{\"stateValue
\":\"ALARM\",\"stateReason\":\"testing purposes\"},\"newState\":{\"stateValue
\":\"OK\",\"stateReason\":\"Threshold Crossed: 2 datapoints were not
 greater than the threshold (70.0). The most recent datapoints: [38.958,
 40.292].\",\"stateReasonData\":{\"version\":\"1.0\",\"queryDate\":
\"2014-04-09T18:59:06.419+0000\",\"startDate\":\"2014-04-09T18:44:00.000+0000\",
\"statistic\":\"Average\",\"period\":300,\"recentDatapoints\":[38.958,40.292],
\"threshold\":70.0}}}",
            "HistorySummary": "Alarm updated from ALARM to OK"
        },
        {
            "Timestamp": "2014-04-09T18:59:05.805Z",
            "HistoryItemType": "StateUpdate",
            "AlarmName": "myalarm",
            "HistoryData": "{\"version\":\"1.0\",\"oldState\":{\"stateValue
\":\"OK\",\"stateReason\":\"Threshold Crossed: 2 datapoints were
 not greater than the threshold (70.0). The most recent datapoints:
 [38.839999999999996, 39.714].\",\"stateReasonData\":{\"version\":

CLI

AWS CLI

To display information about alarms associated with a metric

The following example uses the `describe-alarms-for-metric` command to display information about any alarms associated with the Amazon EC2 CPUUtilization metric and the instance with the ID i-0c986c72.:

```
aws cloudwatch describe-alarms-for-metric --metric-name CPUUtilization --
namespace AWS/EC2 --dimensions Name=InstanceId,Value=i-0c986c72
```

Output:

```
{
    "MetricAlarms": [
        {
            "EvaluationPeriods": 10,
            "AlarmArn": "arn:aws:cloudwatch:us-

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Import the SDK and client modules and call the API.

```
import { DescribeAlarmsCommand } from "@aws-sdk/client-cloudwatch";
import { client } from "../libs/client.js";

const run = async () => {
  const command = new DescribeAlarmsCommand({
    AlarmNames: [process.env.CLOUDWATCH_ALARM_NAME], // Set the value of
 CLOUDWATCH_ALARM_NAME to the name of an existing alarm.
  });

  try {
    return await client.send(command);
  } catch (err) {
    console.error(err);
  }
};

export default run();
```

Create the client in a separate module and export it.

```
import { CloudWatchClient } from "@aws-sdk/client-cloudwatch";

export const client = new CloudWatchClient({});
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see DescribeAlarmsForMetric in *AWS SDK for JavaScript API Reference*.

SDK for JavaScript (v2)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
// Load the AWS SDK for Node.js
var AWS = require("aws-sdk");
// Set the region
AWS.config.update({ region: "REGION" });

// Create CloudWatch service object
var cw = new AWS.CloudWatch({ apiVersion: "2010-08-01" });

cw.describeAlarms({ StateValue: "INSUFFICIENT_DATA" }, function (err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    // List the names of all current alarms in the console
    data.MetricAlarms.forEach(function (item, index, array) {
      console.log(item.AlarmName);
    });
  }
});

Use `DescribeAnomalyDetectors` with an AWS SDK or CLI

The following code examples show how to use `DescribeAnomalyDetectors`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

.NET

SDK for .NET (v4)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// Describe anomaly detectors for a metric and namespace.
    /// </summary>
    /// <param name="metricNamespace">The namespace of the metric.</param>
    /// <param name="metricName">The metric of the anomaly detectors.</param>
    /// <returns>The list of detectors.</returns>
    public async Task<List<AnomalyDetector>> DescribeAnomalyDetectors(string
metricNamespace, string metricName)
    {
        List<AnomalyDetector> detectors = new List<AnomalyDetector>();
        var paginatedDescribeAnomalyDetectors =
_amazonCloudWatch.Paginators.DescribeAnomalyDetectors(
            new DescribeAnomalyDetectorsRequest()
```

```
            {
                MetricName = metricName,
                Namespace = metricNamespace
            });

        await foreach (var data in
paginatedDescribeAnomalyDetectors.AnomalyDetectors)
        {
            detectors.Add(data);
        }

        return detectors;
    }
```

- For API details, see DescribeAnomalyDetectors in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To retrieve a list of anomaly detection models

The following `describe-anomaly-detectors` example displays information about anomaly detector models that are associated with the `AWS/Logs` namespace in the specified account.

```
aws cloudwatch describe-anomaly-detectors \
    --namespace AWS/Logs
```

Output:

```
{
    "AnomalyDetectors": [
        {
            "Namespace": "AWS/Logs",
            "MetricName": "IncomingBytes",
            "Dimensions": [],
            "Stat": "SampleCount",
            "Configuration": {
                "ExcludedTimeRanges": []
```

```
            },
            "StateValue": "TRAINED",
            "SingleMetricAnomalyDetector": {
                "AccountId": "123456789012",
                "Namespace": "AWS/Logs",
                "MetricName": "IncomingBytes",
                "Dimensions": [],
                "Stat": "SampleCount"
            }
        },
        {
            "Namespace": "AWS/Logs",
            "MetricName": "IncomingBytes",
            "Dimensions": [
                {
                    "Name": "LogGroupName",
                    "Value": "demo"
                }
            ],

Use `DisableAlarmActions` with an AWS SDK or CLI

The following code examples show how to use `DisableAlarmActions`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Get started with alarms
- Manage metrics and alarms

.NET

SDK for .NET (v4)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// Disable the actions for a list of alarms from CloudWatch.
    /// </summary>
    /// <param name="alarmNames">A list of names of alarms.</param>
    /// <returns>True if successful.</returns>
    public async Task<bool> DisableAlarmActions(List<string> alarmNames)
    {
        var disableAlarmActionsResult = await
_amazonCloudWatch.DisableAlarmActionsAsync(
            new DisableAlarmActionsRequest()
            {
                AlarmNames = alarmNames
            });

        return disableAlarmActionsResult.HttpStatusCode == HttpStatusCode.OK;
    }
```

- For API details, see DisableAlarmActions in *AWS SDK for .NET API Reference*.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Include the required files.

```
#include <aws/core/Aws.h>
#include <aws/monitoring/CloudWatchClient.h>
#include <aws/monitoring/model/DisableAlarmActionsRequest.h>
#include <iostream>
```

Disable the alarm actions.

```
        Aws::CloudWatch::CloudWatchClient cw;

        Aws::CloudWatch::Model::DisableAlarmActionsRequest
 disableAlarmActionsRequest;
        disableAlarmActionsRequest.AddAlarmNames(alarm_name);

        auto disableAlarmActionsOutcome =
 cw.DisableAlarmActions(disableAlarmActionsRequest);
        if (!disableAlarmActionsOutcome.IsSuccess())
        {
            std::cout << "Failed to disable actions for alarm " << alarm_name <<
                ": " << disableAlarmActionsOutcome.GetError().GetMessage() <<
                std::endl;
        }
        else
        {
            std::cout << "Successfully disabled actions for alarm " <<
                alarm_name << std::endl;
        }
```

- For API details, see DisableAlarmActions in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To disable actions for an alarm

The following example uses the `disable-alarm-actions` command to disable all actions for the alarm named myalarm.:

```
aws cloudwatch disable-alarm-actions --alarm-names myalarm
```

This command returns to the prompt if successful.

- For API details, see DisableAlarmActions in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Import the SDK and client modules and call the API.

```
import { DisableAlarmActionsCommand } from "@aws-sdk/client-cloudwatch";
import { client } from "../libs/client.js";

const run = async () => {
  const command = new DisableAlarmActionsCommand({
    AlarmNames: process.env.CLOUDWATCH_ALARM_NAME, // Set the value of
 CLOUDWATCH_ALARM_NAME to the name of an existing alarm.
  });

  try {
    return await client.send(command);
  } catch (err) {
    console.error(err);
  }
};

export default run();
```

Create the client in a separate module and export it.

```
import { CloudWatchClient } from "@aws-sdk/client-cloudwatch";

export const client = new CloudWatchClient({});
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see DisableAlarmActions in *AWS SDK for JavaScript API Reference*.

SDK for JavaScript (v2)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Import the SDK and client modules and call the API.

```
// Load the AWS SDK for Node.js
var AWS = require("aws-sdk");
// Set the region
AWS.config.update({ region: "REGION" });

// Create CloudWatch service object
var cw = new AWS.CloudWatch({ apiVersion: "2010-08-01" });

cw.disableAlarmActions(
  { AlarmNames: ["Web_Server_CPU_Utilization"] },
  function (err, data) {
    if (err) {
      console.log("Error", err);
    } else {
      console.log("Success", data);
    }
  }
);
```

    request.SetUnit(Aws::CloudWatch::Model::StandardUnit::Seconds);
    request.AddAlarmActions(actionArn);

    Aws::CloudWatch::Model::Dimension dimension;
    dimension.SetName("InstanceId");
    dimension.SetValue(instanceId);
    request.AddDimensions(dimension);
```

```
    auto outcome = cw.PutMetricAlarm(request);
    if (!outcome.IsSuccess())
    {
        std::cout << "Failed to create CloudWatch alarm:" <<
            outcome.GetError().GetMessage() << std::endl;
        return;
    }

    Aws::CloudWatch::Model::EnableAlarmActionsRequest enable_request;
    enable_request.AddAlarmNames(alarm_name);

    auto enable_outcome = cw.EnableAlarmActions(enable_request);
    if (!enable_outcome.IsSuccess())
    {
        std::cout << "Failed to enable alarm actions:" <<
            enable_outcome.GetError().GetMessage() << std::endl;
        return;
    }

    std::cout << "Successfully created alarm " << alarm_name <<
        " and enabled actions on it." << std::endl;
```

- For API details, see EnableAlarmActions in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To enable all actions for an alarm

The following example uses the `enable-alarm-actions` command to enable all actions for the alarm named myalarm.:

```
aws cloudwatch enable-alarm-actions --alarm-names myalarm
```

This command returns to the prompt if successful.

- For API details, see EnableAlarmActions in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Import the SDK and client modules and call the API.

```
import { EnableAlarmActionsCommand } from "@aws-sdk/client-cloudwatch";
```

```
import { client } from "../libs/client.js";

const run = async () => {
  const command = new EnableAlarmActionsCommand({
    AlarmNames: [process.env.CLOUDWATCH_ALARM_NAME], // Set the value of
 CLOUDWATCH_ALARM_NAME to the name of an existing alarm.
  });

  try {
    return await client.send(command);
  } catch (err) {
    console.error(err);
  }
};

export default run();
```

Create the client in a separate module and export it.

```
import { CloudWatchClient } from "@aws-sdk/client-cloudwatch";

export const client = new CloudWatchClient({});
```

Use `GetDashboard` with an AWS SDK or CLI

The following code examples show how to use `GetDashboard`.

.NET

SDK for .NET (v4)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// Get information on a dashboard.
    /// </summary>
    /// <param name="dashboardName">The name of the dashboard.</param>
    /// <returns>A JSON object with dashboard information.</returns>
    public async Task<string> GetDashboard(string dashboardName)
    {
        var dashboardResponse = await _amazonCloudWatch.GetDashboardAsync(
            new GetDashboardRequest()
            {
                DashboardName = dashboardName
            });

        return dashboardResponse.DashboardBody;
    }
```

- For API details, see GetDashboard in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To retrieve information about a Dashboard

The following `get-dashboard` example displays information about the dashboard named `Dashboard-A` in the specified account.

```
aws cloudwatch get-dashboard \
    --dashboard-name Dashboard-A
```

Output:

```
{
    "DashboardArn": "arn:aws:cloudwatch::123456789012:dashboard/Dashboard-A",
    "DashboardBody": "{\"widgets\":[{\"type\":\"metric\",\"x\":0,\"y\":0,\"width
\":6,\"height\":6,\"properties\":{\"view\":\"timeSeries\",\"stacked\":false,
\"metrics\":[[\"AWS/EC2\",\"NetworkIn\",\"InstanceId\",\"i-0131f062232ade043\"],
[\".\",\"NetworkOut\",\".\",\".\"]],\"region\":\"us-east-1\"}}]}",
    "DashboardName": "Dashboard-A"
}
```

For more information, see Amazon CloudWatch dashboards in the *Amazon CloudWatch User Guide*.

- For API details, see GetDashboard in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: Returns the arn the body of the specified dashboard.

```
Get-CWDashboard -DashboardName Dashboard1
```

Output:

```
DashboardArn                                            DashboardBody
------------                                            -------------
arn:aws:cloudwatch::123456789012:dashboard/Dashboard1 {...
```

- For API details, see GetDashboard in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: Returns the arn the body of the specified dashboard.

```
Get-CWDashboard -DashboardName Dashboard1
```

Output:

```
DashboardArn                                            DashboardBody
------------                                            -------------
```

```
arn:aws:cloudwatch::123456789012:dashboard/Dashboard1 {...
```

- For API details, see GetDashboard in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using CloudWatch with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetMetricData` with an AWS SDK or CLI

The following code examples show how to use `GetMetricData`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

.NET

SDK for .NET (v4)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// Get data for CloudWatch metrics.
    /// </summary>
    /// <param name="minutesOfData">The number of minutes of data to include.</
param>
    /// <param name="useDescendingTime">True to return the data descending by
 time.</param>
    /// <param name="endDateUtc">The end date for the data, in UTC.</param>
    /// <param name="maxDataPoints">The maximum data points to include.</param>
    /// <param name="dataQueries">Optional data queries to include.</param>
    /// <returns>A list of the requested metric data.</returns>
    public async Task<List<MetricDataResult>> GetMetricData(int minutesOfData,
 bool useDescendingTime, DateTime? endDateUtc = null,
```

```
        int maxDataPoints = 0, List<MetricDataQuery>? dataQueries = null)
    {
        var metricData = new List<MetricDataResult>();
        // If no end time is provided, use the current time for the end time.
        endDateUtc ??= DateTime.UtcNow;
        var timeZoneOffset =
 TimeZoneInfo.Local.GetUtcOffset(endDateUtc.Value.ToLocalTime());
        var startTimeUtc = endDateUtc.Value.AddMinutes(-minutesOfData);
        // The timezone string should be in the format +0000, so use the timezone
 offset to format it correctly.
        var timeZoneString = $"{timeZoneOffset.Hours:D2}
{timeZoneOffset.Minutes:D2}";
        // Add the plus sign for positive offsets.
        timeZoneString = timeZoneString.StartsWith('-') ? timeZoneString : "+" +
 timeZoneString;
        var paginatedMetricData = _amazonCloudWatch.Paginators.GetMetricData(
            new GetMetricDataRequest()
            {
                StartTimeUtc = startTimeUtc,
                EndTimeUtc = endDateUtc.Value,
                LabelOptions = new LabelOptions { Timezone = timeZoneString },
                ScanBy = useDescendingTime ? ScanBy.TimestampDescending :
 ScanBy.TimestampAscending,
                MaxDatapoints = maxDataPoints,
                MetricDataQueries = dataQueries,
            });

        if (paginatedMetricData.MetricDataResults != null)
        {
            await foreach (var data in paginatedMetricData.MetricDataResults)
            {
                metricData.Add(data);
            }
        }

        return metricData;
    }
```

- For API details, see GetMetricData in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

Example 1: To get the Average Total IOPS for the specified EC2 using math expression

The following `get-metric-data` example retrieves CloudWatch metric values for the EC2 instance with InstanceID `i-abcdef` using metric math exprssion that combines `EBSReadOps` and `EBSWriteOps` metrics.

```
aws cloudwatch get-metric-data \
    --metric-data-queries file://file.json \
    --start-time 2024-09-29T22:10:00Z \
    --end-time 2024-09-29T22:15:00Z
```

Contents of `file.json`:

```
[
    {
        "Id": "m3",
        "Expression": "(m1+m2)/300",
        "Label": "Avg Total IOPS"
    },
    {
        "Id": "m1",
        "MetricStat": {
            "Metric": {
                "Namespace": "AWS/EC2",
                "MetricName": "EBSReadOps",
                "Dimensions": [
                    {
                        "Name": "InstanceId",
                        "Value": "i-abcdef"
                    }
                ]
            },
            "Period": 300,
            "Stat": "Sum",
            "Unit": "Count"
        },
        "ReturnData": false
    },
    {
```

```
        "Id": "m2",
        "MetricStat": {
            "Metric": {
                "Namespace": "AWS/EC2",
                "MetricName": "EBSWriteOps",
                "Dimensions": [
                    {
                        "Name": "InstanceId",
                        "Value": "i-abcdef"
                    }
                ]
            },
            "Period": 300,
            "Stat": "Sum",
            "Unit": "Count"
        },
        "ReturnData": false
    }
]
```

Output:

```
{
    "MetricDataResults": [
        {
            "Id": "m3",
            "Label": "Avg Total IOPS",
            "Timestamps": [
                "2024-09-29T22:10:00+00:00"
            ],
            "Values": [
                96.85
            ],
            "StatusCode": "Complete"
        }
    ],
    "Messages": []
}
```

Example 2: To monitor the estimated AWS charges using CloudWatch billing metrics

The following `get-metric-data` example retrieves `EstimatedCharges` CloudWatch metric from AWS/Billing namespace.

```
aws cloudwatch get-metric-data \
    --metric-data-queries '[{"Id":"m1","MetricStat":{"Metric":
{"Namespace":"AWS/Billing","MetricName":"EstimatedCharges","Dimensions":
[{"Name":"Currency","Value":"USD"}]},"Period":21600,"Stat":"Maximum"}}]' \
    --start-time 2024-09-26T12:00:00Z \
    --end-time 2024-09-26T18:00:00Z \
    --region us-east-1
```

Output:

```
{
    "MetricDataResults": [
        {
            "Id": "m1",
            "Label": "EstimatedCharges",
            "Timestamps": [
                "2024-09-26T12:00:00+00:00"
            ],
            "Values": [
                542.38
            ],
            "StatusCode": "Complete"
        }
    ],
    "Messages": []
}
```

CLI

AWS CLI

To get the CPU utilization per EC2 instance

The following example uses the `get-metric-statistics` command to get the CPU utilization for an EC2 instance with the ID i-abcdef.

```
aws cloudwatch get-metric-statistics --metric-name CPUUtilization --start-
time 2014-04-08T23:18:00Z --end-time 2014-04-09T23:18:00Z --period 3600 --
namespace AWS/EC2 --statistics Maximum --dimensions Name=InstanceId,Value=i-
abcdef
```

Output:

```
{
    "Datapoints": [
        {
            "Timestamp": "2014-04-09T11:18:00Z",
            "Maximum": 44.79,
            "Unit": "Percent"
        },
        {
            "Timestamp": "2014-04-09T20:18:00Z",
            "Maximum": 47.92,
            "Unit": "Percent"
        },
        {

            "Unit": "Percent"
        },
        {
            "Timestamp": "2014-04-09T01:18:00Z",
            "Maximum": 49.18,
            "Unit": "Percent"
        }
    ],
    "Label": "CPUUtilization"
}
```

Specifying multiple dimensions

The following example illustrates how to specify multiple dimensions. Each dimension is specified as a Name/Value pair, with a comma between the name and the value. Multiple dimensions are separated by a space. If a single metric includes multiple dimensions, you must specify a value for every defined dimension.

For more examples using the `get-metric-statistics` command, see Get Statistics for a Metric in the *Amazon CloudWatch Developer Guide*.

```
aws cloudwatch get-metric-statistics --metric-name Buffers --
namespace MyNameSpace --dimensions Name=InstanceID,Value=i-
abcdef Name=InstanceType,Value=m1.small --start-time 2016-10-15T04:00:00Z --end-
time 2016-10-19T07:00:00Z --statistics Average --period 60
```

- For API details, see GetMetricStatistics in *AWS CLI Command Reference*.

Python

SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
class CloudWatchWrapper:
    """Encapsulates Amazon CloudWatch functions."""

    def __init__(self, cloudwatch_resource):
        """
        :param cloudwatch_resource: A Boto3 CloudWatch resource.
        """
        self.cloudwatch_resource = cloudwatch_resource

    def get_metric_statistics(self, namespace, name, start, end, period,
 stat_types):
        """
        Gets statistics for a metric within a specified time span. Metrics are
 grouped
        into the specified period.

        :param namespace: The namespace of the metric.
        :param name: The name of the metric.
        :param start: The UTC start time of the time span to retrieve.
        :param end: The UTC end time of the time span to retrieve.
```

```
        :param period: The period, in seconds, in which to group metrics. The
period
                       must match the granularity of the metric, which depends on
                       the metric's age. For example, metrics that are older than
                       three hours have a one-minute granularity, so the period
must
                       be at least 60 and must be a multiple of 60.
        :param stat_types: The type of statistics to retrieve, such as average
value
                           or maximum value.
        :return: The retrieved statistics for the metric.

        var metricFileName = $"{metricName}_{DateTime.Now.Ticks}.png";
```

```
        using var sr = new StreamReader(memoryStream);
        // Writes the memory stream to a file.
        File.WriteAllBytes(metricFileName, memoryStream.ToArray());
        var filePath = Path.Join(AppDomain.CurrentDomain.BaseDirectory,
            metricFileName);
        return filePath;
    }
```

- For API details, see GetMetricWidgetImage in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To retrieve a snapshot graph of CPUUtilization

The following `get-metric-widget-image` example retrieves snapshot graph for the metric `CPUUtilization` of the EC2 instance with the ID `i-abcde` and saves the retrieved image as a file named "image.png" on your local machine.

```
aws cloudwatch get-metric-widget-image \
    --metric-widget '{"metrics":[["AWS/EC2","CPUUtilization","InstanceId","i-abcde"]]}' \
    --output-format png \
    --output text | base64 --decode > image.png
```

This command produces no output.

- For API details, see GetMetricWidgetImage in *AWS CLI Command Reference*.

Use `ListDashboards` with an AWS SDK or CLI

The following code examples show how to use `ListDashboards`.

.NET

SDK for .NET (v4)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
/// <summary>
/// Get a list of dashboards.
/// </summary>
/// <returns>A list of DashboardEntry objects.</returns>
public async Task<List<DashboardEntry>> ListDashboards()
{
    var results = new List<DashboardEntry>();
    var paginateDashboards = _amazonCloudWatch.Paginators.ListDashboards(
        new ListDashboardsRequest());
    // Get the entire list using the paginator.
    await foreach (var data in paginateDashboards.DashboardEntries)
    {
        results.Add(data);
    }

    return results;
}
```

- For API details, see ListDashboards in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To retrieve a list of Dashboards

The following `list-dashboards` example lists all the Dashboards in the specified account.

```
aws cloudwatch list-dashboards
```

Output:

```
{
    "DashboardEntries": [
        {
            "DashboardName": "Dashboard-A",
            "DashboardArn": "arn:aws:cloudwatch::123456789012:dashboard/
Dashboard-A",
            "LastModified": "2024-10-11T18:40:11+00:00",
            "Size": 271
        },
        {
            "DashboardName": "Dashboard-B",
            "DashboardArn": "arn:aws:cloudwatch::123456789012:dashboard/
Dashboard-B",
            "LastModified": "2024-10-11T18:44:41+00:00",
            "Size": 522
        }
    ]
}
```

PowerShell

Tools for PowerShell V4

Example 1: Returns the collection of dashboards for your account.

```
Get-CWDashboardList
```

Output:

```
DashboardArn DashboardName LastModified        Size
------------ ------------- ------------        ----
arn:...      Dashboard1    7/6/2017 8:14:15 PM 252
```

Example 2: Returns the collection of dashboards for your account whose names start with the prefix 'dev'.

```
Get-CWDashboardList -DashboardNamePrefix dev
```

- For API details, see ListDashboards in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: Returns the collection of dashboards for your account.

```
Get-CWDashboardList
```

Output:

```
DashboardArn DashboardName LastModified        Size
------------ ------------- ------------        ----
arn:...      Dashboard1    7/6/2017 8:14:15 PM 252
```

Example 2: Returns the collection of dashboards for your account whose names start with the prefix 'dev'.

```
Get-CWDashboardList -DashboardNamePrefix dev
```

- For API details, see ListDashboards in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Import the SDK and client modules and call the API.

```
import {
  CloudWatchServiceException,
  ListMetricsCommand,
} from "@aws-sdk/client-cloudwatch";
import { client } from "../libs/client.js";

export const main = async () => {
  // Use the AWS console to see available namespaces and metric names. Custom
 metrics can also be created.
  // https://docs.aws.amazon.com/AmazonCloudWatch/latest/monitoring/
viewing_metrics_with_cloudwatch.html
  const command = new ListMetricsCommand({
    Dimensions: [
      {
        Name: "LogGroupName",
      },
    ],
    MetricName: "IncomingLogEvents",
    Namespace: "AWS/Logs",
  });

  try {
    const response = await client.send(command);
    console.log(`Metrics count: ${response.Metrics?.length}`);
    return response;
  } catch (caught) {
    if (caught instanceof CloudWatchServiceException) {
      console.error(`Error from CloudWatch. ${caught.name}: ${caught.message}`);
    } else {
      throw caught;
    }
```

```
  }
};
```

Create the client in a separate module and export it.

```
import { CloudWatchClient } from "@aws-sdk/client-cloudwatch";

export const client = new CloudWatchClient({});
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see ListMetrics in *AWS SDK for JavaScript API Reference*.

SDK for JavaScript (v2)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
// Load the AWS SDK for Node.js
var AWS = require("aws-sdk");
// Set the region
AWS.config.update({ region: "REGION" });

// Create CloudWatch service object
var cw = new AWS.CloudWatch({ apiVersion: "2010-08-01" });

var params = {
  Dimensions: [
    {
      Name: "LogGroupName" /* required */,
    },
  ],
  MetricName: "IncomingLogEvents",
  Namespace: "AWS/Logs",
};

cw.listMetrics(params, function (err, data) {
```

```
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Metrics", JSON.stringify(data.Metrics));
  }
});
```

Use `PutAnomalyDetector` with an AWS SDK or CLI

The following code examples show how to use `PutAnomalyDetector`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

.NET

SDK for .NET (v4)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   /// <summary>
   /// Add an anomaly detector for a single metric.
   /// </summary>
   /// <param name="anomalyDetector">A single metric anomaly detector.</param>
   /// <returns>True if successful.</returns>
   public async Task<bool> PutAnomalyDetector(SingleMetricAnomalyDetector
anomalyDetector)
   {
       var putAlarmDetectorResult = await
_amazonCloudWatch.PutAnomalyDetectorAsync(
           new PutAnomalyDetectorRequest()
           {
               SingleMetricAnomalyDetector = anomalyDetector
           });

       return putAlarmDetectorResult.HttpStatusCode == HttpStatusCode.OK;
   }
```

- For API details, see PutAnomalyDetector in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To create an anomaly detection model

The following `put-anomaly-detector` example creates an anomaly detection model for a CloudWatch metric.

```
aws cloudwatch put-anomaly-detector \
    --namespace AWS/Logs \
    --metric-name IncomingBytes \
    --stat SampleCount
```

This command produces no output.

For more information, see Using CloudWatch anomaly detection in the *Amazon CloudWatch User Guide*.

- For API details, see PutAnomalyDetector in *AWS CLI Command Reference*.

    /// <returns>A list of validation messages for the dashboard.</returns>
    public async Task<List<DashboardValidationMessage>> PutDashboard(string
 dashboardName,
        string dashboardBody)
    {
        // Updating a dashboard replaces all contents.
        // Best practice is to include a text widget indicating this dashboard
 was created programmatically.
        var dashboardResponse = await _amazonCloudWatch.PutDashboardAsync(
            new PutDashboardRequest()
            {
                DashboardName = dashboardName,
                DashboardBody = dashboardBody
            });

        return dashboardResponse.DashboardValidationMessages ?? new
 List<DashboardValidationMessage>();
    }
```

- For API details, see PutDashboard in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To create a dashboard

The following `put-dashboard` example creates a dashboard named `Dashboard-A` in the specified account.

```
aws cloudwatch put-dashboard \
    --dashboard-name Dashboard-A \
    --dashboard-body '{"widgets":
[{"height":6,"width":6,"y":0,"x":0,"type":"metric","properties":
{"view":"timeSeries","stacked":false,"metrics":
[["Namespace","CPUUtilization","Environment","Prod","Type","App"]],"region":"us-
east-1"}}]}'
```

Output:

```
{
    "DashboardValidationMessages": []
}
```

For more information, see Creating a CloudWatch dashboard in the *Amazon CloudWatch User Guide*.

- For API details, see PutDashboard in *AWS CLI Command Reference*.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Include the required files.

```
#include <aws/core/Aws.h>
#include <aws/monitoring/CloudWatchClient.h>
#include <aws/monitoring/model/PutMetricAlarmRequest.h>
#include <iostream>
```

Create the alarm to watch the metric.

```
        Aws::CloudWatch::CloudWatchClient cw;
        Aws::CloudWatch::Model::PutMetricAlarmRequest request;
        request.SetAlarmName(alarm_name);
        request.SetComparisonOperator(
            Aws::CloudWatch::Model::ComparisonOperator::GreaterThanThreshold);
        request.SetEvaluationPeriods(1);
        request.SetMetricName("CPUUtilization");
        request.SetNamespace("AWS/EC2");
        request.SetPeriod(60);
        request.SetStatistic(Aws::CloudWatch::Model::Statistic::Average);
        request.SetThreshold(70.0);
        request.SetActionsEnabled(false);
        request.SetAlarmDescription("Alarm when server CPU exceeds 70%");
        request.SetUnit(Aws::CloudWatch::Model::StandardUnit::Seconds);

        Aws::CloudWatch::Model::Dimension dimension;
        dimension.SetName("InstanceId");
```

```
        dimension.SetValue(instanceId);

        request.AddDimensions(dimension);

        auto outcome = cw.PutMetricAlarm(request);
        if (!outcome.IsSuccess())
        {
            std::cout << "Failed to create CloudWatch alarm:" <<
                outcome.GetError().GetMessage() << std::endl;
        }
        else
        {
            std::cout << "Successfully created CloudWatch alarm " << alarm_name
                << std::endl;
        }
```

- For API details, see PutMetricAlarm in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To send an Amazon Simple Notification Service email message when CPU utilization exceeds 70 percent

The following example uses the `put-metric-alarm` command to send an Amazon Simple Notification Service email message when CPU utilization exceeds 70 percent:

```
aws cloudwatch put-metric-alarm --alarm-name cpu-mon --alarm-description "Alarm
 when CPU exceeds 70 percent" --metric-name CPUUtilization --namespace AWS/
EC2 --statistic Average --period 300 --threshold 70 --comparison-
operator GreaterThanThreshold  --dimensions "Name=InstanceId,Value=i-12345678" --
evaluation-periods 2 --alarm-actions arn:aws:sns:us-east-1:111122223333:MyTopic
 --unit Percent
```

This command returns to the prompt if successful. If an alarm with the same name already exists, it will be overwritten by the new alarm.

To specify multiple dimensions

The following example illustrates how to specify multiple dimensions. Each dimension is specified as a Name/Value pair, with a comma between the name and the value. Multiple dimensions are separated by a space:

```
aws cloudwatch put-metric-alarm --alarm-name "Default_Test_Alarm3" --alarm-
description "The default example alarm" --namespace "CW EXAMPLE METRICS"
 --metric-name Default_Test --statistic Average --period 60 --evaluation-
periods 3 --threshold 50 --comparison-operator GreaterThanOrEqualToThreshold --
dimensions Name=key1,Value=value1 Name=key2,Value=value2
```

- For API details, see PutMetricAlarm in *AWS CLI Command Reference*.

Java

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Import the SDK and client modules and call the API.

```
import { PutMetricAlarmCommand } from "@aws-sdk/client-cloudwatch";
import { client } from "../libs/client.js";

const run = async () => {
  // This alarm triggers when CPUUtilization exceeds 70% for one minute.
  const command = new PutMetricAlarmCommand({
    AlarmName: process.env.CLOUDWATCH_ALARM_NAME, // Set the value of
 CLOUDWATCH_ALARM_NAME to the name of an existing alarm.
    ComparisonOperator: "GreaterThanThreshold",
    EvaluationPeriods: 1,
    MetricName: "CPUUtilization",
    Namespace: "AWS/EC2",
    Period: 60,
    Statistic: "Average",
    Threshold: 70.0,
    ActionsEnabled: false,
    AlarmDescription: "Alarm when server CPU exceeds 70%",
    Dimensions: [
      {
        Name: "InstanceId",
        Value: process.env.EC2_INSTANCE_ID, // Set the value of EC_INSTANCE_ID to
 the Id of an existing Amazon EC2 instance.
      },
    ],
    Unit: "Percent",
```

```
  });

  try {
    return await client.send(command);
  } catch (err) {
    console.error(err);
  }
};

export default run();
```

Create the client in a separate module and export it.

```
import { CloudWatchClient } from "@aws-sdk/client-cloudwatch";

export const client = new CloudWatchClient({});
```

```
# Creates or updates an alarm in Amazon CloudWatch.
```

```
#
# @param cloudwatch_client [Aws::CloudWatch::Client]
#   An initialized CloudWatch client.
# @param alarm_name [String] The name of the alarm.
# @param alarm_description [String] A description about the alarm.
# @param metric_name [String] The name of the metric associated with the alarm.
# @param alarm_actions [Array] A list of Strings representing the
#   Amazon Resource Names (ARNs) to execute when the alarm transitions to the
#   ALARM state.
# @param namespace [String] The namespace for the metric to alarm on.
# @param statistic [String] The statistic for the metric.
# @param dimensions [Array] A list of dimensions for the metric, specified as
#   Aws::CloudWatch::Types::Dimension.
# @param period [Integer] The number of seconds before re-evaluating the metric.
# @param unit [String] The unit of measure for the statistic.
# @param evaluation_periods [Integer] The number of periods over which data is
#   compared to the specified threshold.
# @param theshold [Float] The value against which the specified statistic is
 compared.
# @param comparison_operator [String] The arithmetic operation to use when
#   comparing the specified statistic and threshold.
# @return [Boolean] true if the alarm was created or updated; otherwise, false.
# @example
#   exit 1 unless alarm_created_or_updated?(

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Include the required files.

```
#include <aws/core/Aws.h>
#include <aws/monitoring/CloudWatchClient.h>
#include <aws/monitoring/model/PutMetricDataRequest.h>
#include <iostream>
```

Put data into the metric.

```
        Aws::CloudWatch::CloudWatchClient cw;

        Aws::CloudWatch::Model::Dimension dimension;
        dimension.SetName("UNIQUE_PAGES");
        dimension.SetValue("URLS");

        Aws::CloudWatch::Model::MetricDatum datum;
        datum.SetMetricName("PAGES_VISITED");
        datum.SetUnit(Aws::CloudWatch::Model::StandardUnit::None);
        datum.SetValue(data_point);
        datum.AddDimensions(dimension);

        Aws::CloudWatch::Model::PutMetricDataRequest request;
        request.SetNamespace("SITE/TRAFFIC");
        request.AddMetricData(datum);

        auto outcome = cw.PutMetricData(request);
        if (!outcome.IsSuccess())
        {
            std::cout << "Failed to put sample metric data:" <<
                outcome.GetError().GetMessage() << std::endl;
        }
        else
        {
            std::cout << "Successfully put sample metric data" << std::endl;
        }
```

- For API details, see PutMetricData in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To publish a custom metric to Amazon CloudWatch

The following example uses the `put-metric-data` command to publish a custom metric to Amazon CloudWatch:

```
aws cloudwatch put-metric-data --namespace "Usage Metrics" --metric-data file://
metric.json
```

The values for the metric itself are stored in the JSON file, `metric.json`.

Here are the contents of that file:

```
[
  {
    "MetricName": "New Posts",
    "Timestamp": "Wednesday, June 12, 2013 8:28:20 PM",
    "Value": 0.50,
    "Unit": "Count"
  }
]
```

For more information, see Publishing Custom Metrics in the *Amazon CloudWatch Developer Guide*.

To specify multiple dimensions

The following example illustrates how to specify multiple dimensions. Each dimension is specified as a Name=Value pair. Multiple dimensions are separated by a comma.:

```
aws cloudwatch put-metric-data --metric-name Buffers --
namespace MyNameSpace --unit Bytes --value 231434333 --
dimensions InstanceID=1-23456789,InstanceType=m1.small
```

- For API details, see PutMetricData in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Import the SDK and client modules and call the API.

```
import { PutMetricDataCommand } from "@aws-sdk/client-cloudwatch";
import { client } from "../libs/client.js";

const run = async () => {
  // See https://docs.aws.amazon.com/AmazonCloudWatch/latest/APIReference/
API_PutMetricData.html#API_PutMetricData_RequestParameters
  // and https://docs.aws.amazon.com/AmazonCloudWatch/latest/monitoring/
publishingMetrics.html
  // for more information about the parameters in this command.
  const command = new PutMetricDataCommand({
    MetricData: [
      {
        MetricName: "PAGES_VISITED",
        Dimensions: [
          {
            Name: "UNIQUE_PAGES",
            Value: "URLS",
          },
        ],
        Unit: "None",
        Value: 1.0,
      },
    ],
    Namespace: "SITE/TRAFFIC",
```

```
  });

  try {
    return await client.send(command);
  } catch (err) {
    console.error(err);
  }
};

export default run();
```

Create the client in a separate module and export it.

```
import { CloudWatchClient } from "@aws-sdk/client-cloudwatch";

export const client = new CloudWatchClient({});
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see PutMetricData in *AWS SDK for JavaScript API Reference*.

SDK for JavaScript (v2)

PowerShell

Tools for PowerShell V4

Example 1: Creates a new MetricDatum object, and writes it to Amazon Web Services CloudWatch Metrics.

```
### Create a MetricDatum .NET object
$Metric = New-Object -TypeName Amazon.CloudWatch.Model.MetricDatum
$Metric.Timestamp = [DateTime]::UtcNow
$Metric.MetricName = 'CPU'
$Metric.Value = 50

### Write the metric data to the CloudWatch service
Write-CWMetricData -Namespace instance1 -MetricData $Metric
```

- For API details, see PutMetricData in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: Creates a new MetricDatum object, and writes it to Amazon Web Services CloudWatch Metrics.

```
### Create a MetricDatum .NET object
$Metric = New-Object -TypeName Amazon.CloudWatch.Model.MetricDatum
$Metric.Timestamp = [DateTime]::UtcNow
$Metric.MetricName = 'CPU'
$Metric.Value = 50

### Write the metric data to the CloudWatch service
Write-CWMetricData -Namespace instance1 -MetricData $Metric
```

- For API details, see PutMetricData in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using CloudWatch with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Scenarios for CloudWatch using AWS SDKs

The following code examples show you how to implement common scenarios in CloudWatch with AWS SDKs. These scenarios show you how to accomplish specific tasks by calling multiple functions within CloudWatch or combined with other AWS services. Each scenario includes a link to the complete source code, where you can find instructions on how to set up and run the code.

Scenarios target an intermediate level of experience to help you understand service actions in context.

Examples

- Get started with CloudWatch alarms using an AWS SDK
- Manage CloudWatch metrics and alarms using an AWS SDK
- Monitor performance of Amazon DynamoDB using an AWS SDK

Get started with CloudWatch alarms using an AWS SDK

The following code example shows how to:

- Create an alarm.
- Disable alarm actions.
- Describe an alarm.
- Delete an alarm.

        )

    alarm_name = "high_page_views"
    period = 60
    eval_periods = 2
    print(f"Creating alarm {alarm_name} for metric {metric_name}.")
    alarm = cw_wrapper.create_metric_alarm(
        metric_namespace,
        metric_name,
        alarm_name,
        "Maximum",
        period,
        eval_periods,
        100,
        "GreaterThanThreshold",
    )
    print(f"Alarm ARN is {alarm.alarm_arn}.")
    print(f"Current alarm state is: {alarm.state_value}.")
```

```
    print(
        f"Sending data to trigger the alarm. This requires data over the
threshold "
        f"for {eval_periods} periods of {period} seconds each."
    )
    while alarm.state_value == "INSUFFICIENT_DATA":
        print("Sending data for the metric.")
        cw_wrapper.put_metric_data(
            metric_namespace, metric_name, random.randint(100, 200), "Count"
        )
        alarm.load()
        print(f"Current alarm state is: {alarm.state_value}.")
        if alarm.state_value == "INSUFFICIENT_DATA":
            print(f"Waiting for {period} seconds...")
            time.sleep(period)
        else:
            print("Wait for a minute for eventual consistency of metric data.")
            time.sleep(period)
            if alarm.state_value == "OK":
                alarm.load()
                print(f"Current alarm state is: {alarm.state_value}.")

    print(
        f"Getting data for metric {metric_namespace}.{metric_name} during
timespan "
        f"of {start} to {datetime.utcnow()} (times are UTC)."
    )
    stats = cw_wrapper.get_metric_statistics(
        metric_namespace,
        metric_name,
        start,
        datetime.utcnow(),
        60,
        ["Average", "Minimum", "Maximum"],
    )
    print(
        f"Got {len(stats['Datapoints'])} data points for metric "
        f"{metric_namespace}.{metric_name}."
    )
    pprint(sorted(stats["Datapoints"], key=lambda x: x["Timestamp"]))

    print(f"Getting alarms for metric {metric_name}.")
    alarms = cw_wrapper.get_metric_alarms(metric_namespace, metric_name)
    for alarm in alarms:
```

```
            print(f"Alarm {alarm.name} is currently in state {alarm.state_value}.")

    print(f"Deleting alarms for metric {metric_name}.")
    cw_wrapper.delete_metric_alarms(metric_namespace, metric_name)

    print("Thanks for watching!")
    print("-" * 88)
```

Monitor performance of Amazon DynamoDB using an AWS SDK

The following code example shows how to configure an application's use of DynamoDB to monitor performance.

Java

SDK for Java 2.x

This example shows how to configure a Java application to monitor the performance of DynamoDB. The application sends metric data to CloudWatch where you can monitor the performance.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- CloudWatch
- DynamoDB

For a complete list of AWS SDK developer guides and code examples, see Using CloudWatch with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Security in Amazon CloudWatch

Cloud security at AWS is the highest priority. As an AWS customer, you benefit from a data center and network architecture that is built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between AWS and you. The shared responsibility model describes this as security of the cloud and security in the cloud:

- **Security of the cloud** – AWS is responsible for protecting the infrastructure that runs AWS services in the AWS Cloud. AWS also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the AWS Compliance Programs. To learn about the compliance programs that apply to CloudWatch, see AWS Services in Scope by Compliance Program.
- **Security in the cloud** – Your responsibility is determined by the AWS service that you use. You are also responsible for other factors including the sensitivity of your data, your company's requirements, and applicable laws and regulations

This documentation helps you understand how to apply the shared responsibility model when using Amazon CloudWatch. It shows you how to configure Amazon CloudWatch to meet your security and compliance objectives. You also learn how to use other AWS services that help you to monitor and secure your CloudWatch resources.

Contents

- Security considerations for Synthetics canaries

Data protection in Amazon CloudWatch

The AWS shared responsibility model applies to data protection in Amazon CloudWatch. As described in this model, AWS is responsible for protecting the global infrastructure that runs all of the AWS Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. You are also responsible for the security configuration and management tasks for the AWS services that you use. For more information about data privacy, see the Data Privacy FAQ. For information about data protection in Europe, see the AWS Shared Responsibility Model and GDPR blog post on the *AWS Security Blog*.

For data protection purposes, we recommend that you protect AWS account credentials and set up individual users with AWS IAM Identity Center or AWS Identity and Access Management (IAM). That way, each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with AWS resources. We require TLS 1.2 and recommend TLS 1.3.
- Set up API and user activity logging with AWS CloudTrail. For information about using CloudTrail trails to capture AWS activities, see Working with CloudTrail trails in the *AWS CloudTrail User Guide*.
- Use AWS encryption solutions, along with all default security controls within AWS services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing sensitive data that is stored in Amazon S3.
- If you require FIPS 140-3 validated cryptographic modules when accessing AWS through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see Federal Information Processing Standard (FIPS) 140-3.

We strongly recommend that you never put confidential or sensitive information, such as your customers' email addresses, into tags or free-form text fields such as a **Name** field. This includes when you work with CloudWatch or other AWS services using the console, API, AWS CLI, or AWS SDKs. Any data that you enter into tags or free-form text fields used for names may be used for billing or diagnostic logs. If you provide a URL to an external server, we strongly recommend that you do not include credentials information in the URL to validate your request to that server.

Encryption in transit

CloudWatch uses end-to-end encryption of data in transit. For more information, see Encryption of data in transit.

Identity and access management for Amazon CloudWatch

AWS Identity and Access Management (IAM) is an AWS service that helps an administrator securely control access to AWS resources. IAM administrators control who can be *authenticated* (signed in) and *authorized* (have permissions) to use CloudWatch resources. IAM is an AWS service that you can use with no additional charge.

Topics

- Audience
- Authenticating with identities
- Managing access using policies
- How Amazon CloudWatch works with IAM
- Identity-based policy examples for Amazon CloudWatch
- Troubleshooting Amazon CloudWatch identity and access
- CloudWatch dashboard permissions update
- AWS managed (predefined) policies for CloudWatch
- Customer managed policy examples
- Using condition keys to limit access to CloudWatch
- Using service-linked roles for CloudWatch
- Using service-linked roles for CloudWatch RUM
- Using service-linked roles for CloudWatch Application Insights
- AWS managed policies for Amazon CloudWatch Application Insights
- Amazon CloudWatch permissions reference

Audience

How you use AWS Identity and Access Management (IAM) differs based on your role:

- **Service user** - request permissions from your administrator if you cannot access features (see Troubleshooting Amazon CloudWatch identity and access)
- **Service administrator** - determine user access and submit permission requests (see How Amazon CloudWatch works with IAM)
- **IAM administrator** - write policies to manage access (see Identity-based policy examples for Amazon CloudWatch)

Authenticating with identities

Authentication is how you sign in to AWS using your identity credentials. You must be authenticated as the AWS account root user, an IAM user, or by assuming an IAM role.

You can sign in as a federated identity using credentials from an identity source like AWS IAM Identity Center (IAM Identity Center), single sign-on authentication, or Google/Facebook credentials. For more information about signing in, see How to sign in to your AWS account in the *AWS Sign-In User Guide*.

For programmatic access, AWS provides an SDK and CLI to cryptographically sign requests. For more information, see AWS Signature Version 4 for API requests in the *IAM User Guide*.

AWS account root user

When you create an AWS account, you begin with one sign-in identity called the AWS account *root user* that has complete access to all AWS services and resources. We strongly recommend that you don't use the root user for everyday tasks. For tasks that require root user credentials, see Tasks that require root user credentials in the *IAM User Guide*.

Federated identity

As a best practice, require human users to use federation with an identity provider to access AWS services using temporary credentials.

A *federated identity* is a user from your enterprise directory, web identity provider, or Directory Service that accesses AWS services using credentials from an identity source. Federated identities assume roles that provide temporary credentials.

For centralized access management, we recommend AWS IAM Identity Center. For more information, see What is IAM Identity Center? in the *AWS IAM Identity Center User Guide*.

IAM users and groups

An *IAM user* is an identity with specific permissions for a single person or application. We recommend using temporary credentials instead of IAM users with long-term credentials. For more information, see Require human users to use federation with an identity provider to access AWS using temporary credentials in the *IAM User Guide*.

An *IAM group* specifies a collection of IAM users and makes permissions easier to manage for large sets of users. For more information, see Use cases for IAM users in the *IAM User Guide*.

IAM roles

An *IAM role* is an identity with specific permissions that provides temporary credentials. You can assume a role by switching from a user to an IAM role (console) or by calling an AWS CLI or AWS API operation. For more information, see Methods to assume a role in the *IAM User Guide*.

IAM roles are useful for federated user access, temporary IAM user permissions, cross-account access, cross-service access, and applications running on Amazon EC2. For more information, see Cross account resource access in IAM in the *IAM User Guide*.

Managing access using policies

You control access in AWS by creating policies and attaching them to AWS identities or resources. A policy defines permissions when associated with an identity or resource. AWS evaluates these policies when a principal makes a request. Most policies are stored in AWS as JSON documents. For more information about JSON policy documents, see Overview of JSON policies in the *IAM User Guide*.

Using policies, administrators specify who has access to what by defining which **principal** can perform **actions** on what **resources**, and under what **conditions**.

By default, users and roles have no permissions. An IAM administrator creates IAM policies and adds them to roles, which users can then assume. IAM policies define permissions regardless of the method used to perform the operation.

Identity-based policies

Identity-based policies are JSON permissions policy documents that you attach to an identity (user, group, or role). These policies control what actions identities can perform, on which resources, and under what conditions. To learn how to create an identity-based policy, see Define custom IAM permissions with customer managed policies in the *IAM User Guide*.

Identity-based policies can be *inline policies* (embedded directly into a single identity) or *managed policies* (standalone policies attached to multiple identities). To learn how to choose between managed and inline policies, see Choose between managed policies and inline policies in the *IAM User Guide*.

Resource-based policies

Resource-based policies are JSON policy documents that you attach to a resource. Examples include IAM *role trust policies* and Amazon S3 *bucket policies*. In services that support resource-based policies, service administrators can use them to control access to a specific resource. You must specify a principal in a resource-based policy.

Resource-based policies are inline policies that are located in that service. You can't use AWS managed policies from IAM in a resource-based policy.

Other policy types

AWS supports additional policy types that can set the maximum permissions granted by more common policy types:

- **Permissions boundaries** – Set the maximum permissions that an identity-based policy can grant to an IAM entity. For more information, see Permissions boundaries for IAM entities in the *IAM User Guide*.
- **Service control policies (SCPs)** – Specify the maximum permissions for an organization or organizational unit in AWS Organizations. For more information, see Service control policies in the *AWS Organizations User Guide*.
- **Resource control policies (RCPs)** – Set the maximum available permissions for resources in your accounts. For more information, see Resource control policies (RCPs) in the *AWS Organizations User Guide*.
- **Session policies** – Advanced policies passed as a parameter when creating a temporary session for a role or federated user. For more information, see Session policies in the *IAM User Guide*.

Multiple policy types

When multiple types of policies apply to a request, the resulting permissions are more complicated to understand. To learn how AWS determines whether to allow a request when multiple policy types are involved, see Policy evaluation logic in the *IAM User Guide*.

How Amazon CloudWatch works with IAM

Before you use IAM to manage access to CloudWatch, learn what IAM features are available to use with CloudWatch.

The following tables list the IAM features that you can use with Amazon CloudWatch.

IAM feature	CloudWatch support
Identity-based policies	Yes
Resource-based policies	No
Policy actions	Yes
Policy resources	Yes
Policy condition keys (service-specific)	Yes
ACLs	No
ABAC (tags in policies)	Partial
Temporary credentials	Yes
Principal permissions	Yes
Service roles	Yes
Service-linked roles	No

To get a high-level view of how CloudWatch and other AWS services work with most IAM features, see AWS services that work with IAM in the *IAM User Guide*.

Identity-based policies for CloudWatch

Supports identity-based policies: Yes

Identity-based policies are JSON permissions policy documents that you can attach to an identity, such as an IAM user, group of users, or role. These policies control what actions users and roles can

perform, on which resources, and under what conditions. To learn how to create an identity-based policy, see Define custom IAM permissions with customer managed policies in the *IAM User Guide*.

With IAM identity-based policies, you can specify allowed or denied actions and resources as well as the conditions under which actions are allowed or denied. To learn about all of the elements that you can use in a JSON policy, see IAM JSON policy elements reference in the *IAM User Guide*.

Identity-based policy examples for CloudWatch

To view examples of CloudWatch identity-based policies, see Identity-based policy examples for Amazon CloudWatch.

Resource-based policies within CloudWatch

Supports resource-based policies: No

Resource-based policies are JSON policy documents that you attach to a resource. Examples of resource-based policies are IAM *role trust policies* and Amazon S3 *bucket policies*. In services that support resource-based policies, service administrators can use them to control access to a specific resource. For the resource where the policy is attached, the policy defines what actions a specified principal can perform on that resource and under what conditions. You must specify a principal in a resource-based policy. Principals can include accounts, users, roles, federated users, or AWS services.

To enable cross-account access, you can specify an entire account or IAM entities in another account as the principal in a resource-based policy. For more information, see Cross account resource access in IAM in the *IAM User Guide*.

Policy actions for CloudWatch

Supports policy actions: Yes

Administrators can use AWS JSON policies to specify who has access to what. That is, which **principal** can perform **actions** on what **resources**, and under what **conditions**.

The `Action` element of a JSON policy describes the actions that you can use to allow or deny access in a policy. Include actions in a policy to grant permissions to perform the associated operation.

To see a list of CloudWatch actions, see Actions defined by Amazon CloudWatch in the *Service Authorization Reference*.

Policy actions in CloudWatch use the following prefix before the action:

```
cloudwatch
```

To specify multiple actions in a single statement, separate them with commas.

```
"Action": [
      "cloudwatch:action1",
      "cloudwatch:action2"
         ]
```

To view examples of CloudWatch identity-based policies, see Identity-based policy examples for Amazon CloudWatch.

Policy resources for CloudWatch

Supports policy resources: Yes

Administrators can use AWS JSON policies to specify who has access to what. That is, which **principal** can perform **actions** on what **resources**, and under what **conditions**.

The `Resource` JSON policy element specifies the object or objects to which the action applies. As a best practice, specify a resource using its Amazon Resource Name (ARN). For actions that don't support resource-level permissions, use a wildcard (*) to indicate that the statement applies to all resources.

```
"Resource": "*"
```

To see a list of CloudWatch resource types and their ARNs, see Resources defined by Amazon CloudWatch in the *Service Authorization Reference*. To learn with which actions you can specify the ARN of each resource, see Actions defined by Amazon CloudWatch.

To view examples of CloudWatch identity-based policies, see Identity-based policy examples for Amazon CloudWatch.

Policy condition keys for CloudWatch

Supports service-specific policy condition keys: Yes

Administrators can use AWS JSON policies to specify who has access to what. That is, which **principal** can perform **actions** on what **resources**, and under what **conditions**.

The `Condition` element specifies when statements execute based on defined criteria. You can create conditional expressions that use condition operators, such as equals or less than, to match the condition in the policy with values in the request. To see all AWS global condition keys, see AWS global condition context keys in the *IAM User Guide*.

To see a list of CloudWatch condition keys, see Condition keys for Amazon CloudWatch in the *Service Authorization Reference*. To learn with which actions and resources you can use a condition key, see Actions defined by Amazon CloudWatch.

To view examples of CloudWatch identity-based policies, see Identity-based policy examples for Amazon CloudWatch.

ACLs in CloudWatch

Supports ACLs: No

Access control lists (ACLs) control which principals (account members, users, or roles) have permissions to access a resource. ACLs are similar to resource-based policies, although they do not use the JSON policy document format.

ABAC with CloudWatch

Supports ABAC (tags in policies): Partial

Attribute-based access control (ABAC) is an authorization strategy that defines permissions based on attributes called tags. You can attach tags to IAM entities and AWS resources, then design ABAC policies to allow operations when the principal's tag matches the tag on the resource.

To control access based on tags, you provide tag information in the condition element of a policy using the `aws:ResourceTag/key-name`, `aws:RequestTag/key-name`, or `aws:TagKeys` condition keys.

If a service supports all three condition keys for every resource type, then the value is **Yes** for the service. If a service supports all three condition keys for only some resource types, then the value is **Partial**.

For more information about ABAC, see Define permissions with ABAC authorization in the *IAM User Guide*. To view a tutorial with steps for setting up ABAC, see Use attribute-based access control (ABAC) in the *IAM User Guide*.

Using temporary credentials with CloudWatch

Supports temporary credentials: Yes

Temporary credentials provide short-term access to AWS resources and are automatically created when you use federation or switch roles. AWS recommends that you dynamically generate temporary credentials instead of using long-term access keys. For more information, see Temporary security credentials in IAM and AWS services that work with IAM in the *IAM User Guide*.

Cross-service principal permissions for CloudWatch

Supports forward access sessions (FAS): Yes

Forward access sessions (FAS) use the permissions of the principal calling an AWS service, combined with the requesting AWS service to make requests to downstream services. For policy details when making FAS requests, see Forward access sessions.

Service roles for CloudWatch

Supports service roles: Yes

A service role is an IAM role that a service assumes to perform actions on your behalf. An IAM administrator can create, modify, and delete a service role from within IAM. For more information, see Create a role to delegate permissions to an AWS service in the *IAM User Guide*.

> **Warning**
>
> Changing the permissions for a service role might break CloudWatch functionality. Edit service roles only when CloudWatch provides guidance to do so.

Identity-based policy examples for Amazon CloudWatch

By default, users and roles don't have permission to create or modify CloudWatch resources. To grant users permission to perform actions on the resources that they need, an IAM administrator can create IAM policies.

To learn how to create an IAM identity-based policy by using these example JSON policy documents, see Create IAM policies (console) in the *IAM User Guide*.

For details about actions and resource types defined by CloudWatch, including the format of the ARNs for each of the resource types, see Actions, resources, and condition keys for Amazon CloudWatch in the *Service Authorization Reference*.

Topics

- Policy best practices
- Using the CloudWatch console

Policy best practices

Identity-based policies determine whether someone can create, access, or delete CloudWatch resources in your account. These actions can incur costs for your AWS account. When you create or edit identity-based policies, follow these guidelines and recommendations:

- **Get started with AWS managed policies and move toward least-privilege permissions** – To get started granting permissions to your users and workloads, use the *AWS managed policies* that grant permissions for many common use cases. They are available in your AWS account. We recommend that you reduce permissions further by defining AWS customer managed policies that are specific to your use cases. For more information, see AWS managed policies or AWS managed policies for job functions in the *IAM User Guide*.
- **Apply least-privilege permissions** – When you set permissions with IAM policies, grant only the permissions required to perform a task. You do this by defining the actions that can be taken on specific resources under specific conditions, also known as *least-privilege permissions*. For more information about using IAM to apply permissions, see Policies and permissions in IAM in the *IAM User Guide*.
- **Use conditions in IAM policies to further restrict access** – You can add a condition to your policies to limit access to actions and resources. For example, you can write a policy condition to specify that all requests must be sent using SSL. You can also use conditions to grant access to service actions if they are used through a specific AWS service, such as CloudFormation. For more information, see IAM JSON policy elements: Condition in the *IAM User Guide*.
- **Use IAM Access Analyzer to validate your IAM policies to ensure secure and functional permissions** – IAM Access Analyzer validates new and existing policies so that the policies adhere to the IAM policy language (JSON) and IAM best practices. IAM Access Analyzer provides more than 100 policy checks and actionable recommendations to help you author secure and functional policies. For more information, see Validate policies with IAM Access Analyzer in the *IAM User Guide*.

- **Require multi-factor authentication (MFA)** – If you have a scenario that requires IAM users or a root user in your AWS account, turn on MFA for additional security. To require MFA when API operations are called, add MFA conditions to your policies. For more information, see Secure API access with MFA in the *IAM User Guide*.

For more information about best practices in IAM, see Security best practices in IAM in the *IAM User Guide*.

Using the CloudWatch console

To access the Amazon CloudWatch console, you must have a minimum set of permissions. These permissions must allow you to list and view details about the CloudWatch resources in your AWS account. If you create an identity-based policy that is more restrictive than the minimum required permissions, the console won't function as intended for entities (users or roles) with that policy.

You don't need to allow minimum console permissions for users that are making calls only to the AWS CLI or the AWS API. Instead, allow access to only the actions that match the API operation that they're trying to perform.

To ensure that users and roles can still use the CloudWatch console, also attach the CloudWatch `ConsoleAccess` or `ReadOnly` AWS managed policy to the entities. For more information, see Adding permissions to a user in the *IAM User Guide*.

Permissions needed for CloudWatch console

The full set of permissions required to work with the CloudWatch console are listed below. These permissions provide full write and read access to the CloudWatch console.

Troubleshooting Amazon CloudWatch identity and access

Use the following information to help you diagnose and fix common issues that you might encounter when working with CloudWatch and IAM.

Topics

- I am not authorized to perform an action in CloudWatch
- I am not authorized to perform iam:PassRole
- I want to allow people outside of my AWS account to access my CloudWatch resources

I am not authorized to perform an action in CloudWatch

If you receive an error that you're not authorized to perform an action, your policies must be updated to allow you to perform the action.

The following example error occurs when the `mateojackson` IAM user tries to use the console to view details about a fictional *`my-example-widget`* resource but doesn't have the fictional `cloudwatch:`*`GetWidget`* permissions.

```
User: arn:aws:iam::123456789012:user/mateojackson is not authorized to perform:
 cloudwatch:GetWidget on resource: my-example-widget
```

In this case, the policy for the `mateojackson` user must be updated to allow access to the *`my-example-widget`* resource by using the `cloudwatch:`*`GetWidget`* action.

If you need help, contact your AWS administrator. Your administrator is the person who provided you with your sign-in credentials.

I am not authorized to perform iam:PassRole

If you receive an error that you're not authorized to perform the `iam:PassRole` action, your policies must be updated to allow you to pass a role to CloudWatch.

Some AWS services allow you to pass an existing role to that service instead of creating a new service role or service-linked role. To do this, you must have permissions to pass the role to the service.

The following example error occurs when an IAM user named `marymajor` tries to use the console to perform an action in CloudWatch. However, the action requires the service to have permissions that are granted by a service role. Mary does not have permissions to pass the role to the service.

```
User: arn:aws:iam::123456789012:user/marymajor is not authorized to perform:
 iam:PassRole
```

In this case, Mary's policies must be updated to allow her to perform the `iam:PassRole` action.

If you need help, contact your AWS administrator. Your administrator is the person who provided you with your sign-in credentials.

I want to allow people outside of my AWS account to access my CloudWatch resources

You can create a role that users in other accounts or people outside of your organization can use to access your resources. You can specify who is trusted to assume the role. For services that support

resource-based policies or access control lists (ACLs), you can use those policies to grant people access to your resources.

To learn more, consult the following:

- To learn whether CloudWatch supports these features, see How Amazon CloudWatch works with IAM.
- To learn how to provide access to your resources across AWS accounts that you own, see Providing access to an IAM user in another AWS account that you own in the *IAM User Guide*.
- To learn how to provide access to your resources to third-party AWS accounts, see Providing access to AWS accounts owned by third parties in the *IAM User Guide*.
- To learn how to provide access through identity federation, see Providing access to externally authenticated users (identity federation) in the *IAM User Guide*.
- To learn the difference between using roles and resource-based policies for cross-account access, see Cross account resource access in IAM in the *IAM User Guide*.

CloudWatch dashboard permissions update

On May 1, 2018, AWS changed the permissions required to access CloudWatch dashboards. Dashboard access in the CloudWatch console now requires permissions that were introduced in 2017 to support dashboard API operations:

- **cloudwatch:GetDashboard**
- **cloudwatch:ListDashboards**
- **cloudwatch:PutDashboard**
- **cloudwatch:DeleteDashboards**

To access CloudWatch dashboards, you need one of the following:

- The **AdministratorAccess** policy.
- The **CloudWatchFullAccess** policy.
- A custom policy that includes one or more of these specific permissions:
  - `cloudwatch:GetDashboard` and `cloudwatch:ListDashboards` to be able to view dashboards
  - `cloudwatch:PutDashboard` to be able to create or modify dashboards

- `cloudwatch:DeleteDashboards` to be able to delete dashboards

For more information about using policies to change permissions for an IAM user, see Changing Permissions for an IAM user.

For more information about CloudWatch permissions, see Amazon CloudWatch permissions reference.

For more information about dashboard API operations, see PutDashboard in the Amazon CloudWatch API Reference.

AWS managed (predefined) policies for CloudWatch

AWS addresses many common use cases by providing standalone IAM policies that are created and administered by AWS. These AWS managed policies grant necessary permissions for common use cases so that you can avoid having to investigate what permissions are needed. For more information, see AWS managed policies in the *IAM User Guide*.

The following AWS managed policies, which you can attach to users in your account, are specific to CloudWatch.

Topics

- CloudWatch updates to AWS managed policies
- CloudWatchFullAccessV2
- CloudWatchFullAccess
- CloudWatchReadOnlyAccess
- CloudWatchActionsEC2Access
- CloudWatch-CrossAccountAccess
- CloudWatchAutomaticDashboardsAccess
- CloudWatchAgentServerPolicy
- CloudWatchAgentAdminPolicy
- CloudWatchNetworkFlowMonitorTopologyServiceRolePolicy
- AWS managed (predefined) policies for CloudWatch cross-account observability
- AWS managed (predefined) policies for CloudWatch investigations
- AWS managed (predefined) policies for CloudWatch Application Signals

- AWS managed (predefined) policies for CloudWatch Synthetics
- AWS managed (predefined) policies for Amazon CloudWatch RUM
- AWS managed policy for AWS Systems Manager Incident Manager

CloudWatch updates to AWS managed policies

View details about updates to AWS managed policies for CloudWatch since this service began tracking these changes. For automatic alerts about changes to this page, subscribe to the RSS feed on the CloudWatch Document history page.

Change	Description	Date
AIOpsAssistantPolicy – Updated policy	CloudWatch updated the **AIOpsAssistantPolicy** IAM policy. It added permissions to enable CloudWatch investigations to assist in queries, troubleshooting, and topology mapping. The following permissions were added: `appsync:GetGraphqlApiEnvironmentVariables`, `cloudtrail:GetEventConfiguration`, `kms:GetKeyPolicy`, and `s3:GetBucketAbac`	February 06, 2026
AIOpsAssistantPolicy – Updated policy	CloudWatch updated the **AIOpsAssistantPolicy** IAM policy. It added permissions to enable CloudWatch investigations to assist in	December 17, 2025

Change	Description	Date
	queries, troubleshooting, and topology mapping. The following permissions were added: `kms:GetKeyRotationStatus`, `kms:ListAliases`, and `kms:ListKeyRotations`	
CloudWatchNetworkMonitorServiceRolePolicy – Updated policy	CloudWatch added the `ec2:DescribeRouteTables`, `ec2:DescribeTransitGatewayAttachments`, `ec2:DescribeTransitGatewayRouteTables`, `ec2:SearchTransitGatewayRoutes` permissions to the **CloudWatchNetworkMonitorServiceRolePolicy** managed policy to grant permissions for Network Synthetic Monitor to generate the Network Health Indicator values for customers utilizing Transit Gateways.	December 12, 2025

Change	Description	Date
CloudWatchNetworkFlowMonitorTopologyServiceRolePolicy – Updated policy	CloudWatch added the `ec2:DescribeVpcEndpoints` and `ec2:DescribeVpcEndpointServiceConfigurations` permissions to the **CloudWatchNetworkFlowMonitorTopologyServiceRolePolicy** managed policy to grant permissions for Network Flow Monitor to generate topology snapshots of VPC endpoints and vpce service config.	December 10, 2025
CloudWatchFullAccessV2 – Updated policy	CloudWatch added permissions to **CloudWatchFullAccessV2**. Permissions for observability administration actions were added to allow full access to telemetry pipelines and S3 table integrations.	December 02, 2025

Change	Description	Date
CloudWatchReadOnlyAccess – Updated policy	CloudWatch added permissions to **CloudWatchReadOnlyAccess**. Permissions for observability administration actions were added to allow read-only access to telemetry pipelines and S3 table integrations.	December 02, 2025
CloudWatchFullAccessV2 – Updated policy	CloudWatch updated the **CloudWatchFullAccessV2** policy to include permissions to support viewing change events for a given entity and time range, and querying uninstrumented services and resources from Application Signals by enabling resource explorer.	November 20th, 2025
CloudWatchApplicationSignalsFullAccess – Updated policy	CloudWatch updated the **CloudWatchApplicationSignalsFullAccess** policy to include permissions to support viewing change events for a given entity and time range, and querying uninstrumented services and resources from Application Signals by enabling resource explorer.	November 20th, 2025

Change	Description	Date
CloudWatchReadOnlyAccess – Updated policy	CloudWatch updated the **CloudWatchReadOnlyAccess** policy to include permissions to support viewing change events for a given entity and time range, and querying uninstrumented services and resources from Application Signals.	November 20th, 2025
CloudWatchApplicationSignalsReadOnlyAccess – Updated policy	CloudWatch updated the **CloudWatchApplicationSignalsReadOnlyAccess** policy to include permissions to support viewing change events for a given entity and time range, and querying uninstrumented services and resources from Application Signals.	November 20th, 2025
CloudWatchApplicationSignalsServiceRolePolicy – Update to an existing policy	CloudWatch updated the policy named **CloudWatchApplicationSignalsServiceRolePolicy**. Updated the policy to include `resource-explorer-2:Search` and `cloudtrail:CreateServiceLinkedChannel` to enable new Application Signals features.	November 20, 2025

Change	Description	Date
AIOpsConsoleAdminPolicy – Updated policy	CloudWatch updated the **AIOpsConsoleAdminPolicy** policy to include Amazon Q integration permissions, enabling users to interact with CloudWatch investigations incident reports through Amazon Q's conversational interface.	November 17, 2025
AIOpsOperatorAccess – Updated policy	CloudWatch updated the **AIOpsOperatorAccess** policy to include Amazon Q integration permissions, enabling users to interact with CloudWatch investigations incident reports through Amazon Q's conversational interface.	November 7, 2025
CloudWatchNetworkFlowMonitorTopologyServiceRolePolicy – Updated policy	CloudWatch added the `ec2:DescribeManagedPrefixLists` and `ec2:GetManagedPrefixListEntries` permissions to the **CloudWatchNetworkFlowMonitorTopologyServiceRolePolicy** managed policy to grant permissions for Network Flow Monitor to generate topology snapshots of managed prefix lists.	November 06, 2025

Change	Description	Date
AIOpsAssistantIncidentReportPolicy – New policy	CloudWatch added the **AIOpsAssistantIncidentReportPolicy** policy to enable CloudWatch investigations to generate incident reports from investigation data, including permissions to access investigations, create reports, and manage AI-derived facts.	October 10, 2025
AIOpsOperatorAccess – Updated policy	CloudWatch updated the **AIOpsOperatorAccess** policy to include incident report generation permissions, allowing users to create and manage incident reports and work with AI-derived facts in CloudWatch investigations.	October 10, 2025
CloudWatchReadOnlyAccess – Update to an existing policy.	CloudWatch added permissions to **CloudWatchReadOnlyAccess**. Permissions for observability administration actions were added to allow read-only access to telemetry rules, centralization configurations, and resource telemetry data across AWS Organizations.	October 10, 2025

Change	Description	Date
CloudWatchFullAccessV2 – Updates to existing policies	CloudWatch updated **CloudWatchFullAccessV2** to include CloudTrail and Service Quotas permissions to support top observations and change indicators functionality within Application Signals.	October 8, 2025
CloudWatchReadOnlyAccess – Updates to existing policies	CloudWatch updated **CloudWatchReadOnlyAccess** to include CloudTrail and Service Quotas permissions to support top observations and change indicators functionality within Application Signals.	October 8, 2025
CloudWatchApplicationSignalsReadOnlyAccess – Updated policy	CloudWatch updated the **CloudWatchApplicationSignalsReadOnlyAccess** policy to view how resources and services change in your account and view top observations for service anomalies in your account.	September 29, 2025

Change	Description	Date
CloudWatchApplicationSignalsFullAccess – Updated policy	CloudWatch updated the **CloudWatchApplicationSignalsFullAccess** policy to view how resources and services change in your account and view top observations for service anomalies in your account.	September 29, 2025
AIOpsAssistantPolicy – Updated policy	CloudWatch updated the **AIOpsAssistantPolicy** to allow CloudWatch investigations access to additional resources to assist in queries, troubleshooting, and topology mapping. This policy grants CloudWatch investigations the necessary permissions for conducting investigations.	September 24, 2025

Change	Description	Date
AIOpsConsoleAdminPolicy – Updated policy	CloudWatch updated the **AIOpsConsoleAdminPolicy** policy to permit validation of investigation groups across accounts. This policy grants users access to CloudWatch investigations actions, and to additional AWS actions that are necessary for accessing investigation events.	June 13, 2025
AIOpsOperatorAccess – Updated policy	CloudWatch updated the **AIOpsOperatorAccess** policy to permit validation of investigation groups across accounts. This policy grants users access to CloudWatch investigations actions, and to additional AWS actions that are necessary for accessing investigation events.	June 13, 2025

Change	Description	Date
AIOpsAssistantPolicy – Updates to existing policy	CloudWatch updated the **AIOpsAssistantPolicy** IAM policy. It added permissions to enable CloudWatch Application Insights operational investigations to find information in your resources during investigations. The following permissions were added: `appsync:GetGraphqlApi` , `appsync:GetDataSource` , `iam:ListAttachedRolePolicies` , `iam:ListRolePolicies` ,and `iam:ListRoles` Additionally, the `elastic-inference:Describe*` permission was removed from the policy.	June 13, 2025

Change	Description	Date
AmazonCloudWatchRUMReadOnlyAccess – Updated policy	CloudWatch added permissions to the **AmazonCloudWatchRUMReadOnlyAccess** policy. The `synthetics:describeCanaries` and `synthetics:describeCanariesLastRun` was added so that CloudWatch RUM can display associated Synthetics Canaries to the RUM app monitor. The `cloudwatch:GetMetricData` was added so that CloudWatch RUM can display associated CloudWatch metrics to the RUM app monitor. The `cloudwatch:DescribeAlarms` was added so that CloudWatch RUM can display associated CloudWatch alarms to the RUM app monitor. The `logs:DescribeLogGroups` was added so that CloudWatch RUM can display associated CloudWatch logs to the RUM app monitor.	June 28, 2025

Change	Description	Date
	The `xray:GetTraceSummaries` was added so that CloudWatch RUM can display associated X-Ray Trace segments to the RUM app monitor. The `rum:ListTagsForResources` was added so that CloudWatch RUM can display associated tags to the RUM app monitor.	
AIOpsReadOnlyAccess – Updated policy	CloudWatch updated the **AIOpsReadOnlyAccess** policy to permit validation of investigation groups across accounts. This policy grants a user read-only permissions for Amazon AI Operations and other related services.	June 5, 2025
AmazonCloudWatchRUMReadOnlyAccess – Updated policy	CloudWatch added a permission to the **AmazonCloudWatchRUMReadOnlyAccess** policy. The `rum:GetResourcePolicy` permission was added so that CloudWatch RUM can view the resource policy attached to the RUM application monitor.	April 28, 2025

Change	Description	Date
AIOpsConsoleAdminPolicy – New policy	CloudWatch created a new policy named **AIOpsConsoleAdminPolicy**. This policy grants users full administrative access for managing CloudWatch investigations, including the management of trusted identity propagation, and the management of IAM Identity Center and organizational access.	December 3, 2024
AIOpsOperatorAccess – New policy	CloudWatch created a new policy named **AIOpsOperatorAccess**. This policy grants users access to CloudWatch investigations actions, and to additional AWS actions that are necessary for accessing investigation events.	December 3, 2024
AIOpsReadOnlyAccess – New policy	CloudWatch created a new policy named **AIOpsReadOnlyAccess**. This policy grants a user read-only permissions for Amazon AI Operations and other related services.	December 3, 2024

Change	Description	Date
AIOpsAssistantPolicy – New policy	CloudWatch created a new policy named **AIOpsAssistantPolicy**. You don't assign this policy to a user. You assign this policy to the Amazon AI Operations assistant to enable CloudWatch investigations to analyze your AWS resources during the investigation of operational events.	December 3, 2024
CloudWatchFullAccessV2 – Updates to existing policies	CloudWatch updated both **CloudWatchFullAccessV2** and **CloudWatchFullAccess**. Permissions for Amazon OpenSearch Service were added to to enable CloudWatch Logs integration with OpenSearch Service for some features.	December 1, 2024

Change	Description	Date
CloudWatchNetworkFlowMonitorServiceRolePolicy – New policy	CloudWatch added a new policy **CloudWatchNetworkFlowMonitorServiceRolePolicy**. The **CloudWatchNetworkFlowMonitorServiceRolePolicy** grants permissions for Network Flow Monitor to publish metrics to CloudWatch. It also allows the service to use AWS Organizations to get information for multi-account scenarios.	December 1, 2024
CloudWatchNetworkFlowMonitorTopologyServiceRolePolicy – New policy	CloudWatch added a new policy **CloudWatchNetworkFlowMonitorTopologyServiceRolePolicy**. The **CloudWatchNetworkFlowMonitorTopologyServiceRolePolicy** grants permissions for Network Flow Monitor to generate topology snapshots of resources used in your account.	December 1, 2024

Change	Description	Date
CloudWatchNetworkFlowMonitorAgentPublishPolicy – New policy	CloudWatch added a new policy **CloudWatchNetworkFlowMonitorAgentPublishPolicy**. The **CloudWatchNetworkFlowMonitorAgentPublishPolicy** grants permissions for resources, such as Amazon EC2 and Amazon EKS instances, to send telemetry reports (metrics) to a Network Flow Monitor endpoint.	December 1, 2024

Change	Description	Date
CloudWatchSyntheticsFullAccess – Update to an existing policy	CloudWatch updated the policy named **CloudWatchSyntheticsFullAccess**. The following CloudWatch Logs actions have been added to allow CloudWatch Synthetics to get and use canary log data in Lambda log groups. The `lambda:GetFunction` permission has also been added to allow Synthetics to get information about a specific function. • `logs:GetLogRecord` – Required to expand a log entry in CloudWatch Logs Insights. (Required to view logs in the Synthetics console.) • `logs:DescribeLogStreams` – Required to list all log streams on a log group. • `logs:StartQuery` – Required to start a Logs Insights query (required in the Synthetics console to view logs). • `logs:GetLogEvents` –	November 20, 2024

Change	Description	Date
	Required to list log events from the specified log stream. Used for querying a specific log stream on a log group. • `logs:FilterLogEvents` – Required to view logs in a canary's log group. • `logs:GetLogGroupFields` – Required for running a Logs Insights query in the console. (The Synthetics console links to the Logs Insights query. Without this permission, Logs Insights queries on a log group fail.) Additionally, Lambda layer version actions now apply to all CloudWatch Synthetics layer ARNs.	

Change	Description	Date
CloudWatchInternetMonitorReadOnlyAccess – New **CloudWatchInternetMonitorReadOnlyAccess**. This policy grants read only access to resources and actions available in the CloudWatch console for Internet Monitor. The scope of this policy includes `internetmonitor:` so that users can use read-only Internet Monitor actions and resources. It includes some `cloudwatch:` policies to retrieve information on CloudWatch metrics. It includes some `logs:` policies to manage log queries.	November 14, 2024	

Change	Description	Date
CloudWatchInternetMonitorFullAccess – New policy	CloudWatch created a new policy named **CloudWatchInternetMonitorFullAccess**. This policy grants full access to resources and actions available in the CloudWatch console for Internet Monitor. The scope of this policy includes `internetmonitor:` so that users can use Internet Monitor actions and resources. It includes some `cloudwatch:` policies to retrieve information on CloudWatch alarms and metrics. It includes some `logs:` policies to manage log queries. It includes some `ec2:`, `cloudfront:`, `elasticloadbalancing:`, and `workspaces:` policies to work with resources that you add to monitors so that Internet Monitor can create a traffic profile for your application. It contains some `iam:` policies to manage IAM roles.	October 23, 2024

Change	Description	Date
CloudWatchLambdaApplicationSignalsExecutionRolePolicy – New **CloudWatchLambdaApplicationSignalsExecutionRolePolicy**. This policy is used when CloudWatch Application Signals is enabled for Lambda workloads. It enables write access to X-Ray and the log group used by CloudWatch Application Signals.	October 16, 2024	
CloudWatchSyntheticsFullAccess – Update to an existing policy	CloudWatch updated the policy named **CloudWatchSyntheticsFullAccess**. The `lambda:ListTags` , `lambda:TagResource` , and `lambda:UntagResource` permissions were added so that when you apply or change tags on a canary, you can choose to have Synthetics also apply those same tags or changes to the Lambda function that the canary uses.	October 11, 2024

Change	Description	Date
CloudWatchApplicationSignalsReadOnlyAccess – New policy	CloudWatch created a new policy named **CloudWatchApplicationSignalsReadOnlyAccess**. This policy grants read only access to resources and actions available in the CloudWatch console for Application Signals. The scope of this policy includes `application-signals:` policies so that users can use read only actions and resources available in the CloudWatch console under Application Signals. It contains an `iam:` policy to manage IAM roles. It includes some `logs:` policies to manage log queries and filters. It includes `cloudwatch:` policies to retrieve information on CloudWatch alarms and metrics. It includes some `synthetics:` policies to retrive information about synthetics canaries. It includes `rum:` policies to manage RUM clients and jobs. It contains an `xray:` policy to obtain trace summaries.	June 7, 2024

Change	Description	Date
CloudWatchApplicationSignalsFullAccess – New policy	CloudWatch created a new policy named **CloudWatchApplicationSignalsFullAccess**. This policy grants full access to resources and actions available in the CloudWatch console for Application Signals. The scope of this policy includes `application-signals:` so that users can use Application Signals actions and resources. It includes some `cloudwatch:` policies to retrieve information on CloudWatch alarms and metrics. It includes some `logs:` policies to manage log queries. It includes some `synthetics:` policies to write and retrieve information about synthetics canaries. It includes `rum:` policies to manage RUM clients and jobs. It contains an `xray:` policy to obtain trace summaries. It includes some `cloudwatch:` policies to manage CloudWatch alarms. It contains some `iam:` policies to manage IAM roles. It includes some `sns:`	June 7, 2024

Change	Description	Date
	policies to manage Amazon Simple Notification Service notifications.	
CloudWatchFullAccessV2 – Update to an existing policy	CloudWatch updated the policy named **CloudWatchFullAccessV2**. The scope of the `CloudWatchFullAccessPermissions` policy was updated to add `application-signals:*` so that users can use CloudWatch Application Signals to view, investigate, and diagnose issues with the health of their services.	May 20, 2024

Change	Description	Date
CloudWatchReadOnlyAccess – Update to an existing policy	CloudWatch updated the policy named **CloudWatchReadOnlyAccess**. The scope of the `CloudWatchReadOnlyAccessPermissions` policy was updated to add `application-signals:BatchGet*`, `application-signals:List*`, and `application-signals:Get*` so that users can use CloudWatch Application Signals to view, investigate, and diagnose issues with the health of their services. The scope of `CloudWatchReadOnlyGetRolePermissions` was updated to add the `iam:GetRole` action so that users can check if CloudWatch Application Signals is set up.	May 20, 2024

Change	Description	Date
CloudWatchApplicationSignalsServiceRolePolicy – Update to an existing policy	CloudWatch updated the policy named **CloudWatchApplicationSignalsServiceRolePolicy**. The scoping of the `logs:StartQuery` and `logs:GetQueryResults` permissions was changed to add the `arn:aws:logs:*:*:log-group:/aws/appsignals/*:*` and `arn:aws:logs:*:*:log-group:/aws/application-signals/data:*` ARNs to enable Application Signals on more architectures.	April 18, 2024
CloudWatchApplicationSignalsServiceRolePolicy – Update to an existing policy	CloudWatch changed the scope of a permission in **CloudWatchApplicationSignalsServiceRolePolicy**. The scope of the `cloudwatch:GetMetricData` permission was changed to * so that Application Signals can retrieve metrics from sources in linked accounts.	April 08, 2024

Change	Description	Date
CloudWatchAgentServerPolicy – Update to an existing policy	CloudWatch added permissions to **CloudWatchAgentServerPolicy**. The `xray:PutTraceSegments` , `xray:PutTelemetryRecords` , `xray:GetSamplingRules` , `xray:GetSamplingTargets` , `xray:GetSamplingStatisticSummaries` and `logs:PutRetentionPolicy` permissions were added so that the CloudWatch agent can publish X-Ray traces and modify log group retention periods.	February 12, 2024

Change	Description	Date
CloudWatchAgentAdminPolicy – Update to an existing policy	CloudWatch added permissions to **CloudWatchAgentAdminPolicy**. The `xray:PutTraceSegments`, `xray:PutTelemetryRecords`, `xray:GetSamplingRules`, `xray:GetSamplingTargets`, `xray:GetSamplingStatisticSummaries` and `logs:PutRetentionPolicy` permissions were added so that the CloudWatch agent can publish X-Ray traces and modify log group retention periods.	February 12, 2024

Change	Description	Date
CloudWatchFullAccessV2 – Update to an existing policy	CloudWatch added permissions to **CloudWatchFullAccessV2**. Existing permissions for CloudWatch Synthetics, X-Ray, and CloudWatch RUM actions and new permissions for CloudWatch Application Signals were added so that users with this policy can manage CloudWatch Application Signals. The permission to create the CloudWatch Application Signals service-linked role was added to allow CloudWatch Application Signals to discover telemetry data in logs, metrics, traces, and tags.	December 5, 2023

Change	Description	Date
CloudWatchReadOnlyAccess – Update to an existing policy	CloudWatch added permissions to **CloudWatchReadOnlyAccess**. Existing read-only permissions for CloudWatch Synthetics, X-Ray, and CloudWatch RUM actions and new read-only permissions for CloudWatch Application Signals were added so that users with this policy can triage and dignose their service health issues as reported by CloudWatch Application Signals. The `cloudwatch:GenerateQuery` permission was added so that users with this policy can generate a CloudWatch Metrics Insights query string from a natural language prompt.	December 5, 2023

Change	Description	Date
CloudWatchReadOnlyAccess – Update to an existing policy.	CloudWatch added a permission to **CloudWatchReadOnlyAccess**. The `cloudwatch:GenerateQuery` permission was added, so that users with this policy can generate a CloudWatch Metrics Insights query string from a natural language prompt.	December 01, 2023
CloudWatchApplicationSignalsServiceRolePolicy – New policy	CloudWatch added a new policy **CloudWatchApplicationSignalsServiceRolePolicy**. The **CloudWatchApplicationSignalsServiceRolePolicy** grants an upcoming feature permissions to collect CloudWatch Logs data, X-Ray trace data, CloudWatch metrics data, and tagging data.	November 9, 2023

Change	Description	Date
AWSServiceRoleForCloudWatchMetrics_DbPerfInsightsServiceRolePolicy – New policy	CloudWatch added a new policy **AWSServiceRoleForCloudWatchMetrics_DbPerfInsightsServiceRolePolicy**. The **AWSServiceRoleForCloudWatchMetrics_DbPerfInsightsServiceRolePolicy** grants permission to CloudWatch to fetch Performance Insights metrics from databases on your behalf.	September 20, 2023
CloudWatchReadOnlyAccess – Update to an existing policy	CloudWatch added a permission to **CloudWatchReadOnlyAccess**. The `application-autoscaling:DescribeScalingPolicies` permission was added so that users with this policy can access information about Application Auto Scaling policies.	September 14, 2023

Change	Description	Date
CloudWatchFullAccessV2 – New policy	CloudWatch added a new policy **CloudWatchFullAccessV2**. The **CloudWatchFullAccessV2** grants full access to CloudWatch actions and resources while better scoping the permissions granted to other services such as Amazon SNS and Amazon EC2 Auto Scaling. For more information, see CloudWatchFullAccessV2.	August 1, 2023
AWSServiceRoleForInternetMonitor – Update to an existing policy	Amazon CloudWatch Internet Monitor added new permissions to monitor Network Load Balancer resources. The `elasticloadbalancing:DescribeLoadBalancers` and `ec2:DescribeNetworkInterfaces` permissions are required so that Internet Monitor can monitor customers' Network Load Balancer traffic by analyzing flow logs for NLB resources. For more information, see Using Internet Monitor.	July 15, 2023

Change	Description	Date
CloudWatchReadOnlyAccess – Update to an existing policy	CloudWatch added permissions to **CloudWatchReadOnlyAccess**. The `logs:StartLiveTail` and `logs:StopLiveTail` permissions were added so that users with this policy can use the console to start and stop CloudWatch Logs live tail sessions. For more information, see Use live tail to view logs in near real time.	June 6, 2023
CloudWatchCrossAccountSharingConfiguration – New policy	CloudWatch added a new policy to enable you to manage CloudWatch cross-account observability links that share CloudWatch metrics. For more information, see CloudWatch cross-account observability.	November 27, 2022
OAMFullAccess – New policy	CloudWatch added a new policy to enable you to fully manage CloudWatch cross-account observability links and sinks. For more information, see CloudWatch cross-account observability.	November 27, 2022

Change	Description	Date
OAMReadOnlyAccess – New policy	CloudWatch added a new policy to enable you to view information about CloudWatch cross-account observability links and sinks. For more information, see CloudWatch cross-account observability.	November 27, 2022
CloudWatchFullAccess – Update to an existing policy	CloudWatch added permissions to **CloudWatchFullAccess**. The `oam:ListSinks` and `oam:ListAttachedLinks` permissions were added so that users with this policy can use the console to view data shared from source accounts in CloudWatch cross-account observability.	November 27, 2022
CloudWatchReadOnlyAccess – Update to an existing policy	CloudWatch added permissions to **CloudWatchReadOnlyAccess**. The `oam:ListSinks` and `oam:ListAttachedLinks` permissions were added so that users with this policy can use the console to view data shared from source accounts in CloudWatch cross-account observability.	November 27, 2022

Change	Description	Date
AmazonCloudWatchRUMServiceRolePolicy – Update to an existing policy	CloudWatch RUM updated a condition key in **AmazonCloudWatchRUMServiceRolePolicy**. The `"Condition": { "StringEquals": { "cloudwatch:namespace": "AWS/RUM" } }` condition key was changed to the following so that CloudWatch RUM can send custom metrics to custom metric namespaces. `"Condition": { "StringLike": { "cloudwatch:namespace": [ "RUM/CustomMetrics/*", "AWS/RUM" ] } }`	February 2, 2023

Change	Description	Date
AmazonCloudWatchRUMReadOnlyAccess – Updated policy	CloudWatch added permissions the **AmazonCloudWatchRUMReadOnlyAccess** policy. The `rum:ListRumMetricsDestinations` and `rum:BatchGetRumMetricsDefinitions` permissions were added so that CloudWatch RUM can send extended metrics to CloudWatch.	October 27, 2022
AmazonCloudWatchRUMServiceRolePolicy – Update to an existing policy	CloudWatch RUM added permissions to **AmazonCloudWatchRUMServiceRolePolicy**. The `cloudwatch:PutMetricData` permission was added so that CloudWatch RUM can send extended metrics to CloudWatch.	October 26, 2022

Change	Description	Date
CloudWatchSyntheticsFullAccess – Update to an existing policy	CloudWatch Synthetics added permissions to **CloudWatchSyntheticsFullAccess**. The `lambda:DeleteFunction` and `lambda:DeleteLayerVersion` permissions were added so that CloudWatch Synthetics can delete related resources when a canary is deleted. The `iam:ListAttachedRolePolicies` was added so that customers can view the policies that are attached to a canary's IAM role.	May 6, 2022
AmazonCloudWatchRUMFullAccess – New policy	CloudWatch added a new policy to enable full management of CloudWatch RUM. CloudWatch RUM allows you to perform real user monitoring of your web application. For more information, see CloudWatch RUM.	November 29, 2021

Change	Description	Date
AmazonCloudWatchRUMReadOnlyAccess – New policy	CloudWatch added a new policy to enable read-only access to CloudWatch RUM. CloudWatch RUM allows you to perform real user monitoring of your web application. For more information, see CloudWatch RUM.	November 29, 2021
AWSServiceRoleForCloudWatchRUM – New managed policy	CloudWatch added a policy for a new service-linked role to allow CloudWatch RUM to pubish monitoring data to other relevant AWS services.	November 29, 2021

Change	Description	Date
CloudWatchSyntheticsFullAccess – Update to an existing policy	CloudWatch Synthetics added permissions to **CloudWatchSyntheticsFullAccess**, and also changed the scope of one permission. The `kms:ListAliases` permission was added so that users can list available AWS KMS keys that can be used to encrypt canary artifacts. The `kms:DescribeKey` permission was added so that users can see the details of keys that will be used to encrypt for canary artifacts. And the `kms:Decrypt` permission was added to enable users to decrypt canary artifacts. This decryption ability is limited to use on resources within Amazon S3 buckets. The `Resource` scope of the `s3:GetBucketLocation` permission was changed from * to `arn:aws:s3:::*` .	September 29, 2021

Change	Description	Date
CloudWatchSyntheticsFullAccess – Update to an existing policy	CloudWatch Synthetics added a permission to **CloudWatchSyntheticsFullAccess**. The `lambda:UpdateFunctionCode` permission was added so that users with this policy can change the runtime version of canaries.	July 20, 2021
AWSCloudWatchAlarms_ActionSSMIncidentsServiceRolePolicy – New managed policy	CloudWatch added a new managed IAM policy to allow CloudWatch to create incidents in AWS Systems Manager Incident Manager.	May 10, 2021
CloudWatchAutomaticDashboardsAccess – Update to an existing policy	CloudWatch added a permission to the **CloudWatchAutomaticDashboardsAccess** managed policy. The `synthetics:DescribeCanariesLastRun` permission was added to this policy to enable cross-account dashboard users to see details about CloudWatch Synthetics canary runs.	April 20, 2021
CloudWatch started tracking changes	CloudWatch started tracking changes for its AWS managed policies.	April 14, 2021

CloudWatchFullAccessV2

AWS recently added the **CloudWatchFullAccessV2** managed IAM policy. This policy grants full access to CloudWatch actions and resources and also more properly scopes the permissions granted for other services such as Amazon SNS and Amazon EC2 Auto Scaling. We recommend that you begin using this policy instead of using **CloudWatchFullAccess**. AWS plans to deprecate **CloudWatchFullAccess** in the near future.

It includes `application-signals:` permissions so that users can access all the functionality from the CloudWatch console under Application Signals. It includes some `autoscaling:Describe` permissions so that users with this policy can see the Auto Scaling actions that are associated with CloudWatch alarms. It includes some `sns` permissions so that users with this policy can retrieve create Amazon SNS topics and associate them with CloudWatch alarms. It includes IAM permissions so that users with this policy can view information about service-linked roles associated with CloudWatch. It includes the `oam:ListSinks` and `oam:ListAttachedLinks` permissions so that users with this policy can use the console to view data shared from source accounts in CloudWatch cross-account observability. It also includes CloudTrail and Service Quotas permissions to support top observations and change indicators functionality within Application Signals.

It includes Amazon OpenSearch Service permissions to support vended logs dashboards in CloudWatch Logs, which are created with Amazon OpenSearch Service analytics. It includes `resource-explorer-2:` policies so that users can use the console to view unstrumented services in their account.

It includes `rum`, `synthetics`, and `xray` permissions so that users can have full access to CloudWatch Synthetics, AWS X-Ray, and CloudWatch RUM, all of which are under the CloudWatch service.

To see the full contents of the policy, see CloudWatchFullAccessV2 in the *AWS Managed Policy Reference Guide*.

CloudWatchFullAccess

The **CloudWatchFullAccess** policy is on the path to deprecation. We recommend that you stop using it, and use CloudWatchFullAccessV2 instead.

CloudWatchReadOnlyAccess

The **CloudWatchReadOnlyAccess** policy grants read-only access to CloudWatch and related observability features.

The policy includes some `logs:` permissions, so that users with this policy can use the console to view CloudWatch Logs information and CloudWatch Logs Insights queries. It includes `autoscaling:Describe*`, so that users with this policy can see the Auto Scaling actions that are associated with CloudWatch alarms. It includes the `application-signals:` permissions so that users can use Application Signals to monitor the health of their services. It includes `application-autoscaling:DescribeScalingPolicies`, so that users with this policy can access information about Application Auto Scaling policies. It includes `sns:Get*` and `sns:List*`, so that users with this policy can retrieve information about the Amazon SNS topics that receive notifications about CloudWatch alarms. It includes the `oam:ListSinks` and `oam:ListAttachedLinks` permissions, so that users with this policy can use the console to view data shared from source accounts in CloudWatch cross-account observability. It includes the `iam:GetRole` permissions so that users can check if CloudWatch Application Signals have been set up. It also includes CloudTrail and Service Quotas permissions to support top observations and change indicators functionality within Application Signals. It includes observability administration permissions for viewing telemetry rules, centralization configurations, and resource telemetry data across AWS Organizations. It includes the `cloudwatch:GenerateQuery` permission, so that users with this policy can generate a CloudWatch Metrics Insights query string from a natural language prompt. It includes `resource-explorer-2:` policies so that users can use the console to view unstrumented services in their account.

It includes `rum`, `synthetics`, and `xray` permissions so that users can have read-only access to CloudWatch Synthetics, AWS X-Ray, and CloudWatch RUM, all of which are under the CloudWatch service.

To see the full contents of the policy, see CloudWatchReadOnlyAccess in the *AWS Managed Policy Reference Guide*.

CloudWatchActionsEC2Access

The **CloudWatchActionsEC2Access** policy grants read-only access to CloudWatch alarms and metrics in addition to Amazon EC2 metadata. It also grants access to the Stop, Terminate, and Reboot API actions for EC2 instances.

To see the full contents of the policy, see CloudWatchActionsEC2Access in the *AWS Managed Policy Reference Guide*.

CloudWatch-CrossAccountAccess

The **CloudWatch-CrossAccountAccess** managed policy is used by the **CloudWatch-CrossAccountSharingRole** IAM role. This role and policy enable users of cross-account dashboards to view automatic dashboards in each account that is sharing dashboards.

To see the full contents of the policy, see CloudWatch-CrossAccountAccess in the *AWS Managed Policy Reference Guide*.

CloudWatchAutomaticDashboardsAccess

The **CloudWatchAutomaticDashboardsAccess** managed policy grants access to CloudWatch for non-CloudWatch APIs, so that resources such as Lambda functions can be displayed on CloudWatch automatic dashboards.

To see the full contents of the policy, see CloudWatchAutomaticDashboardsAccess in the *AWS Managed Policy Reference Guide*.

CloudWatchAgentServerPolicy

The **CloudWatchAgentServerPolicy** policy can be used in IAM roles that are attached to Amazon EC2 instances to allow the CloudWatch agent to read information from the instance and write it to CloudWatch.

To see the full contents of the policy, see CloudWatchAgentServerPolicy in the *AWS Managed Policy Reference Guide*.

CloudWatchAgentAdminPolicy

The **CloudWatchAgentAdminPolicy** policy can be used in IAM roles that are attached to Amazon EC2 instances. This policy allows the CloudWatch agent to read information from the instance and write it to CloudWatch, and also to write information to Parameter Store.

To see the full contents of the policy, see CloudWatchAgentAdminPolicy in the *AWS Managed Policy Reference Guide*.

CloudWatchNetworkFlowMonitorTopologyServiceRolePolicy

You can't attach `CloudWatchNetworkFlowMonitorTopologyServiceRolePolicy` to your IAM entities. This policy is attached to a service-linked role named **AWSServiceRoleForNetworkFlowMonitor_Topology**. Using these permissions, as well as internal meta data information gathering (for performance efficiencies), this service-linked role gathers meta data about resource network configurations, such as describing route tables and gateways, for resources that this service monitors network traffic for. This meta data enables Network Flow Monitor to generate topology snapshots of the resources. When there is network degradation, Network Flow Monitor uses the topologies to provide insights into the location of issues in the network and to help determine attribution for issues.

To view the permissions for this policy, see CloudWatchNetworkFlowMonitorTopologyServiceRolePolicy in the *AWS Managed Policy Reference*.

For more information, see Service-linked roles for Network Flow Monitor.

> **Note**
>
> You can review these permissions policies by signing in to the IAM console and searching for specific policies there.

You can also create your own custom IAM policies to allow permissions for CloudWatch actions and resources. You can attach these custom policies to the IAM users or groups that require those permissions.

AWS managed (predefined) policies for CloudWatch cross-account observability

The policies in this section grant permissions related to CloudWatch cross-account observability. For more information, see CloudWatch cross-account observability.

CloudWatchCrossAccountSharingConfiguration

The **CloudWatchCrossAccountSharingConfiguration** policy grants access to create, manage, and view Observability Access Manager links for sharing CloudWatch resources between accounts. For more information, see CloudWatch cross-account observability.

To see the full contents of the policy, see CloudWatchCrossAccountSharingConfiguration in the *AWS Managed Policy Reference Guide*.

OAMFullAccess

The **OAMFullAccess** policy grants access to create, manage, and view Observability Access Manager sinks and links, which are used for CloudWatch cross-account observability.

The **OAMFullAccess** policy by itself does not permit you to share observability data across links. To create a link to share CloudWatch metrics, you also need either **CloudWatchFullAccess** or **CloudWatchCrossAccountSharingConfiguration**. To create a link to share CloudWatch Logs log groups, you also need either **CloudWatchLogsFullAccess** or **CloudWatchLogsCrossAccountSharingConfiguration**. To create a link to share X-Ray traces, you also need either **AWSXRayFullAccess** or **AWSXRayCrossAccountSharingConfiguration**.

For more information, see CloudWatch cross-account observability.

To see the full contents of the policy, see OAMFullAccess in the *AWS Managed Policy Reference Guide*.

OAMReadOnlyAccess

The **OAMReadOnlyAccess** policy grants read-only access to Observability Access Manager resources, which are used for CloudWatch cross-account observability. For more information, see CloudWatch cross-account observability.

To see the full contents of the policy, see OAMReadOnlyAccess in the *AWS Managed Policy Reference Guide*.

AWS managed (predefined) policies for CloudWatch investigations

The policies in this section grant permissions related to CloudWatch investigations. For more information, see CloudWatch investigations.

AIOpsConsoleAdminPolicy

The **AIOpsConsoleAdminPolicy** policy grants full access to all CloudWatch investigations actions and their required permissions via the AWS console. This policy also grants limited access to other service's APIs required for CloudWatch investigations functionality.

- The `aiops` permissions grant access to all CloudWatch investigations actions.
- The `organizations`, `sso`, `identitystore`, and `sts` permissions allow actions needed for IAM Identity Center management which facilitate identity-aware sessions.

- The `ssm` permissions are required for SSM Ops Item integration with third-party issue management.
- The `iam` permissions are needed so that administrators can pass IAM roles to the `aiops` and `ssm.integrations` services, and the role is later used by the assistant to analyze AWS resources

> **Important**
>
> These permissions allow users with this policy to pass any IAM role to the `aiops` and `ssm.integrations` services.

- It allows APIs from services outside CloudWatch investigations, which are required for investigation feature functionality. These include actions to configure Amazon Q Developer in chat applications, AWS KMS, CloudTrail trails, and SSM third-party issue management.
- The `q` permissions enable integration with Amazon Q, allowing users to interact with and update CloudWatch investigations reports through Amazon Q's conversational interface.

To see the full contents of the policy, see AIOpsConsoleAdminPolicy in the *AWS Managed Policy Reference Guide*.

AIOpsOperatorAccess

The **AIOpsOperatorAccess** policy grants access to a limited set of CloudWatch investigations APIs which include creating, updating, and deleting investigations, investigation events, and investigation resources.

This policy only provides access to investigations. You should be sure that IAM principals with this policy also have permissions to read CloudWatch observability data such as metrics, SLOs, and CloudWatch Logs query results.

- The `aiops` permissions allow access to CloudWatch investigations APIs to create, update, and delete investigations.
- The `sso-directory`, `sso`, `identitystore`, and `sts` permissions allow actions needed for IAM Identity Center management which facilitate identity-aware sessions.
- The `ssm` permissions are required for SSM Ops Item integration with third-party issue management.

- The q permissions enable integration with Amazon Q, allowing users to interact with and update CloudWatch investigations reports through Amazon Q's conversational interface.

To see the full contents of the policy, see AIOpsOperatorAccess in the *AWS Managed Policy Reference Guide*.

AIOpsReadOnlyAccess

The **AIOpsReadOnlyAccess** policy grants read-only permissions for CloudWatch investigations and other related services.

- The `aiops` permissions allow access to CloudWatch investigations APIs to get, list, and validate investigation groups.
- The `sso` permissions allow actions needed for IAM Identity Center management which facilitate identity-aware sessions.
- The `ssm` permissions are required for SSM Ops Item integration with third-party issue management.

To see the full contents of the policy, see AIOpsReadOnlyAccess in the *AWS Managed Policy Reference Guide*.

AIOpsAssistantPolicy

The **AIOpsAssistantPolicy** policy is the default policy recommended by AWS to assign to the Amazon AI Operations (AIOps) role used by your investigation group to enable it to analyze your AWS resources during investigations of operational events. This policy is not intended for use by human users.

You can choose to have the policy assigned automatically when you create an investigation, or you can assign the policy manually to the role being used by the investigation. This policy is scoped based on the resources that CloudWatch investigations analyzes when performing investigations, and will be updated as more resources are supported. For a complete list of services that work with CloudWatch investigations see, AWS services where investigations are supported.

You can also choose to assign the general AWS **ReadOnlyAccess** to the assistant in addition to assigning it **AIOpsAssistantPolicy**. The reason to do this is that **ReadOnlyAccess** will be updated more frequently by AWS with permissions for new AWS services and actions that are released. The **AIOpsAssistantPolicy** will also be updated for new actions, but not as frequently.

To see the full contents of the policy, see AIOpsAssistantPolicy in the *AWS Managed Policy Reference Guide*.

AIOpsAssistantIncidentReportPolicy

The **AIOpsAssistantIncidentReportPolicy** policy grants permissions required by CloudWatch investigations to generate incident reports from investigation data.

This policy is intended for use by CloudWatch investigations to enable automated incident report generation from investigation findings.

- The `aiops` permissions allow access to CloudWatch investigations APIs to read investigation data and events, create and update incident reports, and manage AI-derived facts that form the foundation of report generation.

To see the full contents of the policy, see AIOpsAssistantIncidentReportPolicy in the *AWS Managed Policy Reference Guide*.

AWS managed (predefined) policies for CloudWatch Application Signals

The policies in this section grant permissions related to CloudWatch Application Signals. For more information, see Application Signals.

CloudWatchApplicationSignalsReadOnlyAccess

AWS has added the **CloudWatchApplicationSignalsReadOnlyAccess** managed IAM policy. This policy grants read only access to actions and resources available to users in the CloudWatch console under Application Signals. It includes `application-signals:` policies so that users can use CloudWatch Application signals to view, investigate and monitor the health of their services. It includes an `iam:GetRole` policy to allow users to retrieve information about an IAM role. It includes `logs:` policies to start and stop queries, retrieve the configuration for a metruc filter, and obtain query results. It includes `cloudwatch:` policies so that users can obtain information about a CloudWatch alarm or metrics. It includes `synthetics:` policies so that users can retrieve information about synthetics canary runs. It includes `rum:` policies to run batch operations, retrieve data, and update metrics definitions for RUM clients. It includes an `xray:` policy to retrieve trace summaries. It includes `oam:` policies so that users can use the console to view data shared from source accounts in CloudWatch cross-account observability. It includes `resource-explorer-2:` policies so that users can use the console to view unstrumented services in their account.

To see the full contents of the policy, see CloudWatchApplicationSignalsReadOnlyAccess in the *AWS Managed Policy Reference Guide*.

CloudWatchApplicationSignalsFullAccess

AWS has added the **CloudWatchApplicationSignalsFullAccess** managed IAM policy. This policy grants access to all actions and resources available to users in the CloudWatch console. It includes `application-signals:` policies so that users can use CloudWatch Application signals to view, investigate and monitor the health of their services. It uses `cloudwatch:` policies to retrieve data from metrics and alarms. It uses `logs:` policies to manage queries and filters. It uses `synthetics:` policies so that users can retrieve information about synthetics canary runs. It includes `rum:` policies to run batch operations, retrieve data and update metrics definitions for RUM clients. It includes an `xray:` policy to retrieve trace summaries. It includes `arn:aws:cloudwatch:*:*:alarm:` policies so that users can retrieve information about a service level objective (SLO) alarm. It includes `iam:` policies to manage IAM roles. It uses `sns:` policies to create, list, and subscribe to an Amazon SNS topic. It includes `oam:` policies so that users can use the console to view data shared from source accounts in CloudWatch cross-account observability. It includes `resource-explorer-2:` policies so that users can use the console to view unstrumented services in their account

To see the full contents of the policy, see CloudWatchApplicationSignalsFullAccess in the *AWS Managed Policy Reference Guide*.

CloudWatchLambdaApplicationSignalsExecutionRolePolicy

This policy is used when CloudWatch Application Signals is enabled for Lambda workloads. It enables write access to X-Ray and the log group used by CloudWatch Application Signals.

To see the full contents of the policy, see CloudWatchLambdaApplicationSignalsExecutionRolePolicy in the *AWS Managed Policy Reference Guide*.

AWS managed (predefined) policies for CloudWatch Synthetics

The **CloudWatchSyntheticsFullAccess** and **CloudWatchSyntheticsReadOnlyAccess** AWS managed policies are available for you to assign to users who will manage or use CloudWatch Synthetics. The following additional policies are also relevant:

- **AmazonS3ReadOnlyAccess** and **CloudWatchReadOnlyAccess** – These are necessary to read all Synthetics data in the CloudWatch console.

- **AWSLambdaReadOnlyAccess** – Required to view the source code used by canaries.
- **CloudWatchSyntheticsFullAccess** – Allows you to create canaries. Additionally, to create and delete canaries that have a new IAM role created for them, you need specific inline policy permissions.

> **Important**
>
> Granting a user the `iam:CreateRole`, `iam:DeleteRole`, `iam:CreatePolicy`, `iam:DeletePolicy`, `iam:AttachRolePolicy`, and `iam:DetachRolePolicy` permissions gives that user full administrative access to create, attach, and delete roles and policies that have ARNs that match `arn:aws:iam::*:role/service-role/CloudWatchSyntheticsRole*` and `arn:aws:iam::*:policy/service-role/CloudWatchSyntheticsPolicy*`. For example, a user with these permissions can create a policy that has full permissions for all resources, and attach that policy to any role that matches that ARN pattern. Be careful to whom you grant these permissions.

For information about attaching policies and granting permissions to users, see Changing Permissions for an IAM User and To embed an inline policy for a user or role.

CloudWatchSyntheticsFullAccess

To see the full contents of the policy, see CloudWatchSyntheticsFullAccess in the *AWS Managed Policy Reference Guide*.

CloudWatchSyntheticsReadOnlyAccess

To see the full contents of the policy, see CloudWatchSyntheticsReadOnlyAccess in the *AWS Managed Policy Reference Guide*.

AWS managed (predefined) policies for Amazon CloudWatch RUM

The **AmazonCloudWatchRUMFullAccess** and **AmazonCloudWatchRUMReadOnlyAccess** AWS managed policies are available for you to assign to users who will manage or use CloudWatch RUM.

AmazonCloudWatchRUMFullAccess

To see the full contents of the policy, see AmazonCloudWatchRUMFullAccess in the *AWS Managed Policy Reference Guide*.

AmazonCloudWatchRUMReadOnlyAccess

The **AmazonCloudWatchRUMReadOnlyAccess** allows read-only administrative access to CloudWatch RUM.

- The `synthetics` permission allows displaying associated Synthetics Canaries to the RUM app monitor
- The `cloudwatch` permission allows displaying associated CloudWatch metrics to the RUM app monitor
- The `cloudwatch alarms` permission allows displaying associated CloudWatch alarms to the RUM app monitor
- The `cloudwatch logs` permission allows displaying associated CloudWatch logs to the RUM app monitor
- The `x-ray` permission allows displaying associated X-Ray Trace segments to the RUM app monitor
- The `rum` permission allows displaying associated tags to the RUM app monitor

To see the full contents of the policy, see AmazonCloudWatchRUMReadOnlyAccess in the *AWS Managed Policy Reference Guide*.

AmazonCloudWatchRUMServiceRolePolicy

You can't attach **AmazonCloudWatchRUMServiceRolePolicy** to your IAM entities. This policy is attached to a service-linked role that allows CloudWatch RUM to publish monitoring data to other relevant AWS services. For more information about this service linked role, see Using service-linked roles for CloudWatch RUM.

To see the full contents of the policy, see AmazonCloudWatchRUMServiceRolePolicy in the *AWS Managed Policy Reference Guide*.

AWS managed policy for AWS Systems Manager Incident Manager

The **AWSCloudWatchAlarms_ActionSSMIncidentsServiceRolePolicy** policy is attached to a service-linked role that allows CloudWatch to start incidents in AWS Systems Manager Incident Manager on your behalf. For more information, see Service-linked role permissions for CloudWatch alarms Systems Manager Incident Manager actions.

The policy has the following permission:

- ssm-incidents:StartIncident

Customer managed policy examples

In this section, you can find example user policies that grant permissions for various CloudWatch actions. These policies work when you are using the CloudWatch API, AWS SDKs, or the AWS CLI.

Examples

- Example 1: Allow user full access to CloudWatch
- Example 2: Allow read-only access to CloudWatch
- Example 3: Stop or terminate an Amazon EC2 instance

Example 1: Allow user full access to CloudWatch

To grant a user full access to CloudWatch, you can use grant them the **CloudWatchFullAccess** managed policy instead of creating a customer-managed policy. The contents of the **CloudWatchFullAccess** are listed in CloudWatchFullAccess.

Example 2: Allow read-only access to CloudWatch

The following policy allows a user read-only access to CloudWatch and view Amazon EC2 Auto Scaling actions, CloudWatch metrics, CloudWatch Logs data, and alarm-related Amazon SNS data.

JSON

```
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Action": [
        "autoscaling:Describe*",
        "cloudwatch:Describe*",
        "cloudwatch:Get*",
        "cloudwatch:List*",
        "logs:Get*",
        "logs:Describe*",
        "logs:StartQuery",
        "logs:StopQuery",
        "logs:TestMetricFilter",
```

```
        "logs:FilterLogEvents",
        "logs:StartLiveTail",
        "logs:StopLiveTail",
        "sns:Get*",
        "sns:List*"
      ],
      "Effect": "Allow",
      "Resource": "*"
    }
  ]
}
```

Example 3: Stop or terminate an Amazon EC2 instance

The following policy allows an CloudWatch alarm action to stop or terminate an EC2 instance. In the sample below, the GetMetricData, ListMetrics, and DescribeAlarms actions are optional. It is recommended that you include these actions to ensure that you have correctly stopped or terminated the instance.

JSON

```
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Action": [
        "cloudwatch:PutMetricAlarm",
        "cloudwatch:GetMetricData",
        "cloudwatch:ListMetrics",
        "cloudwatch:DescribeAlarms"
      ],
      "Resource": [
        "*"
      ],
      "Effect": "Allow"
    },
    {
      "Action": [
        "ec2:DescribeInstanceStatus",
        "ec2:DescribeInstances",
        "ec2:StopInstances",
```

```
        "ec2:TerminateInstances"
      ],
      "Resource": [
        "*"
      ],
      "Effect": "Allow"
    }
  ]
}
```

Using condition keys to limit access to CloudWatch

See the following topics to learn about the service-specific condition keys that can be used in the `Condition` element of an IAM policy. You can use these keys to further refine the conditions under which the policy statement applies.

- Using condition keys to limit access to CloudWatch namespaces
- Using condition keys to limit Contributor Insights users' access to log groups
- Using condition keys to limit alarm actions
- Condition keys for CloudWatch Observability Admin

To see the global condition keys that are available to all services, see Available global condition keys.

Using condition keys to limit access to CloudWatch namespaces

Use IAM condition keys to limit users to publishing metrics only in the CloudWatch namespaces that you specify. This section provides examples that describe how to allow and exclude users from publishing metrics in a namespace.

Allowing publishing in one namespace only

The following policy limits the user to publishing metrics only in the namespace named `MyCustomNamespace`.

JSON

```
{
```

```
    "Version":"2012-10-17",
    "Statement": {
        "Effect": "Allow",
        "Resource": "*",
        "Action": "cloudwatch:PutMetricData",
        "Condition": {
            "StringEquals": {
                "cloudwatch:namespace": "MyCustomNamespace"
            }
        }
    }
}
```

Excluding publishing from a namespace

The following policy allows the user to publish metrics in any namespace except for `CustomNamespace2`.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Resource": "*",
            "Action": "cloudwatch:PutMetricData"
        },
        {
            "Effect": "Deny",
            "Resource": "*",
            "Action": "cloudwatch:PutMetricData",
            "Condition": {
                "StringEquals": {
                    "cloudwatch:namespace": "CustomNamespace2"
                }
            }
        }
    ]
}
```

Using condition keys to limit Contributor Insights users' access to log groups

To create a rule in Contributor Insights and see its results, a user must have the `cloudwatch:PutInsightRule` permission. By default, a user with this permission can create a Contributor Insights rule that evaluates any log group in CloudWatch Logs and then see the results. The results can contain contributor data for those log groups.

You can create IAM policies with condition keys to grant users the permission to write Contributor Insights rules for some log groups while preventing them from writing rules for and seeing this data from other log groups.

For more information about the `Condition` element in IAM policies, see IAM JSON policy elements: Condition.

Allow access to write rules and view results for only certain log groups

The following policy allows the user access to write rules and view results for the log group named `AllowedLogGroup` and all log groups that have names that start with `AllowedWildCard`. It does not grant access to write rules or view rule results for any other log groups.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "AllowCertainLogGroups",
            "Effect": "Allow",
            "Action": "cloudwatch:PutInsightRule",
            "Resource": "arn:aws:cloudwatch:*:*:insight-rule/*",
            "Condition": {
                "ForAllValues:StringEqualsIgnoreCase": {
                    "cloudwatch:requestInsightRuleLogGroups": [
                        "AllowedLogGroup",
                        "AllowedWildcard*"
                    ]
                }
            }
        }
    ]
}
```

Deny writing rules for specific log groups but allow writing rules for all other log groups

The following policy explicitly denies the user access to write rules and view rule results for the log group named `ExplicitlyDeniedLogGroup`, but allows writing rules and viewing rule results for all other log groups.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "AllowInsightRulesOnLogGroupsByDefault",
            "Effect": "Allow",
            "Action": "cloudwatch:PutInsightRule",
            "Resource": "arn:aws:cloudwatch:*:*:insight-rule/*"

        },
        {
            "Sid": "ExplicitDenySomeLogGroups",
            "Effect": "Deny",
            "Action": "cloudwatch:PutInsightRule",
            "Resource": "arn:aws:cloudwatch:*:*:insight-rule/*",
            "Condition": {
                "ForAllValues:StringEqualsIgnoreCase": {
                    "cloudwatch:requestInsightRuleLogGroups": [
                        "/test/alpine/ExplicitlyDeniedLogGroup"
                    ]
                }
            }
        }
    ]
}
```

Using condition keys to limit alarm actions

When CloudWatch alarms change state, they can perform different actions such as stopping and terminating EC2 instances and performing Systems Manager actions. These actions can be initiated when the alarm changes to any state, including ALARM, OK, or INSUFFICIENT_DATA.

Use the `cloudwatch:AlarmActions` condition key to allow a user to create alarms that can only perform the actions you specify when the alarm state changes. For example, you can allow a user to create alarms that can only perform actions which are not EC2 actions.

Allow a user to create alarms that can only send Amazon SNS notifications or perform Systems Manager actions

The following policy limits the user to creating alarms that can only send Amazon SNS notifications and perform Systems Manager actions. The user can't create alarms that perform EC2 actions.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "CreateAlarmsThatCanPerformOnlySNSandSSMActions",
            "Effect": "Allow",
            "Action": "cloudwatch:PutMetricAlarm",
            "Resource": "*",
            "Condition": {
                "ForAllValues:StringLike": {
                    "cloudwatch:AlarmActions": [
                        "arn:aws:sns:*",
                        "arn:aws:ssm:*"
                    ]
                }
            }
        }
    ]
}
```

Condition keys for CloudWatch Observability Admin

You can use IAM policies to control access to Amazon CloudWatch Observability Admin resources and actions by using condition keys.

Observability Admin has the following condition keys:

Condition Key	Description	Type
CentralizationSourceRegions	ArrayOfString	Filters access by the source Regions that are passed in the request
CentralizationDestinationRegion	String	Filters access by the destination Region that is passed in the request
CentralizationBackupRegion	String	Filters access by the backup Region that is passed in the request

CentralizationSourceRegions

Filters access by the backup region specified for centralization rules.

- *Availability* – This key is available for the following resource types: organization-centralization-rule
- *Value type* – String

Example JSON policy with observabilityadmin:CentralizationBackupRegion

JSON

```
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "cloudwatch:PutMetricData",
      "Resource": "*",
      "Condition": {
        "StringEquals": {
        "aws:RequestedRegion": "us-east-1"
```

```
        }
      }
    }
  ]
}
```

CentralizationDestinationRegion

Filters access by the destination region specified for centralization rules.

- *Availability* – This key is available for the following resource types: organization-centralization-rule
- *Value type* – String

Example JSON policy with observabilityadmin:CentralizationDestinationRegion

JSON

```
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "cloudwatch:PutMetricData",
      "Resource": "*",
      "Condition": {
        "StringEquals": {
        "aws:RequestedRegion": "us-east-1"
        }
      }
    }
  ]
}
```

CentralizationBackupRegion

Filters access by the source regions specified for centralization rules.

- *Availability* – This key is available for the following resource types: organization-centralization-rule
- *Value type* – List of strings

Example JSON policy with observabilityadmin:CentralizationSourceRegions

JSON

```
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "cloudwatch:PutMetricData",
      "Resource": "*",
      "Condition": {
        "StringEquals": {
        "aws:RequestedRegion": ["us-east-1", "us-east-1"]
        }
      }
    }
  ]
}
```

Using service-linked roles for CloudWatch

Amazon CloudWatch uses AWS Identity and Access Management (IAM) service-linked roles. A service-linked role is a unique type of IAM role that is linked directly to CloudWatch. Service-linked roles are predefined by CloudWatch and include all the permissions that the service requires to call other AWS services on your behalf.

One service-linked role in CloudWatch makes setting up CloudWatch alarms that can terminate, stop, or reboot an Amazon EC2 instance without requiring you to manually add the necessary permissions. Another service-linked role enables a monitoring account to access CloudWatch data from other accounts that you specify, to build cross-account cross-Region dashboards.

CloudWatch defines the permissions of these service-linked roles, and unless defined otherwise, only CloudWatch can assume the role. The defined permissions include the trust policy and the permissions policy, and that permissions policy cannot be attached to any other IAM entity.

You can delete the roles only after first deleting their related resources. This restriction protects your CloudWatch resources because you can't inadvertently remove permissions to access the resources.

For information about other services that support service-linked roles, see AWS Services That Work with IAM and look for the services that have **Yes** in the **Service-Linked Role** column. Choose a **Yes** with a link to view the service-linked role documentation for that service.

Service-linked role permissions for CloudWatch alarms EC2 actions

CloudWatch uses the service-linked role named **AWSServiceRoleForCloudWatchEvents** – CloudWatch uses this service-linked role to perform Amazon EC2 alarm actions.

The AWSServiceRoleForCloudWatchEvents service-linked role trusts the CloudWatch Events service to assume the role. CloudWatch Events invokes the terminate, stop, or reboot instance actions when called upon by the alarm.

The AWSServiceRoleForCloudWatchEvents service-linked role permissions policy allows CloudWatch Events to complete the following actions on Amazon EC2 instances:

- `ec2:StopInstances`
- `ec2:TerminateInstances`
- `ec2:RecoverInstances`
- `ec2:DescribeInstanceRecoveryAttribute`
- `ec2:DescribeInstances`
- `ec2:DescribeInstanceStatus`

The **AWSServiceRoleForCloudWatchCrossAccount** service-linked role permissions policy allows CloudWatch to complete the following actions:

- `sts:AssumeRole`

Service-linked role permissions for CloudWatch telemetry config

CloudWatch observability admin creates and uses a service-linked role named **AWSServiceRoleForObservabilityAdmin** – CloudWatch uses this service-linked role to support resource and telemetry config discovery for AWS Organizations. The role is created in all member accounts of the Organization.

The **AWSServiceRoleForObservabilityAdmin** service-linked role trusts Observability Admin to assume the role. Observability Admin manages AWS Config Service Linked Configuration Recorders and Service Linked Configuration Aggregator in your Organizations accounts.

The **AWSServiceRoleForObservabilityAdmin** service-linked role has a policy, called AWSObservabilityAdminServiceRolePolicy, attached and this policy grants permission to CloudWatch Observability Admin to complete the following actions:

- `organizations:ListAccounts`
- `organizations:ListAccountsForParent`
- `organizations:ListChildren`
- `organizations:ListParents`
- `organizations:DescribeOrganization`
- `organizations:DescribeOrganizationalUnit`
- `organizations:EnableAWSServiceAccess`
- `organizations:ListDelegatedAdministrators`
- `config:PutServiceLinkedConfigurationRecorder`
- `config:DeleteServiceLinkedConfigurationRecorder`
- `config:PutConfigurationAggregator`
- `config:DeleteConfigurationAggregator`
- `config:SelectAggregateResourceConfig`
- `iam:CreateServiceLinkedRole`
- `iam:PassRole`

The complete contents of the AWSObservabilityAdminServiceRolePolicy policy are as follows:

JSON

```
{
 "Version":"2012-10-17",
 "Statement": [
  {
   "Effect": "Allow",
   "Action": [
    "organizations:ListAccounts",
    "organizations:ListAccountsForParent",

     ]
    }
   }
  }
 ]
}
```

Service-linked role permissions for CloudWatch telemetry enablement

The `AWSObservabilityAdminTelemetryEnablementServiceRolePolicy` grants permissions necessary to enable and manage telemetry configurations for AWS resources based on telemetry rules.

This policy grants permissions for:

- Basic telemetry operations including describing VPCs, flow logs, log groups. It also includes permissions to enable logging configuration for EKS cluster logging, WAF put logging configuration, enabling NLB logs as well as Route53 Resolver query logging.
- Resource tagging operations with the `CloudWatchTelemetryRuleManaged` tag for tracking managed resources
- Log delivery configuration for services like AWS Bedrock and VPC Flow Logs
- Configuration recorder management for telemetry enablement tracking

The policy enforces security boundaries through conditions that:

- Restrict operations to resources within the same account using `aws:ResourceAccount`
- Require the `CloudWatchTelemetryRuleManaged` tag for resource modifications

- Limit configuration recorder access to those associated with telemetry enablement

The complete contents of the AWSObservabilityAdminTelemetryEnablementServiceRolePolicy policy can be found here: AWSObservabilityAdminTelemetryEnablementServiceRolePolicy.

Service-linked role permissions for CloudWatch Application Signals

CloudWatch Application Signals uses the service-linked role named **AWSServiceRoleForCloudWatchApplicationSignals** – CloudWatch uses this service-linked role to collect CloudWatch Logs data, X-Ray trace data, CloudWatch metrics data, and tagging data from applications that you have enabled for CloudWatch Application Signals.

The **AWSServiceRoleForCloudWatchApplicationSignals** service-linked role trusts CloudWatch Application Signals to assume the role. Application Signals collects the logs, traces, metrics, and tags data from your account.

The **AWSServiceRoleForCloudWatchApplicationSignals** has an IAM policy attached, and this policy is named **CloudWatchApplicationSignalsServiceRolePolicy**. This policy grants permission to CloudWatch Application Signals to collect monitoring and tagging data from other relevant AWS services. It includes permissions for Application Signals to complete the following actions:

- `xray` – Retrieve X-Ray traces.
- `logs` – Retrieve the current CloudWatch logs information.
- `cloudwatch` – Retrieve the current CloudWatch metric information.
- `tags` – Retrieve the current tags.
- `application-signals` – Retrieve information on SLOs and their associated time exclusion windows.
- `autoscaling` – Retrieve application tags from Amazon EC2 Autoscaling group.
- `resource-explorer-2` – Retrieve current AWS resources information from AWS Resource Explorer.
- `cloudtrail` – Enable creation of service-linked channels for retrieving CloudTrail events.

The complete contents of **CloudWatchApplicationSignalsServiceRolePolicy** are as follows:

JSON

```
{
 "Version":"2012-10-17",
 "Statement": [
  {
   "Sid": "XRayPermission",
   "Effect": "Allow",

    ],
    "Condition": {
     "StringEquals": {
      "aws:ResourceAccount": "${aws:PrincipalAccount}"
     }
    }
   }
  ]
}
```

Service-linked role permissions for CloudWatch alarms Systems Manager OpsCenter actions

CloudWatch uses the service-linked role named **AWSServiceRoleForCloudWatchAlarms_ActionSSM** – CloudWatch uses this service-linked role to perform Systems Manager OpsCenter actions when a CloudWatch alarm goes into ALARM state.

The AWSServiceRoleForCloudWatchAlarms_ActionSSM service-linked role trusts the CloudWatch service to assume the role. CloudWatch alarms invoke the Systems Manager OpsCenter actions when called upon by the alarm.

The **AWSServiceRoleForCloudWatchAlarms_ActionSSM** service-linked role permissions policy allows Systems Manager to complete the following actions:

- `ssm:CreateOpsItem`

Service-linked role permissions for CloudWatch alarms Systems Manager Incident Manager actions

CloudWatch uses the service-linked role named **AWSServiceRoleForCloudWatchAlarms_ActionSSMIncidents** – CloudWatch uses this service-linked role to start Incident Manager incidents when a CloudWatch alarm goes into ALARM state.

The **AWSServiceRoleForCloudWatchAlarms_ActionSSMIncidents** service-linked role trusts the CloudWatch service to assume the role. CloudWatch alarms invoke the Systems Manager Incident Manager action when called upon by the alarm.

The **AWSServiceRoleForCloudWatchAlarms_ActionSSMIncidents** service-linked role permissions policy allows Systems Manager to complete the following actions:

- `ssm-incidents:StartIncident`

Service-linked role permissions for CloudWatch cross-account cross-Region

CloudWatch uses the service-linked role named **AWSServiceRoleForCloudWatchCrossAccount** – CloudWatch uses this role to access CloudWatch data in other AWS accounts that you specify. The SLR only provides the assume role permission to allow the CloudWatch service to assume the role in the sharing account. It is the sharing role that provides access to data.

The **AWSServiceRoleForCloudWatchCrossAccount** service-linked role permissions policy allows CloudWatch to complete the following actions:

- `sts:AssumeRole`

The **AWSServiceRoleForCloudWatchCrossAccount** service-linked role trusts the CloudWatch service to assume the role.

Service-linked role permissions for CloudWatch database Performance Insights

CloudWatch uses the service-linked role named **AWSServiceRoleForCloudWatchMetrics_DbPerfInsights** – CloudWatch uses this role to retrieve Performance Insights metrics for creating alarms and snapshotting.

The **AWSServiceRoleForCloudWatchMetrics_DbPerfInsights** service-linked role has the `AWSServiceRoleForCloudWatchMetrics_DbPerfInsightsServiceRolePolicy` IAM policy attached. The contents of that policy are as follows:

JSON

```
{
 "Version":"2012-10-17",
 "Statement": [
  {
   "Effect": "Allow",
   "Action": [
    "pi:GetResourceMetrics"
   ],
   "Resource": "*",
   "Condition": {
    "StringEquals": {
     "aws:ResourceAccount": "${aws:PrincipalAccount}"
    }
   }
  }
 ]
}
```

The **AWSServiceRoleForCloudWatchMetrics_DbPerfInsights** service-linked role trusts the CloudWatch service to assume the role.

Service-linked role permissions for CloudWatch Logs centralization

The **AWSObservabilityAdminLogsCentralizationServiceRolePolicy** attaches to appropriate IAM entity in your central management account, such as the CloudWatch service role –, to grant necessary permissions for setting up and managing centralized log collection. CloudWatch uses this role to access telemetry data from other AWS accounts that you specify to create CloudWatch log groups, log streams, and log events in your organization's monitoring account. The SLR only provides the assume role permission to allow the CloudWatch service to assume the role in the monitoring account. This policy is attached automatically if you set up centralized log collection using the AWS Management Console. If you use the AWS CLI or API to configure log centralization you must attach this policy manually to the IAM role that will be used for observability administration tasks.

The **AWSObservabilityAdminLogsCentralizationServiceRolePolicy** service-linked role permissions policy allows CloudWatch to complete the following actions:

- `sts:AssumeRole`
- `logs:CreateLogGroup`
- `logs:CreateLogStream`
- `logs:PutLogEvents`
- `kms:Encrypt`
- `kms:Decrypt`
- `kms:GenerateDataKey`

The **AWSObservabilityAdminLogsCentralizationServiceRolePolicy** service-linked role trusts the `logs-centralization.observabilityadmin.amazonaws.com` service to assume the role.

Creating a service-linked role for CloudWatch

You do not need to manually create any of these service-linked roles. The first time you create an alarm in the AWS Management Console, the IAM CLI, or the IAM API, CloudWatch creates AWSServiceRoleForCloudWatchEvents and **AWSServiceRoleForCloudWatchAlarms_ActionSSM** for you.

The first time that you enable service and topology discovery, Application Signals creates **AWSServiceRoleForCloudWatchApplicationSignals** for you.

When you first enable an account to be a monitoring account for cross-account cross-Region functionality, CloudWatch creates **AWSServiceRoleForCloudWatchCrossAccount** for you.

When you first create an alarm that uses the `DB_PERF_INSIGHTS` metric math function, CloudWatch creates **AWSServiceRoleForCloudWatchMetrics_DbPerfInsights** for you.

For more information, see Creating a Service-Linked Role in the *IAM User Guide*.

Editing a service-linked role for CloudWatch

CloudWatch does not allow you to edit the **AWSServiceRoleForCloudWatchEvents**, **AWSServiceRoleForCloudWatchAlarms_ActionSSM**, **AWSServiceRoleForCloudWatchCrossAccount**, or **AWSServiceRoleForCloudWatchMetrics_DbPerfInsights** roles. After you create these roles, you

cannot change their names because various entities might reference these roles. However, you can edit the description of these roles using IAM.

Editing a service-linked role description (IAM console)

You can use the IAM console to edit the description of a service-linked role.

To edit the description of a service-linked role (console)

1. In the navigation pane of the IAM console, choose **Roles**.
2. Choose the name of the role to modify.
3. To the far right of **Role description**, choose **Edit**.
4. Type a new description in the box, and choose **Save**.

Editing a service-linked role description (AWS CLI)

You can use IAM commands from the AWS Command Line Interface to edit the description of a service-linked role.

To change the description of a service-linked role (AWS CLI)

1. (Optional) To view the current description for a role, use the following commands:

   ```
   $ aws iam get-role --role-name role-name
   ```

   Use the role name, not the ARN, to refer to roles with the AWS CLI commands. For example, if a role has the following ARN: `arn:aws:iam::123456789012:role/myrole`, you refer to the role as **`myrole`**.
2. To update a service-linked role's description, use the following command:

   ```
   $ aws iam update-role-description --role-name role-name --description description
   ```

Editing a service-linked role description (IAM API)

You can use the IAM API to edit the description of a service-linked role.

To change the description of a service-linked role (API)

1. (Optional) To view the current description for a role, use the following command:

GetRole

2. To update a role's description, use the following command:

   UpdateRoleDescription

Deleting a service-linked role for CloudWatch

If you no longer have alarms that automatically stop, terminate, or reboot EC2 instances, we recommend that you delete the AWSServiceRoleForCloudWatchEvents role.

If you not longer have alarms that perform Systems Manager OpsCenter actions, we recommend that you delete the AWSServiceRoleForCloudWatchAlarms_ActionSSM role.

If you delete all alarms that use the `DB_PERF_INSIGHTS` metric math function, we recommend that you delete the **AWSServiceRoleForCloudWatchMetrics_DbPerfInsights** service-linked role.

That way you don't have an unused entity that is not actively monitored or maintained. However, you must clean up your service-linked role before you can delete it.

Cleaning up a service-linked role

Before you can use IAM to delete a service-linked role, you must first confirm that the role has no active sessions and remove any resources used by the role.

To check whether the service-linked role has an active session in the IAM console

1. Open the IAM console at https://console.aws.amazon.com/iam/.
2. In the navigation pane, choose **Roles**. Choose the name (not the check box) of the AWSServiceRoleForCloudWatchEvents role.
3. On the **Summary** page for the selected role, choose **Access Advisor** and review the recent activity for the service-linked role.

> **Note**
>
> If you are unsure whether CloudWatch is using the AWSServiceRoleForCloudWatchEvents role, try to delete the role. If the service is using the role, then the deletion fails and you can view the Regions where the role is being

used. If the role is being used, then you must wait for the session to end before you can delete the role. You cannot revoke the session for a service-linked role.

Deleting a service-linked role (IAM console)

You can use the IAM console to delete a service-linked role.

To delete a service-linked role (console)

1. Open the IAM console at https://console.aws.amazon.com/iam/.
2. In the navigation pane, choose **Roles**. Select the check box next to the name of the role you want to delete, not the name or row itself.
3. For **Role actions**, choose **Delete role**.
4. In the confirmation dialog box, review the service last accessed data, which shows when each of the selected roles last accessed an AWS service. This helps you to confirm whether the role is currently active. To proceed, choose **Yes, Delete**.
5. Watch the IAM console notifications to monitor the progress of the service-linked role deletion. Because the IAM service-linked role deletion is asynchronous, the deletion task can succeed or fail after you submit the role for deletion. If the task fails, choose **View details** or **View Resources** from the notifications to learn why the deletion failed. If the deletion fails because there are resources in the service that are being used by the role, then the reason for the failure includes a list of resources.

Deleting a service-linked role (AWS CLI)

You can use IAM commands from the AWS Command Line Interface to delete a service-linked role.

To delete a service-linked role (AWS CLI)

1. Because a service-linked role cannot be deleted if it is being used or has associated resources, you must submit a deletion request. That request can be denied if these conditions are not met. You must capture the `deletion-task-id` from the response to check the status of the deletion task. Type the following command to submit a service-linked role deletion request:

```
$ aws iam delete-service-linked-role --role-name service-linked-role-name
```

2. Type the following command to check the status of the deletion task:

```
$ aws iam get-service-linked-role-deletion-status --deletion-task-id deletion-task-id
```

The status of the deletion task can be `NOT_STARTED`, `IN_PROGRESS`, `SUCCEEDED`, or `FAILED`. If the deletion fails, the call returns the reason that it failed so that you can troubleshoot.

Deleting a service-linked role (IAM API)

You can use the IAM API to delete a service-linked role.

To delete a service-linked role (API)

1. To submit a deletion request for a service-linked role, call DeleteServiceLinkedRole. In the request, specify the role name that you want to delete.

   Because a service-linked role cannot be deleted if it is being used or has associated resources, you must submit a deletion request. That request can be denied if these conditions are not met. You must capture the `DeletionTaskId` from the response to check the status of the deletion task.
2. To check the status of the deletion, call GetServiceLinkedRoleDeletionStatus. In the request, specify the `DeletionTaskId`.

   The status of the deletion task can be `NOT_STARTED`, `IN_PROGRESS`, `SUCCEEDED`, or `FAILED`. If the deletion fails, the call returns the reason that it failed so that you can troubleshoot.

CloudWatch updates to AWS service-linked roles

View details about updates to AWS managed policies for CloudWatch since this service began tracking these changes. For automatic alerts about changes to this page, subscribe to the RSS feed on the CloudWatch Document history page.

Change	Description	Date
AWSObservabilityAdminTelemetryEnablementServiceRolePolicy –	Updated information about the AWSObservabilityAdminTelemetryEnable	December 2, 2025

Change	Description	Date
Update to service-linked role policy.	mentServiceRolePolicy that grants CloudWatch the permissions necessary to enable and manage telemetry configurations for the additional AWS resources based on telemetry rules.	
AWSServiceRoleForCloudWatchApplicationSignals – Update to permissions of service-linked role policy	Updated the CloudWatchApplicationSignalsServiceRolePolicy to include `resource-explorer-2:Search` and `cloudtrail:CreateServiceLinkedChannel` to enable new Application Signals features.	November 12, 2025
AWSObservabilityAdminLogsCentralizationServiceRolePolicy – New service-linked role policy.	Added information about the AWSObservabilityAdminLogsCentralizationServiceRolePolicy that grants CloudWatch the permissions necessary to enable and manage telemetry configurations for AWS resources based on telemetry rules.	September 5, 2025

Change	Description	Date
AWSObservabilityAdminTelemetryEnablementServiceRolePolicy – New service-linked role policy.	Added information about the AWSObservabilityAdminTelemetryEnablementServiceRolePolicy that grants CloudWatch the permissions necessary to enable and manage telemetry configurations for AWS resources based on telemetry rules.	July 17, 2025
AWSServiceRoleForCloudWatchApplicationSignals – Update to permissions of service-linked role policy	Updated the CloudWatchApplicationSignalsServiceRolePolicy to exclude time windows from impacting the SLO attainment rate, error budget, and burn rate metrics. CloudWatch can retrieve exclusion windows on behalf of you.	March 13, 2025
AWSServiceRoleForObservabilityAdmin – New service-linked role	CloudWatch added this new service-linked role and corresponding managed policy, AWSObservabilityAdminServiceRolePolicy, to support resource and telemetry config discovery for AWS Organizations.	November 26, 2024

Change	Description	Date
AWSServiceRoleForCloudWatchApplicationSignals – Update to permissions of service-linked role policy	CloudWatch add more log groups to the scope of the `logs:StartQuery` and `logs:GetQueryResults` permissions granted by this role.	April 24, 2024
AWSServiceRoleForCloudWatchApplicationSignals – New service-linked role	CloudWatch added this new service-linked role to allow CloudWatch Application Signals to collect CloudWatch Logs data, X-Ray trace data, CloudWatch metrics data, and tagging data from applications that you have enabled for CloudWatch Application Signals.	November 9, 2023
AWSServiceRoleForCloudWatchMetrics_DbPerfInsights – New service-linked role	CloudWatch added this new service-linked role to allow CloudWatch to fetch Performance Insights metrics for alarming and snapshotting. An IAM policy is attached to this role, and the policy grants permission to CloudWatch to fetch Performance Insights metrics on your behalf.	September 13, 2023

Change	Description	Date
AWSServiceRoleForCloudWatchAlarms_ActionSSMIncidents – New service-linked role	CloudWatch added a new service-linked role to allow CloudWatch to create incidents in AWS Systems Manager Incident Manager.	April 26, 2021
CloudWatch started tracking changes	CloudWatch started tracking changes for its service-linked roles.	April 26, 2021

Using service-linked roles for CloudWatch RUM

CloudWatch RUM uses a AWS Identity and Access Management (IAM) service-linked role. A service-linked role is a unique type of IAM role that is linked directly to RUM. The service-linked role is predefined by RUM and includes all the permissions that the service requires to call other AWS services on your behalf.

RUM defines the permissions of the service-linked role, and unless defined otherwise, only RUM can assume the role. The defined permissions include the trust policy and the permissions policy, and that permissions policy cannot be attached to any other IAM entity.

You can delete the role only after first deleting its related resources. This restriction protects your RUM resources because you can't inadvertently remove permissions to access the resources.

For information about other services that support service-linked roles, see AWS services that work with IAM and look for the services that have **Yes** in the **Service-linked roles** column. Choose a **Yes** with a link to view the service-linked role documentation for that service.

Service-linked role permissions for RUM

RUM uses the service-linked role named **AWSServiceRoleForCloudWatchRUM** – this role allows RUM to send AWS X-Ray trace data into your account, for app monitors that you enable X-Ray tracing for.

The **AWSServiceRoleForCloudWatchRUM** service-linked role trusts the X-Ray service to assume the role. X-Ray sends the trace data to your account.

The **AWSServiceRoleForCloudWatchRUM** service-linked role has an IAM policy attached named **AmazonCloudWatchRUMServiceRolePolicy**. This policy grants permission to CloudWatch RUM to publish monitoring data to other relevant AWS services. It includes permissions that allow RUM to complete the following actions:

- `xray:PutTraceSegments`
- `cloudwatch:PutMetricData`

The complete contents of **AmazonCloudWatchRUMServiceRolePolicy** are as follows.

JSON

```
{
 "Version":"2012-10-17",
 "Statement": [
  {
   "Effect": "Allow",
   "Action": [
    "xray:PutTraceSegments"
   ],
   "Resource": [
    "*"
   ]
  },
  {
   "Effect": "Allow",
   "Action": "cloudwatch:PutMetricData",
   "Resource": "*",
   "Condition": {
    "StringLike": {
     "cloudwatch:namespace": [
      "RUM/CustomMetrics/*",
      "AWS/RUM"
     ]
    }
   }
  }
 ]
```

```
}
```

Creating a service-linked role for RUM

You do not need to manually create the service-linked role for CloudWatch RUM. The first time that you create an app monitor with X-Ray tracing enabled, or update an app monitor to use X-Ray tracing, RUM creates **AWSServiceRoleForCloudWatchRUM** for you.

For more information, see Creating a Service-Linked Role in the *IAM User Guide*.

Editing a service-linked role for RUM

CloudWatch RUM does not allow you to edit the **AWSServiceRoleForCloudWatchRUM** role. After you create these roles, you cannot change their names because various entities might reference these roles. However, you can edit the description of these roles using IAM.

Editing a service-linked role description (IAM console)

You can use the IAM console to edit the description of a service-linked role.

To edit the description of a service-linked role (console)

1. In the navigation pane of the IAM console, choose **Roles**.
2. Choose the name of the role to modify.
3. To the far right of **Role description**, choose **Edit**.
4. Type a new description in the box, and choose **Save**.

Editing a service-linked role description (AWS CLI)

You can use IAM commands from the AWS Command Line Interface to edit the description of a service-linked role.

To change the description of a service-linked role (AWS CLI)

1. (Optional) To view the current description for a role, use the following commands:

```
$ aws iam get-role --role-name role-name
```

Use the role name, not the ARN, to refer to roles with the AWS CLI commands. For example, if a role has the following ARN: `arn:aws:iam::123456789012:role/myrole`, you refer to the role as **`myrole`**.

2. To update a service-linked role's description, use the following command:

```
$ aws iam update-role-description --role-name role-name --description description
```

Editing a service-linked role description (IAM API)

You can use the IAM API to edit the description of a service-linked role.

To change the description of a service-linked role (API)

1. (Optional) To view the current description for a role, use the following command:

   GetRole
2. To update a role's description, use the following command:

   UpdateRoleDescription

Deleting a service-linked role for RUM

If you no longer have app monitors with X-Ray enabled, we recommend that you delete the **AWSServiceRoleForCloudWatchRUM** role.

That way you don't have an unused entity that is not actively monitored or maintained. However, you must clean up your service-linked role before you can delete it.

Cleaning up a service-linked role

Before you can use IAM to delete a service-linked role, you must first confirm that the role has no active sessions and remove any resources used by the role.

To check whether the service-linked role has an active session in the IAM console

1. Open the IAM console at https://console.aws.amazon.com/iam/.
2. In the navigation pane, choose **Roles**. Choose the name (not the check box) of the **AWSServiceRoleForCloudWatchRUM** role.

3. On the **Summary** page for the selected role, choose **Access Advisor** and review the recent activity for the service-linked role.

> **Note**
>
> If you are unsure whether RUM is using the **AWSServiceRoleForCloudWatchRUM** role, try to delete the role. If the service is using the role, then the deletion fails and you can view the Regions where the role is being used. If the role is being used, then you must wait for the session to end before you can delete the role. You cannot revoke the session for a service-linked role.

Deleting a service-linked role (IAM console)

You can use the IAM console to delete a service-linked role.

To delete a service-linked role (console)

1. Open the IAM console at https://console.aws.amazon.com/iam/.
2. In the navigation pane, choose **Roles**. Select the check box next to the name of the role you want to delete, not the name or row itself.
3. For **Role actions**, choose **Delete role**.
4. In the confirmation dialog box, review the service last accessed data, which shows when each of the selected roles last accessed an AWS service. This helps you to confirm whether the role is currently active. To proceed, choose **Yes, Delete**.
5. Watch the IAM console notifications to monitor the progress of the service-linked role deletion. Because the IAM service-linked role deletion is asynchronous, the deletion task can succeed or fail after you submit the role for deletion. If the task fails, choose **View details** or **View Resources** from the notifications to learn why the deletion failed. If the deletion fails because there are resources in the service that are being used by the role, then the reason for the failure includes a list of resources.

Deleting a service-linked role (AWS CLI)

You can use IAM commands from the AWS Command Line Interface to delete a service-linked role.

To delete a service-linked role (AWS CLI)

1. Because a service-linked role cannot be deleted if it is being used or has associated resources, you must submit a deletion request. That request can be denied if these conditions are not met. You must capture the `deletion-task-id` from the response to check the status of the deletion task. Type the following command to submit a service-linked role deletion request:

   ```
   $ aws iam delete-service-linked-role --role-name service-linked-role-name
   ```

2. Type the following command to check the status of the deletion task:

   ```
   $ aws iam get-service-linked-role-deletion-status --deletion-task-id deletion-task-id
   ```

   The status of the deletion task can be `NOT_STARTED`, `IN_PROGRESS`, `SUCCEEDED`, or `FAILED`. If the deletion fails, the call returns the reason that it failed so that you can troubleshoot.

Deleting a service-linked role (IAM API)

You can use the IAM API to delete a service-linked role.

To delete a service-linked role (API)

1. To submit a deletion request for a service-linked role, call DeleteServiceLinkedRole. In the request, specify the role name that you want to delete.

   Because a service-linked role cannot be deleted if it is being used or has associated resources, you must submit a deletion request. That request can be denied if these conditions are not met. You must capture the `DeletionTaskId` from the response to check the status of the deletion task.

2. To check the status of the deletion, call GetServiceLinkedRoleDeletionStatus. In the request, specify the `DeletionTaskId`.

   The status of the deletion task can be `NOT_STARTED`, `IN_PROGRESS`, `SUCCEEDED`, or `FAILED`. If the deletion fails, the call returns the reason that it failed so that you can troubleshoot.

Supported Regions for CloudWatch RUM service-linked roles

CloudWatch RUM supports using service-linked roles in all of the AWS Regions where the service is available. For more information, see CloudWatch RUM service endpoints.

Using service-linked roles for CloudWatch Application Insights

CloudWatch Application Insights uses AWS Identity and Access Management (IAM) service-linked roles. A service-linked role is a unique type of IAM role that is linked directly to CloudWatch Application Insights. Service-linked roles are predefined by CloudWatch Application Insights and include all of the permissions that the service requires to call other AWS services on your behalf.

A service-linked role makes setting up CloudWatch Application Insights easier because you don't have to manually add the necessary permissions. CloudWatch Application Insights defines the permissions of its service-linked roles, and unless defined otherwise, only CloudWatch Application Insights can assume its roles. The defined permissions include the trust policy and the permissions policy, and that permissions policy cannot be attached to any other IAM entity.

For information about other services that support service-linked roles, see AWS Services That Work with IAM and look for the services that have **Yes** in the **Service-Linked Role** column. Choose a **Yes** link to view the service-linked role documentation for that service.

Service-linked role permissions for CloudWatch Application Insights

CloudWatch Application Insights uses the service-linked role named **AWSServiceRoleForApplicationInsights**. Application Insights uses this role to perform operations such as analyzing the resource groups of the customer, creating CloudFormation stacks to create alarms on metrics, and configuring the CloudWatch Agent on EC2 instances. This service-linked role has an IAM policy attached to it named `CloudwatchApplicationInsightsServiceLinkedRolePolicy`. For updates to this policy, see Application Insights updates to AWS managed policies.

The role permissions policy allows CloudWatch Application Insights to complete the following actions on resources.

}
```

You must configure permissions to allow an IAM entity (such as a user, group, or role) to create, edit, or delete a service-linked role. For more information, see Service-Linked Role Permissions in the *IAM User Guide*.

Creating a service-linked role for CloudWatch Application Insights

You don't need to manually create a service-linked role. When you create a new Application Insights application in the AWS Management Console, CloudWatch Application Insights creates the service-linked role for you.

If you delete this service-linked role, and then want to create it again, you can use the same process to recreate the role in your account. When you create a new Application Insights application, CloudWatch Application Insights creates the service-linked role for you again.

Editing a service-linked role for CloudWatch Application Insights

CloudWatch Application Insights does not allow you to edit the AWSServiceRoleForApplicationInsights service-linked role. After you create a service-linked role, you cannot change the name of the role because various entities might reference the role. However, you can edit the description of the role using IAM. For more information, see Editing a Service-Linked Role in the *IAM User Guide*.

Deleting a service-linked role for CloudWatch Application Insights

If you no longer need to use a feature or service that requires a service-linked role, we recommend that you delete that role. That way you avoid having an unused entity that is not actively monitored or maintained. However, you must delete all applications in Application Insights before you can manually delete the role.

> **Note**
>
> If the CloudWatch Application Insights service is using the role when you try to delete the resources, the deletion might fail. If that happens, wait for a few minutes and try the operation again.

To delete CloudWatch Application Insights resources used by the AWSServiceRoleForApplicationInsights

- Delete all of your CloudWatch Application Insights applications. For more information, see "Deleting Your Application(s)" in the CloudWatch Application Insights User Guide.

To manually delete the service-linked role using IAM

Use the IAM console, the AWS CLI, or the AWS API to delete the AWSServiceRoleForApplicationInsights service-linked role. For more information, see Deleting a Service-Linked Role in the *IAM User Guide*.

Supported Regions for CloudWatch Application Insights service-linked roles

CloudWatch Application Insights supports using service-linked roles in all of the AWS Regions where the service is available. For more information, see CloudWatch Application Insights Regions and Endpoints.

AWS managed policies for Amazon CloudWatch Application Insights

An AWS managed policy is a standalone policy that is created and administered by AWS. AWS managed policies are designed to provide permissions for many common use cases so that you can start assigning permissions to users, groups, and roles.

Keep in mind that AWS managed policies might not grant least-privilege permissions for your specific use cases because they're available for all AWS customers to use. We recommend that you reduce permissions further by defining customer managed policies that are specific to your use cases.

You cannot change the permissions defined in AWS managed policies. If AWS updates the permissions defined in an AWS managed policy, the update affects all principal identities (users, groups, and roles) that the policy is attached to. AWS is most likely to update an AWS managed policy when a new AWS service is launched or new API operations become available for existing services.

For more information, see AWS managed policies in the *IAM User Guide*.

AWS managed policy: CloudWatchApplicationInsightsFullAccess

You can attach the `CloudWatchApplicationInsightsFullAccess` policy to your IAM identities.

This policy grants administrative permissions that allow full access to Application Insights functionality.

Permissions details

This policy includes the following permissions.

- `applicationinsights` – Allows full access to Application Insights functionality.
- `iam` – Allows Application Insights to create the service-linked role, AWSServiceRoleForApplicationInsights. This is required so that Application Insights can perform operations such as analyze the resource groups of a customer, create CloudFormation stacks to create alarms on metrics, and configure the CloudWatch Agent on EC2 instances. For more information, see Using service-linked roles for CloudWatch Application Insights.

JSON

```
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "applicationinsights:*",
      "Resource": "*"
    },
    {
      "Effect": "Allow",
      "Action": [
        "ec2:DescribeInstances",
        "ec2:DescribeVolumes",
        "rds:DescribeDBInstances",
        "rds:DescribeDBClusters",
        "sqs:ListQueues",
        "elasticloadbalancing:DescribeLoadBalancers",
        "elasticloadbalancing:DescribeTargetGroups",
        "elasticloadbalancing:DescribeTargetHealth",
        "autoscaling:DescribeAutoScalingGroups",
        "lambda:ListFunctions",
        "dynamodb:ListTables",
        "s3:ListAllMyBuckets",

      "Condition": {
        "StringEquals": {
          "iam:AWSServiceName": "application-insights.amazonaws.com"
        }
      }
    }
  ]
}
```

AWS managed policy: CloudWatchApplicationInsightsReadOnlyAccess

You can attach the `CloudWatchApplicationInsightsReadOnlyAccess` policy to your IAM identities.

This policy grants administrative permissions that allow read-only access to all Application Insights functionality.

Permissions details

This policy includes the following permissions.

- `applicationinsights` – Allows read-only access to Application Insights functionality.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
```

```
            "Effect": "Allow",
            "Action": [
                "applicationinsights:Describe*",
                "applicationinsights:List*"
            ],
            "Resource": "*"
        }
    ]
}
```

AWS managed policy: CloudwatchApplicationInsightsServiceLinkedRolePolicy

You can't attach CloudwatchApplicationInsightsServiceLinkedRolePolicy to your IAM entities. This policy is attached to a service-linked role that allows Application Insights to monitor customer resources. For more information, see Using service-linked roles for CloudWatch Application Insights.

Application Insights updates to AWS managed policies

View details about updates to AWS managed policies for Application Insights since this service began tracking these changes. For automatic alerts about changes to this page, subscribe to the RSS feed on the Application Insights Document history page.

Change	Description	Date
CloudwatchApplicationInsightsServiceLinkedRolePolicy – Update to an existing policy	Application Insights added a new permission. The policy change allows Amazon CloudWatch Application Insights to enable and disable termination protection on CloudFormation stacks to manage SSM	July 25, 2024

Change	Description	Date
	resources used to install and configure CloudWatch agents.	
CloudwatchApplicationInsightsServiceLinkedRolePolicy – Update to an existing policy	Application Insights added new permissions to list CloudFormation stacks. These permissions are required for Amazon CloudWatch Application Insights to analyze and monitor AWS resources nested in the CloudFormation stack.	April 24, 2023
CloudwatchApplicationInsightsServiceLinkedRolePolicy – Update to an existing policy	Application Insights added new permissions to get list of Amazon VPC and Route 53 resources. These permissions are required for Amazon CloudWatch Application Insights to automatically set up best practice network monitoring with Amazon CloudWatch.	January 23, 2023

Change	Description	Date
CloudwatchApplicationInsightsServiceLinkedRolePolicy – Update to an existing policy	Application Insights added new permissions to get SSM command invocation results. These permissions are required for Amazon CloudWatch Application Insights to automatically detect and monitor workloads running on Amazon EC2 instances.	December 19, 2022
CloudwatchApplicationInsightsServiceLinkedRolePolicy – Update to an existing policy	Application Insights added new permissions to describe Amazon VPC and Route 53 resources. These permissions are required for Amazon CloudWatch Application Insights to read customer Amazon VPC and Route 53 resource configurations, and to help customers automatic ally set up best practice network monitoring with Amazon CloudWatch.	December 19, 2022

Change	Description	Date
CloudwatchApplicationInsightsServiceLinkedRolePolicy – Update to an existing policy	Application Insights added new permissions to describe EFS resources. These permissions are required for Amazon CloudWatch Application Insights to read Amazon EFS customer resource configurations, and to help customers automatically set up best practices for EFS monitoring with CloudWatch.	October 3, 2022
CloudwatchApplicationInsightsServiceLinkedRolePolicy – Update to an existing policy	Application Insights added new permissions to describe the EFS file system. These permissions are required for Amazon CloudWatch Application Insights to create account-based applications by querying all of the supported resources in an account.	October 3, 2022

Change	Description	Date
CloudwatchApplicationInsightsServiceLinkedRolePolicy – Update to an existing policy	Application Insights added new permissions to retrieve information about FSx resources. These permissions are required for Amazon CloudWatch Application Insights to monitor workloads by retrieving sufficient information about the underlying FSx volumes.	September 12, 2022
AWS managed policy: CloudWatchApplicationInsightsFullAccess – Update to an existing policy	Application Insights added a new permission to describe log groups. This permissions is required for Amazon CloudWatch Application Insights to ensure that the correct permissions for monitoring log groups are in an account when creating a new application.	January 24, 2022

Change	Description	Date
CloudwatchApplicationInsightsServiceLinkedRolePolicy – Update to an existing policy	Application Insights added new permissions to create and delete CloudWatch Log Subscription Filters. These permissions are required for Amazon CloudWatch Application Insights to create Subscription Filters to facilitate log monitoring of resources within configured applications.	January 24, 2022
CloudwatchApplicationInsightsServiceLinkedRolePolicy – Update to an existing policy	Application Insights added new permissions to describe target groups and target health for Elastic Load Balancers. These permissions are required for Amazon CloudWatch Application Insights to create account-based applications by querying all of the supported resources in an account.	November 4, 2021

Change	Description	Date
CloudwatchApplicationInsightsServiceLinkedRolePolicy – Update to an existing policy	Application Insights added new permissions to run the `AmazonCloudWatch-ManageAgent` SSM document on Amazon EC2 instances. This permissions is required for Amazon CloudWatch Application Insights to clean up CloudWatch agent configuration files created by Application Insights.	September 30, 2021

Change	Description	Date
CloudwatchApplicationInsightsServiceLinkedRolePolicy – Update to an existing policy	Application Insights added new permissions to support account-based applicati on monitoring to onboard and monitor all supported resources in your account. These permissions are required for Amazon CloudWatch Applicati on Insights to query, tag resources, and create groups for these resources. Application Insights added new permissions to support monitoring of SNS topics. These permissions are required for Amazon CloudWatch Application Insights to gather metadata from SNS resources to configure monitoring for SNS topics.	September 15, 2021

Change	Description	Date
AWS managed policy: CloudWatchApplicationInsightsFullAccess – Update to an existing policy	Application Insights added new permissions to describe and list supported resources. These permissions are required for Amazon CloudWatch Application Insights to create account-based applications by querying all of the supported resources in an account.	September 15, 2021
CloudwatchApplicationInsightsServiceLinkedRolePolicy – Update to an existing policy	Application Insights added new permissions to describe FSx resources. These permissions are required for Amazon CloudWatch Application Insights to read customer FSx resource configurations, and to help customers automatically set up best practice FSx monitoring with CloudWatch.	August 31, 2021

Change	Description	Date
CloudwatchApplicationInsightsServiceLinkedRolePolicy – Update to an existing policy	Application Insights added new permissions to describe and list ECS and EKS service resources. This permission is required for Amazon CloudWatch Application Insights to read customer container resources configuration, and to help customers automatically set up best practice container monitoring with CloudWatch.	May 18, 2021
CloudwatchApplicationInsightsServiceLinkedRolePolicy – Update to an existing policy	Application Insights added new permissions to allow OpsCenter to tag OpsItems using the `ssm:AddTagsToResource` action on resources with the `opsitem` resource type. This permission is required by OpsCenter. Amazon CloudWatch Application Insights creates OpsItems so that the customer can resolve problems using AWS SSM OpsCenter.	April 13, 2021
Application Insights started tracking changes	Application Insights started tracking changes for its AWS managed policies.	April 13, 2021

Amazon CloudWatch permissions reference

The following table lists each CloudWatch API operation and the corresponding actions for which you can grant permissions to perform the action. You specify the actions in the policy's `Action` field, and you specify a wildcard character (*) as the resource value in the policy's `Resource` field.

You can use AWS-wide condition keys in your CloudWatch policies to express conditions. For a complete list of AWS-wide keys, see AWS Global and IAM Condition Context Keys in the *IAM User Guide*.

> **Note**
>
> To specify an action, use the `cloudwatch:` prefix followed by the API operation name. For example: `cloudwatch:GetMetricData`, `cloudwatch:ListMetrics`, or `cloudwatch:*` (for all CloudWatch actions).

Topics

- CloudWatch API operations and required permissions for actions
- CloudWatch Application Signals API operations and required permissions for actions
- CloudWatch Contributor Insights API operations and required permissions for actions
- CloudWatch Events API operations and required permissions for actions
- CloudWatch Logs API operations and required permissions for actions
- Amazon EC2 API operations and required permissions for actions
- Amazon EC2 Auto Scaling API operations and required permissions for actions

CloudWatch API operations and required permissions for actions

CloudWatch API operations	Required permissions (API actions)
DeleteAlarms	`cloudwatch:DeleteAlarms` Required to delete an alarm.
DeleteDashboards	`cloudwatch:DeleteDashboards`

CloudWatch API operations	Required permissions (API actions)
	Required to delete a dashboard.
DeleteMetricStream	`cloudwatch:DeleteMetricStream` Required to delete a metric stream.
DescribeAlarmHistory	`cloudwatch:DescribeAlarmHistory` Required to view alarm history. To retrieve information about composite alarms, your `cloudwatch:DescribeAlarmHistory` permission must have a * scope. You can't return information about composite alarms if your `cloudwatch:DescribeAlarmHistory` permission has a narrower scope.
DescribeAlarms	`cloudwatch:DescribeAlarms` Required to retrieve information about alarms. To retrieve information about composite alarms, your `cloudwatch:DescribeAlarms` permission must have a * scope. You can't return information about composite alarms if your `cloudwatch:DescribeAlarms` permission has a narrower scope.
DescribeAlarmsForMetric	`cloudwatch:DescribeAlarmsForMetric` Required to view alarms for a metric.

CloudWatch API operations	Required permissions (API actions)
DisableAlarmActions	`cloudwatch:DisableAlarmActions` Required to disable an alarm action.
EnableAlarmActions	`cloudwatch:EnableAlarmActions` Required to enable an alarm action.
GetDashboard	`cloudwatch:GetDashboard` Required to display data about existing dashboards.
GetMetricData	`cloudwatch:GetMetricData` Required to graph metric data in the CloudWatch console, to retrieve large batches of metric data, and perform metric math on that data.
GetMetricStatistics	`cloudwatch:GetMetricStatistics` Required to view graphs in other parts of the CloudWatch console and in dashboard widgets.
GetMetricStream	`cloudwatch:GetMetricStream` Required to view information about a metric stream.

CloudWatch API operations	Required permissions (API actions)
GetMetricWidgetImage	`cloudwatch:GetMetricWidgetImage` Required to retrieve a snapshot graph of one or more CloudWatch metrics as a bitmap image.
ListDashboards	`cloudwatch:ListDashboards` Required to view the list of CloudWatch dashboards in your account.
ListEntitiesForMetric (CloudWatch console-only permission)	`cloudwatch:ListEntitiesForMetric` Required to find the entities associated with a metric. Required to explore related telemetry within the CloudWatch console.
ListMetrics	`cloudwatch:ListMetrics` Required to view or search metric names within the CloudWatch console and in the CLI. Required to select metrics on dashboard widgets.
ListMetricStreams	`cloudwatch:ListMetricStreams` Required to view or search the list of metric streams in the account.

CloudWatch API operations	Required permissions (API actions)
PutCompositeAlarm	`cloudwatch:PutCompositeAlarm` Required to create a composite alarm. To create a composite alarm, your `cloudwatch:PutCompositeAlarm` permission must have a * scope. You can't return information about composite alarms if your `cloudwatch:PutCompositeAlarm` permission has a narrower scope.
PutDashboard	`cloudwatch:PutDashboard` Required to create a dashboard or update an existing dashboard.
PutMetricAlarm	`cloudwatch:PutMetricAlarm` Required to create or update an alarm.
PutMetricData	`cloudwatch:PutMetricData` Required to create metrics.
PutMetricStream	`cloudwatch:PutMetricStream` Required to create a metric stream.
SetAlarmState	`cloudwatch:SetAlarmState` Required to manually set an alarm's state.

CloudWatch API operations	Required permissions (API actions)
StartMetricStreams	`cloudwatch:StartMetricStreams` Required to start the flow of metrics in a metric stream.
StopMetricStreams	`cloudwatch:StopMetricStreams` Required to temporarily stop the flow of metrics in a metric stream.
TagResource	`cloudwatch:TagResource` Required to add or update tags on CloudWatch resources such as alarms and Contributor Insights rules.
UntagResource	`cloudwatch:UntagResource` Required to remove tags from CloudWatch resources .

CloudWatch Application Signals API operations and required permissions for actions

CloudWatch Application Signals API operations	Required permissions (API actions)
BatchGetServiceLevelObjectiveBudgetReport	`application-signals:BatchGetServiceLevelObjectiveBudgetReport`

CloudWatch Application Signals API operations	Required permissions (API actions)
	Required to retrieve service level objective budget reports.
CreateServiceLevelObjective	`application-signals:CreateServiceLevelObjective` Required to create a service level objective (SLO).
DeleteServiceLevelObjective	`application-signals:DeleteServiceLevelObjective` Required to delete a service level objective (SLO).
GetService	`application-signals:GetService` Required to retrieve information about a service discovered by Application Signals.
GetServiceLevelObjective	`application-signals:GetServiceLevelObjective` Required to retrieve information about a service level objective (SLO).
ListObservedEntities	`application-signals:ListObservedEntities` Grants permission to list entities that are associated with other entities.

CloudWatch Application Signals API operations	Required permissions (API actions)
ListServiceDependencies	`application-signals:ListServiceDependencies` Required to retrieve a list of service dependencies of a service that you specify. This service and the dependencies were discovered by Application Signals.
ListServiceDependents	`application-signals:ListServiceDependents` Required to retrieve a list of dependents that invoked a service that you specify. This service and the dependents were discovered by Application Signals.
ListServiceLevelObjectives	`application-signals:ListServiceLevelObjectives` Required to retrieve a list of service level objectives (SLOs) in the account.
ListServiceOperations	`application-signals:ListServiceOperations` Required to retrieve a list of service operations of a service that you specify. This service and the dependencies were discovered by Application Signals.

CloudWatch Application Signals API operations	Required permissions (API actions)
ListServices	`application-signals:ListServices` Required to retrieve a list of services discovered by Application Signals.
ListTagsForResource	`application-signals:ListTagsForResource` Required to retrieve a list of the tags associated with a resource.
StartDiscovery	`application-signals:StartDiscovery` Required to be able to enable Application Signals in the account and create the required service-linked role.
TagResource	`application-signals:TagResource` Required to be able to add tags to resources.
UntagResource	`application-signals:UntagResource` Required to be able to remove tags from resources.

CloudWatch Application Signals API operations	Required permissions (API actions)
UpdateServiceLevelObjective	`application-signals:UpdateServiceLevelObjective` Required to update an existing service level objective

CloudWatch Contributor Insights API operations and required permissions for actions

> **Important**
>
> When you grant a user the `cloudwatch:PutInsightRule` permission, by default that user can create a rule that evaluates any log group in CloudWatch Logs. You can add IAM policy conditions that limit these permissions for a user to include and exclude specific log groups. For more information, see Using condition keys to limit Contributor Insights users' access to log groups.

CloudWatch Contributor Insights API operations	Required permissions (API actions)
DeleteInsightRules	`cloudwatch:DeleteInsightRules` Required to delete Contributor Insights rules.
DescribeInsightRules	`cloudwatch:DescribeInsightRules` Required to view the Contributor Insights rules in your account.
EnableInsightRules	`cloudwatch:EnableInsightRules`

CloudWatch Contributor Insights API operations	Required permissions (API actions)
	Required to enable Contributor Insights rules.
GetInsightRuleReport	`cloudwatch:GetInsightRuleReport` Required to retrieve time series data and other statistics collectd by Contributor Insights rules.
PutInsightRule	`cloudwatch:PutInsightRule` Required to create Contributor Insights rules. See the **Important** note at the beginning of this table.

CloudWatch Events API operations and required permissions for actions

CloudWatch Events API operations	Required permissions (API actions)
DeleteRule	`events:DeleteRule` Required to delete a rule.
DescribeRule	`events:DescribeRule` Required to list the details about a rule.
DisableRule	`events:DisableRule` Required to disable a rule.
EnableRule	`events:EnableRule`

CloudWatch Events API operations	Required permissions (API actions)
	Required to enable a rule.
ListRuleNamesByTarget	`events:ListRuleNamesByTarget` Required to list rules associated with a target.
ListRules	`events:ListRules` Required to list all rules in your account.
ListTargetsByRule	`events:ListTargetsByRule` Required to list all targets associated with a rule.
PutEvents	`events:PutEvents` Required to add custom events that can be matched to rules.
PutRule	`events:PutRule` Required to create or update a rule.
PutTargets	`events:PutTargets` Required to add targets to a rule.
RemoveTargets	`events:RemoveTargets` Required to remove a target from a rule.

CloudWatch Events API operations	Required permissions (API actions)
TestEventPattern	`events:TestEventPattern` Required to test an event pattern against a given event.

CloudWatch Logs API operations and required permissions for actions

> **Note**
>
> CloudWatch Logs permissions can be found in the CloudWatch Logs user guide.

Amazon EC2 API operations and required permissions for actions

Amazon EC2 API operations	Required permissions (API actions)
DescribeInstanceStatus	`ec2:DescribeInstanceStatus` Required to view EC2 instance status details.
DescribeInstances	`ec2:DescribeInstances` Required to view EC2 instance details.
RebootInstances	`ec2:RebootInstances` Required to reboot an EC2 instance.
StopInstances	`ec2:StopInstances` Required to stop an EC2 instance.
TerminateInstances	`ec2:TerminateInstances`

Amazon EC2 API operations	Required permissions (API actions)
	Required to terminate an EC2 instance.

Amazon EC2 Auto Scaling API operations and required permissions for actions

Amazon EC2 Auto Scaling API operations	Required permissions (API actions)
Scaling	`autoscaling:Scaling` Required to scale an Auto Scaling group.
Trigger	`autoscaling:Trigger` Required to trigger an Auto Scaling action.

Compliance validation for Amazon CloudWatch

To learn whether an AWS service is within the scope of specific compliance programs, see AWS services in Scope by Compliance Program and choose the compliance program that you are interested in. For general information, see AWS Compliance Programs.

You can download third-party audit reports using AWS Artifact. For more information, see Downloading Reports in AWS Artifact.

Your compliance responsibility when using AWS services is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. For more information about your compliance responsibility when using AWS services, see AWS Security Documentation.

Resilience in Amazon CloudWatch

The AWS global infrastructure is built around AWS Regions and Availability Zones. Regions provide multiple physically separated and isolated Availability Zones, which are connected through low-latency, high-throughput, and highly redundant networking. With Availability Zones, you can design and operate applications and databases that automatically fail over between zones

without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

For more information about AWS Regions and Availability Zones, see AWS Global Infrastructure.

Infrastructure security in Amazon CloudWatch

As a managed service, Amazon CloudWatch is protected by AWS global network security. For information about AWS security services and how AWS protects infrastructure, see AWS Cloud Security. To design your AWS environment using the best practices for infrastructure security, see Infrastructure Protection in *Security Pillar AWS Well-Architected Framework*.

You use AWS published API calls to access CloudWatch through the network. Clients must support the following:

- Transport Layer Security (TLS). We require TLS 1.2 and recommend TLS 1.3.
- Cipher suites with perfect forward secrecy (PFS) such as DHE (Ephemeral Diffie-Hellman) or ECDHE (Elliptic Curve Ephemeral Diffie-Hellman). Most modern systems such as Java 7 and later support these modes.

Network isolation

A virtual private cloud (VPC) is a virtual network in your own logically isolated area in the Amazon Web Services Cloud. A subnet is a range of IP addresses in a VPC. You can deploy a variety of AWS resources in the subnets of your VPCs. For example, you can deploy Amazon EC2 instances, EMR clusters, and DynamoDB tables in subnets. For more information, see the Amazon VPC User Guide.

To enable CloudWatch to communicate with resources in a VPC without going through the public internet, use AWS PrivateLink. For more information, see Using CloudWatch, CloudWatch Synthetics, and CloudWatch Network Monitoring with interface VPC endpoints.

A private subnet is a subnet with no default route to the public internet. Deploying an AWS resource in a private subnet does not prevent Amazon CloudWatch from collecting built-in metrics from the resource.

If you need to publish custom metrics from an AWS resource in a private subnet, you can do so using a proxy server. The proxy server forwards those HTTPS requests to the public API endpoints for CloudWatch.

AWS Security Hub

Monitor your usage of CloudWatch as it relates to security best practices by using AWS Security Hub. Security Hub uses *security controls* to evaluate resource configurations and *security standards* to help you comply with various compliance frameworks. For more information about using Security Hub to evaluate CloudWatch resources, see Amazon CloudWatch controls in the AWS Security Hub User Guide.

Using CloudWatch, CloudWatch Synthetics, and CloudWatch Network Monitoring with interface VPC endpoints

If you use Amazon Virtual Private Cloud (Amazon VPC) to host your AWS resources, you can establish a private connection between your VPC, CloudWatch, CloudWatch Synthetics, and CloudWatch Network Monitoring features. You can use these connections to enable these services to communicate with resources in your VPC without going through the public internet.

Amazon VPC is an AWS service that you can use to launch AWS resources in a virtual network that you define. With a VPC, you have control over your network settings, such the IP address range, subnets, route tables, and network gateways. To connect your VPC to CloudWatch services, you define an *interface VPC endpoint* for your VPC. The endpoint provides reliable, scalable connectivity to CloudWatch and supported CloudWatch services without requiring an internet gateway, network address translation (NAT) instance, or VPN connection. For more information, see What is Amazon VPC in the *Amazon VPC User Guide*.

Interface VPC endpoints are powered by AWS PrivateLink, an AWS technology that enables private communication between AWS services using an elastic network interface with private IP addresses. For more information, see the following blog post: New – AWS PrivateLink for AWS Services

The following steps are for users of Amazon VPC. For more information, see Getting Started in the *Amazon VPC User Guide*.

CloudWatch VPC endpoints

CloudWatch currently supports VPC endpoints, including IPv6-only and dual stack enabled endpoints, in all AWS Regions, including the AWS GovCloud (US) Regions. For information on endpoints URL, see CloudWatch endpoints and quotas .

Creating a VPC endpoint for CloudWatch

To start using CloudWatch with your VPC, create an interface VPC endpoint for CloudWatch. The service name to choose is `com.amazonaws.region.monitoring`. For more information, see Creating an interface endpoint in the *Amazon VPC User Guide*.

You do not need to change the settings for CloudWatch. CloudWatch calls other AWS services using either public endpoints or private interface VPC endpoints, whichever are in use. For example, if you create an interface VPC endpoint for CloudWatch, and you already have metrics flowing to CloudWatch from resources located on your VPC, these metrics begin flowing through the interface VPC endpoint by default.

Controlling access to your CloudWatch VPC endpoint

A VPC endpoint policy is an IAM resource policy that you attach to an endpoint when you create or modify the endpoint. If you don't attach a policy when you create an endpoint, Amazon VPC attaches a default policy for you that allows full access to the service. An endpoint policy doesn't override or replace user policies or service-specific policies. It's a separate policy for controlling access from the endpoint to the specified service.

Endpoint policies must be written in JSON format.

For more information, see Controlling access to services with VPC endpoints in the *Amazon VPC User Guide*.

The following is an example of an endpoint policy for CloudWatch. This policy allows users connecting to CloudWatch through the VPC to send metric data to CloudWatch and prevents them from performing other CloudWatch actions.

```
{
  "Statement": [
    {
      "Sid": "PutOnly",
      "Principal": "*",
      "Action": [
        "cloudwatch:PutMetricData"
      ],
      "Effect": "Allow",
      "Resource": "*"
    }
```

```
  ]
}
```

To edit the VPC endpoint policy for CloudWatch

1. Open the Amazon VPC console at https://console.aws.amazon.com/vpc/.
2. In the navigation pane, choose **Endpoints**.
3. If you have not already created the endpoint for CloudWatch, choose **Create endpoint**. Select **com.amazonaws.*region*.monitoring**, and then choose **Create endpoint**.
4. Select the **com.amazonaws.*region*.monitoring** endpoint, and then choose the **Policy** tab.
5. Choose **Edit policy**, and then make your changes.

CloudWatch Synthetics VPC endpoint

CloudWatch Synthetics currently supports VPC endpoints in the following AWS Regions:

- US East (Ohio)
- US East (N. Virginia)
- US West (N. California)
- US West (Oregon)
- Asia Pacific (Hong Kong)
- Asia Pacific (Mumbai)
- Asia Pacific (Seoul)
- Asia Pacific (Singapore)
- Asia Pacific (Sydney)
- Asia Pacific (Tokyo)
- Canada (Central)
- Europe (Frankfurt)
- Europe (Ireland)
- Europe (London)
- Europe (Paris)
- South America (São Paulo)

Creating a VPC endpoint for CloudWatch Synthetics

To start using CloudWatch Synthetics with your VPC, create an interface VPC endpoint for CloudWatch Synthetics. The service name to choose is `com.amazonaws.region.synthetics`. For more information, see Creating an interface endpoint in the *Amazon VPC User Guide*.

You do not need to change the settings for CloudWatch Synthetics. CloudWatch Synthetics communicates with other AWS services using either public endpoints or private interface VPC endpoints, whichever are in use. For example, if you create an interface VPC endpoint for CloudWatch Synthetics, and you already have an interface endpoint for Amazon S3, CloudWatch Synthetics begins communicating with Amazon S3 through the interface VPC endpoint by default.

Controlling access to your CloudWatch Synthetics VPC endpoint

A VPC endpoint policy is an IAM resource policy that you attach to an endpoint when you create or modify the endpoint. If you don't attach a policy when you create an endpoint, we attach a default policy for you that allows full access to the service. An endpoint policy doesn't override or replace user policies or service-specific policies. It's a separate policy for controlling access from the endpoint to the specified service.

Endpoint policies affect canaries that are managed privately by VPC. They are not needed for canaries that run on private subnets.

Endpoint policies must be written in JSON format.

For more information, see Controlling access to services with VPC endpoints in the *Amazon VPC User Guide*.

The following is an example of an endpoint policy for CloudWatch Synthetics. This policy enables users connecting to CloudWatch Synthetics through the VPC to view information about canaries and their runs, but not to create, modify, or delete canaries.

```
{
    "Statement": [
        {
            "Action": [
                "synthetics:DescribeCanaries",
                "synthetics:GetCanaryRuns"
            ],
            "Effect": "Allow",
            "Resource": "*",
```

```
            "Principal": "*"
        }
    ]
}
```

To edit the VPC endpoint policy for CloudWatch Synthetics

1. Open the Amazon VPC console at https://console.aws.amazon.com/vpc/.
2. In the navigation pane, choose **Endpoints**.
3. If you have not already created the endpoint for CloudWatch Synthetics, choose **Create endpoint**. Select **com.amazonaws.*region*.synthetics** and then choose **Create endpoint**.
4. Select the **com.amazonaws.*region*.synthetics** endpoint, and then choose the **Policy** tab.
5. Choose **Edit policy**, and then make your changes.

CloudWatch Network Monitoring feature VPC endpoints

CloudWatch Network Monitoring includes the following features: Network Flow Monitor, Internet Monitor, and Network Synthetic Monitor. These features each support VPC endpoints in the AWS Regions where the Network Monitoring feature is supported.

To see a list of supported Regions for each Network Monitoring feature, see the following topics:

- **Network Flow Monitor:** Supported AWS Regions for Network Flow Monitor
- **Internet Monitor:** Supported AWS Regions for Internet Monitor
- **Network Synthetic Monitor:** Supported AWS Regions for Network Synthetic Monitor

Creating a VPC endpoint for a CloudWatch Network Monitoring feature

To start using CloudWatch Network Monitoring features with your VPC, create an interface VPC endpoint for the feature that you want to use. For Network Monitoring, the following service names are available:

- `com.amazonaws.region.networkflowmonitor`
- `com.amazonaws.region.networkflowmonitorreports`
- `com.amazonaws.region.internetmonitor`
- `com.amazonaws.region.internetmonitor-fips`

- com.amazonaws.*region*.networkmonitor

For more information, see Creating an interface endpoint in the *Amazon VPC User Guide*.

You don't need to change the settings for Network Monitoring services. Network Monitoring services communicate with other AWS services using either public endpoints or private interface VPC endpoints, whichever are being used. For example, if you create an interface VPC endpoint for a Network Monitoring service, and you already have metrics flowing to the service from resources located on your VPC, the metrics begin flowing through the interface VPC endpoint by default.

Controlling access to your CloudWatch Network Monitoring feature VPC endpoints

A VPC endpoint policy is an IAM resource policy that you attach to an endpoint when you create or modify the endpoint. An endpoint policy doesn't override or replace user policies or service-specific policies. It's a separate policy for controlling access from the endpoint to the specified service.

If you don't attach a policy when you create an endpoint, Amazon VPC attaches a default policy for you that allows full access and does not restrict access to a specific service. For additional security, you can attach a policy to the endpoint to specifically limit access to the feature. For example, for Internet Monitor, you could allow full access to just Internet Monitor by attaching the AWS managed policy that enables full access to the feature, CloudWatchInternetMonitorFullAccess. Or, you can further limit permissions to just specific actions for the endpoint.

For more information, see Controlling access to services with VPC endpoints in the *Amazon VPC User Guide*.

The following is an example of an endpoint policy that you could create for Network Flow Monitor to limit actions for the endpoint. This policy allows requests to Network Flow Monitor through the VPC to use only the `Publish` action, which enables requests to publish metrics to Network Flow Monitor backend ingestion.

```
{
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": "*",
            "Action": "networkflowmonitor:Publish",
            "Resource": "*"
        }
```

```
    ]
}
```

If you want to use a specific VPC endpoint policy with an interface VPC endpoint for a Network Monitoring feature, use steps similar to the following example for adding a policy for Network Flow Monitor.

To edit a VPC endpoint policy for Network Flow Monitor

1. Open the Amazon VPC console at https://console.aws.amazon.com/vpc/.
2. In the navigation pane, choose **Endpoints**.
3. If you have not already created the endpoint for Internet Monitor, choose **Create endpoint**.
4. Select **com.amazonaws.*region*.networkflowmonitor**, and then choose **Create endpoint**.
5. Select the **com.amazonaws.*region*.networkflowmonitor** endpoint, and then choose the **Policy** tab.
6. Choose **Edit policy**, and then make your changes.

Security considerations for Synthetics canaries

The following sections explain security issues that you should consider when creating and running canaries in Synthetics.

Use secure connections

Because canary code and the results from canary test runs can contain sensitive information, do not have your canary connect to endpoints over unencrypted connections. Always use encrypted connections, such as those that begin with `https://`.

Canary naming considerations

The Amazon Resource Name (ARN) of a canary is included in the user-agent header as a part of outbound calls made from the Puppeteer-driven Chromium browser that is included as a part of the CloudWatch Synthetics wrapper library. This helps identify CloudWatch Synthetics canary traffic and relate it back to the canaries that are making calls.

The canary ARN includes the canary name. Choose canary names that do not reveal proprietary information.

Additionally, be sure to point your canaries only at websites and endpoints that you control.

Secrets and sensitive information in canary code

If you pass your canary code directly into the canary using a zip file, the contents of the script can be seen in AWS CloudTrail logs.

If you have sensitive information or secrets (such as access keys or database credentials) in a canary script, we strongly recommend that you store the script as a versioned object in Amazon S3 and pass the Amazon S3 location into the canary, instead of passing the canary code by a zip file.

If you do use a zip file to pass the canary script, we strongly recommend that you don't include secrets or sensitive information in your canary source code. For more information about how to use AWS Secrets Manager to help keep your secrets safe, see What is AWS Secrets Manager?.

Permissions considerations

We recommend that you restrict access to resources that are created or used by CloudWatch Synthetics. Use tight permissions on the Amazon S3 buckets where canaries store test run results and other artifacts, such as logs and screenshots.

Similarly, keep tight permissions on the locations where your canary source code is stored, so that no user accidentally or maliciously deletes the Lambda layers or Lambda functions used for the canary.

To help make sure you run the canary code you intend, you can use object versioning on the Amazon S3 bucket where your canary code is stored. Then when you specify this code to run as a canary, you can include the object `versionId` as part of the path, as in the following examples.

```
https://bucket.s3.amazonaws.com/path/object.zip?versionId=version-id
https://s3.amazonaws.com/bucket/path/object.zip?versionId=version-id
https://bucket.s3-region.amazonaws.com/path/object.zip?versionId=version-id
```

Stack traces and exception messages

By default, CloudWatch Synthetics canaries capture any exception thrown by your canary script, no matter whether the script is custom or is from a blueprint. CloudWatch Synthetics logs both the exception message and the stack trace to three locations:

- Back into the CloudWatch Synthetics service to speed up debugging when you describe test runs

- Into CloudWatch Logs according to the configuration that your Lambda functions are created with
- Into the Synthetics log file, which is a plaintext file that is uploaded to the Amazon S3 location specified by the value you set for the `resultsLocation` of the canary

If you want to send and store less information, you can capture exceptions before they return to the CloudWatch Synthetics wrapper library.

You can also have request URLs in your errors. CloudWatch Synthetics scans for any URLs in the error thrown by your script and redacts restricted URL parameters from them based on the **restrictedUrlParameters** configuration. If you are logging error messages in your script, you can use getSanitizedErrorMessage to redact URLs before logging.

Scope your IAM roles narrowly

We recommend that you do not configure your canary to visit potentially malicious URLs or endpoints. Pointing your Canary to untrusted or unknown websites or endpoints could expose your Lambda function code to malicious user's scripts. Assuming a malicious website can break out of Chromium, it could have access to your Lambda code in a similar way to if you connected to it using an internet browser.

Run your Lambda function with an IAM execution role that has scoped-down permissions. This way, if your Lambda function is compromised by a malicious script, it is limited in the actions it can take when running as your canary's AWS account.

When you use the CloudWatch console to create a canary, it is created with a scoped-down IAM execution role.

Sensitive data redaction

CloudWatch Synthetics captures URLs, status code, failure reason (if any), and headers and bodies of requests and responses. This enables a canary user to understand, monitor, and debug canaries.

The configurations described in the following sections can be set at any point in canary execution. You can also choose to apply different configurations to different synthetics steps.

Request URLs

By default, CloudWatch Synthetics logs request URLs, status codes, and the status reason for each URL in canary logs. Request URLs can also appear in canary execution reports, HAR files, and so on.

Your request URL might contain sensitive query parameters, such as access tokens or passwords. You can redact sensitive information from being logged by CloudWatch Synthetics.

To redact sensitive information, set the configuration property **restrictedUrlParameters**. For more information, see SyntheticsConfiguration class. This causes CloudWatch Synthetics to redact URL parameters, including path and query parameter values, based on **restrictedUrlParameters** before logging. If you are logging URLs in your script, you can use getSanitizedUrl(url, stepConfig = null) to redact URLs before logging. For more information, see SyntheticsLogHelper class.

Headers

By default, CloudWatch Synthetics doesn't log request/response headers. For UI canaries, this is the default behavior for canaries using runtime version `syn-nodejs-puppeteer-3.2` and later.

If your headers don't contain sensitive information, you can enable headers in HAR file and HTTP reports by setting the **includeRequestHeaders** and **includeResponseHeaders** properties to `true`. You can enable all headers but choose to restrict values of sensitive header keys. For example, you can choose to only redact `Authorization` headers from artifacts produced by canaries.

Request and response body

By default, CloudWatch Synthetics doesn't log the request/response body in canary logs or reports. This information is particularly useful for API canaries. Synthetics captures all HTTP requests and can show headers, request and response bodies. For more information, see executeHttpStep(stepName, requestOptions, [callback], [stepConfig]). You can choose to enable request/response body by setting the **includeRequestBody** and **includeResponseBody** properties to `true`.

Logging Amazon CloudWatch API and console operations with AWS CloudTrail

Amazon CloudWatch, CloudWatch Synthetics, CloudWatch RUM, Amazon Q Developer operational investigations, Network Flow Monitor, and Internet Monitor are integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service. CloudTrail captures API calls made by or on behalf of your AWS account. The captured calls include calls from the CloudWatch console and code calls to CloudWatch API operations. Using the information collected by CloudTrail, you can determine the request that was made to CloudWatch, the IP address from which the request was made, when it was made, and additional details.

Every event or log entry contains information about who generated the request. The identity information helps you determine the following:

- Whether the request was made with root user or user credentials.
- Whether the request was made on behalf of an IAM Identity Center user.
- Whether the request was made with temporary security credentials for a role or federated user.
- Whether the request was made by another AWS service.

CloudTrail is active in your AWS account when you create the account and you automatically have access to the CloudTrail **Event history**. The CloudTrail **Event history** provides a viewable, searchable, downloadable, and immutable record of the past 90 days of recorded management events in an AWS Region. For more information, see Working with CloudTrail Event history in the *AWS CloudTrail User Guide*. There are no CloudTrail charges for viewing the **Event history**.

For an ongoing record of events in your AWS account past 90 days, create a trail or a CloudTrail Lake event data store.

CloudTrail trails

A *trail* enables CloudTrail to deliver log files to an Amazon S3 bucket. All trails created using the AWS Management Console are multi-Region. You can create a single-Region or a multi-Region trail by using the AWS CLI. Creating a multi-Region trail is recommended because you capture activity in all AWS Regions in your account. If you create a single-Region trail, you can view only the events logged in the trail's AWS Region. For more information about trails, see Creating a

trail for your AWS account and Creating a trail for an organization in the *AWS CloudTrail User Guide*.

You can deliver one copy of your ongoing management events to your Amazon S3 bucket at no charge from CloudTrail by creating a trail, however, there are Amazon S3 storage charges. For more information about CloudTrail pricing, see AWS CloudTrail Pricing. For information about Amazon S3 pricing, see Amazon S3 Pricing.

CloudTrail Lake event data stores

CloudTrail Lake lets you run SQL-based queries on your events. CloudTrail Lake converts existing events in row-based JSON format to Apache ORC format. ORC is a columnar storage format that is optimized for fast retrieval of data. Events are aggregated into *event data stores*, which are immutable collections of events based on criteria that you select by applying advanced event selectors. The selectors that you apply to an event data store control which events persist and are available for you to query. For more information about CloudTrail Lake, see Working with AWS CloudTrail Lake in the *AWS CloudTrail User Guide*.

CloudTrail Lake event data stores and queries incur costs. When you create an event data store, you choose the pricing option you want to use for the event data store. The pricing option determines the cost for ingesting and storing events, and the default and maximum retention period for the event data store. For more information about CloudTrail pricing, see AWS CloudTrail Pricing.

Note

For information about CloudWatch Logs API calls that are logged in CloudTrail, see CloudWatch Logs information in CloudTrail.

CloudWatch information in CloudTrail

CloudWatch supports logging the following actions as events in CloudTrail log files:

- DeleteAlarmActions
- DeleteAnomalyDetector
- DeleteDashboards
- DeleteInsightRules
- DeleteMetricStream
- DescribeAlarmHistory
- DescribeAlarms
- DescribeAlarmsForMetric
- DescribeAnomalyDetectors
- DescribeInsightRules
- DisableAlarmActions
- DisableInsightRules
- EnableAlarmActions
- EnableInsightRules
- GetDashboard
- GetInsightRuleReport
- GetMetricStream

- ListDashboards
- ListManagedInsightRules
- ListMetricStreams
- ListTagsForResource
- PutAnomalyDetector
- PutCompositeAlarm
- PutDashboard
- PutInsightRule
- PutManagedInsightRules
- PutMetricAlarm
- PutMetricStream
- SetAlarmState
- StartMetricStreams
- StopMetricStreams
- TagResource
- UntagResource

Example: CloudWatch log file entries

The following example shows a CloudTrail log entry that demonstrates the `PutMetricAlarm` action.

```
{
    "Records": [{
        "eventVersion": "1.01",
        "userIdentity": {
            "type": "Root",
            "principalId": "EX_PRINCIPAL_ID",
            "arn": "arn:aws:iam::123456789012:root",
            "accountId": "123456789012",
            "accessKeyId": "EXAMPLE_KEY_ID"
        },
        "eventTime": "2014-03-23T21:50:34Z",
        "eventSource": "monitoring.amazonaws.com",
        "eventName": "PutMetricAlarm",
        "awsRegion": "us-east-1",
```

```
        "sourceIPAddress": "127.0.0.1",
        "userAgent": "aws-sdk-ruby2/2.0.0.rc4 ruby/1.9.3 x86_64-linux Seahorse/0.1.0",
        "requestParameters": {
            "threshold": 50.0,
            "period": 60,
            "metricName": "CloudTrail Test",
            "evaluationPeriods": 3,
            "comparisonOperator": "GreaterThanThreshold",
            "namespace": "AWS/CloudWatch",
            "alarmName": "CloudTrail Test Alarm",
            "statistic": "Sum"
        },
        "responseElements": null,
        "requestID": "29184022-b2d5-11e3-a63d-9b463e6d0ff0",
        "eventID": "b096d5b7-dcf2-4399-998b-5a53eca76a27"
    },
    ..additional entries
  ]
  }
```

The following log file entry shows that a user called the CloudWatch Events `PutRule` action.

```
{
         "eventVersion":"1.03",
         "userIdentity":{
            "type":"Root",
            "principalId":"123456789012",
            "arn":"arn:aws:iam::123456789012:root",
            "accountId":"123456789012",
            "accessKeyId":"AKIAIOSFODNN7EXAMPLE",
            "sessionContext":{
               "attributes":{
                  "mfaAuthenticated":"false",
                  "creationDate":"2015-11-17T23:56:15Z"
               }
            }
         },
         "eventTime":"2015-11-18T00:11:28Z",
         "eventSource":"events.amazonaws.com",
         "eventName":"PutRule",
         "awsRegion":"us-east-1",
         "sourceIPAddress":"AWS Internal",
         "userAgent":"AWS CloudWatch Console",
```

```
         "requestParameters":{
            "description":"",
            "name":"cttest2",
            "state":"ENABLED",
            "eventPattern":"{\"source\":[\"aws.ec2\"],\"detail-type\":[\"EC2 Instance
 State-change Notification\"]}",
            "scheduleExpression":""
         },
         "responseElements":{
            "ruleArn":"arn:aws:events:us-east-1:123456789012:rule/cttest2"
         },
         "requestID":"e9caf887-8d88-11e5-a331-3332aa445952",
         "eventID":"49d14f36-6450-44a5-a501-b0fdcdfaeb98",
         "eventType":"AwsApiCall",
         "apiVersion":"2015-10-07",
         "recipientAccountId":"123456789012"
}
```

The following log file entry shows that a user called the CloudWatch Logs `CreateExportTask` action.

```
{
        "eventVersion": "1.03",
        "userIdentity": {
            "type": "IAMUser",
            "principalId": "EX_PRINCIPAL_ID",
            "arn": "arn:aws:iam::123456789012:user/someuser",
            "accountId": "123456789012",
            "accessKeyId": "AKIAIOSFODNN7EXAMPLE",
            "userName": "someuser"
        },
        "eventTime": "2016-02-08T06:35:14Z",
        "eventSource": "logs.amazonaws.com",
        "eventName": "CreateExportTask",
        "awsRegion": "us-east-1",
        "sourceIPAddress": "127.0.0.1",
        "userAgent": "aws-sdk-ruby2/2.0.0.rc4 ruby/1.9.3 x86_64-linux Seahorse/0.1.0",
        "requestParameters": {
            "destination": "yourdestination",
            "logGroupName": "yourloggroup",
            "to": 123456789012,
            "from": 0,
            "taskName": "yourtask"
```

```
        },
        "responseElements": {
            "taskId": "15e5e534-9548-44ab-a221-64d9d2b27b9b"
        },
        "requestID": "1cd74c1c-ce2e-12e6-99a9-8dbb26bd06c9",
        "eventID": "fd072859-bd7c-4865-9e76-8e364e89307c",
        "eventType": "AwsApiCall",
        "apiVersion": "20140328",
        "recipientAccountId": "123456789012"
}
```

CloudWatch data events in CloudTrail

CloudTrail can capture API activities related to the CloudWatch data plane operations on metrics GetMetricData, GetMetricWidgetImage, PutMetricData, GetMetricStatistics, and ListMetrics APIs.

Data events, also known as data plane operations, give you insight into the resource operations performed on or within a resource. Data events are often high-volume activities.

By default, CloudTrail doesn't log data events. The CloudTrail **Event history** doesn't record data events.

Additional charges apply for data events. For more information about CloudTrail pricing, see AWS CloudTrail Pricing.

You can log data events for the CloudWatch resource types by using the CloudTrail console, AWS CLI, or CloudTrail API operations. For more information about how to log data events, see Logging data events with the AWS Management Console and Logging data events with the AWS Command Line Interface in the *AWS CloudTrail User Guide*.

Data plane events can be filtered by resource type. Because there are additional costs for using data events in CloudTrail, filtering by resource allows you to have more control over what you log and pay for.

Using the information that CloudTrail collects, you can identify any of the metric APIs, the IP address of the requester, the requester's identity, and the date and time of the request. Logging the **GetMetricData**, **GetMetricWidgetImage**, **PutMetricData**, **GetMetricStatistics**, and **ListMetrics** APIs using CloudTrail helps you enable operational and risk auditing, governance, and compliance of your AWS account.

Note

When you view the **GetMetricData** events in CloudTrail, you might see more calls than the calls that you initiated. This is because CloudWatch logs events to CloudTrail for **GetMetricData** actions that are initiated by internal components. For example, you'll see **GetMetricData** calls initiated by CloudWatch dashboards to refresh widget data, and **GetMetricData** calls initiated by a monitoring account to retrieve data from a source account, in cross-account observability. These internally-initiated calls don't incur CloudWatch charges, but they do count toward the number of events logged in CloudTrail, and CloudTrail charges according to the number of events logged.

The following is an example of a CloudTrail event for a **GetMetricData** operation.

```
{
    "eventVersion": "1.09",
    "userIdentity": {
        "type": "IAMUser",
        "principalId": "AIDA2NYTR2EPCTNY7AF3L",
        "arn": "arn:aws:iam::111122223333:user/admin",
        "accountId": "111122223333",
        "accessKeyId": "EXAMPLE1234567890",
        "userName": "admin"
    },
    "eventTime": "2024-05-08T16:20:34Z",
    "eventSource": "monitoring.amazonaws.com",
    "eventName": "GetMetricData",
    "awsRegion": "us-east-1",
    "sourceIPAddress": "99.45.3.7",
    "userAgent": "aws-cli/2.13.23 Python/3.11.5 Darwin/23.4.0 exe/x86_64 prompt/off
 command/cloudwatch.get-metric-data",
    "requestParameters": {
        "metricDataQueries": [{
                "id": "e1",
                "expression": "m1 / m2",
                "label": "ErrorRate"
            },
            {
                "id": "m1",
                "metricStat": {
                    "metric": {
```

```
                        "namespace": "CWAgent",
                        "metricName": "disk_used_percent",
                        "dimensions": [{
                            "name": "LoadBalancerName",

                        }]
                    },
                    "period": 300,
                    "stat": "Sum",
                    "unit": "Count"
                },
                "returnData": false
            },
            {
                "id": "m2",
                "metricStat": {
                    "metric": {
                        "namespace": "CWAgent",
                        "metricName": "disk_used_percent",
                        "dimensions": [{
                            "name": "LoadBalancerName",
                            "value": "EXAMPLE4623a5cb6a7384c5229"
                        }]
                    },
                    "period": 300,
                    "stat": "Sum"
                },
                "returnData": true
            }
        ],
        "startTime": "Apr 19, 2024, 4:00:00 AM",
        "endTime": "May 8, 2024, 4:30:00 AM"
    },
    "responseElements": null,
    "requestID": "EXAMPLE-57ac-47d5-938c-f5917c6799d5",
    "eventID": "EXAMPLE-211c-404b-b13d-36d93c8b4fbf",
    "readOnly": true,
    "resources": [{
        "type": "AWS::CloudWatch::Metric"
    }],
    "eventType": "AwsApiCall",
    "managementEvent": false,
    "recipientAccountId": "111122223333",
    "eventCategory": "Data",
```

```
    "tlsDetails": {
        "tlsVersion": "TLSv1.3",
        "cipherSuite": "TLS_AES_128_GCM_SHA256",
        "clientProvidedHostHeader": "monitoring.us-east-1.amazonaws.com"
    }
}
```

The following is an example of a CloudTrail event for a **PutMetricData** operation.

```
{
      "eventVersion": "1.11",
      "userIdentity": {
        "type": "AssumedRole",
        "principalId": "111122223333:example.amazon.com",
        "arn": "arn:aws:sts::111122223333:assumed-role/
cloudwatch.full.access/example.amazon.com",
        "accountId": "111122223333",

Query generation information in CloudTrail

CloudTrail logging for Query generator console events is also supported. Query generator is currently supported for CloudWatch Metric Insights and CloudWatch Logs Insights. In these CloudTrail events, the `eventSource` is `monitoring.amazonaws.com`.

The following example shows a CloudTrail log entry that demonstrates the **GenerateQuery** action in CloudWatch Metrics Insights.

```
{
    "eventVersion": "1.09",
    "userIdentity": {
        "type": "AssumedRole",
```

```
        "principalId": "EX_PRINCIPAL_ID",
        "arn": "arn:aws:iam::123456789012:assumed-role/role_name",
        "accountId": "123456789012",
        "accessKeyId": "AKIAIOSFODNN7EXAMPLE",
        "sessionContext": {
            "sessionIssuer": {
                "type": "Role",
                "principalId": "EX_PRINCIPAL_ID",
                "arn": "arn:aws:iam::111222333444:role/Administrator",
                "accountId": "123456789012",
                "userName": "SAMPLE_NAME"
            },
            "attributes": {
                "creationDate": "2020-04-08T21:43:24Z",

Amazon Q Developer operational investigations events in CloudTrail

Amazon Q Developer operational investigations supports logging the following actions as events in CloudTrail log files.

- CreateInvestigationGroup
- GetInvestigationGroup
- DeleteInvestigationGroup
- ListInvestigationGroup
- PutInvestigationGroupPolicy
- DeleteInvestigationGroupPolicy
- ListTagsForResource
- GetInvestigationGroupPolicy
- TagResource
- UntagResource
- UpdateInvestigationGroup

Example: Amazon Q Developer operational investigations log file entries

The following example shows a Amazon Q Developer operational investigations log entry that demonstrates the `CreateInvestigationGroup` action.

```
{
 "eventVersion": "1.09",
 "userIdentity": {
  "type": "AssumedRole",
  "principalId": "EX_PRINCIPAL_ID",
  "arn": "arn:aws:iam::123456789012:assumed-role/role_name",
  "accountId": "123456789012",
  "accessKeyId": "AKIAIOSFODNN7EXAMPLE",
  "sessionContext": {
```

```
    "sessionIssuer": {
     "type": "Role",
     "principalId": "EX_PRINCIPAL_ID",
     "arn": "arn:aws:iam::123456789012:role/role_name",
     "accountId": "123456789012",
     "userName": "SAMPLE_NAME"
    },
    "attributes": {
     "creationDate": "2024-10-30T18:42:05Z",
     "mfaAuthenticated": "false"
    }
   }
  },
  "eventTime": "2024-10-30T18:48:26Z",

Network Flow Monitor in CloudTrail

Network Flow Monitor supports logging the following actions as events in CloudTrail log files.

- CreateMonitor
- CreateScope
- DeleteMonitor
- DeleteScope
- GetMonitor
- GetScope
- ListMonitors
- ListScopes
- ListTagsForResource
- TagResource
- UntagResource
- UpdateMonitor
- UpdateScope

Example: Network Flow Monitor log file entry

The following example shows a Network Flow Monitor CloudTrail log file entry that demonstrates the `CreateMonitor` action.

```
{
    "eventVersion": "1.09",
    "userIdentity": {
        "type": "AssumedRole",
        "principalId": "EX_PRINCIPAL_ID",
        "arn": "arn:aws:iam::000000000000:assumed-role/role_name",
        "accountId": "123456789012",
        "accessKeyId": "AKIAIOSFODNN7EXAMPLE",
        "sessionContext": {
            "sessionIssuer": {

```

Network Flow Monitor data plane events in CloudTrail

CloudTrail can capture API activities related to the CloudWatch-NetworkFlowMonitor data plane operations.

Data events, also known as data plane operations, give you insight into the resource operations performed on or within a resource. Data events are often high-volume activities.

To enable logging of Network Flow Monitor data events in CloudTrail files, you'll need to enable the logging of data plane API activity in CloudTrail. See Logging data events for trails for more information.

Data plane events can be filtered by resource type. Because there are additional costs for using data events in CloudTrail, filtering by resource allows you to have more control over what you log and pay for.

Using the information that CloudTrail collects, you can identify a specific request to the CloudWatch-NetworkFlowMonitor data plane APIs, the IP address of the requester, the requester's identity, and the date and time of the request. Logging the data plane APIs using CloudTrail can help you with operational and risk auditing, governance, and compliance of your AWS account.

The following are data plane APIs in Network Flow Monitor.

- GetQueryResultsMonitorTopContributors
- GetQueryResultsMonitorsTopContributors
- GetQueryResultsWorkloadInsightsTopContributors
- GetQueryResultsWorkloadInsightsTopContributorsData
- GetQueryStatusMonitorTopContributors
- GetQueryStatusMonitorsTopContributors
- GetQueryStatusWorkloadInsightsTopContributors
- GetQueryStatusWorkloadInsightsTopContributorsData
- StartQueryMonitorTopContributors
- StartQueryMonitorsTopContributors
- StartQueryWorkloadInsightsTopContributors
- StartQueryWorkloadInsightsTopContributorsData
- StopQueryMonitorTopContributors
- StopQueryMonitorsTopContributors
- StopQueryWorkloadInsightsTopContributors
- StopQueryWorkloadInsightsTopContributorsData

The following example shows a CloudTrail log entry that demonstrates the GetQueryResultsMonitorsTopContributors action.

```
{
  "eventVersion": "1.09",
  "userIdentity": {
    "type": "AssumedRole",

Internet Monitor in CloudTrail

Internet Monitor supports logging the following actions as events in CloudTrail log files.

- CreateMonitor
- DeleteMonitor
- GetHealthEvent
- GetMonitor
- GetQueryResults
- GetQueryStatus
- ListHealthEvents
- ListInternetEvents
- ListMonitors
- ListTagsForResource
- StartQuery
- StopQuery
- TagResource

- UntagResource
- UpdateMonitor

Example: Internet Monitor log file entries

The following example shows a CloudTrail Internet Monitor log entry that demonstrates the `ListMonitors` action.

```
{
        "eventVersion": "1.08",
        "userIdentity": {
            "type": "AssumedRole",
            "principalId": "EX_PRINCIPAL_ID",
            "arn": "arn:aws:iam::000000000000:assumed-role/role_name",
            "accountId":"123456789012",
            "accessKeyId":"AKIAIOSFODNN7EXAMPLE",
            "sessionContext": {
                "sessionIssuer": {
                "type": "Role",
                "principalId": "EX_PRINCIPAL_ID",
                "arn": "arn:aws:iam::000000000000:role/Admin",
                "accountId":"123456789012",
                "userName": "SAMPLE_NAME"
                },
                "webIdFederationData": {},
                "attributes": {
                    "creationDate": "2022-10-11T17:25:41Z",
                    "mfaAuthenticated": "false"
                }
            }
        },
        "eventTime": "2022-10-11T17:30:18Z",
        "eventSource": "internetmonitor.amazonaws.com",
        "eventName": "ListMonitors",
        "awsRegion": "us-east-2",
        "sourceIPAddress": "192.0.2.0",

```

CloudWatch Synthetics information in CloudTrail

CloudWatch Synthetics supports logging the following actions as events in CloudTrail log files:

- AssociateResource
- CreateCanary
- CreateGroup
- DeleteCanary
- DeleteGroup
- DescribeCanaries
- DescribeCanariesLastRun
- DescribeRuntimeVersions
- DisassociateResource
- GetCanary
- GetCanaryRuns
- GetGroup
- ListAssociatedGroups
- ListGroupResources
- ListGroups
- ListTagsForResource

- StartCanary
- StartCanaryDryRun
- StopCanary
- TagResource
- UntagResource
- UpdateCanary

Example: CloudWatch Synthetics log file entries

The following example shows a CloudTrail Synthetics log entry that demonstrates the `DescribeCanaries` action.

```
{
    "eventVersion": "1.05",
    "userIdentity": {
        "type": "AssumedRole",
        "principalId": "EX_PRINCIPAL_ID",
        "arn": "arn:aws:iam::123456789012:assumed-role/role_name",
        "accountId":"123456789012",
        "accessKeyId":"AKIAIOSFODNN7EXAMPLE",
        "sessionContext": {
            "sessionIssuer": {
                "type": "Role",
                "principalId": "EX_PRINCIPAL_ID",
                "arn": "arn:aws:iam::111222333444:role/Administrator",
                "accountId":"123456789012",
                "userName": "SAMPLE_NAME"
            },
            "webIdFederationData": {},
            "attributes": {
                "mfaAuthenticated": "false",
                "creationDate": "2020-04-08T21:43:24Z"
            }
        }
    },

CloudWatch RUM information in CloudTrail

CloudWatch RUM supports logging the following actions as events in CloudTrail log files:

- BatchCreateRumMetricDefinitions
- BatchDeleteRumMetricDefinitions
- BatchGetRumMetricDefinitions
- CreateAppMonitor
- DeleteAppMonitor
- DeleteResourcePolicy
- DeleteRumMetricsDestination
- GetAppMonitor

- GetAppMonitorData
- GetResourcePolicy
- ListAppMonitors
- ListRumMetricsDestinations
- ListTagsForResource
- PutResourcePolicy
- PutRumMetricsDestination
- TagResource
- UntagResource
- UpdateAppMonitor
- UpdateRumMetricDefinition

Example: CloudWatch RUM log file entries

This section contains example CloudTrail entries for some CloudWatch RUM APIs.

The following example shows a CloudTrail log entry that demonstrates the CreateAppMonitor action.

```
{
    "eventVersion": "1.09",
    "userIdentity": {
        "type": "AssumedRole",
        "principalId": "EXAMPLE_PRINCIPAL_ID",
        "arn": "arn:aws:sts::777777777777:assumed-role/EXAMPLE",
        "accountId": "777777777777",
        "accessKeyId": "AKIAIOSFODNN7EXAMPLE",
        "sessionContext": {
            "sessionIssuer": {
                "type": "Role",
                "principalId": "EXAMPLE_PRINCIPAL_ID",
                "arn": "arn:aws:iam::777777777777:role/EXAMPLE",
                "accountId": "777777777777",
                "userName": "USERNAME_EXAMPLE"
            },
            "attributes": {
                "creationDate": "2024-07-23T16:48:47Z",
                "mfaAuthenticated": "false"
```

```
            }
        }
    },
    "eventTime": "2024-07-23T18:02:57Z",
    "eventSource": "rum.amazonaws.com",

CloudWatch RUM data plane events in CloudTrail

CloudTrail can capture API activities related to the CloudWatch RUM data plane operation PutRumEvents.

Data events, also known as data plane operations, give you insight into the resource operations performed on or within a resource. Data events are often high-volume activities.

To enable logging of the **PutRumEvents** data events in CloudTrail files, you'll need to enable the logging of data plane API activity in CloudTrail. See Logging data events for trails for more information.

Data plane events can be filtered by resource type. Because there are additional costs for using data events in CloudTrail, filtering by resource allows you to have more control over what you log and pay for.

Using the information that CloudTrail collects, you can identify a specific request to the CloudWatch RUM **PutRumEvents** API, the IP address of the requester, the requester's identity, and the date and time of the request. Logging the **PutRumEvents** API using CloudTrail helps you enable operational and risk auditing, governance, and compliance of your AWS account.

The following example shows a CloudTrail log entry that demonstrates the PutRumEvents action.

```
{
 "Records": [
     {
         "eventVersion": "1.09",

}
```

CloudWatch Observability Access Manager information in CloudTrail

CloudWatch Observability Access Manager supports logging the following actions as events in CloudTrail log files:

- CreateLink

- CreateSink
- DeleteLink
- DeleteSink
- GetLink
- GetSink
- GetSinkPolicy
- ListAttachedLinks
- ListLinks
- ListSinks
- ListTagsForResource
- PutSinkPolicy
- TagResource
- UntagResource
- UpdateLink

Example: CloudWatch Observability Access Manager log file entries

The following example shows a CloudWatch Observability Access Manager CloudTrail log entry that demonstrates the `CreateSink` action.

```
{
    "eventVersion": "1.09",
    "userIdentity": {
        "type": "AssumedRole",
        "principalId": "EX_PRINCIPAL_ID",

}
```

CloudWatch Observability Admin information in CloudTrail

CloudWatch Observability Admin supports logging the following actions as events in CloudTrail log files:

- GetTelemetryEvaluationStatus
- GetTelemetryEvaluationStatusForOrganization
- ListResourceTelemetry
- ListResourceTelemetryForOrganization
- StartTelemetryEvaluation
- StartTelemetryEvaluationForOrganization

- StopTelemetryEvaluation
- StopTelemetryEvaluationForOrganization

Example: CloudWatch Observability Admin log file entries

The following example shows a CloudWatch Observability Admin CloudTrail log entry that demonstrates the `StartTelemetryEvaluation` action.

```
{
    "eventVersion": "1.09",
    "userIdentity": {
        "type": "AssumedRole",
        "principalId": "EX_PRINCIPAL_ID",
        "arn": "arn:aws:iam::111122223333:assumed-role/role_name",
        "accountId": "111122223333",

    "recipientAccountId": "111122223333",
    "eventCategory": "Management"
}
```

CloudWatch Application Signals information in CloudTrail

CloudWatch Application Signals supports logging the following actions as events in CloudTrail log files:

- BatchGetServiceLevelObjectiveBudgetReport
- BatchUpdateExclusionWindows
- CreateServiceLevelObjective
- DeleteServiceLevelObjective
- GetService
- GetServiceLevelObjective
- ListServiceDependencies
- ListServiceDependents
- ListServiceLevelObjectives
- ListServiceOperations
- ListServices
- ListTagsForResource
- StartDiscovery
- TagResource
- UntagResource
- UpdateServiceLevelObjective

Example: CloudWatch Application Signals log file entries

The following example shows a CloudWatch Application Signals CloudTrail log entry that demonstrates the `CreateServiceLevelObjective` action.

```
{
    "eventVersion": "1.09",
    "userIdentity": {
```

```
        "type": "AssumedRole",

CloudWatch Application Insights information in CloudTrail

CloudWatch Application Insights supports logging the following actions as events in CloudTrail log files:

- AddWorkload
- CreateApplication
- CreateComponent
- CreateLogPattern
- DeleteApplication
- DeleteComponent
- DeleteLogPattern
- DescribeApplication
- DescribeComponent
- DescribeComponentConfiguration
- DescribeComponentConfigurationRecommendation
- DescribeLogPattern
- DescribeObservation
- DescribeProblem
- DescribeProblemObservations
- DescribeWorkload
- ListApplications
- ListComponents
- ListConfigurationHistory
- ListLogPatterns
- ListLogPatternSets
- ListProblems
- ListTagsForResource
- ListWorkloads
- RemoveWorkload
- TagResource

- UntagResource
- UpdateApplication
- UpdateComponent
- UpdateComponentConfiguration
- UpdateLogPattern
- UpdateProblem
- UpdateWorkload

Example: CloudWatch Application Insights log file entries

The following example shows a CloudWatch Application Insights CloudTrail log entry that demonstrates the `CreateApplication` action.

```
{
    "eventVersion": "1.09",
    "userIdentity": {
        "type": "AssumedRole",
        "principalId": "EX_PRINCIPAL_ID",
        "arn": "arn:aws:iam::111122223333:assumed-role/role_name",
        "accountId": "111122223333",
        "accessKeyId": "AKIAIOSFODNN7EXAMPLE",
        "sessionContext": {
            "sessionIssuer": {
                "type": "Role",
                "principalId": "EX_PRINCIPAL_ID",
                "arn": "arn:aws:iam::111122223333:role/Admin",
                "accountId": "111122223333",
                "userName": "SAMPLE_NAME"
            },
            "attributes": {
                "creationDate": "2024-11-03T15:43:27Z",
                "mfaAuthenticated": "false"
            }
        }
    },
    "eventTime": "2024-11-03T15:58:11Z",

}
```

Tagging your Amazon CloudWatch resources

A *tag* is a custom attribute label that you or AWS assigns to an AWS resource.

Tags help you do the following:

- Identify and organize your AWS resources. Many AWS services support tagging. You can assign the same tag to resources from different services to indicate the resources are related. For example, you can assign the tag that you assigned to a CloudWatch rule to an EC2 instance.

Tags have two parts:

- A *tag key* (for example, `CostCenter`, `Environment`, or `Project`). Tag keys are case sensitive.
- An optional field known as a *tag value* (for example, `111122223333` or `Production`). Omitting the tag value is the same as using an empty string. Like tag keys, tag values are case sensitive.

The following sections provide more information about tags for CloudWatch.

Supported resources in CloudWatch

The following resources in CloudWatch support tagging:

- Alarms – You can tag alarms using the tag-resource AWS CLI command and the TagResource API. You can also view and manage your alarm tags using the *Alarms* details page in the CloudWatch console.
- Canaries – You can tag canaries using the CloudWatch console. For more information, see Creating a canary.
- Contributor Insights rules – You can tag Contributor Insights rules when you create them by using the put-insight-rule AWS CLI command and the PutInsightRule API. You can add tags to existing rules by using the tag-resource AWS CLI command and the TagResource API.
- Metric streams – You can tag metric streams when you create them by using the put-metric-stream AWS CLI command and the PutMetricStream API. You can add tags to existing metric streams by using the tag-resource AWS CLI command and the TagResource API.

For information about adding and managing tags, see Managing tags.

Managing tags

Tags consist of the `Key` and `Value` properties on a resource. You can use the CloudWatch console, the AWS CLI, or the CloudWatch API to add, edit, or delete the values for these properties. For information about working with tags, see the following:

- TagResource, UntagResource, and ListTagsForResource in the *Amazon CloudWatch API Reference*
- tag-resource, untag-resource, and list-tags-for-resource in the *Amazon CloudWatch CLI Reference*
- Working with Tag Editor in the *Resource Groups User Guide*

Tag naming and usage conventions

The following basic naming and usage conventions apply to using tags with CloudWatch resources:

- Each resource can have a maximum of 50 tags.
- For each resource, each tag key must be unique, and each tag key can have only one value.
- The maximum tag key length is 128 Unicode characters in UTF-8.
- The maximum tag value length is 256 Unicode characters in UTF-8.
- Allowed characters are letters, numbers, spaces representable in UTF-8, and the following characters: **. : + = @ _ / -** (hyphen).
- Tag keys and values are case sensitive. As a best practice, decide on a strategy for capitalizing tags and consistently implement that strategy across all resource types. For example, decide whether to use `Costcenter`, `costcenter`, or `CostCenter` and use the same convention for all tags. Avoid using similar tags with inconsistent case treatment.
- The `aws:` prefix is prohibited for tags because it's reserved for AWS use. You can't edit or delete tag keys or values with this prefix. Tags with this prefix don't count against your tags per resource limit.

Grafana integration

You can use Grafana version 6.5.0 and later to contextually advance through the CloudWatch console and query a dynamic list of metrics by using wildcards. This can help you monitor metrics for AWS resources, such as Amazon Elastic Compute Cloud instances or containers. When new instances are created as part of an Auto Scaling event, they appear in the graph automatically. You don't need to track the new instance IDs. Prebuilt dashboards help simplify the getting started experience for monitoring Amazon EC2, Amazon Elastic Block Store, and AWS Lambda resources.

You can use Grafana version 7.0 and later to perform CloudWatch Logs Insights queries on log groups in CloudWatch Logs. You can visualize your query results in bar, line, and stacked graphs and in a table format. For more information about CloudWatch Logs Insights, see Analyzing Log Data with CloudWatch Logs Insights.

For more information about how to get started, see Using AWS CloudWatch in Grafana in the Grafana Labs documentation.

CloudWatch service quotas

Amazon CloudWatch provides monitoring and observability for your AWS resources and applications. To ensure optimal performance and prevent abuse, CloudWatch imposes service quotas on various aspects of its functionality. This chapter outlines the key quotas for CloudWatch services, including metrics, alarms, API requests, and notifications. Understanding these quotas is crucial for effectively planning and managing your CloudWatch usage.

> **Note**
>
> For some AWS services including CloudWatch, you can use the CloudWatch usage metrics to visualize your current service usage on CloudWatch graphs and dashboards. You can use a CloudWatch metric math function to display the service quotas for those resources on your graphs. You can also configure alarms that alert you when your usage approaches a service quota. For more information, see Visualizing your service quotas and setting alarms.

Topics

- Managing your CloudWatch service quotas

CloudWatch

This section details the service quotas specifically for core CloudWatch functionality. These quotas cover aspects such as metrics, alarms, API requests, and dashboards. Familiarizing yourself with

these limits helps you optimize your CloudWatch configuration and avoid potential throttling or service disruptions.

Name	Default	Adjustable	Description
Canary limit	us-east-1: 300 ap-northeast-1: 300 Each of the other supported Regions: 500	Yes	The maximum number of canaries per account per region.
Minimum frequency	Each supported Region: 60,000 Milliseconds	No	The minimum time, in milliseconds, between runs of the same canary.
Number of Alarm Mute Rules	Each supported Region: 2,000	No	The maximum number of Alarm Mute Rules that you can have in this account in the current region.
Number of Contributor Insights rules	Each supported Region: 100	Yes	The maximum number of Contributor Insights rules you can have in this account.
Number of Metrics Insights alarms	Each supported Region: 200	No	The maximum number of Metrics Insights alarms that you can have in this account in the current region.
Rate of ANOMALY_DETECTION_BAND usage in GetMetricData	Each supported Region: 1,000	No	The maximum number of times the ANOMALY_DETECTION_BAND

Name	Default	Adjustable	Description
			function can be used in all GetMetricData requests, per second, in this account in the current region.
Rate of DB_PERF_INSIGHTS usage in GetMetricData	Each supported Region: 4	No	The maximum number of times the DB_PERF_INSIGHTS function can be used in all GetMetricData requests, per second, in this account in the current region.
Rate of DeleteAlarmMuteRule requests	Each supported Region: 3 per second	No	The maximum number of DeleteAlarmMuteRule requests that you can make, per second, in this account in the current region.
Rate of DeleteAlarms requests	Each supported Region: 3 per second	No	The maximum number of DeleteAlarms requests that you can make, per second, in this account in the current region.
Rate of DeleteAnomalyDetector requests	Each supported Region: 5 per second	No	The maximum number of DeleteAnomalyDetector requests that you can make, per second, in this account in the current region.

Name	Default	Adjustable	Description
Rate of DeleteDashboards requests	Each supported Region: 10 per second	Yes	The maximum number of DeleteDashboards requests that you can make, per second, in this account in the current region.
Rate of DeleteInsightRules requests	Each supported Region: 5 per second	No	The maximum number of DeleteInsightRules requests you can make per second in this account.
Rate of DeleteMetricStream requests	Each supported Region: 10 per second	Yes	The maximum number of DeleteMetricStream requests that you can make, per second, in this account in the current region.
Rate of DescribeAlarmContributors requests	Each supported Region: 9 per second	Yes	The maximum number of DescribeAlarmContributors requests that you can make, per second, in this account in the current region.
Rate of DescribeAlarmHistory requests	Each supported Region: 20 per second	No	The maximum number of DescribeAlarmHistory requests that you can make, per second, in this account in the current region.

Name	Default	Adjustable	Description
Rate of DescribeAlarms requests	Each supported Region: 9 per second	Yes	The maximum number of DescribeAlarms requests that you can make, per second, in this account in the current region.
Rate of DescribeAlarmsForMetric requests	Each supported Region: 9 per second	No	The maximum number of DescribeAlarmsForMetric requests that you can make, per second, in this account in the current region.
Rate of DescribeAnomalyDetectors requests	Each supported Region: 10 per second	Yes	The maximum number of DescribeAnomalyDetectors requests that you can make, per second, in this account in the current region.
Rate of DescribeInsightRules requests	Each supported Region: 20 per second	No	The maximum number of DescribeInsightRules requests you can make per second in this account.
Rate of DisableAlarmActions requests	Each supported Region: 3 per second	No	The maximum number of DisableAlarmActions requests that you can make, per second, in this account in the current region.

Name	Default	Adjustable	Description
Rate of DisableInsightRules requests	Each supported Region: 1 per second	No	The maximum number of DisableInsightRules requests you can make per second in this account.
Rate of EnableAlarmActions requests	Each supported Region: 3 per second	No	The maximum number of EnableAlarmActions requests that you can make, per second, in this account in the current region.
Rate of EnableInsightRules requests	Each supported Region: 1 per second	No	The maximum number of EnableInsightRules requests you can make per second in this account.
Rate of GetAlarmMuteRule requests	Each supported Region: 20 per second	Yes	The maximum number of GetAlarmMuteRule requests that you can make, per second, in this account in the current region.
Rate of GetDashboard requests	Each supported Region: 10 per second	Yes	The maximum number of GetDashboard requests that you can make, per second, in this account in the current region.

Name	Default	Adjustable	Description
Rate of GetInsightRuleReport requests	Each supported Region: 20 per second	Yes	The maximum number of GetInsightRuleReport requests you can make, per second in this account.
Rate of GetMetricData datapoints for metrics older than three hours	Each supported Region: 396,000	No	The maximum number of GetMetricData datapoints that you can fetch, per second, for a request with a StartTime of more than three hours in this account in the current region.
Rate of GetMetricData datapoints for the last three hours of metrics	Each supported Region: 180,000	No	The maximum number of GetMetricData datapoints that you can fetch, per second, for a request with a StartTime of less than or equal to three hours in this account in the current region.
Rate of GetMetricData datapoints using Metrics Insights	Each supported Region: 4,300,000	No	The maximum number of GetMetricData datapoints that you can fetch using Metrics Insights, per second, for a request with a StartTime of less than or equal to three hours in this account in the current region.

Name	Default	Adjustable	Description
Rate of GetMetricData requests	Each supported Region: 500 per second	Yes	The maximum number of GetMetricData requests that you can make, per second, in this account in the current region.
Rate of GetMetricStatistics requests	Each supported Region: 400 per second	Yes	The maximum number of GetMetricStatistics requests that you can make, per second, in this account in the current region.
Rate of GetMetricStream requests	Each supported Region: 10 per second	Yes	The maximum number of GetMetricStream requests that you can make, per second, in this account in the current region.
Rate of GetMetricWidgetImage requests	Each supported Region: 20 per second	Yes	The maximum number of GetMetricWidgetImage requests that you can make, per second, in this account in the current region.

Name	Default	Adjustable	Description
Rate of INSIGHT_RULE_METRIC usage in GetMetricData	Each supported Region: 20	No	The maximum number of times the INSIGHT_RULE_METRIC function can be used in all GetMetricData requests, per second, in this account in the current region.
Rate of LAMBDA usage in GetMetricData	Each supported Region: 5	No	The maximum number of times the LAMBDA function can be used in all GetMetricData requests, per second, in this account in the current region.
Rate of ListAlarmMuteRules requests	Each supported Region: 50 per second	Yes	The maximum number of ListAlarmMuteRules requests that you can make, per second, in this account in the current region.
Rate of ListDashboards requests	Each supported Region: 10 per second	Yes	The maximum number of ListDashboards requests that you can make, per second, in this account in the current region.

Name	Default	Adjustable	Description
Rate of ListMetricStreams requests	Each supported Region: 10 per second	Yes	The maximum number of ListMetricStreams requests that you can make, per second, in this account in the current region.
Rate of ListMetrics requests	Each supported Region: 25 per second	Yes	The maximum number of ListMetrics requests that you can make, per second, in this account in the current region.
Rate of ListTagsForResource requests	Each supported Region: 10 per second	No	The maximum number of ListTagsForResource requests that you can make, per second, in this account in the current region.
Rate of Metrics Insights usage in GetMetricData	Each supported Region: 10	No	The maximum number of times Metrics Insights can be used in all GetMetricData requests, per second, in this account in the current region.
Rate of PutAlarmMuteRule requests	Each supported Region: 3 per second	Yes	The maximum number of PutAlarmMuteRule requests that you can make, per second, in this account in the current region.

Name	Default	Adjustable	Description
Rate of PutAnomalyDetector requests	Each supported Region: 10 per second	Yes	The maximum number of PutAnomalyDetector requests that you can make, per second, in this account in the current region.
Rate of PutCompositeAlarm requests	Each supported Region: 3 per second	Yes	The maximum number of PutCompositeAlarm requests that you can make, per second, in this account in the current region.
Rate of PutDashboard requests	Each supported Region: 10 per second	Yes	The maximum number of PutDashboard requests that you can make, per second, in this account in the current region.
Rate of PutInsightRule requests	Each supported Region: 5 per second	No	The maximum number of PutInsightRule requests you can make, per second in this account.
Rate of PutMetricAlarm requests	Each supported Region: 3 per second	Yes	The maximum number of PutMetricAlarm requests that you can make, per second, in this account in the current region.

Name	Default	Adjustable	Description
Rate of PutMetricData requests	Each supported Region: 500 per second	Yes	The maximum number of PutMetricData requests that you can make, per second, in this account in the current region.
Rate of PutMetricStream requests	Each supported Region: 10 per second	Yes	The maximum number of PutMetricStream requests that you can make, per second, in this account in the current region.
Rate of SEARCH usage in GetMetricData	Each supported Region: 50	No	The maximum number of times the SEARCH function can be used in all GetMetricData requests, per second, in this account in the current region.
Rate of SERVICE_QUOTA usage in GetMetricData	Each supported Region: 1,000	No	The maximum number of times the SERVICE_QUOTA function can be used in all GetMetricData requests, per second, in this account in the current region.
Rate of SetAlarmState requests	Each supported Region: 3 per second	No	The maximum number of SetAlarmState requests that you can make, per second, in this account in the current region.

Name	Default	Adjustable	Description
Rate of StartMetricStreams requests	Each supported Region: 10 per second	Yes	The maximum number of StartMetricStreams requests that you can make, per second, in this account in the current region.
Rate of StopMetricStreams requests	Each supported Region: 10 per second	Yes	The maximum number of StopMetricStreams requests that you can make, per second, in this account in the current region.
Rate of TagResource requests	Each supported Region: 20 per second	No	The maximum number of TagResource requests that you can make, per second, in this account in the current region.
Rate of UntagResource requests	Each supported Region: 20 per second	No	The maximum number of UntagResource requests that you can make, per second, in this account in the current region.

CloudWatch investigations (Amazon AI Operations)

CloudWatch investigations (Amazon AI Operations) enables intelligent problem detection and root cause analysis. This section outlines the quotas related to concurrent investigations, investigation groups, and AI-assisted analyses.

Name	Default	Adjuse	Description
Concurrent active investigations	Each supported Region: 2	No	The maximum number of concurrent investigations with active AI analysis per account per region.
Investigation groups	Each supported Region: 1	No	The maximum number of investigation groups that can be created per account in a region.
Monthly investigations	Each supported Region: 150	No	The maximum number of AI-assisted investigations per month in this account in the current region.

CloudWatch Application Insights

CloudWatch Application Insights helps you monitor your applications and troubleshoot issues quickly. This section presents the quotas for CloudWatch Application Insights, including limits on API requests, applications, log streams, and metrics. Knowing these quotas allows you to effectively plan your application monitoring setup.

Resource	Default quota	Adjustable
API requests	All API actions are throttled to 5 TPS	No
Resource Group applications	100 per account	No
Account applications	1 per account	No
Log Streams	5 per resource	No

Resource	Default quota	Adjustable
Observations per problem	20 per dashboard 40 per DescribeProblemObservations action	No
Metrics	60 per resource	No

CloudWatch Application Signals

CloudWatch Application Signals provides deep insights into your application's performance and dependencies. This section covers the quotas for Application Signals, including API request limits and service-level objective (SLO) constraints. Understanding these quotas is crucial for implementing effective application performance monitoring.

Name	Default	Adjustable	Description
Number of SLOs per Region	Each supported Region: 250	Yes	The maximum number of SLOs that you can have in this account in the current region.
Number of SLOs per Service	Each supported Region: 100	Yes	The maximum number of SLOs that you can have per service in the current region.
Rate of BatchGetServiceLevelObjectiveBudgetReport requests	Each supported Region: 10 per second	Yes	The maximum number of BatchGetServiceLevelObjectiveBudgetReport requests you can make per second in this Region.

Name	Default	Adjustable	Description
Rate of BatchUpdateExclusionWindows requests	Each supported Region: 5 per second	Yes	The maximum number of BatchUpdateExclusionWindows requests you can make per second in this Region.
Rate of CreateServiceLevelObjective requests	Each supported Region: 5 per second	Yes	The maximum number of CreateServiceLevelObjective requests you can make per second in this Region.
Rate of DeleteGroupingConfiguration requests	Each supported Region: 10 per second	Yes	The maximum number of DeleteGroupingConfiguration requests you can make per second in this Region.
Rate of DeleteServiceLevelObjective requests	Each supported Region: 5 per second	Yes	The maximum number of DeleteServiceLevelObjective requests you can make per second in this Region.
Rate of GetService requests	Each supported Region: 10 per second	Yes	The maximum number of GetService requests you can make per second in this Region.
Rate of GetServiceLevelObjective requests	Each supported Region: 5 per second	Yes	The maximum number of GetServiceLevelObjective requests you can make per second in this Region.

Name	Default	Adjustable	Description
Rate of ListAuditFindings requests	Each supported Region: 1 per second	Yes	The maximum number of ListAuditFindings requests you can make per second in this Region.
Rate of ListEntityEvents requests	Each supported Region: 10 per second	Yes	The maximum number of ListEntityEvents requests you can make per second in this Region.
Rate of ListGroupingAttributeDefinitions requests	Each supported Region: 10 per second	Yes	The maximum number of ListGroupingAttributeDefinitions requests you can make per second in this Region.
Rate of ListServiceDependencies requests	Each supported Region: 10 per second	Yes	The maximum number of ListServiceDependencies requests you can make per second in this Region.
Rate of ListServiceDependents requests	Each supported Region: 10 per second	Yes	The maximum number of ListServiceDependents requests you can make per second in this Region.
Rate of ListServiceLevelObjectiveExclusionWindows requests	Each supported Region: 5 per second	Yes	The maximum number of ListServiceLevelObjectiveExclusionWindows requests you can make per second in this Region.

Name	Default	Adjustable	Description
Rate of ListServiceLevelObjectives requests	Each supported Region: 5 per second	Yes	The maximum number of ListServiceLevelObjectives requests you can make per second in this Region.
Rate of ListServiceOperations requests	Each supported Region: 10 per second	Yes	The maximum number of ListServiceOperations requests you can make per second in this Region.
Rate of ListServiceStates requests	Each supported Region: 5 per second	Yes	The maximum number of ListServiceStates requests you can make per second in this Region.
Rate of ListServices requests	Each supported Region: 10 per second	Yes	The maximum number of ListServices requests you can make per second in this Region.
Rate of ListTagsForResource requests	Each supported Region: 5 per second	Yes	The maximum number of ListTagsForResource requests you can make per second in this Region.
Rate of PutGroupingConfiguration requests	Each supported Region: 10 per second	Yes	The maximum number of PutGroupingConfiguration requests you can make per second in this Region.

Name	Default	Adjustable	Description
Rate of StartDiscovery requests	Each supported Region: 5 per second	Yes	The maximum number of StartDiscovery requests you can make per second in this Region.
Rate of TagResource requests	Each supported Region: 5 per second	Yes	The maximum number of TagResource requests you can make per second in this Region.
Rate of UntagResource requests	Each supported Region: 5 per second	Yes	The maximum number of UntagResource requests you can make per second in this Region.
Rate of UpdateServiceLevelObjective requests	Each supported Region: 5 per second	Yes	The maximum number of UpdateServiceLevel Objective requests you can make per second in this Region.

Internet Monitor

Internet Monitor, a feature of CloudWatch Network Monitoring, helps you understand how internet issues impact your application's performance. This section provides the quotas specific to Internet Monitor, to help you to plan an effective internet performance monitoring strategy.

Name	Default	Adjustable	Description
Days that health events are retained	Each supported Region: 400	No	The number of days that AWS keeps information

Name	Default	Adjuse	Description
			about a resolved Internet Monitor health event.
Monitors per account per AWS Region	Each supported Region: 50	No	The maximum number of monitors in an account in one AWS Region.
Resources per monitor	Each supported Region: 50	No	The maximum number of resources that a monitor can have.

Network Flow Monitor

Network Flow Monitor, a feature of CloudWatch Network Monitoring, provides near real-time visibility into network performance, such as packet loss and latency, for traffic between Amazon EC2 instances, as well as traffic toward certain other AWS services. It also helps you to determine if AWS issues are causing network performance degradation for your application. This section provides the quotas for Network Flow Monitor, including limits on monitored flows, data retention, and API requests. Understanding these quotas can help you to plan an effective network flow monitoring strategy.

Resource	Default quota	Adjustable?
Scopes per account per AWS Region	1	No
Monitors per account per AWS Region	20	Yes
Local resources per monitor	25	No
Remote resources per monitor	25	No

Network Synthetic Monitor

Network Synthetic Monitor, a feature of CloudWatch Network Monitoring, enables you to proactively monitor your network endpoints and API operations using configurable tests. This section details the quotas for Network Synthetic Monitor, including limits on synthetic monitors, test frequency, and script execution. These quotas are important for planning your network testing strategy and maintaining reliable endpoint monitoring.

Name	Default	Adjustable	Description
Number of monitors per account per AWS region	Each supported Region: 100	Yes	The maximum number of monitors in an account in one AWS Region.
Number of probes per monitor	Each supported Region: 24	Yes	The maximum number of probes that a monitor can have.
Number of probes per subnet for each monitor	Each supported Region: 4	Yes	The maximum number of probes that a subnet in a monitor can have.

CloudWatch Observability Access Manager

CloudWatch Observability Access Manager allows you to securely share CloudWatch resources across accounts. This section details the quotas for Observability Access Manager, including limits on API requests, source account links, and sinks. Understanding these quotas is essential for implementing cross-account observability effectively.

Name	Default	Adjustable	Description
Links per sink	Each supported Region: 100,000	No	Maximum number of links that can be attached to a sink

Name	Default	Adjustable	Description
Number of links	Each supported Region: 5	No	Maximum number of links in your account
Number of sinks	Each supported Region: 1	No	Maximum number of sinks in your account
Rate of CreateLink requests	Each supported Region: 10 per second	No	Maximum number of CreateLink requests you can make per second, in this account in the current region
Rate of CreateSink requests	Each supported Region: 10 per second	No	Maximum number of CreateSink requests you can make per second, in this account in the current region
Rate of DeleteLink requests	Each supported Region: 10 per second	No	Maximum number of DeleteLink requests you can make per second, in this account in the current region
Rate of DeleteSink requests	Each supported Region: 10 per second	No	Maximum number of DeleteSink requests you can make per second, in this account in the current region
Rate of GetLink requests	Each supported Region: 10 per second	No	Maximum number of GetLink requests you can make per second, in this account in the current region

Name	Default	Adjustable	Description
Rate of GetSink requests	Each supported Region: 10 per second	No	Maximum number of GetSink requests you can make per second, in this account in the current region
Rate of GetSinkPolicy requests	Each supported Region: 10 per second	No	Maximum number of GetSinkPolicy requests you can make per second, in this account in the current region
Rate of ListAttachedLinks requests	Each supported Region: 10 per second	No	Maximum number of ListAttachedLinks requests you can make per second, in this account in the current region
Rate of ListLinks requests	Each supported Region: 10 per second	No	Maximum number of ListLinks requests you can make per second, in this account in the current region
Rate of ListSinks requests	Each supported Region: 10 per second	No	Maximum number of ListSinks requests you can make per second, in this account in the current region

Name	Default	Adjustable	Description
Rate of ListTagsForResource requests	Each supported Region: 10 per second	No	Maximum number of ListTagsForResource requests you can make per second, in this account in the current region
Rate of PutSinkPolicy requests	Each supported Region: 1 per second	No	Maximum number of PutSinkPolicy requests you can make per second, in this account in the current region
Rate of TagResource requests	Each supported Region: 10 per second	No	Maximum number of TagResource requests you can make per second, in this account in the current region
Rate of UntagResource requests	Each supported Region: 10 per second	No	Maximum number of UntagResource requests you can make per second, in this account in the current region
Rate of UpdateLink requests	Each supported Region: 10 per second	No	Maximum number of UpdateLink requests you can make per second, in this account in the current region

CloudWatch Observability Admin

CloudWatch Observability Admin helps you discover, audit, and manage CloudWatch telemetry configurations across an AWS account or organization. It provides a consolidated view of monitoring settings for resources, enabling you to ensure consistent and proper data collection by simplifying the management of telemetry across multiple accounts. Most quotas are adjustable to accommodate enterprise-scale deployments that need higher limits for managing observability rules across large organizations.

Name	Default	Adjustable	Description
CreateCentralizationRuleForOrganization throttle limit in transactions per second	Each supported Region: 5	No	The maximum number of create-centralization-rule-for-organization calls per second per account/per region
CreateTelemetryPipeline throttle limit in transactions per second	Each supported Region: 5 per second	No	The maximum number of CreateTelemetryPipeline calls per second per account and per Region
CreateTelemetryRule throttle limit in transactions per second	Each supported Region: 5	No	The maximum number of create-telemetry-rule calls per second per account/per region
CreateTelemetryRuleForOrganization throttle limit in transactions per second	Each supported Region: 5	No	The maximum number of create-telemetry-rule-for-organization calls per second per account/per region
DeleteCentralizationRuleForOrganization throttle limit in transactions per second	Each supported Region: 5	No	The maximum number of delete-centralization-rule-for-organization

Name	Default	Adjustable	Description
			calls per second per account/per region
DeleteTelemetryPipeline throttle limit in transactions per second	Each supported Region: 5 per second	No	The maximum number of DeleteTelemetryPipeline calls per second per account and per Region
DeleteTelemetryRule throttle limit in transactions per second	Each supported Region: 5	No	The maximum number of delete-telemetry-rule calls per second per account/per region
DeleteTelemetryRuleForOrganization throttle limit in transactions per second	Each supported Region: 5	No	The maximum number of delete-telemetry-rule-for-organization calls per second per account/per region
GetCentralizationRuleForOrganization throttle limit in transactions per second	Each supported Region: 5	No	The maximum number of get-centralization-rule-for-organization calls per second per account/per region
GetTelemetryEnrichmentStatus throttle limit in transactions per second	Each supported Region: 5 per second	Yes	The maximum number of GetTelemetryEnrichmentStatus calls per second per account and per region
GetTelemetryPipeline throttle limit in transactions per second	Each supported Region: 5 per second	No	The maximum number of GetTelemetryPipeline calls per second per account and per Region

Name	Default	Adjustable	Description
GetTelemetryRule throttle limit in transactions per second	Each supported Region: 5	No	The maximum number of get-telemetry-rule calls per second per account/per region
GetTelemetryRuleForOrganization throttle limit in transactions per second	Each supported Region: 5	No	The maximum number of get-telemetry-rule-for-organization calls per second per account/per region
ListCentralizationRulesForOrganization throttle limit in transactions per second	Each supported Region: 5	No	The maximum number of list-centralization-rules-for-organization calls per second per account/per region
ListTagsForResource throttle limit in transactions per second	Each supported Region: 5	No	The maximum number of list-tags-for-resource calls per second per account/per region
ListTelemetryPipelines throttle limit in transactions per second	Each supported Region: 5 per second	No	The maximum number of ListTelemetryPipelines calls per second per account and per Region
ListTelemetryRules throttle limit in transactions per second	Each supported Region: 5	No	The maximum number of list-telemetry-rules calls per second per account/per region

Name	Default	Adjustable	Description
ListTelemetryRulesForOrganization throttle limit in transactions per second	Each supported Region: 5	No	The maximum number of list-telemetry-rules-for-organization calls per second per account/per region
Logs Centralization throughput per destination region	Each supported Region: 2.5 Gigabytes per second	No	The maximum organization-level throughput for centralization of logs per destination region
Organization Centralization Rules	Each supported Region: 50	Yes	The maximum number of organization centralization rules that you can create for an organization
Organization Telemetry Rules	Each supported Region: 50	Yes	The maximum number of organization telemetry rules that you can create for an organization
Pipelines with a CloudWatch Logs source	Each supported Region: 300	Yes	The maximum number of pipelines with a CloudWatch Logs source allowed per account per Region
Pipelines with a third-party integration source	Each supported Region: 30	Yes	The maximum number of pipelines with a third-party integration source allowed per account per Region

Name	Default	Adjustable	Description
StartTelemetryEnrichment throttle limit in transactions per second	Each supported Region: 1 per second	Yes	The maximum number of StartTelemetryEnrichment calls per second per account and per region
StopTelemetryEnrichment throttle limit in transactions per second	Each supported Region: 1 per second	Yes	The maximum number of StopTelemetryEnrichment calls per second per account and per region
TagResource throttle limit in transactions per second	Each supported Region: 5	No	The maximum number of tag-resource calls per second per account/per region
Telemetry Rules	Each supported Region: 20	Yes	The maximum number of telemetry rules that you can create for an account
TestTelemetryPipeline throttle limit in transactions per second	Each supported Region: 5 per second	No	The maximum number of TestTelemetryPipeline calls per second per account and per Region
UntagResource throttle limit in transactions per second	Each supported Region: 5	No	The maximum number of untag-resource calls per second per account/per region

Name	Default	Adjustable	Description
UpdateCentralizationRuleForOrganization throttle limit in transactions per second	Each supported Region: 5	No	The maximum number of update-centralization-rule-for-organization calls per second per account/per region
UpdateTelemetryPipeline throttle limit in transactions per second	Each supported Region: 5 per second	No	The maximum number of UpdateTelemetryPipeline calls per second per account and per Region
UpdateTelemetryRule throttle limit in transactions per second	Each supported Region: 5	No	The maximum number of update-telemetry-rule calls per second per account/per region
UpdateTelemetryRuleForOrganization throttle limit in transactions per second	Each supported Region: 5	No	The maximum number of update-telemetry-rule-for-organization calls per second per account/per region
ValidateTelemetryPipelineConfiguration throttle limit in transactions per second	Each supported Region: 5 per second	No	The maximum number of ValidateTelemetryPipelineConfiguration calls per second per account and per Region

CloudWatch RUM

CloudWatch RUM (Real-User Monitoring) helps you collect and analyze performance data from real user interactions with your web applications. This section presents the quotas for CloudWatch RUM, allowing you to plan your real-user monitoring strategy within the service limits.

Name	Default	Adjuse	Description
RUM AppMonitors	Each supported Region: 20	Yes	The maximum number of RUM AppMonitors that you can have in this AWS account.
RUM Events per second per AWS Account	Each supported Region: 50	Yes	The maximum number of RUM Events per second that RUM will ingest for this AWS account.

Managing your CloudWatch service quotas

Effective management of CloudWatch service quotas is crucial for maintaining optimal performance and avoiding service disruptions. This section provides guidance on viewing your current quota usage, requesting quota increases when necessary, and best practices for working within CloudWatch service limits.

CloudWatch quotas are integrated with Service Quotas, an AWS service that enables you to view and manage your quotas from a central location. For more information, see What Is Service Quotas? in the *Service Quotas User Guide*.

AWS Management Console

To view CloudWatch service quotas using the console

1. Open the Service Quotas console at https://console.aws.amazon.com/servicequotas/.
2. In the navigation pane, choose **AWS services**.
3. From the **AWS services** list, search for and select the CloudWatch service whose quotas you want to view.

   In the **Service quotas** list, you can see the service quota name, applied value (if it is available), AWS default quota, and whether the quota value is adjustable.
4. To view additional information about a service quota, such as the description, choose the quota name.

5. (Optional) To request a quota increase, select the quota that you want to increase, select **Request quota increase**, enter or select the required information, and select **Request**.

To work more with service quotas using the console see the Service Quotas User Guide. To learn more about quota increases, see Requesting a quota increase in the *Service Quotas User Guide*.

AWS CLI

To view CloudWatch service quotas using the AWS CLI

1. Run the following command to view the default CloudWatch quotas.

```
aws service-quotas list-aws-default-service-quotas \
    --query 'Quotas[*].
{Adjustable:Adjustable,Name:QuotaName,Value:Value,Code:QuotaCode}' \
    --service-code ServiceCode
    --output table
```

> **Note**
>
> The following list contains the CloudWatch **ServiceCode** values:
>
> - To see the CloudWatch quotas, use `--service-code monitoring`.
> - To see the Amazon AI Operations quotas, use `--service-code aiops`.
> - To see the CloudWatch Application Signals quotas, use `--service-code application-signals`.
> - To see the Amazon CloudWatch Internet Monitor quotas, use `--service-code internetmonitor`.
> - To see the CloudWatch Network Monitor quotas, use `--service-code networkmonitor`.
> - To see the CloudWatch Observability Access Manager quotas, use `--service-code oam`.
> - To see the CloudWatch RUM (Real-User Monitoring) quotas, use `--service-code rum`.

2. (Optional) Request a quota increase for a CloudWatch service:

   a. Identify the quota code for the quota you want to increase.

```
aws service-quotas list-service-quotas --service-code ServiceCode
```

b. Note the `QuotaCode` value for the item. For example if you wanted to increase your quota for the **Rate of PutCompositeAlarm requests** that are supported by CloudWatch for your account, you would record the **QuotaCode** `L-8742A250`.

c. Type the following command using the identified `ServiceCode` and `QuotaCode` values and providing the numeric value for the desired new quota:

```
aws service-quotas request-service-quota-increase \
    --service-code ServiceCode \
    --quota-code QuotaCode \
    --desired-value new-quota-value
```

For more details about quota increases, see the `request-service-quota-increase` command in the AWS CLI Command Reference.

To work more with service quotas using the AWS CLI, see the Service Quotas AWS CLI Command Reference.

Document history

The following table describes important changes for each release of the *Amazon CloudWatch User Guide*, beginning in June 2018. To receive notifications about updates to this documentation, you can subscribe to an RSS feed.

Change	Description	Date
Update to AIOPsAssistantPolicy managed policy	CloudWatch updated the **AIOpsAssistantPolicy** to allow CloudWatch investigations access to additional resources to assist in queries, troubleshooting, and topology mapping. For more information, see AIOpsAssistantPolicy.	February 6, 2026
Update to AIOPsAssistantPolicy managed policy	CloudWatch updated the **AIOpsAssistantPolicy** to allow CloudWatch investigations access to additional resources to assist in queries, troubleshooting, and topology mapping. For more information, see AIOpsAssistantPolicy.	December 17, 2025
Updated CloudWatchNetworkMonitorServiceRolePolicy managed policy with TGW permissions	CloudWatch added the `ec2:DescribeRouteTables` , `ec2:DescribeTransitGatewayAttachments` , `ec2:DescribeTransitGatewayRouteTables` , `ec2:SearchTransitGatewayRoutes` permissions to the	December 12, 2025

	CloudWatchNetworkMonitorServiceRolePolicy managed policy to grant permissions for Network Synthetic Monitor to generate the Network Health Indicator values for customers utilizing Transit Gateways.	
Updated CloudWatchNetworkFlowMonitorTopologyServiceRolePolicy managed policy with VPC Endpoints and vpce service config permissions	CloudWatch added the `ec2:DescribeVpcEndpoints` and `ec2:DescribeVpcEndpointServiceConfigurations` permissions to the CloudWatchNetworkFlowMonitorTopologyServiceRolePolicy managed policy to grant permissions for Network Flow Monitor to generate topology snapshots of VPC endpoints and vpce service config.	December 10, 2025
Updated CloudWatchFullAccessV2 policy	Permissions for observability administration actions were added to CloudWatchFullAccessV2 to allow full access to telemetry pipelines and S3 table integrations.	December 2, 2025
Observability for Amazon Bedrock AgentCore policies	You can now monitor invocation metrics for Amazon Bedrock AgentCore policies using Amazon CloudWatch. For more information, see Gateways.	December 2, 2025

Observability for Amazon Bedrock AgentCore Evaluations	You can now monitor and assess the performance, quality, and reliability of your AI agents using the Evaluations dashboard. For more information, see Agent details - Evaluations.	December 2, 2025
New AWSObservabilityAdminTelemetryEnablementServiceRolePolicy policy	CloudWatch updated the **AWSObservabilityAdminTelemetryEnablementServiceRolePolicy** that grants CloudWatch the permissions necessary to enable and manage telemetry configurations for the newly supported AWS resources based on telemetry rules. For more information, see AWSObservabilityAdminTelemetryEnablementServiceRolePolicy.	December 2, 2025
Introduced CloudWatch pipelines	The new pipeline feature of CloudWatch connects data from a catalogue of data sources, so that you can add and configure pipeline processors from a library to parse, enrich, and standardize data. For more information, see CloudWatch pipelines.	December 2, 2025

Introduced CloudWatch pipelines	The new pipeline feature of CloudWatch connects data from a catalogue of data sources, so that you can add and configure pipeline processors from a library to parse, enrich, and standardize data. For more information, see CloudWatch pipelines.	December 2, 2025
New CloudWatch investigations feature	Amazon CloudWatch now offers interactive incident report generation, enabling customers to create comprehensive post-incident analysis reports in minutes. The new capability, available within CloudWatch investigations, automatically gathers and correlates your telemetry data, as well as your input and any actions taken during an investigation, and produces a streamlined incident report. Amazon CloudWatch enhanced incident report generation capabilities with an AI-powered root-cause workflow that guides customers through the "Five Why's" analysis technique. For more information, see Generate incident reports	November 30, 2025

Updated CloudWatchReadOnlyAccess policy	CloudWatch updated CloudWatchReadOnlyAccess to include Resource Explorer permissions to support uninstrumented service functionalities in Application Signals.	November 20, 2025
Updated CloudWatchFullAccessV2 policy	CloudWatch updated CloudWatchFullAccessV2 to include Resource Explorer permissions to support uninstrumented service functionalities in Application Signals.	November 20, 2025
Updated CloudWatchApplicationSignalsServiceRolePolicy policy	CloudWatch updated the policy to include `resource-explorer-2:Search` and `cloudtrail:CreateServiceLinkedChannel` to enable new Application Signals features. For more information, see CloudWatchApplicationSignalsServiceRolePolicy.	November 20, 2025
Updated CloudWatchApplicationSignalsReadOnlyAccess policy	CloudWatch updated CloudWatchApplicationSignalsReadOnlyAccess to include new Application Signals operation and OAM and Resource Explorer permissions to support change events, cross account and uninstrumented service functionalities in Application Signals.	November 20, 2025

Updated CloudWatchApplicationSignalsFullAccess policy	CloudWatch updated CloudWatchApplicationSignalsFullAccess to include OAM and Resource Explorer permissions to support cross account and uninstrumented service functionalities in Application Signals.	November 20, 2025
CloudWatch updated AIOpsConsoleAdminPolicy managed policy with Amazon Q permissions	CloudWatch updated the **AIOpsConsoleAdminPolicy** managed policy to include Amazon Q integration permissions. These permissions enable users to interact with CloudWatch investigations incident reports through Amazon Q's conversational interface. For more information see, AIOpsConsoleAdminPolicy.	November 17, 2025
CloudWatch updated AIOpsOperatorAccess managed policy with Amazon Q permissions	CloudWatch updated the **AIOpsOperatorAccess** managed policy to include Amazon Q integration permissions. These permissions enable users to interact with CloudWatch investigations incident reports through Amazon Q's conversational interface. For more information see, AIOpsOperatorAccess.	November 7, 2025

Updated CloudWatchNetworkFlowMonitorTopologyServiceRolePolicy managed policy with managed prefix lists permissions	CloudWatch added the `ec2:DescribeManagedPrefixLists` and `ec2:GetManagedPrefixListEntries` permissions to the CloudWatchNetworkFlowMonitorTopologyServiceRolePolicy managed policy to grant permissions for Network Flow Monitor to generate topology snapshots of managed prefix lists.	November 6, 2025
Updated CloudWatchReadOnlyAccess Policy with observability administration permissions	CloudWatch updated the **CloudWatchReadOnlyAccess** managed policy to include observability administration permissions. These permissions provide read-only access to telemetry rules, centralization configurations, and resource telemetry data across AWS Organizations. For more information, see CloudWatchReadOnlyAccess.	October 10, 2025

CloudWatch updated AIOpsOperatorAccess managed policy with incident report permissions	CloudWatch updated the **AIOpsOperatorAccess** managed policy to include incident report generation permissions. These permissio ns allow users to create and manage incident reports and work with AI-derived facts in CloudWatch investigations. For more information, see AIOpsOperatorAccess.	October 10, 2025
CloudWatch investigations added incident reports	CloudWatch updated CloudWatch investigations to provide incident reporting . These AI-generated reports capture investigation findings, root causes, timeline events, and recommended corrective actions in a structured format. For more information see, Generate incident reports.	October 10, 2025

CloudWatch added AIOpsAssistantIncidentReportPolicy managed policy to support CloudWatch investigations AI-generated incident reports	CloudWatch added the **AIOpsAssistantIncidentReportPolicy** managed policy to enable CloudWatch investigations to generate incident reports from investigation data. This policy provides permissions to access investigations, create and manage reports, and work with AI-derived facts that form the foundation of incident documentation. For more information, see AIOpsAssistantIncidentReportPolicy.	October 10, 2025
Updated CloudWatchReadOnlyAccess policy with CloudTrail and Service Quotas permissions	CloudWatch updated CloudWatchReadOnlyAccess to include CloudTrail and Service Quotas permissions to support top observations and change indicators functionality within Application Signals.	October 8, 2025
Updated CloudWatchFullAccessV2 policy	CloudWatch updated CloudWatchFullAccessV2 to include CloudTrail and Service Quotas permissions to support top observations and change indicators functionality within Application Signals.	October 8, 2025

Updated CloudWatchApplicationSignalsReadOnlyAccess policy	CloudWatch updated the `CloudWatchApplicationSignalsReadOnlyAccess` policy to view how resources and services change in your account and view top observations for service anomalies in your account. For more information, see CloudWatchApplicationSignalsReadOnlyAccess.	September 29, 2025
Updated CloudWatchApplicationSignalsFullAccess policy	CloudWatch updated the `CloudWatchApplicationSignalsFullAccess` policy to view how resources and services change in your account and view top observations for service anomalies in your account. For more information, see CloudWatchApplicationSignalsFullAccess.	September 29, 2025
CloudWatch Application Signals added support for dynamic service grouping and filtering, last deployment tracking, and automated audit findings	You can group and filter services with Application Signals' dynamic grouping capabilities track deployment activities through Application Signals' automatic processing of CloudTrail events, and discover critical insights through Application Signals' automated audit findings. For more information, see Application Signals.	September 29, 2025

Update to AIOPsAssistantPolicy managed policy	CloudWatch updated the **AIOpsAssistantPolicy** to allow CloudWatch investigations access to additional resources to assist in queries, troubleshooting, and topology mapping. For more information, see AIOpsAssistantPolicy.	September 24, 2025
New AWSObservabilityAdminLogsCentralizationServiceRolePolicy policy	CloudWatch added the **AWSObservabilityAdminLogsCentralizationServiceRolePolicy** that grants CloudWatch permission to use telemetry data from other AWS accounts that you specify to create CloudWatch log groups, log streams, and log events in your organization's monitoring account. The SLR only provides the assume role permission to allow the CloudWatch service to assume the role in the monitoring account. For more information, see AWSObservabilityAdminLogsCentralizationServiceRolePolicy.	September 17, 2025

CloudWatch added support for Cross-account cross-Region log centralization	CloudWatch added support for the **Cross-account cross-Region log centralization** that enables CloudWatch Logs to gather log data from AWS Organizations member accounts into a central account for analysis. For more information, see Monitor across accounts and Regions.	September 17, 2025
Collect EC2 instance store volume NVMe driver metrics	You can now use the CloudWatch agent to collect AWS NVMe driver metrics for instance store volumes attached to Nitro-based Amazon EC2 instances.	September 16, 2025
Removed AWS OpsWorks metrics and dimensions	AWS OpsWorks reached end-of-life and the service is deprecated.	August 20, 2025
New AWSObservabilityAdminTelemetryEnablementServiceRolePolicy policy	CloudWatch added the **AWSObservabilityAdminTelemetryEnablementServiceRolePolicy** that grants CloudWatch the permissions necessary to enable and manage telemetry configurations for AWS resources based on telemetry rules. For more information, see AWSObservabilityAdminTelemetryEnablementServiceRolePolicy.	July 17, 2025

Gen AI observability	With CloudWatch, you can observe generative AI workloads, including Amazon Bedrock AgentCore agents, and gain insights into AI performance, health, and accuracy. For more information, see Generative AI observability.	July 16, 2025
AIOpsReadOnlyAccess policy updated	CloudWatch updated the **AIOpsReadOnlyAccess** policy to permit validation of investigation groups across accounts. For more informati on, see AIOpsReadOnlyAccess policy.	June 23, 2025
Updated AIOpsCons oleAdminPolicy policy	CloudWatch updated the AIOpsConsoleAdminPolicy policy to permit validation of investigation groups across accounts. For more informati on, see AIOpsConsoleAdminP olicy policy.	June 13, 2025
Updated AIOpsAssistantPolicy policy	CloudWatch updated the AIOpsAssistantPolicy policy to provide additional IAM permissions. For more information, see AIOpsCons oleAdminPolicy policy.	June 13, 2025

Update managed policy	CloudWatch updated the **AIOpsOperatorAccess** policy to permit validation of investigation groups across accounts. For more information, see AIOpsOperatorAccess.	June 13, 2025
AmazonCloudWatchRUMReadOnlyAccess updated	The `synthetics:describeCanaries`, `synthetics:describeCanariesLastRun`, `cloudwatch:GetMetricData`, `cloudwatch:DescribeAlarms`, `logs:DescribeLogGroups`, `xray:GetTraceSummaries`, and `rum:ListTagsForResources` permissions was added to the CloudWatch RUM `AmazonCloudWatchRUMReadOnlyAccess` policy.	June 12, 2025
Added functionality	You can now monitor Amazon Aurora PostgreSQL Limitless Databases at the instance level from the Database Instance Dashboard. For more information, see Monitoring Aurora Limitless databases with Database Insights.	May 22, 2025

Added functionality	You can now enable Application Signals for your applications on an existing Amazon EKS cluster using CloudWatch Observability add-on Auto monitor advanced configuration. For more information, see Enable Application Signals on an Amazon EKS cluster using the CloudWatch Observability add-on advanced configuration.	May 19, 2025
CloudWatch Network Monitoring releases multiple account support for Network Flow Monitor	Network Flow Monitor, a feature of CloudWatch Network Monitoring, now supports monitoring network performance metrics for network flows for resources in multiple accounts. For more information, see Initialize Network Flow Monitor for multi-account monitoring.	May 6, 2025
AmazonCloudWatchRUMReadOnlyAccess updated	The `rum:GetResourcePolicy` permission was added so that CloudWatch RUM can view the resource policy attached to the RUM application monitor.	April 28, 2025

Updated AIOpsAssistantPolicy policy	CloudWatch added permissions to the **AIOpsAssistantPolicy** policy, which Amazon Q Developer operational investigations uses to find information during investigations.	April 11, 2025
CloudWatch Synthetics deprecates five runtime metrics on October 1, 2025	CloudWatch Synthetics metrics `syn-nodejs-puppeteer-7.0` , `syn-nodejs-puppeteer-6.2` , `syn-nodejs-puppeteer-5.2` , `syn-python-selenium-3.0` , and `syn-python-selenium-2.1` will be deprecated on October 1, 2025.	April 4, 2025
Updated CloudWatchApplicationSignalsServiceRolePolicy policy	CloudWatch updated the policy to exclude time windows from impacting the SLO attainment rate, error budget, and burn rate metrics. CloudWatch can retrieve exclusion windows on behalf of you. For more information, see CloudWatchApplicationSignalsServiceRolePolicy.	March 13, 2025

Time window exclusions	SLOs adds support for time window exclusions which is a block of time with a defined start and end date. This time period is excluded from the SLO's performance metrics and you can schedule one-time or recurring time exclusions windows. For more information, see Service level objectives (SLOs).	March 13, 2025
New AIOpsReadOnlyAccess policy	CloudWatch added the **AIOpsReadOnlyAccess** policy, which grants read-only permissions for Amazon AI Operations and other related services.	December 3, 2024
New AIOpsOperatorAccess policy	CloudWatch added the **AIOpsOperatorAccess** policy, which grants users access to Amazon AI Operations actions, and to additiona l AWS actions that are necessary for accessing investigation events.	December 3, 2024

New AIOpsConsoleAdminPolicy policy	CloudWatch added the **AIOpsConsoleAdminPolicy** policy, which grants users full administrative access for managing Amazon Q investigations, including the management of trusted identity propagation, and the management of IAM Identity Center and organizational access.	December 3, 2024
New AIOpsAssistantPolicy policy	CloudWatch added the **AIOpsAssistantBasicAccess** policy, which you can assign to the Amazon AI Operations assistant to enable the assistant to have basic functionality.	December 3, 2024
Amazon Q Developer operational investigations feature in Preview	CloudWatch released a Preview of Amazon Q Developer operational investigations. This feature is a generative AI-powered assistant that can help you respond to incidents in your system. It uses generative AI to scan your system's telemetry and quickly surface suggestions that might be related to your issue, to help you troubleshoot operational issues faster.	December 3, 2024

CloudWatchFullAccessV2 and CloudWatchFullAccess policies updated	CloudWatch updated both **CloudWatchFullAccessV2** and **CloudWatchFullAccess**. Permissions for Amazon OpenSearch Service were added to to enable CloudWatch Logs integration with OpenSearch Service for some features.	December 1, 2024
Telemetry config feature generally available	CloudWatch added the telemetry config feature to discover and understand the state of telemetry configuration for your AWS resources.	November 26, 2024
New AWSServiceRoleForObservabilityAdmin service-linked role	CloudWatch added the new AWSServiceRoleForObservabilityAdmin service-linked role and AWSObservabilityAdminServiceRolePolicy policy.	November 26, 2024
CloudWatch supports exploring related telemetry	CloudWatch supports exploring related telemetry data across interconnected resources.	November 22, 2024

Updated CloudWatchSyntheticsFullAccess IAM policy	CloudWatch updated the **CloudWatchSyntheticsFullAccess** policy to grant CloudWatch Synthetics access to get AWS Lambda functions , and perform actions on logs available in CloudWatch Logs. Additionally, Lambda layer version actions apply to all CloudWatch Synthetics layer ARNs.	November 21, 2024
New CloudWatch Synthetics support for Node.js with the Playwright runtime	CloudWatch Synthetics adds support for Node.js canary scripts that use the Playwright runtime.	November 21, 2024
CloudWatchReadOnlyAccess policy updated	The scope of the policy was changed to include the `xray:List *`, `xray:StartTraceRetrieval` , and `xray:CancelTraceRetrieval` permissions. This change allows CloudWatch to access new X-Ray read APIs. For more infomration, see CloudWatchReadOnlyAccess.	November 21, 2024

CloudWatch Transaction Search is generally available	CloudWatch releases Transaction Search, a search and analytics experience. Transaction Search provides visibility into application transaction issues. Explore interactions between application components to establish a root cause. Understand your application transactions and their impact on customers. Search transactions using terms like customer name or order. For more information, see CloudWatch Transaction Search.	November 21, 2024
Application Signals supports Lambda functions	You can now enable Application Signals for Lambda functions.	November 21, 2024
OpenTelemetry	You can use OpenTelemetry to directly send traces to an OpenTelemetry Protocol (OTLP) endpoint, and get out-of-the box application performance monitoring experiences in CloudWatch Application Signals.	November 20, 2024
Application Signals collects runtime metrics	Application Signals now collects OpenTelemetry-compatible runtime metrics from your Java and Python applications.	November 19, 2024

Application Signals collects runtime metrics	Application Signals now collects OpenTelemetry-compatible runtime metrics from your Java and Python applications.	November 19, 2024
Internet traffic monitoring for VPCs in AWS Local Zones	Internet Monitor now supports internet traffic monitoring for VPCs deployed in AWS Local Zones	November 18, 2024
Application Signals support for Node.js applications is generally available	CloudWatch supports enabling Node.js applications for Application Signals.	November 15, 2024
New CloudWatchInternetMonitorReadOnlyAccess IAM policy	CloudWatch added a **CloudWatchInternetMonitorReadOnlyAccess** policy, to grant read-only access to actions and resources available in the CloudWatch console for Internet Monitor.	November 14, 2024
CloudWatch added observability solutions	CloudWatch observability solutions offer a catalog of readily available configurations to help you quickly implement monitoring for various AWS services and common workloads, such as Java Virtual Machines (JVM), Apache Kafka, Apache Tomcat, and NGINX.	November 13, 2024

CloudWatch added burn rate monitoring for Application Signals SLOs	CloudWatch added burn rate monitoring to Application Signals SLOs. A burn rate is a metric that indicates how fast the service is consuming the error budget, relative to the attainment goal of the SLO.	November 13, 2024
New Internet Monitor latency reduction suggestions through Route 53 routing updates	Amazon CloudWatch Internet Monitor now provides actionable suggestions to help you optimize your Route 53 IP-based routing configurations. Easily identify the optimal AWS Regions for routing your end user traffic, and then configure your Route 53 IP-based routing based on the recommend ations.	November 1, 2024
New CloudWatchInternet MonitorFullAccess IAM policy	CloudWatch added a **CloudWatchInternet MonitorFullAccess** policy, to grant full access to actions and resources available in the CloudWatch console for Internet Monitor.	October 23, 2024
End of support notice	End of support notice: On October 16, 2025, AWS will discontinue support for CloudWatch Evidently. After October 16, 2025, you will no longer be able to access the Evidently console or Evidently resources.	October 17, 2024

End of support notice	End of support notice: On October 16, 2025, AWS will discontinue support for CloudWatch Evidently. After October 16, 2025, you will no longer be able to access the Evidently console or Evidently resources.	October 17, 2024
New CloudWatchLambdaApplicationSignalsExecutionRolePolicy IAM policy	CloudWatch added a new policy named **CloudWatchLambdaApplicationSignalsExecutionRolePolicy**. This policy is used when CloudWatch Application Signals is enabled for Lambda workloads. It enables write access to X-Ray and the log group used by CloudWatch Application Signals.	October 16, 2024
New CloudWatchLambdaApplicationSignalsExecutionRolePolicy IAM policy	CloudWatch added a new policy named **CloudWatchLambdaApplicationSignalsExecutionRolePolicy**. This policy is used when CloudWatch Application Signals is enabled for Lambda workloads. It enables write access to X-Ray and the log group used by CloudWatch Application Signals.	October 16, 2024

CloudWatchSyntheticsFullAccess policy updated	Permissions were added to the **CloudWatchSyntheticsFullAccess** IAM policy. The `lambda:ListTags` , `lambda:TagResource` , and `lambda:UntagResource` permissions were added so that when you apply or change tags on a canary, you can choose to have Synthetics also apply those same tags or changes to the Lambda function that the canary uses.	October 11, 2024
Application Signals supports request-based SLOs	Application Signals adds support for request-based service level objects (SLOs). For more information, see Service level objectives (SLOs).	September 6, 2024
Internet Monitor refreshed dashboard and latency improvement suggestions	Amazon CloudWatch Internet Monitor has launched an updated console experience, including new features for visualizing configuration changes that can help you reduce latency for your application.	August 12, 2024
Application Signals previewing support for .NET applications	CloudWatch Application Signals has added support for .NET applications, with ADOT Instrumentation for .NET on supported platforms. This feature is in preview release.	August 5, 2024

New CloudWatch Application Insights service linked role permission added	Allows CloudWatch Application Insights to enable and disable termination protection on CloudFormation stacks.	July 25, 2024
CloudWatch Metrics Insights support for natural language query generation is generally available.	CloudWatch Metrics Insights supports natural language query to generate and update queries. For more information, see Use natural language to generate and update CloudWatch Metric Insights queries.	June 10, 2024
CloudWatch Application Signals is generally available	CloudWatch Application Signals is now generally available. Use Application Signals to instrument your applications on AWS so that you can monitor current application health, create service level objectives (SLOs), and track long-term application performance against your business objectives. For more information, see Application Signals.	June 10, 2024
New CloudWatchApplicationSignalsReadOnlyAccess IAM policy	CloudWatch added a **CloudWatchApplicationSignalsReadOnlyAccess** policy to add read only actions and resources available in the CloudWatch console for Application Signals.	June 7, 2024

New CloudWatchApplicationSignalsFullAccess policy	CloudWatch added a **CloudWatchApplicationSignalsFullAccess** policy to add actions and resources available in the CloudWatch console for Application Signals.	June 7, 2024
CloudTrail now captures API activities related to CloudWatch data plane operations.	CloudTrail now logs events in CloudTrail for **GetMetricData** and **GetMetricWidgetImage** API activities.	June 6, 2024
CloudWatch Application Signals application map supports canary, RUM clients and AWS service dependency groupings.	The Application Signals preview release has added default groupings in the application map for canaries, RUM clients, and AWS service dependencies of the same type. This change reduces the number of icons in the application map default view to make it easier to view and navigate.	May 21, 2024

CloudWatchReadOnlyAccess policy updated	CloudWatch changed the scope of a permission in **CloudWatchReadOnlyAccess**. The scope of the policy added the `application-signals:BatchGet*` , `application-signals:Get*` , and `application-signals:List*` actions so that users can use CloudWatch Application Signals to view, investigate, and diagnose issues with the health of their services. CloudWatch also added an `iam:GetRole` action so that users can check if Application Signals is set up.	May 17, 2024
CloudWatchFullAccessV2 policy updated	CloudWatch changed the scope of a permission in **CloudWatchFullAccessV2**. The scope of the policy added the `application-signals:*` so that users can use CloudWatch Application Signals to view, investigate, and diagnose issues with the health of their services.	May 17, 2024
Lambda Insights supports AWS GovCloud (US-East) and AWS GovCloud (US-West)	CloudWatch Lambda Insights has added support for the AWS GovCloud (US-East) and AWS GovCloud (US-West) Regions.	April 29, 2024

CloudWatch cross-account observability supports resource filters	You can now create filters to specify which metric namespaces and log groups are shared from the source account to the monitoring account, when you create the link between the accounts.	April 26, 2024
CloudWatch Application Signals updates	The Application Signals preview release has added three features. Applicati on Signals now supports Python applications. It offers a simpler enablement process for applications on Amazon EKS architectures. And it includes new configurations that you can use to manage the cardinality of metrics that are collected.	April 26, 2024
CloudWatch Container Insights with enhanced observability for Amazon EKS can collect AWS Elastic Fabric Adapter (EFA) metrics	You can now use CloudWatc h Container Insights with enhanced observability for Amazon EKS collect AWS Elastic Fabric Adapter (EFA) metrics from Amazon EKS clusters.	April 23, 2024

Updated IAM policy	CloudWatch updated the **CloudWatchApplicationSignalsServiceRolePolicy** policy. The scoping of the `logs:StartQuery` and `logs:GetQueryResults` permissions in this policy was changed to add `arn:aws:logs:*:*:log-group:/aws/appsignals/*:*` and `"arn:aws:logs:*:*:log-group:/aws/application-signals/data:*"` to enable Application Signals on more architecures. This policy is attached to the **AWSServiceRoleForCloudWatchApplicationSignals** service-linked role.	April 18, 2024
Internet Monitor provides a global internet weather map to authenticated AWS customers	Amazon CloudWatch Internet Monitor now displays a global internet weather map that is available in the console to all authenticated AWS customers. To view the map, in the Amazon CloudWatch console, navigate to Internet Monitor.	April 16, 2024
CloudWatch Container Insights with enhanced observability for Amazon EKS can collect AWS Neuron metrics	You can now use CloudWatch Container Insights with enhanced observability for Amazon EKS collect AWS Neuron metrics from Amazon EKS clusters.	April 16, 2024

CloudWatch Application Signals adds a **Service overview** tab and more metrics to aid in diagnostics	A new **Service overview** tab displays an overview of your service, including number of operations, dependencies, synthetics, and client pages. The tab shows key metrics for your entire service, and top operations and dependencies. You can also now view X-Ray traces that are correlated with issues including faults, errors, and latency problems.	April 16, 2024
CloudWatch Container Insights with enhanced observability for Amazon EKS adds support for Windows	You can now use CloudWatch Container Insights with enhanced observability for Amazon EKS collect metrics from Windows worker nodes on Amazon EKS clusters.	April 10, 2024
CloudWatchApplicationSignalsServiceRolePolicy IAM policy updated	CloudWatch changed the scope of a permission in **CloudWatchApplicationSignalsServiceRolePolicy**. The scope of the `cloudwatch:GetMetricData` permission was changed to * so that Application Signals can retrieve metrics from sources in linked accounts.	April 8, 2024
Amazon CloudWatch Internet Monitor now supports cross-account observability	You can now use Internet Monitor cross-account observability to monitor your applications that span multiple AWS accounts within a single AWS Region.	March 29, 2024

CloudWatchAgentServerPolicy and **CloudWatchAgentAdminPolicy** policies updated	CloudWatch added permissions to both the `CloudWatchAgentServerPolicy` and `CloudWatchAgentAdminPolicy` policies to allow the CloudWatch agent to publish X-Ray traces and modify log group retention periods. In both policies, the `xray:PutTraceSegments`, `xray:PutTelemetryRecords`, `xray:GetSamplingRules`, `xray:GetSamplingTargets`, `xray:GetSamplingStatisticSummaries` and `logs:PutRetentionPolicy` permissions were added	February 12, 2024

New service linked role and IAM policy for CloudWatch Network Monitor	CloudWatch added a new service-linked role, called **AWSServiceRoleForNetworkMonitor**. CloudWatch added this new service-linked role to allow you to create monitors to fetch network metrics between source subnets and destination IP addresses. The new **CloudWatchNetworkMonitorServiceRolePolicy** IAM policy is attached to this role, and the policy grants permission to CloudWatch to fetch network metrics on your behalf.	December 22, 2023
CloudWatch releases Amazon CloudWatch Network Monitor	CloudWatch released a new feature, Amazon CloudWatch Network Monitor. This is a new active network monitoring service that identifies if a network issues exists within the AWS network or your own company network.	December 22, 2023

CloudWatchReadOnlyAccess policy updated	CloudWatch added existing read-only permissions for CloudWatch Synthetics, X-Ray, and CloudWatch RUM and new read-only permissions for CloudWatch Application Signals to **CloudWatchReadOnlyAccess** so that users with this policy can triage and diagnose service health issues as reported by CloudWatch Application Signals. The `cloudwatch:GenerateQuery` permission was added so that users with this policy can generate a CloudWatch Metrics Insights query string from a natural language prompt.	December 5, 2023
CloudWatchFullAccessV2 policy updated	CloudWatch added existing permissions to **CloudWatchFullAccessV2** for CloudWatch Synthetics, X-Ray, and CloudWatch RUM, and added new permissions for CloudWatch Application Signals so that users with this policy can fully manage Application Signals to triage and diagnose issues with service health.	December 5, 2023

New service-linked role and new IAM policy	CloudWatch added a new service-linked role, called **AWSServiceRoleForCloudWatchApplicationSignals**. CloudWatch added this new service-linked role to allow CloudWatch Application Signals to collect CloudWatch Logs data, X-Ray trace data, CloudWatch metrics data, and tagging data from applications that you have enabled for CloudWatch Application Signals. The new **CloudWatchApplicationSignalsServiceRolePolicy** IAM policy is attached to this role, and the policy grants permission to CloudWatch Application Signals to collect monitoring and tagging data from other relevant AWS services.	November 30, 2023

CloudWatch launches Preview release of Application Signals	CloudWatch Application Signals is in Preview. Use Application Signals to instrument your applications on AWS so that you can monitor current application health, create service level objectives (SLOs), and track long-term application performance against your business objectives. For more information, see Application Signals.	November 30, 2023
CloudWatch adds support for querying other data sources	You can use CloudWatch to query, visualize, and create alarms for metrics from other data sources For more information, see Querying metrics from other data sources.	November 26, 2023
CloudWatch Metrics Insights supports natural language query generation	CloudWatch Metrics Insights supports natural language query to generate and update queries. For more information, see Use natural language to generate and update CloudWatch Metric Insights queries.	November 26, 2023

CloudWatch releases Container Insights with enhanced observability for Amazon EKS	CloudWatch released a new version of Container Insights. This version supports enhanced observability for Amazon EKS clusters and can collect more detailed metrics from clusters running Amazon EKS. After installat ion, it automatically collects detailed infrastructure telemetry and container logs for your Amazon EKS clusters. You can then use curated, immediately usable dashboards to drill down into application and infrastructure telemetry.	November 6, 2023
CloudWatch metric streams adds quick partner setup	CloudWatch metric streams now provides a quick partner setup option, which you can use to quickly set up a metric stream to some third-party providers.	October 17, 2023
CloudWatch releases alarm recommendations	CloudWatch Synthetics now provides alarm recommend ations for metrics from other AWS services. These recommendations can help you identify the metrics that you should set alarms for to follow best practices for monitoring these services.	October 16, 2023

CloudWatch Synthetics releases runtime syn-nodejs-puppeteer-6.0	CloudWatch Synthetics released runtime `syn-nodejs-puppeteer-6.0` .	September 26, 2023
Adds Amazon CloudWatch Application Insights support for cross-account applications	You can now share CloudWatch Application Insights applications across account boundaries.	September 26, 2023
New service-linked role and new IAM policy	CloudWatch added a new service-linked role, called **AWSServiceRoleForCloudWatchMetrics_DbPerfInsights**. CloudWatch added this new service-linked role to allow CloudWatch to fetch Performance Insights metrics for alarming, anomaly detection, and snapshotting. The new **AWSServiceRoleForCloudWatchMetrics_DbPerfInsightsServiceRolePolicy** IAM policy is attached to this role, and the policy grants permission to CloudWatch to fetch Performance Insights metrics on your behalf.	September 20, 2023
Adds new metric math function	CloudWatch added a new metric math function, `DB_PERF_INSIGHTS` , that you can use to fetch Performance Insights metrics from AWS database services for alarming, anomaly detection, and snapshotting.	September 20, 2023

CloudWatchReadOnlyAccess policy updated	CloudWatch added the `application-autoscaling:DescribeScalingPolicies` permission to **CloudWatchReadOnlyAccess** so that users with this policy can access information about Application Auto Scaling policies.	September 14, 2023
CloudWatch agent added support for AL2023	The CloudWatch agent supports AL2023.	August 8, 2023
New managed IAM policy, CloudWatchFullAccessV2	CloudWatch added a new policy **CloudWatchFullAccessV2**. This policy grants full access to CloudWatch actions and resources while better scoping the permissions granted to other services such as Amazon SNS and Amazon EC2 Auto Scaling.	August 1, 2023
Updated service linked role for Amazon CloudWatch Internet Monitor – update to an existing policy	Adds new permissions, `elasticloadbalancing:DescribeLoadBalancers` and `ec2:DescribeNetworkInterfaces`, to the service linked role for Internet Monitor, to support monitoring traffic for specific Network Load Balancer resources.	July 25, 2023

Added support for Network Load Balancer resources in Amazon CloudWatch Internet Monitor	Adds support for creating a monitor in Internet Monitor with specific Network Load Balancer resources, to provide more granular levels of observability for your application.	July 25, 2023
Dashboard variables feature	CloudWatch released *dashboard variables*, which you can use to create flexible dashboards that can quickly display different contents depending on how you set one input field within the dashboard. For example, you can create a dashboard that can quickly switch between different Lambda functions or Amazon EC2 instance IDs, or one that can switch to different AWS Regions. For more information, see Create flexible dashboards with dashboard variables.	June 28, 2023
Internet Monitor now supports customizing the threshold for health events	Internet Monitor added the ability to customize the threshold for when a global performance score or availabil ity score triggers a heath event. For more informati on, see Tracking real-time performance and availabil ity in Amazon CloudWatch Internet Monitor.	June 26, 2023

Internet Monitor now supports all commercial Regions	Internet Monitor added seven new AWS Regions and now supports all commercial Regions.	June 19, 2023
New Lambda Insights extension versions	CloudWatch added the 1.0.229.0 version of the Lambda Insights extension for both x86-64 platforms and ARM64 platforms. For more information, see Available versions of the Lambda Insights extension.	June 12, 2023
CloudWatchReadOnlyAccess policy updated	CloudWatch added permissions to **CloudWatchReadOnlyAccess**. The `logs:StartLiveTail` and `logs:StopLiveTail` permissions were added so that users with this policy can use the console to start and stop CloudWatch Logs live tail sessions. For more information, see Use live tail to view logs in near real time.	June 6, 2023

CloudWatch RUM adds support for custom metrics	You can use CloudWatch RUM app monitors to create custom metrics and send them to CloudWatch and CloudWatch Evidently. This feature includes an update to the **AmazonCloudWatchRUMServiceRolePolicy** managed IAM policy. In that policy, a condition key was changed so that CloudWatch RUM can send custom metrics to custom metric namespaces.	February 9, 2023
New and updated managed polices for CloudWatch	To support CloudWatch cross-account observability, the `CloudWatchFullAccess` and `CloudWatchReadOnlyAccess` policies have been updated, and the following new managed policies have been added: `CloudWatchCrossAccountSharingConfiguration`, `OAMFullAccess`, and `OAMReadOnlyAccess`. For more information, see CloudWatch updates to AWS managed policies.	February 7, 2023
CloudWatch Application Insights service-linked role policy updates — update to an existing policy.	CloudWatch Application Insights updated an existing AWS service-linked role policy.	December 19, 2022

Amazon CloudWatch Application Insights support for containerized applications and microservices from the Container Insights console.	You can display CloudWatch Application Insights detected problems for Amazon ECS and Amazon EKS on your Container Insights dashboard.	November 17, 2021
Amazon CloudWatch Application Insights monitoring for SAP HANA databases.	You can monitor SAP HANA databases with Application Insights.	November 15, 2021
Amazon CloudWatch Application Insights support for monitoring all resources in an account.	You can onboard and monitor all resources in an account.	September 15, 2021
Amazon CloudWatch Application Insights support for Amazon FSx.	You can monitor metrics retrieved from Amazon FSx.	August 31, 2021
SDK Metrics is no longer supported.	CloudWatch SDK Metrics is no longer supported.	August 25, 2021
Amazon CloudWatch Application Insights support for setting up container monitoring.	You can monitor containers using best practices with Amazon CloudWatch Application Insights.	May 18, 2021
Metric streams is generally available	You can use metric streams to continually stream CloudWatch metrics to a destination of your choice. For more information, see Metric streams in the *Amazon CloudWatch User Guide*.	March 31, 2021

Amazon CloudWatch Application Insights monitoring for Oracle databases on Amazon RDS and Amazon EC2.	You can monitor metrics and logs retrieved from Oracle with Amazon CloudWatch Application Insights.	January 16, 2021
Lambda Insights is generally available	CloudWatch Lambda Insights is a monitoring and troubleshooting solution for serverless applications running on AWS Lambda. For more information, see Using Lambda Insights in the *Amazon CloudWatch User Guide*.	December 3, 2020
Amazon CloudWatch Application Insights monitoring for Prometheus JMX exporter metrics.	You can monitor metrics retrieved from Prometheus JMX exporter with Amazon CloudWatch Application Insights.	November 20, 2020
CloudWatch Synthetics releases new runtime version	CloudWatch Synthetics has released a new runtime version. For more information, see Canary Runtime Versions in the *Amazon CloudWatch User Guide*.	September 11, 2020
Amazon CloudWatch Application Insights monitoring for Postgre SQL on Amazon RDS and Amazon EC2.	You can monitor applications built with PostgreSQL running on Amazon RDS or Amazon EC2.	September 11, 2020

CloudWatch supports dashboard sharing	You can now share CloudWatch dashboards with people outside of your organization and AWS account. For more information, see Sharing CloudWatch Dashboards in the *Amazon CloudWatch User Guide*.	September 10, 2020
Set up monitors for .NET applications using SQL Server on the backend with CloudWatch Application Insights	You can use the documentation tutorial to help you to set up monitors for .NET applications using SQL Server on the backend with CloudWatch Application Insights.	August 19, 2020
CloudFormation support for Amazon CloudWatch Application Insights applications.	You can add CloudWatch Application Insights monitoring, including key metrics and telemetry, to your application, database, and web server, directly from CloudFormation templates.	July 30, 2020
Amazon CloudWatch Application Insights monitoring for Aurora for MySQL database clusters.	You can monitor Aurora for MySQL database clusters (RDS Aurora) with Amazon CloudWatch Application Insights.	July 2, 2020

CloudWatch Contributor Insights general availability	CloudWatch Contributor Insights is now generally available. It enables you to analyze log data and create time series that display contributor data. You can see metrics about the top-N contributors, the total number of unique contributors, and their usage. For more information, see Using Contributor Insights to Analyze High-Cardinality Data in the *Amazon CloudWatch User Guide*.	April 2, 2020
CloudWatch Synthetics public preview	CloudWatch Synthetics is now in public preview. It enables you to create canaries to monitor your endpoints and APIs. For more information, see Using Canaries in the *Amazon CloudWatch User Guide*.	November 25, 2019

CloudWatch Contributor Insights public preview	CloudWatch Contributor Insights is now in public preview. It enables you to analyze log data and create time series that display contributor data. You can see metrics about the top-N contributors, the total number of unique contributors, and their usage. For more information, see Using Contributor Insights to Analyze High-Cardinality Data in the *Amazon CloudWatch User Guide*.	November 25, 2019
CloudWatch launches ServiceLens feature	ServiceLens ehances the observability of your services and applications by enabling you to integrate traces, metrics, logs, and alarms into one place. ServiceLens integrates CloudWatch with AWS X-Ray to provide an end-to-end view of your application.	November 21, 2019

Use CloudWatch to proactively manage your AWS service quotas	You can use CloudWatch to proactively manage your AWS service quotas. CloudWatch usage metrics provide visibility into your account's usage of resources and API operations. For more information, see Service Quotas Integration and Usage Metrics in the *Amazon CloudWatch User Guide*.	November 19, 2019
CloudWatch sends events when alarms change state	CloudWatch now sends an event to Amazon EventBridge when any CloudWatch alarm changes state. For more information, see Alarm Events and EventBridge in the *Amazon CloudWatch User Guide*.	October 8, 2019
Container Insights	CloudWatch Container Insights is now generally available. It enables you to collect, aggregate, and summarize metrics and logs from your containerized applications and microservices. For more information, see Using Container Insights in the *Amazon CloudWatch User Guide*.	August 30, 2019

Updates for Container Insights preview metrics on Amazon EKS and Kubernetes	The Container Insights on Amazon EKS and Kubernetes public preview has been updated. InstanceId is now included as a dimension to the cluster EC2 instances. This allows alarms that have been created on these metrics to trigger the following EC2 actions: Stop, Terminate, Reboot, or Recover. Additionally, pod and service metrics are now reported by Kubernetes namespace to simplify the monitoring and alarming on metrics by namespace.	August 19, 2019
Updates for AWS Systems Manager OpsCenter integration	Updates on how CloudWatch Application Insights integrates with Systems Manager OpsCenter.	August 7, 2019
CloudWatch usage metrics	CloudWatch usage metrics help you track the usage of your CloudWatch resources and stay within your service limits. For more information, see https://docs.aws.amazon.com/AmazonCloudWatch/latest/monitoring/CloudWatch-Usage-Metrics.html.	August 6, 2019

CloudWatch Container Insights public preview	CloudWatch Container Insights is now in public preview. It enables you to collect, aggregate, and summarize metrics and logs from your containerized applications and microservices. For more information, see Using Container Insights in the *Amazon CloudWatch User Guide*.	July 9, 2019
CloudWatch Anomaly Detection public preview	CloudWatch anomaly detection is now in public preview. CloudWatch applies machine-learning algorithms to a metric's past data to create a model of the metric's expected values. You can use this model for visualization and for setting alarms. For more information, see Using CloudWatch Anomaly Detection in the *Amazon CloudWatch User Guide*.	July 9, 2019
CloudWatch Application Insights for .NET and SQL Server	CloudWatch Application Insights for .NET and SQL Server facilitates observability for .NET and SQL Server applications. It can help you set up the best monitors for your application resources to continuously analyze data for signs of problems with your applications.	June 21, 2019

CloudWatch agent section re-organized	The CloudWatch agent documentation has been rewritten to improve clarity, especially for customers using the command line to install and configure the agent. For more information, see Collecting Metrics and Logs from Amazon EC2 Instances and On-Premises Servers with the CloudWatch Agent in the *Amazon CloudWatch User Guide*.	March 28, 2019
SEARCH function added to metric math expressions	You can now use a SEARCH function in metric math expressions. This enables you to create dashboards that update automatically as new resources are created that match the search query. For more information, see Using Search Expressions in Graphs in the *Amazon CloudWatch User Guide*.	March 21, 2019
AWS SDK Metrics for Enterprise Support	SDK Metrics helps you assess the health of your AWS services and diagnose latency caused by reaching your account usage limits or by a service outage. For more information, see Monitor Applications Using AWS SDK Metrics in the *Amazon CloudWatch User Guide*.	December 11, 2018

Alarms on math expressions	CloudWatch supports creating alarms based on metric math expressions. For more information, see Alarms on Math Expressions in the *Amazon CloudWatch User Guide*.	November 20, 2018
New CloudWatch console home page	Amazon has created a new home page in the CloudWatch console, which automatically displays key metrics and alarms for all the AWS services you are using. For more information, see Getting Started with Amazon CloudWatch in the *Amazon CloudWatch User Guide*.	November 19, 2018
CloudFormation templates for the CloudWatch Agent	Amazon has uploaded CloudFormation templates that you can use to install and update the CloudWatch agent. For more information, see Install the CloudWatch Agent on New Instances Using CloudFormation in the *Amazon CloudWatch User Guide*.	November 9, 2018

Enhancements to the CloudWatch Agent	The CloudWatch agent has been updated to work with both the StatsD and collectd protocols. It also has improved cross-account support. For more informati on, see Retrieve Custom Metrics with StatsD, Retrieve Custom Metrics with collectd, and Sending Metrics and Logs to a Different AWS Account in the *Amazon CloudWatch User Guide*.	September 28, 2018
Support for Amazon VPC endpoints	You can now establish a private connection between your VPC and CloudWatc h. For more information, see Using CloudWatch with Interface VPC Endpoints in the *Amazon CloudWatch User Guide*.	June 28, 2018

The following table describes important changes to the *Amazon CloudWatch User Guide* before June 2018.

Change	Description	Release date
Metric math	You can now perform math expressions on CloudWatch metrics, producing new time series that you can add to graphs on your dashboard. For more information, see Using math expressions with CloudWatch metrics.	April 4, 2018
"M out of N" alarms	You can now configure an alarm to trigger based on "M out of N" datapoints in any alarm evaluatio	December 8, 2017

Change	Description	Release date
	n interval. For more information, see Alarm evaluation.	
CloudWatch agent	A new unified CloudWatch agent was released. You can use the unified multi-platform agent to collect custom both system metrics and log files from Amazon EC2 instances and on-premises servers. The new agent supports both Windows and Linux and enables customization of metrics collected, including sub-resource metrics such as per-CPU core. For more information, see Collect metrics, logs, and traces using the CloudWatch agent.	September 7, 2017
NAT gateway metrics	Added metrics for Amazon VPC NAT gateway.	September 7, 2017
High-resolution metrics	You can now optionally set up custom metrics as high-resolution metrics, with a granularity of as low as one second. For more information, see High-resolution metrics.	July 26, 2017
Dashboard APIs	You can now create, modify, and delete dashboards using APIs and the AWS CLI. For more information, see Creating a customized CloudWatch dashboard.	July 6, 2017
Direct Connect metrics	Added metrics for Direct Connect.	June 29, 2017
Amazon VPC VPN metrics	Added metrics for Amazon VPC VPN.	May 15, 2017
WorkSpaces Applications metrics	Added metrics for WorkSpaces Applications.	March 8, 2017

Change	Description	Release date
CloudWatch console color picker	You can now choose the color for each metric on your dashboard widgets. For more information, see Editing a graph on a CloudWatch dashboard.	February 27, 2017
Alarms on dashboards	Alarms can now be added to dashboards. For more information, see Adding an alarm to a CloudWatch dashboard.	February 15, 2017
Added metrics for Amazon Polly	Added metrics for Amazon Polly.	December 1, 2016
Added metrics for Amazon Managed Service for Apache Flink	Added metrics for Amazon Managed Service for Apache Flink.	December 1, 2016
Added support for percentile statistics	You can specify any percentile, using up to two decimal places (for example, p95.45). For more information, see Percentiles.	November 17, 2016
Added metrics for Amazon Simple Email Service	Added metrics for Amazon Simple Email Service.	November 2, 2016
Updated metrics retention	Amazon CloudWatch now retains metrics data for 15 months instead of 14 days.	November 1, 2016
Updated metrics console interface	The CloudWatch console is updated with improvements to existing functionality and new functionality.	November 1, 2016
Added metrics for Amazon Elastic Transcoder	Added metrics for Amazon Elastic Transcoder.	September 20, 2016

Change	Description	Release date
Added metrics for Amazon API Gateway	Added metrics for Amazon API Gateway.	September 9, 2016
Added metrics for AWS Key Management Service	Added metrics for AWS Key Management Service.	September 9, 2016
Added metrics for the new Application Load Balancers supported by Elastic Load Balancing	Added metrics for Application Load Balancers.	August 11, 2016
Added new NetworkPacketsIn and NetworkPacketsOut metrics for Amazon EC2	Added new NetworkPacketsIn and NetworkPacketsOut metrics for Amazon EC2.	March 23, 2016
Added new metrics for Amazon EC2 Spot fleet	Added new metrics for Amazon EC2 Spot fleet.	March 21, 2016
Added new CloudWatch Logs metrics	Added new CloudWatch Logs metrics.	March 10, 2016

Change	Description	Release date
Added Amazon OpenSearch Service and AWS WAF metrics and dimensions	Added Amazon OpenSearch Service and AWS WAF metrics and dimensions.	October 14, 2015
Added support for CloudWatch dashboards	Dashboards are customizable home pages in the CloudWatch console that you can use to monitor your resources in a single view, even those that are spread out across different Regions. For more information, see Using Amazon CloudWatch dashboards.	October 8, 2015
Added AWS Lambda metrics and dimensions	Added AWS Lambda metrics and dimensions.	September 4, 2015
Added Amazon Elastic Container Service metrics and dimensions	Added Amazon Elastic Container Service metrics and dimensions.	August 17, 2015
Added Amazon Simple Storage Service metrics and dimensions	Added Amazon Simple Storage Service metrics and dimensions.	July 26, 2015
New feature: Reboot alarm action	Added the reboot alarm action and new IAM role for use with alarm actions. For more informati on, see Stop, terminate, reboot, or recover an EC2 instance.	July 23, 2015
Added Amazon WorkSpaces metrics and dimensions	Added Amazon WorkSpaces metrics and dimensions.	April 30, 2015

Change	Description	Release date
Added Amazon Machine Learning metrics and dimensions	Added Amazon Machine Learning metrics and dimensions.	April 9, 2015
New feature: Amazon EC2 instance recovery alarm actions	Updated alarm actions to include new EC2 instance recovery action. For more information, see Stop, terminate, reboot, or recover an EC2 instance.	March 12, 2015
Added Amazon CloudFront and Amazon CloudSearch metrics and dimensions	Added Amazon CloudFront and Amazon CloudSearch metrics and dimensions.	March 6, 2015
Added Amazon Simple Workflow Service metrics and dimensions	Added Amazon Simple Workflow Service metrics and dimensions.	May 9, 2014
Updated guide to add support for AWS CloudTrail	Added a new topic to explain how you can use AWS CloudTrail to log activity in Amazon CloudWatch. For more information, see Logging Amazon CloudWatch API and console operations with AWS CloudTrail.	April 30, 2014

Change	Description	Release date
Updated guide to use the new AWS Command Line Interface (AWS CLI)	The AWS CLI is a cross-service CLI with a simplified installation, unified configuration, and consistent command line syntax. The AWS CLI is supported on Linux/Unix, Windows, and Mac. The CLI examples in this guide have been updated to use the new AWS CLI. For information about how to install and configure the new AWS CLI, see Getting Set Up with the AWS CLI Interface in the *AWS Command Line Interface User Guide*.	February 21, 2014
Added Amazon Redshift and AWS OpsWorks metrics and dimensions	Added Amazon Redshift and AWS OpsWorks metrics and dimensions.	July 16, 2013
Added Amazon Route 53 metrics and dimensions	Added Amazon Route 53 metrics and dimensions.	June 26, 2013
New feature: Amazon CloudWatch Alarm Actions	Added a new section to document Amazon CloudWatch alarm actions, which you can use to stop or terminate an Amazon Elastic Compute Cloud instance. For more information, see Stop, terminate, reboot, or recover an EC2 instance.	January 8, 2013
Updated EBS metrics	Updated the EBS metrics to include two new metrics for Provisioned IOPS volumes.	November 20, 2012

Change	Description	Release date
New billing alerts	You can now monitor your AWS charges using Amazon CloudWatch metrics and create alarms to notify you when you have exceeded the specified threshold. For more information, see Create a billing alarm to monitor your estimated AWS charges.	May 10, 2012
New metrics	You can now access six new Elastic Load Balancing metrics that provide counts of various HTTP response codes.	October 19, 2011
New feature	You can now access metrics from Amazon EMR.	June 30, 2011
New feature	You can now access metrics from Amazon Simple Notification Service and Amazon Simple Queue Service.	July 14, 2011
New Feature	Added information about using the `PutMetricData` API to publish custom metrics. For more information, see Publish custom metrics.	May 10, 2011
Updated metrics retention	Amazon CloudWatch now retains the history of an alarm for two weeks rather than six weeks. With this change, the retention period for alarms matches the retention period for metrics data.	April 7, 2011
New feature	Added ability to send Amazon Simple Notification Service or Auto Scaling notifications when a metric has crossed a threshold. For more information, see Alarms.	December 2, 2010
New feature	A number of CloudWatch actions now include the MaxRecords and NextToken parameters, which enable you to control pages of results to display.	December 2, 2010

Change	Description	Release date
New feature	This service now integrates with AWS Identity and Access Management (IAM).	December 2, 2010
