Occlusion queries track the number of samples that pass the per-fragment tests for a set of drawing commands. As such, occlusion queries are only available on queue families supporting graphics operations. The application **can** then use these results to inform future rendering decisions. An occlusion query is begun and ended by calling `vkCmdBeginQuery` and `vkCmdEndQuery`, respectively. When an occlusion query begins, the count of passing samples always starts at zero. For each drawing command, the count is incremented as described in [Sample Counting](#). If `flags` does not contain `VK_QUERY_CONTROL_PRECISE_BIT` an implementation **may** generate any non-zero result value for the query if the count of passing samples is non-zero.

NOTE

Not setting `VK_QUERY_CONTROL_PRECISE_BIT` mode **may** be more efficient on some implementations, and **should** be used where it is sufficient to know a boolean result on whether any samples passed the per-fragment tests. In this case, some implementations **may** only return zero or one, indifferent to the actual number of

samples passing the per-fragment tests.

Setting `VK_QUERY_CONTROL_PRECISE_BIT` does not guarantee that different implementations return the same number of samples in an occlusion query. Some implementations may kill fragments in the [pre-rasterization shader stage](#), and these killed fragments do not contribute to the final result of the query. It is possible that some implementations generate a zero result value for the query, while others generate a non-zero value.

When an occlusion query finishes, the result for that query is marked as available. The application **can** then either copy the result to a buffer (via `vkCmdCopyQueryPoolResults`) or request it be put into host memory (via `vkGetQueryPoolResults`).

NOTE

If occluding geometry is not drawn first, samples **can** pass the depth test, but still not be visible in a final image.

18.4. Pipeline Statistics Queries

Pipeline statistics queries allow the application to sample a specified set of `VkPipeline` counters. These counters are accumulated by Vulkan for a set of either drawing or dispatching commands while a pipeline statistics query is active. As such, pipeline statistics queries are available on queue families supporting either graphics or compute operations. The availability of pipeline statistics queries is indicated by the `pipelineStatisticsQuery` member of the `VkPhysicalDeviceFeatures` object (see `vkGetPhysicalDeviceFeatures` and `vkCreateDevice` for detecting and requesting this query type on a `VkDevice`).

A pipeline statistics query is begun and ended by calling `vkCmdBeginQuery` and `vkCmdEndQuery`, respectively. When a pipeline statistics query begins, all statistics counters are set to zero. While the query is active, the pipeline type determines which set of statistics are available, but these **must** be configured on the query pool when it is created. If a statistic counter is issued on a command buffer that does not support the corresponding operation, or the counter corresponds to a shading stage which is missing from any of the pipelines used while the query is active, the value of that counter is undefined after the query has been made available. At least one statistic counter relevant to the operations supported on the recording command buffer **must** be enabled.

Bits which **can** be set in `VkQueryPoolCreateInfo::pipelineStatistics` for query pools and in `VkCommandBufferInheritanceInfo::pipelineStatistics` for secondary command buffers, individually enabling pipeline statistics counters, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkQueryPipelineStatisticFlagBits {
    VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT = 0x00000001,
    VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT = 0x00000002,
    VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT = 0x00000004,
    VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT = 0x00000008,
    VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT = 0x00000010,
    VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT = 0x00000020,
    VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT = 0x00000040,
    VK_QUERY_PIPELINE_STATISTIC_FRAGMENT_SHADER_INVOCATIONS_BIT = 0x00000080,
    VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT = 0x00000100,
    VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT =
0x00000200,
    VK_QUERY_PIPELINE_STATISTIC_COMPUTE_SHADER_INVOCATIONS_BIT = 0x00000400,
} VkQueryPipelineStatisticFlagBits;
```

- **VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT** specifies that queries managed by the pool will count the number of vertices processed by the **input assembly** stage. Vertices corresponding to incomplete primitives **may** contribute to the count.
- **VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT** specifies that queries managed by the pool will count the number of primitives processed by the **input assembly** stage. If primitive restart is enabled, restarting the primitive topology has no effect on the count. Incomplete primitives **may** be counted.
- **VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of vertex shader invocations. This counter's value is incremented each time a vertex shader is **invoked**.
- **VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of geometry shader invocations. This counter's value is incremented each time a geometry shader is **invoked**. In the case of **instanced geometry shaders**, the geometry shader invocations count is incremented for each separate instanced invocation.
- **VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT** specifies that queries managed by the pool will count the number of primitives generated by geometry shader invocations. The counter's value is incremented each time the geometry shader emits a primitive. Restarting primitive topology using the SPIR-V instructions **OpEndPrimitive** or **OpEndStreamPrimitive** has no effect on the geometry shader output primitives count.
- **VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of primitives processed by the **Primitive Clipping** stage of the pipeline. The counter's value is incremented each time a primitive reaches the primitive clipping stage.
- **VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT** specifies that queries managed by the pool will count the number of primitives output by the **Primitive Clipping** stage of the pipeline. The counter's value is incremented each time a primitive passes the primitive clipping stage. The actual number of primitives output by the primitive clipping stage for a particular input primitive is implementation-dependent but **must** satisfy the following conditions:

- If at least one vertex of the input primitive lies inside the clipping volume, the counter is incremented by one or more.
- Otherwise, the counter is incremented by zero or more.
- `VK_QUERY_PIPELINE_STATISTIC_FRAGMENT_SHADER_INVOCATIONS_BIT` specifies that queries managed by the pool will count the number of fragment shader invocations. The counter's value is incremented each time the fragment shader is [invoked](#).
- `VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT` specifies that queries managed by the pool will count the number of patches processed by the tessellation control shader. The counter's value is incremented once for each patch for which a tessellation control shader is [invoked](#).
- `VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT` specifies that queries managed by the pool will count the number of invocations of the tessellation evaluation shader. The counter's value is incremented each time the tessellation evaluation shader is [invoked](#).
- `VK_QUERY_PIPELINE_STATISTIC_COMPUTE_SHADER_INVOCATIONS_BIT` specifies that queries managed by the pool will count the number of compute shader invocations. The counter's value is incremented every time the compute shader is invoked. Implementations **may** skip the execution of certain compute shader invocations or execute additional compute shader invocations for implementation-dependent reasons as long as the results of rendering otherwise remain unchanged.

These values are intended to measure relative statistics on one implementation. Various device architectures will count these values differently. Any or all counters **may** be affected by the issues described in [Query Operation](#).

NOTE

For example, tile-based rendering devices **may** need to replay the scene multiple times, affecting some of the counts.

If a pipeline has `rasterizerDiscardEnable` enabled, implementations **may** discard primitives after the final [pre-rasterization shader stage](#). As a result, if `rasterizerDiscardEnable` is enabled, the clipping input and output primitives counters **may** not be incremented.

When a pipeline statistics query finishes, the result for that query is marked as available. The application **can** copy the result to a buffer (via `vkCmdCopyQueryPoolResults`), or request it be put into host memory (via `vkGetQueryPoolResults`).

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryPipelineStatisticFlags;
```

`VkQueryPipelineStatisticFlags` is a bitmask type for setting a mask of zero or more [VkQueryPipelineStatisticFlagBits](#).

18.5. Timestamp Queries

Timestamps provide applications with a mechanism for monotonically tracking the execution of

commands. A timestamp is an integer value generated by the `VkPhysicalDevice`. Unlike other queries, timestamps do not operate over a range, and so do not use `vkCmdBeginQuery` or `vkCmdEndQuery`. The mechanism is built around a set of commands that allow the application to tell the `VkPhysicalDevice` to write timestamp values to a `query pool` and then either read timestamp values on the host (using `vkGetQueryPoolResults`) or copy timestamp values to a `VkBuffer` (using `vkCmdCopyQueryPoolResults`).

The number of valid bits in a timestamp value is determined by the `VkQueueFamilyProperties::timestampValidBits` property of the queue on which the timestamp is written. Timestamps are supported on any queue which reports a non-zero value for `timestampValidBits` via `vkGetPhysicalDeviceQueueFamilyProperties`. If the `timestampComputeAndGraphics` limit is `VK_TRUE`, timestamps are supported by every queue family that supports either graphics or compute operations (see `VkQueueFamilyProperties`).

The number of nanoseconds it takes for a timestamp value to be incremented by 1 **can** be obtained from `VkPhysicalDeviceLimits::timestampPeriod` after a call to `vkGetPhysicalDeviceProperties`.

To request a timestamp and write the value to memory, call:

```
// Provided by VK_KHR_synchronization2
void vkCmdWriteTimestamp2KHR(
    VkCommandBuffer          commandBuffer,
    VkPipelineStageFlags2    stage,
    VkQueryPool              queryPool,
    uint32_t                 query);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `stage` specifies a stage of the pipeline.
- `queryPool` is the query pool that will manage the timestamp.
- `query` is the query within the query pool that will contain the timestamp.

When `vkCmdWriteTimestamp2KHR` is submitted to a queue, it defines an execution dependency on commands that were submitted before it, and writes a timestamp to a query pool.

The first `synchronization scope` includes all commands that occur earlier in `submission order`. The synchronization scope is limited to operations on the pipeline stage specified by `stage`.

The second `synchronization scope` includes only the timestamp write operation.

NOTE

Implementations may write the timestamp at any stage that is `logically later` than `stage`.

Any timestamp write that `happens-after` another timestamp write in the same submission **must** not have a lower value unless its value overflows the maximum supported integer bit width of the query. If `VK_KHR_calibrated_timestamps` is enabled, this extends to timestamp writes across all submissions on the same logical device: any timestamp write that `happens-after` another **must** not have a lower value unless its value overflows the maximum supported integer bit width of the

query. Timestamps written by this command **must** be in the `VK_TIME_DOMAIN_DEVICE_KHR` time domain. If an overflow occurs, the timestamp value **must** wrap back to zero.

If `vkCmdWriteTimestamp2KHR` is called while executing a render pass instance that has multiview enabled, the timestamp uses N consecutive query indices in the query pool (starting at `query`) where N is the number of bits set in the view mask of the subpass the command is executed in. The resulting query values are determined by an implementation-dependent choice of one of the following behaviors:

- The first query is a timestamp value and (if more than one bit is set in the view mask) zero is written to the remaining queries.
- All N queries are timestamp values.

Either way, if two timestamps are written in the same subpass with multiview enabled, each of the N consecutive queries written for a timestamp **must** not have a lower value than the queries with corresponding indices written by the timestamp that happens-before unless the value overflows the maximum supported integer bit width of the query.

Valid Usage

- VUID-vkCmdWriteTimestamp2-stage-03929
If the `geometryShader` feature is not enabled, `stage` **must** not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`
- VUID-vkCmdWriteTimestamp2-stage-03930
If the `tessellationShader` feature is not enabled, `stage` **must** not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-vkCmdWriteTimestamp2-stage-07317
If the `attachmentFragmentShadingRate` feature is not enabled, `stage` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-vkCmdWriteTimestamp2-synchronization2-03858
The `synchronization2` feature **must** be enabled
- VUID-vkCmdWriteTimestamp2-stage-03859
`stage` **must** only include a single pipeline stage
- VUID-vkCmdWriteTimestamp2-stage-03860
`stage` **must** only include stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from
- VUID-vkCmdWriteTimestamp2-queryPool-03861
`queryPool` **must** have been created with a `queryType` of `VK_QUERY_TYPE_TIMESTAMP`
- VUID-vkCmdWriteTimestamp2-timestampValidBits-03863
The command pool's queue family **must** support a non-zero `timestampValidBits`
- VUID-vkCmdWriteTimestamp2-query-04903
`query` **must** be less than the number of queries in `queryPool`
- VUID-vkCmdWriteTimestamp2-None-03864

All queries used by the command **must** be *unavailable*

- VUID-vkCmdWriteTimestamp2-query-03865

If `vkCmdWriteTimestamp2KHR` is called within a render pass instance, the sum of `query` and the number of bits set in the current subpass's view mask **must** be less than or equal to the number of queries in `queryPool`

Valid Usage (Implicit)

- VUID-vkCmdWriteTimestamp2-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdWriteTimestamp2-stage-parameter
`stage` **must** be a valid combination of `VkPipelineStageFlagBits2` values
- VUID-vkCmdWriteTimestamp2-queryPool-parameter
`queryPool` **must** be a valid `VkQueryPool` handle
- VUID-vkCmdWriteTimestamp2-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdWriteTimestamp2-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, `VK_QUEUE_GRAPHICS_BIT`, or `VK_QUEUE_TRANSFER_BIT` operations
- VUID-vkCmdWriteTimestamp2-commonparent
Both of `commandBuffer`, and `queryPool` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_TRANSFER_BIT	Action

To request a timestamp and write the value to memory, call:

```
// Provided by VK_VERSION_1_0
void vkCmdWriteTimestamp(
    VkCommandBuffer          commandBuffer,
    VkPipelineStageFlagBits  pipelineStage,
    VkQueryPool              queryPool,
    uint32_t                 query);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pipelineStage` is a `VkPipelineStageFlagBits` value, specifying a stage of the pipeline.
- `queryPool` is the query pool that will manage the timestamp.
- `query` is the query within the query pool that will contain the timestamp.

When `vkCmdWriteTimestamp` is submitted to a queue, it defines an execution dependency on commands that were submitted before it, and writes a timestamp to a query pool.

The first [synchronization scope](#) includes all commands that occur earlier in [submission order](#). The synchronization scope is limited to operations on the pipeline stage specified by `pipelineStage`.

The second [synchronization scope](#) includes only the timestamp write operation.

NOTE

Implementations may write the timestamp at any stage that is [logically later](#) than [stage](#).

Any timestamp write that [happens-after](#) another timestamp write in the same submission **must** not have a lower value unless its value overflows the maximum supported integer bit width of the query. If `VK_KHR_calibrated_timestamps` is enabled, this extends to timestamp writes across all submissions on the same logical device: any timestamp write that [happens-after](#) another **must** not have a lower value unless its value overflows the maximum supported integer bit width of the query. Timestamps written by this command **must** be in the `VK_TIME_DOMAIN_DEVICE_KHR` [time domain](#). If an overflow occurs, the timestamp value **must** wrap back to zero.

If `vkCmdWriteTimestamp` is called while executing a render pass instance that has multiview enabled, the timestamp uses N consecutive query indices in the query pool (starting at `query`) where N is the number of bits set in the view mask of the subpass the command is executed in. The resulting query values are determined by an implementation-dependent choice of one of the following behaviors:

- The first query is a timestamp value and (if more than one bit is set in the view mask) zero is written to the remaining queries.
- All N queries are timestamp values.

Either way, if two timestamps are written in the same subpass with multiview enabled, each of the N consecutive queries written for a timestamp **must** not have a lower value than the queries with corresponding indices written by the timestamp that happens-before unless the value overflows the maximum supported integer bit width of the query.

Valid Usage

- VUID-vkCmdWriteTimestamp-pipelineStage-04074
`pipelineStage` **must** be a `valid stage` for the queue family that was used to create the command pool that `commandBuffer` was allocated from
- VUID-vkCmdWriteTimestamp-pipelineStage-04075
If the `geometryShader` feature is not enabled, `pipelineStage` **must** not be `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- VUID-vkCmdWriteTimestamp-pipelineStage-04076
If the `tessellationShader` feature is not enabled, `pipelineStage` **must** not be `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-vkCmdWriteTimestamp-fragmentShadingRate-07315
If the `attachmentFragmentShadingRate` feature is not enabled, `pipelineStage` **must** not be `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-vkCmdWriteTimestamp-synchronization2-06489
If the `synchronization2` feature is not enabled, `pipelineStage` **must** not be `VK_PIPELINE_STAGE_NONE`
- VUID-vkCmdWriteTimestamp-queryPool-01416
`queryPool` **must** have been created with a `queryType` of `VK_QUERY_TYPE_TIMESTAMP`
- VUID-vkCmdWriteTimestamp-timestampValidBits-00829
The command pool's queue family **must** support a non-zero `timestampValidBits`
- VUID-vkCmdWriteTimestamp-query-04904
`query` **must** be less than the number of queries in `queryPool`
- VUID-vkCmdWriteTimestamp-None-00830
All queries used by the command **must** be *unavailable*
- VUID-vkCmdWriteTimestamp-query-00831
If `vkCmdWriteTimestamp` is called within a render pass instance, the sum of `query` and the number of bits set in the current subpass's view mask **must** be less than or equal to the number of queries in `queryPool`

Valid Usage (Implicit)

- VUID-vkCmdWriteTimestamp-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdWriteTimestamp-pipelineStage-parameter
`pipelineStage` **must** be a valid `VkPipelineStageFlagBits` value
- VUID-vkCmdWriteTimestamp-queryPool-parameter
`queryPool` **must** be a valid `VkQueryPool` handle
- VUID-vkCmdWriteTimestamp-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`

- VUID-vkCmdWriteTimestamp-commandBuffer-cmdpool

The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, `VK_QUEUE_GRAPHICS_BIT`, or `VK_QUEUE_TRANSFER_BIT` operations

- VUID-vkCmdWriteTimestamp-commonparent

Both of `commandBuffer`, and `queryPool` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_TRANSFER_BIT	Action

18.6. Performance Queries

Performance queries provide applications with a mechanism for getting performance counter information about the execution of command buffers, render passes, and commands.

Each queue family advertises the performance counters that **can** be queried on a queue of that family via a call to `vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR`. Implementations **may** limit access to performance counters based on platform requirements or only to specialized drivers for development purposes.

NOTE

This may include no performance counters being enumerated, or a reduced set. Please refer to platform-specific documentation for guidance on any such restrictions.

Performance queries use the existing `vkCmdBeginQuery` and `vkCmdEndQuery` to control what command buffers, render passes, or commands to get performance information for.

Implementations **may** require multiple passes where the command buffer, render passes, or commands being recorded are the same and are executed on the same queue to record

performance counter data. This is achieved by submitting the same batch and providing a [VkPerformanceQuerySubmitInfoKHR](#) structure containing a counter pass index. The number of passes required for a given performance query pool **can** be queried via a call to [vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR](#).

NOTE

Command buffers recorded with `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` **must** not be re-submitted. Changing command buffer usage bits **may** affect performance. To avoid this, the application **should** re-record any command buffers with the `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` when multiple counter passes are required.

Performance counter results from a performance query pool **can** be obtained with the command [vkGetQueryPoolResults](#).

The [VkPerformanceCounterResultKHR](#) union is defined as:

```
// Provided by VK_KHR_performance_query
typedef union VkPerformanceCounterResultKHR {
    int32_t      int32;
    int64_t      int64;
    uint32_t     uint32;
    uint64_t     uint64;
    float        float32;
    double       float64;
} VkPerformanceCounterResultKHR;
```

- `int32` is a 32-bit signed integer value.
- `int64` is a 64-bit signed integer value.
- `uint32` is a 32-bit unsigned integer value.
- `uint64` is a 64-bit unsigned integer value.
- `float32` is a 32-bit floating-point value.
- `float64` is a 64-bit floating-point value.

Performance query results are returned in an array of [VkPerformanceCounterResultKHR](#) unions containing the data associated with each counter in the query, stored in the same order as the counters supplied in `pCounterIndices` when creating the performance query. [VkPerformanceCounterKHR::storage](#) specifies how to parse the counter data.

18.6.1. Profiling Lock

To record and submit a command buffer containing a performance query pool the profiling lock **must** be held. The profiling lock **must** be acquired prior to any call to [vkBeginCommandBuffer](#) that will be using a performance query pool. The profiling lock **must** be held while any command buffer containing a performance query pool is in the *recording*, *executable*, or *pending state*. To acquire the profiling lock, call:

```
// Provided by VK_KHR_performance_query
VkResult vkAcquireProfilingLockKHR(
    VkDevice device,
    const VkAcquireProfilingLockInfoKHR* pInfo);
```

- **device** is the logical device to profile.
- **pInfo** is a pointer to a [VkAcquireProfilingLockInfoKHR](#) structure containing information about how the profiling is to be acquired.

Implementations **may** allow multiple actors to hold the profiling lock concurrently.

If [VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations](#) is **VK_TRUE**, **vkAcquireProfilingLockKHR** **must** not return **VK_ERROR_OUT_OF_HOST_MEMORY**.

Valid Usage (Implicit)

- VUID-vkAcquireProfilingLockKHR-device-parameter **device** **must** be a valid [VkDevice](#) handle
- VUID-vkAcquireProfilingLockKHR-pInfo-parameter **pInfo** **must** be a valid pointer to a valid [VkAcquireProfilingLockInfoKHR](#) structure

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_UNKNOWN**
- **VK_ERROR_VALIDATION_FAILED**
- **VK_TIMEOUT**

The **VkAcquireProfilingLockInfoKHR** structure is defined as:

```
// Provided by VK_KHR_performance_query
typedef struct VkAcquireProfilingLockInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAcquireProfilingLockFlagsKHR flags;
    uint64_t timeout;
} VkAcquireProfilingLockInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `timeout` indicates how long the function waits, in nanoseconds, if the profiling lock is not available.

Valid Usage (Implicit)

- VUID-VkAcquireProfilingLockInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_ACQUIRE_PROFILING_LOCK_INFO_KHR`
- VUID-VkAcquireProfilingLockInfoKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkAcquireProfilingLockInfoKHR-flags-zero bitmask
`flags` **must** be 0

If `timeout` is 0, `vkAcquireProfilingLockKHR` will not block while attempting to acquire the profiling lock. If `timeout` is `UINT64_MAX`, the function will not return until the profiling lock was acquired.

```
// Provided by VK_KHR_performance_query
typedef enum VkAcquireProfilingLockFlagBitsKHR {
} VkAcquireProfilingLockFlagBitsKHR;
```

```
// Provided by VK_KHR_performance_query
typedef VkFlags VkAcquireProfilingLockFlagsKHR;
```

`VkAcquireProfilingLockFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

To release the profiling lock, call:

```
// Provided by VK_KHR_performance_query
void vkReleaseProfilingLockKHR(
    VkDevice device);
```

- `device` is the logical device to cease profiling on.

Valid Usage

- VUID-vkReleaseProfilingLockKHR-device-03235
The profiling lock of `device` **must** have been held via a previous successful call to `vkAcquireProfilingLockKHR`

Valid Usage (Implicit)

- VUID-vkReleaseProfilingLockKHR-device-parameter **device** must be a valid [VkDevice](#) handle

Chapter 19. Clear Commands

19.1. Clearing Images Outside a Render Pass Instance

Color and depth/stencil images **can** be cleared outside a render pass instance using [vkCmdClearColorImage](#) or [vkCmdClearDepthStencilImage](#), respectively. These commands are only allowed outside of a render pass instance.

To clear one or more subranges of a color image, call:

```
// Provided by VK_VERSION_1_0
void vkCmdClearColorImage(
    VkCommandBuffer          commandBuffer,
    VkImage                  image,
    VkImageLayout             imageLayout,
    const VkClearColorValue* pColor,
    uint32_t                  rangeCount,
    const VkImageSubresourceRange* pRanges);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `image` is the image to be cleared.
- `imageLayout` specifies the current layout of the image subresource ranges to be cleared, and **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`.
- `pColor` is a pointer to a [VkClearColorValue](#) structure containing the values that the image subresource ranges will be cleared to (see [Clear Values](#) below).
- `rangeCount` is the number of image subresource range structures in `pRanges`.
- `pRanges` is a pointer to an array of [VkImageSubresourceRange](#) structures describing a range of mipmap levels, array layers, and aspects to be cleared, as described in [Image Views](#).

Each specified range in `pRanges` is cleared to the value specified by `pColor`.

Valid Usage

- VUID-vkCmdClearColorImage-image-01993
The [format features](#) of `image` **must** contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`
- VUID-vkCmdClearColorImage-image-00002
`image` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag
- VUID-vkCmdClearColorImage-image-01545
`image` **must** not use any of the [formats that require a sampler Y'C_BC_R conversion](#)
- VUID-vkCmdClearColorImage-image-00003
If `image` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdClearColorImage-imageLayout-00004
`imageLayout` **must** specify the layout of the image subresource ranges of `image` specified in `pRanges` at the time this command is executed on a `VkDevice`
- VUID-vkCmdClearColorImage-imageLayout-01394
`imageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`
- VUID-vkCmdClearColorImage-aspectMask-02498
The `VkImageSubresourceRange::aspectMask` members of the elements of the `pRanges` array **must** each only include `VK_IMAGE_ASPECT_COLOR_BIT`
- VUID-vkCmdClearColorImage-baseMipLevel-01470
The `VkImageSubresourceRange::baseMipLevel` members of the elements of the `pRanges` array **must** each be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created
- VUID-vkCmdClearColorImage-pRanges-01692
For each `VkImageSubresourceRange` element of `pRanges`, if the `levelCount` member is not `VK_REMAINING_MIP_LEVELS`, then `baseMipLevel` + `levelCount` **must** be less than or equal to the `mipLevels` specified in `VkImageCreateInfo` when `image` was created
- VUID-vkCmdClearColorImage-baseArrayLayer-01472
The `VkImageSubresourceRange::baseArrayLayer` members of the elements of the `pRanges` array **must** each be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created
- VUID-vkCmdClearColorImage-pRanges-01693
For each `VkImageSubresourceRange` element of `pRanges`, if the `layerCount` member is not `VK_REMAINING_ARRAY_LAYERS`, then `baseArrayLayer` + `layerCount` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created
- VUID-vkCmdClearColorImage-image-00007
`image` **must** not have a compressed or depth/stencil format
- VUID-vkCmdClearColorImage-pColor-04961
`pColor` **must** be a valid pointer to a `VkClearColorValue` union
- VUID-vkCmdClearColorImage-commandBuffer-01805
If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `image` **must** not be a protected image
- VUID-vkCmdClearColorImage-commandBuffer-01806
If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, **must** not be an unprotected image
- VUID-vkCmdClearColorImage-image-09678
If `image`'s format has components other than R and G, it **must** not have a 64-bit component width

Valid Usage (Implicit)

- VUID-vkCmdClearColorImage-commandBuffer-parameter

`commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdClearColorImage-image-parameter
`image` **must** be a valid `VkImage` handle
- VUID-vkCmdClearColorImage-imageLayout-parameter
`imageLayout` **must** be a valid `VkImageLayout` value
- VUID-vkCmdClearColorImage-pRanges-parameter
`pRanges` **must** be a valid pointer to an array of `rangeCount` valid `VkImageSubresourceRange` structures
- VUID-vkCmdClearColorImage-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdClearColorImage-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, or `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdClearColorImage-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdClearColorImage-rangeCount-arraylength
`rangeCount` **must** be greater than 0
- VUID-vkCmdClearColorImage-commonparent
Both of `commandBuffer`, and `image` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT	Action

To clear one or more subranges of a depth/stencil image, call:

```
// Provided by VK_VERSION_1_0
void vkCmdClearDepthStencilImage(
    VkCommandBuffer          commandBuffer,
    VkImage                  image,
    VkImageLayout            imageLayout,
    const VkClearDepthStencilValue* pDepthStencil,
    uint32_t                 rangeCount,
    const VkImageSubresourceRange* pRanges);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **image** is the image to be cleared.
- **imageLayout** specifies the current layout of the image subresource ranges to be cleared, and **must** be **VK_IMAGE_LAYOUT_GENERAL** or **VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL**.
- **pDepthStencil** is a pointer to a **VkClearDepthStencilValue** structure containing the values that the depth and stencil image subresource ranges will be cleared to (see **Clear Values** below).
- **rangeCount** is the number of image subresource range structures in **pRanges**.
- **pRanges** is a pointer to an array of **VkImageSubresourceRange** structures describing a range of mipmap levels, array layers, and aspects to be cleared, as described in **Image Views**.

Valid Usage

- VUID-vkCmdClearDepthStencilImage-image-01994
The **format features** of **image** **must** contain **VK_FORMAT_FEATURE_TRANSFER_DST_BIT**
- VUID-vkCmdClearDepthStencilImage-pRanges-02658
If the **aspect** member of any element of **pRanges** includes **VK_IMAGE_ASPECT_STENCIL_BIT**, and **image** was created with **separate stencil usage**, **VK_IMAGE_USAGE_TRANSFER_DST_BIT** **must** have been included in the **VkImageStencilUsageCreateInfo::stencilUsage** used to create **image**
- VUID-vkCmdClearDepthStencilImage-pRanges-02659
If the **aspect** member of any element of **pRanges** includes **VK_IMAGE_ASPECT_STENCIL_BIT**, and **image** was not created with **separate stencil usage**, **VK_IMAGE_USAGE_TRANSFER_DST_BIT** **must** have been included in the **VkImageCreateInfo::usage** used to create **image**
- VUID-vkCmdClearDepthStencilImage-pRanges-02660
If the **aspect** member of any element of **pRanges** includes **VK_IMAGE_ASPECT_DEPTH_BIT**, **VK_IMAGE_USAGE_TRANSFER_DST_BIT** **must** have been included in the **VkImageCreateInfo::usage** used to create **image**
- VUID-vkCmdClearDepthStencilImage-image-00010
If **image** is non-sparse then it **must** be bound completely and contiguously to a single **VkDeviceMemory** object
- VUID-vkCmdClearDepthStencilImage-imageLayout-00011
imageLayout **must** specify the layout of the image subresource ranges of **image** specified in **pRanges** at the time this command is executed on a **VkDevice**
- VUID-vkCmdClearDepthStencilImage-imageLayout-00012

`imageLayout` **must** be either of `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`

- VUID-vkCmdClearDepthStencilImage-aspectMask-02824

The `VkImageSubresourceRange::aspectMask` member of each element of the `pRanges` array **must** not include bits other than `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`

- VUID-vkCmdClearDepthStencilImage-image-02825

If the `image`'s format does not have a stencil component, then the `VkImageSubresourceRange::aspectMask` member of each element of the `pRanges` array **must** not include the `VK_IMAGE_ASPECT_STENCIL_BIT` bit

- VUID-vkCmdClearDepthStencilImage-image-02826

If the `image`'s format does not have a depth component, then the `VkImageSubresourceRange::aspectMask` member of each element of the `pRanges` array **must** not include the `VK_IMAGE_ASPECT_DEPTH_BIT` bit

- VUID-vkCmdClearDepthStencilImage-baseMipLevel-01474

The `VkImageSubresourceRange::baseMipLevel` members of the elements of the `pRanges` array **must** each be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created

- VUID-vkCmdClearDepthStencilImage-pRanges-01694

For each `VkImageSubresourceRange` element of `pRanges`, if the `levelCount` member is not `VK_REMAINING_MIP_LEVELS`, then `baseMipLevel + levelCount` **must** be less than or equal to the `mipLevels` specified in `VkImageCreateInfo` when `image` was created

- VUID-vkCmdClearDepthStencilImage-baseArrayLayer-01476

The `VkImageSubresourceRange::baseArrayLayer` members of the elements of the `pRanges` array **must** each be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created

- VUID-vkCmdClearDepthStencilImage-pRanges-01695

For each `VkImageSubresourceRange` element of `pRanges`, if the `layerCount` member is not `VK_REMAINING_ARRAY_LAYERS`, then `baseArrayLayer + layerCount` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created

- VUID-vkCmdClearDepthStencilImage-image-00014

`image` **must** have a depth/stencil format

- VUID-vkCmdClearDepthStencilImage-commandBuffer-01807

If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `image` **must** not be a protected image

- VUID-vkCmdClearDepthStencilImage-commandBuffer-01808

If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `image` **must** not be an unprotected image

Valid Usage (Implicit)

- VUID-vkCmdClearDepthStencilImage-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdClearDepthStencilImage-image-parameter
image **must** be a valid [VkImage](#) handle
- VUID-vkCmdClearDepthStencilImage-imageLayout-parameter
imageLayout **must** be a valid [VkImageLayout](#) value
- VUID-vkCmdClearDepthStencilImage-pDepthStencil-parameter
pDepthStencil **must** be a valid pointer to a valid [VkClearDepthStencilValue](#) structure
- VUID-vkCmdClearDepthStencilImage-pRanges-parameter
pRanges **must** be a valid pointer to an array of **rangeCount** valid [VkImageSubresourceRange](#) structures
- VUID-vkCmdClearDepthStencilImage-commandBuffer-recording
commandBuffer **must** be in the [recording state](#)
- VUID-vkCmdClearDepthStencilImage-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support [VK_QUEUE_GRAPHICS_BIT](#) operations
- VUID-vkCmdClearDepthStencilImage-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdClearDepthStencilImage-rangeCount-arraylength
rangeCount **must** be greater than 0
- VUID-vkCmdClearDepthStencilImage-commonparent
Both of **commandBuffer**, and **image** **must** have been created, allocated, or retrieved from the same [VkDevice](#)

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	VK_QUEUE_GRAPHIC S_BIT	Action

Clears outside render pass instances are treated as transfer operations for the purposes of memory barriers.

19.2. Clearing Images Inside a Render Pass Instance

To clear one or more regions of color and depth/stencil attachments inside a render pass instance, call:

```
// Provided by VK_VERSION_1_0
void vkCmdClearAttachments(
    VkCommandBuffer          commandBuffer,
    uint32_t                 attachmentCount,
    const VkClearAttachment* pAttachments,
    uint32_t                 rectCount,
    const VkClearRect*       pRects);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `attachmentCount` is the number of entries in the `pAttachments` array.
- `pAttachments` is a pointer to an array of `VkClearAttachment` structures defining the attachments to clear and the clear values to use.
- `rectCount` is the number of entries in the `pRects` array.
- `pRects` is a pointer to an array of `VkClearRect` structures defining regions to clear for every attachment in `pAttachments`.

Unlike other [clear commands](#), `vkCmdClearAttachments` is not a transfer command. It performs its operations in [rasterization order](#). For color attachments, the operations are executed as color attachment writes, by the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` stage. For depth/stencil attachments, the operations are executed as [depth writes](#) and [stencil writes](#) by the `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` and `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` stages.

`vkCmdClearAttachments` is not affected by the bound pipeline state.

NOTE	It is generally preferable to clear attachments by using the <code>VK_ATTACHMENT_LOAD_OP_CLEAR</code> load operation at the start of rendering, as it is more efficient on some implementations.

If any attachment's `aspectMask` to be cleared is not backed by an image view, the clear has no effect on that aspect.

If an attachment being cleared refers to an image view created with an `aspectMask` equal to one of `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT` or `VK_IMAGE_ASPECT_PLANE_2_BIT`, it is considered to be `VK_IMAGE_ASPECT_COLOR_BIT` for purposes of this command, and **must** be cleared with the `VK_IMAGE_ASPECT_COLOR_BIT` aspect as specified by [image view creation](#).

Valid Usage

- VUID-vkCmdClearAttachments-aspectMask-07884

If the `aspectMask` member of any element of `pAttachments` contains `VK_IMAGE_ASPECT_DEPTH_BIT`, the current subpass instance's depth-stencil attachment **must**

be either `VK_ATTACHMENT_UNUSED` or the attachment `format` **must** contain a depth component

- VUID-vkCmdClearAttachments-aspectMask-07885

If the `aspectMask` member of any element of `pAttachments` contains `VK_IMAGE_ASPECT_STENCIL_BIT`, the current subpass instance's depth-stencil attachment **must** be either `VK_ATTACHMENT_UNUSED` or the attachment `format` **must** contain a stencil component

- VUID-vkCmdClearAttachments-aspectMask-07271

If the `aspectMask` member of any element of `pAttachments` contains `VK_IMAGE_ASPECT_COLOR_BIT`, the `colorAttachment` **must** be a valid color attachment index in the current render pass instance

- VUID-vkCmdClearAttachments-rect-02682

The `rect` member of each element of `pRects` **must** have an `extent.width` greater than 0

- VUID-vkCmdClearAttachments-rect-02683

The `rect` member of each element of `pRects` **must** have an `extent.height` greater than 0

- VUID-vkCmdClearAttachments-pRects-00016

The rectangular region specified by each element of `pRects` **must** be contained within the render area of the current render pass instance

- VUID-vkCmdClearAttachments-pRects-06937

The layers specified by each element of `pRects` **must** be contained within every attachment that `pAttachments` refers to, i.e. for each element of `pRects`, `VkClearRect::baseArrayLayer` + `VkClearRect::layerCount` **must** be less than or equal to the number of layers rendered to in the current render pass instance

- VUID-vkCmdClearAttachments-layerCount-01934

The `layerCount` member of each element of `pRects` **must** not be 0

- VUID-vkCmdClearAttachments-commandBuffer-02504

If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, each attachment to be cleared **must** not be a protected image

- VUID-vkCmdClearAttachments-commandBuffer-02505

If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, each attachment to be cleared **must** not be an unprotected image

- VUID-vkCmdClearAttachments-baseArrayLayer-00018

If the render pass instance this is recorded in uses multiview, then `baseArrayLayer` **must** be zero and `layerCount` **must** be one

- VUID-vkCmdClearAttachments-None-09679

If the attachment format has components other than R and G, it **must** not have a 64-bit component width

Valid Usage (Implicit)

- VUID-vkCmdClearAttachments-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdClearAttachments-pAttachments-parameter

`pAttachments` **must** be a valid pointer to an array of `attachmentCount` valid `VkClearAttachment` structures

- VUID-vkCmdClearAttachments-pRects-parameter
`pRects` **must** be a valid pointer to an array of `rectCount` `VkClearRect` structures
- VUID-vkCmdClearAttachments-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdClearAttachments-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdClearAttachments-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdClearAttachments-attachmentCount-arraylength
`attachmentCount` **must** be greater than 0
- VUID-vkCmdClearAttachments-rectCount-arraylength
`rectCount` **must** be greater than 0

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Inside	VK_QUEUE_GRAPHICS_BIT	Action

The `VkClearRect` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkClearRect {
    VkRect2D    rect;
    uint32_t    baseArrayLayer;
    uint32_t    layerCount;
} VkClearRect;
```

- `rect` is the two-dimensional region to be cleared.
- `baseArrayLayer` is the first layer to be cleared.

- `layerCount` is the number of layers to clear.

The layers [`baseArrayLayer`, `baseArrayLayer` + `layerCount`) counting from the base layer of the attachment image view are cleared.

The `VkClearAttachment` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkClearAttachment {
    VkImageAspectFlags    aspectMask;
    uint32_t              colorAttachment;
    VkClearColorValue     clearColor;
} VkClearAttachment;
```

- `aspectMask` is a mask selecting the color, depth and/or stencil aspects of the attachment to be cleared.
- `colorAttachment` is only meaningful if `VK_IMAGE_ASPECT_COLOR_BIT` is set in `aspectMask`, in which case it is an index into the bound color attachments.
- `clearValue` is the color or depth/stencil value to clear the attachment to, as described in [Clear Values](#) below.

Valid Usage

- VUID-VkClearAttachment-aspectMask-00019
If `aspectMask` includes `VK_IMAGE_ASPECT_COLOR_BIT`, it **must** not include `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`
- VUID-VkClearAttachment-aspectMask-00020
`aspectMask` **must** not include `VK_IMAGE_ASPECT_METADATA_BIT`
- VUID-VkClearAttachment-aspectMask-02246
`aspectMask` **must** not include `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT` for any index *i*

Valid Usage (Implicit)

- VUID-VkClearAttachment-aspectMask-parameter
`aspectMask` **must** be a valid combination of `VkImageAspectFlagBits` values
- VUID-VkClearAttachment-aspectMask-requiredbitmask
`aspectMask` **must** not be 0

19.3. Clear Values

The `VkClearColorValue` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef union VkClearColorValue {
    float        float32[4];
    int32_t      int32[4];
    uint32_t     uint32[4];
} VkClearColorValue;
```

- **float32** are the color clear values when the format of the image or attachment is one of the **numeric formats** with a numeric type that is floating-point. Floating-point values are automatically converted to the format of the image, with the clear value being treated as linear if the image is sRGB.
- **int32** are the color clear values when the format of the image or attachment has a numeric type that is signed integer (**SINT**). Signed integer values are converted to the format of the image by casting to the smaller type (with negative 32-bit values mapping to negative values in the smaller type). If the integer clear value is not representable in the target type (e.g. would overflow in conversion to that type), the clear value is undefined.
- **uint32** are the color clear values when the format of the image or attachment has a numeric type that is unsigned integer (**UINT**). Unsigned integer values are converted to the format of the image by casting to the integer type with fewer bits.

The four array elements of the clear color map to R, G, B, and A components of image formats, in order.

If the image has more than one sample, the same value is written to all samples for any pixels being cleared.

If the image or attachment format has a 64-bit component width, the first 2 array elements of each of the arrays above are reinterpreted as a single 64-bit element for the R component. The next 2 array elements are used in the same way for the G component. In other words, the union behaves as if it had the following additional members:

```
double float64[2];
int64_t int64[2];
uint64_t uint64[2];
```

The **VkClearDepthStencilValue** structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkClearDepthStencilValue {
    float        depth;
    uint32_t     stencil;
} VkClearDepthStencilValue;
```

- **depth** is the clear value for the depth aspect of the depth/stencil attachment. It is a floating-point value which is automatically converted to the attachment's format.

- **stencil** is the clear value for the stencil aspect of the depth/stencil attachment. It is a 32-bit integer value which is converted to the attachment's format by taking the appropriate number of LSBs.

Valid Usage

- VUID-VkClearDepthStencilValue-depth-00022
Unless the `VK_EXT_depth_range_unrestricted` extension is enabled **depth** **must** be between **0.0** and **1.0**, inclusive

The `VkClearColorValue` union is defined as:

```
// Provided by VK_VERSION_1_0
typedef union VkClearColorValue {
    VkClearColorValue    color;
    VkClearDepthStencilValue    depthStencil;
} VkClearColorValue;
```

- **color** specifies the color image clear values to use when clearing a color image or attachment.
- **depthStencil** specifies the depth and stencil clear values to use when clearing a depth/stencil image or attachment.

This union is used where part of the API requires either color or depth/stencil clear values, depending on the attachment, and defines the initial clear values in the `VkRenderPassBeginInfo` structure.

19.4. Filling Buffers

To clear buffer data, call:

```
// Provided by VK_VERSION_1_0
void vkCmdFillBuffer(
    VkCommandBuffer    commandBuffer,
    VkBuffer            dstBuffer,
    VkDeviceSize        dstOffset,
    VkDeviceSize        size,
    uint32_t            data);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **dstBuffer** is the buffer to be filled.
- **dstOffset** is the byte offset into the buffer at which to start filling, and **must** be a multiple of 4.
- **size** is the number of bytes to fill, and **must** be either a multiple of 4, or `VK_WHOLE_SIZE` to fill the range from **offset** to the end of the buffer. If `VK_WHOLE_SIZE` is used and the remaining size of the buffer is not a multiple of 4, then the nearest smaller multiple is used.

- **data** is the 4-byte word written repeatedly to the buffer to fill **size** bytes of data. The data word is written to memory according to the host endianness.

vkCmdFillBuffer is treated as a “transfer” operation for the purposes of synchronization barriers. The **VK_BUFFER_USAGE_TRANSFER_DST_BIT** **must** be specified in **usage** of **VkBufferCreateInfo** in order for the buffer to be compatible with **vkCmdFillBuffer**.

Valid Usage

- VUID-vkCmdFillBuffer-dstOffset-00024
dstOffset **must** be less than the size of **dstBuffer**
- VUID-vkCmdFillBuffer-dstOffset-00025
dstOffset **must** be a multiple of 4
- VUID-vkCmdFillBuffer-size-00026
If **size** is not equal to **VK_WHOLE_SIZE**, **size** **must** be greater than 0
- VUID-vkCmdFillBuffer-size-00027
If **size** is not equal to **VK_WHOLE_SIZE**, **size** **must** be less than or equal to the size of **dstBuffer** minus **dstOffset**
- VUID-vkCmdFillBuffer-size-00028
If **size** is not equal to **VK_WHOLE_SIZE**, **size** **must** be a multiple of 4
- VUID-vkCmdFillBuffer-dstBuffer-00029
dstBuffer **must** have been created with **VK_BUFFER_USAGE_TRANSFER_DST_BIT** usage flag
- VUID-vkCmdFillBuffer-apiVersion-07894
VkCommandPool that **commandBuffer** was allocated from **must** support graphics or compute operations
- VUID-vkCmdFillBuffer-dstBuffer-00031
If **dstBuffer** is non-sparse then it **must** be bound completely and contiguously to a single **VkDeviceMemory** object
- VUID-vkCmdFillBuffer-commandBuffer-01811
If **commandBuffer** is an unprotected command buffer and **protectedNoFault** is not supported, **dstBuffer** **must** not be a protected buffer
- VUID-vkCmdFillBuffer-commandBuffer-01812
If **commandBuffer** is a protected command buffer and **protectedNoFault** is not supported, **dstBuffer** **must** not be an unprotected buffer

Valid Usage (Implicit)

- VUID-vkCmdFillBuffer-commandBuffer-parameter
commandBuffer **must** be a valid **VkCommandBuffer** handle
- VUID-vkCmdFillBuffer-dstBuffer-parameter
dstBuffer **must** be a valid **VkBuffer** handle
- VUID-vkCmdFillBuffer-commandBuffer-recording

`commandBuffer` **must** be in the `recording` state

- VUID-vkCmdFillBuffer-commandBuffer-cmdpool

The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, `VK_QUEUE_GRAPHICS_BIT`, or `VK_QUEUE_TRANSFER_BIT` operations

- VUID-vkCmdFillBuffer-renderpass

This command **must** only be called outside of a render pass instance

- VUID-vkCmdFillBuffer-commonparent

Both of `commandBuffer`, and `dstBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_TRANSFER_BIT	Action

19.5. Updating Buffers

To update buffer data inline in a command buffer, call:

```
// Provided by VK_VERSION_1_0
void vkCmdUpdateBuffer(
    VkCommandBuffer          commandBuffer,
    VkBuffer                 dstBuffer,
    VkDeviceSize             dstOffset,
    VkDeviceSize             dataSize,
    const void*              pData);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `dstBuffer` is a handle to the buffer to be updated.

- `dstOffset` is the byte offset into the buffer to start updating, and **must** be a multiple of 4.
- `dataSize` is the number of bytes to update, and **must** be a multiple of 4.
- `pData` is a pointer to the source data for the buffer update, and **must** be at least `dataSize` bytes in size.

`dataSize` **must** be less than or equal to 65536 bytes. For larger updates, applications **can** use buffer to buffer [copies](#).

NOTE

Buffer updates performed with `vkCmdUpdateBuffer` first copy the data into command buffer memory when the command is recorded (which requires additional storage and may incur an additional allocation), and then copy the data from the command buffer into `dstBuffer` when the command is executed on a device.

The additional cost of this functionality compared to [buffer to buffer copies](#) means it should only be used for very small amounts of data, and is why it is limited to at most 65536 bytes. Applications **can** work around this restriction by issuing multiple `vkCmdUpdateBuffer` commands to different ranges of the same buffer, but doing so is not recommended.

The source data is copied from `pData` to the command buffer when the command is called.

`vkCmdUpdateBuffer` is only allowed outside of a render pass. This command is treated as a “transfer” operation for the purposes of synchronization barriers. The `VK_BUFFER_USAGE_TRANSFER_DST_BIT` **must** be specified in `usage` of `VkBufferCreateInfo` in order for the buffer to be compatible with `vkCmdUpdateBuffer`.

Valid Usage

- VUID-vkCmdUpdateBuffer-dstOffset-00032
`dstOffset` **must** be less than the size of `dstBuffer`
- VUID-vkCmdUpdateBuffer-dataSize-00033
`dataSize` **must** be less than or equal to the size of `dstBuffer` minus `dstOffset`
- VUID-vkCmdUpdateBuffer-dstBuffer-00034
`dstBuffer` **must** have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag
- VUID-vkCmdUpdateBuffer-dstBuffer-00035
If `dstBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdUpdateBuffer-dstOffset-00036
`dstOffset` **must** be a multiple of 4
- VUID-vkCmdUpdateBuffer-dataSize-00037
`dataSize` **must** be less than or equal to 65536
- VUID-vkCmdUpdateBuffer-dataSize-00038
`dataSize` **must** be a multiple of 4
- VUID-vkCmdUpdateBuffer-commandBuffer-01813
If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported,

`dstBuffer` **must** not be a protected buffer

- VUID-vkCmdUpdateBuffer-commandBuffer-01814

If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstBuffer` **must** not be an unprotected buffer

Valid Usage (Implicit)

- VUID-vkCmdUpdateBuffer-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdUpdateBuffer-dstBuffer-parameter
`dstBuffer` **must** be a valid `VkBuffer` handle
- VUID-vkCmdUpdateBuffer-pData-parameter
`pData` **must** be a valid pointer to an array of `dataSize` bytes
- VUID-vkCmdUpdateBuffer-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdUpdateBuffer-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, `VK_QUEUE_GRAPHICS_BIT`, or `VK_QUEUE_TRANSFER_BIT` operations
- VUID-vkCmdUpdateBuffer-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdUpdateBuffer-dataSize-arraylength
`dataSize` **must** be greater than 0
- VUID-vkCmdUpdateBuffer-commonparent
Both of `commandBuffer`, and `dstBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_TRANSFER_BIT	Action

Chapter 20. Copy Commands

An application **can** copy buffer and image data using several methods described in this chapter, depending on the type of data transfer.

All copy commands are treated as “transfer” operations for the purposes of synchronization barriers.

All copy commands that have a source format with an X component in its format description read undefined values from those bits.

All copy commands that have a destination format with an X component in its format description write undefined values to those bits.

20.1. Copying Data Between Buffers

To copy data between buffer objects, call:

```
// Provided by VK_VERSION_1_0
void vkCmdCopyBuffer(
    VkCommandBuffer          commandBuffer,
    VkBuffer                 srcBuffer,
    VkBuffer                 dstBuffer,
    uint32_t                 regionCount,
    const VkBufferCopy*      pRegions);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **srcBuffer** is the source buffer.
- **dstBuffer** is the destination buffer.
- **regionCount** is the number of regions to copy.
- **pRegions** is a pointer to an array of **VkBufferCopy** structures specifying the regions to copy.

Each source region specified by **pRegions** is copied from the source buffer to the destination region of the destination buffer. If any of the specified regions in **srcBuffer** overlaps in memory with any of the specified regions in **dstBuffer**, values read from those overlapping regions are undefined.

Valid Usage

- VUID-vkCmdCopyBuffer-commandBuffer-01822
If **commandBuffer** is an unprotected command buffer and **protectedNoFault** is not supported, **srcBuffer** **must** not be a protected buffer
- VUID-vkCmdCopyBuffer-commandBuffer-01823
If **commandBuffer** is an unprotected command buffer and **protectedNoFault** is not supported, **dstBuffer** **must** not be a protected buffer
- VUID-vkCmdCopyBuffer-commandBuffer-01824

If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstBuffer` **must** not be an unprotected buffer

- VUID-vkCmdCopyBuffer-srcOffset-00113
The `srcOffset` member of each element of `pRegions` **must** be less than the size of `srcBuffer`
- VUID-vkCmdCopyBuffer-dstOffset-00114
The `dstOffset` member of each element of `pRegions` **must** be less than the size of `dstBuffer`
- VUID-vkCmdCopyBuffer-size-00115
The `size` member of each element of `pRegions` **must** be less than or equal to the size of `srcBuffer` minus `srcOffset`
- VUID-vkCmdCopyBuffer-size-00116
The `size` member of each element of `pRegions` **must** be less than or equal to the size of `dstBuffer` minus `dstOffset`
- VUID-vkCmdCopyBuffer-pRegions-00117
The union of the source regions, and the union of the destination regions, specified by the elements of `pRegions`, **must** not overlap in memory
- VUID-vkCmdCopyBuffer-srcBuffer-00118
`srcBuffer` **must** have been created with `VK_BUFFER_USAGE_TRANSFER_SRC_BIT` usage flag
- VUID-vkCmdCopyBuffer-srcBuffer-00119
If `srcBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdCopyBuffer-dstBuffer-00120
`dstBuffer` **must** have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag
- VUID-vkCmdCopyBuffer-dstBuffer-00121
If `dstBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

Valid Usage (Implicit)

- VUID-vkCmdCopyBuffer-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdCopyBuffer-srcBuffer-parameter
`srcBuffer` **must** be a valid `VkBuffer` handle
- VUID-vkCmdCopyBuffer-dstBuffer-parameter
`dstBuffer` **must** be a valid `VkBuffer` handle
- VUID-vkCmdCopyBuffer-pRegions-parameter
`pRegions` **must** be a valid pointer to an array of `regionCount` valid `VkBufferCopy` structures
- VUID-vkCmdCopyBuffer-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdCopyBuffer-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, `VK_QUEUE_GRAPHICS_BIT`, or `VK_QUEUE_TRANSFER_BIT` operations

- VUID-vkCmdCopyBuffer-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdCopyBuffer-regionCount-arraylength
regionCount **must** be greater than 0
- VUID-vkCmdCopyBuffer-commonparent
Each of **commandBuffer**, **dstBuffer**, and **srcBuffer** **must** have been created, allocated, or retrieved from the same **VkDevice**

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_TRANSFER_BIT	Action

The **VkBufferCopy** structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkBufferCopy {
    VkDeviceSize    srcOffset;
    VkDeviceSize    dstOffset;
    VkDeviceSize    size;
} VkBufferCopy;
```

- **srcOffset** is the starting offset in bytes from the start of **srcBuffer**.
- **dstOffset** is the starting offset in bytes from the start of **dstBuffer**.
- **size** is the number of bytes to copy.

Valid Usage

- VUID-VkBufferCopy-size-01988

The **size** **must** be greater than 0

A more extensible version of the copy buffer command is defined below.

To copy data between buffer objects, call:

```
// Provided by VK_KHR_copy_commands2
void vkCmdCopyBuffer2KHR(
    VkCommandBuffer                      commandBuffer,
    const VkCopyBufferInfo2*            pCopyBufferInfo);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **pCopyBufferInfo** is a pointer to a [VkCopyBufferInfo2](#) structure describing the copy parameters.

Each source region specified by **pCopyBufferInfo->pRegions** is copied from the source buffer to the destination region of the destination buffer. If any of the specified regions in **pCopyBufferInfo->srcBuffer** overlaps in memory with any of the specified regions in **pCopyBufferInfo->dstBuffer**, values read from those overlapping regions are undefined.

Valid Usage

- VUID-vkCmdCopyBuffer2-commandBuffer-01822
If **commandBuffer** is an unprotected command buffer and **protectedNoFault** is not supported, **srcBuffer** **must** not be a protected buffer
- VUID-vkCmdCopyBuffer2-commandBuffer-01823
If **commandBuffer** is an unprotected command buffer and **protectedNoFault** is not supported, **dstBuffer** **must** not be a protected buffer
- VUID-vkCmdCopyBuffer2-commandBuffer-01824
If **commandBuffer** is a protected command buffer and **protectedNoFault** is not supported, **dstBuffer** **must** not be an unprotected buffer

Valid Usage (Implicit)

- VUID-vkCmdCopyBuffer2-commandBuffer-parameter
commandBuffer **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdCopyBuffer2-pCopyBufferInfo-parameter
pCopyBufferInfo **must** be a valid pointer to a valid [VkCopyBufferInfo2](#) structure
- VUID-vkCmdCopyBuffer2-commandBuffer-recording
commandBuffer **must** be in the [recording state](#)
- VUID-vkCmdCopyBuffer2-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support [VK_QUEUE_COMPUTE_BIT](#), [VK_QUEUE_GRAPHICS_BIT](#), or [VK_QUEUE_TRANSFER_BIT](#) operations
- VUID-vkCmdCopyBuffer2-renderpass

This command **must** only be called outside of a render pass instance

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_TRANSFER_BIT	Action

The `VkCopyBufferInfo2` structure is defined as:

```
typedef struct VkCopyBufferInfo2 {  
    VkStructureType    sType;  
    const void*        pNext;  
    VkBuffer            srcBuffer;  
    VkBuffer            dstBuffer;  
    uint32_t           regionCount;  
    const VkBufferCopy2* pRegions;  
} VkCopyBufferInfo2;
```

```
// Provided by VK_KHR_copy_commands2  
typedef VkCopyBufferInfo2 VkCopyBufferInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcBuffer` is the source buffer.
- `dstBuffer` is the destination buffer.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkBufferCopy2` structures specifying the regions to copy.

Valid Usage

- VUID-VkCopyBufferInfo2-srcOffset-00113
The `srcOffset` member of each element of `pRegions` **must** be less than the size of `srcBuffer`
- VUID-VkCopyBufferInfo2-dstOffset-00114
The `dstOffset` member of each element of `pRegions` **must** be less than the size of `dstBuffer`
- VUID-VkCopyBufferInfo2-size-00115
The `size` member of each element of `pRegions` **must** be less than or equal to the size of `srcBuffer` minus `srcOffset`
- VUID-VkCopyBufferInfo2-size-00116
The `size` member of each element of `pRegions` **must** be less than or equal to the size of `dstBuffer` minus `dstOffset`
- VUID-VkCopyBufferInfo2-pRegions-00117
The union of the source regions, and the union of the destination regions, specified by the elements of `pRegions`, **must** not overlap in memory
- VUID-VkCopyBufferInfo2-srcBuffer-00118
`srcBuffer` **must** have been created with `VK_BUFFER_USAGE_TRANSFER_SRC_BIT` usage flag
- VUID-VkCopyBufferInfo2-srcBuffer-00119
If `srcBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-VkCopyBufferInfo2-dstBuffer-00120
`dstBuffer` **must** have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag
- VUID-VkCopyBufferInfo2-dstBuffer-00121
If `dstBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

Valid Usage (Implicit)

- VUID-VkCopyBufferInfo2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_COPY_BUFFER_INFO_2`
- VUID-VkCopyBufferInfo2-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkCopyBufferInfo2-srcBuffer-parameter
`srcBuffer` **must** be a valid `VkBuffer` handle
- VUID-VkCopyBufferInfo2-dstBuffer-parameter
`dstBuffer` **must** be a valid `VkBuffer` handle
- VUID-VkCopyBufferInfo2-pRegions-parameter
`pRegions` **must** be a valid pointer to an array of `regionCount` valid `VkBufferCopy2` structures
- VUID-VkCopyBufferInfo2-regionCount-arraylength
`regionCount` **must** be greater than 0

- VUID-VkCopyBufferInfo2-commonparent

Both of `dstBuffer`, and `srcBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

The `VkBufferCopy2` structure is defined as:

```
typedef struct VkBufferCopy2 {  
    VkStructureType    sType;  
    const void*        pNext;  
    VkDeviceSize        srcOffset;  
    VkDeviceSize        dstOffset;  
    VkDeviceSize        size;  
} VkBufferCopy2;
```

```
// Provided by VK_KHR_copy_commands2  
typedef VkBufferCopy2 VkBufferCopy2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcOffset` is the starting offset in bytes from the start of `srcBuffer`.
- `dstOffset` is the starting offset in bytes from the start of `dstBuffer`.
- `size` is the number of bytes to copy.

Valid Usage

- VUID-VkBufferCopy2-size-01988
The `size` **must** be greater than 0

Valid Usage (Implicit)

- VUID-VkBufferCopy2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_BUFFER_COPY_2`
- VUID-VkBufferCopy2-pNext-pNext
`pNext` **must** be `NULL`

20.2. Copying Data Between Images

To copy data between image objects, call:

```
// Provided by VK_VERSION_1_0
void vkCmdCopyImage(
    VkCommandBuffer          commandBuffer,
    VkImage                  srcImage,
    VkImageLayout            srcImageLayout,
    VkImage                  dstImage,
    VkImageLayout            dstImageLayout,
    uint32_t                 regionCount,
    const VkImageCopy*       pRegions);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **srcImage** is the source image.
- **srcImageLayout** is the current layout of the source image subresource.
- **dstImage** is the destination image.
- **dstImageLayout** is the current layout of the destination image subresource.
- **regionCount** is the number of regions to copy.
- **pRegions** is a pointer to an array of **VkImageCopy** structures specifying the regions to copy.

Each source region specified by **pRegions** is copied from the source image to the destination region of the destination image. If any of the specified regions in **srcImage** overlaps in memory with any of the specified regions in **dstImage**, values read from those overlapping regions are undefined. If any region accesses a depth aspect in **dstImage** and the **VK_EXT_depth_range_unrestricted** extension is not enabled, values copied from **srcBuffer** outside of the range [0,1] will be written as undefined values to the destination image.

Multi-planar images **can** only be copied on a per-plane basis, and the subresources used in each region when copying to or from such images **must** specify only one plane, though different regions **can** specify different planes. When copying planes of multi-planar images, the format considered is the **compatible format for that plane**, rather than the format of the multi-planar image.

If the format of the destination image has a different **block extent** than the source image (e.g. one is a compressed format), the offset and extent for each of the regions specified is **scaled according to the block extents of each format** to match in size. Copy regions for each image **must** be aligned to a multiple of the texel block extent in each dimension, except at the edges of the image, where region extents **must** match the edge of the image.

Image data **can** be copied between images with different image types. If one image is **VK_IMAGE_TYPE_3D** and the other image is **VK_IMAGE_TYPE_2D** with multiple layers, then each slice is copied to or from a different layer; **depth** slices in the 3D image correspond to **layerCount** layers in the 2D image, with an effective **depth** of **1** used for the 2D image. Other combinations of image types are disallowed.

Valid Usage

- VUID-vkCmdCopyImage-commandBuffer-01825

If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` **must** not be a protected image

- VUID-vkCmdCopyImage-commandBuffer-01826

If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` **must** not be a protected image

- VUID-vkCmdCopyImage-commandBuffer-01827

If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` **must** not be an unprotected image

- VUID-vkCmdCopyImage-pRegions-00124

The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, **must** not overlap in memory

- VUID-vkCmdCopyImage-srcImage-01995

The `format features` of `srcImage` **must** contain `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT`

- VUID-vkCmdCopyImage-srcImageLayout-00128

`srcImageLayout` **must** specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`

- VUID-vkCmdCopyImage-srcImageLayout-01917

`srcImageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, or `VK_IMAGE_LAYOUT_GENERAL`

- VUID-vkCmdCopyImage-srcImage-09460

If `srcImage` and `dstImage` are the same, and any elements of `pRegions` contains the `srcSubresource` and `dstSubresource` with matching `mipLevel` and overlapping array layers, then the `srcImageLayout` and `dstImageLayout` **must** be `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`

- VUID-vkCmdCopyImage-dstImage-01996

The `format features` of `dstImage` **must** contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`

- VUID-vkCmdCopyImage-dstImageLayout-00133

`dstImageLayout` **must** specify the layout of the image subresources of `dstImage` specified in `pRegions` at the time this command is executed on a `VkDevice`

- VUID-vkCmdCopyImage-dstImageLayout-01395

`dstImageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, or `VK_IMAGE_LAYOUT_GENERAL`

- VUID-vkCmdCopyImage-srcImage-01548

If the `VkFormat` of each of `srcImage` and `dstImage` is not a `multi-planar format`, the `VkFormat` of each of `srcImage` and `dstImage` **must** be `size-compatible`

- VUID-vkCmdCopyImage-None-01549

In a copy to or from a plane of a `multi-planar image`, the `VkFormat` of the image and plane **must** be compatible according to `the description of compatible planes` for the plane being copied

- VUID-vkCmdCopyImage-srcImage-09247

If the `VkFormat` of each of `srcImage` and `dstImage` is a `compressed image format`, the formats **must** have the same texel block extent

- VUID-vkCmdCopyImage-srcImage-00136
The sample count of `srcImage` and `dstImage` **must** match
- VUID-vkCmdCopyImage-srcOffset-01783
The `srcOffset` and `extent` members of each element of `pRegions` **must** respect the image transfer granularity requirements of `commandBuffer`'s command pool's queue family, as described in [VkQueueFamilyProperties](#)
- VUID-vkCmdCopyImage-dstOffset-01784
The `dstOffset` and `extent` members of each element of `pRegions` **must** respect the image transfer granularity requirements of `commandBuffer`'s command pool's queue family, as described in [VkQueueFamilyProperties](#)
- VUID-vkCmdCopyImage-srcImage-01551
If neither `srcImage` nor `dstImage` has a [multi-planar format](#) then for each element of `pRegions`, `srcSubresource.aspectMask` and `dstSubresource.aspectMask` **must** match
- VUID-vkCmdCopyImage-srcImage-08713
If `srcImage` has a [multi-planar format](#), then for each element of `pRegions`, `srcSubresource.aspectMask` **must** be a single valid [multi-planar aspect mask](#) bit
- VUID-vkCmdCopyImage-dstImage-08714
If `dstImage` has a [multi-planar format](#), then for each element of `pRegions`, `dstSubresource.aspectMask` **must** be a single valid [multi-planar aspect mask](#) bit
- VUID-vkCmdCopyImage-srcImage-01556
If `srcImage` has a [multi-planar format](#) and the `dstImage` does not have a multi-planar image format, then for each element of `pRegions`, `dstSubresource.aspectMask` **must** be `VK_IMAGE_ASPECT_COLOR_BIT`
- VUID-vkCmdCopyImage-dstImage-01557
If `dstImage` has a [multi-planar format](#) and the `srcImage` does not have a multi-planar image format, then for each element of `pRegions`, `srcSubresource.aspectMask` **must** be `VK_IMAGE_ASPECT_COLOR_BIT`
- VUID-vkCmdCopyImage-srcImage-04443
If `srcImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcSubresource.baseArrayLayer` **must** be 0 and `srcSubresource.layerCount` **must** be 1
- VUID-vkCmdCopyImage-dstImage-04444
If `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `dstSubresource.baseArrayLayer` **must** be 0 and `dstSubresource.layerCount` **must** be 1
- VUID-vkCmdCopyImage-aspectMask-00142
For each element of `pRegions`, `srcSubresource.aspectMask` **must** specify aspects present in `srcImage`
- VUID-vkCmdCopyImage-aspectMask-00143
For each element of `pRegions`, `dstSubresource.aspectMask` **must** specify aspects present in `dstImage`
- VUID-vkCmdCopyImage-srcOffset-00144
For each element of `pRegions`, `srcOffset.x` and `(extent.width + srcOffset.x)` **must** both be greater than or equal to 0 and less than or equal to the width of the specified `srcSubresource` of `srcImage`

- VUID-vkCmdCopyImage-srcOffset-00145
For each element of `pRegions`, `srcOffset.y` and `(extent.height + srcOffset.y)` **must** both be greater than or equal to `0` and less than or equal to the height of the specified `srcSubresource` of `srcImage`
- VUID-vkCmdCopyImage-srcImage-00146
If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffset.y` **must** be `0` and `extent.height` **must** be `1`
- VUID-vkCmdCopyImage-srcOffset-00147
If `srcImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcOffset.z` and `(extent.depth + srcOffset.z)` **must** both be greater than or equal to `0` and less than or equal to the depth of the specified `srcSubresource` of `srcImage`
- VUID-vkCmdCopyImage-srcImage-01785
If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffset.z` **must** be `0` and `extent.depth` **must** be `1`
- VUID-vkCmdCopyImage-dstImage-01786
If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `dstOffset.z` **must** be `0`
- VUID-vkCmdCopyImage-srcImage-10907
If either the `VkFormat` of each of `srcImage` and `dstImage` is not a `compressed image format`, and `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `extent.depth` **must** be `1`
- VUID-vkCmdCopyImage-srcImage-01787
If `srcImage` is of type `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `srcOffset.z` **must** be `0`
- VUID-vkCmdCopyImage-dstImage-01788
If `dstImage` is of type `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `dstOffset.z` **must** be `0`
- VUID-vkCmdCopyImage-srcImage-07743
If `srcImage` and `dstImage` have a different `VkImageType`, one **must** be `VK_IMAGE_TYPE_3D` and the other **must** be `VK_IMAGE_TYPE_2D`
- VUID-vkCmdCopyImage-srcImage-08793
If `srcImage` and `dstImage` have the same `VkImageType`, for each element of `pRegions`, the `layerCount` members of `srcSubresource` or `dstSubresource` **must** match
- VUID-vkCmdCopyImage-srcImage-01790
If `srcImage` and `dstImage` are both of type `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `extent.depth` **must** be `1`
- VUID-vkCmdCopyImage-srcImage-01791
If `srcImage` is of type `VK_IMAGE_TYPE_2D`, and `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `extent.depth` **must** equal `srcSubresource.layerCount`
- VUID-vkCmdCopyImage-dstImage-01792
If `dstImage` is of type `VK_IMAGE_TYPE_2D`, and `srcImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `extent.depth` **must** equal `dstSubresource.layerCount`
- VUID-vkCmdCopyImage-dstOffset-00150

For each element of `pRegions`, `dstOffset.x` and `(extent.width + dstOffset.x)`, where `extent` is [adjusted for size-compatibility](#), **must** both be greater than or equal to `0` and less than or equal to the width of the specified `dstSubresource` of `dstImage`

- VUID-vkCmdCopyImage-dstOffset-00151

For each element of `pRegions`, `dstOffset.y` and `(extent.height + dstOffset.y)`, where `extent` is [adjusted for size-compatibility](#), **must** both be greater than or equal to `0` and less than or equal to the height of the specified `dstSubresource` of `dstImage`

- VUID-vkCmdCopyImage-dstImage-00152

If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `dstOffset.y` **must** be `0`

- VUID-vkCmdCopyImage-srcImage-10908

If either the `VkFormat` of each of `srcImage` and `dstImage` is not a [compressed image format](#), and `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `extent.height` **must** be `1`, where `extent` is [adjusted for size-compatibility](#)

- VUID-vkCmdCopyImage-dstOffset-00153

If `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `dstOffset.z` and `(extent.depth + dstOffset.z)`, where `extent` is [adjusted for size-compatibility](#), **must** both be greater than or equal to `0` and less than or equal to the depth of the specified `dstSubresource` of `dstImage`

- VUID-vkCmdCopyImage-pRegions-07278

For each element of `pRegions`, `srcOffset.x` **must** be a multiple of the [texel block extent width](#) of the `VkFormat` of `srcImage`

- VUID-vkCmdCopyImage-pRegions-07279

For each element of `pRegions`, `srcOffset.y` **must** be a multiple of the [texel block extent height](#) of the `VkFormat` of `srcImage`

- VUID-vkCmdCopyImage-pRegions-07280

For each element of `pRegions`, `srcOffset.z` **must** be a multiple of the [texel block extent depth](#) of the `VkFormat` of `srcImage`

- VUID-vkCmdCopyImage-pRegions-07281

For each element of `pRegions`, `dstOffset.x` **must** be a multiple of the [texel block extent width](#) of the `VkFormat` of `dstImage`

- VUID-vkCmdCopyImage-pRegions-07282

For each element of `pRegions`, `dstOffset.y` **must** be a multiple of the [texel block extent height](#) of the `VkFormat` of `dstImage`

- VUID-vkCmdCopyImage-pRegions-07283

For each element of `pRegions`, `dstOffset.z` **must** be a multiple of the [texel block extent depth](#) of the `VkFormat` of `dstImage`

- VUID-vkCmdCopyImage-srcImage-01728

For each element of `pRegions`, if the sum of `srcOffset.x` and `extent.width` does not equal the width of the subresource specified by `srcSubresource`, `extent.width` **must** be a multiple of the [texel block extent width](#) of the `VkFormat` of `srcImage`

- VUID-vkCmdCopyImage-srcImage-01729

For each element of `pRegions`, if the sum of `srcOffset.y` and `extent.height` does not equal

the height of the subresource specified by `srcSubresource`, `extent.height` **must** be a multiple of the `texel block extent height` of the `VkFormat` of `srcImage`

- VUID-vkCmdCopyImage-srcImage-01730

For each element of `pRegions`, if the sum of `srcOffset.z` and `extent.depth` does not equal the depth of the subresource specified by `srcSubresource`, `extent.depth` **must** be a multiple of the `texel block extent depth` of the `VkFormat` of `srcImage`

- VUID-vkCmdCopyImage-aspect-06662

If the `aspect` member of any element of `pRegions` includes any flag other than `VK_IMAGE_ASPECT_STENCIL_BIT` or `srcImage` was not created with `separate stencil usage`, `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` **must** have been included in the `VkImageCreateInfo::usage` used to create `srcImage`

- VUID-vkCmdCopyImage-aspect-06663

If the `aspect` member of any element of `pRegions` includes any flag other than `VK_IMAGE_ASPECT_STENCIL_BIT` or `dstImage` was not created with `separate stencil usage`, `VK_IMAGE_USAGE_TRANSFER_DST_BIT` **must** have been included in the `VkImageCreateInfo::usage` used to create `dstImage`

- VUID-vkCmdCopyImage-aspect-06664

If the `aspect` member of any element of `pRegions` includes `VK_IMAGE_ASPECT_STENCIL_BIT`, and `srcImage` was created with `separate stencil usage`, `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` **must** have been included in the `VkImageStencilUsageCreateInfo::stencilUsage` used to create `srcImage`

- VUID-vkCmdCopyImage-aspect-06665

If the `aspect` member of any element of `pRegions` includes `VK_IMAGE_ASPECT_STENCIL_BIT`, and `dstImage` was created with `separate stencil usage`, `VK_IMAGE_USAGE_TRANSFER_DST_BIT` **must** have been included in the `VkImageStencilUsageCreateInfo::stencilUsage` used to create `dstImage`

- VUID-vkCmdCopyImage-srcImage-07966

If `srcImage` is non-sparse then the image or the specified *disjoint* plane **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdCopyImage-srcSubresource-07967

The `srcSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created

- VUID-vkCmdCopyImage-srcSubresource-07968

`srcSubresource.baseArrayLayer` + `srcSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created

- VUID-vkCmdCopyImage-dstImage-07966

If `dstImage` is non-sparse then the image or the specified *disjoint* plane **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdCopyImage-dstSubresource-07967

The `dstSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created

- VUID-vkCmdCopyImage-dstSubresource-07968

`dstSubresource.baseArrayLayer + dstSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created

Valid Usage (Implicit)

- VUID-vkCmdCopyImage-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdCopyImage-srcImage-parameter
`srcImage` **must** be a valid `VkImage` handle
- VUID-vkCmdCopyImage-srcImageLayout-parameter
`srcImageLayout` **must** be a valid `VkImageLayout` value
- VUID-vkCmdCopyImage-dstImage-parameter
`dstImage` **must** be a valid `VkImage` handle
- VUID-vkCmdCopyImage-dstImageLayout-parameter
`dstImageLayout` **must** be a valid `VkImageLayout` value
- VUID-vkCmdCopyImage-pRegions-parameter
`pRegions` **must** be a valid pointer to an array of `regionCount` valid `VkImageCopy` structures
- VUID-vkCmdCopyImage-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdCopyImage-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, `VK_QUEUE_GRAPHICS_BIT`, or `VK_QUEUE_TRANSFER_BIT` operations
- VUID-vkCmdCopyImage-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdCopyImage-regionCount-arraylength
`regionCount` **must** be greater than 0
- VUID-vkCmdCopyImage-commonparent
Each of `commandBuffer`, `dstImage`, and `srcImage` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_TRANSFER_BIT	Action

The `VkImageCopy` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkImageCopy {
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D               srcOffset;
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D               dstOffset;
    VkExtent3D               extent;
} VkImageCopy;
```

- `srcSubresource` and `dstSubresource` are `VkImageSubresourceLayers` structures specifying the image subresources of the images used for the source and destination image data, respectively.
- `srcOffset` and `dstOffset` select the initial `x`, `y`, and `z` offsets in texels of the sub-regions of the source and destination image data.
- `extent` is the size in texels of the image to copy in `width`, `height` and `depth`.

Valid Usage

- VUID-VkImageCopy-extent-06668
`extent.width` **must** not be 0
- VUID-VkImageCopy-extent-06669
`extent.height` **must** not be 0
- VUID-VkImageCopy-extent-06670
`extent.depth` **must** not be 0

Valid Usage (Implicit)

- VUID-VkImageCopy-srcSubresource-parameter
`srcSubresource` **must** be a valid `VkImageSubresourceLayers` structure
- VUID-VkImageCopy-dstSubresource-parameter

`dstSubresource` **must** be a valid `VkImageSubresourceLayers` structure

The `VkImageSubresourceLayers` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkImageSubresourceLayers {
    VkImageAspectFlags    aspectMask;
    uint32_t              mipLevel;
    uint32_t              baseArrayLayer;
    uint32_t              layerCount;
} VkImageSubresourceLayers;
```

- `aspectMask` is a combination of `VkImageAspectFlagBits`, selecting the color, depth and/or stencil aspects to be copied.
- `mipLevel` is the mipmap level to copy
- `baseArrayLayer` and `layerCount` are the starting layer and number of layers to copy.

Valid Usage

- VUID-VkImageSubresourceLayers-aspectMask-00167
If `aspectMask` contains `VK_IMAGE_ASPECT_COLOR_BIT`, it **must** not contain either of `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`
- VUID-VkImageSubresourceLayers-aspectMask-00168
`aspectMask` **must** not contain `VK_IMAGE_ASPECT_METADATA_BIT`
- VUID-VkImageSubresourceLayers-aspectMask-02247
`aspectMask` **must** not include `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT` for any index *i*
- VUID-VkImageSubresourceLayers-layerCount-09243
`layerCount` **must** not be `VK_REMAINING_ARRAY_LAYERS`
- VUID-VkImageSubresourceLayers-layerCount-01700
If `layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, it **must** be greater than 0

Valid Usage (Implicit)

- VUID-VkImageSubresourceLayers-aspectMask-parameter
`aspectMask` **must** be a valid combination of `VkImageAspectFlagBits` values
- VUID-VkImageSubresourceLayers-aspectMask-requiredbitmask
`aspectMask` **must** not be 0

A more extensible version of the copy image command is defined below.

To copy data between image objects, call:

```
// Provided by VK_KHR_copy_commands2
void vkCmdCopyImage2KHR(
    VkCommandBuffer                      commandBuffer,
    const VkCopyImageInfo2*             pCopyImageInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pCopyImageInfo` is a pointer to a [VkCopyImageInfo2](#) structure describing the copy parameters.

This command is functionally identical to [vkCmdCopyImage](#), but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

Valid Usage

- VUID-vkCmdCopyImage2-commandBuffer-01825
If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` **must** not be a protected image
- VUID-vkCmdCopyImage2-commandBuffer-01826
If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` **must** not be a protected image
- VUID-vkCmdCopyImage2-commandBuffer-01827
If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` **must** not be an unprotected image

Valid Usage (Implicit)

- VUID-vkCmdCopyImage2-commandBuffer-parameter
`commandBuffer` **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdCopyImage2-pCopyImageInfo-parameter
`pCopyImageInfo` **must** be a valid pointer to a valid [VkCopyImageInfo2](#) structure
- VUID-vkCmdCopyImage2-commandBuffer-recording
`commandBuffer` **must** be in the [recording state](#)
- VUID-vkCmdCopyImage2-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, `VK_QUEUE_GRAPHICS_BIT`, or `VK_QUEUE_TRANSFER_BIT` operations
- VUID-vkCmdCopyImage2-renderpass
This command **must** only be called outside of a render pass instance

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally

synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_TRANSFER_BIT	Action

The `VkCopyImageInfo2` structure is defined as:

```
typedef struct VkCopyImageInfo2 {  
    VkStructureType      sType;  
    const void*          pNext;  
    VkImage               srcImage;  
    VkImageLayout         srcImageLayout;  
    VkImage               dstImage;  
    VkImageLayout         dstImageLayout;  
    uint32_t              regionCount;  
    const VkImageCopy2*   pRegions;  
} VkCopyImageInfo2;
```

```
// Provided by VK_KHR_copy_commands2  
typedef VkCopyImageInfo2 VkCopyImageInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcImage` is the source image.
- `srcImageLayout` is the current layout of the source image subresource.
- `dstImage` is the destination image.
- `dstImageLayout` is the current layout of the destination image subresource.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkImageCopy2` structures specifying the regions to copy.

Valid Usage

- VUID-VkCopyImageInfo2-pRegions-00124

The union of all source regions, and the union of all destination regions, specified by the elements of **pRegions**, **must** not overlap in memory

- VUID-VkCopyImageInfo2-srcImage-01995
The **format features** of **srcImage** **must** contain **VK_FORMAT_FEATURE_TRANSFER_SRC_BIT**
- VUID-VkCopyImageInfo2-srcImageLayout-00128
srcImageLayout **must** specify the layout of the image subresources of **srcImage** specified in **pRegions** at the time this command is executed on a **VkDevice**
- VUID-VkCopyImageInfo2-srcImageLayout-01917
srcImageLayout **must** be **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR**, **VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL**, or **VK_IMAGE_LAYOUT_GENERAL**
- VUID-VkCopyImageInfo2-srcImage-09460
If **srcImage** and **dstImage** are the same, and any elements of **pRegions** contains the **srcSubresource** and **dstSubresource** with matching **mipLevel** and overlapping array layers, then the **srcImageLayout** and **dstImageLayout** **must** be **VK_IMAGE_LAYOUT_GENERAL** or **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR**
- VUID-VkCopyImageInfo2-dstImage-01996
The **format features** of **dstImage** **must** contain **VK_FORMAT_FEATURE_TRANSFER_DST_BIT**
- VUID-VkCopyImageInfo2-dstImageLayout-00133
dstImageLayout **must** specify the layout of the image subresources of **dstImage** specified in **pRegions** at the time this command is executed on a **VkDevice**
- VUID-VkCopyImageInfo2-dstImageLayout-01395
dstImageLayout **must** be **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR**, **VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL**, or **VK_IMAGE_LAYOUT_GENERAL**
- VUID-VkCopyImageInfo2-srcImage-01548
If the **VkFormat** of each of **srcImage** and **dstImage** is not a **multi-planar format**, the **VkFormat** of each of **srcImage** and **dstImage** **must** be **size-compatible**
- VUID-VkCopyImageInfo2-None-01549
In a copy to or from a plane of a **multi-planar image**, the **VkFormat** of the image and plane **must** be compatible according to **the description of compatible planes** for the plane being copied
- VUID-VkCopyImageInfo2-srcImage-09247
If the **VkFormat** of each of **srcImage** and **dstImage** is a **compressed image format**, the formats **must** have the same texel block extent
- VUID-VkCopyImageInfo2-srcImage-00136
The sample count of **srcImage** and **dstImage** **must** match
- VUID-VkCopyImageInfo2-srcOffset-01783
The **srcOffset** and **extent** members of each element of **pRegions** **must** respect the image transfer granularity requirements of **commandBuffer**'s command pool's queue family, as described in **VkQueueFamilyProperties**
- VUID-VkCopyImageInfo2-dstOffset-01784
The **dstOffset** and **extent** members of each element of **pRegions** **must** respect the image transfer granularity requirements of **commandBuffer**'s command pool's queue family, as described in **VkQueueFamilyProperties**

- VUID-VkCopyImageInfo2-srcImage-01551
If neither `srcImage` nor `dstImage` has a [multi-planar format](#) then for each element of `pRegions`, `srcSubresource.aspectMask` and `dstSubresource.aspectMask` **must** match
- VUID-VkCopyImageInfo2-srcImage-08713
If `srcImage` has a [multi-planar format](#), then for each element of `pRegions`, `srcSubresource.aspectMask` **must** be a single valid [multi-planar aspect mask](#) bit
- VUID-VkCopyImageInfo2-dstImage-08714
If `dstImage` has a [multi-planar format](#), then for each element of `pRegions`, `dstSubresource.aspectMask` **must** be a single valid [multi-planar aspect mask](#) bit
- VUID-VkCopyImageInfo2-srcImage-01556
If `srcImage` has a [multi-planar format](#) and the `dstImage` does not have a multi-planar image format, then for each element of `pRegions`, `dstSubresource.aspectMask` **must** be `VK_IMAGE_ASPECT_COLOR_BIT`
- VUID-VkCopyImageInfo2-dstImage-01557
If `dstImage` has a [multi-planar format](#) and the `srcImage` does not have a multi-planar image format, then for each element of `pRegions`, `srcSubresource.aspectMask` **must** be `VK_IMAGE_ASPECT_COLOR_BIT`
- VUID-VkCopyImageInfo2-srcImage-04443
If `srcImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcSubresource.baseArrayLayer` **must** be `0` and `srcSubresource.layerCount` **must** be `1`
- VUID-VkCopyImageInfo2-dstImage-04444
If `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `dstSubresource.baseArrayLayer` **must** be `0` and `dstSubresource.layerCount` **must** be `1`
- VUID-VkCopyImageInfo2-aspectMask-00142
For each element of `pRegions`, `srcSubresource.aspectMask` **must** specify aspects present in `srcImage`
- VUID-VkCopyImageInfo2-aspectMask-00143
For each element of `pRegions`, `dstSubresource.aspectMask` **must** specify aspects present in `dstImage`
- VUID-VkCopyImageInfo2-srcOffset-00144
For each element of `pRegions`, `srcOffset.x` and `(extent.width + srcOffset.x)` **must** both be greater than or equal to `0` and less than or equal to the width of the specified `srcSubresource` of `srcImage`
- VUID-VkCopyImageInfo2-srcOffset-00145
For each element of `pRegions`, `srcOffset.y` and `(extent.height + srcOffset.y)` **must** both be greater than or equal to `0` and less than or equal to the height of the specified `srcSubresource` of `srcImage`
- VUID-VkCopyImageInfo2-srcImage-00146
If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffset.y` **must** be `0` and `extent.height` **must** be `1`
- VUID-VkCopyImageInfo2-srcOffset-00147
If `srcImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcOffset.z` and `(extent.depth + srcOffset.z)` **must** both be greater than or equal to `0` and less than or

equal to the depth of the specified `srcSubresource` of `srcImage`

- VUID-VkCopyImageInfo2-srcImage-01785
If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffset.z` **must** be 0 and `extent.depth` **must** be 1
- VUID-VkCopyImageInfo2-dstImage-01786
If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `dstOffset.z` **must** be 0
- VUID-VkCopyImageInfo2-srcImage-10907
If either the `VkFormat` of each of `srcImage` and `dstImage` is not a `compressed image format`, and `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `extent.depth` **must** be 1
- VUID-VkCopyImageInfo2-srcImage-01787
If `srcImage` is of type `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `srcOffset.z` **must** be 0
- VUID-VkCopyImageInfo2-dstImage-01788
If `dstImage` is of type `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `dstOffset.z` **must** be 0
- VUID-VkCopyImageInfo2-srcImage-07743
If `srcImage` and `dstImage` have a different `VkImageType`, one **must** be `VK_IMAGE_TYPE_3D` and the other **must** be `VK_IMAGE_TYPE_2D`
- VUID-VkCopyImageInfo2-srcImage-08793
If `srcImage` and `dstImage` have the same `VkImageType`, for each element of `pRegions`, the `layerCount` members of `srcSubresource` or `dstSubresource` **must** match
- VUID-VkCopyImageInfo2-srcImage-01790
If `srcImage` and `dstImage` are both of type `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `extent.depth` **must** be 1
- VUID-VkCopyImageInfo2-srcImage-01791
If `srcImage` is of type `VK_IMAGE_TYPE_2D`, and `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `extent.depth` **must** equal `srcSubresource.layerCount`
- VUID-VkCopyImageInfo2-dstImage-01792
If `dstImage` is of type `VK_IMAGE_TYPE_2D`, and `srcImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `extent.depth` **must** equal `dstSubresource.layerCount`
- VUID-VkCopyImageInfo2-dstOffset-00150
For each element of `pRegions`, `dstOffset.x` and $(\text{extent.width} + \text{dstOffset.x})$, where `extent` is `adjusted for size-compatibility`, **must** both be greater than or equal to 0 and less than or equal to the width of the specified `dstSubresource` of `dstImage`
- VUID-VkCopyImageInfo2-dstOffset-00151
For each element of `pRegions`, `dstOffset.y` and $(\text{extent.height} + \text{dstOffset.y})$, where `extent` is `adjusted for size-compatibility`, **must** both be greater than or equal to 0 and less than or equal to the height of the specified `dstSubresource` of `dstImage`
- VUID-VkCopyImageInfo2-dstImage-00152
If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `dstOffset.y` **must** be 0

- VUID-VkCopyImageInfo2-srcImage-10908
If either the `VkFormat` of each of `srcImage` and `dstImage` is not a `compressed image format`, and `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `extent.height` **must** be 1, where `extent` is `adjusted for size-compatibility`
- VUID-VkCopyImageInfo2-dstOffset-00153
If `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `dstOffset.z` and `(extent.depth + dstOffset.z)`, where `extent` is `adjusted for size-compatibility`, **must** both be greater than or equal to 0 and less than or equal to the depth of the specified `dstSubresource` of `dstImage`
- VUID-VkCopyImageInfo2-pRegions-07278
For each element of `pRegions`, `srcOffset.x` **must** be a multiple of the `texel block extent width` of the `VkFormat` of `srcImage`
- VUID-VkCopyImageInfo2-pRegions-07279
For each element of `pRegions`, `srcOffset.y` **must** be a multiple of the `texel block extent height` of the `VkFormat` of `srcImage`
- VUID-VkCopyImageInfo2-pRegions-07280
For each element of `pRegions`, `srcOffset.z` **must** be a multiple of the `texel block extent depth` of the `VkFormat` of `srcImage`
- VUID-VkCopyImageInfo2-pRegions-07281
For each element of `pRegions`, `dstOffset.x` **must** be a multiple of the `texel block extent width` of the `VkFormat` of `dstImage`
- VUID-VkCopyImageInfo2-pRegions-07282
For each element of `pRegions`, `dstOffset.y` **must** be a multiple of the `texel block extent height` of the `VkFormat` of `dstImage`
- VUID-VkCopyImageInfo2-pRegions-07283
For each element of `pRegions`, `dstOffset.z` **must** be a multiple of the `texel block extent depth` of the `VkFormat` of `dstImage`
- VUID-VkCopyImageInfo2-srcImage-01728
For each element of `pRegions`, if the sum of `srcOffset.x` and `extent.width` does not equal the width of the subresource specified by `srcSubresource`, `extent.width` **must** be a multiple of the `texel block extent width` of the `VkFormat` of `srcImage`
- VUID-VkCopyImageInfo2-srcImage-01729
For each element of `pRegions`, if the sum of `srcOffset.y` and `extent.height` does not equal the height of the subresource specified by `srcSubresource`, `extent.height` **must** be a multiple of the `texel block extent height` of the `VkFormat` of `srcImage`
- VUID-VkCopyImageInfo2-srcImage-01730
For each element of `pRegions`, if the sum of `srcOffset.z` and `extent.depth` does not equal the depth of the subresource specified by `srcSubresource`, `extent.depth` **must** be a multiple of the `texel block extent depth` of the `VkFormat` of `srcImage`
- VUID-VkCopyImageInfo2-aspect-06662
If the `aspect` member of any element of `pRegions` includes any flag other than `VK_IMAGE_ASPECT_STENCIL_BIT` or `srcImage` was not created with `separate stencil usage`, `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` **must** have been included in the `VkImageCreateInfo`

::usage used to create srcImage

- VUID-VkCopyImageInfo2-aspect-06663

If the aspect member of any element of pRegions includes any flag other than VK_IMAGE_ASPECT_STENCIL_BIT or dstImage was not created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_DST_BIT **must** have been included in the VkImageCreateInfo::usage used to create dstImage

- VUID-VkCopyImageInfo2-aspect-06664

If the aspect member of any element of pRegions includes VK_IMAGE_ASPECT_STENCIL_BIT, and srcImage was created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_SRC_BIT **must** have been included in the VkImageStencilUsageCreateInfo::stencilUsage used to create srcImage

- VUID-VkCopyImageInfo2-aspect-06665

If the aspect member of any element of pRegions includes VK_IMAGE_ASPECT_STENCIL_BIT, and dstImage was created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_DST_BIT **must** have been included in the VkImageStencilUsageCreateInfo::stencilUsage used to create dstImage

- VUID-VkCopyImageInfo2-srcImage-07966

If srcImage is non-sparse then the image or the specified disjoint plane **must** be bound completely and contiguously to a single VkDeviceMemory object

- VUID-VkCopyImageInfo2-srcSubresource-07967

The srcSubresource.mipLevel member of each element of pRegions **must** be less than the mipLevels specified in VkImageCreateInfo when srcImage was created

- VUID-VkCopyImageInfo2-srcSubresource-07968

srcSubresource.baseArrayLayer + srcSubresource.layerCount of each element of pRegions **must** be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created

- VUID-VkCopyImageInfo2-dstImage-07966

If dstImage is non-sparse then the image or the specified disjoint plane **must** be bound completely and contiguously to a single VkDeviceMemory object

- VUID-VkCopyImageInfo2-dstSubresource-07967

The dstSubresource.mipLevel member of each element of pRegions **must** be less than the mipLevels specified in VkImageCreateInfo when dstImage was created

- VUID-VkCopyImageInfo2-dstSubresource-07968

dstSubresource.baseArrayLayer + dstSubresource.layerCount of each element of pRegions **must** be less than or equal to the arrayLayers specified in VkImageCreateInfo when dstImage was created

Valid Usage (Implicit)

- VUID-VkCopyImageInfo2-sType-sType

sType **must** be VK_STRUCTURE_TYPE_COPY_IMAGE_INFO_2

- VUID-VkCopyImageInfo2-pNext-pNext

pNext must be NULL

- VUID-VkCopyImageInfo2-srcImage-parameter
srcImage must be a valid [VkImage](#) handle
- VUID-VkCopyImageInfo2-srcImageLayout-parameter
srcImageLayout must be a valid [VkImageLayout](#) value
- VUID-VkCopyImageInfo2-dstImage-parameter
dstImage must be a valid [VkImage](#) handle
- VUID-VkCopyImageInfo2-dstImageLayout-parameter
dstImageLayout must be a valid [VkImageLayout](#) value
- VUID-VkCopyImageInfo2-pRegions-parameter
pRegions must be a valid pointer to an array of **regionCount** valid [VkImageCopy2](#) structures
- VUID-VkCopyImageInfo2-regionCount-arraylength
regionCount must be greater than 0
- VUID-VkCopyImageInfo2-commonparent
Both of **dstImage**, and **srcImage** must have been created, allocated, or retrieved from the same [VkDevice](#)

The [VkImageCopy2](#) structure is defined as:

```
typedef struct VkImageCopy2 {  
    VkStructureType    sType;  
    const void*        pNext;  
    VkImageSubresourceLayers srcSubresource;  
    VkOffset3D          srcOffset;  
    VkImageSubresourceLayers dstSubresource;  
    VkOffset3D          dstOffset;  
    VkExtent3D          extent;  
} VkImageCopy2;
```

```
// Provided by VK_KHR_copy_commands2  
typedef VkImageCopy2 VkImageCopy2KHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **srcSubresource** and **dstSubresource** are [VkImageSubresourceLayers](#) structures specifying the image subresources of the images used for the source and destination image data, respectively.
- **srcOffset** and **dstOffset** select the initial **x**, **y**, and **z** offsets in texels of the sub-regions of the source and destination image data.
- **extent** is the size in texels of the image to copy in **width**, **height** and **depth**.

Valid Usage

- VUID-VkImageCopy2-extent-06668
`extent.width` **must** not be 0
- VUID-VkImageCopy2-extent-06669
`extent.height` **must** not be 0
- VUID-VkImageCopy2-extent-06670
`extent.depth` **must** not be 0

Valid Usage (Implicit)

- VUID-VkImageCopy2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_COPY_2`
- VUID-VkImageCopy2-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkImageCopy2-srcSubresource-parameter
`srcSubresource` **must** be a valid `VkImageSubresourceLayers` structure
- VUID-VkImageCopy2-dstSubresource-parameter
`dstSubresource` **must** be a valid `VkImageSubresourceLayers` structure

20.3. Copying Data Between Buffers and Images

Data **can** be copied between buffers and images, enabling applications to load and store data between images and application-defined offsets in buffer memory.

When copying between a buffer and an image, texels in the image and bytes in the buffer are accessed as follows.

Texels at each coordinate (x,y,z,layer) in the image subresource are accessed, where:

x is in the range [`imageOffset.x`, `imageOffset.x + imageExtent.width`),

y is in the range [`imageOffset.y`, `imageOffset.y + imageExtent.height`),

z is in the range [`imageOffset.z`, `imageOffset.z + imageExtent.depth`),

layer is in the range [`imageSubresource.baseArrayLayer`, `imageSubresource.baseArrayLayer + imageSubresource.layerCount`)

For each (x,y,z,layer) coordinate in the image, bytes in the buffer are accessed at offsets in the range

[texelOffset, texelOffset + blockSize), where:

$$\text{texelOffset} = \text{bufferOffset} + ((x - \text{imageOffset.x}) / \text{blockWidth} \times \text{blockSize}) + ((y - \text{imageOffset.y}) / \text{blockHeight} \times \text{rowExtent}) + ((z - \text{imageOffset.z}) / \text{blockDepth} \times \text{sliceExtent}) + ((\text{layer} - \text{imageSubresource.baseArrayLayer}) \times \text{layerExtent})$$
$$\text{rowExtent} = \lceil \max(\text{bufferRowLength}, \text{imageExtent.width}) / \text{blockWidth} \rceil \times \text{blockSize}$$
$$\text{sliceExtent} = \lceil \max(\text{bufferImageHeight}, \text{imageExtent.height}) / \text{blockHeight} \rceil \times \text{rowExtent}$$
$$\text{layerExtent} = \lceil \text{imageExtent.depth} / \text{blockDepth} \rceil \times \text{sliceExtent}$$

and where blockSize, blockWidth, blockHeight, and blockDepth are the [texel block size and extents](#) of the image's format.

When copying between a buffer and the depth or stencil aspect of an image, data in the buffer is assumed to be laid out as separate planes rather than interleaved. Addressing calculations are thus performed for a different format than the base image, according to the aspect, as described in the following table:

Table 24. Depth/Stencil Aspect Copy Table

Base Format	Depth Aspect Format	Stencil Aspect Format
VK_FORMAT_D16_UNORM	VK_FORMAT_D16_UNORM	-
VK_FORMAT_X8_D24_UNORM_PACK32	VK_FORMAT_X8_D24_UNORM_PACK32	-
VK_FORMAT_D32_SFLOAT	VK_FORMAT_D32_SFLOAT	-
VK_FORMAT_S8_UINT	-	VK_FORMAT_S8_UINT
VK_FORMAT_D16_UNORM_S8_UINT	VK_FORMAT_D16_UNORM	VK_FORMAT_S8_UINT
VK_FORMAT_D24_UNORM_S8_UINT	VK_FORMAT_X8_D24_UNORM_PACK32	VK_FORMAT_S8_UINT
VK_FORMAT_D32_SFLOAT_S8_UINT	VK_FORMAT_D32_SFLOAT	VK_FORMAT_S8_UINT

When copying between a buffer and any plane of a [multi-planar image](#), addressing calculations are performed using the [compatible format for that plane](#), rather than the format of the multi-planar image.

Each texel block is copied from one resource to the other according to the above addressing equations.

To copy data from a buffer object to an image object, call:

```
// Provided by VK_VERSION_1_0
void vkCmdCopyBufferToImage(
    VkCommandBuffer          commandBuffer,
    VkBuffer                 srcBuffer,
    VkImage                 dstImage,
    VkImageLayout            dstImageLayout,
    uint32_t                 regionCount,
    const VkBufferImageCopy* pRegions);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **srcBuffer** is the source buffer.
- **dstImage** is the destination image.
- **dstImageLayout** is the layout of the destination image subresources for the copy.
- **regionCount** is the number of regions to copy.
- **pRegions** is a pointer to an array of **VkBufferImageCopy** structures specifying the regions to copy.

Each source region specified by **pRegions** is copied from the source buffer to the destination region of the destination image according to the [addressing calculations](#) for each resource. If any of the specified regions in **srcBuffer** overlaps in memory with any of the specified regions in **dstImage**, values read from those overlapping regions are undefined. If any region accesses a depth aspect in **dstImage** and the **VK_EXT_depth_range_unrestricted** extension is not enabled, values copied from **srcBuffer** outside of the range [0,1] will be written as undefined values to the destination image.

Copy regions for the image **must** be aligned to a multiple of the texel block extent in each dimension, except at the edges of the image, where region extents **must** match the edge of the image.

Valid Usage

- VUID-vkCmdCopyBufferToImage-dstImage-07966
If **dstImage** is non-sparse then the image or the specified *disjoint* plane **must** be bound completely and contiguously to a single **VkDeviceMemory** object
- VUID-vkCmdCopyBufferToImage-imageSubresource-07967
The **imageSubresource.mipLevel** member of each element of **pRegions** **must** be less than the **mipLevels** specified in **VkImageCreateInfo** when **dstImage** was created
- VUID-vkCmdCopyBufferToImage-imageSubresource-07968
imageSubresource.baseArrayLayer + **imageSubresource.layerCount** of each element of **pRegions** **must** be less than or equal to the **arrayLayers** specified in **VkImageCreateInfo** when **dstImage** was created
- VUID-vkCmdCopyBufferToImage-imageSubresource-07971
For each element of **pRegions**, **imageOffset.x** and **(imageExtent.width + imageOffset.x)** **must** both be greater than or equal to 0 and less than or equal to the width of the specified **imageSubresource** of **dstImage**

- VUID-vkCmdCopyBufferToImage-imageSubresource-07972
For each element of `pRegions`, `imageOffset.y` and `(imageExtent.height + imageOffset.y)` **must** both be greater than or equal to 0 and less than or equal to the height of the specified `imageSubresource` of `dstImage`
- VUID-vkCmdCopyBufferToImage-dstImage-07973
`dstImage` **must** have a sample count equal to `VK_SAMPLE_COUNT_1_BIT`
- VUID-vkCmdCopyBufferToImage-commandBuffer-01828
If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcBuffer` **must** not be a protected buffer
- VUID-vkCmdCopyBufferToImage-commandBuffer-01829
If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` **must** not be a protected image
- VUID-vkCmdCopyBufferToImage-commandBuffer-01830
If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` **must** not be an unprotected image
- VUID-vkCmdCopyBufferToImage-commandBuffer-07737
If the queue family used to create the `VkCommandPool` which `commandBuffer` was allocated from does not support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`, the `bufferOffset` member of any element of `pRegions` **must** be a multiple of 4
- VUID-vkCmdCopyBufferToImage-imageOffset-07738
The `imageOffset` and `imageExtent` members of each element of `pRegions` **must** respect the image transfer granularity requirements of `commandBuffer`'s command pool's queue family, as described in `VkQueueFamilyProperties`
- VUID-vkCmdCopyBufferToImage-commandBuffer-07739
If the queue family used to create the `VkCommandPool` which `commandBuffer` was allocated from does not support `VK_QUEUE_GRAPHICS_BIT`, for each element of `pRegions`, the `aspectMask` member of `imageSubresource` **must** not be `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`
- VUID-vkCmdCopyBufferToImage-pRegions-00171
`srcBuffer` **must** be large enough to contain all buffer locations that are accessed according to `Buffer and Image Addressing`, for each element of `pRegions`
- VUID-vkCmdCopyBufferToImage-pRegions-00173
The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, **must** not overlap in memory
- VUID-vkCmdCopyBufferToImage-srcBuffer-00174
`srcBuffer` **must** have been created with `VK_BUFFER_USAGE_TRANSFER_SRC_BIT` usage flag
- VUID-vkCmdCopyBufferToImage-dstImage-01997
The `format features` of `dstImage` **must** contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`
- VUID-vkCmdCopyBufferToImage-srcBuffer-00176
If `srcBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdCopyBufferToImage-dstImage-00177
dstImage **must** have been created with VK_IMAGE_USAGE_TRANSFER_DST_BIT usage flag
- VUID-vkCmdCopyBufferToImage-dstImageLayout-00180
dstImageLayout **must** specify the layout of the image subresources of dstImage specified in pRegions at the time this command is executed on a VkDevice
- VUID-vkCmdCopyBufferToImage-dstImageLayout-01396
dstImageLayout **must** be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL, or VK_IMAGE_LAYOUT_GENERAL
- VUID-vkCmdCopyBufferToImage-pRegions-07931
If VK_EXT_depth_range_unrestricted is not enabled, for each element of pRegions whose imageSubresource contains a depth aspect, the data in srcBuffer **must** be in the range [0,1]
- VUID-vkCmdCopyBufferToImage-dstImage-07979
If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, imageOffset.y **must** be 0 and imageExtent.height **must** be 1
- VUID-vkCmdCopyBufferToImage-imageOffset-09104
For each element of pRegions, imageOffset.z and (imageExtent.depth + imageOffset.z) **must** both be greater than or equal to 0 and less than or equal to the depth of the specified imageSubresource of dstImage
- VUID-vkCmdCopyBufferToImage-dstImage-07980
If dstImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, imageOffset.z **must** be 0 and imageExtent.depth **must** be 1
- VUID-vkCmdCopyBufferToImage-dstImage-07274
For each element of pRegions, imageOffset.x **must** be a multiple of the texel block extent width of the VkFormat of dstImage
- VUID-vkCmdCopyBufferToImage-dstImage-07275
For each element of pRegions, imageOffset.y **must** be a multiple of the texel block extent height of the VkFormat of dstImage
- VUID-vkCmdCopyBufferToImage-dstImage-07276
For each element of pRegions, imageOffset.z **must** be a multiple of the texel block extent depth of the VkFormat of dstImage
- VUID-vkCmdCopyBufferToImage-dstImage-00207
For each element of pRegions, if the sum of imageOffset.x and extent.width does not equal the width of the subresource specified by imageSubresource, extent.width **must** be a multiple of the texel block extent width of the VkFormat of dstImage
- VUID-vkCmdCopyBufferToImage-dstImage-00208
For each element of pRegions, if the sum of imageOffset.y and extent.height does not equal the height of the subresource specified by imageSubresource, extent.height **must** be a multiple of the texel block extent height of the VkFormat of dstImage
- VUID-vkCmdCopyBufferToImage-dstImage-00209
For each element of pRegions, if the sum of imageOffset.z and extent.depth does not equal the depth of the subresource specified by srcSubresource, extent.depth **must** be a multiple of the texel block extent depth of the VkFormat of dstImage

- VUID-vkCmdCopyBufferToImage-imageSubresource-09105
For each element of `pRegions`, `imageSubresource.aspectMask` **must** specify aspects present in `dstImage`
- VUID-vkCmdCopyBufferToImage-dstImage-07981
If `dstImage` has a `multi-planar format`, then for each element of `pRegions`, `imageSubresource.aspectMask` **must** be a single valid `multi-planar aspect mask` bit
- VUID-vkCmdCopyBufferToImage-dstImage-07983
If `dstImage` is of type `VK_IMAGE_TYPE_3D`, for each element of `pRegions`, `imageSubresource.baseArrayLayer` **must** be 0 and `imageSubresource.layerCount` **must** be 1
- VUID-vkCmdCopyBufferToImage-bufferRowLength-09106
For each element of `pRegions`, `bufferRowLength` **must** be a multiple of the `texel block extent width` of the `VkFormat` of `dstImage`
- VUID-vkCmdCopyBufferToImage-bufferImageHeight-09107
For each element of `pRegions`, `bufferImageHeight` **must** be a multiple of the `texel block extent height` of the `VkFormat` of `dstImage`
- VUID-vkCmdCopyBufferToImage-bufferRowLength-09108
For each element of `pRegions`, `bufferRowLength` divided by the `texel block extent width` and then multiplied by the texel block size of `dstImage` **must** be less than or equal to $2^{31}-1$
- VUID-vkCmdCopyBufferToImage-dstImage-07975
If `dstImage` does not have either a depth/stencil format or a `multi-planar format`, then for each element of `pRegions`, `bufferOffset` **must** be a multiple of the `texel block size`
- VUID-vkCmdCopyBufferToImage-dstImage-07976
If `dstImage` has a `multi-planar format`, then for each element of `pRegions`, `bufferOffset` **must** be a multiple of the element size of the compatible format for the format and the `aspectMask` of the `imageSubresource` as defined in `Compatible Formats of Planes of Multi-Planar Formats`
- VUID-vkCmdCopyBufferToImage-dstImage-07978
If `dstImage` has a depth/stencil format, the `bufferOffset` member of any element of `pRegions` **must** be a multiple of 4

Valid Usage (Implicit)

- VUID-vkCmdCopyBufferToImage-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdCopyBufferToImage-srcBuffer-parameter
`srcBuffer` **must** be a valid `VkBuffer` handle
- VUID-vkCmdCopyBufferToImage-dstImage-parameter
`dstImage` **must** be a valid `VkImage` handle
- VUID-vkCmdCopyBufferToImage-dstImageLayout-parameter
`dstImageLayout` **must** be a valid `VkImageLayout` value
- VUID-vkCmdCopyBufferToImage-pRegions-parameter

`pRegions` **must** be a valid pointer to an array of `regionCount` valid `VkBufferImageCopy` structures

- VUID-vkCmdCopyBufferToImage-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdCopyBufferToImage-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, `VK_QUEUE_GRAPHICS_BIT`, or `VK_QUEUE_TRANSFER_BIT` operations
- VUID-vkCmdCopyBufferToImage-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdCopyBufferToImage-regionCount-arraylength
`regionCount` **must** be greater than 0
- VUID-vkCmdCopyBufferToImage-commonparent
Each of `commandBuffer`, `dstImage`, and `srcBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_TRANSFER_BIT	Action

To copy data from an image object to a buffer object, call:

```
// Provided by VK_VERSION_1_0
void vkCmdCopyImageToBuffer(
    VkCommandBuffer          commandBuffer,
    VkImage                  srcImage,
    VkImageLayout            srcImageLayout,
    VkBuffer                 dstBuffer,
    uint32_t                 regionCount,
    const VkBufferImageCopy* pRegions);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **srcImage** is the source image.
- **srcImageLayout** is the layout of the source image subresources for the copy.
- **dstBuffer** is the destination buffer.
- **regionCount** is the number of regions to copy.
- **pRegions** is a pointer to an array of **VkBufferImageCopy** structures specifying the regions to copy.

Each source region specified by **pRegions** is copied from the source image to the destination region of the destination buffer according to the [addressing calculations](#) for each resource. If any of the specified regions in **srcImage** overlaps in memory with any of the specified regions in **dstBuffer**, values read from those overlapping regions are undefined.

Copy regions for the image **must** be aligned to a multiple of the texel block extent in each dimension, except at the edges of the image, where region extents **must** match the edge of the image.

Valid Usage

- VUID-vkCmdCopyImageToBuffer-srcImage-07966
If **srcImage** is non-sparse then the image or the specified *disjoint* plane **must** be bound completely and contiguously to a single **VkDeviceMemory** object
- VUID-vkCmdCopyImageToBuffer-imageSubresource-07967
The **imageSubresource.mipLevel** member of each element of **pRegions** **must** be less than the **mipLevels** specified in **VkImageCreateInfo** when **srcImage** was created
- VUID-vkCmdCopyImageToBuffer-imageSubresource-07968
imageSubresource.baseArrayLayer + **imageSubresource.layerCount** of each element of **pRegions** **must** be less than or equal to the **arrayLayers** specified in **VkImageCreateInfo** when **srcImage** was created
- VUID-vkCmdCopyImageToBuffer-imageSubresource-07971
For each element of **pRegions**, **imageOffset.x** and **(imageExtent.width + imageOffset.x)** **must** both be greater than or equal to **0** and less than or equal to the width of the specified **imageSubresource** of **srcImage**
- VUID-vkCmdCopyImageToBuffer-imageSubresource-07972
For each element of **pRegions**, **imageOffset.y** and **(imageExtent.height + imageOffset.y)**

must both be greater than or equal to 0 and less than or equal to the height of the specified `imageSubresource` of `srcImage`

- VUID-vkCmdCopyImageToBuffer-srcImage-07973
`srcImage` **must** have a sample count equal to `VK_SAMPLE_COUNT_1_BIT`
- VUID-vkCmdCopyImageToBuffer-commandBuffer-01831
If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` **must** not be a protected image
- VUID-vkCmdCopyImageToBuffer-commandBuffer-01832
If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstBuffer` **must** not be a protected buffer
- VUID-vkCmdCopyImageToBuffer-commandBuffer-01833
If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstBuffer` **must** not be an unprotected buffer
- VUID-vkCmdCopyImageToBuffer-commandBuffer-07746
If the queue family used to create the `VkCommandPool` which `commandBuffer` was allocated from does not support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`, the `bufferOffset` member of any element of `pRegions` **must** be a multiple of 4
- VUID-vkCmdCopyImageToBuffer-imageOffset-07747
The `imageOffset` and `imageExtent` members of each element of `pRegions` **must** respect the image transfer granularity requirements of `commandBuffer`'s command pool's queue family, as described in `VkQueueFamilyProperties`
- VUID-vkCmdCopyImageToBuffer-commandBuffer-10216
If the queue family used to create the `VkCommandPool` which `commandBuffer` was allocated from does not support `VK_QUEUE_GRAPHICS_BIT`, for each element of `pRegions`, the `aspectMask` member of `imageSubresource` **must** not be `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`
- VUID-vkCmdCopyImageToBuffer-pRegions-00183
`dstBuffer` **must** be large enough to contain all buffer locations that are accessed according to `Buffer and Image Addressing`, for each element of `pRegions`
- VUID-vkCmdCopyImageToBuffer-pRegions-00184
The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, **must** not overlap in memory
- VUID-vkCmdCopyImageToBuffer-srcImage-00186
`srcImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag
- VUID-vkCmdCopyImageToBuffer-srcImage-01998
The `formatFeatures` of `srcImage` **must** contain `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT`
- VUID-vkCmdCopyImageToBuffer-dstBuffer-00191
`dstBuffer` **must** have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag
- VUID-vkCmdCopyImageToBuffer-dstBuffer-00192
If `dstBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdCopyImageToBuffer-srcImageLayout-00189
`srcImageLayout` **must** specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`
- VUID-vkCmdCopyImageToBuffer-srcImageLayout-01397
`srcImageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, or `VK_IMAGE_LAYOUT_GENERAL`
- VUID-vkCmdCopyImageToBuffer-srcImage-07979
If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `imageOffset.y` **must** be 0 and `imageExtent.height` **must** be 1
- VUID-vkCmdCopyImageToBuffer-imageOffset-09104
For each element of `pRegions`, `imageOffset.z` and `(imageExtent.depth + imageOffset.z)` **must** both be greater than or equal to 0 and less than or equal to the depth of the specified `imageSubresource` of `srcImage`
- VUID-vkCmdCopyImageToBuffer-srcImage-07980
If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `imageOffset.z` **must** be 0 and `imageExtent.depth` **must** be 1
- VUID-vkCmdCopyImageToBuffer-srcImage-07274
For each element of `pRegions`, `imageOffset.x` **must** be a multiple of the `texel block extent width` of the `VkFormat` of `srcImage`
- VUID-vkCmdCopyImageToBuffer-srcImage-07275
For each element of `pRegions`, `imageOffset.y` **must** be a multiple of the `texel block extent height` of the `VkFormat` of `srcImage`
- VUID-vkCmdCopyImageToBuffer-srcImage-07276
For each element of `pRegions`, `imageOffset.z` **must** be a multiple of the `texel block extent depth` of the `VkFormat` of `srcImage`
- VUID-vkCmdCopyImageToBuffer-srcImage-00207
For each element of `pRegions`, if the sum of `imageOffset.x` and `extent.width` does not equal the width of the subresource specified by `imageSubresource`, `extent.width` **must** be a multiple of the `texel block extent width` of the `VkFormat` of `srcImage`
- VUID-vkCmdCopyImageToBuffer-srcImage-00208
For each element of `pRegions`, if the sum of `imageOffset.y` and `extent.height` does not equal the height of the subresource specified by `imageSubresource`, `extent.height` **must** be a multiple of the `texel block extent height` of the `VkFormat` of `srcImage`
- VUID-vkCmdCopyImageToBuffer-srcImage-00209
For each element of `pRegions`, if the sum of `imageOffset.z` and `extent.depth` does not equal the depth of the subresource specified by `srcSubresource`, `extent.depth` **must** be a multiple of the `texel block extent depth` of the `VkFormat` of `srcImage`
- VUID-vkCmdCopyImageToBuffer-imageSubresource-09105
For each element of `pRegions`, `imageSubresource.aspectMask` **must** specify aspects present in `srcImage`
- VUID-vkCmdCopyImageToBuffer-srcImage-07981
If `srcImage` has a `multi-planar format`, then for each element of `pRegions`, `imageSubresource.aspectMask` **must** be a single valid `multi-planar aspect mask` bit

- VUID-vkCmdCopyImageToBuffer-srcImage-07983
If `srcImage` is of type `VK_IMAGE_TYPE_3D`, for each element of `pRegions`, `imageSubresource.baseArrayLayer` **must** be 0 and `imageSubresource.layerCount` **must** be 1
- VUID-vkCmdCopyImageToBuffer-bufferRowLength-09106
For each element of `pRegions`, `bufferRowLength` **must** be a multiple of the `texel block extent width` of the `VkFormat` of `srcImage`
- VUID-vkCmdCopyImageToBuffer-bufferImageHeight-09107
For each element of `pRegions`, `bufferImageHeight` **must** be a multiple of the `texel block extent height` of the `VkFormat` of `srcImage`
- VUID-vkCmdCopyImageToBuffer-bufferRowLength-09108
For each element of `pRegions`, `bufferRowLength` divided by the `texel block extent width` and then multiplied by the texel block size of `srcImage` **must** be less than or equal to $2^{31}-1$
- VUID-vkCmdCopyImageToBuffer-srcImage-07975
If `srcImage` does not have either a depth/stencil format or a `multi-planar format`, then for each element of `pRegions`, `bufferOffset` **must** be a multiple of the `texel block size`
- VUID-vkCmdCopyImageToBuffer-srcImage-07976
If `srcImage` has a `multi-planar format`, then for each element of `pRegions`, `bufferOffset` **must** be a multiple of the element size of the compatible format for the format and the `aspectMask` of the `imageSubresource` as defined in `Compatible Formats of Planes of Multi-Planar Formats`
- VUID-vkCmdCopyImageToBuffer-srcImage-07978
If `srcImage` has a depth/stencil format, the `bufferOffset` member of any element of `pRegions` **must** be a multiple of 4

Valid Usage (Implicit)

- VUID-vkCmdCopyImageToBuffer-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdCopyImageToBuffer-srcImage-parameter
`srcImage` **must** be a valid `VkImage` handle
- VUID-vkCmdCopyImageToBuffer-srcImageLayout-parameter
`srcImageLayout` **must** be a valid `VkImageLayout` value
- VUID-vkCmdCopyImageToBuffer-dstBuffer-parameter
`dstBuffer` **must** be a valid `VkBuffer` handle
- VUID-vkCmdCopyImageToBuffer-pRegions-parameter
`pRegions` **must** be a valid pointer to an array of `regionCount` valid `VkBufferImageCopy` structures
- VUID-vkCmdCopyImageToBuffer-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdCopyImageToBuffer-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support

VK_QUEUE_COMPUTE_BIT, VK_QUEUE_GRAPHICS_BIT, or VK_QUEUE_TRANSFER_BIT operations

- VUID-vkCmdCopyImageToBuffer-renderpass

This command **must** only be called outside of a render pass instance

- VUID-vkCmdCopyImageToBuffer-regionCount-arraylength

regionCount **must** be greater than 0

- VUID-vkCmdCopyImageToBuffer-commonparent

Each of commandBuffer, dstBuffer, and srcImage **must** have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_TRANSFER_BIT	Action

For both vkCmdCopyBufferToImage and vkCmdCopyImageToBuffer, each element of pRegions is a structure defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkBufferImageCopy {
    VkDeviceSize          bufferOffset;
    uint32_t              bufferRowLength;
    uint32_t              bufferImageHeight;
    VkImageSubresourceLayers imageSubresource;
    VkOffset3D            imageOffset;
    VkExtent3D            imageExtent;
} VkBufferImageCopy;
```

- bufferOffset is the offset in bytes from the start of the buffer object where the image data is copied from or to.
- bufferRowLength and bufferImageHeight specify in texels a subregion of a larger two- or three-

dimensional image in buffer memory, and control the addressing calculations. If either of these values is zero, that aspect of the buffer memory is considered to be tightly packed according to the `imageExtent`.

- `imageSubresource` is a `VkImageSubresourceLayers` used to specify the specific image subresources of the image used for the source or destination image data.
- `imageOffset` selects the initial `x`, `y`, `z` offsets in texels of the sub-region of the source or destination image data.
- `imageExtent` is the size in texels of the image to copy in `width`, `height` and `depth`.

Valid Usage

- VUID-VkBufferImageCopy-bufferRowLength-09101
`bufferRowLength` **must** be 0, or greater than or equal to the `width` member of `imageExtent`
- VUID-VkBufferImageCopy-bufferImageHeight-09102
`bufferImageHeight` **must** be 0, or greater than or equal to the `height` member of `imageExtent`
- VUID-VkBufferImageCopy-aspectMask-09103
The `aspectMask` member of `imageSubresource` **must** only have a single bit set
- VUID-VkBufferImageCopy-imageExtent-06659
`imageExtent.width` **must** not be 0
- VUID-VkBufferImageCopy-imageExtent-06660
`imageExtent.height` **must** not be 0
- VUID-VkBufferImageCopy-imageExtent-06661
`imageExtent.depth` **must** not be 0

Valid Usage (Implicit)

- VUID-VkBufferImageCopy-imageSubresource-parameter
`imageSubresource` **must** be a valid `VkImageSubresourceLayers` structure

More extensible versions of the commands to copy between buffers and images are defined below.

To copy data from a buffer object to an image object, call:

```
// Provided by VK_KHR_copy_commands2
void vkCmdCopyBufferToImage2KHR(
    VkCommandBuffer                      commandBuffer,
    const VkCopyBufferToImageInfo2*     pCopyBufferToImageInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pCopyBufferToImageInfo` is a pointer to a `VkCopyBufferToImageInfo2` structure describing the copy parameters.

This command is functionally identical to [vkCmdCopyBufferToImage](#), but includes extensible sub-structures that include [sType](#) and [pNext](#) parameters, allowing them to be more easily extended.

Valid Usage

- VUID-vkCmdCopyBufferToImage2-commandBuffer-01828
If [commandBuffer](#) is an unprotected command buffer and [protectedNoFault](#) is not supported, [srcBuffer](#) **must** not be a protected buffer
- VUID-vkCmdCopyBufferToImage2-commandBuffer-01829
If [commandBuffer](#) is an unprotected command buffer and [protectedNoFault](#) is not supported, [dstImage](#) **must** not be a protected image
- VUID-vkCmdCopyBufferToImage2-commandBuffer-01830
If [commandBuffer](#) is a protected command buffer and [protectedNoFault](#) is not supported, [dstImage](#) **must** not be an unprotected image
- VUID-vkCmdCopyBufferToImage2-commandBuffer-07737
If the queue family used to create the [VkCommandPool](#) which [commandBuffer](#) was allocated from does not support [VK_QUEUE_GRAPHICS_BIT](#) or [VK_QUEUE_COMPUTE_BIT](#), the [bufferOffset](#) member of any element of [pCopyBufferToImageInfo->pRegions](#) **must** be a multiple of 4
- VUID-vkCmdCopyBufferToImage2-imageOffset-07738
The [imageOffset](#) and [imageExtent](#) members of each element of [pCopyBufferToImageInfo->pRegions](#) **must** respect the image transfer granularity requirements of [commandBuffer](#)'s command pool's queue family, as described in [VkQueueFamilyProperties](#)
- VUID-vkCmdCopyBufferToImage2-commandBuffer-07739
If the queue family used to create the [VkCommandPool](#) which [commandBuffer](#) was allocated from does not support [VK_QUEUE_GRAPHICS_BIT](#), for each element of [pCopyBufferToImageInfo->pRegions](#), the [aspectMask](#) member of [imageSubresource](#) **must** not be [VK_IMAGE_ASPECT_DEPTH_BIT](#) or [VK_IMAGE_ASPECT_STENCIL_BIT](#)

Valid Usage (Implicit)

- VUID-vkCmdCopyBufferToImage2-commandBuffer-parameter
[commandBuffer](#) **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdCopyBufferToImage2-pCopyBufferToImageInfo-parameter
[pCopyBufferToImageInfo](#) **must** be a valid pointer to a valid [VkCopyBufferToImageInfo2](#) structure
- VUID-vkCmdCopyBufferToImage2-commandBuffer-recording
[commandBuffer](#) **must** be in the [recording state](#)
- VUID-vkCmdCopyBufferToImage2-commandBuffer-cmdpool
The [VkCommandPool](#) that [commandBuffer](#) was allocated from **must** support [VK_QUEUE_COMPUTE_BIT](#), [VK_QUEUE_GRAPHICS_BIT](#), or [VK_QUEUE_TRANSFER_BIT](#) operations
- VUID-vkCmdCopyBufferToImage2-renderpass
This command **must** only be called outside of a render pass instance

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_TRANSFER_BIT	Action

The `VkCopyBufferToImageInfo2` structure is defined as:

```
typedef struct VkCopyBufferToImageInfo2 {  
    VkStructureType      sType;  
    const void*          pNext;  
    VkBuffer              srcBuffer;  
    VkImage               dstImage;  
    VkImageLayout         dstImageLayout;  
    uint32_t              regionCount;  
    const VkBufferImageCopy2* pRegions;  
} VkCopyBufferToImageInfo2;
```

```
// Provided by VK_KHR_copy_commands2  
typedef VkCopyBufferToImageInfo2 VkCopyBufferToImageInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcBuffer` is the source buffer.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the copy.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkBufferImageCopy2` structures specifying the regions to copy.

Valid Usage

- VUID-VkCopyBufferToImageInfo2-pRegions-04565
The image region specified by each element of **pRegions** **must** be contained within the specified **imageSubresource** of **dstImage**
- VUID-VkCopyBufferToImageInfo2-pRegions-00171
srcBuffer **must** be large enough to contain all buffer locations that are accessed according to **Buffer and Image Addressing**, for each element of **pRegions**
- VUID-VkCopyBufferToImageInfo2-pRegions-00173
The union of all source regions, and the union of all destination regions, specified by the elements of **pRegions**, **must** not overlap in memory
- VUID-VkCopyBufferToImageInfo2-srcBuffer-00174
srcBuffer **must** have been created with **VK_BUFFER_USAGE_TRANSFER_SRC_BIT** usage flag
- VUID-VkCopyBufferToImageInfo2-dstImage-01997
The **format features** of **dstImage** **must** contain **VK_FORMAT_FEATURE_TRANSFER_DST_BIT**
- VUID-VkCopyBufferToImageInfo2-srcBuffer-00176
If **srcBuffer** is non-sparse then it **must** be bound completely and contiguously to a single **VkDeviceMemory** object
- VUID-VkCopyBufferToImageInfo2-dstImage-00177
dstImage **must** have been created with **VK_IMAGE_USAGE_TRANSFER_DST_BIT** usage flag
- VUID-VkCopyBufferToImageInfo2-dstImageLayout-00180
dstImageLayout **must** specify the layout of the image subresources of **dstImage** specified in **pRegions** at the time this command is executed on a **VkDevice**
- VUID-VkCopyBufferToImageInfo2-dstImageLayout-01396
dstImageLayout **must** be **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR**, **VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL**, or **VK_IMAGE_LAYOUT_GENERAL**
- VUID-VkCopyBufferToImageInfo2-pRegions-07931
If **VK_EXT_depth_range_unrestricted** is not enabled, for each element of **pRegions** whose **imageSubresource** contains a depth aspect, the data in **srcBuffer** **must** be in the range [0,1]
- VUID-VkCopyBufferToImageInfo2-dstImage-07966
If **dstImage** is non-sparse then the image or the specified *disjoint* plane **must** be bound completely and contiguously to a single **VkDeviceMemory** object
- VUID-VkCopyBufferToImageInfo2-imageSubresource-07967
The **imageSubresource.mipLevel** member of each element of **pRegions** **must** be less than the **mipLevels** specified in **VkImageCreateInfo** when **dstImage** was created
- VUID-VkCopyBufferToImageInfo2-imageSubresource-07968
imageSubresource.baseArrayLayer + **imageSubresource.layerCount** of each element of **pRegions** **must** be less than or equal to the **arrayLayers** specified in **VkImageCreateInfo** when **dstImage** was created
- VUID-VkCopyBufferToImageInfo2-dstImage-07973
dstImage **must** have a sample count equal to **VK_SAMPLE_COUNT_1_BIT**

- VUID-VkCopyBufferToImageInfo2-dstImage-07979
If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `imageOffset.y` **must** be 0 and `imageExtent.height` **must** be 1
- VUID-VkCopyBufferToImageInfo2-imageOffset-09104
For each element of `pRegions`, `imageOffset.z` and `(imageExtent.depth + imageOffset.z)` **must** both be greater than or equal to 0 and less than or equal to the depth of the specified `imageSubresource` of `dstImage`
- VUID-VkCopyBufferToImageInfo2-dstImage-07980
If `dstImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `imageOffset.z` **must** be 0 and `imageExtent.depth` **must** be 1
- VUID-VkCopyBufferToImageInfo2-dstImage-07274
For each element of `pRegions`, `imageOffset.x` **must** be a multiple of the `texel block extent width` of the `VkFormat` of `dstImage`
- VUID-VkCopyBufferToImageInfo2-dstImage-07275
For each element of `pRegions`, `imageOffset.y` **must** be a multiple of the `texel block extent height` of the `VkFormat` of `dstImage`
- VUID-VkCopyBufferToImageInfo2-dstImage-07276
For each element of `pRegions`, `imageOffset.z` **must** be a multiple of the `texel block extent depth` of the `VkFormat` of `dstImage`
- VUID-VkCopyBufferToImageInfo2-dstImage-00207
For each element of `pRegions`, if the sum of `imageOffset.x` and `extent.width` does not equal the width of the subresource specified by `imageSubresource`, `extent.width` **must** be a multiple of the `texel block extent width` of the `VkFormat` of `dstImage`
- VUID-VkCopyBufferToImageInfo2-dstImage-00208
For each element of `pRegions`, if the sum of `imageOffset.y` and `extent.height` does not equal the height of the subresource specified by `imageSubresource`, `extent.height` **must** be a multiple of the `texel block extent height` of the `VkFormat` of `dstImage`
- VUID-VkCopyBufferToImageInfo2-dstImage-00209
For each element of `pRegions`, if the sum of `imageOffset.z` and `extent.depth` does not equal the depth of the subresource specified by `srcSubresource`, `extent.depth` **must** be a multiple of the `texel block extent depth` of the `VkFormat` of `dstImage`
- VUID-VkCopyBufferToImageInfo2-imageSubresource-09105
For each element of `pRegions`, `imageSubresource.aspectMask` **must** specify aspects present in `dstImage`
- VUID-VkCopyBufferToImageInfo2-dstImage-07981
If `dstImage` has a `multi-planar format`, then for each element of `pRegions`, `imageSubresource.aspectMask` **must** be a single valid `multi-planar aspect mask` bit
- VUID-VkCopyBufferToImageInfo2-dstImage-07983
If `dstImage` is of type `VK_IMAGE_TYPE_3D`, for each element of `pRegions`, `imageSubresource.baseArrayLayer` **must** be 0 and `imageSubresource.layerCount` **must** be 1
- VUID-VkCopyBufferToImageInfo2-bufferRowLength-09106
For each element of `pRegions`, `bufferRowLength` **must** be a multiple of the `texel block extent width` of the `VkFormat` of `dstImage`

- VUID-VkCopyBufferToImageInfo2-bufferImageHeight-09107
For each element of `pRegions`, `bufferImageHeight` **must** be a multiple of the `texel block extent height` of the `VkFormat` of `dstImage`
- VUID-VkCopyBufferToImageInfo2-bufferRowLength-09108
For each element of `pRegions`, `bufferRowLength` divided by the `texel block extent width` and then multiplied by the texel block size of `dstImage` **must** be less than or equal to $2^{31}-1$
- VUID-VkCopyBufferToImageInfo2-dstImage-07975
If `dstImage` does not have either a depth/stencil format or a `multi-planar format`, then for each element of `pRegions`, `bufferOffset` **must** be a multiple of the `texel block size`
- VUID-VkCopyBufferToImageInfo2-dstImage-07976
If `dstImage` has a `multi-planar format`, then for each element of `pRegions`, `bufferOffset` **must** be a multiple of the element size of the compatible format for the format and the `aspectMask` of the `imageSubresource` as defined in `Compatible Formats of Planes of Multi-Planar Formats`
- VUID-VkCopyBufferToImageInfo2-dstImage-07978
If `dstImage` has a depth/stencil format, the `bufferOffset` member of any element of `pRegions` **must** be a multiple of 4
- VUID-VkCopyBufferToImageInfo2-pRegions-06223
For each element of `pRegions` not containing `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, `imageOffset.x` and `(imageExtent.width + imageOffset.x)` **must** both be greater than or equal to 0 and less than or equal to the width of the specified `imageSubresource` of `dstImage`
- VUID-VkCopyBufferToImageInfo2-pRegions-06224
For each element of `pRegions` not containing `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, `imageOffset.y` and `(imageExtent.height + imageOffset.y)` **must** both be greater than or equal to 0 and less than or equal to the height of the specified `imageSubresource` of `dstImage`

Valid Usage (Implicit)

- VUID-VkCopyBufferToImageInfo2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_COPY_BUFFER_TO_IMAGE_INFO_2`
- VUID-VkCopyBufferToImageInfo2-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkCopyBufferToImageInfo2-srcBuffer-parameter
`srcBuffer` **must** be a valid `VkBuffer` handle
- VUID-VkCopyBufferToImageInfo2-dstImage-parameter
`dstImage` **must** be a valid `VkImage` handle
- VUID-VkCopyBufferToImageInfo2-dstImageLayout-parameter
`dstImageLayout` **must** be a valid `VkImageLayout` value
- VUID-VkCopyBufferToImageInfo2-pRegions-parameter
`pRegions` **must** be a valid pointer to an array of `regionCount` valid `VkBufferImageCopy2` structures

- VUID-VkCopyBufferToImageInfo2-regionCount-arraylength
`regionCount` **must** be greater than 0
- VUID-VkCopyBufferToImageInfo2-commonparent
Both of `dstImage`, and `srcBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

To copy data from an image object to a buffer object, call:

```
// Provided by VK_KHR_copy_commands2
void vkCmdCopyImageToBuffer2KHR(
    VkCommandBuffer                      commandBuffer,
    const VkCopyImageToBufferInfo2*     pCopyImageToBufferInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pCopyImageToBufferInfo` is a pointer to a `VkCopyImageToBufferInfo2` structure describing the copy parameters.

This command is functionally identical to `vkCmdCopyImageToBuffer`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

Valid Usage

- VUID-vkCmdCopyImageToBuffer2-commandBuffer-01831
If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` **must** not be a protected image
- VUID-vkCmdCopyImageToBuffer2-commandBuffer-01832
If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstBuffer` **must** not be a protected buffer
- VUID-vkCmdCopyImageToBuffer2-commandBuffer-01833
If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstBuffer` **must** not be an unprotected buffer
- VUID-vkCmdCopyImageToBuffer2-commandBuffer-07746
If the queue family used to create the `VkCommandPool` which `commandBuffer` was allocated from does not support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`, the `bufferOffset` member of any element of `pCopyImageToBufferInfo->pRegions` **must** be a multiple of 4
- VUID-vkCmdCopyImageToBuffer2-imageOffset-07747
The `imageOffset` and `imageExtent` members of each element of `pCopyImageToBufferInfo->pRegions` **must** respect the image transfer granularity requirements of `commandBuffer`'s command pool's queue family, as described in `VkQueueFamilyProperties`
- VUID-vkCmdCopyImageToBuffer2-commandBuffer-10216
If the queue family used to create the `VkCommandPool` which `commandBuffer` was allocated from does not support `VK_QUEUE_GRAPHICS_BIT`, for each element of `pCopyImageToBufferInfo->pRegions`, the `aspectMask` member of `imageSubresource` **must** not be `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`

Valid Usage (Implicit)

- VUID-vkCmdCopyImageToBuffer2-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdCopyImageToBuffer2-pCopyImageToBufferInfo-parameter
`pCopyImageToBufferInfo` **must** be a valid pointer to a valid `VkCopyImageToBufferInfo2` structure
- VUID-vkCmdCopyImageToBuffer2-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdCopyImageToBuffer2-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, `VK_QUEUE_GRAPHICS_BIT`, or `VK_QUEUE_TRANSFER_BIT` operations
- VUID-vkCmdCopyImageToBuffer2-renderpass
This command **must** only be called outside of a render pass instance

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_TRANSFER_BIT	Action

The `VkCopyImageToBufferInfo2` structure is defined as:

```
typedef struct VkCopyImageToBufferInfo2 {
    VkStructureType      sType;
    const void*          pNext;
    VkImage               srcImage;
    VkImageLayout         srcImageLayout;
    VkBuffer              dstBuffer;
    uint32_t              regionCount;
    const VkBufferImageCopy2* pRegions;
} VkCopyImageToBufferInfo2;
```

```
// Provided by VK_KHR_copy_commands2
typedef VkCopyImageToBufferInfo2 VkCopyImageToBufferInfo2KHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **srcImage** is the source image.
- **srcImageLayout** is the layout of the source image subresources for the copy.
- **dstBuffer** is the destination buffer.
- **regionCount** is the number of regions to copy.
- **pRegions** is a pointer to an array of **VkBufferImageCopy2** structures specifying the regions to copy.

Valid Usage

- VUID-VkCopyImageToBufferInfo2-pRegions-04566
The image region specified by each element of **pRegions** **must** be contained within the specified **imageSubresource** of **srcImage**
- VUID-VkCopyImageToBufferInfo2-pRegions-00183
dstBuffer **must** be large enough to contain all buffer locations that are accessed according to **Buffer and Image Addressing**, for each element of **pRegions**
- VUID-VkCopyImageToBufferInfo2-pRegions-00184
The union of all source regions, and the union of all destination regions, specified by the elements of **pRegions**, **must** not overlap in memory
- VUID-VkCopyImageToBufferInfo2-srcImage-00186
srcImage **must** have been created with **VK_IMAGE_USAGE_TRANSFER_SRC_BIT** usage flag
- VUID-VkCopyImageToBufferInfo2-srcImage-01998
The **format features** of **srcImage** **must** contain **VK_FORMAT_FEATURE_TRANSFER_SRC_BIT**
- VUID-VkCopyImageToBufferInfo2-dstBuffer-00191
dstBuffer **must** have been created with **VK_BUFFER_USAGE_TRANSFER_DST_BIT** usage flag
- VUID-VkCopyImageToBufferInfo2-dstBuffer-00192
If **dstBuffer** is non-sparse then it **must** be bound completely and contiguously to a single

VkDeviceMemory object

- VUID-VkCopyImageToBufferInfo2-srcImageLayout-00189
`srcImageLayout` **must** specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`
- VUID-VkCopyImageToBufferInfo2-srcImageLayout-01397
`srcImageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, or `VK_IMAGE_LAYOUT_GENERAL`
- VUID-VkCopyImageToBufferInfo2-srcImage-07966
If `srcImage` is non-sparse then the image or the specified *disjoint* plane **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-VkCopyImageToBufferInfo2-imageSubresource-07967
The `imageSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created
- VUID-VkCopyImageToBufferInfo2-imageSubresource-07968
`imageSubresource.baseArrayLayer` + `imageSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created
- VUID-VkCopyImageToBufferInfo2-srcImage-07973
`srcImage` **must** have a sample count equal to `VK_SAMPLE_COUNT_1_BIT`
- VUID-VkCopyImageToBufferInfo2-srcImage-07979
If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `imageOffset.y` **must** be 0 and `imageExtent.height` **must** be 1
- VUID-VkCopyImageToBufferInfo2-imageOffset-09104
For each element of `pRegions`, `imageOffset.z` and `(imageExtent.depth + imageOffset.z)` **must** both be greater than or equal to 0 and less than or equal to the depth of the specified `imageSubresource` of `srcImage`
- VUID-VkCopyImageToBufferInfo2-srcImage-07980
If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `imageOffset.z` **must** be 0 and `imageExtent.depth` **must** be 1
- VUID-VkCopyImageToBufferInfo2-srcImage-07274
For each element of `pRegions`, `imageOffset.x` **must** be a multiple of the `texel block extent width` of the `VkFormat` of `srcImage`
- VUID-VkCopyImageToBufferInfo2-srcImage-07275
For each element of `pRegions`, `imageOffset.y` **must** be a multiple of the `texel block extent height` of the `VkFormat` of `srcImage`
- VUID-VkCopyImageToBufferInfo2-srcImage-07276
For each element of `pRegions`, `imageOffset.z` **must** be a multiple of the `texel block extent depth` of the `VkFormat` of `srcImage`
- VUID-VkCopyImageToBufferInfo2-srcImage-00207
For each element of `pRegions`, if the sum of `imageOffset.x` and `extent.width` does not equal the width of the subresource specified by `imageSubresource`, `extent.width` **must** be a

multiple of the [texel block extent width](#) of the [VkFormat](#) of [srcImage](#)

- VUID-VkCopyImageToBufferInfo2-srcImage-00208

For each element of [pRegions](#), if the sum of [imageOffset.y](#) and [extent.height](#) does not equal the height of the subresource specified by [imageSubresource](#), [extent.height](#) **must** be a multiple of the [texel block extent height](#) of the [VkFormat](#) of [srcImage](#)

- VUID-VkCopyImageToBufferInfo2-srcImage-00209

For each element of [pRegions](#), if the sum of [imageOffset.z](#) and [extent.depth](#) does not equal the depth of the subresource specified by [srcSubresource](#), [extent.depth](#) **must** be a multiple of the [texel block extent depth](#) of the [VkFormat](#) of [srcImage](#)

- VUID-VkCopyImageToBufferInfo2-imageSubresource-09105

For each element of [pRegions](#), [imageSubresource.aspectMask](#) **must** specify aspects present in [srcImage](#)

- VUID-VkCopyImageToBufferInfo2-srcImage-07981

If [srcImage](#) has a [multi-planar format](#), then for each element of [pRegions](#), [imageSubresource.aspectMask](#) **must** be a single valid [multi-planar aspect mask](#) bit

- VUID-VkCopyImageToBufferInfo2-srcImage-07983

If [srcImage](#) is of type [VK_IMAGE_TYPE_3D](#), for each element of [pRegions](#), [imageSubresource.baseArrayLayer](#) **must** be 0 and [imageSubresource.layerCount](#) **must** be 1

- VUID-VkCopyImageToBufferInfo2-bufferRowLength-09106

For each element of [pRegions](#), [bufferRowLength](#) **must** be a multiple of the [texel block extent width](#) of the [VkFormat](#) of [srcImage](#)

- VUID-VkCopyImageToBufferInfo2-bufferImageHeight-09107

For each element of [pRegions](#), [bufferImageHeight](#) **must** be a multiple of the [texel block extent height](#) of the [VkFormat](#) of [srcImage](#)

- VUID-VkCopyImageToBufferInfo2-bufferRowLength-09108

For each element of [pRegions](#), [bufferRowLength](#) divided by the [texel block extent width](#) and then multiplied by the texel block size of [srcImage](#) **must** be less than or equal to $2^{31}-1$

- VUID-VkCopyImageToBufferInfo2-srcImage-07975

If [srcImage](#) does not have either a depth/stencil format or a [multi-planar format](#), then for each element of [pRegions](#), [bufferOffset](#) **must** be a multiple of the [texel block size](#)

- VUID-VkCopyImageToBufferInfo2-srcImage-07976

If [srcImage](#) has a [multi-planar format](#), then for each element of [pRegions](#), [bufferOffset](#) **must** be a multiple of the element size of the compatible format for the format and the [aspectMask](#) of the [imageSubresource](#) as defined in [Compatible Formats of Planes of Multi-Planar Formats](#)

- VUID-VkCopyImageToBufferInfo2-srcImage-07978

If [srcImage](#) has a depth/stencil format, the [bufferOffset](#) member of any element of [pRegions](#) **must** be a multiple of 4

- VUID-VkCopyImageToBufferInfo2-imageOffset-00197

For each element of [pRegions](#) not containing [VkCopyCommandTransformInfoQCOM](#) in its [pNext](#) chain, [imageOffset.x](#) and ([imageExtent.width](#) + [imageOffset.x](#)) **must** both be greater than or equal to 0 and less than or equal to the width of the specified [imageSubresource](#) of [srcImage](#)

- VUID-VkCopyImageToBufferInfo2-imageOffset-00198
For each element of `pRegions` not containing `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, `imageOffset.y` and `(imageExtent.height + imageOffset.y)` **must** both be greater than or equal to `0` and less than or equal to the height of the specified `imageSubresource` of `srcImage`

Valid Usage (Implicit)

- VUID-VkCopyImageToBufferInfo2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_COPY_IMAGE_TO_BUFFER_INFO_2`
- VUID-VkCopyImageToBufferInfo2-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkCopyImageToBufferInfo2-srcImage-parameter
`srcImage` **must** be a valid `VkImage` handle
- VUID-VkCopyImageToBufferInfo2-srcImageLayout-parameter
`srcImageLayout` **must** be a valid `VkImageLayout` value
- VUID-VkCopyImageToBufferInfo2-dstBuffer-parameter
`dstBuffer` **must** be a valid `VkBuffer` handle
- VUID-VkCopyImageToBufferInfo2-pRegions-parameter
`pRegions` **must** be a valid pointer to an array of `regionCount` valid `VkBufferImageCopy2` structures
- VUID-VkCopyImageToBufferInfo2-regionCount-arraylength
`regionCount` **must** be greater than `0`
- VUID-VkCopyImageToBufferInfo2-commonparent
Both of `dstBuffer`, and `srcImage` **must** have been created, allocated, or retrieved from the same `VkDevice`

For both `vkCmdCopyBufferToImage2KHR` and `vkCmdCopyImageToBuffer2KHR`, each element of `pRegions` is a structure defined as:

```
typedef struct VkBufferImageCopy2 {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceSize        bufferOffset;
    uint32_t            bufferRowLength;
    uint32_t            bufferImageHeight;
    VkImageSubresourceLayers imageSubresource;
    VkOffset3D          imageOffset;
    VkExtent3D          imageExtent;
} VkBufferImageCopy2;
```

```
// Provided by VK_KHR_copy_commands2
typedef VkBufferImageCopy2 VkBufferImageCopy2KHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **bufferOffset** is the offset in bytes from the start of the buffer object where the image data is copied from or to.
- **bufferRowLength** and **bufferImageHeight** specify in texels a subregion of a larger two- or three-dimensional image in buffer memory, and control the addressing calculations. If either of these values is zero, that aspect of the buffer memory is considered to be tightly packed according to the **imageExtent**.
- **imageSubresource** is a [VkImageSubresourceLayers](#) used to specify the specific image subresources of the image used for the source or destination image data.
- **imageOffset** selects the initial **x**, **y**, **z** offsets in texels of the sub-region of the source or destination image data.
- **imageExtent** is the size in texels of the image to copy in **width**, **height** and **depth**.

This structure is functionally identical to [VkBufferImageCopy](#), but adds **sType** and **pNext** parameters, allowing it to be more easily extended.

Valid Usage

- VUID-VkBufferImageCopy2-bufferRowLength-09101
bufferRowLength **must** be 0, or greater than or equal to the **width** member of **imageExtent**
- VUID-VkBufferImageCopy2-bufferImageHeight-09102
bufferImageHeight **must** be 0, or greater than or equal to the **height** member of **imageExtent**
- VUID-VkBufferImageCopy2-aspectMask-09103
The **aspectMask** member of **imageSubresource** **must** only have a single bit set
- VUID-VkBufferImageCopy2-imageExtent-06659
imageExtent.width **must** not be 0
- VUID-VkBufferImageCopy2-imageExtent-06660
imageExtent.height **must** not be 0
- VUID-VkBufferImageCopy2-imageExtent-06661
imageExtent.depth **must** not be 0

Valid Usage (Implicit)

- VUID-VkBufferImageCopy2-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_BUFFER_IMAGE_COPY_2**
- VUID-VkBufferImageCopy2-pNext-pNext
pNext **must** be **NULL**

- VUID-VkBufferImageCopy2-imageSubresource-parameter
`imageSubresource` **must** be a valid [VkImageSubresourceLayers](#) structure

20.4. Image Copies With Scaling

To copy regions of a source image into a destination image, potentially performing format conversion, arbitrary scaling, and filtering, call:

```
// Provided by VK_VERSION_1_0
void vkCmdBlitImage(
    VkCommandBuffer          commandBuffer,
    VkImage                  srcImage,
    VkImageLayout            srcImageLayout,
    VkImage                  dstImage,
    VkImageLayout            dstImageLayout,
    uint32_t                 regionCount,
    const VkImageBlit*       pRegions,
    VkFilter                  filter);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the blit.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the blit.
- `regionCount` is the number of regions to blit.
- `pRegions` is a pointer to an array of [VkImageBlit](#) structures specifying the regions to blit.
- `filter` is a [VkFilter](#) specifying the filter to apply if the blits require scaling.

`vkCmdBlitImage` **must** not be used for multisampled source or destination images. Use [vkCmdResolveImage](#) for this purpose.

As the sizes of the source and destination extents **can** differ in any dimension, texels in the source extent are scaled and filtered to the destination extent. Scaling occurs via the following operations:

- For each destination texel, the integer coordinate of that texel is converted to an unnormalized texture coordinate, using the effective inverse of the equations described in [unnormalized to integer conversion](#):

$$u_{\text{base}} = i + \frac{1}{2}$$

$$v_{\text{base}} = j + \frac{1}{2}$$

$$w_{\text{base}} = k + \frac{1}{2}$$

- These base coordinates are then offset by the first destination offset:

$$u_{\text{offset}} = u_{\text{base}} - x_{\text{dst0}}$$

$$v_{\text{offset}} = v_{\text{base}} - y_{\text{dst0}}$$

$$w_{\text{offset}} = w_{\text{base}} - z_{\text{dst0}}$$

$$a_{\text{offset}} = a - \text{baseArrayCount}_{\text{dst}}$$

- The scale is determined from the source and destination regions, and applied to the offset coordinates:

$$\text{scale}_u = (x_{\text{src1}} - x_{\text{src0}}) / (x_{\text{dst1}} - x_{\text{dst0}})$$

$$\text{scale}_v = (y_{\text{src1}} - y_{\text{src0}}) / (y_{\text{dst1}} - y_{\text{dst0}})$$

$$\text{scale}_w = (z_{\text{src1}} - z_{\text{src0}}) / (z_{\text{dst1}} - z_{\text{dst0}})$$

$$u_{\text{scaled}} = u_{\text{offset}} \times \text{scale}_u$$

$$v_{\text{scaled}} = v_{\text{offset}} \times \text{scale}_v$$

$$w_{\text{scaled}} = w_{\text{offset}} \times \text{scale}_w$$

- Finally the source offset is added to the scaled coordinates, to determine the final unnormalized coordinates used to sample from `srcImage`:

$$u = u_{\text{scaled}} + x_{\text{src0}}$$

$$v = v_{\text{scaled}} + y_{\text{src0}}$$

$$w = w_{\text{scaled}} + z_{\text{src0}}$$

$q = \text{mipLevel}$

$a = a_{\text{offset}} + \text{baseArrayCount}_{\text{src}}$

These coordinates are used to sample from the source image, as described in [Image Operations chapter](#), with the filter mode equal to that of `filter`, a mipmap mode of `VK_SAMPLER_MIPMAP_MODE_NEAREST` and an address mode of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`. Implementations **must** clamp at the edge of the source image, and **may** additionally clamp to the edge of the source region.

NOTE

Due to allowable rounding errors in the generation of the source texture coordinates, it is not always possible to guarantee exactly which source texels will be sampled for a given blit. As rounding errors are implementation-dependent, the exact results of a blitting operation are also implementation-dependent.

Blits are done layer by layer starting with the `baseArrayLayer` member of `srcSubresource` for the source and `dstSubresource` for the destination. `layerCount` layers are blitted to the destination image.

When blitting 3D textures, slices in the destination region bounded by `dstOffsets[0].z` and `dstOffsets[1].z` are sampled from slices in the source region bounded by `srcOffsets[0].z` and `srcOffsets[1].z`. If the `filter` parameter is `VK_FILTER_LINEAR` then the value sampled from the source image is taken by doing linear filtering using the interpolated `z` coordinate represented by `w` in the previous equations. If the `filter` parameter is `VK_FILTER_NEAREST` then the value sampled from the source image is taken from the single nearest slice, with an implementation-dependent arithmetic rounding mode.

The following filtering and conversion rules apply:

- Integer formats **can** only be converted to other integer formats with the same signedness.
- No format conversion is supported between depth/stencil images. The formats **must** match.
- Format conversions on unorm, snorm, scaled and packed float formats of the copied aspect of the image are performed by first converting the pixels to float values.
- For sRGB source formats, nonlinear RGB values are converted to linear representation prior to filtering.
- After filtering, the float values are first clamped and then cast to the destination image format. In case of sRGB destination format, linear RGB values are converted to nonlinear representation before writing the pixel to the image.

Signed and unsigned integers are converted by first clamping to the representable range of the destination format, then casting the value.

Valid Usage

- VUID-vkCmdBlitImage-commandBuffer-01834

If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported,

`srcImage` **must** not be a protected image

- VUID-vkCmdBlitImage-commandBuffer-01835

If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` **must** not be a protected image

- VUID-vkCmdBlitImage-commandBuffer-01836

If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` **must** not be an unprotected image

- VUID-vkCmdBlitImage-pRegions-00217

The union of all destination regions, specified by the elements of `pRegions`, **must** not overlap in memory with any texel that **may** be sampled during the blit operation

- VUID-vkCmdBlitImage-srcImage-01999

The `format features` of `srcImage` **must** contain `VK_FORMAT_FEATURE_BLIT_SRC_BIT`

- VUID-vkCmdBlitImage-srcImage-06421

`srcImage` **must** not use a `format that requires a sampler Y'CBCR conversion`

- VUID-vkCmdBlitImage-srcImage-00219

`srcImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag

- VUID-vkCmdBlitImage-srcImage-00220

If `srcImage` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdBlitImage-srcImageLayout-00221

`srcImageLayout` **must** specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`

- VUID-vkCmdBlitImage-srcImageLayout-01398

`srcImageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`

- VUID-vkCmdBlitImage-srcImage-09459

If `srcImage` and `dstImage` are the same, and an elements of `pRegions` contains the `srcSubresource` and `dstSubresource` with matching `mipLevel` and overlapping array layers, then the `srcImageLayout` and `dstImageLayout` **must** be `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`

- VUID-vkCmdBlitImage-dstImage-02000

The `format features` of `dstImage` **must** contain `VK_FORMAT_FEATURE_BLIT_DST_BIT`

- VUID-vkCmdBlitImage-dstImage-06422

`dstImage` **must** not use a `format that requires a sampler Y'CBCR conversion`

- VUID-vkCmdBlitImage-dstImage-00224

`dstImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag

- VUID-vkCmdBlitImage-dstImage-00225

If `dstImage` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdBlitImage-dstImageLayout-00226

`dstImageLayout` **must** specify the layout of the image subresources of `dstImage` specified in

`pRegions` at the time this command is executed on a `VkDevice`

- VUID-vkCmdBlitImage-dstImageLayout-01399
`dstImageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`
- VUID-vkCmdBlitImage-srcImage-00229
If either of `srcImage` or `dstImage` was created with a signed integer `VkFormat`, the other **must** also have been created with a signed integer `VkFormat`
- VUID-vkCmdBlitImage-srcImage-00230
If either of `srcImage` or `dstImage` was created with an unsigned integer `VkFormat`, the other **must** also have been created with an unsigned integer `VkFormat`
- VUID-vkCmdBlitImage-srcImage-00231
If either of `srcImage` or `dstImage` was created with a depth/stencil format, the other **must** have exactly the same format
- VUID-vkCmdBlitImage-srcImage-00232
If `srcImage` was created with a depth/stencil format, `filter` **must** be `VK_FILTER_NEAREST`
- VUID-vkCmdBlitImage-srcImage-00233
`srcImage` **must** have been created with a `samples` value of `VK_SAMPLE_COUNT_1_BIT`
- VUID-vkCmdBlitImage-dstImage-00234
`dstImage` **must** have been created with a `samples` value of `VK_SAMPLE_COUNT_1_BIT`
- VUID-vkCmdBlitImage-filter-02001
If `filter` is `VK_FILTER_LINEAR`, then the `format features` of `srcImage` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdBlitImage-filter-02002
If `filter` is `VK_FILTER_CUBIC_EXT`, then the `format features` of `srcImage` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`
- VUID-vkCmdBlitImage-filter-00237
If `filter` is `VK_FILTER_CUBIC_EXT`, `srcImage` **must** be of type `VK_IMAGE_TYPE_2D`
- VUID-vkCmdBlitImage-srcSubresource-01705
The `srcSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created
- VUID-vkCmdBlitImage-dstSubresource-01706
The `dstSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created
- VUID-vkCmdBlitImage-srcSubresource-01707
`srcSubresource.baseArrayLayer` + `srcSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created
- VUID-vkCmdBlitImage-dstSubresource-01708
`dstSubresource.baseArrayLayer` + `dstSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created
- VUID-vkCmdBlitImage-srcImage-00240

If either `srcImage` or `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcSubresource.baseArrayLayer` and `dstSubresource.baseArrayLayer` **must** each be `0`, and `srcSubresource.layerCount` and `dstSubresource.layerCount` **must** each be `1`

- VUID-vkCmdBlitImage-aspectMask-00241

For each element of `pRegions`, `srcSubresource.aspectMask` **must** specify aspects present in `srcImage`

- VUID-vkCmdBlitImage-aspectMask-00242

For each element of `pRegions`, `dstSubresource.aspectMask` **must** specify aspects present in `dstImage`

- VUID-vkCmdBlitImage-srcOffset-00243

For each element of `pRegions`, `srcOffsets[0].x` and `srcOffsets[1].x` **must** both be greater than or equal to `0` and less than or equal to the width of the specified `srcSubresource` of `srcImage`

- VUID-vkCmdBlitImage-srcOffset-00244

For each element of `pRegions`, `srcOffsets[0].y` and `srcOffsets[1].y` **must** both be greater than or equal to `0` and less than or equal to the height of the specified `srcSubresource` of `srcImage`

- VUID-vkCmdBlitImage-srcImage-00245

If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffsets[0].y` **must** be `0` and `srcOffsets[1].y` **must** be `1`

- VUID-vkCmdBlitImage-srcOffset-00246

For each element of `pRegions`, `srcOffsets[0].z` and `srcOffsets[1].z` **must** both be greater than or equal to `0` and less than or equal to the depth of the specified `srcSubresource` of `srcImage`

- VUID-vkCmdBlitImage-srcImage-00247

If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `srcOffsets[0].z` **must** be `0` and `srcOffsets[1].z` **must** be `1`

- VUID-vkCmdBlitImage-dstOffset-00248

For each element of `pRegions`, `dstOffsets[0].x` and `dstOffsets[1].x` **must** both be greater than or equal to `0` and less than or equal to the width of the specified `dstSubresource` of `dstImage`

- VUID-vkCmdBlitImage-dstOffset-00249

For each element of `pRegions`, `dstOffsets[0].y` and `dstOffsets[1].y` **must** both be greater than or equal to `0` and less than or equal to the height of the specified `dstSubresource` of `dstImage`

- VUID-vkCmdBlitImage-dstImage-00250

If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `dstOffsets[0].y` **must** be `0` and `dstOffsets[1].y` **must** be `1`

- VUID-vkCmdBlitImage-dstOffset-00251

For each element of `pRegions`, `dstOffsets[0].z` and `dstOffsets[1].z` **must** both be greater than or equal to `0` and less than or equal to the depth of the specified `dstSubresource` of `dstImage`

- VUID-vkCmdBlitImage-dstImage-00252

If `dstImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `dstOffsets[0].z` **must** be `0` and `dstOffsets[1].z` **must** be `1`

Valid Usage (Implicit)

- VUID-vkCmdBlitImage-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdBlitImage-srcImage-parameter
`srcImage` **must** be a valid `VkImage` handle
- VUID-vkCmdBlitImage-srcImageLayout-parameter
`srcImageLayout` **must** be a valid `VkImageLayout` value
- VUID-vkCmdBlitImage-dstImage-parameter
`dstImage` **must** be a valid `VkImage` handle
- VUID-vkCmdBlitImage-dstImageLayout-parameter
`dstImageLayout` **must** be a valid `VkImageLayout` value
- VUID-vkCmdBlitImage-pRegions-parameter
`pRegions` **must** be a valid pointer to an array of `regionCount` valid `VkImageBlit` structures
- VUID-vkCmdBlitImage-filter-parameter
`filter` **must** be a valid `VkFilter` value
- VUID-vkCmdBlitImage-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdBlitImage-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdBlitImage-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdBlitImage-regionCount-arraylength
`regionCount` **must** be greater than `0`
- VUID-vkCmdBlitImage-commonparent
Each of `commandBuffer`, `dstImage`, and `srcImage` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	VK_QUEUE_GRAPHICS_BIT	Action

The `VkImageBlit` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkImageBlit {
    VkImageSubresourceLayers    srcSubresource;
    VkOffset3D                  srcOffsets[2];
    VkImageSubresourceLayers    dstSubresource;
    VkOffset3D                  dstOffsets[2];
} VkImageBlit;
```

- `srcSubresource` is the subresource to blit from.
- `srcOffsets` is a pointer to an array of two `VkOffset3D` structures specifying the bounds of the source region within `srcSubresource`.
- `dstSubresource` is the subresource to blit into.
- `dstOffsets` is a pointer to an array of two `VkOffset3D` structures specifying the bounds of the destination region within `dstSubresource`.

For each element of the `pRegions` array, a blit operation is performed for the specified source and destination regions.

Valid Usage

- VUID-VkImageBlit-aspectMask-00238
The `aspectMask` member of `srcSubresource` and `dstSubresource` **must** match
- VUID-VkImageBlit-layerCount-08800
The `layerCount` members of `srcSubresource` or `dstSubresource` **must** match

Valid Usage (Implicit)

- VUID-VkImageBlit-srcSubresource-parameter
`srcSubresource` **must** be a valid `VkImageSubresourceLayers` structure
- VUID-VkImageBlit-dstSubresource-parameter
`dstSubresource` **must** be a valid `VkImageSubresourceLayers` structure

A more extensible version of the blit image command is defined below.

To copy regions of a source image into a destination image, potentially performing format conversion, arbitrary scaling, and filtering, call:

```
// Provided by VK_KHR_copy_commands2
void vkCmdBlitImage2KHR(
    VkCommandBuffer                      commandBuffer,
    const VkBlitImageInfo2*             pBlitImageInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pBlitImageInfo` is a pointer to a `VkBlitImageInfo2` structure describing the blit parameters.

This command is functionally identical to `vkCmdBlitImage`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

Valid Usage

- VUID-vkCmdBlitImage2-commandBuffer-01834
If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` **must** not be a protected image
- VUID-vkCmdBlitImage2-commandBuffer-01835
If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` **must** not be a protected image
- VUID-vkCmdBlitImage2-commandBuffer-01836
If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` **must** not be an unprotected image

Valid Usage (Implicit)

- VUID-vkCmdBlitImage2-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdBlitImage2-pBlitImageInfo-parameter
`pBlitImageInfo` **must** be a valid pointer to a valid `VkBlitImageInfo2` structure
- VUID-vkCmdBlitImage2-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdBlitImage2-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdBlitImage2-renderpass
This command **must** only be called outside of a render pass instance

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	VK_QUEUE_GRAPHICS_BIT	Action

The `VkBlitImageInfo2` structure is defined as:

```
typedef struct VkBlitImageInfo2 {  
    VkStructureType    sType;  
    const void*        pNext;  
    VkImage             srcImage;  
    VkImageLayout      srcImageLayout;  
    VkImage             dstImage;  
    VkImageLayout      dstImageLayout;  
    uint32_t           regionCount;  
    const VkImageBlit2* pRegions;  
    VkFilter            filter;  
} VkBlitImageInfo2;
```

```
// Provided by VK_KHR_copy_commands2  
typedef VkBlitImageInfo2 VkBlitImageInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the blit.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the blit.
- `regionCount` is the number of regions to blit.
- `pRegions` is a pointer to an array of `VkImageBlit2` structures specifying the regions to blit.
- `filter` is a `VkFilter` specifying the filter to apply if the blits require scaling.

Valid Usage

- VUID-VkBlitImageInfo2-pRegions-00217
The union of all destination regions, specified by the elements of `pRegions`, **must** not overlap in memory with any texel that **may** be sampled during the blit operation
- VUID-VkBlitImageInfo2-srcImage-01999
The `format features` of `srcImage` **must** contain `VK_FORMAT_FEATURE_BLIT_SRC_BIT`
- VUID-VkBlitImageInfo2-srcImage-06421
`srcImage` **must** not use a `format that requires a sampler Y'CBCR conversion`
- VUID-VkBlitImageInfo2-srcImage-00219
`srcImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag
- VUID-VkBlitImageInfo2-srcImage-00220
If `srcImage` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-VkBlitImageInfo2-srcImageLayout-00221
`srcImageLayout` **must** specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`
- VUID-VkBlitImageInfo2-srcImageLayout-01398
`srcImageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`
- VUID-VkBlitImageInfo2-srcImage-09459
If `srcImage` and `dstImage` are the same, and an elements of `pRegions` contains the `srcSubresource` and `dstSubresource` with matching `mipLevel` and overlapping array layers, then the `srcImageLayout` and `dstImageLayout` **must** be `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`
- VUID-VkBlitImageInfo2-dstImage-02000
The `format features` of `dstImage` **must** contain `VK_FORMAT_FEATURE_BLIT_DST_BIT`
- VUID-VkBlitImageInfo2-dstImage-06422
`dstImage` **must** not use a `format that requires a sampler Y'CBCR conversion`
- VUID-VkBlitImageInfo2-dstImage-00224
`dstImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag
- VUID-VkBlitImageInfo2-dstImage-00225
If `dstImage` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-VkBlitImageInfo2-dstImageLayout-00226
`dstImageLayout` **must** specify the layout of the image subresources of `dstImage` specified in `pRegions` at the time this command is executed on a `VkDevice`
- VUID-VkBlitImageInfo2-dstImageLayout-01399
`dstImageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`
- VUID-VkBlitImageInfo2-srcImage-00229
If either of `srcImage` or `dstImage` was created with a signed integer `VkFormat`, the other

must also have been created with a signed integer `VkFormat`

- VUID-VkBlitImageInfo2-srcImage-00230

If either of `srcImage` or `dstImage` was created with an unsigned integer `VkFormat`, the other **must** also have been created with an unsigned integer `VkFormat`

- VUID-VkBlitImageInfo2-srcImage-00231

If either of `srcImage` or `dstImage` was created with a depth/stencil format, the other **must** have exactly the same format

- VUID-VkBlitImageInfo2-srcImage-00232

If `srcImage` was created with a depth/stencil format, `filter` **must** be `VK_FILTER_NEAREST`

- VUID-VkBlitImageInfo2-srcImage-00233

`srcImage` **must** have been created with a `samples` value of `VK_SAMPLE_COUNT_1_BIT`

- VUID-VkBlitImageInfo2-dstImage-00234

`dstImage` **must** have been created with a `samples` value of `VK_SAMPLE_COUNT_1_BIT`

- VUID-VkBlitImageInfo2-filter-02001

If `filter` is `VK_FILTER_LINEAR`, then the `format features` of `srcImage` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-VkBlitImageInfo2-filter-02002

If `filter` is `VK_FILTER_CUBIC_EXT`, then the `format features` of `srcImage` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- VUID-VkBlitImageInfo2-filter-00237

If `filter` is `VK_FILTER_CUBIC_EXT`, `srcImage` **must** be of type `VK_IMAGE_TYPE_2D`

- VUID-VkBlitImageInfo2-srcSubresource-01705

The `srcSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created

- VUID-VkBlitImageInfo2-dstSubresource-01706

The `dstSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created

- VUID-VkBlitImageInfo2-srcSubresource-01707

`srcSubresource.baseArrayLayer` + `srcSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created

- VUID-VkBlitImageInfo2-dstSubresource-01708

`dstSubresource.baseArrayLayer` + `dstSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created

- VUID-VkBlitImageInfo2-srcImage-00240

If either `srcImage` or `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcSubresource.baseArrayLayer` and `dstSubresource.baseArrayLayer` **must** each be 0, and `srcSubresource.layerCount` and `dstSubresource.layerCount` **must** each be 1

- VUID-VkBlitImageInfo2-aspectMask-00241

For each element of `pRegions`, `srcSubresource.aspectMask` **must** specify aspects present in `srcImage`

- VUID-VkBlitImageInfo2-aspectMask-00242
For each element of `pRegions`, `dstSubresource.aspectMask` **must** specify aspects present in `dstImage`
- VUID-VkBlitImageInfo2-srcOffset-00243
For each element of `pRegions`, `srcOffsets[0].x` and `srcOffsets[1].x` **must** both be greater than or equal to `0` and less than or equal to the width of the specified `srcSubresource` of `srcImage`
- VUID-VkBlitImageInfo2-srcOffset-00244
For each element of `pRegions`, `srcOffsets[0].y` and `srcOffsets[1].y` **must** both be greater than or equal to `0` and less than or equal to the height of the specified `srcSubresource` of `srcImage`
- VUID-VkBlitImageInfo2-srcImage-00245
If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffsets[0].y` **must** be `0` and `srcOffsets[1].y` **must** be `1`
- VUID-VkBlitImageInfo2-srcOffset-00246
For each element of `pRegions`, `srcOffsets[0].z` and `srcOffsets[1].z` **must** both be greater than or equal to `0` and less than or equal to the depth of the specified `srcSubresource` of `srcImage`
- VUID-VkBlitImageInfo2-srcImage-00247
If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `srcOffsets[0].z` **must** be `0` and `srcOffsets[1].z` **must** be `1`
- VUID-VkBlitImageInfo2-dstOffset-00248
For each element of `pRegions`, `dstOffsets[0].x` and `dstOffsets[1].x` **must** both be greater than or equal to `0` and less than or equal to the width of the specified `dstSubresource` of `dstImage`
- VUID-VkBlitImageInfo2-dstOffset-00249
For each element of `pRegions`, `dstOffsets[0].y` and `dstOffsets[1].y` **must** both be greater than or equal to `0` and less than or equal to the height of the specified `dstSubresource` of `dstImage`
- VUID-VkBlitImageInfo2-dstImage-00250
If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `dstOffsets[0].y` **must** be `0` and `dstOffsets[1].y` **must** be `1`
- VUID-VkBlitImageInfo2-dstOffset-00251
For each element of `pRegions`, `dstOffsets[0].z` and `dstOffsets[1].z` **must** both be greater than or equal to `0` and less than or equal to the depth of the specified `dstSubresource` of `dstImage`
- VUID-VkBlitImageInfo2-dstImage-00252
If `dstImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `dstOffsets[0].z` **must** be `0` and `dstOffsets[1].z` **must** be `1`

Valid Usage (Implicit)

- VUID-VkBlitImageInfo2-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_BLIT_IMAGE_INFO_2`

- `VUID-VkBlitImageInfo2-pNext-pNext`
`pNext` **must** be `NULL`
- `VUID-VkBlitImageInfo2-srcImage-parameter`
`srcImage` **must** be a valid `VkImage` handle
- `VUID-VkBlitImageInfo2-srcImageLayout-parameter`
`srcImageLayout` **must** be a valid `VkImageLayout` value
- `VUID-VkBlitImageInfo2-dstImage-parameter`
`dstImage` **must** be a valid `VkImage` handle
- `VUID-VkBlitImageInfo2-dstImageLayout-parameter`
`dstImageLayout` **must** be a valid `VkImageLayout` value
- `VUID-VkBlitImageInfo2-pRegions-parameter`
`pRegions` **must** be a valid pointer to an array of `regionCount` valid `VkImageBlit2` structures
- `VUID-VkBlitImageInfo2-filter-parameter`
`filter` **must** be a valid `VkFilter` value
- `VUID-VkBlitImageInfo2-regionCount-arraylength`
`regionCount` **must** be greater than `0`
- `VUID-VkBlitImageInfo2-commonparent`
Both of `dstImage`, and `srcImage` **must** have been created, allocated, or retrieved from the same `VkDevice`

The `VkImageBlit2` structure is defined as:

```
typedef struct VkImageBlit2 {  
    VkStructureType    sType;  
    const void*        pNext;  
    VkImageSubresourceLayers srcSubresource;  
    VkOffset3D          srcOffsets[2];  
    VkImageSubresourceLayers dstSubresource;  
    VkOffset3D          dstOffsets[2];  
} VkImageBlit2;
```

```
// Provided by VK_KHR_copy_commands2  
typedef VkImageBlit2 VkImageBlit2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcSubresource` is the subresource to blit from.
- `srcOffsets` is a pointer to an array of two `VkOffset3D` structures specifying the bounds of the source region within `srcSubresource`.
- `dstSubresource` is the subresource to blit into.

- `dstOffsets` is a pointer to an array of two `VkOffset3D` structures specifying the bounds of the destination region within `dstSubresource`.

For each element of the `pRegions` array, a blit operation is performed for the specified source and destination regions.

Valid Usage

- VUID-VkImageBlit2-aspectMask-00238
The `aspectMask` member of `srcSubresource` and `dstSubresource` **must** match
- VUID-VkImageBlit2-layerCount-08800
The `layerCount` members of `srcSubresource` or `dstSubresource` **must** match

Valid Usage (Implicit)

- VUID-VkImageBlit2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_BLIT_2`
- VUID-VkImageBlit2-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkImageBlit2-srcSubresource-parameter
`srcSubresource` **must** be a valid `VkImageSubresourceLayers` structure
- VUID-VkImageBlit2-dstSubresource-parameter
`dstSubresource` **must** be a valid `VkImageSubresourceLayers` structure

20.5. Resolving Multisample Images

To resolve a multisample color image to a non-multisample color image, call:

```
// Provided by VK_VERSION_1_0
void vkCmdResolveImage(
    VkCommandBuffer          commandBuffer,
    VkImage                  srcImage,
    VkImageLayout            srcImageLayout,
    VkImage                  dstImage,
    VkImageLayout            dstImageLayout,
    uint32_t                 regionCount,
    const VkImageResolve*    pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the resolve.
- `dstImage` is the destination image.

- `dstImageLayout` is the layout of the destination image subresources for the resolve.
- `regionCount` is the number of regions to resolve.
- `pRegions` is a pointer to an array of `VkImageResolve` structures specifying the regions to resolve.

During the resolve the samples corresponding to each pixel location in the source are converted to a single sample before being written to the destination.

If the source format is a floating-point or normalized type, the resolve mode is chosen as implementation-dependent behavior. If the resolve mode requires to calculate the result from multiple samples, such as by computing an average or weighted average of the samples, the values for each pixel are resolved with implementation-defined numerical precision.

If the `numeric format` of `srcImage` uses sRGB encoding and the resolve mode requires the implementation to convert the samples to floating-point to perform the calculations, the implementation **should** convert samples from nonlinear to linear before resolving the samples as described in the “sRGB EOTF” section of the [Khronos Data Format Specification](#). In this case, the implementation **must** convert the linear averaged value to nonlinear before writing the resolved result to `dstImage`.

If the source format is an integer type, a single sample’s value is selected for each pixel.

`srcOffset` and `dstOffset` select the initial `x`, `y`, and `z` offsets in texels of the sub-regions of the source and destination image data. `extent` is the size in texels of the source image to resolve in `width`, `height` and `depth`. Each element of `pRegions` **must** be a region that is contained within its corresponding image.

Resolves are done layer by layer starting with `baseArrayLayer` member of `srcSubresource` for the source and `dstSubresource` for the destination. `layerCount` layers are resolved to the destination image.

Valid Usage

- VUID-vkCmdResolveImage-commandBuffer-01837
If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` **must** not be a protected image
- VUID-vkCmdResolveImage-commandBuffer-01838
If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` **must** not be a protected image
- VUID-vkCmdResolveImage-commandBuffer-01839
If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` **must** not be an unprotected image
- VUID-vkCmdResolveImage-pRegions-00255
The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, **must** not overlap in memory
- VUID-vkCmdResolveImage-srcImage-00256
If `srcImage` is non-sparse then it **must** be bound completely and contiguously to a single

VkDeviceMemory object

- VUID-vkCmdResolveImage-srcImage-00257
`srcImage` **must** have a sample count equal to any valid sample count value other than `VK_SAMPLE_COUNT_1_BIT`
- VUID-vkCmdResolveImage-dstImage-00258
If `dstImage` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdResolveImage-dstImage-00259
`dstImage` **must** have a sample count equal to `VK_SAMPLE_COUNT_1_BIT`
- VUID-vkCmdResolveImage-srcImageLayout-00260
`srcImageLayout` **must** specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`
- VUID-vkCmdResolveImage-srcImageLayout-01400
`srcImageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`
- VUID-vkCmdResolveImage-dstImageLayout-00262
`dstImageLayout` **must** specify the layout of the image subresources of `dstImage` specified in `pRegions` at the time this command is executed on a `VkDevice`
- VUID-vkCmdResolveImage-dstImageLayout-01401
`dstImageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`
- VUID-vkCmdResolveImage-dstImage-02003
The `format features` of `dstImage` **must** contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`
- VUID-vkCmdResolveImage-srcImage-01386
`srcImage` and `dstImage` **must** have been created with the same image format
- VUID-vkCmdResolveImage-srcSubresource-01709
The `srcSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created
- VUID-vkCmdResolveImage-dstSubresource-01710
The `dstSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created
- VUID-vkCmdResolveImage-srcSubresource-01711
`srcSubresource.baseArrayLayer` + `srcSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created
- VUID-vkCmdResolveImage-dstSubresource-01712
`dstSubresource.baseArrayLayer` + `dstSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created
- VUID-vkCmdResolveImage-srcImage-04446
If `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcSubresource.layerCount` **must** be 1

- VUID-vkCmdResolveImage-srcImage-04447
If `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `dstSubresource.baseArrayLayer` **must** be `0` and `dstSubresource.layerCount` **must** be `1`
- VUID-vkCmdResolveImage-srcOffset-00269
For each element of `pRegions`, `srcOffset.x` and `(extent.width + srcOffset.x)` **must** both be greater than or equal to `0` and less than or equal to the width of the specified `srcSubresource` of `srcImage`
- VUID-vkCmdResolveImage-srcOffset-00270
For each element of `pRegions`, `srcOffset.y` and `(extent.height + srcOffset.y)` **must** both be greater than or equal to `0` and less than or equal to the height of the specified `srcSubresource` of `srcImage`
- VUID-vkCmdResolveImage-srcImage-00271
If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffset.y` **must** be `0` and `extent.height` **must** be `1`
- VUID-vkCmdResolveImage-srcOffset-00272
For each element of `pRegions`, `srcOffset.z` and `(extent.depth + srcOffset.z)` **must** both be greater than or equal to `0` and less than or equal to the depth of the specified `srcSubresource` of `srcImage`
- VUID-vkCmdResolveImage-srcImage-00273
If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `srcOffset.z` **must** be `0` and `extent.depth` **must** be `1`
- VUID-vkCmdResolveImage-dstOffset-00274
For each element of `pRegions`, `dstOffset.x` and `(extent.width + dstOffset.x)` **must** both be greater than or equal to `0` and less than or equal to the width of the specified `dstSubresource` of `dstImage`
- VUID-vkCmdResolveImage-dstOffset-00275
For each element of `pRegions`, `dstOffset.y` and `(extent.height + dstOffset.y)` **must** both be greater than or equal to `0` and less than or equal to the height of the specified `dstSubresource` of `dstImage`
- VUID-vkCmdResolveImage-dstImage-00276
If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `dstOffset.y` **must** be `0` and `extent.height` **must** be `1`
- VUID-vkCmdResolveImage-dstOffset-00277
For each element of `pRegions`, `dstOffset.z` and `(extent.depth + dstOffset.z)` **must** both be greater than or equal to `0` and less than or equal to the depth of the specified `dstSubresource` of `dstImage`
- VUID-vkCmdResolveImage-dstImage-00278
If `dstImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `dstOffset.z` **must** be `0` and `extent.depth` **must** be `1`
- VUID-vkCmdResolveImage-srcImage-06762
`srcImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag
- VUID-vkCmdResolveImage-srcImage-06763
The `format features` of `srcImage` **must** contain `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT`

- VUID-vkCmdResolveImage-dstImage-06764
`dstImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag
- VUID-vkCmdResolveImage-dstImage-06765
The `format features` of `dstImage` **must** contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`
- VUID-vkCmdResolveImage-srcSubresource-11800
`srcSubresource.aspectMask` for each element in `pRegions` **must** not specify an aspect which is not part of the image format of `srcImage`
- VUID-vkCmdResolveImage-dstSubresource-11801
`dstSubresource.aspectMask` for each element in `pRegions` **must** not specify an aspect which is not part of the image format of `dstImage`
- VUID-vkCmdResolveImage-srcSubresource-11802
`srcSubresource.aspectMask` **must** equal `dstSubresource.aspectMask` for each element in `pRegions`

Valid Usage (Implicit)

- VUID-vkCmdResolveImage-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdResolveImage-srcImage-parameter
`srcImage` **must** be a valid `VkImage` handle
- VUID-vkCmdResolveImage-srcImageLayout-parameter
`srcImageLayout` **must** be a valid `VkImageLayout` value
- VUID-vkCmdResolveImage-dstImage-parameter
`dstImage` **must** be a valid `VkImage` handle
- VUID-vkCmdResolveImage-dstImageLayout-parameter
`dstImageLayout` **must** be a valid `VkImageLayout` value
- VUID-vkCmdResolveImage-pRegions-parameter
`pRegions` **must** be a valid pointer to an array of `regionCount` valid `VkImageResolve` structures
- VUID-vkCmdResolveImage-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdResolveImage-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdResolveImage-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdResolveImage-regionCount-arraylength
`regionCount` **must** be greater than 0
- VUID-vkCmdResolveImage-commonparent
Each of `commandBuffer`, `dstImage`, and `srcImage` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	VK_QUEUE_GRAPHICS_BIT	Action

The `VkImageResolve` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkImageResolve {
    VkImageSubresourceLayers    srcSubresource;
    VkOffset3D                  srcOffset;
    VkImageSubresourceLayers    dstSubresource;
    VkOffset3D                  dstOffset;
    VkExtent3D                  extent;
} VkImageResolve;
```

- `srcSubresource` and `dstSubresource` are `VkImageSubresourceLayers` structures specifying the image subresources of the images used for the source and destination image data, respectively. Resolve of depth/stencil images is not supported.
- `srcOffset` and `dstOffset` select the initial `x`, `y`, and `z` offsets in texels of the sub-regions of the source and destination image data.
- `extent` is the size in texels of the source image to resolve in `width`, `height` and `depth`.

Valid Usage

- VUID-VkImageResolve-aspectMask-10981
The `aspectMask` member of `srcSubresource` and `dstSubresource` **must** only contain `VK_IMAGE_ASPECT_COLOR_BIT`
- VUID-VkImageResolve-layerCount-08803
The `layerCount` member of `srcSubresource` and `dstSubresource` **must** match

Valid Usage (Implicit)

- VUID-VkImageResolve-srcSubresource-parameter
`srcSubresource` **must** be a valid [VkImageSubresourceLayers](#) structure
- VUID-VkImageResolve-dstSubresource-parameter
`dstSubresource` **must** be a valid [VkImageSubresourceLayers](#) structure

A more extensible version of the resolve image command is defined below.

To resolve a multisample image to a non-multisample image, call:

```
// Provided by VK_KHR_copy_commands2
void vkCmdResolveImage2KHR(
    VkCommandBuffer          commandBuffer,
    const VkResolveImageInfo2* pResolveImageInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pResolveImageInfo` is a pointer to a [VkResolveImageInfo2](#) structure describing the resolve parameters.

This command is functionally identical to [vkCmdResolveImage](#), but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

Valid Usage

- VUID-vkCmdResolveImage2-commandBuffer-01837
If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` **must** not be a protected image
- VUID-vkCmdResolveImage2-commandBuffer-01838
If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` **must** not be a protected image
- VUID-vkCmdResolveImage2-commandBuffer-01839
If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` **must** not be an unprotected image

Valid Usage (Implicit)

- VUID-vkCmdResolveImage2-commandBuffer-parameter
`commandBuffer` **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdResolveImage2-pResolveImageInfo-parameter
`pResolveImageInfo` **must** be a valid pointer to a valid [VkResolveImageInfo2](#) structure
- VUID-vkCmdResolveImage2-commandBuffer-recording
`commandBuffer` **must** be in the [recording state](#)

- VUID-vkCmdResolveImage2-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdResolveImage2-renderpass
This command **must** only be called outside of a render pass instance

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	VK_QUEUE_GRAPHICS_BIT	Action

The `VkResolveImageInfo2` structure is defined as:

```
typedef struct VkResolveImageInfo2 {
    VkStructureType    sType;
    const void*        pNext;
    VkImage             srcImage;
    VkImageLayout      srcImageLayout;
    VkImage             dstImage;
    VkImageLayout      dstImageLayout;
    uint32_t           regionCount;
    const VkImageResolve2* pRegions;
} VkResolveImageInfo2;
```

```
// Provided by VK_KHR_copy_commands2
typedef VkResolveImageInfo2 VkResolveImageInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the resolve.
- `dstImage` is the destination image.

- `dstImageLayout` is the layout of the destination image subresources for the resolve.
- `regionCount` is the number of regions to resolve.
- `pRegions` is a pointer to an array of `VkImageResolve2` structures specifying the regions to resolve.

Valid Usage

- VUID-VkResolveImageInfo2-pRegions-00255
The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, **must** not overlap in memory
- VUID-VkResolveImageInfo2-srcImage-00256
If `srcImage` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-VkResolveImageInfo2-srcImage-00257
`srcImage` **must** have a sample count equal to any valid sample count value other than `VK_SAMPLE_COUNT_1_BIT`
- VUID-VkResolveImageInfo2-dstImage-00258
If `dstImage` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-VkResolveImageInfo2-dstImage-00259
`dstImage` **must** have a sample count equal to `VK_SAMPLE_COUNT_1_BIT`
- VUID-VkResolveImageInfo2-srcImageLayout-00260
`srcImageLayout` **must** specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`
- VUID-VkResolveImageInfo2-srcImageLayout-01400
`srcImageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`
- VUID-VkResolveImageInfo2-dstImageLayout-00262
`dstImageLayout` **must** specify the layout of the image subresources of `dstImage` specified in `pRegions` at the time this command is executed on a `VkDevice`
- VUID-VkResolveImageInfo2-dstImageLayout-01401
`dstImageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`
- VUID-VkResolveImageInfo2-dstImage-02003
The `format features` of `dstImage` **must** contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`
- VUID-VkResolveImageInfo2-srcImage-01386
`srcImage` and `dstImage` **must** have been created with the same image format
- VUID-VkResolveImageInfo2-srcSubresource-01709
The `srcSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created
- VUID-VkResolveImageInfo2-dstSubresource-01710
The `dstSubresource.mipLevel` member of each element of `pRegions` **must** be less than the

`mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created

- VUID-VkResolveImageInfo2-srcSubresource-01711
`srcSubresource.baseArrayLayer` + `srcSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created
- VUID-VkResolveImageInfo2-dstSubresource-01712
`dstSubresource.baseArrayLayer` + `dstSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created
- VUID-VkResolveImageInfo2-srcImage-04446
If `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcSubresource.layerCount` **must** be 1
- VUID-VkResolveImageInfo2-srcImage-04447
If `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `dstSubresource.baseArrayLayer` **must** be 0 and `dstSubresource.layerCount` **must** be 1
- VUID-VkResolveImageInfo2-srcOffset-00269
For each element of `pRegions`, `srcOffset.x` and `(extent.width + srcOffset.x)` **must** both be greater than or equal to 0 and less than or equal to the width of the specified `srcSubresource` of `srcImage`
- VUID-VkResolveImageInfo2-srcOffset-00270
For each element of `pRegions`, `srcOffset.y` and `(extent.height + srcOffset.y)` **must** both be greater than or equal to 0 and less than or equal to the height of the specified `srcSubresource` of `srcImage`
- VUID-VkResolveImageInfo2-srcImage-00271
If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffset.y` **must** be 0 and `extent.height` **must** be 1
- VUID-VkResolveImageInfo2-srcOffset-00272
For each element of `pRegions`, `srcOffset.z` and `(extent.depth + srcOffset.z)` **must** both be greater than or equal to 0 and less than or equal to the depth of the specified `srcSubresource` of `srcImage`
- VUID-VkResolveImageInfo2-srcImage-00273
If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `srcOffset.z` **must** be 0 and `extent.depth` **must** be 1
- VUID-VkResolveImageInfo2-dstOffset-00274
For each element of `pRegions`, `dstOffset.x` and `(extent.width + dstOffset.x)` **must** both be greater than or equal to 0 and less than or equal to the width of the specified `dstSubresource` of `dstImage`
- VUID-VkResolveImageInfo2-dstOffset-00275
For each element of `pRegions`, `dstOffset.y` and `(extent.height + dstOffset.y)` **must** both be greater than or equal to 0 and less than or equal to the height of the specified `dstSubresource` of `dstImage`
- VUID-VkResolveImageInfo2-dstImage-00276
If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `dstOffset.y`

must be 0 and **extent.height** **must** be 1

- VUID-VkResolveImageInfo2-dstOffset-00277

For each element of **pRegions**, **dstOffset.z** and **(extent.depth + dstOffset.z)** **must** both be greater than or equal to 0 and less than or equal to the depth of the specified **dstSubresource** of **dstImage**

- VUID-VkResolveImageInfo2-dstImage-00278

If **dstImage** is of type **VK_IMAGE_TYPE_1D** or **VK_IMAGE_TYPE_2D**, then for each element of **pRegions**, **dstOffset.z** **must** be 0 and **extent.depth** **must** be 1

- VUID-VkResolveImageInfo2-srcImage-06762

srcImage **must** have been created with **VK_IMAGE_USAGE_TRANSFER_SRC_BIT** usage flag

- VUID-VkResolveImageInfo2-srcImage-06763

The **format features** of **srcImage** **must** contain **VK_FORMAT_FEATURE_TRANSFER_SRC_BIT**

- VUID-VkResolveImageInfo2-dstImage-06764

dstImage **must** have been created with **VK_IMAGE_USAGE_TRANSFER_DST_BIT** usage flag

- VUID-VkResolveImageInfo2-dstImage-06765

The **format features** of **dstImage** **must** contain **VK_FORMAT_FEATURE_TRANSFER_DST_BIT**

- VUID-VkResolveImageInfo2-srcSubresource-11800

srcSubresource.aspectMask for each element in **pRegions** **must** not specify an aspect which is not part of the image format of **srcImage**

- VUID-VkResolveImageInfo2-dstSubresource-11801

dstSubresource.aspectMask for each element in **pRegions** **must** not specify an aspect which is not part of the image format of **dstImage**

- VUID-VkResolveImageInfo2-srcSubresource-11802

srcSubresource.aspectMask **must** equal **dstSubresource.aspectMask** for each element in **pRegions**

Valid Usage (Implicit)

- VUID-VkResolveImageInfo2-sType-sType

sType **must** be **VK_STRUCTURE_TYPE_RESOLVE_IMAGE_INFO_2**

- VUID-VkResolveImageInfo2-pNext-pNext

pNext **must** be **NULL**

- VUID-VkResolveImageInfo2-srcImage-parameter

srcImage **must** be a valid **VkImage** handle

- VUID-VkResolveImageInfo2-srcImageLayout-parameter

srcImageLayout **must** be a valid **VkImageLayout** value

- VUID-VkResolveImageInfo2-dstImage-parameter

dstImage **must** be a valid **VkImage** handle

- VUID-VkResolveImageInfo2-dstImageLayout-parameter

dstImageLayout **must** be a valid **VkImageLayout** value

- VUID-VkResolveImageInfo2-pRegions-parameter

pRegions **must** be a valid pointer to an array of **regionCount** valid **VkImageResolve2** structures

- VUID-VkResolveImageInfo2-regionCount-arraylength
regionCount **must** be greater than 0
- VUID-VkResolveImageInfo2-commonparent
Both of **dstImage**, and **srcImage** **must** have been created, allocated, or retrieved from the same **VkDevice**

The **VkImageResolve2** structure is defined as:

```
typedef struct VkImageResolve2 {  
    VkStructureType      sType;  
    const void*          pNext;  
    VkImageSubresourceLayers srcSubresource;  
    VkOffset3D           srcOffset;  
    VkImageSubresourceLayers dstSubresource;  
    VkOffset3D           dstOffset;  
    VkExtent3D           extent;  
} VkImageResolve2;
```

```
// Provided by VK_KHR_copy_commands2  
typedef VkImageResolve2 VkImageResolve2KHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **srcSubresource** and **dstSubresource** are **VkImageSubresourceLayers** structures specifying the image subresources of the images used for the source and destination image data, respectively. Resolve of depth/stencil images is not supported.
- **srcOffset** and **dstOffset** select the initial **x**, **y**, and **z** offsets in texels of the sub-regions of the source and destination image data.
- **extent** is the size in texels of the source image to resolve in **width**, **height** and **depth**.

Valid Usage

- VUID-VkImageResolve2-aspectMask-10993
The **aspectMask** member of **srcSubresource** and **dstSubresource** **must** only contain **VK_IMAGE_ASPECT_COLOR_BIT**
- VUID-VkImageResolve2-layerCount-08803
The **layerCount** member of **srcSubresource** and **dstSubresource** **must** match

Valid Usage (Implicit)

- VUID-VkImageResolve2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_RESOLVE_2`
- VUID-VkImageResolve2-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkImageResolve2-srcSubresource-parameter
`srcSubresource` **must** be a valid `VkImageSubresourceLayers` structure
- VUID-VkImageResolve2-dstSubresource-parameter
`dstSubresource` **must** be a valid `VkImageSubresourceLayers` structure

20.6. Object Refreshes

Safety critical applications **may** need to contend with single event upsets (SEUs). For a Vulkan object explicitly backed by device memory, such as a `VkImage` or `VkBuffer`, an application **can** bind its backing memory to a SEU-safe heap with the `VK_MEMORY_HEAP_SEU_SAFE_BIT` bit set. Alternatively, an application **can** also periodically reload the non-SEU-safe device memory contents from a known SEU-safe portion of host memory, or otherwise periodically regenerate or refresh the contents of non-SEU-safe device memory.

However, an implementation **may** store implementation-specific internal object data in non-SEU-safe memory, and Base Vulkan provides no method to determine which object types this applies to or how to refresh their data. An application **can** query the list of object types that have implementation internal object data stored in non-SEU-safe memory using `vkGetPhysicalDeviceRefreshableObjectTypesKHR`, and **can** instruct the implementation to refresh the internal data of specific objects from a backup in SEU-safe memory using the `vkCmdRefreshObjectsKHR` command.

To refresh a list of objects as a pipelined operation, call:

```
// Provided by VK_KHR_object_refresh
void vkCmdRefreshObjectsKHR(
    VkCommandBuffer          commandBuffer,
    const VkRefreshObjectListKHR* pRefreshObjects);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pRefreshObjects` is a pointer to a `VkRefreshObjectListKHR` structure specifying the list of objects to refresh.

The access scope for object refreshes falls under the `VK_ACCESS_TRANSFER_WRITE_BIT`, and the pipeline stages for identifying the synchronization scope **must** include `VK_PIPELINE_STAGE_TRANSFER_BIT`.

NOTE

If an implementation does not store a supplied object's internal data in SEU-susceptible memory, it **may** ignore the refresh command for that object.

Valid Usage (Implicit)

- VUID-vkCmdRefreshObjectsKHR-commandBuffer-parameter `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdRefreshObjectsKHR-pRefreshObjects-parameter `pRefreshObjects` **must** be a valid pointer to a valid `VkRefreshObjectListKHR` structure
- VUID-vkCmdRefreshObjectsKHR-commandBuffer-recording `commandBuffer` **must** be in the `recording` state
- VUID-vkCmdRefreshObjectsKHR-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, `VK_QUEUE_GRAPHICS_BIT`, or `VK_QUEUE_TRANSFER_BIT` operations
- VUID-vkCmdRefreshObjectsKHR-renderpass
This command **must** only be called outside of a render pass instance

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_TRANSFER_BIT	Action

The `VkRefreshObjectListKHR` structure is defined as:

```
// Provided by VK_KHR_object_refresh
typedef struct VkRefreshObjectListKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           objectCount;
    const VkRefreshObjectKHR* pObjects;
} VkRefreshObjectListKHR;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `objectCount` is the number of objects to refresh.
- `pObjects` is a pointer to an array of [VkRefreshObjectKHR](#) structures, defining the objects to refresh.

Valid Usage (Implicit)

- VUID-VkRefreshObjectListKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_REFRESH_OBJECT_LIST_KHR`
- VUID-VkRefreshObjectListKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkRefreshObjectListKHR-pObjects-parameter
`pObjects` **must** be a valid pointer to an array of `objectCount` valid [VkRefreshObjectKHR](#) structures
- VUID-VkRefreshObjectListKHR-objectCount-arraylength
`objectCount` **must** be greater than `0`

The [VkRefreshObjectKHR](#) structure is defined as:

```
// Provided by VK_KHR_object_refresh
typedef struct VkRefreshObjectKHR {
    VkObjectType          objectType;
    uint64_t              objectHandle;
    VkRefreshObjectFlagsKHR flags;
} VkRefreshObjectKHR;
```

- `objectType` is a [VkObjectType](#) specifying the type of the object to refresh.
- `objectHandle` is the object to refresh.
- `flags` is a bitmask of [VkRefreshObjectFlagsKHR](#).

Valid Usage

- VUID-VkRefreshObjectKHR-objectHandle-05069
`objectHandle` **must** be a valid Vulkan handle of the type associated with `objectType` as defined in the [VkObjectType and Vulkan Handle Relationship](#) table
- VUID-VkRefreshObjectKHR-objectType-05070
`objectType` **must** not be `VK_OBJECT_TYPE_UNKNOWN`

Valid Usage (Implicit)

- VUID-VkRefreshObjectKHR-objectType-parameter
`objectType` **must** be a valid `VkObjectType` value
- VUID-VkRefreshObjectKHR-flags-zero bitmask
`flags` **must** be 0

Host Synchronization

- Host access to `objectHandle` **must** be externally synchronized

```
// Provided by VK_KHR_object_refresh
typedef enum VkRefreshObjectFlagBitsKHR {
} VkRefreshObjectFlagBitsKHR;
```

```
// Provided by VK_KHR_object_refresh
typedef VkFlags VkRefreshObjectFlagsKHR;
```

`VkRefreshObjectFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

Chapter 21. Drawing Commands

Drawing commands (commands with **Draw** in the name) provoke work in a graphics pipeline. Drawing commands are recorded into a command buffer and when executed by a queue, will produce work which executes according to the bound graphics pipeline. A graphics pipeline **must** be bound to a command buffer before any drawing commands are recorded in that command buffer.

Each draw is made up of zero or more vertices and zero or more instances, which are processed by the device and result in the assembly of primitives. Primitives are assembled according to the `pInputAssemblyState` member of the `VkGraphicsPipelineCreateInfo` structure, which is of type `VkPipelineInputAssemblyStateCreateInfo`:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineInputAssemblyStateCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkPipelineInputAssemblyStateCreateFlags flags;
    VkPrimitiveTopology        topology;
    VkBool32                  primitiveRestartEnable;
} VkPipelineInputAssemblyStateCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `topology` is a `VkPrimitiveTopology` defining the primitive topology, as described below.
- `primitiveRestartEnable` controls whether a special vertex index value is treated as restarting the assembly of primitives. This enable only applies to indexed draws (`vkCmdDrawIndexed`, and `vkCmdDrawIndexedIndirect`), and the special index value is either `0xFFFFFFFF` when the `indexType` parameter of `vkCmdBindIndexBuffer` is equal to `VK_INDEX_TYPE_UINT32`; `0xFF` when `indexType` is equal to `VK_INDEX_TYPE_UINT8`; or `0xFFFF` when `indexType` is equal to `VK_INDEX_TYPE_UINT16`. Primitive restart is not allowed for “list” topologies.

Restarting the assembly of primitives discards the most recent index values if those elements formed an incomplete primitive, and restarts the primitive assembly using the subsequent indices, but only assembling the immediately following element through the end of the originally specified elements. The primitive restart index value comparison is performed before adding the `vertexOffset` value to the index value.

Valid Usage

- VUID-VkPipelineInputAssemblyStateCreateInfo-topology-06252
If `topology` is `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`, or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY`, `primitiveRestartEnable` **must** be

VK_FALSE

- VUID-VkPipelineInputAssemblyStateCreateInfo-topology-06253
If `topology` is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, `primitiveRestartEnable` **must** be `VK_FALSE`
- VUID-VkPipelineInputAssemblyStateCreateInfo-topology-00429
If the `geometryShader` feature is not enabled, `topology` **must** not be any of `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`,
`VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY`,
`VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY` or
`VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY`
- VUID-VkPipelineInputAssemblyStateCreateInfo-topology-00430
If the `tessellationShader` feature is not enabled, `topology` **must** not be `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`

Valid Usage (Implicit)

- VUID-VkPipelineInputAssemblyStateCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_INPUT_ASSEMBLY_STATE_CREATE_INFO`
- VUID-VkPipelineInputAssemblyStateCreateInfo-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkPipelineInputAssemblyStateCreateInfo-flags-zeroBitmask
`flags` **must** be `0`
- VUID-VkPipelineInputAssemblyStateCreateInfo-topology-parameter
`topology` **must** be a valid `VkPrimitiveTopology` value

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineInputAssemblyStateCreateFlags;
```

`VkPipelineInputAssemblyStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

To [dynamically control](#) whether a special vertex index value is treated as restarting the assembly of primitives, call:

```
// Provided by VK_EXT_extended_dynamic_state2
void vkCmdSetPrimitiveRestartEnableEXT(
    VkCommandBuffer          commandBuffer,
    VkBool32                  primitiveRestartEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `primitiveRestartEnable` controls whether a special vertex index value is treated as restarting the assembly of primitives. It behaves in the same way as `VkPipelineInputAssemblyStateCreateInfo::primitiveRestartEnable`

This command sets the primitive restart enable for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineInputAssemblyStateCreateInfo::primitiveRestartEnable` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetPrimitiveRestartEnable-None-08970

At least one of the following **must** be true:

- the `extendedDynamicState2` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetPrimitiveRestartEnable-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetPrimitiveRestartEnable-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdSetPrimitiveRestartEnable-commandBuffer-cmdpool

The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

21.1. Primitive Topologies

Primitive topology determines how consecutive vertices are organized into primitives, and determines the type of primitive that is used at the beginning of the graphics pipeline. The effective topology for later stages of the pipeline is altered by tessellation or geometry shading (if either is in use) and depends on the execution modes of those shaders.

The primitive topologies defined by [VkPrimitiveTopology](#) are:

```
// Provided by VK_VERSION_1_0
typedef enum VkPrimitiveTopology {
    VK_PRIMITIVE_TOPOLOGY_POINT_LIST = 0,
    VK_PRIMITIVE_TOPOLOGY_LINE_LIST = 1,
    VK_PRIMITIVE_TOPOLOGY_LINE_STRIP = 2,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST = 3,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP = 4,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN = 5,
    VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY = 6,
    VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY = 7,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY = 8,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY = 9,
    VK_PRIMITIVE_TOPOLOGY_PATCH_LIST = 10,
} VkPrimitiveTopology;
```

- [VK_PRIMITIVE_TOPOLOGY_POINT_LIST](#) specifies a series of [separate point primitives](#).
- [VK_PRIMITIVE_TOPOLOGY_LINE_LIST](#) specifies a series of [separate line primitives](#).
- [VK_PRIMITIVE_TOPOLOGY_LINE_STRIP](#) specifies a series of [connected line primitives](#) with consecutive lines sharing a vertex.
- [VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST](#) specifies a series of [separate triangle primitives](#).
- [VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP](#) specifies a series of [connected triangle primitives](#) with consecutive triangles sharing an edge.
- [VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN](#) specifies a series of [connected triangle primitives](#) with all triangles sharing a common vertex.
- [VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY](#) specifies a series of [separate line primitives with adjacency](#).
- [VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY](#) specifies a series of [connected line primitives with adjacency](#), with consecutive primitives sharing three vertices.
- [VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY](#) specifies a series of [separate triangle primitives with adjacency](#).
- [VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY](#) specifies [connected triangle primitives with adjacency](#), with consecutive triangles sharing an edge.
- [VK_PRIMITIVE_TOPOLOGY_PATCH_LIST](#) specifies [separate patch primitives](#).

Each primitive topology, and its construction from a list of vertices, is described in detail below with a supporting diagram, according to the following key:

•	Vertex	A point in 3-dimensional space. Positions chosen within the diagrams are arbitrary and for illustration only.
5	Vertex Number	Sequence position of a vertex within the provided vertex data.

	Provoking Vertex	Provoking vertex within the main primitive. The tail is angled towards the relevant primitive. Used in flat shading .
	Primitive Edge	An edge connecting the points of a main primitive.
	Adjacency Edge	Points connected by these lines do not contribute to a main primitive, and are only accessible in a geometry shader .
	Winding Order	The relative order in which vertices are defined within a primitive, used in the facing determination . This ordering has no specific start or end point.

The diagrams are supported with mathematical definitions where the vertices (v) and primitives (p) are numbered starting from 0; v_0 is the first vertex in the provided data and p_0 is the first primitive in the set of primitives defined by the vertices and topology.

To [dynamically set](#) primitive topology, call:

```
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetPrimitiveTopologyEXT(
    VkCommandBuffer          commandBuffer,
    VkPrimitiveTopology       primitiveTopology);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `primitiveTopology` specifies the primitive topology to use for drawing.

This command sets the primitive topology for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineInputAssemblyStateCreateInfo::topology` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetPrimitiveTopology-None-08971
At least one of the following **must** be true:
 - the `extendedDynamicState` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetPrimitiveTopology-commandBuffer-parameter `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetPrimitiveTopology-primitiveTopology-parameter `primitiveTopology` **must** be a valid `VkPrimitiveTopology` value
- VUID-vkCmdSetPrimitiveTopology-commandBuffer-recording `commandBuffer` **must** be in the `recording state`

- VUID-vkCmdSetPrimitiveTopology-commandBuffer-cmdpool

The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

21.1.1. Topology Class

The primitive topologies are grouped into the following topology classes:

Table 25. Topology Classes

Topology Class	Primitive Topology
Point	<code>VK_PRIMITIVE_TOPOLOGY_POINT_LIST</code>
Line	<code>VK_PRIMITIVE_TOPOLOGY_LINE_LIST</code> , <code>VK_PRIMITIVE_TOPOLOGY_LINE_STRIP</code> , <code>VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY</code> , <code>VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY</code>
Triangle	<code>VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST</code> , <code>VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP</code> , <code>VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN</code> , <code>VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY</code> , <code>VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY</code>
Patch	<code>VK_PRIMITIVE_TOPOLOGY_PATCH_LIST</code>

21.1.2. Point Lists

When the topology is `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, each consecutive vertex defines a single point primitive, according to the equation:

$$p_i = \{v_i\}$$

As there is only one vertex, that vertex is the provoking vertex. The number of primitives generated is equal to `vertexCount`.

21.1.3. Line Lists

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_LINE_LIST`, each consecutive pair of vertices defines a single line primitive, according to the equation:

$$p_i = \{v_{2i}, v_{2i+1}\}$$

The number of primitives generated is equal to $\lceil \text{vertexCount} / 2 \rceil$.

The provoking vertex for p_i is v_{2i} .

21.1.4. Line Strips

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP`, one line primitive is defined by each vertex and the following vertex, according to the equation:

$$p_i = \{v_i, v_{i+1}\}$$

The number of primitives generated is equal to $\max(0, \text{vertexCount} - 1)$.

The provoking vertex for p_i is v_i .

21.1.5. Triangle Lists

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, each consecutive set of three vertices defines a single triangle primitive, according to the equation:

$$p_i = \{v_{3i}, v_{3i+1}, v_{3i+2}\}$$

The number of primitives generated is equal to $\lfloor \text{vertexCount} / 3 \rfloor$.

The provoking vertex for p_i is v_{3i} .

21.1.6. Triangle Strips

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP`, one triangle primitive is defined by each vertex and the two vertices that follow it, according to the equation:

$$p_i = \{v_i, v_{i+(1+i\%2)}, v_{i+(2-i\%2)}\}$$

The number of primitives generated is equal to $\max(0, \text{vertexCount} - 2)$.

The provoking vertex for p_i is v_i .

NOTE

The ordering of the vertices in each successive triangle is reversed, so that the winding order is consistent throughout the strip.

21.1.7. Triangle Fans

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN`, triangle primitives are defined around a shared common vertex, according to the equation:

$$p_i = \{v_{i+1}, v_{i+2}, v_0\}$$

The number of primitives generated is equal to $\max(0, \text{vertexCount}-2)$.

The provoking vertex for p_i is v_{i+1} .

21.1.8. Line Lists With Adjacency

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`, each consecutive set of four vertices defines a single line primitive with adjacency, according to the equation:

$$p_i = \{v_{4i}, v_{4i+1}, v_{4i+2}, v_{4i+3}\}$$

A line primitive is described by the second and third vertices of the total primitive, with the remaining two vertices only accessible in a [geometry shader](#).

The number of primitives generated is equal to $\lfloor \text{vertexCount}/4 \rfloor$.

The provoking vertex for p_i is v_{4i+1} .

21.1.9. Line Strips With Adjacency

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY`, one line primitive with adjacency is defined by each vertex and the following vertex, according to the equation:

$$p_i = \{v_i, v_{i+1}, v_{i+2}, v_{i+3}\}$$

A line primitive is described by the second and third vertices of the total primitive, with the remaining two vertices only accessible in a [geometry shader](#).

The number of primitives generated is equal to $\max(0, \text{vertexCount}-3)$.

The provoking vertex for p_i is v_{i+1} .

21.1.10. Triangle Lists With Adjacency

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY`, each consecutive set of six vertices defines a single triangle primitive with adjacency, according to the equations:

$$p_i = \{v_{6i}, v_{6i+1}, v_{6i+2}, v_{6i+3}, v_{6i+4}, v_{6i+5}\}$$

A triangle primitive is described by the first, third, and fifth vertices of the total primitive, with the remaining three vertices only accessible in a [geometry shader](#).

The number of primitives generated is equal to $\lfloor \text{vertexCount} / 6 \rfloor$.

The provoking vertex for p_i is v_{6i} .

21.1.11. Triangle Strips With Adjacency

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY`, one triangle primitive with adjacency is defined by each vertex and the following 5 vertices.

The number of primitives generated, n , is equal to $\lfloor \max(0, \text{vertexCount} - 4) / 2 \rfloor$.

If $n=1$, the primitive is defined as:

$$p = \{v_0, v_1, v_2, v_3, v_4, v_5\}$$

If $n>1$, the total primitive consists of different vertices according to where it is in the strip:

$$p_i = \{v_{2i}, v_{2i+1}, v_{2i+2}, v_{2i+6}, v_{2i+4}, v_{2i+3}\} \text{ when } i=0$$

$$p_i = \{v_{2i}, v_{2i+3}, v_{2i+4}, v_{2i+6}, v_{2i+2}, v_{2i-2}\} \text{ when } i>0, i<n-1, \text{ and } i\%2=1$$

$p_i = \{v_{2i}, v_{2i-2}, v_{2i+2}, v_{2i+6}, v_{2i+4}, v_{2i+3}\}$ when $i > 0$, $i < n-1$, and $i \% 2 = 0$

$p_i = \{v_{2i}, v_{2i+3}, v_{2i+4}, v_{2i+5}, v_{2i+2}, v_{2i-2}\}$ when $i = n-1$ and $i \% 2 = 1$

$p_i = \{v_{2i}, v_{2i-2}, v_{2i+2}, v_{2i+5}, v_{2i+4}, v_{2i+3}\}$ when $i = n-1$ and $i \% 2 = 0$

A triangle primitive is described by the first, third, and fifth vertices of the total primitive in all cases, with the remaining three vertices only accessible in a [geometry shader](#).

NOTE

The ordering of the vertices in each successive triangle is altered so that the winding order is consistent throughout the strip.

The provoking vertex for p_i is always v_{2i} .

21.1.12. Patch Lists

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, each consecutive set of m vertices defines a single patch primitive, according to the equation:

$$p_i = \{v_{mi}, v_{mi+1}, \dots, v_{mi+(m-2)}, v_{mi+(m-1)}\}$$

where m is equal to `VkPipelineTessellationStateCreateInfo::patchControlPoints`.

Patch lists are never passed to [vertex post-processing](#), and as such no provoking vertex is defined for patch primitives. The number of primitives generated is equal to $\lceil \text{vertexCount}/m \rceil$.

The vertices comprising a patch have no implied geometry, and are used as inputs to tessellation shaders and the fixed-function tessellator to generate new point, line, or triangle primitives.

21.2. Effective Primitive Topology

The effective primitive topology is the primitive topology that is consumed or produced by a given stage of the graphics pipeline. The interpretation of this topology depends on the active shader stages and other state set in the graphics pipeline.

21.2.1. Vertex Input Assembler Topology

This is the topology set when the `VK_SHADER_STAGE_VERTEX_BIT` stage is used and [Programmable Primitive Shading](#) occurs. It **can** be set with `VkPipelineInputAssemblyStateCreateInfo::topology` or `vkCmdSetPrimitiveTopologyEXT`.

21.2.2. Clip Space Topology

This is the output of the last pre-rasterization shader stage involved.

- If `VK_SHADER_STAGE_VERTEX_BIT` is the last pre-rasterization stage, the topology is not changed from what was set in the [input assembly](#).
- If `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` is the last pre-rasterization stage, the topology depends on the `OpExecutionMode` found in either [tessellation stage](#).
 - The `Isolines Execution Mode` is in line [topology class](#).
 - The `Triangles and Quads Execution Mode` is in triangle [topology class](#).
 - The `PointMode Execution Mode` is in point [topology class](#) and will take precedence over the other tessellation stage `Execution Mode`.
- If `VK_SHADER_STAGE_GEOMETRY_BIT` is the last pre-rasterization stage, the topology depends on the `OpExecutionMode` found in this shader stage.
 - The `OutputPoints Execution Mode` is in point [topology class](#).
 - The `OutputLineStrip Execution Mode` is in line [topology class](#).
 - The `OutputTriangleStrip Execution Mode` is in triangle [topology class](#).

21.2.3. Rasterization Input Topology

After clipping and viewport transformations, the [Polygon Mode](#) **can** set a topology as an input for rasterization. This **can** be different from what was used in [Clip Space Topology](#).

If `VkPipelineRasterizationStateCreateInfo::rasterizerDiscardEnable` or `vkCmdSetRasterizerDiscardEnableEXT::rasterizerDiscardEnable` is set to `VK_FALSE`, then this Rasterization Input Topology is not observed.

If the `clip space topology` is in triangle `topology class` then `VK_POLYGON_MODE_LINE` will turn it into line topology and `VK_POLYGON_MODE_POINT` will turn it into point topology.

If the `clip space topology` is in line `topology class` then `VK_POLYGON_MODE_POINT` will turn it into point topology.

21.3. Primitive Order

Primitives generated by `drawing commands` progress through the stages of the `graphics pipeline` in *primitive order*. Primitive order is initially determined in the following way:

1. Submission order determines the initial ordering
2. For indirect drawing commands, the order in which accessed instances of the `VkDrawIndirectCommand` are stored in `buffer`, from lower indirect buffer addresses to higher addresses.
3. If a drawing command includes multiple instances, the order in which instances are executed, from lower numbered instances to higher.
4. The order in which primitives are specified by a drawing command:
 - For non-indexed draws, from vertices with a lower numbered `vertexIndex` to a higher numbered `vertexIndex`.
 - For indexed draws, vertices sourced from a lower index buffer addresses to higher addresses.

Within this order implementations further sort primitives:

5. If tessellation shading is active, by an implementation-dependent order of new primitives generated by `tessellation`.
6. If geometry shading is active, by the order new primitives are generated by `geometry shading`.
7. If the `polygon mode` is not `VK_POLYGON_MODE_FILL`, by an implementation-dependent ordering of the new primitives generated within the original primitive.

Primitive order is later used to define `rasterization order`, which determines the order in which fragments output results to a framebuffer.

21.4. Programmable Primitive Shading

Once primitives are assembled, they proceed to the vertex shading stage of the pipeline. If the draw includes multiple instances, then the set of primitives is sent to the vertex shading stage multiple times, once for each instance.

It is implementation-dependent whether vertex shading occurs on vertices that are discarded as part of incomplete primitives, but if it does occur then it operates as if they were vertices in

complete primitives and such invocations **can** have side effects.

Vertex shading receives two per-vertex inputs from the primitive assembly stage - the **vertexIndex** and the **instanceIndex**. How these values are generated is defined below, with each command.

Drawing commands fall roughly into two categories:

- Non-indexed drawing commands present a sequential **vertexIndex** to the vertex shader. The sequential index is generated automatically by the device (see [Fixed-Function Vertex Processing](#) for details on both specifying the vertex attributes indexed by **vertexIndex**, as well as binding vertex buffers containing those attributes to a command buffer). These commands are:
 - **vkCmdDraw**
 - **vkCmdDrawIndirect**
 - **vkCmdDrawIndirectCount**
- Indexed drawing commands read index values from an *index buffer* and use this to compute the **vertexIndex** value for the vertex shader. These commands are:
 - **vkCmdDrawIndexed**
 - **vkCmdDrawIndexedIndirect**
 - **vkCmdDrawIndexedIndirectCount**

To bind an index buffer to a command buffer, call:

```
// Provided by VK_VERSION_1_0
void vkCmdBindIndexBuffer(
    VkCommandBuffer          commandBuffer,
    VkBuffer                 buffer,
    VkDeviceSize             offset,
    VkIndexType              indexType);
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **buffer** is the buffer being bound.
- **offset** is the starting offset in bytes within **buffer** used in index buffer address calculations.
- **indexType** is a **VkIndexType** value specifying the size of the indices.

Valid Usage

- VUID-vkCmdBindIndexBuffer-offset-08782
offset must be less than the size of **buffer**
- VUID-vkCmdBindIndexBuffer-offset-08783
The sum of **offset** and the base address of the range of **VkDeviceMemory** object that is backing **buffer**, **must** be a multiple of the size of the type indicated by **indexType**
- VUID-vkCmdBindIndexBuffer-buffer-08784
buffer must have been created with the **VK_BUFFER_USAGE_INDEX_BUFFER_BIT** flag

- VUID-vkCmdBindIndexBuffer-buffer-08785
If **buffer** is non-sparse then it **must** be bound completely and contiguously to a single **VkDeviceMemory** object
- VUID-vkCmdBindIndexBuffer-indexType-08787
If **indexType** is **VK_INDEX_TYPE_UINT8**, the **indexTypeUint8** feature **must** be enabled
- VUID-vkCmdBindIndexBuffer-None-09493
buffer **must** not be **VK_NULL_HANDLE**

Valid Usage (Implicit)

- VUID-vkCmdBindIndexBuffer-commandBuffer-parameter
commandBuffer **must** be a valid **VkCommandBuffer** handle
- VUID-vkCmdBindIndexBuffer-buffer-parameter
If **buffer** is not **VK_NULL_HANDLE**, **buffer** **must** be a valid **VkBuffer** handle
- VUID-vkCmdBindIndexBuffer-indexType-parameter
indexType **must** be a valid **VkIndexType** value
- VUID-vkCmdBindIndexBuffer-commandBuffer-recording
commandBuffer **must** be in the **recording state**
- VUID-vkCmdBindIndexBuffer-commandBuffer-cmdpool
The **VkCommandPool** that **commandBuffer** was allocated from **must** support **VK_QUEUE_GRAPHICS_BIT** operations
- VUID-vkCmdBindIndexBuffer-commonparent
Both of **buffer**, and **commandBuffer** that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same **VkDevice**

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

Possible values of **vkCmdBindIndexBuffer::indexType**, specifying the size of indices, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkIndexType {
    VK_INDEX_TYPE_UINT16 = 0,
    VK_INDEX_TYPE_UINT32 = 1,
    VK_INDEX_TYPE_UINT8 = 1000265000,
    // Provided by VK_EXT_index_type_uint8
    VK_INDEX_TYPE_UINT8_EXT = VK_INDEX_TYPE_UINT8,
    // Provided by VK_KHR_index_type_uint8
    VK_INDEX_TYPE_UINT8_KHR = VK_INDEX_TYPE_UINT8,
} VkIndexType;
```

- `VK_INDEX_TYPE_UINT16` specifies that indices are 16-bit unsigned integer values.
- `VK_INDEX_TYPE_UINT32` specifies that indices are 32-bit unsigned integer values.
- `VK_INDEX_TYPE_UINT8` specifies that indices are 8-bit unsigned integer values.

The parameters for each drawing command are specified directly in the command or read from buffer memory, depending on the command. Drawing commands that source their parameters from buffer memory are known as *indirect* drawing commands.

All drawing commands interact with the `robustBufferAccess` feature.

To record a non-indexed draw, call:

```
// Provided by VK_VERSION_1_0
void vkCmdDraw(
    VkCommandBuffer          commandBuffer,
    uint32_t                 vertexCount,
    uint32_t                 instanceCount,
    uint32_t                 firstVertex,
    uint32_t                 firstInstance);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `vertexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstVertex` is the index of the first vertex to draw.
- `firstInstance` is the instance ID of the first instance to draw.

When the command is executed, primitives are assembled using the current primitive topology and `vertexCount` consecutive vertex indices with the first `vertexIndex` value equal to `firstVertex`. The primitives are drawn `instanceCount` times with `instanceIndex` starting with `firstInstance` and increasing sequentially for each instance. The assembled primitives execute the bound graphics pipeline.

Valid Usage

- VUID-vkCmdDraw-magFilter-04553

If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDraw-magFilter-09598

If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- VUID-vkCmdDraw-mipmapMode-04770

If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDraw-mipmapMode-09599

If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- VUID-vkCmdDraw-unnormalizedCoordinates-09635

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` **must** be 1

- VUID-vkCmdDraw-None-08609

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `viewType` **must** be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`

- VUID-vkCmdDraw-None-08610

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name

- VUID-vkCmdDraw-None-08611

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values

- VUID-vkCmdDraw-aspectMask-06478
If a [VkImageView](#) is sampled with [depth comparison](#), the image view **must** have been created with an [aspectMask](#) that contains [VK_IMAGE_ASPECT_DEPTH_BIT](#)
- VUID-vkCmdDraw-None-02691
If a [VkImageView](#) is accessed using atomic operations as a result of this command, then the image view's [format](#) [features](#) **must** contain [VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT](#)
- VUID-vkCmdDraw-None-07888
If a [VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER](#) descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's [format](#) [features](#) **must** contain [VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT](#)
- VUID-vkCmdDraw-None-02692
If a [VkImageView](#) is sampled with [VK_FILTER_CUBIC_EXT](#) as a result of this command, then the image view's [format](#) [features](#) **must** contain [VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT](#)
- VUID-vkCmdDraw-None-02693
If the [VK_EXT_filter_cubic](#) extension is not enabled and any [VkImageView](#) is sampled with [VK_FILTER_CUBIC_EXT](#) as a result of this command, it **must** not have a [VkImageViewType](#) of [VK_IMAGE_VIEW_TYPE_3D](#), [VK_IMAGE_VIEW_TYPE_CUBE](#), or [VK_IMAGE_VIEW_TYPE_CUBE_ARRAY](#)
- VUID-vkCmdDraw-filterCubic-02694
Any [VkImageView](#) being sampled with [VK_FILTER_CUBIC_EXT](#) as a result of this command **must** have a [VkImageViewType](#) and format that supports cubic filtering, as specified by [VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic](#) returned by [vkGetPhysicalDeviceImageFormatProperties2](#)
- VUID-vkCmdDraw-filterCubicMinmax-02695
Any [VkImageView](#) being sampled with [VK_FILTER_CUBIC_EXT](#) with a reduction mode of either [VK_SAMPLER_REDUCTION_MODE_MIN](#) or [VK_SAMPLER_REDUCTION_MODE_MAX](#) as a result of this command **must** have a [VkImageViewType](#) and format that supports cubic filtering together with minmax filtering, as specified by [VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax](#) returned by [vkGetPhysicalDeviceImageFormatProperties2](#)
- VUID-vkCmdDraw-None-08600
For each set *n* that is statically used by a [bound shader](#), a descriptor set **must** have been bound to *n* at the same pipeline bind point, with a [VkPipelineLayout](#) that is compatible for set *n*, with the [VkPipelineLayout](#) used to create the current [VkPipeline](#) , as described in [Pipeline Layout Compatibility](#)
- VUID-vkCmdDraw-None-08601
For each push constant that is statically used by a [bound shader](#), a push constant value **must** have been set for the same pipeline bind point, with a [VkPipelineLayout](#) that is compatible for push constants, with the [VkPipelineLayout](#) used to create the current [VkPipeline](#) , as described in [Pipeline Layout Compatibility](#)
- VUID-vkCmdDraw-None-10068
For each array of resources that is used by a [bound shader](#), the indices used to access members of the array **must** be less than the descriptor count for the identified binding in

the descriptor sets used by this command

- VUID-vkCmdDraw-None-08114

Descriptors in each bound descriptor set, specified via [vkCmdBindDescriptorSets](#), **must** be valid as described by [descriptor validity](#) if they are statically used by a [bound shader](#)

- VUID-vkCmdDraw-imageLayout-00344

If an image descriptor is accessed by a shader, the [VkImageLayout](#) **must** match the subresource accessible from the [VkImageView](#) as defined by the [image layout matching rules](#)

- VUID-vkCmdDraw-None-08606

A valid pipeline **must** be bound to the pipeline bind point used by this command

- VUID-vkCmdDraw-None-08608

There **must** not have been any calls to dynamic state setting commands for any state specified statically in the [VkPipeline](#) object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdDraw-uniformBuffers-06935

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a uniform buffer, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDraw-storageBuffers-06936

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a storage buffer, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDraw-commandBuffer-02707

If [commandBuffer](#) is an unprotected command buffer and [protectedNoFault](#) is not supported, any resource accessed by [bound shaders](#) **must** not be a protected resource

- VUID-vkCmdDraw-viewType-07752

If a [VkImageView](#) is accessed as a result of this command, then the image view's [viewType](#) **must** match the [Dim](#) operand of the [OpTypeImage](#) as described in [Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types](#)

- VUID-vkCmdDraw-format-07753

If a [VkImageView](#) or [VkBufferView](#) is accessed as a result of this command, then the [numeric type](#) of the view's [format](#) and the [Sampled Type](#) operand of the [OpTypeImage](#) **must** match

- VUID-vkCmdDraw-OpImageWrite-08795

If a [VkImageView](#) is accessed using [OpImageWrite](#) as a result of this command, then the [Type](#) of the [Texel](#) operand of that instruction **must** have at least as many components as the image view's format

- VUID-vkCmdDraw-OpImageWrite-04469

If a [VkBufferView](#) is accessed using [OpImageWrite](#) as a result of this command, then the [Type](#) of the [Texel](#) operand of that instruction **must** have at least as many components as the buffer view's format

- VUID-vkCmdDraw-SampledType-04470
If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64
- VUID-vkCmdDraw-SampledType-04471
If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32
- VUID-vkCmdDraw-SampledType-04472
If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64
- VUID-vkCmdDraw-SampledType-04473
If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32
- VUID-vkCmdDraw-sparseImageInt64Atomics-04474
If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command
- VUID-vkCmdDraw-sparseImageInt64Atomics-04475
If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command
- VUID-vkCmdDraw-None-07288
Any shader invocation executed by this command **must** `terminate`
- VUID-vkCmdDraw-None-09600
If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, all image subresources identified by that descriptor **must** be in the image layout identified when the descriptor was written
- VUID-vkCmdDraw-renderPass-02684
The current render pass **must** be `compatible` with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`
- VUID-vkCmdDraw-subpass-02685
The subpass index of the current render pass **must** be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`
- VUID-vkCmdDraw-None-07748
If any shader statically accesses an input attachment, a valid descriptor **must** be bound to the pipeline via a descriptor set
- VUID-vkCmdDraw-OpTypeImage-07468

If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it **must** be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass

- VUID-vkCmdDraw-None-07469

Input attachment views accessed in a subpass **must** be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImageView` that is compatible with the attachment referenced by the subpass' `pInputAttachments` [`InputAttachmentIndex`] in the bound `VkFramebuffer` as specified by [Fragment Input Attachment Compatibility](#)

- VUID-vkCmdDraw-None-06537

Memory backing image subresources used as attachments in the current render pass **must** not be written in any way other than as an attachment by this command

- VUID-vkCmdDraw-None-10795

If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass,

it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDraw-None-10796

If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass,

it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDraw-None-10797

If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass,

it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDraw-None-06539

If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command **must** not write to that image subresource as an attachment

- VUID-vkCmdDraw-None-06886

If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, `depth writes` **must** be disabled

- VUID-vkCmdDraw-None-06887

If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back `writeMask` are not zero, and stencil test is enabled, `all stencil ops` **must** be `VK_STENCIL_OP_KEEP`

- VUID-vkCmdDraw-None-07831

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT` dynamic state enabled then `vkCmdSetViewport` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-07832

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR` dynamic state enabled then `vkCmdSetScissor` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-08617

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LINE_WIDTH` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `effective rasterization input topology` is in line topology class, then `vkCmdSetLineWidth` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-07834

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `depthBiasEnable` is `VK_TRUE`, then `vkCmdSetDepthBias` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-07835

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_BLEND_CONSTANTS` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and an active color attachment `current value` of `blendEnable` is `VK_TRUE` with a blend equations where any `VkBlendFactor` member is `VK_BLEND_FACTOR_CONSTANT_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR`, `VK_BLEND_FACTOR_CONSTANT_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`, then `vkCmdSetBlendConstants` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-07836

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `depthBoundsTestEnable` is `VK_TRUE`, then `vkCmdSetDepthBounds` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-07837

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilCompareMask` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-07838

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilWriteMask` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-07839

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_REFERENCE` dynamic state enabled, the `current value` of and

`rasterizerDiscardEnable` is `VK_FALSE`, the `current value` of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilReference` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-maxMultiviewInstanceIndex-02688

If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`

- VUID-vkCmdDraw-sampleLocationsEnable-02689

If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE`, then the active depth attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set

- VUID-vkCmdDraw-None-06666

If the `VK_EXT_sample_locations` extension is enabled, a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `sampleLocationsEnable` is `VK_TRUE`, then `vkCmdSetSampleLocationsEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-07840

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_CULL_MODE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetCullModeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-07841

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_FRONT_FACE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetFrontFaceEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-07843

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, `vkCmdSetDepthTestEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-07844

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `depthTestEnable` is `VK_TRUE`, then `vkCmdSetDepthWriteEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-07845

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `depthTestEnable` is `VK_TRUE`,

then `vkCmdSetDepthCompareOpEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-07846

If the `depthBounds` feature is enabled, a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthBoundsTestEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-07847

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetStencilTestEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-07848

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_OP` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, the `current value` of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilOpEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-viewportCount-03417

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCountEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-scissorCount-03418

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCountEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing

- VUID-vkCmdDraw-viewportCount-03419

If a graphics pipeline is bound which was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled, then the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` **must** match the `scissorCount` parameter of `vkCmdSetScissorWithCountEXT`

- VUID-vkCmdDraw-None-04876

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled, then `vkCmdSetRasterizerDiscardEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-04877

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthBiasEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this

drawing command

- VUID-vkCmdDraw-logicOp-04878

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, and the **current value** of `logicOpEnable` is `VK_TRUE`, then `vkCmdSetLogicOpEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-primitiveFragmentShadingRateWithMultipleViewports-04552

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCountEXT` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` **must** be 1

- VUID-vkCmdDraw-blendEnable-04727

If a graphics pipeline is bound which was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then for each color attachment, if the corresponding image view's **format features** do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the corresponding **current value** of `blendEnable` **must** be `VK_FALSE`

- VUID-vkCmdDraw-None-08644

If a graphics pipeline is bound, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`,

then the **current value** of `rasterizationSamples` **must** be the same as the current color and/or depth/stencil attachments

- VUID-vkCmdDraw-maxFragmentDualSrcAttachments-09239

If **blending** is enabled for any attachment where either the source or destination blend factors for that attachment **use the secondary color input**, the maximum value of `Location` for any output attachment **statically used** in the `Fragment Execution Model` executed by this command **must** be less than `maxFragmentDualSrcAttachments`

- VUID-vkCmdDraw-commandBuffer-02712

If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, any resource written to by the `VkPipeline` object bound to the pipeline bind point used by this command **must** not be an unprotected resource

- VUID-vkCmdDraw-commandBuffer-02713

If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, pipeline stages other than the framebuffer-space and compute stages in the `VkPipeline` object bound to the pipeline bind point used by this command **must** not write to any resource

- VUID-vkCmdDraw-None-04007

All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** have either valid or `VK_NULL_HANDLE` buffers bound

- VUID-vkCmdDraw-None-04008
If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** not be `VK_NULL_HANDLE`
- VUID-vkCmdDraw-None-02721
If the `robustBufferAccess` feature is not enabled, then for a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in [Vertex Input Description](#)
- VUID-vkCmdDraw-format-10389
For each vertex attribute accessed by this command, if its `VkVertexInputAttributeDescription::format` or `VkVertexInputAttributeDescription2EXT::format` is a `packed format`, the value of `attribAddress`, calculated as described in [Vertex Input Calculation](#), **must** be a multiple of the `size of the format`
- VUID-vkCmdDraw-format-10390
For each vertex attribute accessed by this command, if its `VkVertexInputAttributeDescription::format` or `VkVertexInputAttributeDescription2EXT::format` is not a `packed format`, the value of `attribAddress`, calculated as described in [Vertex Input Calculation](#), **must** be a multiple of the `component size of the format`
- VUID-vkCmdDraw-None-07842
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDraw-dynamicPrimitiveTopologyUnrestricted-07500
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state enabled then the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` **must** be of the same `topology class` as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state
- VUID-vkCmdDraw-primitiveTopology-10286
If a `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage is bound, then the `current value` of `primitiveTopology` **must** be `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST` prior to this drawing command
- VUID-vkCmdDraw-primitiveTopology-10747
If `vkCmdSetPrimitiveTopologyEXT` set `primitiveTopology` to `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST` prior to this drawing command, then a `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage **must** be bound
- VUID-vkCmdDraw-primitiveTopology-10748
If `vkCmdSetPrimitiveTopologyEXT` set `primitiveTopology` to `VK_PRIMITIVE_TOPOLOGY_POINT_LIST` prior to this drawing command, both a `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` and `VK_SHADER_STAGE_GEOMETRY_BIT` stage are not bound, then the `Vertex Execution Model` **must** have a `PointSize` decorated variable that is statically written to
- VUID-vkCmdDraw-pStrides-04913
If the bound graphics pipeline was created with the

`VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE` dynamic state enabled, but without the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` **must** not be `NULL`

- VUID-vkCmdDraw-None-04914

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then `vkCmdSetVertexInputEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this draw command

- VUID-vkCmdDraw-Input-07939

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then all variables with the `Input` storage class decorated with `Location` in the `Vertex Execution Model OpEntryPoint` **must** contain a location in `VkVertexInputAttributeDescription2EXT::location`

- VUID-vkCmdDraw-Input-08734

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then the numeric type associated with all `Input` variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` **must** be the same as `VkVertexInputAttributeDescription2EXT::format`

- VUID-vkCmdDraw-format-08936

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then the scalar width associated with all `Input` variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` **must** be 64-bit

- VUID-vkCmdDraw-format-08937

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and the scalar width associated with a `Location` decorated `Input` variable in the `Vertex Execution Model OpEntryPoint` is 64-bit, then the corresponding `VkVertexInputAttributeDescription2EXT::format` **must** have a 64-bit component

- VUID-vkCmdDraw-None-09203

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then all `Input` variables at the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` **must** not use components that are not present in the format

- VUID-vkCmdDraw-None-04875

If the bound graphics pipeline state was created with both a `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage and the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled, and the `current value` of `primitiveTopology` is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, then `vkCmdSetPatchControlPointsEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-04879

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-09637

If the `input assembly` is `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`, or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY`, the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` dynamic state enabled, then `vkCmdSetPrimitiveRestartEnableEXT` **must** be `VK_FALSE`

- VUID-vkCmdDraw-None-10909

If the `input assembly` is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` **must** be `VK_FALSE`

- VUID-vkCmdDraw-pNext-09461

If the bound graphics pipeline state was created with `VkPipelineVertexInputDivisorStateCreateInfo` in the `pNext` chain of `VkGraphicsPipelineCreateInfo::pVertexInputState`, any member of `VkPipelineVertexInputDivisorStateCreateInfo::pVertexBindingDivisors` has a value other than `1` in `divisor`, and `VkPhysicalDeviceVertexAttributeDivisorProperties::supportsNonZeroFirstInstance` is `VK_FALSE`, then `firstInstance` **must** be `0`

- VUID-vkCmdDraw-None-09462

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, any member of the `pVertexBindingDescriptions` parameter to the `vkCmdSetVertexInputEXT` call that sets this dynamic state has a value other than `1` in `divisor`, and `VkPhysicalDeviceVertexAttributeDivisorProperties::supportsNonZeroFirstInstance` is `VK_FALSE`, then `firstInstance` **must** be `0`

Valid Usage (Implicit)

- VUID-vkCmdDraw-commandBuffer-parameter

`commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdDraw-commandBuffer-recording

`commandBuffer` **must** be in the `recording` state

- VUID-vkCmdDraw-commandBuffer-cmdpool

The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

- VUID-vkCmdDraw-renderpass

This command **must** only be called inside of a render pass instance

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Inside	VK_QUEUE_GRAPHICS_BIT	Action

To record an indexed draw, call:

```
// Provided by VK_VERSION_1_0
void vkCmdDrawIndexed(
    VkCommandBuffer          commandBuffer,
    uint32_t                 indexCount,
    uint32_t                 instanceCount,
    uint32_t                 firstIndex,
    int32_t                  vertexOffset,
    uint32_t                 firstInstance);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `indexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstIndex` is the base index within the index buffer.
- `vertexOffset` is the value added to the vertex index before indexing into the vertex buffer.
- `firstInstance` is the instance ID of the first instance to draw.

When the command is executed, primitives are assembled using the current primitive topology and `indexCount` vertices whose indices are retrieved from the index buffer. The index buffer is treated as an array of tightly packed unsigned integers of size defined by the `vkCmdBindIndexBuffer::indexType` parameter with which the buffer was bound.

The first vertex index is at an offset of $\text{firstIndex} \times \text{indexSize} + \text{offset}$ within the bound index buffer, where `offset` is the offset specified by `vkCmdBindIndexBuffer` and `indexSize` is the byte size of the type specified by `indexType`. Subsequent index values are retrieved from consecutive locations in the index buffer. Indices are first compared to the primitive restart value, then zero extended to 32 bits (if the `indexType` is `VK_INDEX_TYPE_UINT8` or `VK_INDEX_TYPE_UINT16`) and have `vertexOffset` added to them, before being supplied as the `vertexIndex` value.

The primitives are drawn `instanceCount` times with `instanceIndex` starting with `firstInstance` and increasing sequentially for each instance. The assembled primitives execute the bound graphics pipeline.

Valid Usage

- VUID-vkCmdDrawIndexed-magFilter-04553

If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDrawIndexed-magFilter-09598

If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- VUID-vkCmdDrawIndexed-mipmapMode-04770

If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDrawIndexed-mipmapMode-09599

If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- VUID-vkCmdDrawIndexed-unnormalizedCoordinates-09635

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` **must** be 1

- VUID-vkCmdDrawIndexed-None-08609

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `viewType` **must** be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`

- VUID-vkCmdDrawIndexed-None-08610

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name

- VUID-vkCmdDrawIndexed-None-08611

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a

[VkImageView](#) as a result of this command, then the sampler **must** not be used with any of the SPIR-V [OpImageSample*](#) or [OpImageSparseSample*](#) instructions that includes a LOD bias or any offset values

- VUID-vkCmdDrawIndexed-aspectMask-06478

If a [VkImageView](#) is sampled with [depth comparison](#), the image view **must** have been created with an [aspectMask](#) that contains [VK_IMAGE_ASPECT_DEPTH_BIT](#)

- VUID-vkCmdDrawIndexed-None-02691

If a [VkImageView](#) is accessed using atomic operations as a result of this command, then the image view's [format](#) [features](#) **must** contain [VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT](#)

- VUID-vkCmdDrawIndexed-None-07888

If a [VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER](#) descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's [format](#) [features](#) **must** contain [VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT](#)

- VUID-vkCmdDrawIndexed-None-02692

If a [VkImageView](#) is sampled with [VK_FILTER_CUBIC_EXT](#) as a result of this command, then the image view's [format](#) [features](#) **must** contain [VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT](#)

- VUID-vkCmdDrawIndexed-None-02693

If the [VK_EXT_filter_cubic](#) extension is not enabled and any [VkImageView](#) is sampled with [VK_FILTER_CUBIC_EXT](#) as a result of this command, it **must** not have a [VkImageViewType](#) of [VK_IMAGE_VIEW_TYPE_3D](#), [VK_IMAGE_VIEW_TYPE_CUBE](#), or [VK_IMAGE_VIEW_TYPE_CUBE_ARRAY](#)

- VUID-vkCmdDrawIndexed-filterCubic-02694

Any [VkImageView](#) being sampled with [VK_FILTER_CUBIC_EXT](#) as a result of this command **must** have a [VkImageViewType](#) and format that supports cubic filtering, as specified by [VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic](#) returned by [vkGetPhysicalDeviceImageFormatProperties2](#)

- VUID-vkCmdDrawIndexed-filterCubicMinmax-02695

Any [VkImageView](#) being sampled with [VK_FILTER_CUBIC_EXT](#) with a reduction mode of either [VK_SAMPLER_REDUCTION_MODE_MIN](#) or [VK_SAMPLER_REDUCTION_MODE_MAX](#) as a result of this command **must** have a [VkImageViewType](#) and format that supports cubic filtering together with minmax filtering, as specified by [VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax](#) returned by [vkGetPhysicalDeviceImageFormatProperties2](#)

- VUID-vkCmdDrawIndexed-None-08600

For each set n that is statically used by a [bound shader](#), a descriptor set **must** have been bound to n at the same pipeline bind point, with a [VkPipelineLayout](#) that is compatible for set n , with the [VkPipelineLayout](#) used to create the current [VkPipeline](#), as described in [Pipeline Layout Compatibility](#)

- VUID-vkCmdDrawIndexed-None-08601

For each push constant that is statically used by a [bound shader](#), a push constant value **must** have been set for the same pipeline bind point, with a [VkPipelineLayout](#) that is compatible for push constants, with the [VkPipelineLayout](#) used to create the current [VkPipeline](#), as described in [Pipeline Layout Compatibility](#)

- VUID-vkCmdDrawIndexed-None-10068
For each array of resources that is used by a [bound shader](#), the indices used to access members of the array **must** be less than the descriptor count for the identified binding in the descriptor sets used by this command
- VUID-vkCmdDrawIndexed-None-08114
Descriptors in each bound descriptor set, specified via [vkCmdBindDescriptorSets](#), **must** be valid as described by [descriptor validity](#) if they are statically used by a [bound shader](#)
- VUID-vkCmdDrawIndexed-imageLayout-00344
If an image descriptor is accessed by a shader, the [VkImageLayout](#) **must** match the subresource accessible from the [VkImageView](#) as defined by the [image layout matching rules](#)
- VUID-vkCmdDrawIndexed-None-08606
A valid pipeline **must** be bound to the pipeline bind point used by this command
- VUID-vkCmdDrawIndexed-None-08608
There **must** not have been any calls to dynamic state setting commands for any state specified statically in the [VkPipeline](#) object bound to the pipeline bind point used by this command, since that pipeline was bound
- VUID-vkCmdDrawIndexed-uniformBuffers-06935
If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a uniform buffer, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdDrawIndexed-storageBuffers-06936
If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a storage buffer, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdDrawIndexed-commandBuffer-02707
If [commandBuffer](#) is an unprotected command buffer and [protectedNoFault](#) is not supported, any resource accessed by [bound shaders](#) **must** not be a protected resource
- VUID-vkCmdDrawIndexed-viewType-07752
If a [VkImageView](#) is accessed as a result of this command, then the image view's [viewType](#) **must** match the [Dim](#) operand of the [OpTypeImage](#) as described in [Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types](#)
- VUID-vkCmdDrawIndexed-format-07753
If a [VkImageView](#) or [VkBufferView](#) is accessed as a result of this command, then the [numeric type](#) of the view's [format](#) and the [Sampled Type](#) operand of the [OpTypeImage](#) **must** match
- VUID-vkCmdDrawIndexed-OpImageWrite-08795
If a [VkImageView](#) is accessed using [OpImageWrite](#) as a result of this command, then the [Type](#) of the [Texel](#) operand of that instruction **must** have at least as many components as the image view's format
- VUID-vkCmdDrawIndexed-OpImageWrite-04469

If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view's format

- VUID-vkCmdDrawIndexed-SampledType-04470

If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64

- VUID-vkCmdDrawIndexed-SampledType-04471

If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- VUID-vkCmdDrawIndexed-SampledType-04472

If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64

- VUID-vkCmdDrawIndexed-SampledType-04473

If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- VUID-vkCmdDrawIndexed-sparseImageInt64Atomics-04474

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdDrawIndexed-sparseImageInt64Atomics-04475

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdDrawIndexed-None-07288

Any shader invocation executed by this command **must** `terminate`

- VUID-vkCmdDrawIndexed-None-09600

If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, all image subresources identified by that descriptor **must** be in the image layout identified when the descriptor was written

- VUID-vkCmdDrawIndexed-renderPass-02684

The current render pass **must** be `compatible` with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- VUID-vkCmdDrawIndexed-subpass-02685

The subpass index of the current render pass **must** be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- VUID-vkCmdDrawIndexed-None-07748

If any shader statically accesses an input attachment, a valid descriptor **must** be bound to the pipeline via a descriptor set

- VUID-vkCmdDrawIndexed-OpTypeImage-07468

If any shader executed by this pipeline accesses an **OpTypeImage** variable with a **Dim** operand of **SubpassData**, it **must** be decorated with an **InputAttachmentIndex** that corresponds to a valid input attachment in the current subpass

- VUID-vkCmdDrawIndexed-None-07469

Input attachment views accessed in a subpass **must** be created with the same **VkFormat** as the corresponding subpass definition, and be created with a **VkImageView** that is compatible with the attachment referenced by the subpass' **pInputAttachments** [**InputAttachmentIndex**] in the bound **VkFramebuffer** as specified by **Fragment Input Attachment Compatibility**

- VUID-vkCmdDrawIndexed-None-06537

Memory backing image subresources used as attachments in the current render pass **must** not be written in any way other than as an attachment by this command

- VUID-vkCmdDrawIndexed-None-10795

If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass,

it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawIndexed-None-10796

If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass,

it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawIndexed-None-10797

If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass,

it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawIndexed-None-06539

If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command **must** not write to that image subresource as an attachment

- VUID-vkCmdDrawIndexed-None-06886

If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, **depth writes must** be disabled

- VUID-vkCmdDrawIndexed-None-06887

If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back **writeMask** are not zero, and stencil test is enabled, **all stencil ops must** be **VK_STENCIL_OP_KEEP**

- VUID-vkCmdDrawIndexed-None-07831

If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT**

dynamic state enabled then `vkCmdSetViewport` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07832

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR` dynamic state enabled then `vkCmdSetScissor` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-08617

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LINE_WIDTH` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `effective rasterization input topology` is in line topology class, then `vkCmdSetLineWidth` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07834

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `depthBiasEnable` is `VK_TRUE`, then `vkCmdSetDepthBias` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07835

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_BLEND_CONSTANTS` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and an active color attachment `current value` of `blendEnable` is `VK_TRUE` with a blend equations where any `VkBlendFactor` member is `VK_BLEND_FACTOR_CONSTANT_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR`, `VK_BLEND_FACTOR_CONSTANT_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`, then `vkCmdSetBlendConstants` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07836

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `depthBoundsTestEnable` is `VK_TRUE`, then `vkCmdSetDepthBounds` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07837

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilCompareMask` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07838

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilWriteMask` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07839

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_REFERENCE` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, the `current value` of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilReference` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-maxMultiviewInstanceIndex-02688

If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`

- VUID-vkCmdDrawIndexed-sampleLocationsEnable-02689

If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE`, then the active depth attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set

- VUID-vkCmdDrawIndexed-None-06666

If the `VK_EXT_sample_locations` extension is enabled, a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `sampleLocationsEnable` is `VK_TRUE`, then `vkCmdSetSampleLocationsEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07840

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_CULL_MODE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetCullModeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07841

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_FRONT_FACE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetFrontFaceEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07843

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, `vkCmdSetDepthTestEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07844

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `depthTestEnable` is `VK_TRUE`, then `vkCmdSetDepthWriteEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07845

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, and the **current value** of `depthTestEnable` is `VK_TRUE`, then `vkCmdSetDepthCompareOpEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07846

If the `depthBounds` feature is enabled, a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state enabled, and the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthBoundsTestEnableEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07847

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled, and the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetStencilTestEnableEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07848

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_OP` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, the **current value** of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilOpEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-viewportCount-03417

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCountEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-scissorCount-03418

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCountEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing

- VUID-vkCmdDrawIndexed-viewportCount-03419

If a graphics pipeline is bound which was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled, then the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` **must** match the `scissorCount` parameter of `vkCmdSetScissorWithCountEXT`

- VUID-vkCmdDrawIndexed-None-04876

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled, then `vkCmdSetRasterizerDiscardEnableEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-04877

If a graphics pipeline is bound which was created with the

`VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthBiasEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-logicOp-04878

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `logicOpEnable` is `VK_TRUE`, then `vkCmdSetLogicOpEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-primitiveFragmentShadingRateWithMultipleViewports-04552

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCountEXT` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` **must** be 1

- VUID-vkCmdDrawIndexed-blendEnable-04727

If a graphics pipeline is bound which was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then for each color attachment, if the corresponding image view's `format` `features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the corresponding `current value` of `blendEnable` **must** be `VK_FALSE`

- VUID-vkCmdDrawIndexed-None-08644

If a graphics pipeline is bound, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`,

then the `current value` of `rasterizationSamples` **must** be the same as the current color and/or depth/stencil attachments

- VUID-vkCmdDrawIndexed-maxFragmentDualSrcAttachments-09239

If `blending` is enabled for any attachment where either the source or destination blend factors for that attachment `use the secondary color input`, the maximum value of `Location` for any output attachment `statically used` in the `Fragment Execution Model` executed by this command **must** be less than `maxFragmentDualSrcAttachments`

- VUID-vkCmdDrawIndexed-commandBuffer-02712

If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, any resource written to by the `VkPipeline` object bound to the pipeline bind point used by this command **must** not be an unprotected resource

- VUID-vkCmdDrawIndexed-commandBuffer-02713

If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, pipeline stages other than the framebuffer-space and compute stages in the `VkPipeline` object bound to the pipeline bind point used by this command **must** not write to any resource

- VUID-vkCmdDrawIndexed-None-04007

All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** have either valid or [VK_NULL_HANDLE](#) buffers bound

- VUID-vkCmdDrawIndexed-None-04008

If the [nullDescriptor](#) feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** not be [VK_NULL_HANDLE](#)

- VUID-vkCmdDrawIndexed-None-02721

If the [robustBufferAccess](#) feature is not enabled, then for a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in [Vertex Input Description](#)

- VUID-vkCmdDrawIndexed-format-10389

For each vertex attribute accessed by this command, if its [VkVertexInputAttributeDescription::format](#) or [VkVertexInputAttributeDescription2EXT::format](#) is a [packed format](#), the value of [attribAddress](#), calculated as described in [Vertex Input Calculation](#), **must** be a multiple of the [size of the format](#)

- VUID-vkCmdDrawIndexed-format-10390

For each vertex attribute accessed by this command, if its [VkVertexInputAttributeDescription::format](#) or [VkVertexInputAttributeDescription2EXT::format](#) is not a [packed format](#), the value of [attribAddress](#), calculated as described in [Vertex Input Calculation](#), **must** be a multiple of the [component size of the format](#)

- VUID-vkCmdDrawIndexed-None-07842

If the bound graphics pipeline state was created with the [VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY](#) dynamic state enabled then [vkCmdSetPrimitiveTopologyEXT](#) **must** have been called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-dynamicPrimitiveTopologyUnrestricted-07500

If the bound graphics pipeline state was created with the [VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY](#) dynamic state enabled then the [primitiveTopology](#) parameter of [vkCmdSetPrimitiveTopologyEXT](#) **must** be of the same [topology class](#) as the pipeline [VkPipelineInputAssemblyStateCreateInfo::topology](#) state

- VUID-vkCmdDrawIndexed-primitiveTopology-10286

If a [VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT](#) stage is bound, then the [current value](#) of [primitiveTopology](#) **must** be [VK_PRIMITIVE_TOPOLOGY_PATCH_LIST](#) prior to this drawing command

- VUID-vkCmdDrawIndexed-primitiveTopology-10747

If [vkCmdSetPrimitiveTopologyEXT](#) set [primitiveTopology](#) to [VK_PRIMITIVE_TOPOLOGY_PATCH_LIST](#) prior to this drawing command, then a [VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT](#) stage **must** be bound

- VUID-vkCmdDrawIndexed-primitiveTopology-10748

If [vkCmdSetPrimitiveTopologyEXT](#) set [primitiveTopology](#) to [VK_PRIMITIVE_TOPOLOGY_POINT_LIST](#) prior to this drawing command, both a [VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT](#) and [VK_SHADER_STAGE_GEOMETRY_BIT](#) stage are not bound, then the [Vertex Execution Model](#) **must** have a [PointSize](#) decorated variable that

is statically written to

- VUID-vkCmdDrawIndexed-pStrides-04913

If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE` dynamic state enabled, but without the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` **must** not be `NULL`

- VUID-vkCmdDrawIndexed-None-04914

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then `vkCmdSetVertexInputEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this draw command

- VUID-vkCmdDrawIndexed-Input-07939

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then all variables with the `Input` storage class decorated with `Location` in the `Vertex Execution Model OpEntryPoint` **must** contain a location in `VkVertexInputAttributeDescription2EXT::location`

- VUID-vkCmdDrawIndexed-Input-08734

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then the numeric type associated with all `Input` variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` **must** be the same as `VkVertexInputAttributeDescription2EXT::format`

- VUID-vkCmdDrawIndexed-format-08936

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then the scalar width associated with all `Input` variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` **must** be 64-bit

- VUID-vkCmdDrawIndexed-format-08937

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and the scalar width associated with a `Location` decorated `Input` variable in the `Vertex Execution Model OpEntryPoint` is 64-bit, then the corresponding `VkVertexInputAttributeDescription2EXT::format` **must** have a 64-bit component

- VUID-vkCmdDrawIndexed-None-09203

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then all `Input` variables at the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` **must** not use components that are not present in the format

- VUID-vkCmdDrawIndexed-None-04875

If the bound graphics pipeline state was created with both a `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage and the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled, and the `current value`

of `primitiveTopology` is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, then `vkCmdSetPatchControlPointsEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-04879

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-09637

If the `input assembly` is `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`, or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY`, the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` dynamic state enabled, then `vkCmdSetPrimitiveRestartEnableEXT` **must** be `VK_FALSE`

- VUID-vkCmdDrawIndexed-None-10909

If the `input assembly` is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` **must** be `VK_FALSE`

- VUID-vkCmdDrawIndexed-None-07312

A valid index buffer **must** be bound

- VUID-vkCmdDrawIndexed-pNext-09461

If the bound graphics pipeline state was created with `VkPipelineVertexInputDivisorStateCreateInfo` in the `pNext` chain of `VkGraphicsPipelineCreateInfo::pVertexInputState`, any member of `VkPipelineVertexInputDivisorStateCreateInfo::pVertexBindingDivisors` has a value other than `1` in `divisor`, and `VkPhysicalDeviceVertexAttributeDivisorProperties::supportsNonZeroFirstInstance` is `VK_FALSE`, then `firstInstance` **must** be `0`

- VUID-vkCmdDrawIndexed-None-09462

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, any member of the `pVertexBindingDescriptions` parameter to the `vkCmdSetVertexInputEXT` call that sets this dynamic state has a value other than `1` in `divisor`, and `VkPhysicalDeviceVertexAttributeDivisorProperties::supportsNonZeroFirstInstance` is `VK_FALSE`, then `firstInstance` **must** be `0`

- VUID-vkCmdDrawIndexed-robustBufferAccess2-08798

If the `robustBufferAccess2` feature is not enabled, $(indexSize \times (firstIndex + indexCount) + offset)$ **must** be less than or equal to the size of the bound index buffer, with `indexSize` being based on the type specified by `indexType`, where the index buffer, `indexType`, and `offset` are specified via `vkCmdBindIndexBuffer`

Valid Usage (Implicit)

- VUID-vkCmdDrawIndexed-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdDrawIndexed-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdDrawIndexed-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdDrawIndexed-renderpass
This command **must** only be called inside of a render pass instance

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Inside	VK_QUEUE_GRAPHICS_BIT	Action

To record a non-indexed indirect drawing command, call:

```
// Provided by VK_VERSION_1_0
void vkCmdDrawIndirect(
    VkCommandBuffer          commandBuffer,
    VkBuffer                 buffer,
    VkDeviceSize             offset,
    uint32_t                 drawCount,
    uint32_t                 stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `drawCount` is the number of draws to execute, and **can** be zero.
- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndirect` behaves similarly to `vkCmdDraw` except that the parameters are read by the device from a buffer during execution. `drawCount` draws are executed by the command, with parameters taken from `buffer` starting at `offset` and increasing by `stride` bytes for each successive draw. The parameters of each draw are encoded in an array of `VkDrawIndirectCommand` structures. If `drawCount` is less than or equal to one, `stride` is ignored.

Valid Usage

- VUID-vkCmdDrawIndirect-magFilter-04553

If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDrawIndirect-magFilter-09598

If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- VUID-vkCmdDrawIndirect-mipmapMode-04770

If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDrawIndirect-mipmapMode-09599

If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- VUID-vkCmdDrawIndirect-unnormalizedCoordinates-09635

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` **must** be 1

- VUID-vkCmdDrawIndirect-None-08609

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `viewType` **must** be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`

- VUID-vkCmdDrawIndirect-None-08610

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name

- VUID-vkCmdDrawIndirect-None-08611
If a [VkSampler](#) created with [unnormalizedCoordinates](#) equal to [VK_TRUE](#) is used to sample a [VkImageView](#) as a result of this command, then the sampler **must** not be used with any of the SPIR-V [OpImageSample*](#) or [OpImageSparseSample*](#) instructions that includes a LOD bias or any offset values
- VUID-vkCmdDrawIndirect-aspectMask-06478
If a [VkImageView](#) is sampled with [depth comparison](#), the image view **must** have been created with an [aspectMask](#) that contains [VK_IMAGE_ASPECT_DEPTH_BIT](#)
- VUID-vkCmdDrawIndirect-None-02691
If a [VkImageView](#) is accessed using atomic operations as a result of this command, then the image view's [format](#) [features](#) **must** contain [VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT](#)
- VUID-vkCmdDrawIndirect-None-07888
If a [VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER](#) descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's [format](#) [features](#) **must** contain [VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT](#)
- VUID-vkCmdDrawIndirect-None-02692
If a [VkImageView](#) is sampled with [VK_FILTER_CUBIC_EXT](#) as a result of this command, then the image view's [format](#) [features](#) **must** contain [VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT](#)
- VUID-vkCmdDrawIndirect-None-02693
If the [VK_EXT_filter_cubic](#) extension is not enabled and any [VkImageView](#) is sampled with [VK_FILTER_CUBIC_EXT](#) as a result of this command, it **must** not have a [VkImageViewType](#) of [VK_IMAGE_VIEW_TYPE_3D](#), [VK_IMAGE_VIEW_TYPE_CUBE](#), or [VK_IMAGE_VIEW_TYPE_CUBE_ARRAY](#)
- VUID-vkCmdDrawIndirect-filterCubic-02694
Any [VkImageView](#) being sampled with [VK_FILTER_CUBIC_EXT](#) as a result of this command **must** have a [VkImageViewType](#) and format that supports cubic filtering, as specified by [VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic](#) returned by [vkGetPhysicalDeviceImageFormatProperties2](#)
- VUID-vkCmdDrawIndirect-filterCubicMinmax-02695
Any [VkImageView](#) being sampled with [VK_FILTER_CUBIC_EXT](#) with a reduction mode of either [VK_SAMPLER_REDUCTION_MODE_MIN](#) or [VK_SAMPLER_REDUCTION_MODE_MAX](#) as a result of this command **must** have a [VkImageViewType](#) and format that supports cubic filtering together with minmax filtering, as specified by [VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax](#) returned by [vkGetPhysicalDeviceImageFormatProperties2](#)
- VUID-vkCmdDrawIndirect-None-08600
For each set *n* that is statically used by a [bound shader](#), a descriptor set **must** have been bound to *n* at the same pipeline bind point, with a [VkPipelineLayout](#) that is compatible for set *n*, with the [VkPipelineLayout](#) used to create the current [VkPipeline](#) , as described in [Pipeline Layout Compatibility](#)
- VUID-vkCmdDrawIndirect-None-08601
For each push constant that is statically used by a [bound shader](#), a push constant value **must** have been set for the same pipeline bind point, with a [VkPipelineLayout](#) that is

compatible for push constants, with the [VkPipelineLayout](#) used to create the current [VkPipeline](#) , as described in [Pipeline Layout Compatibility](#)

- VUID-vkCmdDrawIndirect-None-10068

For each array of resources that is used by a [bound shader](#), the indices used to access members of the array **must** be less than the descriptor count for the identified binding in the descriptor sets used by this command

- VUID-vkCmdDrawIndirect-None-08114

Descriptors in each bound descriptor set, specified via [vkCmdBindDescriptorSets](#), **must** be valid as described by [descriptor validity](#) if they are statically used by a [bound shader](#)

- VUID-vkCmdDrawIndirect-imageLayout-00344

If an image descriptor is accessed by a shader, the [VkImageLayout](#) **must** match the subresource accessible from the [VkImageView](#) as defined by the [image layout matching rules](#)

- VUID-vkCmdDrawIndirect-None-08606

A valid pipeline **must** be bound to the pipeline bind point used by this command

- VUID-vkCmdDrawIndirect-None-08608

There **must** not have been any calls to dynamic state setting commands for any state specified statically in the [VkPipeline](#) object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdDrawIndirect-uniformBuffers-06935

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a uniform buffer, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawIndirect-storageBuffers-06936

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a storage buffer, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawIndirect-commandBuffer-02707

If [commandBuffer](#) is an unprotected command buffer and [protectedNoFault](#) is not supported, any resource accessed by [bound shaders](#) **must** not be a protected resource

- VUID-vkCmdDrawIndirect-viewType-07752

If a [VkImageView](#) is accessed as a result of this command, then the image view's [viewType](#) **must** match the [Dim](#) operand of the [OpTypeImage](#) as described in [Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types](#)

- VUID-vkCmdDrawIndirect-format-07753

If a [VkImageView](#) or [VkBufferView](#) is accessed as a result of this command, then the [numeric type](#) of the view's [format](#) and the [Sampled Type](#) operand of the [OpTypeImage](#) **must** match

- VUID-vkCmdDrawIndirect-OpImageWrite-08795

If a [VkImageView](#) is accessed using [OpImageWrite](#) as a result of this command, then the [Type](#) of the [Texel](#) operand of that instruction **must** have at least as many components as

the image view's format

- VUID-vkCmdDrawIndirect-OpImageWrite-04469

If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view's format

- VUID-vkCmdDrawIndirect-SampledType-04470

If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64

- VUID-vkCmdDrawIndirect-SampledType-04471

If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- VUID-vkCmdDrawIndirect-SampledType-04472

If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64

- VUID-vkCmdDrawIndirect-SampledType-04473

If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- VUID-vkCmdDrawIndirect-sparseImageInt64Atomics-04474

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdDrawIndirect-sparseImageInt64Atomics-04475

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdDrawIndirect-None-07288

Any shader invocation executed by this command **must** `terminate`

- VUID-vkCmdDrawIndirect-None-09600

If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, all image subresources identified by that descriptor **must** be in the image layout identified when the descriptor was written

- VUID-vkCmdDrawIndirect-renderPass-02684

The current render pass **must** be `compatible` with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- VUID-vkCmdDrawIndirect-subpass-02685

The subpass index of the current render pass **must** be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to

VK_PIPELINE_BIND_POINT_GRAPHICS

- VUID-vkCmdDrawIndirect-None-07748

If any shader statically accesses an input attachment, a valid descriptor **must** be bound to the pipeline via a descriptor set

- VUID-vkCmdDrawIndirect-OpTypeImage-07468

If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it **must** be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass

- VUID-vkCmdDrawIndirect-None-07469

Input attachment views accessed in a subpass **must** be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImageView` that is compatible with the attachment referenced by the subpass' `pInputAttachments[InputAttachmentIndex]` in the bound `VkFramebuffer` as specified by [Fragment Input Attachment Compatibility](#)

- VUID-vkCmdDrawIndirect-None-06537

Memory backing image subresources used as attachments in the current render pass **must** not be written in any way other than as an attachment by this command

- VUID-vkCmdDrawIndirect-None-10795

If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass,

it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawIndirect-None-10796

If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass,

it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawIndirect-None-10797

If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass,

it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawIndirect-None-06539

If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command **must** not write to that image subresource as an attachment

- VUID-vkCmdDrawIndirect-None-06886

If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, `depth writes` **must** be disabled

- VUID-vkCmdDrawIndirect-None-06887

If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back `writeMask` are not zero, and stencil test is enabled, `all stencil ops` **must** be `VK_STENCIL_OP_KEEP`

- VUID-vkCmdDrawIndirect-None-07831
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT` dynamic state enabled then `vkCmdSetViewport` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawIndirect-None-07832
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR` dynamic state enabled then `vkCmdSetScissor` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawIndirect-None-08617
If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LINE_WIDTH` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `effective rasterization input topology` is in line topology class, then `vkCmdSetLineWidth` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawIndirect-None-07834
If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `depthBiasEnable` is `VK_TRUE`, then `vkCmdSetDepthBias` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawIndirect-None-07835
If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_BLEND_CONSTANTS` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and an active color attachment `current value` of `blendEnable` is `VK_TRUE` with a blend equations where any `VkBlendFactor` member is `VK_BLEND_FACTOR_CONSTANT_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR`, `VK_BLEND_FACTOR_CONSTANT_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`, then `vkCmdSetBlendConstants` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawIndirect-None-07836
If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `depthBoundsTestEnable` is `VK_TRUE`, then `vkCmdSetDepthBounds` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawIndirect-None-07837
If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilCompareMask` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawIndirect-None-07838
If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `stencilTestEnable` is `VK_TRUE`,

then `vkCmdSetStencilWriteMask` **must** have been called and not subsequently *invalidated* in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-07839

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_REFERENCE` dynamic state enabled, the *current value* of `rasterizerDiscardEnable` is `VK_FALSE`, the *current value* of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilReference` **must** have been called and not subsequently *invalidated* in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-maxMultiviewInstanceIndex-02688

If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`

- VUID-vkCmdDrawIndirect-sampleLocationsEnable-02689

If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE`, then the active depth attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set

- VUID-vkCmdDrawIndirect-None-06666

If the `VK_EXT_sample_locations` extension is enabled, a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` dynamic state enabled, the *current value* of `rasterizerDiscardEnable` is `VK_FALSE`, and the *current value* of `sampleLocationsEnable` is `VK_TRUE`, then `vkCmdSetSampleLocationsEXT` **must** have been called and not subsequently *invalidated* in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-07840

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_CULL_MODE` dynamic state enabled, and the *current value* of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetCullModeEXT` **must** have been called and not subsequently *invalidated* in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-07841

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_FRONT_FACE` dynamic state enabled, and the *current value* of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetFrontFaceEXT` **must** have been called and not subsequently *invalidated* in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-07843

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` dynamic state enabled, and the *current value* of `rasterizerDiscardEnable` is `VK_FALSE`, `vkCmdSetDepthTestEnableEXT` **must** have been called and not subsequently *invalidated* in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-07844

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` dynamic state enabled, and the *current value* of `rasterizerDiscardEnable` is `VK_FALSE`, and the *current value* of `depthTestEnable` is `VK_TRUE`, then `vkCmdSetDepthWriteEnableEXT` **must** have been called and not subsequently

invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-07845

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, and the **current value** of `depthTestEnable` is `VK_TRUE`, then `vkCmdSetDepthCompareOpEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-07846

If the `depthBounds` feature is enabled, a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state enabled, and the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthBoundsTestEnableEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-07847

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled, and the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetStencilTestEnableEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-07848

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_OP` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, the **current value** of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilOpEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-viewportCount-03417

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCountEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-scissorCount-03418

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCountEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing

- VUID-vkCmdDrawIndirect-viewportCount-03419

If a graphics pipeline is bound which was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled, then the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` **must** match the `scissorCount` parameter of `vkCmdSetScissorWithCountEXT`

- VUID-vkCmdDrawIndirect-None-04876

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled, then `vkCmdSetRasterizerDiscardEnableEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-04877

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthBiasEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-logicOp-04878

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `logicOpEnable` is `VK_TRUE`, then `vkCmdSetLogicOpEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-primitiveFragmentShadingRateWithMultipleViewports-04552

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCountEXT` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` **must** be 1

- VUID-vkCmdDrawIndirect-blendEnable-04727

If a graphics pipeline is bound which was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then for each color attachment, if the corresponding image view's `format` `features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the corresponding `current value` of `blendEnable` **must** be `VK_FALSE`

- VUID-vkCmdDrawIndirect-None-08644

If a graphics pipeline is bound, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then the `current value` of `rasterizationSamples` **must** be the same as the current color and/or depth/stencil attachments

- VUID-vkCmdDrawIndirect-maxFragmentDualSrcAttachments-09239

If `blending` is enabled for any attachment where either the source or destination blend factors for that attachment `use the secondary color input`, the maximum value of `Location` for any output attachment `statically used` in the `Fragment Execution Model` executed by this command **must** be less than `maxFragmentDualSrcAttachments`

- VUID-vkCmdDrawIndirect-None-04007

All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** have either valid or `VK_NULL_HANDLE` buffers bound

- VUID-vkCmdDrawIndirect-None-04008

If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** not be `VK_NULL_HANDLE`

- VUID-vkCmdDrawIndirect-None-02721
If the `robustBufferAccess` feature is not enabled, then for a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in [Vertex Input Description](#)
- VUID-vkCmdDrawIndirect-format-10389
For each vertex attribute accessed by this command, if its `VkVertexInputAttributeDescription::format` or `VkVertexInputAttributeDescription2EXT::format` is a `packed format`, the value of `attribAddress`, calculated as described in [Vertex Input Calculation](#), **must** be a multiple of the `size of the format`
- VUID-vkCmdDrawIndirect-format-10390
For each vertex attribute accessed by this command, if its `VkVertexInputAttributeDescription::format` or `VkVertexInputAttributeDescription2EXT::format` is not a `packed format`, the value of `attribAddress`, calculated as described in [Vertex Input Calculation](#), **must** be a multiple of the `component size of the format`
- VUID-vkCmdDrawIndirect-None-07842
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawIndirect-dynamicPrimitiveTopologyUnrestricted-07500
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state enabled then the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` **must** be of the same `topology class` as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state
- VUID-vkCmdDrawIndirect-primitiveTopology-10286
If a `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage is bound, then the `current value` of `primitiveTopology` **must** be `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST` prior to this drawing command
- VUID-vkCmdDrawIndirect-primitiveTopology-10747
If `vkCmdSetPrimitiveTopologyEXT` set `primitiveTopology` to `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST` prior to this drawing command, then a `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage **must** be bound
- VUID-vkCmdDrawIndirect-primitiveTopology-10748
If `vkCmdSetPrimitiveTopologyEXT` set `primitiveTopology` to `VK_PRIMITIVE_TOPOLOGY_POINT_LIST` prior to this drawing command, both a `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` and `VK_SHADER_STAGE_GEOMETRY_BIT` stage are not bound, then the `Vertex Execution Model` **must** have a `PointSize` decorated variable that is statically written to
- VUID-vkCmdDrawIndirect-pStrides-04913
If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE` dynamic state enabled, but without the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` **must** not be `NULL`

- VUID-vkCmdDrawIndirect-None-04914
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then `vkCmdSetVertexInputEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this draw command
- VUID-vkCmdDrawIndirect-Input-07939
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then all variables with the `Input` storage class decorated with `Location` in the `Vertex Execution Model OpEntryPoint` **must** contain a location in `VkVertexInputAttributeDescription2EXT::location`
- VUID-vkCmdDrawIndirect-Input-08734
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then the numeric type associated with all `Input` variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` **must** be the same as `VkVertexInputAttributeDescription2EXT::format`
- VUID-vkCmdDrawIndirect-format-08936
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then the scalar width associated with all `Input` variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` **must** be 64-bit
- VUID-vkCmdDrawIndirect-format-08937
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and the scalar width associated with a `Location` decorated `Input` variable in the `Vertex Execution Model OpEntryPoint` is 64-bit, then the corresponding `VkVertexInputAttributeDescription2EXT::format` **must** have a 64-bit component
- VUID-vkCmdDrawIndirect-None-09203
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then all `Input` variables at the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` **must** not use components that are not present in the format
- VUID-vkCmdDrawIndirect-None-04875
If the bound graphics pipeline state was created with both a `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage and the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled, and the `current value` of `primitiveTopology` is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, then `vkCmdSetPatchControlPointsEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawIndirect-None-04879
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-09637
If the **input assembly** is **VK_PRIMITIVE_TOPOLOGY_POINT_LIST**, **VK_PRIMITIVE_TOPOLOGY_LINE_LIST**, **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST**, **VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY**, or **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY**, the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE** dynamic state enabled, then **vkCmdSetPrimitiveRestartEnableEXT** **must** be **VK_FALSE**
- VUID-vkCmdDrawIndirect-None-10909
If the **input assembly** is **VK_PRIMITIVE_TOPOLOGY_PATCH_LIST**, the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE** dynamic state enabled then **vkCmdSetPrimitiveRestartEnableEXT** **must** be **VK_FALSE**
- VUID-vkCmdDrawIndirect-buffer-02708
If **buffer** is non-sparse then it **must** be bound completely and contiguously to a single **VkDeviceMemory** object
- VUID-vkCmdDrawIndirect-buffer-02709
buffer **must** have been created with the **VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT** bit set
- VUID-vkCmdDrawIndirect-offset-02710
offset **must** be a multiple of 4
- VUID-vkCmdDrawIndirect-commandBuffer-02711
commandBuffer **must** not be a protected command buffer
- VUID-vkCmdDrawIndirect-drawCount-02718
If the **multiDrawIndirect** feature is not enabled, **drawCount** **must** be 0 or 1
- VUID-vkCmdDrawIndirect-drawCount-02719
drawCount **must** be less than or equal to **VkPhysicalDeviceLimits::maxDrawIndirectCount**
- VUID-vkCmdDrawIndirect-drawCount-00476
If **drawCount** is greater than 1, **stride** **must** be a multiple of 4 and **must** be greater than or equal to **sizeof(VkDrawIndirectCommand)**
- VUID-vkCmdDrawIndirect-drawCount-00487
If **drawCount** is equal to 1, (**offset** + **sizeof(VkDrawIndirectCommand)**) **must** be less than or equal to the size of **buffer**
- VUID-vkCmdDrawIndirect-drawCount-00488
If **drawCount** is greater than 1, (**stride** × (**drawCount** - 1) + **offset** + **sizeof(VkDrawIndirectCommand)**) **must** be less than or equal to the size of **buffer**

Valid Usage (Implicit)

- VUID-vkCmdDrawIndirect-commandBuffer-parameter
commandBuffer **must** be a valid **VkCommandBuffer** handle
- VUID-vkCmdDrawIndirect-buffer-parameter
buffer **must** be a valid **VkBuffer** handle
- VUID-vkCmdDrawIndirect-commandBuffer-recording

`commandBuffer` **must** be in the `recording` state

- VUID-vkCmdDrawIndirect-commandBuffer-cmdpool

The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

- VUID-vkCmdDrawIndirect-renderpass

This command **must** only be called inside of a render pass instance

- VUID-vkCmdDrawIndirect-commonparent

Both of `buffer`, and `commandBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Inside	VK_QUEUE_GRAPHICS_BIT	Action

The `VkDrawIndirectCommand` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkDrawIndirectCommand {
    uint32_t    vertexCount;
    uint32_t    instanceCount;
    uint32_t    firstVertex;
    uint32_t    firstInstance;
} VkDrawIndirectCommand;
```

- `vertexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstVertex` is the index of the first vertex to draw.
- `firstInstance` is the instance ID of the first instance to draw.

The members of `VkDrawIndirectCommand` have the same meaning as the similarly named parameters of `vkCmdDraw`.

Valid Usage

- VUID-VkDrawIndirectCommand-pNext-09461

If the bound graphics pipeline state was created with `VkPipelineVertexInputDivisorStateCreateInfo` in the `pNext` chain of `VkGraphicsPipelineCreateInfo::pVertexInputState`, any member of `VkPipelineVertexInputDivisorStateCreateInfo::pVertexBindingDivisors` has a value other than `1` in `divisor`, and `VkPhysicalDeviceVertexAttributeDivisorProperties::supportsNonZeroFirstInstance` is `VK_FALSE`, then `firstInstance` **must** be `0`

- VUID-VkDrawIndirectCommand-None-09462

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, any member of the `pVertexBindingDescriptions` parameter to the `vkCmdSetVertexInputEXT` call that sets this dynamic state has a value other than `1` in `divisor`, and `VkPhysicalDeviceVertexAttributeDivisorProperties::supportsNonZeroFirstInstance` is `VK_FALSE`, then `firstInstance` **must** be `0`

- VUID-VkDrawIndirectCommand-firstInstance-00501

If the `drawIndirectFirstInstance` feature is not enabled, `firstInstance` **must** be `0`

To record a non-indexed draw call with a draw call count sourced from a buffer, call:

```
// Provided by VK_VERSION_1_2
void vkCmdDrawIndirectCount(
    VkCommandBuffer          commandBuffer,
    VkBuffer                  buffer,
    VkDeviceSize              offset,
    VkBuffer                  countBuffer,
    VkDeviceSize              countBufferOffset,
    uint32_t                  maxDrawCount,
    uint32_t                  stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `countBuffer` is the buffer containing the draw count.
- `countBufferOffset` is the byte offset into `countBuffer` where the draw count begins.
- `maxDrawCount` specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in `countBuffer` and `maxDrawCount`.
- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndirectCount` behaves similarly to `vkCmdDrawIndirect` except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from `countBuffer` located at `countBufferOffset` and use this as the draw count.

Valid Usage

- VUID-vkCmdDrawIndirectCount-magFilter-04553

If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDrawIndirectCount-magFilter-09598

If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- VUID-vkCmdDrawIndirectCount-mipmapMode-04770

If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDrawIndirectCount-mipmapMode-09599

If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- VUID-vkCmdDrawIndirectCount-unnormalizedCoordinates-09635

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` **must** be 1

- VUID-vkCmdDrawIndirectCount-None-08609

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `viewType` **must** be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`

- VUID-vkCmdDrawIndirectCount-None-08610

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name

- VUID-vkCmdDrawIndirectCount-None-08611

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values

- VUID-vkCmdDrawIndirectCount-aspectMask-06478
If a [VkImageView](#) is sampled with [depth comparison](#), the image view **must** have been created with an [aspectMask](#) that contains [VK_IMAGE_ASPECT_DEPTH_BIT](#)
- VUID-vkCmdDrawIndirectCount-None-02691
If a [VkImageView](#) is accessed using atomic operations as a result of this command, then the image view's [format](#) [features](#) **must** contain [VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT](#)
- VUID-vkCmdDrawIndirectCount-None-07888
If a [VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER](#) descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's [format](#) [features](#) **must** contain [VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT](#)
- VUID-vkCmdDrawIndirectCount-None-02692
If a [VkImageView](#) is sampled with [VK_FILTER_CUBIC_EXT](#) as a result of this command, then the image view's [format](#) [features](#) **must** contain [VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT](#)
- VUID-vkCmdDrawIndirectCount-None-02693
If the [VK_EXT_filter_cubic](#) extension is not enabled and any [VkImageView](#) is sampled with [VK_FILTER_CUBIC_EXT](#) as a result of this command, it **must** not have a [VkImageViewType](#) of [VK_IMAGE_VIEW_TYPE_3D](#), [VK_IMAGE_VIEW_TYPE_CUBE](#), or [VK_IMAGE_VIEW_TYPE_CUBE_ARRAY](#)
- VUID-vkCmdDrawIndirectCount-filterCubic-02694
Any [VkImageView](#) being sampled with [VK_FILTER_CUBIC_EXT](#) as a result of this command **must** have a [VkImageViewType](#) and format that supports cubic filtering, as specified by [VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic](#) returned by [vkGetPhysicalDeviceImageFormatProperties2](#)
- VUID-vkCmdDrawIndirectCount-filterCubicMinmax-02695
Any [VkImageView](#) being sampled with [VK_FILTER_CUBIC_EXT](#) with a reduction mode of either [VK_SAMPLER_REDUCTION_MODE_MIN](#) or [VK_SAMPLER_REDUCTION_MODE_MAX](#) as a result of this command **must** have a [VkImageViewType](#) and format that supports cubic filtering together with minmax filtering, as specified by [VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax](#) returned by [vkGetPhysicalDeviceImageFormatProperties2](#)
- VUID-vkCmdDrawIndirectCount-None-08600
For each set *n* that is statically used by a [bound shader](#), a descriptor set **must** have been bound to *n* at the same pipeline bind point, with a [VkPipelineLayout](#) that is compatible for set *n*, with the [VkPipelineLayout](#) used to create the current [VkPipeline](#) , as described in [Pipeline Layout Compatibility](#)
- VUID-vkCmdDrawIndirectCount-None-08601
For each push constant that is statically used by a [bound shader](#), a push constant value **must** have been set for the same pipeline bind point, with a [VkPipelineLayout](#) that is compatible for push constants, with the [VkPipelineLayout](#) used to create the current [VkPipeline](#) , as described in [Pipeline Layout Compatibility](#)
- VUID-vkCmdDrawIndirectCount-None-10068
For each array of resources that is used by a [bound shader](#), the indices used to access members of the array **must** be less than the descriptor count for the identified binding in

the descriptor sets used by this command

- VUID-vkCmdDrawIndirectCount-None-08114

Descriptors in each bound descriptor set, specified via [vkCmdBindDescriptorSets](#), **must** be valid as described by [descriptor validity](#) if they are statically used by a [bound shader](#)

- VUID-vkCmdDrawIndirectCount-imageLayout-00344

If an image descriptor is accessed by a shader, the [VkImageLayout](#) **must** match the subresource accessible from the [VkImageView](#) as defined by the [image layout matching rules](#)

- VUID-vkCmdDrawIndirectCount-None-08606

A valid pipeline **must** be bound to the pipeline bind point used by this command

- VUID-vkCmdDrawIndirectCount-None-08608

There **must** not have been any calls to dynamic state setting commands for any state specified statically in the [VkPipeline](#) object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdDrawIndirectCount-uniformBuffers-06935

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a uniform buffer, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawIndirectCount-storageBuffers-06936

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a storage buffer, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawIndirectCount-commandBuffer-02707

If [commandBuffer](#) is an unprotected command buffer and [protectedNoFault](#) is not supported, any resource accessed by [bound shaders](#) **must** not be a protected resource

- VUID-vkCmdDrawIndirectCount-viewType-07752

If a [VkImageView](#) is accessed as a result of this command, then the image view's [viewType](#) **must** match the [Dim](#) operand of the [OpTypeImage](#) as described in [Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types](#)

- VUID-vkCmdDrawIndirectCount-format-07753

If a [VkImageView](#) or [VkBufferView](#) is accessed as a result of this command, then the [numeric type](#) of the view's [format](#) and the [Sampled Type](#) operand of the [OpTypeImage](#) **must** match

- VUID-vkCmdDrawIndirectCount-OpImageWrite-08795

If a [VkImageView](#) is accessed using [OpImageWrite](#) as a result of this command, then the [Type](#) of the [Texel](#) operand of that instruction **must** have at least as many components as the image view's format

- VUID-vkCmdDrawIndirectCount-OpImageWrite-04469

If a [VkBufferView](#) is accessed using [OpImageWrite](#) as a result of this command, then the [Type](#) of the [Texel](#) operand of that instruction **must** have at least as many components as the buffer view's format

- VUID-vkCmdDrawIndirectCount-SampledType-04470
If a [VkImageView](#) with a [VkFormat](#) that has a 64-bit component width is accessed as a result of this command, the [SampledType](#) of the [OpTypeImage](#) operand of that instruction **must** have a [Width](#) of 64
- VUID-vkCmdDrawIndirectCount-SampledType-04471
If a [VkImageView](#) with a [VkFormat](#) that has a component width less than 64-bit is accessed as a result of this command, the [SampledType](#) of the [OpTypeImage](#) operand of that instruction **must** have a [Width](#) of 32
- VUID-vkCmdDrawIndirectCount-SampledType-04472
If a [VkBufferView](#) with a [VkFormat](#) that has a 64-bit component width is accessed as a result of this command, the [SampledType](#) of the [OpTypeImage](#) operand of that instruction **must** have a [Width](#) of 64
- VUID-vkCmdDrawIndirectCount-SampledType-04473
If a [VkBufferView](#) with a [VkFormat](#) that has a component width less than 64-bit is accessed as a result of this command, the [SampledType](#) of the [OpTypeImage](#) operand of that instruction **must** have a [Width](#) of 32
- VUID-vkCmdDrawIndirectCount-sparseImageInt64Atomics-04474
If the [sparseImageInt64Atomics](#) feature is not enabled, [VkImage](#) objects created with the [VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT](#) flag **must** not be accessed by atomic instructions through an [OpTypeImage](#) with a [SampledType](#) with a [Width](#) of 64 by this command
- VUID-vkCmdDrawIndirectCount-sparseImageInt64Atomics-04475
If the [sparseImageInt64Atomics](#) feature is not enabled, [VkBuffer](#) objects created with the [VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT](#) flag **must** not be accessed by atomic instructions through an [OpTypeImage](#) with a [SampledType](#) with a [Width](#) of 64 by this command
- VUID-vkCmdDrawIndirectCount-None-07288
Any shader invocation executed by this command **must** [terminate](#)
- VUID-vkCmdDrawIndirectCount-None-09600
If a descriptor with type equal to any of [VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE](#), [VK_DESCRIPTOR_TYPE_STORAGE_IMAGE](#), or [VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT](#) is accessed as a result of this command, all image subresources identified by that descriptor **must** be in the image layout identified when the descriptor was written
- VUID-vkCmdDrawIndirectCount-renderPass-02684
The current render pass **must** be [compatible](#) with the [renderPass](#) member of the [VkGraphicsPipelineCreateInfo](#) structure specified when creating the [VkPipeline](#) bound to [VK_PIPELINE_BIND_POINT_GRAPHICS](#)
- VUID-vkCmdDrawIndirectCount-subpass-02685
The subpass index of the current render pass **must** be equal to the [subpass](#) member of the [VkGraphicsPipelineCreateInfo](#) structure specified when creating the [VkPipeline](#) bound to [VK_PIPELINE_BIND_POINT_GRAPHICS](#)
- VUID-vkCmdDrawIndirectCount-None-07748
If any shader statically accesses an input attachment, a valid descriptor **must** be bound to the pipeline via a descriptor set
- VUID-vkCmdDrawIndirectCount-OpTypeImage-07468

If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it **must** be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass

- VUID-vkCmdDrawIndirectCount-None-07469

Input attachment views accessed in a subpass **must** be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImageView` that is compatible with the attachment referenced by the subpass' `pInputAttachments` [`InputAttachmentIndex`] in the bound `VkFramebuffer` as specified by [Fragment Input Attachment Compatibility](#)

- VUID-vkCmdDrawIndirectCount-None-06537

Memory backing image subresources used as attachments in the current render pass **must** not be written in any way other than as an attachment by this command

- VUID-vkCmdDrawIndirectCount-None-10795

If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass,

it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawIndirectCount-None-10796

If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass,

it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawIndirectCount-None-10797

If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass,

it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawIndirectCount-None-06539

If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command **must** not write to that image subresource as an attachment

- VUID-vkCmdDrawIndirectCount-None-06886

If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, [depth writes](#) **must** be disabled

- VUID-vkCmdDrawIndirectCount-None-06887

If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back `writeMask` are not zero, and stencil test is enabled, [all stencil ops](#) **must** be `VK_STENCIL_OP_KEEP`

- VUID-vkCmdDrawIndirectCount-None-07831

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT` dynamic state enabled then `vkCmdSetViewport` **must** have been called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07832

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR` dynamic state enabled then `vkCmdSetScissor` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-08617

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LINE_WIDTH` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `effective rasterization input topology` is in line topology class, then `vkCmdSetLineWidth` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07834

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `depthBiasEnable` is `VK_TRUE`, then `vkCmdSetDepthBias` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07835

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_BLEND_CONSTANTS` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and an active color attachment `current value` of `blendEnable` is `VK_TRUE` with a blend equations where any `VkBlendFactor` member is `VK_BLEND_FACTOR_CONSTANT_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR`, `VK_BLEND_FACTOR_CONSTANT_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`, then `vkCmdSetBlendConstants` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07836

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `depthBoundsTestEnable` is `VK_TRUE`, then `vkCmdSetDepthBounds` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07837

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilCompareMask` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07838

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilWriteMask` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07839

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_REFERENCE` dynamic state enabled, the `current value` of and

`rasterizerDiscardEnable` is `VK_FALSE`, the `current value` of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilReference` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-maxMultiviewInstanceIndex-02688

If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`

- VUID-vkCmdDrawIndirectCount-sampleLocationsEnable-02689

If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE`, then the active depth attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set

- VUID-vkCmdDrawIndirectCount-None-06666

If the `VK_EXT_sample_locations` extension is enabled, a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `sampleLocationsEnable` is `VK_TRUE`, then `vkCmdSetSampleLocationsEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07840

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_CULL_MODE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetCullModeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07841

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_FRONT_FACE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetFrontFaceEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07843

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, `vkCmdSetDepthTestEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07844

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `depthTestEnable` is `VK_TRUE`, then `vkCmdSetDepthWriteEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07845

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `depthTestEnable` is `VK_TRUE`,

then `vkCmdSetDepthCompareOpEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07846

If the `depthBounds` feature is enabled, a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthBoundsTestEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07847

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetStencilTestEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07848

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_OP` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, the `current value` of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilOpEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-viewportCount-03417

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCountEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-scissorCount-03418

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCountEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing

- VUID-vkCmdDrawIndirectCount-viewportCount-03419

If a graphics pipeline is bound which was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled, then the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` **must** match the `scissorCount` parameter of `vkCmdSetScissorWithCountEXT`

- VUID-vkCmdDrawIndirectCount-None-04876

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled, then `vkCmdSetRasterizerDiscardEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-04877

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthBiasEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this

drawing command

- VUID-vkCmdDrawIndirectCount-logicOp-04878

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, and the **current value** of `logicOpEnable` is `VK_TRUE`, then `vkCmdSetLogicOpEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-primitiveFragmentShadingRateWithMultipleViewports-04552

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCountEXT` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` **must** be 1

- VUID-vkCmdDrawIndirectCount-blendEnable-04727

If a graphics pipeline is bound which was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then for each color attachment, if the corresponding image view's **format features** do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the corresponding **current value** of `blendEnable` **must** be `VK_FALSE`

- VUID-vkCmdDrawIndirectCount-None-08644

If a graphics pipeline is bound, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`,

then the **current value** of `rasterizationSamples` **must** be the same as the current color and/or depth/stencil attachments

- VUID-vkCmdDrawIndirectCount-maxFragmentDualSrcAttachments-09239

If **blending** is enabled for any attachment where either the source or destination blend factors for that attachment **use the secondary color input**, the maximum value of `Location` for any output attachment **statically used** in the `Fragment Execution Model` executed by this command **must** be less than `maxFragmentDualSrcAttachments`

- VUID-vkCmdDrawIndirectCount-None-04007

All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** have either valid or `VK_NULL_HANDLE` buffers bound

- VUID-vkCmdDrawIndirectCount-None-04008

If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** not be `VK_NULL_HANDLE`

- VUID-vkCmdDrawIndirectCount-None-02721

If the `robustBufferAccess` feature is not enabled, then for a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in [Vertex Input Description](#)

- VUID-vkCmdDrawIndirectCount-format-10389
For each vertex attribute accessed by this command, if its `VkVertexInputAttributeDescription::format` or `VkVertexInputAttributeDescription2EXT::format` is a **packed format**, the value of `attribAddress`, calculated as described in **Vertex Input Calculation**, **must** be a multiple of the **size of the format**
- VUID-vkCmdDrawIndirectCount-format-10390
For each vertex attribute accessed by this command, if its `VkVertexInputAttributeDescription::format` or `VkVertexInputAttributeDescription2EXT::format` is not a **packed format**, the value of `attribAddress`, calculated as described in **Vertex Input Calculation**, **must** be a multiple of the **component size of the format**
- VUID-vkCmdDrawIndirectCount-None-07842
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command
- VUID-vkCmdDrawIndirectCount-dynamicPrimitiveTopologyUnrestricted-07500
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state enabled then the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` **must** be of the same **topology class** as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state
- VUID-vkCmdDrawIndirectCount-primitiveTopology-10286
If a `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage is bound, then the **current value** of `primitiveTopology` **must** be `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST` prior to this drawing command
- VUID-vkCmdDrawIndirectCount-primitiveTopology-10747
If `vkCmdSetPrimitiveTopologyEXT` set `primitiveTopology` to `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST` prior to this drawing command, then a `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage **must** be bound
- VUID-vkCmdDrawIndirectCount-primitiveTopology-10748
If `vkCmdSetPrimitiveTopologyEXT` set `primitiveTopology` to `VK_PRIMITIVE_TOPOLOGY_POINT_LIST` prior to this drawing command, both a `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` and `VK_SHADER_STAGE_GEOMETRY_BIT` stage are not bound, then the **Vertex Execution Model** **must** have a **PointSize** decorated variable that is statically written to
- VUID-vkCmdDrawIndirectCount-pStrides-04913
If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE` dynamic state enabled, but without the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` **must** not be `NULL`
- VUID-vkCmdDrawIndirectCount-None-04914
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then `vkCmdSetVertexInputEXT` **must** have been called and not subsequently **invalidated** in the current command buffer

prior to this draw command

- VUID-vkCmdDrawIndirectCount-Input-07939

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then all variables with the `Input` storage class decorated with `Location` in the `Vertex Execution Model OpEntryPoint` **must** contain a location in `VkVertexInputAttributeDescription2EXT::location`

- VUID-vkCmdDrawIndirectCount-Input-08734

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then the numeric type associated with all `Input` variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` **must** be the same as `VkVertexInputAttributeDescription2EXT::format`

- VUID-vkCmdDrawIndirectCount-format-08936

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then the scalar width associated with all `Input` variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` **must** be 64-bit

- VUID-vkCmdDrawIndirectCount-format-08937

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and the scalar width associated with a `Location` decorated `Input` variable in the `Vertex Execution Model OpEntryPoint` is 64-bit, then the corresponding `VkVertexInputAttributeDescription2EXT::format` **must** have a 64-bit component

- VUID-vkCmdDrawIndirectCount-None-09203

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then all `Input` variables at the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` **must** not use components that are not present in the format

- VUID-vkCmdDrawIndirectCount-None-04875

If the bound graphics pipeline state was created with both a `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage and the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled, and the `current value` of `primitiveTopology` is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, then `vkCmdSetPatchControlPointsEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-04879

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-09637

If the `input assembly` is `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`, or

`VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY`, the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` dynamic state enabled, then `vkCmdSetPrimitiveRestartEnableEXT` **must** be `VK_FALSE`

- VUID-vkCmdDrawIndirectCount-None-10909

If the `input assembly` is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` **must** be `VK_FALSE`

- VUID-vkCmdDrawIndirectCount-buffer-02708

If `buffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdDrawIndirectCount-buffer-02709

`buffer` **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set

- VUID-vkCmdDrawIndirectCount-offset-02710

`offset` **must** be a multiple of 4

- VUID-vkCmdDrawIndirectCount-commandBuffer-02711

`commandBuffer` **must** not be a protected command buffer

- VUID-vkCmdDrawIndirectCount-countBuffer-02714

If `countBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdDrawIndirectCount-countBuffer-02715

`countBuffer` **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set

- VUID-vkCmdDrawIndirectCount-countBufferOffset-02716

`countBufferOffset` **must** be a multiple of 4

- VUID-vkCmdDrawIndirectCount-countBuffer-02717

The count stored in `countBuffer` **must** be less than or equal to `VkPhysicalDeviceLimits::maxDrawIndirectCount`

- VUID-vkCmdDrawIndirectCount-countBufferOffset-04129

$(\text{countBufferOffset} + \text{sizeof}(\text{uint32\_t}))$ **must** be less than or equal to the size of `countBuffer`

- VUID-vkCmdDrawIndirectCount-None-04445

If the `drawIndirectCount` feature is not enabled this function **must** not be used

- VUID-vkCmdDrawIndirectCount-stride-03110

`stride` **must** be a multiple of 4 and **must** be greater than or equal to `sizeof(VkDrawIndirectCommand)`

- VUID-vkCmdDrawIndirectCount-maxDrawCount-03111

If `maxDrawCount` is greater than or equal to 1, $(\text{stride} \times (\text{maxDrawCount} - 1) + \text{offset} + \text{sizeof}(\text{VkDrawIndirectCommand}))$ **must** be less than or equal to the size of `buffer`

Valid Usage (Implicit)

- VUID-vkCmdDrawIndirectCount-commandBuffer-parameter

`commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdDrawIndirectCount-buffer-parameter
buffer **must** be a valid [VkBuffer](#) handle
- VUID-vkCmdDrawIndirectCount-countBuffer-parameter
countBuffer **must** be a valid [VkBuffer](#) handle
- VUID-vkCmdDrawIndirectCount-commandBuffer-recording
commandBuffer **must** be in the [recording state](#)
- VUID-vkCmdDrawIndirectCount-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support [VK_QUEUE_GRAPHICS_BIT](#) operations
- VUID-vkCmdDrawIndirectCount-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdDrawIndirectCount-commonparent
Each of **buffer**, **commandBuffer**, and **countBuffer** **must** have been created, allocated, or retrieved from the same [VkDevice](#)

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Inside	VK_QUEUE_GRAPHICS_BIT	Action

To record an indexed indirect drawing command, call:

```
// Provided by VK_VERSION_1_0
void vkCmdDrawIndexedIndirect(
    VkCommandBuffer          commandBuffer,
    VkBuffer                 buffer,
    VkDeviceSize             offset,
    uint32_t                 drawCount,
    uint32_t                 stride);
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **buffer** is the buffer containing draw parameters.
- **offset** is the byte offset into **buffer** where parameters begin.

- `drawCount` is the number of draws to execute, and **can** be zero.
- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndexedIndirect` behaves similarly to `vkCmdDrawIndexed` except that the parameters are read by the device from a buffer during execution. `drawCount` draws are executed by the command, with parameters taken from `buffer` starting at `offset` and increasing by `stride` bytes for each successive draw. The parameters of each draw are encoded in an array of `VkDrawIndexedIndirectCommand` structures. If `drawCount` is less than or equal to one, `stride` is ignored.

Valid Usage

- VUID-vkCmdDrawIndexedIndirect-magFilter-04553
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdDrawIndexedIndirect-magFilter-09598
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`
- VUID-vkCmdDrawIndexedIndirect-mipmapMode-04770
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdDrawIndexedIndirect-mipmapMode-09599
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`
- VUID-vkCmdDrawIndexedIndirect-unnormalizedCoordinates-09635
If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` **must** be 1
- VUID-vkCmdDrawIndexedIndirect-None-08609
If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `viewType` **must** be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`
- VUID-vkCmdDrawIndexedIndirect-None-08610

If a [VkSampler](#) created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a [VkImageView](#) as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name

- VUID-vkCmdDrawIndexedIndirect-None-08611

If a [VkSampler](#) created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a [VkImageView](#) as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values

- VUID-vkCmdDrawIndexedIndirect-aspectMask-06478

If a [VkImageView](#) is sampled with `depth comparison`, the image view **must** have been created with an `aspectMask` that contains `VK_IMAGE_ASPECT_DEPTH_BIT`

- VUID-vkCmdDrawIndexedIndirect-None-02691

If a [VkImageView](#) is accessed using atomic operations as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- VUID-vkCmdDrawIndexedIndirect-None-07888

If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's `format` `features` **must** contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`

- VUID-vkCmdDrawIndexedIndirect-None-02692

If a [VkImageView](#) is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- VUID-vkCmdDrawIndexedIndirect-None-02693

If the `VK_EXT_filter_cubic` extension is not enabled and any [VkImageView](#) is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it **must** not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`

- VUID-vkCmdDrawIndexedIndirect-filterCubic-02694

Any [VkImageView](#) being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- VUID-vkCmdDrawIndexedIndirect-filterCubicMinmax-02695

Any [VkImageView](#) being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- VUID-vkCmdDrawIndexedIndirect-None-08600

For each set n that is statically used by a `bound shader`, a descriptor set **must** have been bound to n at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set n , with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in

Pipeline Layout Compatibility

- VUID-vkCmdDrawIndexedIndirect-None-08601

For each push constant that is statically used by a [bound shader](#), a push constant value **must** have been set for the same pipeline bind point, with a [VkPipelineLayout](#) that is compatible for push constants, with the [VkPipelineLayout](#) used to create the current [VkPipeline](#), as described in [Pipeline Layout Compatibility](#)

- VUID-vkCmdDrawIndexedIndirect-None-10068

For each array of resources that is used by a [bound shader](#), the indices used to access members of the array **must** be less than the descriptor count for the identified binding in the descriptor sets used by this command

- VUID-vkCmdDrawIndexedIndirect-None-08114

Descriptors in each bound descriptor set, specified via [vkCmdBindDescriptorSets](#), **must** be valid as described by [descriptor validity](#) if they are statically used by a [bound shader](#)

- VUID-vkCmdDrawIndexedIndirect-imageLayout-00344

If an image descriptor is accessed by a shader, the [VkImageLayout](#) **must** match the subresource accessible from the [VkImageView](#) as defined by the [image layout matching rules](#)

- VUID-vkCmdDrawIndexedIndirect-None-08606

A valid pipeline **must** be bound to the pipeline bind point used by this command

- VUID-vkCmdDrawIndexedIndirect-None-08608

There **must** not have been any calls to dynamic state setting commands for any state specified statically in the [VkPipeline](#) object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdDrawIndexedIndirect-uniformBuffers-06935

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a uniform buffer, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawIndexedIndirect-storageBuffers-06936

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a storage buffer, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawIndexedIndirect-commandBuffer-02707

If [commandBuffer](#) is an unprotected command buffer and [protectedNoFault](#) is not supported, any resource accessed by [bound shaders](#) **must** not be a protected resource

- VUID-vkCmdDrawIndexedIndirect-viewType-07752

If a [VkImageView](#) is accessed as a result of this command, then the image view's [viewType](#) **must** match the [Dim](#) operand of the [OpTypeImage](#) as described in [Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types](#)

- VUID-vkCmdDrawIndexedIndirect-format-07753

If a [VkImageView](#) or [VkBufferView](#) is accessed as a result of this command, then the [numeric type](#) of the view's [format](#) and the [Sampled Type](#) operand of the [OpTypeImage](#) **must**

match

- VUID-vkCmdDrawIndexedIndirect-OpImageWrite-08795

If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view's format

- VUID-vkCmdDrawIndexedIndirect-OpImageWrite-04469

If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view's format

- VUID-vkCmdDrawIndexedIndirect-SampledType-04470

If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64

- VUID-vkCmdDrawIndexedIndirect-SampledType-04471

If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- VUID-vkCmdDrawIndexedIndirect-SampledType-04472

If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64

- VUID-vkCmdDrawIndexedIndirect-SampledType-04473

If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- VUID-vkCmdDrawIndexedIndirect-sparseImageInt64Atomics-04474

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdDrawIndexedIndirect-sparseImageInt64Atomics-04475

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdDrawIndexedIndirect-None-07288

Any shader invocation executed by this command **must** `terminate`

- VUID-vkCmdDrawIndexedIndirect-None-09600

If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, all image subresources identified by that descriptor **must** be in the image layout identified when the descriptor was written

- VUID-vkCmdDrawIndexedIndirect-renderPass-02684

The current render pass **must** be `compatible` with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to

VK_PIPELINE_BIND_POINT_GRAPHICS

- VUID-vkCmdDrawIndexedIndirect-subpass-02685

The subpass index of the current render pass **must** be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- VUID-vkCmdDrawIndexedIndirect-None-07748

If any shader statically accesses an input attachment, a valid descriptor **must** be bound to the pipeline via a descriptor set

- VUID-vkCmdDrawIndexedIndirect-OpTypeImage-07468

If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it **must** be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass

- VUID-vkCmdDrawIndexedIndirect-None-07469

Input attachment views accessed in a subpass **must** be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImageView` that is compatible with the attachment referenced by the subpass' `pInputAttachments` [`InputAttachmentIndex`] in the bound `VkFramebuffer` as specified by [Fragment Input Attachment Compatibility](#)

- VUID-vkCmdDrawIndexedIndirect-None-06537

Memory backing image subresources used as attachments in the current render pass **must** not be written in any way other than as an attachment by this command

- VUID-vkCmdDrawIndexedIndirect-None-10795

If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass,

it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawIndexedIndirect-None-10796

If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass,

it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawIndexedIndirect-None-10797

If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass,

it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawIndexedIndirect-None-06539

If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command **must** not write to that image subresource as an attachment

- VUID-vkCmdDrawIndexedIndirect-None-06886

If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, `depth writes` **must** be disabled

- VUID-vkCmdDrawIndexedIndirect-None-06887
If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back **writeMask** are not zero, and stencil test is enabled, **all stencil ops must** be **VK_STENCIL_OP_KEEP**
- VUID-vkCmdDrawIndexedIndirect-None-07831
If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT** dynamic state enabled then **vkCmdSetViewport must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command
- VUID-vkCmdDrawIndexedIndirect-None-07832
If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SCISSOR** dynamic state enabled then **vkCmdSetScissor must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command
- VUID-vkCmdDrawIndexedIndirect-None-08617
If a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_LINE_WIDTH** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and the **effective rasterization input topology** is in line topology class, then **vkCmdSetLineWidth must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command
- VUID-vkCmdDrawIndexedIndirect-None-07834
If a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_DEPTH_BIAS** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and the **current value** of **depthBiasEnable** is **VK_TRUE**, then **vkCmdSetDepthBias must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command
- VUID-vkCmdDrawIndexedIndirect-None-07835
If a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_BLEND_CONSTANTS** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and an active color attachment **current value** of **blendEnable** is **VK_TRUE** with a blend equations where any **VkBlendFactor** member is **VK_BLEND_FACTOR_CONSTANT_COLOR**, **VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR**, **VK_BLEND_FACTOR_CONSTANT_ALPHA**, or **VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA**, then **vkCmdSetBlendConstants must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command
- VUID-vkCmdDrawIndexedIndirect-None-07836
If a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_DEPTH_BOUNDS** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and the **current value** of **depthBoundsTestEnable** is **VK_TRUE**, then **vkCmdSetDepthBounds must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command
- VUID-vkCmdDrawIndexedIndirect-None-07837
If a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and the **current value** of **stencilTestEnable** is **VK_TRUE**, then **vkCmdSetStencilCompareMask must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-07838

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilWriteMask` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-07839

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_REFERENCE` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, the `current value` of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilReference` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-maxMultiviewInstanceIndex-02688

If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`

- VUID-vkCmdDrawIndexedIndirect-sampleLocationsEnable-02689

If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE`, then the active depth attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set

- VUID-vkCmdDrawIndexedIndirect-None-06666

If the `VK_EXT_sample_locations` extension is enabled, a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `sampleLocationsEnable` is `VK_TRUE`, then `vkCmdSetSampleLocationsEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-07840

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_CULL_MODE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetCullModeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-07841

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_FRONT_FACE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetFrontFaceEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-07843

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, `vkCmdSetDepthTestEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-07844

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `depthTestEnable` is `VK_TRUE`, then `vkCmdSetDepthWriteEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-07845

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `depthTestEnable` is `VK_TRUE`, then `vkCmdSetDepthCompareOpEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-07846

If the `depthBounds` feature is enabled, a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthBoundsTestEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-07847

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetStencilTestEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-07848

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_OP` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, the `current value` of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilOpEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-viewportCount-03417

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCountEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-scissorCount-03418

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCountEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing

- VUID-vkCmdDrawIndexedIndirect-viewportCount-03419

If a graphics pipeline is bound which was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled, then the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` **must** match the `scissorCount` parameter of `vkCmdSetScissorWithCountEXT`

- VUID-vkCmdDrawIndexedIndirect-None-04876

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled, then `vkCmdSetRasterizerDiscardEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-04877

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthBiasEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-logicOp-04878

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `logicOpEnable` is `VK_TRUE`, then `vkCmdSetLogicOpEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-primitiveFragmentShadingRateWithMultipleViewports-04552

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCountEXT` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` **must** be 1

- VUID-vkCmdDrawIndexedIndirect-blendEnable-04727

If a graphics pipeline is bound which was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then for each color attachment, if the corresponding image view's `format` `features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the corresponding `current value` of `blendEnable` **must** be `VK_FALSE`

- VUID-vkCmdDrawIndexedIndirect-None-08644

If a graphics pipeline is bound, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then the `current value` of `rasterizationSamples` **must** be the same as the current color and/or depth/stencil attachments

- VUID-vkCmdDrawIndexedIndirect-maxFragmentDualSrcAttachments-09239

If `blending` is enabled for any attachment where either the source or destination blend factors for that attachment `use the secondary color input`, the maximum value of `Location` for any output attachment `statically used` in the `Fragment Execution Model` executed by this command **must** be less than `maxFragmentDualSrcAttachments`

- VUID-vkCmdDrawIndexedIndirect-None-04007

All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** have either valid or `VK_NULL_HANDLE` buffers

bound

- VUID-vkCmdDrawIndexedIndirect-None-04008

If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** not be `VK_NULL_HANDLE`

- VUID-vkCmdDrawIndexedIndirect-None-02721

If the `robustBufferAccess` feature is not enabled, then for a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in [Vertex Input Description](#)

- VUID-vkCmdDrawIndexedIndirect-format-10389

For each vertex attribute accessed by this command, if its `VkVertexInputAttributeDescription::format` or `VkVertexInputAttributeDescription2EXT::format` is a `packed format`, the value of `attribAddress`, calculated as described in [Vertex Input Calculation](#), **must** be a multiple of the `size of the format`

- VUID-vkCmdDrawIndexedIndirect-format-10390

For each vertex attribute accessed by this command, if its `VkVertexInputAttributeDescription::format` or `VkVertexInputAttributeDescription2EXT::format` is not a `packed format`, the value of `attribAddress`, calculated as described in [Vertex Input Calculation](#), **must** be a multiple of the `component size of the format`

- VUID-vkCmdDrawIndexedIndirect-None-07842

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-dynamicPrimitiveTopologyUnrestricted-07500

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state enabled then the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` **must** be of the same `topology class` as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state

- VUID-vkCmdDrawIndexedIndirect-primitiveTopology-10286

If a `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage is bound, then the `current value` of `primitiveTopology` **must** be `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST` prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-primitiveTopology-10747

If `vkCmdSetPrimitiveTopologyEXT` set `primitiveTopology` to `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST` prior to this drawing command, then a `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage **must** be bound

- VUID-vkCmdDrawIndexedIndirect-primitiveTopology-10748

If `vkCmdSetPrimitiveTopologyEXT` set `primitiveTopology` to `VK_PRIMITIVE_TOPOLOGY_POINT_LIST` prior to this drawing command, both a `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` and `VK_SHADER_STAGE_GEOMETRY_BIT` stage are not bound, then the `Vertex Execution Model` **must** have a `PointSize` decorated variable that is statically written to

- VUID-vkCmdDrawIndexedIndirect-pStrides-04913

If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE` dynamic state enabled, but without the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` **must** not be `NULL`

- VUID-vkCmdDrawIndexedIndirect-None-04914

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then `vkCmdSetVertexInputEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this draw command

- VUID-vkCmdDrawIndexedIndirect-Input-07939

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then all variables with the `Input` storage class decorated with `Location` in the `Vertex Execution Model OpEntryPoint` **must** contain a location in `VkVertexInputAttributeDescription2EXT::location`

- VUID-vkCmdDrawIndexedIndirect-Input-08734

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then the numeric type associated with all `Input` variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` **must** be the same as `VkVertexInputAttributeDescription2EXT::format`

- VUID-vkCmdDrawIndexedIndirect-format-08936

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then the scalar width associated with all `Input` variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` **must** be 64-bit

- VUID-vkCmdDrawIndexedIndirect-format-08937

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and the scalar width associated with a `Location` decorated `Input` variable in the `Vertex Execution Model OpEntryPoint` is 64-bit, then the corresponding `VkVertexInputAttributeDescription2EXT::format` **must** have a 64-bit component

- VUID-vkCmdDrawIndexedIndirect-None-09203

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then all `Input` variables at the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` **must** not use components that are not present in the format

- VUID-vkCmdDrawIndexedIndirect-None-04875

If the bound graphics pipeline state was created with both a `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage and the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled, and the `current value` of `primitiveTopology` is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, then `vkCmdSetPatchControlPointsEXT` **must** have been called and not subsequently

invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-04879

If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE** dynamic state enabled then **vkCmdSetPrimitiveRestartEnableEXT** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-09637

If the **input assembly** is **VK_PRIMITIVE_TOPOLOGY_POINT_LIST**, **VK_PRIMITIVE_TOPOLOGY_LINE_LIST**, **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST**, **VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY**, or **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY**, the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE** dynamic state enabled, then **vkCmdSetPrimitiveRestartEnableEXT** **must** be **VK_FALSE**

- VUID-vkCmdDrawIndexedIndirect-None-10909

If the **input assembly** is **VK_PRIMITIVE_TOPOLOGY_PATCH_LIST**, the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE** dynamic state enabled then **vkCmdSetPrimitiveRestartEnableEXT** **must** be **VK_FALSE**

- VUID-vkCmdDrawIndexedIndirect-buffer-02708

If **buffer** is non-sparse then it **must** be bound completely and contiguously to a single **VkDeviceMemory** object

- VUID-vkCmdDrawIndexedIndirect-buffer-02709

buffer **must** have been created with the **VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT** bit set

- VUID-vkCmdDrawIndexedIndirect-offset-02710

offset **must** be a multiple of 4

- VUID-vkCmdDrawIndexedIndirect-commandBuffer-02711

commandBuffer **must** not be a protected command buffer

- VUID-vkCmdDrawIndexedIndirect-drawCount-02718

If the **multiDrawIndirect** feature is not enabled, **drawCount** **must** be 0 or 1

- VUID-vkCmdDrawIndexedIndirect-drawCount-02719

drawCount **must** be less than or equal to **VkPhysicalDeviceLimits::maxDrawIndirectCount**

- VUID-vkCmdDrawIndexedIndirect-None-07312

A valid index buffer **must** be bound

- VUID-vkCmdDrawIndexedIndirect-drawCount-00528

If **drawCount** is greater than 1, **stride** **must** be a multiple of 4 and **must** be greater than or equal to **sizeof(VkDrawIndexedIndirectCommand)**

- VUID-vkCmdDrawIndexedIndirect-drawCount-00539

If **drawCount** is equal to 1, (**offset** + **sizeof(VkDrawIndexedIndirectCommand)**) **must** be less than or equal to the size of **buffer**

- VUID-vkCmdDrawIndexedIndirect-drawCount-00540

If **drawCount** is greater than 1, (**stride** × (**drawCount** - 1) + **offset** + **sizeof(VkDrawIndexedIndirectCommand)**) **must** be less than or equal to the size of **buffer**

Valid Usage (Implicit)

- VUID-vkCmdDrawIndexedIndirect-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdDrawIndexedIndirect-buffer-parameter
`buffer` **must** be a valid `VkBuffer` handle
- VUID-vkCmdDrawIndexedIndirect-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdDrawIndexedIndirect-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdDrawIndexedIndirect-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdDrawIndexedIndirect-commonparent
Both of `buffer`, and `commandBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Inside	VK_QUEUE_GRAPHICS_BIT	Action

The `VkDrawIndexedIndirectCommand` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkDrawIndexedIndirectCommand {
    uint32_t    indexCount;
    uint32_t    instanceCount;
    uint32_t    firstIndex;
    int32_t     vertexOffset;
    uint32_t    firstInstance;
} VkDrawIndexedIndirectCommand;
```

- `indexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstIndex` is the base index within the index buffer.
- `vertexOffset` is the value added to the vertex index before indexing into the vertex buffer.
- `firstInstance` is the instance ID of the first instance to draw.

The members of `VkDrawIndexedIndirectCommand` have the same meaning as the similarly named parameters of `vkCmdDrawIndexed`.

Valid Usage

- VUID-VkDrawIndexedIndirectCommand-pNext-09461

If the bound graphics pipeline state was created with `VkPipelineVertexInputDivisorStateCreateInfo` in the `pNext` chain of `VkGraphicsPipelineCreateInfo::pVertexInputState`, any member of `VkPipelineVertexInputDivisorStateCreateInfo::pVertexBindingDivisors` has a value other than `1` in `divisor`, and `VkPhysicalDeviceVertexAttributeDivisorProperties::supportsNonZeroFirstInstance` is `VK_FALSE`, then `firstInstance` **must** be `0`

- VUID-VkDrawIndexedIndirectCommand-None-09462

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, any member of the `pVertexBindingDescriptions` parameter to the `vkCmdSetVertexInputEXT` call that sets this dynamic state has a value other than `1` in `divisor`, and `VkPhysicalDeviceVertexAttributeDivisorProperties::supportsNonZeroFirstInstance` is `VK_FALSE`, then `firstInstance` **must** be `0`

- VUID-VkDrawIndexedIndirectCommand-robustBufferAccess2-08798

If the `robustBufferAccess2` feature is not enabled, $(\text{indexSize} \times (\text{firstIndex} + \text{indexCount}) + \text{offset})$ **must** be less than or equal to the size of the bound index buffer, with `indexSize` being based on the type specified by `indexType`, where the index buffer, `indexType`, and `offset` are specified via `vkCmdBindIndexBuffer`

- VUID-VkDrawIndexedIndirectCommand-firstInstance-00554

If the `drawIndirectFirstInstance` feature is not enabled, `firstInstance` **must** be `0`

To record an indexed draw call with a draw call count sourced from a buffer, call:

```
// Provided by VK_VERSION_1_2
void vkCmdDrawIndexedIndirectCount(
    VkCommandBuffer          commandBuffer,
    VkBuffer                 buffer,
    VkDeviceSize             offset,
    VkBuffer                 countBuffer,
    VkDeviceSize             countBufferOffset,
    uint32_t                 maxDrawCount,
    uint32_t                 stride);
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **buffer** is the buffer containing draw parameters.
- **offset** is the byte offset into **buffer** where parameters begin.
- **countBuffer** is the buffer containing the draw count.
- **countBufferOffset** is the byte offset into **countBuffer** where the draw count begins.
- **maxDrawCount** specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in **countBuffer** and **maxDrawCount**.
- **stride** is the byte stride between successive sets of draw parameters.

vkCmdDrawIndexedIndirectCount behaves similarly to **vkCmdDrawIndexedIndirect** except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from **countBuffer** located at **countBufferOffset** and use this as the draw count.

Valid Usage

- VUID-vkCmdDrawIndexedIndirectCount-magFilter-04553
If a **VkSampler** created with **magFilter** or **minFilter** equal to **VK_FILTER_LINEAR**, **reductionMode** equal to **VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE**, and **compareEnable** equal to **VK_FALSE** is used to sample a **VkImageView** as a result of this command, then the image view's **format features** **must** contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT**
- VUID-vkCmdDrawIndexedIndirectCount-magFilter-09598
If a **VkSampler** created with **magFilter** or **minFilter** equal to **VK_FILTER_LINEAR** and **reductionMode** equal to either **VK_SAMPLER_REDUCTION_MODE_MIN** or **VK_SAMPLER_REDUCTION_MODE_MAX** is used to sample a **VkImageView** as a result of this command, then the image view's **format features** **must** contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT**
- VUID-vkCmdDrawIndexedIndirectCount-mipmapMode-04770
If a **VkSampler** created with **mipmapMode** equal to **VK_SAMPLER_MIPMAP_MODE_LINEAR**, **reductionMode** equal to **VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE**, and **compareEnable** equal to **VK_FALSE** is used to sample a **VkImageView** as a result of this command, then the image view's **format features** **must** contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT**

- VUID-vkCmdDrawIndexedIndirectCount-mipmapMode-09599
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`
- VUID-vkCmdDrawIndexedIndirectCount-unnormalizedCoordinates-09635
If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` **must** be 1
- VUID-vkCmdDrawIndexedIndirectCount-None-08609
If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `viewType` **must** be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`
- VUID-vkCmdDrawIndexedIndirectCount-None-08610
If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name
- VUID-vkCmdDrawIndexedIndirectCount-None-08611
If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values
- VUID-vkCmdDrawIndexedIndirectCount-aspectMask-06478
If a `VkImageView` is sampled with `depth comparison`, the image view **must** have been created with an `aspectMask` that contains `VK_IMAGE_ASPECT_DEPTH_BIT`
- VUID-vkCmdDrawIndexedIndirectCount-None-02691
If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`
- VUID-vkCmdDrawIndexedIndirectCount-None-07888
If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's `format features` **must** contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`
- VUID-vkCmdDrawIndexedIndirectCount-None-02692
If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`
- VUID-vkCmdDrawIndexedIndirectCount-None-02693
If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it **must** not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`
- VUID-vkCmdDrawIndexedIndirectCount-filterCubic-02694

Any [VkImageView](#) being sampled with [VK_FILTER_CUBIC_EXT](#) as a result of this command **must** have a [VkImageViewType](#) and format that supports cubic filtering, as specified by [VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic](#) returned by [vkGetPhysicalDeviceImageFormatProperties2](#)

- VUID-vkCmdDrawIndexedIndirectCount-filterCubicMinmax-02695

Any [VkImageView](#) being sampled with [VK_FILTER_CUBIC_EXT](#) with a reduction mode of either [VK_SAMPLER_REDUCTION_MODE_MIN](#) or [VK_SAMPLER_REDUCTION_MODE_MAX](#) as a result of this command **must** have a [VkImageViewType](#) and format that supports cubic filtering together with minmax filtering, as specified by [VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax](#) returned by [vkGetPhysicalDeviceImageFormatProperties2](#)

- VUID-vkCmdDrawIndexedIndirectCount-None-08600

For each set n that is statically used by a [bound shader](#), a descriptor set **must** have been bound to n at the same pipeline bind point, with a [VkPipelineLayout](#) that is compatible for set n , with the [VkPipelineLayout](#) used to create the current [VkPipeline](#), as described in [Pipeline Layout Compatibility](#)

- VUID-vkCmdDrawIndexedIndirectCount-None-08601

For each push constant that is statically used by a [bound shader](#), a push constant value **must** have been set for the same pipeline bind point, with a [VkPipelineLayout](#) that is compatible for push constants, with the [VkPipelineLayout](#) used to create the current [VkPipeline](#), as described in [Pipeline Layout Compatibility](#)

- VUID-vkCmdDrawIndexedIndirectCount-None-10068

For each array of resources that is used by a [bound shader](#), the indices used to access members of the array **must** be less than the descriptor count for the identified binding in the descriptor sets used by this command

- VUID-vkCmdDrawIndexedIndirectCount-None-08114

Descriptors in each bound descriptor set, specified via [vkCmdBindDescriptorSets](#), **must** be valid as described by [descriptor validity](#) if they are statically used by a [bound shader](#)

- VUID-vkCmdDrawIndexedIndirectCount-imageLayout-00344

If an image descriptor is accessed by a shader, the [VkImageLayout](#) **must** match the subresource accessible from the [VkImageView](#) as defined by the [image layout matching rules](#)

- VUID-vkCmdDrawIndexedIndirectCount-None-08606

A valid pipeline **must** be bound to the pipeline bind point used by this command

- VUID-vkCmdDrawIndexedIndirectCount-None-08608

There **must** not have been any calls to dynamic state setting commands for any state specified statically in the [VkPipeline](#) object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdDrawIndexedIndirectCount-uniformBuffers-06935

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a uniform buffer, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawIndexedIndirectCount-storageBuffers-06936

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a storage buffer, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-02707

If [commandBuffer](#) is an unprotected command buffer and [protectedNoFault](#) is not supported, any resource accessed by [bound shaders](#) **must** not be a protected resource

- VUID-vkCmdDrawIndexedIndirectCount-viewType-07752

If a [VkImageView](#) is accessed as a result of this command, then the image view's [viewType](#) **must** match the [Dim](#) operand of the [OpTypeImage](#) as described in [Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types](#)

- VUID-vkCmdDrawIndexedIndirectCount-format-07753

If a [VkImageView](#) or [VkBufferView](#) is accessed as a result of this command, then the [numeric type](#) of the view's [format](#) and the [Sampled Type](#) operand of the [OpTypeImage](#) **must** match

- VUID-vkCmdDrawIndexedIndirectCount-OpImageWrite-08795

If a [VkImageView](#) is accessed using [OpImageWrite](#) as a result of this command, then the [Type](#) of the [Texel](#) operand of that instruction **must** have at least as many components as the image view's format

- VUID-vkCmdDrawIndexedIndirectCount-OpImageWrite-04469

If a [VkBufferView](#) is accessed using [OpImageWrite](#) as a result of this command, then the [Type](#) of the [Texel](#) operand of that instruction **must** have at least as many components as the buffer view's format

- VUID-vkCmdDrawIndexedIndirectCount-SampledType-04470

If a [VkImageView](#) with a [VkFormat](#) that has a 64-bit component width is accessed as a result of this command, the [SampledType](#) of the [OpTypeImage](#) operand of that instruction **must** have a [Width](#) of 64

- VUID-vkCmdDrawIndexedIndirectCount-SampledType-04471

If a [VkImageView](#) with a [VkFormat](#) that has a component width less than 64-bit is accessed as a result of this command, the [SampledType](#) of the [OpTypeImage](#) operand of that instruction **must** have a [Width](#) of 32

- VUID-vkCmdDrawIndexedIndirectCount-SampledType-04472

If a [VkBufferView](#) with a [VkFormat](#) that has a 64-bit component width is accessed as a result of this command, the [SampledType](#) of the [OpTypeImage](#) operand of that instruction **must** have a [Width](#) of 64

- VUID-vkCmdDrawIndexedIndirectCount-SampledType-04473

If a [VkBufferView](#) with a [VkFormat](#) that has a component width less than 64-bit is accessed as a result of this command, the [SampledType](#) of the [OpTypeImage](#) operand of that instruction **must** have a [Width](#) of 32

- VUID-vkCmdDrawIndexedIndirectCount-sparseImageInt64Atomics-04474

If the [sparseImageInt64Atomics](#) feature is not enabled, [VkImage](#) objects created with the [VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT](#) flag **must** not be accessed by atomic instructions through an [OpTypeImage](#) with a [SampledType](#) with a [Width](#) of 64 by this command

- VUID-vkCmdDrawIndexedIndirectCount-sparseImageInt64Atomics-04475
If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command
- VUID-vkCmdDrawIndexedIndirectCount-None-07288
Any shader invocation executed by this command **must** `terminate`
- VUID-vkCmdDrawIndexedIndirectCount-None-09600
If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, all image subresources identified by that descriptor **must** be in the image layout identified when the descriptor was written
- VUID-vkCmdDrawIndexedIndirectCount-renderPass-02684
The current render pass **must** be `compatible` with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`
- VUID-vkCmdDrawIndexedIndirectCount-subpass-02685
The subpass index of the current render pass **must** be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`
- VUID-vkCmdDrawIndexedIndirectCount-None-07748
If any shader statically accesses an input attachment, a valid descriptor **must** be bound to the pipeline via a descriptor set
- VUID-vkCmdDrawIndexedIndirectCount-OpTypeImage-07468
If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it **must** be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass
- VUID-vkCmdDrawIndexedIndirectCount-None-07469
Input attachment views accessed in a subpass **must** be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImageView` that is compatible with the attachment referenced by the subpass' `pInputAttachments` [`InputAttachmentIndex`] in the bound `VkFramebuffer` as specified by `Fragment Input Attachment Compatibility`
- VUID-vkCmdDrawIndexedIndirectCount-None-06537
Memory backing image subresources used as attachments in the current render pass **must** not be written in any way other than as an attachment by this command
- VUID-vkCmdDrawIndexedIndirectCount-None-10795
If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass,

it **must** not be accessed in any way other than as an attachment by this command
- VUID-vkCmdDrawIndexedIndirectCount-None-10796
If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass,

it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawIndexedIndirectCount-None-10797

If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass,

it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawIndexedIndirectCount-None-06539

If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command **must** not write to that image subresource as an attachment

- VUID-vkCmdDrawIndexedIndirectCount-None-06886

If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, **depth writes must** be disabled

- VUID-vkCmdDrawIndexedIndirectCount-None-06887

If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back **writeMask** are not zero, and stencil test is enabled, **all stencil ops must** be **VK_STENCIL_OP_KEEP**

- VUID-vkCmdDrawIndexedIndirectCount-None-07831

If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT** dynamic state enabled then **vkCmdSetViewport must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-07832

If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SCISSOR** dynamic state enabled then **vkCmdSetScissor must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-08617

If a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_LINE_WIDTH** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and the **effective rasterization input topology** is in line topology class, then **vkCmdSetLineWidth must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-07834

If a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_DEPTH_BIAS** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and the **current value** of **depthBiasEnable** is **VK_TRUE**, then **vkCmdSetDepthBias must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-07835

If a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_BLEND_CONSTANTS** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and an active color attachment **current value** of **blendEnable** is **VK_TRUE** with a blend equations where any **VkBlendFactor** member is **VK_BLEND_FACTOR_CONSTANT_COLOR**, **VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR**, **VK_BLEND_FACTOR_CONSTANT_ALPHA**, or **VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA**, then

`vkCmdSetBlendConstants` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-07836

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `depthBoundsTestEnable` is `VK_TRUE`, then `vkCmdSetDepthBounds` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-07837

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilCompareMask` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-07838

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilWriteMask` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-07839

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_REFERENCE` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, the `current value` of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilReference` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-maxMultiviewInstanceIndex-02688

If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`

- VUID-vkCmdDrawIndexedIndirectCount-sampleLocationsEnable-02689

If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE`, then the active depth attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set

- VUID-vkCmdDrawIndexedIndirectCount-None-06666

If the `VK_EXT_sample_locations` extension is enabled, a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `sampleLocationsEnable` is `VK_TRUE`, then `vkCmdSetSampleLocationsEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-07840

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_CULL_MODE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then

`vkCmdSetCullModeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-07841

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_FRONT_FACE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetFrontFaceEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-07843

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, `vkCmdSetDepthTestEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-07844

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `depthTestEnable` is `VK_TRUE`, then `vkCmdSetDepthWriteEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-07845

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `depthTestEnable` is `VK_TRUE`, then `vkCmdSetDepthCompareOpEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-07846

If the `depthBounds` feature is enabled, a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthBoundsTestEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-07847

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetStencilTestEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-07848

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_OP` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, the `current value` of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilOpEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-viewportCount-03417

If a graphics pipeline is bound which was created with the

`VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCountEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-scissorCount-03418

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCountEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing

- VUID-vkCmdDrawIndexedIndirectCount-viewportCount-03419

If a graphics pipeline is bound which was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled, then the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` **must** match the `scissorCount` parameter of `vkCmdSetScissorWithCountEXT`

- VUID-vkCmdDrawIndexedIndirectCount-None-04876

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled, then `vkCmdSetRasterizerDiscardEnableEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-04877

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled, and the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthBiasEnableEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-logicOp-04878

If a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, and the **current value** of `logicOpEnable` is `VK_TRUE`, then `vkCmdSetLogicOpEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-primitiveFragmentShadingRateWithMultipleViewports-04552

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCountEXT` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` **must** be 1

- VUID-vkCmdDrawIndexedIndirectCount-blendEnable-04727

If a graphics pipeline is bound which was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then for each color attachment, if the corresponding image view's **format features** do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the corresponding **current value** of `blendEnable` **must** be `VK_FALSE`

- VUID-vkCmdDrawIndexedIndirectCount-None-08644
If a graphics pipeline is bound, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then the **current value** of `rasterizationSamples` **must** be the same as the current color and/or depth/stencil attachments
- VUID-vkCmdDrawIndexedIndirectCount-maxFragmentDualSrcAttachments-09239
If **blending** is enabled for any attachment where either the source or destination blend factors for that attachment **use the secondary color input**, the maximum value of `Location` for any output attachment **statically used** in the `Fragment Execution Model` executed by this command **must** be less than `maxFragmentDualSrcAttachments`
- VUID-vkCmdDrawIndexedIndirectCount-None-04007
All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** have either valid or `VK_NULL_HANDLE` buffers bound
- VUID-vkCmdDrawIndexedIndirectCount-None-04008
If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** not be `VK_NULL_HANDLE`
- VUID-vkCmdDrawIndexedIndirectCount-None-02721
If the `robustBufferAccess` feature is not enabled, then for a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in [Vertex Input Description](#)
- VUID-vkCmdDrawIndexedIndirectCount-format-10389
For each vertex attribute accessed by this command, if its `VkVertexInputAttributeDescription::format` or `VkVertexInputAttributeDescription2EXT::format` is a **packed format**, the value of `attribAddress`, calculated as described in [Vertex Input Calculation](#), **must** be a multiple of the **size of the format**
- VUID-vkCmdDrawIndexedIndirectCount-format-10390
For each vertex attribute accessed by this command, if its `VkVertexInputAttributeDescription::format` or `VkVertexInputAttributeDescription2EXT::format` is not a **packed format**, the value of `attribAddress`, calculated as described in [Vertex Input Calculation](#), **must** be a multiple of the **component size of the format**
- VUID-vkCmdDrawIndexedIndirectCount-None-07842
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command
- VUID-vkCmdDrawIndexedIndirectCount-dynamicPrimitiveTopologyUnrestricted-07500
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state enabled then the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` **must** be of the same **topology class** as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state
- VUID-vkCmdDrawIndexedIndirectCount-primitiveTopology-10286
If a `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage is bound, then the **current value** of

`primitiveTopology` **must** be `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST` prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-primitiveTopology-10747

If `vkCmdSetPrimitiveTopologyEXT` set `primitiveTopology` to `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST` prior to this drawing command, then a `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage **must** be bound

- VUID-vkCmdDrawIndexedIndirectCount-primitiveTopology-10748

If `vkCmdSetPrimitiveTopologyEXT` set `primitiveTopology` to `VK_PRIMITIVE_TOPOLOGY_POINT_LIST` prior to this drawing command, both a `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` and `VK_SHADER_STAGE_GEOMETRY_BIT` stage are not bound, then the `Vertex Execution Model` **must** have a `PointSize` decorated variable that is statically written to

- VUID-vkCmdDrawIndexedIndirectCount-pStrides-04913

If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE` dynamic state enabled, but without the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` **must** not be `NULL`

- VUID-vkCmdDrawIndexedIndirectCount-None-04914

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then `vkCmdSetVertexInputEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this draw command

- VUID-vkCmdDrawIndexedIndirectCount-Input-07939

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then all variables with the `Input` storage class decorated with `Location` in the `Vertex Execution Model OpEntryPoint` **must** contain a location in `VkVertexInputAttributeDescription2EXT::location`

- VUID-vkCmdDrawIndexedIndirectCount-Input-08734

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then the numeric type associated with all `Input` variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` **must** be the same as `VkVertexInputAttributeDescription2EXT::format`

- VUID-vkCmdDrawIndexedIndirectCount-format-08936

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then the scalar width associated with all `Input` variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` **must** be 64-bit

- VUID-vkCmdDrawIndexedIndirectCount-format-08937

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and the scalar width associated with a `Location` decorated `Input` variable in the `Vertex Execution Model OpEntryPoint` is 64-bit, then the corresponding `VkVertexInputAttributeDescription2EXT::format` **must** have a

64-bit component

- VUID-vkCmdDrawIndexedIndirectCount-None-09203

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then all `Input` variables at the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` **must** not use components that are not present in the format

- VUID-vkCmdDrawIndexedIndirectCount-None-04875

If the bound graphics pipeline state was created with both a `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage and the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled, and the `current value` of `primitiveTopology` is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, then `vkCmdSetPatchControlPointsEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-04879

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-09637

If the `input assembly` is `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`, or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY`, the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` dynamic state enabled, then `vkCmdSetPrimitiveRestartEnableEXT` **must** be `VK_FALSE`

- VUID-vkCmdDrawIndexedIndirectCount-None-10909

If the `input assembly` is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` **must** be `VK_FALSE`

- VUID-vkCmdDrawIndexedIndirectCount-buffer-02708

If `buffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdDrawIndexedIndirectCount-buffer-02709

`buffer` **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set

- VUID-vkCmdDrawIndexedIndirectCount-offset-02710

`offset` **must** be a multiple of 4

- VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-02711

`commandBuffer` **must** not be a protected command buffer

- VUID-vkCmdDrawIndexedIndirectCount-countBuffer-02714

If `countBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdDrawIndexedIndirectCount-countBuffer-02715

`countBuffer` **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set

- VUID-vkCmdDrawIndexedIndirectCount-countBufferOffset-02716
`countBufferOffset` **must** be a multiple of 4
- VUID-vkCmdDrawIndexedIndirectCount-countBuffer-02717
The count stored in `countBuffer` **must** be less than or equal to `VkPhysicalDeviceLimits::maxDrawIndirectCount`
- VUID-vkCmdDrawIndexedIndirectCount-countBufferOffset-04129
(`countBufferOffset + sizeof(uint32_t)`) **must** be less than or equal to the size of `countBuffer`
- VUID-vkCmdDrawIndexedIndirectCount-None-04445
If the `drawIndirectCount` feature is not enabled this function **must** not be used
- VUID-vkCmdDrawIndexedIndirectCount-None-07312
A valid index buffer **must** be bound
- VUID-vkCmdDrawIndexedIndirectCount-stride-03142
`stride` **must** be a multiple of 4 and **must** be greater than or equal to `sizeof(VkDrawIndexedIndirectCommand)`
- VUID-vkCmdDrawIndexedIndirectCount-maxDrawCount-03143
If `maxDrawCount` is greater than or equal to 1, (`stride × (maxDrawCount - 1) + offset + sizeof(VkDrawIndexedIndirectCommand)`) **must** be less than or equal to the size of `buffer`

Valid Usage (Implicit)

- VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdDrawIndexedIndirectCount-buffer-parameter
`buffer` **must** be a valid `VkBuffer` handle
- VUID-vkCmdDrawIndexedIndirectCount-countBuffer-parameter
`countBuffer` **must** be a valid `VkBuffer` handle
- VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdDrawIndexedIndirectCount-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdDrawIndexedIndirectCount-commonparent
Each of `buffer`, `commandBuffer`, and `countBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Inside	VK_QUEUE_GRAPHIC S_BIT	Action

Chapter 22. Fixed-Function Vertex Processing

Vertex fetching is controlled via configurable state, as a logically distinct graphics pipeline stage.

22.1. Vertex Attributes

Vertex shaders **can** define input variables, which receive *vertex attribute* data transferred from one or more `VkBuffer`(s) by drawing commands. Vertex shader input variables are bound to buffers via an indirect binding where the vertex shader associates a *vertex input attribute* number with each variable, vertex input attributes are associated to *vertex input bindings* on a per-pipeline basis, and vertex input bindings are associated with specific buffers on a per-draw basis via the `vkCmdBindVertexBuffers` command. Vertex input attribute and vertex input binding descriptions also contain format information controlling how data is extracted from buffer memory and converted to the format expected by the vertex shader.

There are `VkPhysicalDeviceLimits::maxVertexInputAttributes` number of vertex input attributes and `VkPhysicalDeviceLimits::maxVertexInputBindings` number of vertex input bindings (each referred to by zero-based indices), where there are at least as many vertex input attributes as there are vertex input bindings. Applications **can** store multiple vertex input attributes interleaved in a single buffer, and use a single vertex input binding to access those attributes.

In GLSL, vertex shaders associate input variables with a vertex input attribute number using the `location` layout qualifier. The `Component` layout qualifier associates components of a vertex shader input variable with components of a vertex input attribute.

GLSL Example

```
// Assign location M to variableName
layout (location=M, component=2) in vec2 variableName;

// Assign locations [N,N+L) to the array elements of variableNameArray
layout (location=N) in vec4 variableNameArray[L];
```

In SPIR-V, vertex shaders associate input variables with a vertex input attribute number using the `Location` decoration. The `Component` decoration associates components of a vertex shader input variable with components of a vertex input attribute. The `Location` and `Component` decorations are specified via the `OpDecorate` instruction.

SPIR-V Example

```
...
%1 = OpExtInstImport "GLSL.std.450"
...
OpName %9 "variableName"
OpName %15 "variableNameArray"
OpDecorate %18 BuiltIn VertexIndex
```

```

OpDecorate %19 BuiltIn InstanceIndex
OpDecorate %9 Location M
OpDecorate %9 Component 2
OpDecorate %15 Location N
...
%2 = OpTypeVoid
%3 = OpTypeFunction %2
%6 = OpTypeFloat 32
%7 = OpTypeVector %6 2
%8 = OpTypePointer Input %7
%9 = OpVariable %8 Input
%10 = OpTypeVector %6 4
%11 = OpTypeInt 32 0
%12 = OpConstant %11 L
%13 = OpTypeArray %10 %12
%14 = OpTypePointer Input %13
%15 = OpVariable %14 Input
...

```

22.1.1. Attribute Location and Component Assignment

The **Location** decoration specifies which vertex input attribute is used to read and interpret the data that a variable will consume.

When a vertex shader input variable declared using a 16- or 32-bit scalar or vector data type is assigned a **Location**, its value(s) are taken from the components of the input attribute specified with the corresponding `VkVertexInputAttributeDescription::location`. The components used depend on the type of variable and the **Component** decoration specified in the variable declaration, as identified in [Input Attribute Components Accessed By 16-Bit and 32-Bit Input Variables](#). Any 16-bit or 32-bit scalar or vector input will consume a single **Location**. For 16-bit and 32-bit data types, missing components are filled in with default values as described [below](#).

If an implementation supports `storageInputOutput16`, vertex shader input variables **can** have a width of 16 bits.

Table 26. Input Attribute Components Accessed By 16-Bit and 32-Bit Input Variables

16-bit or 32-bit data type	Component decoration	Components consumed
scalar	0 or unspecified	(x, o, o, o)
scalar	1	(o, y, o, o)
scalar	2	(o, o, z, o)
scalar	3	(o, o, o, w)
two-component vector	0 or unspecified	(x, y, o, o)
two-component vector	1	(o, y, z, o)
two-component vector	2	(o, o, z, w)

16-bit or 32-bit data type	Component decoration	Components consumed
three-component vector	0 or unspecified	(x, y, z, o)
three-component vector	1	(o, y, z, w)
four-component vector	0 or unspecified	(x, y, z, w)

Components indicated by “o” are available for use by other input variables which are sourced from the same attribute, and if used, are either filled with the corresponding component from the input format (if present), or the default value.

When a vertex shader input variable declared using a 32-bit floating-point matrix type is assigned a **Location** *i*, its values are taken from consecutive input attributes starting with the corresponding `VkVertexInputAttributeDescription::location`. Such matrices are treated as an array of column vectors with values taken from the input attributes identified in [Input Attributes Accessed by 32-Bit Input Matrix Variables](#). The `VkVertexInputAttributeDescription::format` **must** be specified with a `VkFormat` that corresponds to the appropriate type of column vector. The **Component** decoration **must** not be used with matrix types.

Table 27. Input Attributes Accessed by 32-Bit Input Matrix Variables

Data type	Column vector type	Locations consumed	Components consumed
mat2	two-component vector	i, i+1	(x, y, o, o), (x, y, o, o)
mat2x3	three-component vector	i, i+1	(x, y, z, o), (x, y, z, o)
mat2x4	four-component vector	i, i+1	(x, y, z, w), (x, y, z, w)
mat3x2	two-component vector	i, i+1, i+2	(x, y, o, o), (x, y, o, o), (x, y, o, o)
mat3	three-component vector	i, i+1, i+2	(x, y, z, o), (x, y, z, o), (x, y, z, o)
mat3x4	four-component vector	i, i+1, i+2	(x, y, z, w), (x, y, z, w), (x, y, z, w)
mat4x2	two-component vector	i, i+1, i+2, i+3	(x, y, o, o), (x, y, o, o), (x, y, o, o), (x, y, o, o)
mat4x3	three-component vector	i, i+1, i+2, i+3	(x, y, z, o), (x, y, z, o), (x, y, z, o), (x, y, z, o)
mat4	four-component vector	i, i+1, i+2, i+3	(x, y, z, w), (x, y, z, w), (x, y, z, w), (x, y, z, w)

Components indicated by “o” are available for use by other input variables which are sourced from the same attribute, and if used, are either filled with the corresponding component from the input (if present), or the default value.

When a vertex shader input variable declared using a scalar or vector 64-bit data type is assigned a **Location** *i*, its values are taken from consecutive input attributes starting with the corresponding

VkVertexInputAttributeDescription::location. The **Location** slots and **Component** words used depend on the type of variable and the **Component** decoration specified in the variable declaration, as identified in [Input Attribute Locations and Components Accessed by 64-Bit Input Variables](#). For 64-bit data types, no default attribute values are provided. Input variables **must** not use more components than provided by the attribute.

Table 28. Input Attribute Locations and Components Accessed by 64-Bit Input Variables

Input format	Locations consumed	64-bit data type	Location decoration	Component decoration	32-bit component s consumed
R64	i	scalar	i	0 or unspecified	(x, y, -, -)
R64G64	i	scalar	i	0 or unspecified	(x, y, o, o)
		scalar	i	2	(o, o, z, w)
		two-component vector	i	0 or unspecified	(x, y, z, w)
R64G64B64	i, i+1	scalar	i	0 or unspecified	(x, y, o, o), (o, o, -, -)
		scalar	i	2	(o, o, z, w), (o, o, -, -)
		scalar	i+1	0 or unspecified	(o, o, o, o), (x, y, -, -)
		two-component vector	i	0 or unspecified	(x, y, z, w), (o, o, -, -)
		three-component vector	i	unspecified	(x, y, z, w), (x, y, -, -)
R64G64B64A64	i, i+1	scalar	i	0 or unspecified	(x, y, o, o), (o, o, o, o)
		scalar	i	2	(o, o, z, w), (o, o, o, o)
		scalar	i+1	0 or unspecified	(o, o, o, o), (x, y, o, o)
		scalar	i+1	2	(o, o, o, o), (o, o, z, w)
		two-component vector	i	0 or unspecified	(x, y, z, w), (o, o, o, o)
		two-component vector	i+1	0 or unspecified	(o, o, o, o), (x, y, z, w)
		three-component vector	i	unspecified	(x, y, z, w), (x, y, o, o)
		four-component vector	i	unspecified	(x, y, z, w), (x, y, z, w)

Components indicated by “o” are available for use by other input variables which are sourced from the same attribute. Components indicated by “-” are not available for input variables as there are no default values provided for 64-bit data types, and there is no data provided by the input format.

When a vertex shader input variable declared using a 64-bit floating-point matrix type is assigned a **Location** *i*, its values are taken from consecutive input attribute locations. Such matrices are treated as an array of column vectors with values taken from the input attributes as shown in [Input Attribute Locations and Components Accessed by 64-Bit Input Variables](#). Each column vector starts at the **Location** immediately following the last **Location** of the previous column vector. The number of attributes and components assigned to each matrix is determined by the matrix dimensions and ranges from two to eight locations.

When a vertex shader input variable declared using an array type is assigned a location, its values are taken from consecutive input attributes starting with the corresponding **VkVertexInputAttributeDescription::location**. The number of attributes and components assigned to each element are determined according to the data type of the array elements and **Component** decoration (if any) specified in the declaration of the array, as described above. Each element of the array, in order, is assigned to consecutive locations, but all at the same specified component within each location.

Only input variables declared with the data types and component decorations as specified above are supported. Two variables are allowed to share the same **Location** slot only if their **Component** words do not overlap. If multiple variables share the same **Location** slot, they **must** all have the same SPIR-V floating-point component type or all have the same width scalar type components.

22.2. Vertex Input Description

Applications specify vertex input attribute and vertex input binding descriptions as part of graphics pipeline creation by setting the **VkGraphicsPipelineCreateInfo::pVertexInputState** pointer to a **VkPipelineVertexInputStateCreateInfo** structure. Alternatively, if the graphics pipeline is created with the **VK_DYNAMIC_STATE_VERTEX_INPUT_EXT** dynamic state enabled, then the vertex input attribute and vertex input binding descriptions are specified dynamically with **vkCmdSetVertexInputEXT**, and the **VkGraphicsPipelineCreateInfo::pVertexInputState** pointer is ignored.

The **VkPipelineVertexInputStateCreateInfo** structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineVertexInputStateCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkPipelineVertexInputStateCreateFlags flags;
    uint32_t                  vertexBindingDescriptionCount;
    const VkVertexInputBindingDescription* pVertexBindingDescriptions;
    uint32_t                  vertexAttributeDescriptionCount;
    const VkVertexInputAttributeDescription* pVertexAttributeDescriptions;
} VkPipelineVertexInputStateCreateInfo;
```

- **sType** is a **VkStructureType** value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `vertexBindingDescriptionCount` is the number of vertex binding descriptions provided in `pVertexBindingDescriptions`.
- `pVertexBindingDescriptions` is a pointer to an array of `VkVertexInputBindingDescription` structures.
- `vertexAttributeDescriptionCount` is the number of vertex attribute descriptions provided in `pVertexAttributeDescriptions`.
- `pVertexAttributeDescriptions` is a pointer to an array of `VkVertexInputAttributeDescription` structures.

Valid Usage

- VUID-VkPipelineVertexInputStateCreateInfo-vertexBindingDescriptionCount-00613
`vertexBindingDescriptionCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`
- VUID-VkPipelineVertexInputStateCreateInfo-vertexAttributeDescriptionCount-00614
`vertexAttributeDescriptionCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputAttributes`
- VUID-VkPipelineVertexInputStateCreateInfo-binding-00615
For every `binding` specified by each element of `pVertexAttributeDescriptions`, a `VkVertexInputBindingDescription` **must** exist in `pVertexBindingDescriptions` with the same value of `binding`
- VUID-VkPipelineVertexInputStateCreateInfo-pVertexBindingDescriptions-00616
All elements of `pVertexBindingDescriptions` **must** describe distinct binding numbers
- VUID-VkPipelineVertexInputStateCreateInfo-pVertexAttributeDescriptions-00617
All elements of `pVertexAttributeDescriptions` **must** describe distinct attribute locations

Valid Usage (Implicit)

- VUID-VkPipelineVertexInputStateCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_STATE_CREATE_INFO`
- VUID-VkPipelineVertexInputStateCreateInfo-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkPipelineVertexInputDivisorStateCreateInfo`
- VUID-VkPipelineVertexInputStateCreateInfo-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkPipelineVertexInputStateCreateInfo-flags-zero bitmask
`flags` **must** be 0
- VUID-VkPipelineVertexInputStateCreateInfo-pVertexBindingDescriptions-parameter
If `vertexBindingDescriptionCount` is not 0, `pVertexBindingDescriptions` **must** be a valid

pointer to an array of `vertexBindingDescriptionCount` valid `VkVertexInputBindingDescription` structures

- VUID-VkPipelineVertexInputStateCreateInfo-pVertexAttributeDescriptions-parameter
If `vertexAttributeDescriptionCount` is not 0, `pVertexAttributeDescriptions` **must** be a valid pointer to an array of `vertexAttributeDescriptionCount` valid `VkVertexInputAttributeDescription` structures

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineVertexInputStateCreateFlags;
```

`VkPipelineVertexInputStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

Each vertex input binding is specified by the `VkVertexInputBindingDescription` structure, defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkVertexInputBindingDescription {
    uint32_t      binding;
    uint32_t      stride;
    VkVertexInputRate inputRate;
} VkVertexInputBindingDescription;
```

- `binding` is the binding number that this structure describes.
- `stride` is the byte stride between consecutive elements within the buffer.
- `inputRate` is a `VkVertexInputRate` value specifying whether vertex attribute addressing is a function of the vertex index or of the instance index.

Valid Usage

- VUID-VkVertexInputBindingDescription-binding-00618
`binding` **must** be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`
- VUID-VkVertexInputBindingDescription-stride-00619
`stride` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindingStride`

Valid Usage (Implicit)

- VUID-VkVertexInputBindingDescription-inputRate-parameter
`inputRate` **must** be a valid `VkVertexInputRate` value

Possible values of `VkVertexInputBindingDescription::inputRate`, specifying the rate at which vertex attributes are pulled from buffers, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkVertexInputRate {
    VK_VERTEX_INPUT_RATE_VERTEX = 0,
    VK_VERTEX_INPUT_RATE_INSTANCE = 1,
} VkVertexInputRate;
```

- `VK_VERTEX_INPUT_RATE_VERTEX` specifies that vertex attribute addressing is a function of the vertex index.
- `VK_VERTEX_INPUT_RATE_INSTANCE` specifies that vertex attribute addressing is a function of the instance index.

Each vertex input attribute is specified by the `VkVertexInputAttributeDescription` structure, defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkVertexInputAttributeDescription {
    uint32_t    location;
    uint32_t    binding;
    VkFormat     format;
    uint32_t    offset;
} VkVertexInputAttributeDescription;
```

- `location` is the shader input location number for this attribute.
- `binding` is the binding number which this attribute takes its data from.
- `format` is the size and type of the vertex attribute data.
- `offset` is a byte offset of this attribute relative to the start of an element in the vertex input binding.

Valid Usage

- VUID-VkVertexInputAttributeDescription-location-00620
`location` **must** be less than `VkPhysicalDeviceLimits::maxVertexInputAttributes`
- VUID-VkVertexInputAttributeDescription-binding-00621
`binding` **must** be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`
- VUID-VkVertexInputAttributeDescription-offset-00622
`offset` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputAttributeOffset`
- VUID-VkVertexInputAttributeDescription-format-00623
The `format features` of `format` **must** contain `VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT`

Valid Usage (Implicit)

- VUID-VkVertexInputAttributeDescription-format-parameter **format** must be a valid [VkFormat](#) value

To [dynamically set](#) the vertex input attribute and vertex input binding descriptions, call:

```
// Provided by VK_EXT_vertex_input_dynamic_state
void vkCmdSetVertexInputEXT(
    VkCommandBuffer                commandBuffer,
    uint32_t                       vertexBindingDescriptionCount,
    const VkVertexInputBindingDescription2EXT* pVertexBindingDescriptions,
    uint32_t                       vertexAttributeDescriptionCount,
    const VkVertexInputAttributeDescription2EXT* pVertexAttributeDescriptions);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **vertexBindingDescriptionCount** is the number of vertex binding descriptions provided in **pVertexBindingDescriptions**.
- **pVertexBindingDescriptions** is a pointer to an array of [VkVertexInputBindingDescription2EXT](#) structures.
- **vertexAttributeDescriptionCount** is the number of vertex attribute descriptions provided in **pVertexAttributeDescriptions**.
- **pVertexAttributeDescriptions** is a pointer to an array of [VkVertexInputAttributeDescription2EXT](#) structures.

This command sets the vertex input attribute and vertex input binding descriptions state for subsequent drawing commands when the graphics pipeline is created with [VK_DYNAMIC_STATE_VERTEX_INPUT_EXT](#) set in [VkPipelineDynamicStateCreateInfo::pDynamicStates](#). Otherwise, this state is specified by the [VkGraphicsPipelineCreateInfo::pVertexInputState](#) values used to create the currently active pipeline.

If the bound pipeline state object was also created with the [VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE](#) dynamic state enabled, then [vkCmdBindVertexBuffers2EXT](#) can be used instead of [vkCmdSetVertexInputEXT](#) to dynamically set the stride.

The vertex attribute description for any location in the range `[0,VkPhysicalDeviceLimits::maxVertexInputAttributes)` not specified in the **pVertexAttributeDescriptions** array becomes undefined.

Valid Usage

- VUID-vkCmdSetVertexInputEXT-None-04790
The **vertexInputDynamicState** feature **must** be enabled
- VUID-vkCmdSetVertexInputEXT-vertexBindingDescriptionCount-04791

`vertexBindingDescriptionCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-vkCmdSetVertexInputEXT-vertexAttributeDescriptionCount-04792
`vertexAttributeDescriptionCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputAttributes`
- VUID-vkCmdSetVertexInputEXT-binding-04793
For every `binding` specified by each element of `pVertexAttributeDescriptions`, a `VkVertexInputBindingDescription2EXT` **must** exist in `pVertexBindingDescriptions` with the same value of `binding`
- VUID-vkCmdSetVertexInputEXT-pVertexBindingDescriptions-04794
All elements of `pVertexBindingDescriptions` **must** describe distinct binding numbers
- VUID-vkCmdSetVertexInputEXT-pVertexAttributeDescriptions-04795
All elements of `pVertexAttributeDescriptions` **must** describe distinct attribute locations

Valid Usage (Implicit)

- VUID-vkCmdSetVertexInputEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetVertexInputEXT-pVertexBindingDescriptions-parameter
If `vertexBindingDescriptionCount` is not 0, `pVertexBindingDescriptions` **must** be a valid pointer to an array of `vertexBindingDescriptionCount` valid `VkVertexInputBindingDescription2EXT` structures
- VUID-vkCmdSetVertexInputEXT-pVertexAttributeDescriptions-parameter
If `vertexAttributeDescriptionCount` is not 0, `pVertexAttributeDescriptions` **must** be a valid pointer to an array of `vertexAttributeDescriptionCount` valid `VkVertexInputAttributeDescription2EXT` structures
- VUID-vkCmdSetVertexInputEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdSetVertexInputEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

The `VkVertexInputBindingDescription2EXT` structure is defined as:

```
// Provided by VK_EXT_vertex_input_dynamic_state
typedef struct VkVertexInputBindingDescription2EXT {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           binding;
    uint32_t           stride;
    VkVertexInputRate   inputRate;
    uint32_t           divisor;
} VkVertexInputBindingDescription2EXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `binding` is the binding number that this structure describes.
- `stride` is the byte stride between consecutive elements within the buffer.
- `inputRate` is a `VkVertexInputRate` value specifying whether vertex attribute addressing is a function of the vertex index or of the instance index.
- `divisor` is the number of successive instances that will use the same value of the vertex attribute when instanced rendering is enabled. This member **can** be a value other than `1` if the `vertexAttributeInstanceRateDivisor` feature is enabled. For example, if the divisor is `N`, the same vertex attribute will be applied to `N` successive instances before moving on to the next vertex attribute. The maximum value of `divisor` is implementation-dependent and can be queried using `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor`. A value of `0` **can** be used for the divisor if the `vertexAttributeInstanceRateZeroDivisor` feature is enabled. In this case, the same vertex attribute will be applied to all instances.

Valid Usage

- VUID-VkVertexInputBindingDescription2EXT-binding-04796
`binding` **must** be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`
- VUID-VkVertexInputBindingDescription2EXT-stride-04797
`stride` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindingStride`
- VUID-VkVertexInputBindingDescription2EXT-divisor-04798
If the `vertexAttributeInstanceRateZeroDivisor` feature is not enabled, `divisor` **must** not be

0

- VUID-VkVertexInputBindingDescription2EXT-divisor-04799
If the `vertexAttributeInstanceRateDivisor` feature is not enabled, `divisor` **must** be 1
- VUID-VkVertexInputBindingDescription2EXT-divisor-06226
`divisor` **must** be a value between 0 and `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor`, inclusive
- VUID-VkVertexInputBindingDescription2EXT-divisor-06227
If `divisor` is not 1 then `inputRate` **must** be of type `VK_VERTEX_INPUT_RATE_INSTANCE`

Valid Usage (Implicit)

- VUID-VkVertexInputBindingDescription2EXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VERTEX_INPUT_BINDING_DESCRIPTION_2_EXT`
- VUID-VkVertexInputBindingDescription2EXT-inputRate-parameter
`inputRate` **must** be a valid `VkVertexInputRate` value

The `VkVertexInputAttributeDescription2EXT` structure is defined as:

```
// Provided by VK_EXT_vertex_input_dynamic_state
typedef struct VkVertexInputAttributeDescription2EXT {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           location;
    uint32_t           binding;
    VkFormat            format;
    uint32_t           offset;
} VkVertexInputAttributeDescription2EXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `location` is the shader input location number for this attribute.
- `binding` is the binding number which this attribute takes its data from.
- `format` is the size and type of the vertex attribute data.
- `offset` is a byte offset of this attribute relative to the start of an element in the vertex input binding.

Valid Usage

- VUID-VkVertexInputAttributeDescription2EXT-location-06228
`location` **must** be less than `VkPhysicalDeviceLimits::maxVertexInputAttributes`
- VUID-VkVertexInputAttributeDescription2EXT-binding-06229
`binding` **must** be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-VkVertexInputAttributeDescription2EXT-offset-06230
offset **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputAttributeOffset`
- VUID-VkVertexInputAttributeDescription2EXT-format-04805
The `format` features of `format` **must** contain `VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT`

Valid Usage (Implicit)

- VUID-VkVertexInputAttributeDescription2EXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_VERTEX_INPUT_ATTRIBUTE_DESCRIPTION_2_EXT`
- VUID-VkVertexInputAttributeDescription2EXT-format-parameter
format **must** be a valid `VkFormat` value

To bind vertex buffers to a command buffer for use in subsequent drawing commands, call:

```
// Provided by VK_VERSION_1_0
void vkCmdBindVertexBuffers(
    VkCommandBuffer          commandBuffer,
    uint32_t                 firstBinding,
    uint32_t                 bindingCount,
    const VkBuffer*          pBuffer,
    const VkDeviceSize*      pOffsets);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstBinding` is the index of the first vertex input binding whose state is updated by the command.
- `bindingCount` is the number of vertex input bindings whose state is updated by the command.
- `pBuffers` is a pointer to an array of buffer handles.
- `pOffsets` is a pointer to an array of buffer offsets.

The values taken from elements `i` of `pBuffers` and `pOffsets` replace the current state for the vertex input binding `firstBinding + i`, for `i` in `[0, bindingCount)`. The vertex input binding is updated to start at the offset indicated by `pOffsets[i]` from the start of the buffer `pBuffers[i]`. All vertex input attributes that use each of these bindings will use these updated addresses in their address calculations for subsequent drawing commands. If the `nullDescriptor` feature is enabled, elements of `pBuffers` **can** be `VK_NULL_HANDLE`, and **can** be used by the vertex shader. If a vertex input attribute is bound to a vertex input binding that is `VK_NULL_HANDLE`, the values taken from memory are considered to be zero, and missing G, B, or A components are filled with (0,0,1).

Valid Usage

- VUID-vkCmdBindVertexBuffers-firstBinding-00624
firstBinding **must** be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-vkCmdBindVertexBuffers-firstBinding-00625
The sum of `firstBinding` and `bindingCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`
- VUID-vkCmdBindVertexBuffers-pOffsets-00626
All elements of `pOffsets` **must** be less than the size of the corresponding element in `pBuffers`
- VUID-vkCmdBindVertexBuffers-pBuffers-00627
All elements of `pBuffers` **must** have been created with the `VK_BUFFER_USAGE_VERTEX_BUFFER_BIT` flag
- VUID-vkCmdBindVertexBuffers-pBuffers-00628
Each element of `pBuffers` that is non-sparse **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdBindVertexBuffers-pBuffers-04001
If the `nullDescriptor` feature is not enabled, all elements of `pBuffers` **must** not be `VK_NULL_HANDLE`
- VUID-vkCmdBindVertexBuffers-pBuffers-04002
If an element of `pBuffers` is `VK_NULL_HANDLE`, then the corresponding element of `pOffsets` **must** be zero

Valid Usage (Implicit)

- VUID-vkCmdBindVertexBuffers-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdBindVertexBuffers-pBuffers-parameter
`pBuffers` **must** be a valid pointer to an array of `bindingCount` valid or `VK_NULL_HANDLE` `VkBuffer` handles
- VUID-vkCmdBindVertexBuffers-pOffsets-parameter
`pOffsets` **must** be a valid pointer to an array of `bindingCount` `VkDeviceSize` values
- VUID-vkCmdBindVertexBuffers-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdBindVertexBuffers-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdBindVertexBuffers-bindingCount-arraylength
`bindingCount` **must** be greater than 0
- VUID-vkCmdBindVertexBuffers-commonparent
Both of `commandBuffer`, and the elements of `pBuffers` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

Alternatively, to bind vertex buffers, along with their sizes and strides, to a command buffer for use in subsequent drawing commands, call:

```
// Provided by VK_EXT_extended_dynamic_state
void vkCmdBindVertexBuffers2EXT(
    VkCommandBuffer                commandBuffer,
    uint32_t                       firstBinding,
    uint32_t                       bindingCount,
    const VkBuffer*                 pBuffers,
    const VkDeviceSize*             pOffsets,
    const VkDeviceSize*             pSizes,
    const VkDeviceSize*             pStrides);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstBinding` is the index of the first vertex input binding whose state is updated by the command.
- `bindingCount` is the number of vertex input bindings whose state is updated by the command.
- `pBuffers` is a pointer to an array of buffer handles.
- `pOffsets` is a pointer to an array of buffer offsets.
- `pSizes` is `NULL` or a pointer to an array of the size in bytes of vertex data bound from `pBuffers`.
- `pStrides` is `NULL` or a pointer to an array of buffer strides.

The values taken from elements `i` of `pBuffers` and `pOffsets` replace the current state for the vertex input binding `firstBinding + i`, for `i` in `[0, bindingCount)`. The vertex input binding is updated to start at the offset indicated by `pOffsets[i]` from the start of the buffer `pBuffers[i]`. If `pSizes` is not `NULL` then `pSizes[i]` specifies the bound size of the vertex buffer starting from the corresponding elements of `pBuffers[i]` plus `pOffsets[i]`. All vertex input attributes that use each of these bindings will use these updated addresses in their address calculations for subsequent drawing commands. If the `nullDescriptor` feature is enabled, elements of `pBuffers` **can** be `VK_NULL_HANDLE`, and **can** be used

by the vertex shader. If a vertex input attribute is bound to a vertex input binding that is `VK_NULL_HANDLE`, the values taken from memory are considered to be zero, and missing G, B, or A components are filled with (0,0,1).

This command also dynamically sets the byte strides between consecutive elements within buffer `pBuffers[i]` to the corresponding `pStrides[i]` value when the graphics pipeline is created with `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, strides are specified by the `VkVertexInputBindingDescription::stride` values used to create the currently active pipeline.

If the bound pipeline state object was also created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then `vkCmdSetVertexInputEXT` can be used instead of `vkCmdBindVertexBuffers2EXT` to set the stride.

NOTE

Unlike the static state to set the same, `pStrides` must be between 0 and the maximum extent of the attributes in the binding. `vkCmdSetVertexInputEXT` does not have this restriction so can be used if other stride values are desired.

Valid Usage

- VUID-vkCmdBindVertexBuffers2-None-08971

At least one of the following **must** be true:

- the `extendedDynamicState` feature is enabled
- VUID-vkCmdBindVertexBuffers2-firstBinding-03355
`firstBinding` **must** be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`
- VUID-vkCmdBindVertexBuffers2-firstBinding-03356
The sum of `firstBinding` and `bindingCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`
- VUID-vkCmdBindVertexBuffers2-pOffsets-03357
If `pSizes` is not `NULL`, all elements of `pOffsets` **must** be less than the size of the corresponding element in `pBuffers`
- VUID-vkCmdBindVertexBuffers2-pSizes-03358
If `pSizes` is not `NULL`, all elements of `pOffsets` plus `pSizes` **must** be less than or equal to the size of the corresponding element in `pBuffers`
- VUID-vkCmdBindVertexBuffers2-pBuffers-03359
All elements of `pBuffers` **must** have been created with the `VK_BUFFER_USAGE_VERTEX_BUFFER_BIT` flag
- VUID-vkCmdBindVertexBuffers2-pBuffers-03360
Each element of `pBuffers` that is non-sparse **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdBindVertexBuffers2-pBuffers-04111
If the `nullDescriptor` feature is not enabled, all elements of `pBuffers` **must** not be `VK_NULL_HANDLE`
- VUID-vkCmdBindVertexBuffers2-pBuffers-04112

If an element of `pBuffers` is `VK_NULL_HANDLE`, then the corresponding element of `pOffsets` **must** be zero

- VUID-vkCmdBindVertexBuffers2-pStrides-03362

If `pStrides` is not `NULL` each element of `pStrides` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindingStride`

- VUID-vkCmdBindVertexBuffers2-pStrides-06209

If `pStrides` is not `NULL` each element of `pStrides` **must** be either 0 or greater than or equal to the maximum extent of all vertex input attributes fetched from the corresponding binding, where the extent is calculated as the `VkVertexInputAttributeDescription::offset` plus `VkVertexInputAttributeDescription::format` size

Valid Usage (Implicit)

- VUID-vkCmdBindVertexBuffers2-commandBuffer-parameter

`commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdBindVertexBuffers2-pBuffers-parameter

`pBuffers` **must** be a valid pointer to an array of `bindingCount` valid or `VK_NULL_HANDLE` `VkBuffer` handles

- VUID-vkCmdBindVertexBuffers2-pOffsets-parameter

`pOffsets` **must** be a valid pointer to an array of `bindingCount` `VkDeviceSize` values

- VUID-vkCmdBindVertexBuffers2-pSizes-parameter

If `pSizes` is not `NULL`, `pSizes` **must** be a valid pointer to an array of `bindingCount` `VkDeviceSize` values

- VUID-vkCmdBindVertexBuffers2-pStrides-parameter

If `pStrides` is not `NULL`, `pStrides` **must** be a valid pointer to an array of `bindingCount` `VkDeviceSize` values

- VUID-vkCmdBindVertexBuffers2-commandBuffer-recording

`commandBuffer` **must** be in the `recording` state

- VUID-vkCmdBindVertexBuffers2-commandBuffer-cmdpool

The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

- VUID-vkCmdBindVertexBuffers2-bindingCount-arraylength

If any of `pSizes`, or `pStrides` are not `NULL`, `bindingCount` **must** be greater than 0

- VUID-vkCmdBindVertexBuffers2-commonparent

Both of `commandBuffer`, and the elements of `pBuffers` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally

synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

22.3. Vertex Attribute Divisor in Instanced Rendering

If the `vertexAttributeInstanceRateDivisor` feature is enabled and the `pNext` chain of `VkPipelineVertexInputStateCreateInfo` includes a `VkPipelineVertexInputDivisorStateCreateInfo` structure, then that structure controls how vertex attributes are assigned to an instance when instanced rendering is enabled.

The `VkPipelineVertexInputDivisorStateCreateInfo` structure is defined as:

```
typedef struct VkPipelineVertexInputDivisorStateCreateInfo {
    VkStructureType          sType;
    const void*              pNext;
    uint32_t                 vertexBindingDivisorCount;
    const VkVertexInputBindingDivisorDescription* pVertexBindingDivisors;
} VkPipelineVertexInputDivisorStateCreateInfo;
```

```
// Provided by VK_KHR_vertex_attribute_divisor
typedef VkPipelineVertexInputDivisorStateCreateInfo
VkPipelineVertexInputDivisorStateCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `vertexBindingDivisorCount` is the number of elements in the `pVertexBindingDivisors` array.
- `pVertexBindingDivisors` is a pointer to an array of `VkVertexInputBindingDivisorDescription` structures specifying the divisor value for each binding.

Valid Usage (Implicit)

- VUID-VkPipelineVertexInputDivisorStateCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_DIVISOR_STATE_CREATE_INFO`
- VUID-VkPipelineVertexInputDivisorStateCreateInfo-pVertexBindingDivisors-parameter
`pVertexBindingDivisors` **must** be a valid pointer to an array of `vertexBindingDivisorCount` `VkVertexInputBindingDivisorDescription` structures

- VUID-VkPipelineVertexInputDivisorStateCreateInfo-vertexBindingDivisorCount-arraylength
`vertexBindingDivisorCount` **must** be greater than 0

The individual divisor values per binding are specified using the `VkVertexInputBindingDivisorDescription` structure which is defined as:

```
typedef struct VkVertexInputBindingDivisorDescription {
    uint32_t    binding;
    uint32_t    divisor;
} VkVertexInputBindingDivisorDescription;
```

```
// Provided by VK_KHR_vertex_attribute_divisor
typedef VkVertexInputBindingDivisorDescription
VkVertexInputBindingDivisorDescriptionKHR;
```

- `binding` is the binding number for which the divisor is specified.
- `divisor` is the number of successive instances that will use the same value of the vertex attribute when instanced rendering is enabled. For example, if the divisor is N, the same vertex attribute will be applied to N successive instances before moving on to the next vertex attribute. The maximum value of `divisor` is implementation-dependent and can be queried using `VkPhysicalDeviceVertexAttributeDivisorProperties::maxVertexAttribDivisor`. A value of 0 **can** be used for the divisor if the `vertexAttributeInstanceRateZeroDivisor` feature is enabled. In this case, the same vertex attribute will be applied to all instances.

If this structure is not used to define a divisor value for an attribute, then the divisor has a logical default value of 1.

Valid Usage

- VUID-VkVertexInputBindingDivisorDescription-binding-01869
`binding` **must** be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`
- VUID-VkVertexInputBindingDivisorDescription-vertexAttributeInstanceRateZeroDivisor-02228
 If the `vertexAttributeInstanceRateZeroDivisor` feature is not enabled, `divisor` **must** not be 0
- VUID-VkVertexInputBindingDivisorDescription-vertexAttributeInstanceRateDivisor-02229
 If the `vertexAttributeInstanceRateDivisor` feature is not enabled, `divisor` **must** be 1
- VUID-VkVertexInputBindingDivisorDescription-divisor-01870
`divisor` **must** be a value between 0 and `VkPhysicalDeviceVertexAttributeDivisorProperties::maxVertexAttribDivisor`, inclusive
- VUID-VkVertexInputBindingDivisorDescription-inputRate-01871
`VkVertexInputBindingDescription::inputRate` **must** be of type

22.4. Vertex Input Address Calculation

The address of each attribute for each `vertexIndex` and `instanceIndex` is calculated as follows:

- Let `attribDesc` be the member of `VkPipelineVertexInputStateCreateInfo::pVertexAttributeDescriptions` with `VkVertexInputAttributeDescription::location` equal to the vertex input attribute number.
- Let `bindingDesc` be the member of `VkPipelineVertexInputStateCreateInfo::pVertexBindingDescriptions` with `VkVertexInputAttributeDescription::binding` equal to `attribDesc.binding`.
- Let `vertexIndex` be the index of the vertex within the draw (a value between `firstVertex` and `firstVertex+vertexCount` for `vkCmdDraw`, or a value taken from the index buffer plus `vertexOffset` for `vkCmdDrawIndexed`), and let `instanceIndex` be the instance number of the draw (a value between `firstInstance` and `firstInstance+instanceCount`).
- Let `offset` be an array of offsets into the bound vertex buffers specified during `vkCmdBindVertexBuffers` or `vkCmdBindVertexBuffers2EXT` with `pOffsets`.
- Let `divisor` be the member of `VkPipelineVertexInputDivisorStateCreateInfo::pVertexBindingDivisors` with `VkVertexInputBindingDivisorDescription::binding` equal to `attribDesc.binding`. If the vertex binding state is dynamically set, instead let `divisor` be the member of the `pVertexBindingDescriptions` parameter to the `vkCmdSetVertexInputEXT` call with `VkVertexInputBindingDescription2EXT::binding` equal to `attribDesc.binding`.
- Let `stride` be the member of `VkPipelineVertexInputStateCreateInfo::pVertexBindingDescriptions->stride` unless there is dynamic state causing the value to be ignored. In this case the value is set from the last value from one of the following
 - `vkCmdSetVertexInputEXT::pVertexBindingDescriptions->stride`
 - `vkCmdBindVertexBuffers2EXT::pStrides`, if not `NULL`

```
bufferBindingAddress = buffer[binding].baseAddress + offset[binding];

if (bindingDesc.inputRate == VK_VERTEX_INPUT_RATE_VERTEX)
    effectiveVertexOffset = vertexIndex * stride;
else
    if (divisor == 0)
        effectiveVertexOffset = firstInstance * stride;
    else
        effectiveVertexOffset = (firstInstance + ((instanceIndex - firstInstance) /
divisor)) * stride;

attribAddress = bufferBindingAddress + effectiveVertexOffset + attribDesc.offset;
```

22.4.1. Vertex Input Extraction

For each attribute, raw data is extracted starting at `attribAddress` and is converted from the `VkVertexInputAttributeDescription`'s `format` in the same manner as described for [image reads](#) as if a texel were read from that address. The numeric type of the attribute's `format` **must** match the numeric type of the input variable in the shader. The input variable in the shader **must** be declared as a 64-bit data type if and only if `format` is a 64-bit data type. If the sum of `attribAddress` and the data extracted is outside of the bound vertex buffer, behavior is as described by [Shader Out-of-Bounds Memory Access](#).

If `format` is a packed format, `attribAddress` **must** be a multiple of the size in bytes of the size of the format as described in [Packed Formats](#). Otherwise, `attribAddress` **must** be a multiple of the size in bytes of the component type indicated by `format` (see [Formats](#)).

The number of components in the vertex shader input variable need not exactly match the number of components in the format. If the vertex shader has fewer components, the extra components are discarded. If the [numeric format](#) of `format` uses sRGB encoding, the implementation **should** convert values from nonlinear to linear as described in the “sRGB EOTF” section of the [Khronos Data Format Specification](#). Implementations which do not convert nonlinear to linear for sRGB formats **should** not expose `VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT` for such formats.

Chapter 23. Tessellation

Tessellation involves three pipeline stages. First, a [tessellation control shader](#) transforms control points of a patch and **can** produce per-patch data. Second, a fixed-function tessellator generates multiple primitives corresponding to a tessellation of the patch in (u,v) or (u,v,w) parameter space. Third, a [tessellation evaluation shader](#) transforms the vertices of the tessellated patch, for example to compute their positions and attributes as part of the tessellated surface. The tessellator is enabled when the pipeline contains both a tessellation control shader and a tessellation evaluation shader.

23.1. Tessellator

If a pipeline includes both tessellation shaders (control and evaluation), the tessellator consumes each input patch (after vertex shading) and produces a new set of independent primitives (points, lines, or triangles). These primitives are logically produced by subdividing a geometric primitive (rectangle or triangle) according to the per-patch outer and inner tessellation levels written by the tessellation control shader. These levels are specified using the [built-in variables](#) `TessLevelOuter` and `TessLevelInner`, respectively. This subdivision is performed in an implementation-dependent manner. If no tessellation shaders are present in the pipeline, the tessellator is disabled and incoming primitives are passed through without modification.

The type of subdivision performed by the tessellator is specified by an `OpExecutionMode` instruction using one of the `Triangles`, `Quads`, or `Isolines` execution modes. This instruction **may** be specified in either the tessellation evaluation or tessellation control shader. Other tessellation-related execution modes **can** also be specified in either the tessellation control or tessellation evaluation shaders.

Any tessellation-related modes specified in both the tessellation control and tessellation evaluation shaders **must** be the same.

Tessellation execution modes include:

- `Triangles`, `Quads`, and `Isolines`. These control the type of subdivision and topology of the output primitives. One mode **must** be set in at least one of the tessellation shader stages.
- `VertexOrderCw` and `VertexOrderCcw`. These control the orientation of triangles generated by the tessellator. One mode **must** be set in at least one of the tessellation shader stages.
- `PointMode`. Controls generation of points rather than triangles or lines. This functionality defaults to disabled, and is enabled if either shader stage includes the execution mode.
- `SpacingEqual`, `SpacingFractionalEven`, and `SpacingFractionalOdd`. Controls the spacing of segments on the edges of tessellated primitives. One mode **must** be set in at least one of the tessellation shader stages.
- `OutputVertices`. Controls the size of the output patch of the tessellation control shader. One value **must** be set in at least one of the tessellation shader stages.

For triangles, the tessellator subdivides a triangle primitive into smaller triangles. For quads, the tessellator subdivides a rectangle primitive into smaller triangles. For isolines, the tessellator subdivides a rectangle primitive into a collection of line segments arranged in strips stretching

across the rectangle in the u dimension (i.e. the coordinates in **TessCoord** are of the form (0,x) through (1,x) for all tessellation evaluation shader invocations that share a line).

Each vertex produced by the tessellator has an associated (u,v,w) or (u,v) position in a normalized parameter space, with parameter values in the range [0,1], as illustrated in figures [Domain parameterization for tessellation primitive modes \(upper-left origin\)](#) and [Domain parameterization for tessellation primitive modes \(lower-left origin\)](#). The domain space **can** have either an upper-left or lower-left origin, selected by the **domainOrigin** member of [VkPipelineTessellationDomainOriginStateCreateInfo](#).

Figure 11. Domain parameterization for tessellation primitive modes (upper-left origin)

Figure 12. Domain parameterization for tessellation primitive modes (lower-left origin)

Caption

In the domain parameterization diagrams, the coordinates illustrate the value of **TessCoord** at the corners of the domain. The labels on the edges indicate the inner (IL0 and IL1) and outer (OL0 through OL3) tessellation level values used to control the number of subdivisions along each edge of the domain.

For triangles, the vertex's position is a barycentric coordinate (u,v,w) , where $u + v + w = 1.0$, and indicates the relative influence of the three vertices of the triangle on the position of the vertex. For quads and isolines, the position is a (u,v) coordinate indicating the relative horizontal and vertical position of the vertex relative to the subdivided rectangle. The subdivision process is explained in more detail in subsequent sections.

23.2. Tessellator Patch Discard

A patch is discarded by the tessellator if any relevant outer tessellation level is less than or equal to zero.

Patches will also be discarded if any relevant outer tessellation level corresponds to a floating-point

NaN (not a number) in implementations supporting NaN.

No new primitives are generated and the tessellation evaluation shader is not executed for patches that are discarded. For **Quads**, all four outer levels are relevant. For **Triangles** and **Isolines**, only the first three or two outer levels, respectively, are relevant. Negative inner levels will not cause a patch to be discarded; they will be clamped as described below.

23.3. Tessellator Spacing

Each of the tessellation levels is used to determine the number and spacing of segments used to subdivide a corresponding edge. The method used to derive the number and spacing of segments is specified by an **OpExecutionMode** in the tessellation control or tessellation evaluation shader using one of the identifiers **SpacingEqual**, **SpacingFractionalEven**, or **SpacingFractionalOdd**.

If **SpacingEqual** is used, the floating-point tessellation level is first clamped to $[1, \text{maxLevel}]$, where **maxLevel** is the implementation-dependent maximum tessellation level (**VkPhysicalDeviceLimits::maxTessellationGenerationLevel**). The result is rounded up to the nearest integer n , and the corresponding edge is divided into n segments of equal length in (u,v) space.

If **SpacingFractionalEven** is used, the tessellation level is first clamped to $[2, \text{maxLevel}]$ and then rounded up to the nearest even integer n . If **SpacingFractionalOdd** is used, the tessellation level is clamped to $[1, \text{maxLevel} - 1]$ and then rounded up to the nearest odd integer n . If n is one, the edge will not be subdivided. Otherwise, the corresponding edge will be divided into $n - 2$ segments of equal length, and two additional segments of equal length that are typically shorter than the other segments. The length of the two additional segments relative to the others will decrease monotonically with $n - f$, where f is the clamped floating-point tessellation level. When $n - f$ is zero, the additional segments will have equal length to the other segments. As $n - f$ approaches 2.0, the relative length of the additional segments approaches zero. The two additional segments **must** be placed symmetrically on opposite sides of the subdivided edge. The relative location of these two segments is implementation-dependent, but **must** be identical for any pair of subdivided edges with identical values of f .

When tessellating triangles or quads using **point mode** with fractional odd spacing, the tessellator **may** produce *interior vertices* that are positioned on the edge of the patch if an inner tessellation level is less than or equal to one. Such vertices are considered distinct from vertices produced by subdividing the outer edge of the patch, even if there are pairs of vertices with identical coordinates.

23.4. Tessellation Primitive Ordering

Few guarantees are provided for the relative ordering of primitives produced by tessellation, as they pertain to **primitive order**.

- The output primitives generated from each input primitive are passed to subsequent pipeline stages in an implementation-dependent order.
- All output primitives generated from a given input primitive are passed to subsequent pipeline stages before any output primitives generated from subsequent input primitives.

23.5. Tessellator Vertex Winding Order

When the tessellator produces triangles (in the **Triangles** or **Quads** modes), the orientation of all triangles is specified with an **OpExecutionMode** of **VertexOrderCw** or **VertexOrderCcw** in the tessellation control or tessellation evaluation shaders. If the order is **VertexOrderCw**, the vertices of all generated triangles will have clockwise ordering in (u,v) or (u,v,w) space. If the order is **VertexOrderCcw**, the vertices will have counter-clockwise ordering in that space.

If the tessellation domain has an upper-left origin, the vertices of a triangle have counter-clockwise ordering if

$$a = u_0 v_1 - u_1 v_0 + u_1 v_2 - u_2 v_1 + u_2 v_0 - u_0 v_2$$

is negative, and clockwise ordering if a is positive. u_i and v_i are the u and v coordinates in normalized parameter space of the i th vertex of the triangle. If the tessellation domain has a lower-left origin, the vertices of a triangle have counter-clockwise ordering if a is positive, and clockwise ordering if a is negative.

NOTE

The value a is proportional (with a positive factor) to the signed area of the triangle.

In **Triangles** mode, even though the vertex coordinates have a w value, it does not participate directly in the computation of a , being an affine combination of u and v .

23.6. Triangle Tessellation

If the tessellation primitive mode is **Triangles**, an equilateral triangle is subdivided into a collection of triangles covering the area of the original triangle. First, the original triangle is subdivided into a collection of concentric equilateral triangles. The edges of each of these triangles are subdivided, and the area between each triangle pair is filled by triangles produced by joining the vertices on the subdivided edges. The number of concentric triangles and the number of subdivisions along each triangle except the outermost is derived from the first inner tessellation level. The edges of the outermost triangle are subdivided independently, using the first, second, and third outer tessellation levels to control the number of subdivisions of the $u = 0$ (left), $v = 0$ (bottom), and $w = 0$ (right) edges, respectively. The second inner tessellation level and the fourth outer tessellation level have no effect in this mode.

If the first inner tessellation level and all three outer tessellation levels are exactly one after clamping and rounding, only a single triangle with (u,v,w) coordinates of (0,0,1), (1,0,0), and (0,1,0) is generated. If the inner tessellation level is one and any of the outer tessellation levels is greater than one, the inner tessellation level is treated as though it were originally specified as $1 + \epsilon$ and will result in a two- or three-segment subdivision depending on the tessellation spacing. When used with fractional odd spacing, the three-segment subdivision **may** produce *inner vertices* positioned on the edge of the triangle.

If any tessellation level is greater than one, tessellation begins by producing a set of concentric inner triangles and subdividing their edges. First, the three outer edges are temporarily subdivided using the clamped and rounded first inner tessellation level and the specified tessellation spacing,

generating n segments. For the outermost inner triangle, the inner triangle is degenerate — a single point at the center of the triangle — if n is two. Otherwise, for each corner of the outer triangle, an inner triangle corner is produced at the intersection of two lines extended perpendicular to the corner's two adjacent edges running through the vertex of the subdivided outer edge nearest that corner. If n is three, the edges of the inner triangle are not subdivided and it is the final triangle in the set of concentric triangles. Otherwise, each edge of the inner triangle is divided into $n - 2$ segments, with the $n - 1$ vertices of this subdivision produced by intersecting the inner edge with lines perpendicular to the edge running through the $n - 1$ innermost vertices of the subdivision of the outer edge. Once the outermost inner triangle is subdivided, the previous subdivision process repeats itself, using the generated triangle as an outer triangle. This subdivision process is illustrated in [Inner Triangle Tessellation](#).

Figure 13. Inner Triangle Tessellation

Caption

In the [Inner Triangle Tessellation](#) diagram, inner tessellation levels of (a) four and (b) five are shown (not to scale). Solid black circles depict vertices along the edges of the concentric triangles. The edges of inner triangles are subdivided by intersecting the edge with segments perpendicular to the edge passing through each inner vertex of the subdivided outer edge. Dotted lines depict edges connecting corresponding vertices on the inner and outer triangle edges.

Once all the concentric triangles are produced and their edges are subdivided, the area between each pair of adjacent inner triangles is filled completely with a set of non-overlapping triangles. In this subdivision, two of the three vertices of each triangle are taken from adjacent vertices on a subdivided edge of one triangle; the third is one of the vertices on the corresponding edge of the other triangle. If the innermost triangle is degenerate (i.e., a point), the triangle containing it is subdivided into six triangles by connecting each of the six vertices on that triangle with the center point. If the innermost triangle is not degenerate, that triangle is added to the set of generated triangles as-is.

After the area corresponding to any inner triangles is filled, the tessellator generates triangles to cover the area between the outermost triangle and the outermost inner triangle. To do this, the

temporary subdivision of the outer triangle edge above is discarded. Instead, the $u = 0$, $v = 0$, and $w = 0$ edges are subdivided according to the first, second, and third outer tessellation levels, respectively, and the tessellation spacing. The original subdivision of the first inner triangle is retained. The area between the outer and first inner triangles is completely filled by non-overlapping triangles as described above. If the first (and only) inner triangle is degenerate, a set of triangles is produced by connecting each vertex on the outer triangle edges with the center point.

After all triangles are generated, each vertex in the subdivided triangle is assigned a barycentric (u,v,w) coordinate based on its location relative to the three vertices of the outer triangle.

The algorithm used to subdivide the triangular domain in (u,v,w) space into individual triangles is implementation-dependent. However, the set of triangles produced will completely cover the domain, and no portion of the domain will be covered by multiple triangles.

Output triangles are generated with a topology similar to [triangle lists](#), except that the order in which each triangle is generated, and the order in which the vertices are generated for each triangle, are implementation-dependent. However, the order of vertices in each triangle is consistent across the domain as described in [Tessellator Vertex Winding Order](#).

23.7. Quad Tessellation

If the tessellation primitive mode is **Quads**, a rectangle is subdivided into a collection of triangles covering the area of the original rectangle. First, the original rectangle is subdivided into a regular mesh of rectangles, where the number of rectangles along the $u = 0$ and $u = 1$ (vertical) and $v = 0$ and $v = 1$ (horizontal) edges are derived from the first and second inner tessellation levels, respectively. All rectangles, except those adjacent to one of the outer rectangle edges, are decomposed into triangle pairs. The outermost rectangle edges are subdivided independently, using the first, second, third, and fourth outer tessellation levels to control the number of subdivisions of the $u = 0$ (left), $v = 0$ (bottom), $u = 1$ (right), and $v = 1$ (top) edges, respectively. The area between the inner rectangles of the mesh and the outer rectangle edges are filled by triangles produced by joining the vertices on the subdivided outer edges to the vertices on the edge of the inner rectangle mesh.

If both clamped inner tessellation levels and all four clamped outer tessellation levels are exactly one, only a single triangle pair covering the outer rectangle is generated. Otherwise, if either clamped inner tessellation level is one, that tessellation level is treated as though it was originally specified as $1 + \epsilon$ and will result in a two- or three-segment subdivision depending on the tessellation spacing. When used with fractional odd spacing, the three-segment subdivision **may** produce *inner vertices* positioned on the edge of the rectangle.

If any tessellation level is greater than one, tessellation begins by subdividing the $u = 0$ and $u = 1$ edges of the outer rectangle into m segments using the clamped and rounded first inner tessellation level and the tessellation spacing. The $v = 0$ and $v = 1$ edges are subdivided into n segments using the second inner tessellation level. Each vertex on the $u = 0$ and $v = 0$ edges are joined with the corresponding vertex on the $u = 1$ and $v = 1$ edges to produce a set of vertical and horizontal lines that divide the rectangle into a grid of smaller rectangles. The primitive generator emits a pair of non-overlapping triangles covering each such rectangle not adjacent to an edge of the outer rectangle. The boundary of the region covered by these triangles forms an inner rectangle, the

edges of which are subdivided by the grid vertices that lie on the edge. If either m or n is two, the inner rectangle is degenerate, and one or both of the rectangle's *edges* consist of a single point. This subdivision is illustrated in Figure [Inner Quad Tessellation](#).

Figure 14. Inner Quad Tessellation

Caption

In the [Inner Quad Tessellation](#) diagram, inner quad tessellation levels of (a) (4,2) and (b) (7,4) are shown. The regions highlighted in red in figure (b) depict the 10 inner rectangles, each of which will be subdivided into two triangles. Solid black circles depict vertices on the boundary of the outer and inner rectangles, where the inner rectangle of figure (a) is degenerate (a single line segment). Dotted lines depict the horizontal and vertical edges connecting corresponding vertices on the inner and outer rectangle edges.

After the area corresponding to the inner rectangle is filled, the tessellator **must** produce triangles to cover the area between the inner and outer rectangles. To do this, the subdivision of the outer rectangle edge above is discarded. Instead, the $u = 0$, $v = 0$, $u = 1$, and $v = 1$ edges are subdivided according to the first, second, third, and fourth outer tessellation levels, respectively, and the tessellation spacing. The original subdivision of the inner rectangle is retained. The area between the outer and inner rectangles is completely filled by non-overlapping triangles. Two of the three vertices of each triangle are adjacent vertices on a subdivided edge of one rectangle; the third is one of the vertices on the corresponding edge of the other rectangle. If either edge of the innermost rectangle is degenerate, the area near the corresponding outer edges is filled by connecting each vertex on the outer edge with the single vertex making up the *inner edge*.

The algorithm used to subdivide the rectangular domain in (u,v) space into individual triangles is implementation-dependent. However, the set of triangles produced will completely cover the domain, and no portion of the domain will be covered by multiple triangles.

Output triangles are generated with a topology similar to [triangle lists](#), except that the order in which each triangle is generated, and the order in which the vertices are generated for each triangle, are implementation-dependent. However, the order of vertices in each triangle is consistent across the domain as described in [Tessellator Vertex Winding Order](#).

23.8. Isoline Tessellation

If the tessellation primitive mode is **Isolines**, a set of independent horizontal line segments is drawn. The segments are arranged into connected strips called *isolines*, where the vertices of each isoline have a constant *v* coordinate and *u* coordinates covering the full range [0,1]. The number of isolines generated is derived from the first outer tessellation level; the number of segments in each isoline is derived from the second outer tessellation level. Both inner tessellation levels and the third and fourth outer tessellation levels have no effect in this mode.

As with quad tessellation above, isoline tessellation begins with a rectangle. The *u* = 0 and *u* = 1 edges of the rectangle are subdivided according to the first outer tessellation level. For the purposes of this subdivision, the tessellation spacing mode is ignored and treated as `equal_spacing`. An isoline is drawn connecting each vertex on the *u* = 0 rectangle edge to the corresponding vertex on the *u* = 1 rectangle edge, except that no line is drawn between (0,1) and (1,1). If the number of isolines on the subdivided *u* = 0 and *u* = 1 edges is *n*, this process will result in *n* equally spaced lines with constant *v* coordinates of $0, \frac{1}{n}, \frac{2}{n}, \dots, \frac{n-1}{n}$.

Each of the *n* isolines is then subdivided according to the second outer tessellation level and the tessellation spacing, resulting in *m* line segments. Each segment of each line is emitted by the tessellator. These line segments are generated with a topology similar to [line lists](#), except that the order in which each line is generated, and the order in which the vertices are generated for each line segment, are implementation-dependent.

23.9. Tessellation Point Mode

For all primitive modes, the tessellator is capable of generating points instead of lines or triangles. If the tessellation control or tessellation evaluation shader specifies the **OpExecutionMode PointMode**, the primitive generator will generate one point for each distinct vertex produced by tessellation, rather than emitting triangles or lines. Otherwise, the tessellator will produce a collection of line segments or triangles according to the primitive mode. These points are generated with a topology similar to [point lists](#), except the order in which the points are generated for each input primitive is undefined.

23.10. Tessellation Pipeline State

The `pTessellationState` member of [VkGraphicsPipelineCreateInfo](#) is a pointer to a [VkPipelineTessellationStateCreateInfo](#) structure.

The [VkPipelineTessellationStateCreateInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineTessellationStateCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkPipelineTessellationStateCreateFlags flags;
    uint32_t                  patchControlPoints;
} VkPipelineTessellationStateCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `patchControlPoints` is the number of control points per patch.

Valid Usage

- VUID-VkPipelineTessellationStateCreateInfo-patchControlPoints-01214
`patchControlPoints` **must** be greater than zero and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`

Valid Usage (Implicit)

- VUID-VkPipelineTessellationStateCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_STATE_CREATE_INFO`
- VUID-VkPipelineTessellationStateCreateInfo-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkPipelineTessellationDomainOriginStateCreateInfo`
- VUID-VkPipelineTessellationStateCreateInfo-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkPipelineTessellationStateCreateInfo-flags-zero bitmask
`flags` **must** be 0

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineTessellationStateCreateFlags;
```

`VkPipelineTessellationStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkPipelineTessellationDomainOriginStateCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPipelineTessellationDomainOriginStateCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkTessellationDomainOrigin domainOrigin;
} VkPipelineTessellationDomainOriginStateCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `domainOrigin` is a `VkTessellationDomainOrigin` value controlling the origin of the tessellation

domain space.

If the `VkPipelineTessellationDomainOriginStateCreateInfo` structure is included in the `pNext` chain of `VkPipelineTessellationStateCreateInfo`, it controls the origin of the tessellation domain. If this structure is not present, it is as if `domainOrigin` was `VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT`.

Valid Usage (Implicit)

- VUID-VkPipelineTessellationDomainOriginStateCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_DOMAIN_ORIGIN_STATE_CREATE_INFO`
- VUID-VkPipelineTessellationDomainOriginStateCreateInfo-domainOrigin-parameter
`domainOrigin` **must** be a valid `VkTessellationDomainOrigin` value

The possible tessellation domain origins are specified by the `VkTessellationDomainOrigin` enumeration:

```
// Provided by VK_VERSION_1_1
typedef enum VkTessellationDomainOrigin {
    VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT = 0,
    VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT = 1,
} VkTessellationDomainOrigin;
```

- `VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT` specifies that the origin of the domain space is in the upper left corner, as shown in figure [Domain parameterization for tessellation primitive modes \(upper-left origin\)](#).
- `VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT` specifies that the origin of the domain space is in the lower left corner, as shown in figure [Domain parameterization for tessellation primitive modes \(lower-left origin\)](#).

This enum affects how the `VertexOrderCw` and `VertexOrderCcw` tessellation execution modes are interpreted, since the winding is defined relative to the orientation of the domain.

Chapter 24. Geometry Shading

The geometry shader operates on a group of vertices and their associated data assembled from a single input primitive, and emits zero or more output primitives and the group of vertices and their associated data required for each output primitive. Geometry shading is enabled when a geometry shader is included in the pipeline.

24.1. Geometry Shader Input Primitives

Each geometry shader invocation has access to all vertices in the primitive (and their associated data), which are presented to the shader as an array of inputs.

The input primitive type expected by the geometry shader is specified with an `OpExecutionMode` instruction in the geometry shader, and **must** match the incoming primitive type specified by either the pipeline's `primitive topology` if tessellation is inactive, or the `tessellation mode` if tessellation is active, as follows:

- An input primitive type of `InputPoints` **must** only be used with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, or with a tessellation shader specifying `PointMode`. The input arrays always contain one element, as described by the `point list topology` or `tessellation in point mode`.
- An input primitive type of `InputLines` **must** only be used with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_LINE_LIST` or `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP`, or with a tessellation shader specifying `IsoLines` that does not specify `PointMode`. The input arrays always contain two elements, as described by the `line list topology` or `line strip topology`, or by `isoline tessellation`.
- An input primitive type of `InputLinesAdjacency` **must** only be used when tessellation is inactive, with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY`. The input arrays always contain four elements, as described by the `line list with adjacency topology` or `line strip with adjacency topology`.
- An input primitive type of `Triangles` **must** only be used with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP`, or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN`; or with a tessellation shader specifying `Quads` or `Triangles` that does not specify `PointMode`. The input arrays always contain three elements, as described by the `triangle list topology`, `triangle strip topology`, or `triangle fan topology`, or by `triangle` or `quad tessellation`. Vertices **may** be in a different absolute order than specified by the topology, but **must** adhere to the specified winding order.
- An input primitive type of `InputTrianglesAdjacency` **must** only be used when tessellation is inactive, with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY`. The input arrays always contain six elements, as described by the `triangle list with adjacency topology` or `triangle strip with adjacency topology`. Vertices **may** be in a different absolute order than specified by the topology, but **must** adhere to the specified winding order, and the vertices making up the main primitive **must** still occur at the first, third, and fifth index.

24.2. Geometry Shader Output Primitives

A geometry shader generates primitives in one of three output modes: points, line strips, or triangle strips. The primitive mode is specified in the shader using an `OpExecutionMode` instruction with the `OutputPoints`, `OutputLineStrip` or `OutputTriangleStrip` modes, respectively. Each geometry shader **must** include exactly one output primitive mode.

The vertices output by the geometry shader are assembled into points, lines, or triangles based on the output primitive type and the resulting primitives are then further processed as described in [Rasterization](#). If the number of vertices emitted by the geometry shader is not sufficient to produce a single primitive, vertices corresponding to incomplete primitives are not processed by subsequent pipeline stages. The number of vertices output by the geometry shader is limited to a maximum count specified in the shader.

The maximum output vertex count is specified in the shader using an `OpExecutionMode` instruction with the mode set to `OutputVertices` and the maximum number of vertices that will be produced by the geometry shader specified as a literal. Each geometry shader **must** specify a maximum output vertex count.

24.3. Multiple Invocations of Geometry Shaders

Geometry shaders **can** be invoked more than one time for each input primitive. This is known as *geometry shader instancing* and is requested by including an `OpExecutionMode` instruction with `mode` specified as `Invocations` and the number of invocations specified as an integer literal.

In this mode, the geometry shader will execute at least *n* times for each input primitive, where *n* is the number of invocations specified in the `OpExecutionMode` instruction. The instance number is available to each invocation as a built-in input using `InvocationId`.

24.4. Geometry Shader Primitive Ordering

Limited guarantees are provided for the relative ordering of primitives produced by a geometry shader, as they pertain to [primitive order](#).

- For instanced geometry shaders, the output primitives generated from each input primitive are passed to subsequent pipeline stages using the invocation number to order the primitives, from least to greatest.
- All output primitives generated from a given input primitive are passed to subsequent pipeline stages before any output primitives generated from subsequent input primitives.

Chapter 25. Fixed-Function Vertex Post-Processing

After [pre-rasterization shader stages](#), the following fixed-function operations are applied to vertices of the resulting primitives:

- Flat shading (see [Flat Shading](#)).
- Primitive clipping, including application-defined half-spaces (see [Primitive Clipping](#)).
- Shader output attribute clipping (see [Clipping Shader Outputs](#)).
- Perspective division on clip coordinates (see [Coordinate Transformations](#)).
- Viewport mapping, including depth range scaling (see [Controlling the Viewport](#)).
- Front face determination for polygon primitives (see [Basic Polygon Rasterization](#)).

Next, rasterization is performed on primitives as described in chapter [Rasterization](#).

25.1. Flat Shading

Flat shading a vertex output attribute means to assign all vertices of the primitive the same value for that output. The output values assigned are those of the *provoking vertex* of the primitive. Flat shading is applied to those vertex attributes that [match](#) fragment input attributes which are decorated as **Flat**.

If neither [geometry](#) nor [tessellation shading](#) is active, the provoking vertex is determined by the [primitive topology](#) defined by `VkPipelineInputAssemblyStateCreateInfo:topology` used to execute the [drawing command](#).

If [geometry shading](#) is active, the provoking vertex is determined by the [primitive topology](#) defined by the `OutputPoints`, `OutputLineStrip`, or `OutputTriangleStrip` execution mode.

If [tessellation shading](#) is active but [geometry shading](#) is not, the provoking vertex **may** be any of the vertices in each primitive.

25.2. Primitive Clipping

Primitives are culled against the *cull volume* and then clipped to the *clip volume*. In clip coordinates, the *view volume* is defined by:

$$\begin{aligned} -w_c &\leq x_c \leq w_c \\ -w_c &\leq y_c \leq w_c \\ z_m &\leq z_c \leq w_c \end{aligned}$$

where z_m is equal to zero.

This view volume **can** be further restricted by as many as `VkPhysicalDeviceLimits::maxClipDistances` application-defined half-spaces.

The cull volume is the intersection of up to `VkPhysicalDeviceLimits::maxCullDistances` application-defined half-spaces (if no application-defined cull half-spaces are enabled, culling against the cull volume is skipped).

A shader **must** write a single cull distance for each enabled cull half-space to elements of the `CullDistance` array. If the cull distance for any enabled cull half-space is negative for all of the vertices of the primitive under consideration, the primitive is discarded. Otherwise the primitive is clipped against the clip volume as defined below.

The clip volume is the intersection of up to `VkPhysicalDeviceLimits::maxClipDistances` application-defined half-spaces with the view volume (if no application-defined clip half-spaces are enabled, the clip volume is the view volume).

A shader **must** write a single clip distance for each enabled clip half-space to elements of the `ClipDistance` array. Clip half-space i is then given by the set of points satisfying the inequality

$$c_i(\mathbf{P}) \geq 0$$

where $c_i(\mathbf{P})$ is the clip distance i at point $\mathbf{P}$. For point primitives, $c_i(\mathbf{P})$ is simply the clip distance for the vertex in question. For line and triangle primitives, per-vertex clip distances are interpolated using a weighted mean, with weights derived according to the algorithms described in sections [Basic Line Segment Rasterization](#) and [Basic Polygon Rasterization](#), using the perspective interpolation equations.

The number of application-defined clip and cull half-spaces that are enabled is determined by the explicit size of the built-in arrays `ClipDistance` and `CullDistance`, respectively, declared as an output in the interface of the entry point of the final shader stage before clipping.

If `VkPipelineRasterizationDepthClipStateCreateInfoEXT` is present in the graphics pipeline state then depth clipping is disabled if `VkPipelineRasterizationDepthClipStateCreateInfoEXT::depthClipEnable` is `VK_FALSE`. Otherwise, if `VkPipelineRasterizationDepthClipStateCreateInfoEXT` is not present, depth clipping is disabled when `VkPipelineRasterizationStateCreateInfo::depthClampEnable` is `VK_TRUE`.

When depth clipping is disabled, the plane equation

$$Z_m \leq Z_c \leq W_c$$

(see the clip volume definition above) is ignored by view volume clipping (effectively, there is no near or far plane clipping).

If the primitive under consideration is a point or line segment, then clipping passes it unchanged if its vertices lie entirely within the clip volume.

Possible values of `VkPhysicalDevicePointClippingProperties::pointClippingBehavior`, specifying clipping behavior of a point primitive whose vertex lies outside the clip volume, are:

```
// Provided by VK_VERSION_1_1
typedef enum VkPointClippingBehavior {
    VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES = 0,
    VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY = 1,
} VkPointClippingBehavior;
```

- **VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES** specifies that the primitive is discarded if the vertex lies outside any clip plane, including the planes bounding the view volume.
- **VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY** specifies that the primitive is discarded only if the vertex lies outside any user clip plane.

If either of a line segment's vertices lie outside of the clip volume, the line segment **may** be clipped, with new vertex coordinates computed for each vertex that lies outside the clip volume. A clipped line segment endpoint lies on both the original line segment and the boundary of the clip volume.

This clipping produces a value, $0 \leq t \leq 1$, for each clipped vertex. If the coordinates of a clipped vertex are **P** and the unclipped line segment's vertex coordinates are **P**₁ and **P**₂, then t satisfies the following equation

$$\mathbf{P} = t \mathbf{P}_1 + (1-t) \mathbf{P}_2.$$

t is used to clip vertex output attributes as described in [Clipping Shader Outputs](#).

If the primitive is a polygon, it passes unchanged if every one of its edges lies entirely inside the clip volume, and is either clipped or discarded otherwise. If the edges of the polygon intersect the boundary of the clip volume, the intersecting edges are reconnected by new edges that lie along the boundary of the clip volume - in some cases requiring the introduction of new vertices into a polygon.

If a polygon intersects an edge of the clip volume's boundary, the clipped polygon **must** include a point on this boundary edge.

Primitives rendered with application-defined half-spaces **must** satisfy a complementarity criterion. Suppose a series of primitives is drawn where each vertex i has a single specified clip distance d_i (or a number of similarly specified clip distances, if multiple half-spaces are enabled). Next, suppose that the same series of primitives are drawn again with each such clip distance replaced by $-d_i$ (and the graphics pipeline is otherwise the same). In this case, primitives **must** not be missing any pixels, and pixels **must** not be drawn twice in regions where those primitives are cut by the clip planes.

25.3. Clipping Shader Outputs

Next, vertex output attributes are clipped. The output values associated with a vertex that lies within the clip volume are unaffected by clipping. If a primitive is clipped, however, the output values assigned to vertices produced by clipping are clipped.

Let the output values assigned to the two vertices **P**₁ and **P**₂ of an unclipped edge be **c**₁ and **c**₂. The value of t (see [Primitive Clipping](#)) for a clipped point **P** is used to obtain the output value associated

with $\mathbf{P}$ as

$$\mathbf{c} = t \mathbf{c}_1 + (1-t) \mathbf{c}_2.$$

(Multiplying an output value by a scalar means multiplying each of x , y , z , and w by the scalar.)

Since this computation is performed in clip space before division by w_c , clipped output values are perspective-correct.

Polygon clipping creates a clipped vertex along an edge of the clip volume's boundary. This situation is handled by noting that polygon clipping proceeds by clipping against one half-space at a time. Output value clipping is done in the same way, so that clipped points always occur at the intersection of polygon edges (possibly already clipped) with the clip volume's boundary.

For vertex output attributes whose matching fragment input attributes are decorated with **NoPerspective**, the value of t used to obtain the output value associated with $\mathbf{P}$ will be adjusted to produce results that vary linearly in framebuffer space.

Output attributes of integer or unsigned integer type **must** always be flat shaded. Flat shaded attributes are constant over the primitive being rasterized (see [Basic Line Segment Rasterization](#) and [Basic Polygon Rasterization](#)), and no interpolation is performed. The output value $\mathbf{c}$ is taken from either $\mathbf{c}_1$ or $\mathbf{c}_2$, since flat shading has already occurred and the two values are identical.

25.4. Coordinate Transformations

Clip coordinates for a vertex result from shader execution, which yields a vertex coordinate **Position**.

Perspective division on clip coordinates yields *normalized device coordinates*, followed by a *viewport* transformation (see [Controlling the Viewport](#)) to convert these coordinates into *framebuffer coordinates*.

If a vertex in clip coordinates has a position given by

$$\begin{pmatrix} x_c \\ y_c \\ z_c \\ w_c \end{pmatrix}$$

then the vertex's normalized device coordinates are

$$\begin{pmatrix} x_d \\ y_d \\ z_d \end{pmatrix} = \begin{pmatrix} \frac{x_c}{w_c} \\ \frac{y_c}{w_c} \\ \frac{z_c}{w_c} \end{pmatrix}$$

25.5. Controlling the Viewport

The viewport transformation is determined by the selected viewport's width and height in pixels, p_x and p_y , respectively, and its center (o_x , o_y) (also in pixels), as well as its depth range min and max determining a depth range scale value p_z and a depth range bias value o_z (defined below). The vertex's framebuffer coordinates (x_f , y_f) and depth z_f are given by

$$x_f = (p_x / 2) x_d + o_x$$

$$y_f = (p_y / 2) y_d + o_y$$

$$z_f = p_z \times z_d + o_z$$

Multiple viewports are available, numbered zero up to `VkPhysicalDeviceLimits::maxViewports` minus one. The number of viewports used by a pipeline is controlled by the `viewportCount` member of the `VkPipelineViewportStateCreateInfo` structure used in pipeline creation.

x_f and y_f have limited precision, where the number of fractional bits retained is specified by `VkPhysicalDeviceLimits::subPixelPrecisionBits`. When rasterizing [line segments](#), the number of fractional bits is specified by `VkPhysicalDeviceLineRasterizationProperties::lineSubPixelPrecisionBits`.

The `VkPipelineViewportStateCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineViewportStateCreateInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkPipelineViewportStateCreateFlags flags;
    uint32_t                 viewportCount;
    const VkViewport*        pViewports;
    uint32_t                 scissorCount;
    const VkRect2D*          pScissors;
} VkPipelineViewportStateCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `viewportCount` is the number of viewports used by the pipeline.
- `pViewports` is a pointer to an array of `VkViewport` structures, defining the viewport transforms. If the viewport state is dynamic, this member is ignored.
- `scissorCount` is the number of `scissors` and **must** match the number of viewports.
- `pScissors` is a pointer to an array of `VkRect2D` structures defining the rectangular bounds of the

scissor for the corresponding viewport. If the scissor state is dynamic, this member is ignored.

Valid Usage

- VUID-VkPipelineViewportStateCreateInfo-viewportCount-01216
If the `multiViewport` feature is not enabled, `viewportCount` **must** not be greater than 1
- VUID-VkPipelineViewportStateCreateInfo-scissorCount-01217
If the `multiViewport` feature is not enabled, `scissorCount` **must** not be greater than 1
- VUID-VkPipelineViewportStateCreateInfo-viewportCount-01218
`viewportCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxViewports`
- VUID-VkPipelineViewportStateCreateInfo-scissorCount-01219
`scissorCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxViewports`
- VUID-VkPipelineViewportStateCreateInfo-x-02821
The `x` and `y` members of `offset` member of any element of `pScissors` **must** be greater than or equal to 0
- VUID-VkPipelineViewportStateCreateInfo-offset-02822
Evaluation of $(\text{offset.x} + \text{extent.width})$ **must** not cause a signed integer addition overflow for any element of `pScissors`
- VUID-VkPipelineViewportStateCreateInfo-offset-02823
Evaluation of $(\text{offset.y} + \text{extent.height})$ **must** not cause a signed integer addition overflow for any element of `pScissors`
- VUID-VkPipelineViewportStateCreateInfo-scissorCount-04134
If `scissorCount` and `viewportCount` are both not dynamic, then `scissorCount` and `viewportCount` **must** be identical
- VUID-VkPipelineViewportStateCreateInfo-viewportCount-04135
If the graphics pipeline is being created with `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` set then `viewportCount` **must** be 0, otherwise `viewportCount` **must** be greater than 0
- VUID-VkPipelineViewportStateCreateInfo-scissorCount-04136
If the graphics pipeline is being created with `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` set then `scissorCount` **must** be 0, otherwise `scissorCount` **must** be greater than 0

Valid Usage (Implicit)

- VUID-VkPipelineViewportStateCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_STATE_CREATE_INFO`
- VUID-VkPipelineViewportStateCreateInfo-pNext-pNext
`pNext` **must** be NULL
- VUID-VkPipelineViewportStateCreateInfo-flags-zeroBitmask
`flags` **must** be 0

To [dynamically set](#) the viewport count and viewports, call:

```
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetViewportWithCountEXT(
    VkCommandBuffer                      commandBuffer,
    uint32_t                             viewportCount,
    const VkViewport*                   pViewports);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `viewportCount` specifies the viewport count.
- `pViewports` specifies the viewports to use for drawing.

This command sets the viewport count and viewports state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineViewportStateCreateInfo::viewportCount` and `pViewports` values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetViewportWithCount-None-08971
At least one of the following **must** be true:
 - the `extendedDynamicState` feature is enabled
- VUID-vkCmdSetViewportWithCount-viewportCount-03394
`viewportCount` **must** be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive
- VUID-vkCmdSetViewportWithCount-viewportCount-03395
If the `multiViewport` feature is not enabled, `viewportCount` **must** be 1

Valid Usage (Implicit)

- VUID-vkCmdSetViewportWithCount-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetViewportWithCount-pViewports-parameter
`pViewports` **must** be a valid pointer to an array of `viewportCount` valid `VkViewport` structures
- VUID-vkCmdSetViewportWithCount-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdSetViewportWithCount-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetViewportWithCount-viewportCount-arraylength
`viewportCount` **must** be greater than 0

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

To [dynamically set](#) the scissor count and scissor rectangular bounds, call:

```
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetScissorWithCountEXT(
    VkCommandBuffer          commandBuffer,
    uint32_t                 scissorCount,
    const VkRect2D*          pScissors);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `scissorCount` specifies the scissor count.
- `pScissors` specifies the scissors to use for drawing.

This command sets the scissor count and scissor rectangular bounds state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineViewportStateCreateInfo::scissorCount` and `pScissors` values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetScissorWithCount-None-08971
At least one of the following **must** be true:
 - the `extendedDynamicState` feature is enabled
- VUID-vkCmdSetScissorWithCount-scissorCount-03397
`scissorCount` **must** be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive
- VUID-vkCmdSetScissorWithCount-scissorCount-03398
If the `multiViewport` feature is not enabled, `scissorCount` **must** be 1
- VUID-vkCmdSetScissorWithCount-x-03399

The `x` and `y` members of `offset` member of any element of `pScissors` **must** be greater than or equal to `0`

- VUID-vkCmdSetScissorWithCount-offset-03400
Evaluation of $(\text{offset.x} + \text{extent.width})$ **must** not cause a signed integer addition overflow for any element of `pScissors`
- VUID-vkCmdSetScissorWithCount-offset-03401
Evaluation of $(\text{offset.y} + \text{extent.height})$ **must** not cause a signed integer addition overflow for any element of `pScissors`

Valid Usage (Implicit)

- VUID-vkCmdSetScissorWithCount-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetScissorWithCount-pScissors-parameter
`pScissors` **must** be a valid pointer to an array of `scissorCount` `VkRect2D` structures
- VUID-vkCmdSetScissorWithCount-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetScissorWithCount-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetScissorWithCount-scissorCount-arraylength
`scissorCount` **must** be greater than `0`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineViewportStateCreateFlags;
```

`VkPipelineViewportStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

A *pre-rasterization shader stage* **can** direct each primitive to one of several viewports. The destination viewport for a primitive is selected by the last active *pre-rasterization shader stage* that has an output variable decorated with `ViewportIndex`. The viewport transform uses the viewport corresponding to the value assigned to `ViewportIndex`, and taken from an implementation-dependent vertex of each primitive. If `ViewportIndex` is outside the range zero to `viewportCount` minus one for a primitive, or if the last active *pre-rasterization shader stage* did not assign a value to `ViewportIndex` for all vertices of a primitive due to flow control, the values resulting from the viewport transformation of the vertices of such primitives are undefined. If the last *pre-rasterization shader stage* does not have an output decorated with `ViewportIndex`, the viewport numbered zero is used by the viewport transformation.

A single vertex **can** be used in more than one individual primitive, in primitives such as `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP`. In this case, the viewport transformation is applied separately for each primitive.

To *dynamically set* the viewport transformation parameters, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetViewport(
    VkCommandBuffer          commandBuffer,
    uint32_t                 firstViewport,
    uint32_t                 viewportCount,
    const VkViewport*        pViewports);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstViewport` is the index of the first viewport whose parameters are updated by the command.
- `viewportCount` is the number of viewports whose parameters are updated by the command.
- `pViewports` is a pointer to an array of `VkViewport` structures specifying viewport parameters.

This command sets the viewport transformation parameters state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_VIEWPORT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportStateCreateInfo::pViewports` values used to create the currently active pipeline.

The viewport parameters taken from element `i` of `pViewports` replace the current state for the viewport index `firstViewport + i`, for `i` in `[0, viewportCount)`.

Valid Usage

- VUID-vkCmdSetViewport-firstViewport-01223
The sum of `firstViewport` and `viewportCount` **must** be between `1` and `VkPhysicalDeviceLimits::maxViewports`, inclusive
- VUID-vkCmdSetViewport-firstViewport-01224

If the `multiViewport` feature is not enabled, `firstViewport` **must** be 0

- VUID-vkCmdSetViewport-viewportCount-01225

If the `multiViewport` feature is not enabled, `viewportCount` **must** be 1

Valid Usage (Implicit)

- VUID-vkCmdSetViewport-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetViewport-pViewports-parameter
`pViewports` **must** be a valid pointer to an array of `viewportCount` valid `VkViewport` structures
- VUID-vkCmdSetViewport-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdSetViewport-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetViewport-viewportCount-arraylength
`viewportCount` **must** be greater than 0

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

Both `VkPipelineViewportStateCreateInfo` and `vkCmdSetViewport` use `VkViewport` to set the viewport transformation parameters.

The `VkViewport` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkViewport {
    float    x;
    float    y;
    float    width;
    float    height;
    float    minDepth;
    float    maxDepth;
} VkViewport;
```

- **x** and **y** are the viewport's upper left corner (x,y).
- **width** and **height** are the viewport's width and height, respectively.
- **minDepth** and **maxDepth** are the depth range for the viewport.

NOTE Despite their names, **minDepth** **can** be less than, equal to, or greater than **maxDepth**.

The framebuffer depth coordinate z_f **may** be represented using either a fixed-point or floating-point representation. However, a floating-point representation **must** be used if the depth/stencil attachment has a floating-point depth component. If an m-bit fixed-point representation is used, we assume that it represents each value $\frac{k}{2^m-1}$, where $k \in \{ 0, 1, \dots, 2^m-1 \}$, as k (e.g. 1.0 is represented in binary as a string of all ones).

The viewport parameters shown in the above equations are found from these values as

$$O_x = x + \text{width} / 2$$

$$O_y = y + \text{height} / 2$$

$$O_z = \text{minDepth}$$

$$p_x = \text{width}$$

$$p_y = \text{height}$$

$$p_z = \text{maxDepth} - \text{minDepth}$$

The application **can** specify a negative term for **height**, which has the effect of negating the y coordinate in clip space before performing the transform. When using a negative **height**, the application **should** also adjust the **y** value to point to the lower left corner of the viewport instead of the upper left corner. Using the negative **height** allows the application to avoid having to negate the y component of the **Position** output from the last [pre-rasterization shader stage](#).

The width and height of the [implementation-dependent maximum viewport dimensions](#) **must** be greater than or equal to the width and height of the largest image which **can** be created and attached to a framebuffer.

The floating-point viewport bounds are represented with an [implementation-dependent precision](#).

Valid Usage

- VUID-VkViewport-width-01770
width must be greater than **0.0**
- VUID-VkViewport-width-01771
width must be less than or equal to **VkPhysicalDeviceLimits::maxViewportDimensions[0]**
- VUID-VkViewport-height-01773
The absolute value of **height must** be less than or equal to **VkPhysicalDeviceLimits::maxViewportDimensions[1]**
- VUID-VkViewport-x-01774
x must be greater than or equal to **viewportBoundsRange[0]**
- VUID-VkViewport-x-01232
(**x + width**) **must** be less than or equal to **viewportBoundsRange[1]**
- VUID-VkViewport-y-01775
y must be greater than or equal to **viewportBoundsRange[0]**
- VUID-VkViewport-y-01776
y must be less than or equal to **viewportBoundsRange[1]**
- VUID-VkViewport-y-01777
(**y + height**) **must** be greater than or equal to **viewportBoundsRange[0]**
- VUID-VkViewport-y-01233
(**y + height**) **must** be less than or equal to **viewportBoundsRange[1]**
- VUID-VkViewport-minDepth-01234
If the [VK_EXT_depth_range_unrestricted](#) extension is not enabled, **minDepth must** be between **0.0** and **1.0**, inclusive
- VUID-VkViewport-maxDepth-01235
If the [VK_EXT_depth_range_unrestricted](#) extension is not enabled, **maxDepth must** be between **0.0** and **1.0**, inclusive

Chapter 26. Rasterization

Rasterization is the process by which a primitive is converted to a two-dimensional image. Each discrete location of this image contains associated data such as depth, color, or other attributes.

Rasterizing a primitive begins by determining which squares of an integer grid in framebuffer coordinates are occupied by the primitive, and assigning one or more depth values to each such square. This process is described below for points, lines, and polygons.

A grid square, including its (x,y) framebuffer coordinates, z (depth), and associated data added by fragment shaders, is called a fragment. A fragment is located by its upper left corner, which lies on integer grid coordinates.

Rasterization operations also refer to a fragment's sample locations, which are offset by fractional values from its upper left corner. The rasterization rules for points, lines, and triangles involve testing whether each sample location is inside the primitive. Fragments need not actually be square, and rasterization rules are not affected by the aspect ratio of fragments. Display of non-square grids, however, will cause rasterized points and line segments to appear fatter in one direction than the other.

We assume that fragments are square, since it simplifies antialiasing and texturing. After rasterization, fragments are processed by [fragment operations](#).

Several factors affect rasterization, including the members of [VkPipelineRasterizationStateCreateInfo](#) and [VkPipelineMultisampleStateCreateInfo](#).

The [VkPipelineRasterizationStateCreateInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineRasterizationStateCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkPipelineRasterizationStateCreateFlags flags;
    VkBool32                  depthClampEnable;
    VkBool32                  rasterizerDiscardEnable;
    VkPolygonMode              polygonMode;
    VkCullModeFlags            cullMode;
    VkFrontFace                frontFace;
    VkBool32                  depthBiasEnable;
    float                     depthBiasConstantFactor;
    float                     depthBiasClamp;
    float                     depthBiasSlopeFactor;
    float                     lineWidth;
} VkPipelineRasterizationStateCreateInfo;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.

- **depthClampEnable** controls whether to clamp the fragment's depth values as described in [Depth Test](#). If the pipeline is not created with [VkPipelineRasterizationDepthClipStateCreateInfoEXT](#) present then enabling depth clamp will also disable clipping primitives to the z planes of the frustum as described in [Primitive Clipping](#). Otherwise depth clipping is controlled by the state set in [VkPipelineRasterizationDepthClipStateCreateInfoEXT](#).
- **rasterizerDiscardEnable** controls whether primitives are discarded immediately before the rasterization stage.
- **polygonMode** is the triangle rendering mode. See [VkPolygonMode](#).
- **cullMode** is the triangle facing direction used for primitive culling. See [VkCullModeFlagBits](#).
- **frontFace** is a [VkFrontFace](#) value specifying the front-facing triangle orientation to be used for culling.
- **depthBiasEnable** controls whether to bias fragment depth values.
- **depthBiasConstantFactor** is a scalar factor controlling the constant depth value added to each fragment.
- **depthBiasClamp** is the maximum (or minimum) depth bias of a fragment.
- **depthBiasSlopeFactor** is a scalar factor applied to a fragment's slope in depth bias calculations.
- **lineWidth** is the width of rasterized line segments.

Valid Usage

- VUID-VkPipelineRasterizationStateCreateInfo-depthClampEnable-00782
If the **depthClamp** feature is not enabled, **depthClampEnable** **must** be **VK_FALSE**
- VUID-VkPipelineRasterizationStateCreateInfo-polygonMode-01507
If the **fillModeNonSolid** feature is not enabled, **polygonMode** **must** be **VK_POLYGON_MODE_FILL**

Valid Usage (Implicit)

- VUID-VkPipelineRasterizationStateCreateInfo-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_CREATE_INFO**
- VUID-VkPipelineRasterizationStateCreateInfo-pNext-pNext
Each **pNext** member of any structure (including this one) in the **pNext** chain **must** be either **NULL** or a pointer to a valid instance of [VkPipelineRasterizationConservativeStateCreateInfoEXT](#), [VkPipelineRasterizationDepthClipStateCreateInfoEXT](#), or [VkPipelineRasterizationLineStateCreateInfo](#)
- VUID-VkPipelineRasterizationStateCreateInfo-sType-unique
The **sType** value of each structure in the **pNext** chain **must** be unique
- VUID-VkPipelineRasterizationStateCreateInfo-flags-zeroBitmask
flags **must** be 0
- VUID-VkPipelineRasterizationStateCreateInfo-polygonMode-parameter
polygonMode **must** be a valid [VkPolygonMode](#) value

- VUID-VkPipelineRasterizationStateCreateInfo-cullMode-parameter **cullMode** **must** be a valid combination of [VkCullModeFlagBits](#) values
- VUID-VkPipelineRasterizationStateCreateInfo-frontFace-parameter **frontFace** **must** be a valid [VkFrontFace](#) value

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineRasterizationStateCreateFlags;
```

[VkPipelineRasterizationStateCreateFlags](#) is a bitmask type for setting a mask, but is currently reserved for future use.

If the **pNext** chain of [VkPipelineRasterizationStateCreateInfo](#) includes a [VkPipelineRasterizationDepthClipStateCreateInfoEXT](#) structure, then that structure controls whether depth clipping is enabled or disabled.

The [VkPipelineRasterizationDepthClipStateCreateInfoEXT](#) structure is defined as:

```
// Provided by VK_EXT_depth_clip_enable
typedef struct VkPipelineRasterizationDepthClipStateCreateInfoEXT {
    VkStructureType              sType;
    const void*                  pNext;
    VkPipelineRasterizationDepthClipStateCreateFlagsEXT flags;
    VkBool32                     depthClipEnable;
} VkPipelineRasterizationDepthClipStateCreateInfoEXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **depthClipEnable** controls whether depth clipping is enabled as described in [Primitive Clipping](#).

Valid Usage (Implicit)

- VUID-VkPipelineRasterizationDepthClipStateCreateInfoEXT-sType-sType **must** be [VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_DEPTH_CLIP_STATE_CREATE_INFO_EXT](#)
- VUID-VkPipelineRasterizationDepthClipStateCreateInfoEXT-flags-zero bitmask **flags** **must** be 0

```
// Provided by VK_EXT_depth_clip_enable
typedef VkFlags VkPipelineRasterizationDepthClipStateCreateFlagsEXT;
```

[VkPipelineRasterizationDepthClipStateCreateFlagsEXT](#) is a bitmask type for setting a mask, but is

currently reserved for future use.

The `VkPipelineMultisampleStateCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineMultisampleStateCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkPipelineMultisampleStateCreateFlags flags;
    VkSampleCountFlagBits    rasterizationSamples;
    VkBool32                 sampleShadingEnable;
    float                    minSampleShading;
    const VkSampleMask*      pSampleMask;
    VkBool32                 alphaToCoverageEnable;
    VkBool32                 alphaToOneEnable;
} VkPipelineMultisampleStateCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `rasterizationSamples` is a `VkSampleCountFlagBits` value specifying the number of samples used in rasterization.
- `sampleShadingEnable` **can** be used to enable [Sample Shading](#).
- `minSampleShading` specifies a minimum fraction of sample shading if `sampleShadingEnable` is `VK_TRUE`.
- `pSampleMask` is a pointer to an array of `VkSampleMask` values used in the [sample mask test](#).
- `alphaToCoverageEnable` controls whether a temporary coverage value is generated based on the alpha component of the fragment's first color output as specified in the [Multisample Coverage](#) section.
- `alphaToOneEnable` controls whether the alpha component of the fragment's first color output is replaced with one as described in [Multisample Coverage](#).

Each bit in the sample mask is associated with a unique [sample index](#) as defined for the [coverage mask](#). Each bit `b` for mask word `w` in the sample mask corresponds to sample index `i`, where $i = 32 \times w + b$. `pSampleMask` has a length equal to $\lceil \text{rasterizationSamples} / 32 \rceil$ words.

If `pSampleMask` is `NULL`, it is treated as if the mask has all bits set to 1.

Valid Usage

- VUID-VkPipelineMultisampleStateCreateInfo-sampleShadingEnable-00784
If the `sampleRateShading` feature is not enabled, `sampleShadingEnable` **must** be `VK_FALSE`
- VUID-VkPipelineMultisampleStateCreateInfo-alphaToOneEnable-00785
If the `alphaToOne` feature is not enabled, `alphaToOneEnable` **must** be `VK_FALSE`

- VUID-VkPipelineMultisampleStateCreateInfo-minSampleShading-00786
`minSampleShading` **must** be in the range [0,1]

Valid Usage (Implicit)

- VUID-VkPipelineMultisampleStateCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_MULTISAMPLE_STATE_CREATE_INFO`
- VUID-VkPipelineMultisampleStateCreateInfo-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkPipelineSampleLocationsStateCreateInfoEXT`
- VUID-VkPipelineMultisampleStateCreateInfo-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkPipelineMultisampleStateCreateInfo-flags-zeroBitmask
`flags` **must** be 0
- VUID-VkPipelineMultisampleStateCreateInfo-rasterizationSamples-parameter
`rasterizationSamples` **must** be a valid `VkSampleCountFlagBits` value

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineMultisampleStateCreateFlags;
```

`VkPipelineMultisampleStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

The elements of the sample mask array are of type `VkSampleMask`, each representing 32 bits of coverage information:

```
// Provided by VK_VERSION_1_0
typedef uint32_t VkSampleMask;
```

Rasterization only generates fragments which cover one or more pixels inside the framebuffer. Pixels outside the framebuffer are never considered covered in the fragment. Fragments which would be produced by application of any of the primitive rasterization rules described below but which lie outside the framebuffer are not produced, nor are they processed by any later stage of the pipeline, including any of the [fragment operations](#).

Surviving fragments are processed by fragment shaders. Fragment shaders determine associated data for fragments, and **can** also modify or replace their assigned depth values.

26.1. Discarding Primitives Before Rasterization

Primitives are discarded before rasterization if the `rasterizerDiscardEnable` member of `VkPipelineRasterizationStateCreateInfo` is enabled. When enabled, primitives are discarded after they are processed by the last active shader stage in the pipeline before rasterization.

To **dynamically enable** whether primitives are discarded before the rasterization stage, call:

```
// Provided by VK_EXT_extended_dynamic_state2
void vkCmdSetRasterizerDiscardEnableEXT(
    VkCommandBuffer          commandBuffer,
    VkBool32                  rasterizerDiscardEnable);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **rasterizerDiscardEnable** controls whether primitives are discarded immediately before the rasterization stage.

This command sets the discard enable for subsequent drawing commands when the graphics pipeline is created with **VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the **VkPipelineRasterizationStateCreateInfo::rasterizerDiscardEnable** value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetRasterizerDiscardEnable-None-08970
At least one of the following **must** be true:
 - the **extendedDynamicState2** feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-parameter
commandBuffer **must** be a valid **VkCommandBuffer** handle
- VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-recording
commandBuffer **must** be in the **recording state**
- VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-cmdpool
The **VkCommandPool** that **commandBuffer** was allocated from **must** support **VK_QUEUE_GRAPHICS_BIT** operations

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

26.2. Rasterization Order

Within a subpass of a [render pass instance](#), for a given (x,y,layer,sample) sample location, the following operations are guaranteed to execute in *rasterization order*, for each separate primitive that includes that sample location:

1. [Fragment operations](#), in the order defined
2. [Blending](#), [logic operations](#), and color writes

Execution of these operations for each primitive in a subpass occurs in [primitive order](#).

26.3. Multisampling

Multisampling is a mechanism to antialias all Vulkan primitives: points, lines, and polygons. The technique is to sample all primitives multiple times at each pixel. Each sample in each framebuffer attachment has storage for a color, depth, and/or stencil value, such that per-fragment operations apply to each sample independently. The color sample values **can** be later *resolved* to a single color (see [Resolving Multisample Images](#) and the [Render Pass](#) chapter for more details on how to resolve multisample images to non-multisample images).

Vulkan defines rasterization rules for single-sample modes in a way that is equivalent to a multisample mode with a single sample in the center of each fragment.

Each fragment includes a [coverage mask](#) with a single bit for each sample in the fragment, and a number of depth values and associated data for each sample.

It is understood that each pixel has [rasterizationSamples](#) locations associated with it. These locations are exact positions, rather than regions or areas, and each is referred to as a sample point. The sample points associated with a pixel **must** be located inside or on the boundary of the unit square that is considered to bound the pixel. Furthermore, the relative locations of sample points **may** be identical for each pixel in the framebuffer, or they **may** differ.

If the current pipeline includes a fragment shader with one or more variables in its interface decorated with [Sample](#) and [Input](#), the data associated with those variables will be assigned independently for each sample. The values for each sample **must** be evaluated at the location of the sample. The data associated with any other variables not decorated with [Sample](#) and [Input](#) need not be evaluated independently for each sample.

A *coverage mask* is generated for each fragment, based on which samples within that fragment are

determined to be within the area of the primitive that generated the fragment.

Single pixel fragments have one set of samples. Multi-pixel fragments defined by setting the [fragment shading rate](#) have one set of samples per pixel. Each set of samples has a number of samples determined by [VkPipelineMultisampleStateCreateInfo::rasterizationSamples](#). Each sample in a set is assigned a unique *sample index* i in the range $[0, \text{rasterizationSamples})$.

Each sample in a fragment is also assigned a unique *coverage index* j in the range $[0, n \times \text{rasterizationSamples})$, where n is the number of sets in the fragment. If the fragment contains a single set of samples, the *coverage index* is always equal to the *sample index*.

If the [fragment shading rate](#) is set, the coverage index j is determined as a function of the *pixel index* p , the *sample index* i , and the number of rasterization samples r as:

$$j = i + r \times ((f_w \times f_h) - 1 - p)$$

where the pixel index p is determined as a function of the pixel's framebuffer location (x,y) and the fragment size (f_w, f_h) :

$$p_x = x \% f_w$$

$$p_y = y \% f_h$$

$$p = p_x + (p_y \times f_w)$$

The tables below illustrate the pixel index for multi-pixel fragments:

Table 29. Pixel Indices - 1 Wide

1x1	1x2	1x4
		

Table 30. Pixel Indices - 2 Wide

2x1	2x2	2x4
		

Table 31. Pixel Indices - 4 Wide

4x1	4x2	4x4
		

The coverage mask includes B bits packed into W words, defined as:

$$B = n \times \text{rasterizationSamples}$$

$$W = \lceil B/32 \rceil$$

Bit b in coverage mask word w is **1** if the sample with coverage index $j = 32 \times w + b$ is covered, and **0** otherwise.

If the `standardSampleLocations` member of `VkPhysicalDeviceLimits` is `VK_TRUE`, then the sample counts `VK_SAMPLE_COUNT_1_BIT`, `VK_SAMPLE_COUNT_2_BIT`, `VK_SAMPLE_COUNT_4_BIT`, `VK_SAMPLE_COUNT_8_BIT`, and `VK_SAMPLE_COUNT_16_BIT` have sample locations as listed in the following table, with the i th entry in the table corresponding to sample index i . `VK_SAMPLE_COUNT_32_BIT` and `VK_SAMPLE_COUNT_64_BIT` do not have standard sample locations. Locations are defined relative to an origin in the upper left corner of the fragment.

Table 32. Standard Sample Locations

Sample count	Sample Locations	
VK_SAMPLE_COUNT_1_BIT	(0.5,0.5)	
VK_SAMPLE_COUNT_2_BIT	(0.75,0.75) (0.25,0.25)	
VK_SAMPLE_COUNT_4_BIT	(0.375, 0.125) (0.875, 0.375) (0.125, 0.625) (0.625, 0.875)	
VK_SAMPLE_COUNT_8_BIT	(0.5625, 0.3125) (0.4375, 0.6875) (0.8125, 0.5625) (0.3125, 0.1875) (0.1875, 0.8125) (0.0625, 0.4375) (0.6875, 0.9375) (0.9375, 0.0625)	
VK_SAMPLE_COUNT_16_BIT	(0.5625, 0.5625) (0.4375, 0.3125) (0.3125, 0.625) (0.75, 0.4375) (0.1875, 0.375) (0.625, 0.8125) (0.8125, 0.6875) (0.6875, 0.1875) (0.375, 0.875) (0.5, 0.0625) (0.25, 0.125) (0.125, 0.75) (0.0, 0.5) (0.9375, 0.25) (0.875, 0.9375) (0.0625, 0.0)	

26.4. Custom Sample Locations

Applications **can** also control the sample locations used for rasterization.

If the `pNext` chain of the `VkPipelineMultisampleStateCreateInfo` structure specified at pipeline creation time includes a `VkPipelineSampleLocationsStateCreateInfoEXT` structure, then that structure controls the sample locations used when rasterizing primitives with the pipeline.

The `VkPipelineSampleLocationsStateCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_sample_locations
typedef struct VkPipelineSampleLocationsStateCreateInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    VkBool32             sampleLocationsEnable;
    VkSampleLocationsInfoEXT sampleLocationsInfo;
} VkPipelineSampleLocationsStateCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `sampleLocationsEnable` controls whether custom sample locations are used. If `sampleLocationsEnable` is `VK_FALSE`, the default sample locations are used and the values specified in `sampleLocationsInfo` are ignored.
- `sampleLocationsInfo` is the sample locations to use during rasterization if `sampleLocationsEnable` is `VK_TRUE` and the graphics pipeline is not created with `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT`.

Valid Usage (Implicit)

- VUID-VkPipelineSampleLocationsStateCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_SAMPLE_LOCATIONS_STATE_CREATE_INFO_EXT`
- VUID-VkPipelineSampleLocationsStateCreateInfoEXT-sampleLocationsInfo-parameter
`sampleLocationsInfo` **must** be a valid `VkSampleLocationsInfoEXT` structure

The `VkSampleLocationsInfoEXT` structure is defined as:

```
// Provided by VK_EXT_sample_locations
typedef struct VkSampleLocationsInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    VkSampleCountFlagBits sampleLocationsPerPixel;
    VkExtent2D           sampleLocationGridSize;
    uint32_t             sampleLocationsCount;
    const VkSampleLocationEXT* pSampleLocations;
} VkSampleLocationsInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `sampleLocationsPerPixel` is a `VkSampleCountFlagBits` value specifying the number of sample locations per pixel.
- `sampleLocationGridSize` is the size of the sample location grid to select custom sample locations for.
- `sampleLocationsCount` is the number of sample locations in `pSampleLocations`.
- `pSampleLocations` is a pointer to an array of `sampleLocationsCount` `VkSampleLocationEXT` structures.

This structure **can** be used either to specify the sample locations to be used for rendering or to specify the set of sample locations an image subresource has been last rendered with for the purposes of layout transitions of depth/stencil images created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT`.

The sample locations in `pSampleLocations` specify `sampleLocationsPerPixel` number of sample locations for each pixel in the grid of the size specified in `sampleLocationGridSize`. The sample location for sample `i` at the pixel grid location `(x,y)` is taken from `pSampleLocations[(x + y × sampleLocationGridSize.width) × sampleLocationsPerPixel + i]`.

Valid Usage

- VUID-VkSampleLocationsInfoEXT-sampleLocationsPerPixel-01526
`sampleLocationsPerPixel` **must** be a valid `VkSampleCountFlagBits` value that is set in `VkPhysicalDeviceSampleLocationsPropertiesEXT::sampleLocationSampleCounts`
- VUID-VkSampleLocationsInfoEXT-sampleLocationsCount-01527
`sampleLocationsCount` **must** equal `sampleLocationsPerPixel × sampleLocationGridSize.width × sampleLocationGridSize.height`

Valid Usage (Implicit)

- VUID-VkSampleLocationsInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SAMPLE_LOCATIONS_INFO_EXT`
- VUID-VkSampleLocationsInfoEXT-pSampleLocations-parameter
If `sampleLocationsCount` is not 0, `pSampleLocations` **must** be a valid pointer to an array of `sampleLocationsCount` `VkSampleLocationEXT` structures

The `VkSampleLocationEXT` structure is defined as:

```
// Provided by VK_EXT_sample_locations
typedef struct VkSampleLocationEXT {
    float    x;
    float    y;
} VkSampleLocationEXT;
```

- **x** is the horizontal coordinate of the sample's location.
- **y** is the vertical coordinate of the sample's location.

The domain space of the sample location coordinates has an upper-left origin within the pixel in framebuffer space.

The values specified in a **VkSampleLocationEXT** structure are always clamped to the implementation-dependent sample location coordinate range **[sampleLocationCoordinateRange[0],sampleLocationCoordinateRange[1]]** that **can** be queried using **VkPhysicalDeviceSampleLocationsPropertiesEXT**.

To **dynamically set** the sample locations used for rasterization, call:

```
// Provided by VK_EXT_sample_locations
void vkCmdSetSampleLocationsEXT(
    VkCommandBuffer          commandBuffer,
    const VkSampleLocationsInfoEXT* pSampleLocationsInfo);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **pSampleLocationsInfo** is the sample locations state to set.

This command sets the custom sample locations for subsequent drawing commands when the graphics pipeline is created with **VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**, and when the **VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable** property of the bound graphics pipeline is **VK_TRUE**. Otherwise, this state is specified by the **VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsInfo** values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetSampleLocationsEXT-variableSampleLocations-01530
If **VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations** is **VK_FALSE** then the current render pass **must** have been begun by specifying a **VkRenderPassSampleLocationsBeginInfoEXT** structure whose **pPostSubpassSampleLocations** member contains an element with a **subpassIndex** matching the current subpass index and the **sampleLocationsInfo** member of that element **must** match the sample locations state pointed to by **pSampleLocationsInfo**

Valid Usage (Implicit)

- VUID-vkCmdSetSampleLocationsEXT-commandBuffer-parameter `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetSampleLocationsEXT-pSampleLocationsInfo-parameter `pSampleLocationsInfo` **must** be a valid pointer to a valid `VkSampleLocationsInfoEXT` structure
- VUID-vkCmdSetSampleLocationsEXT-commandBuffer-recording `commandBuffer` **must** be in the `recording` state
- VUID-vkCmdSetSampleLocationsEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

26.5. Fragment Shading Rates

The features advertised by `VkPhysicalDeviceFragmentShadingRateFeaturesKHR` allow an application to control the `shading rate` of a given fragment shader invocation.

The fragment shading rate strongly interacts with `Multisampling`, and the set of available rates for an implementation **may** be restricted by sample rate.

To query available shading rates, call:

```
// Provided by VK_KHR_fragment_shading_rate
VkResult vkGetPhysicalDeviceFragmentShadingRatesKHR(
    VkPhysicalDevice          physicalDevice,
    uint32_t*                 pFragmentShadingRateCount,
    VkPhysicalDeviceFragmentShadingRateKHR* pFragmentShadingRates);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pFragmentShadingRateCount` is a pointer to an integer related to the number of fragment shading rates available or queried, as described below.
- `pFragmentShadingRates` is either `NULL` or a pointer to an array of `VkPhysicalDeviceFragmentShadingRateKHR` structures.

If `pFragmentShadingRates` is `NULL`, then the number of fragment shading rates available is returned in `pFragmentShadingRateCount`. Otherwise, `pFragmentShadingRateCount` **must** point to a variable set by the application to the number of elements in the `pFragmentShadingRates` array, and on return the variable is overwritten with the number of structures actually written to `pFragmentShadingRates`. If `pFragmentShadingRateCount` is less than the number of fragment shading rates available, at most `pFragmentShadingRateCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available fragment shading rates were returned.

The returned array of fragment shading rates **must** be ordered from largest `fragmentSize.width` value to smallest, and each set of fragment shading rates with the same `fragmentSize.width` value **must** be ordered from largest `fragmentSize.height` to smallest. Any two entries in the array **must** not have the same `fragmentSize` values.

For any entry in the array, the following rules also apply:

- The value of `fragmentSize.width` **must** be less than or equal to `maxFragmentSize.width`.
- The value of `fragmentSize.width` **must** be greater than or equal to 1.
- The value of `fragmentSize.width` **must** be a power-of-two.
- The value of `fragmentSize.height` **must** be less than or equal to `maxFragmentSize.height`.
- The value of `fragmentSize.height` **must** be greater than or equal to 1.
- The value of `fragmentSize.height` **must** be a power-of-two.
- The highest sample count in `sampleCounts` **must** be less than or equal to `maxFragmentShadingRateRasterizationSamples`.
- The product of `fragmentSize.width`, `fragmentSize.height`, and the highest sample count in `sampleCounts` **must** be less than or equal to `maxFragmentShadingRateCoverageSamples`.

Implementations **must** support at least the following shading rates:

<code>sampleCounts</code>	<code>fragmentSize</code>
<code>VK_SAMPLE_COUNT_1_BIT VK_SAMPLE_COUNT_4_BIT</code>	{2,2}
<code>VK_SAMPLE_COUNT_1_BIT VK_SAMPLE_COUNT_4_BIT</code>	{2,1}
<code>~0</code>	{1,1}

If `framebufferColorSampleCounts`, includes `VK_SAMPLE_COUNT_2_BIT`, the required rates **must** also include `VK_SAMPLE_COUNT_2_BIT`.

NOTE

Including the {1,1} fragment size is done for completeness; it has no actual effect on the support of rendering without setting the fragment size. All sample counts are

supported for this rate.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetPhysicalDeviceFragmentShadingRatesKHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-pFragmentShadingRateCount-parameter `pFragmentShadingRateCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-pFragmentShadingRates-parameter

If the value referenced by `pFragmentShadingRateCount` is not `0`, and `pFragmentShadingRates` is not `NULL`, `pFragmentShadingRates` **must** be a valid pointer to an array of `pFragmentShadingRateCount` `VkPhysicalDeviceFragmentShadingRateKHR` structures

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkPhysicalDeviceFragmentShadingRateKHR` structure is defined as

```
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPhysicalDeviceFragmentShadingRateKHR {
    VkStructureType    sType;
    void*              pNext;
    VkSampleCountFlags sampleCounts;
    VkExtent2D         fragmentSize;
} VkPhysicalDeviceFragmentShadingRateKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `sampleCounts` is a bitmask of sample counts for which the shading rate described by `fragmentSize` is supported.

- `fragmentSize` is a `VkExtent2D` describing the width and height of a supported shading rate.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentShadingRateKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE_KHR`
- VUID-VkPhysicalDeviceFragmentShadingRateKHR-pNext-pNext
`pNext` **must** be `NULL`

Fragment shading rates **can** be set at three points, with the three rates combined to determine the final shading rate.

26.5.1. Pipeline Fragment Shading Rate

The *pipeline fragment shading rate* **can** be set on a per-draw basis by either setting the rate in a graphics pipeline, or dynamically via `vkCmdSetFragmentShadingRateKHR`.

The `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPipelineFragmentShadingRateStateCreateInfoKHR {
    VkStructureType          sType;
    const void*              pNext;
    VkExtent2D               fragmentSize;
    VkFragmentShadingRateCombinerOpKHR    combinerOps[2];
} VkPipelineFragmentShadingRateStateCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fragmentSize` specifies a `VkExtent2D` structure containing the fragment size used to define the pipeline fragment shading rate for drawing commands using this pipeline.
- `combinerOps` specifies a `VkFragmentShadingRateCombinerOpKHR` value determining how the `pipeline`, `primitive`, and `attachment shading rates` are `combined` for fragments generated by drawing commands using the created pipeline.

If the `pNext` chain of `VkGraphicsPipelineCreateInfo` includes a `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure, then that structure includes parameters controlling the pipeline fragment shading rate.

If this structure is not present, `fragmentSize` is considered to be equal to (1,1), and both elements of `combinerOps` are considered to be equal to `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`.

Valid Usage (Implicit)

- VUID-VkPipelineFragmentShadingRateStateCreateInfoKHR-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_FRAGMENT_SHADING_RATE_STATE_CREATE_INFO_KHR`

To [dynamically set](#) the pipeline fragment shading rate and combiner operation, call:

```
// Provided by VK_KHR_fragment_shading_rate
void vkCmdSetFragmentShadingRateKHR(
    VkCommandBuffer          commandBuffer,
    const VkExtent2D*        pFragmentSize,
    const VkFragmentShadingRateCombinerOpKHR combinerOps[2]);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pFragmentSize` specifies the pipeline fragment shading rate for subsequent drawing commands.
- `combinerOps` specifies a `VkFragmentShadingRateCombinerOpKHR` determining how the [pipeline](#), [primitive](#), and [attachment shading rates](#) are [combined](#) for fragments generated by subsequent drawing commands.

This command sets the pipeline fragment shading rate and combiner operation for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineFragmentShadingRateStateCreateInfoKHR` values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04507
If the `pipelineFragmentShadingRate` feature is not enabled, `pFragmentSize->width` **must** be 1
- VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04508
If the `pipelineFragmentShadingRate` feature is not enabled, `pFragmentSize->height` **must** be 1
- VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04509
One of the `pipelineFragmentShadingRate`, `primitiveFragmentShadingRate`, or `attachmentFragmentShadingRate` features **must** be enabled
- VUID-vkCmdSetFragmentShadingRateKHR-primitiveFragmentShadingRate-04510
If the `primitiveFragmentShadingRate` feature is not enabled, `combinerOps[0]` **must** be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`
- VUID-vkCmdSetFragmentShadingRateKHR-attachmentFragmentShadingRate-04511
If the `attachmentFragmentShadingRate` feature is not enabled, `combinerOps[1]` **must** be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`
- VUID-vkCmdSetFragmentShadingRateKHR-fragmentSizeNonTrivialCombinerOps-04512
If the `fragmentSizeNonTrivialCombinerOps` limit is not supported, elements of `combinerOps` **must** be either `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` or `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR`
- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04513

pFragmentSize->width **must** be greater than or equal to 1

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04514
pFragmentSize->height **must** be greater than or equal to 1
- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04515
pFragmentSize->width **must** be a power-of-two value
- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04516
pFragmentSize->height **must** be a power-of-two value
- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04517
pFragmentSize->width **must** be less than or equal to 4
- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04518
pFragmentSize->height **must** be less than or equal to 4

Valid Usage (Implicit)

- VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-parameter
commandBuffer **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-parameter
pFragmentSize **must** be a valid pointer to a valid [VkExtent2D](#) structure
- VUID-vkCmdSetFragmentShadingRateKHR-combinerOps-parameter
Each element of combinerOps **must** be a valid [VkFragmentShadingRateCombinerOpKHR](#) value
- VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-recording
commandBuffer **must** be in the [recording state](#)
- VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-cmdpool
The [VkCommandPool](#) that commandBuffer was allocated from **must** support [VK_QUEUE_GRAPHICS_BIT](#) operations

Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the [VkCommandPool](#) that commandBuffer was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

26.5.2. Primitive Fragment Shading Rate

The *primitive fragment shading rate* **can** be set via the `PrimitiveShadingRateKHR` built-in in the last active `pre-rasterization shader stage`. The rate associated with a given primitive is sourced from the value written to `PrimitiveShadingRateKHR` by that primitive's `provoking vertex`.

26.5.3. Attachment Fragment Shading Rate

The *attachment shading rate* **can** be set by including `VkFragmentShadingRateAttachmentInfoKHR` in a subpass to define a *fragment shading rate attachment*. Each pixel in the framebuffer is assigned an attachment fragment shading rate by the corresponding texel in the fragment shading rate attachment, according to:

$$x' = \text{floor}(x / \text{region}_x)$$

$$y' = \text{floor}(y / \text{region}_y)$$

where x' and y' are the coordinates of a texel in the fragment shading rate attachment, x and y are the coordinates of the pixel in the framebuffer, and region_x and region_y are the size of the region each texel corresponds to, as defined by the `shadingRateAttachmentTexelSize` member of `VkFragmentShadingRateAttachmentInfoKHR`.

If `multiview is enabled` and the shading rate attachment has multiple layers, the shading rate attachment texel is selected using `layer = ViewIndex`. If `multiview is disabled`, and both the shading rate attachment and the framebuffer have multiple layers, the shading rate attachment texel is selected using `layer = Layer`. Otherwise, `layer = 0`.

The texel is `read from the fragment shading rate attachment image` using image coordinates equal to $(x', y', 0, \text{layer}, 0, 0)$. The fragment size is encoded into the first component of the result of that operation as follows:

$$\text{size}_w = 2^{((\text{texel}/4)\&3)}$$

$$\text{size}_h = 2^{(\text{texel}\&3)}$$

where `texel` is the value in the first component of the returned value, and size_w and size_h are the width and height of the fragment size, decoded from the texel.

If no fragment shading rate attachment is specified, this size is calculated as $\text{size}_w = \text{size}_h = 1$. Applications **must** not specify a width or height greater than 4 by this method.

The *Fragment Shading Rate* enumeration in SPIR-V adheres to the above encoding.

26.5.4. Combining the Fragment Shading Rates

The final rate (C_{xy}) used for fragment shading **must** be one of the rates returned by `vkGetPhysicalDeviceFragmentShadingRatesKHR` for the sample count used by rasterization.

If any of the following conditions are met, C_{xy} is set to {1,1} by the implementation:

- If `Sample Shading` is enabled.
- The `fragmentShadingRateWithSampleMask` limit is not supported, and `VkPipelineMultisampleStateCreateInfo::pSampleMask` contains a zero value in any bit used by fragment operations.
- The `fragmentShadingRateWithShaderSampleMask` is not supported, and the fragment shader has `SampleMask` in the input or output interface.
- The `fragmentShadingRateWithShaderDepthStencilWrites` limit is not supported, and the fragment shader declares the `FragDepth` or `FragStencilRefEXT` built-in.
- The `fragmentShadingRateWithConservativeRasterization` limit is not supported, and `VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode` is not `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`.
- The `fragmentShadingRateWithFragmentShaderInterlock` limit is not supported, and the fragment shader declares any of the `fragment shader interlock` execution modes.
- The `fragmentShadingRateWithCustomSampleLocations` limit is not supported, and `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` is `VK_TRUE`.

Otherwise, each of the specified shading rates are combined and then used to derive the value of C_{xy} . As there are three ways to specify shading rates, two combiner operations are specified - between the `pipeline` and `primitive` shading rates, and between the result of that and the `attachment shading rate`.

The equation used for each combiner operation is defined by `VkFragmentShadingRateCombinerOpKHR`:

```
// Provided by VK_KHR_fragment_shading_rate
typedef enum VkFragmentShadingRateCombinerOpKHR {
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR = 0,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR = 1,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR = 2,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR = 3,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR = 4,
} VkFragmentShadingRateCombinerOpKHR;
```

- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` specifies a combiner operation of $\text{combine}(A_{xy}, B_{xy}) = A_{xy}$.
- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR` specifies a combiner operation of $\text{combine}(A_{xy}, B_{xy}) = B_{xy}$.
- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR` specifies a combiner operation of $\text{combine}(A_{xy}, B_{xy}) = \min(A_{xy}, B_{xy})$.

- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR` specifies a combiner operation of $\text{combine}(A_{xy}, B_{xy}) = \max(A_{xy}, B_{xy})$.
- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR` specifies a combiner operation of $\text{combine}(A_{xy}, B_{xy}) = A_{xy} * B_{xy}$.

where $\text{combine}(A_{xy}, B_{xy})$ is the combine operation, and A_{xy} and B_{xy} are the inputs to the operation.

If `fragmentShadingRateStrictMultiplyCombiner` is `VK_FALSE`, using `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR` with values of 1 for both A and B in the same dimension results in the value 2 being produced for that dimension. See the definition of `fragmentShadingRateStrictMultiplyCombiner` for more information.

These operations are performed in a component-wise fashion.

This is used to generate a combined fragment area using the equation:

$$C_{xy} = \text{combine}(A_{xy}, B_{xy})$$

where C_{xy} is the combined fragment area result, and A_{xy} and B_{xy} are the fragment areas of the fragment shading rates being combined.

Two combine operations are performed, first with A_{xy} equal to the [pipeline fragment shading rate](#) and B_{xy} equal to the [primitive fragment shading rate](#), with the combine() operation selected by `combinerOps[0]`. A second combination is then performed, with A_{xy} equal to the result of the first combination and B_{xy} equal to the [attachment fragment shading rate](#), with the combine() operation selected by `combinerOps[1]`. The result of the second combination is used as the final fragment shading rate, reported via the [ShadingRateKHR built-in](#).

Implementations **should** clamp the inputs to the combiner operations A_{xy} and B_{xy} , and **must** clamp the result of the second combiner operation.

A fragment shading rate R_{xy} representing any of A_{xy} , B_{xy} or C_{xy} is clamped as follows. If R_{xy} is one of the rates returned by [vkGetPhysicalDeviceFragmentShadingRatesKHR](#) for the sample count used by rasterization, the clamped shading rate R_{xy}' is R_{xy} . Otherwise, the clamped shading rate is selected from the rates returned by [vkGetPhysicalDeviceFragmentShadingRatesKHR](#) for the sample count used by rasterization. From this list of supported rates, the following steps are applied in order, to select a single value:

1. Keep only rates where $R_x' \leq R_x$ and $R_y' \leq R_y$.
 - Implementations **may** also keep rates where $R_x' \leq R_y$ and $R_y' \leq R_x$.
2. Keep only rates with the highest area ($R_x' \times R_y'$).
3. Keep only rates with the lowest aspect ratio ($R_x' + R_y'$).
4. In cases where a wide (e.g. 4x1) and tall (e.g. 1x4) rate remain, the implementation **may** choose either rate. However, it **must** choose this rate consistently for the same shading rates, and combiner operations for the lifetime of the [VkDevice](#).

26.6. Sample Shading

Sample shading **can** be used to specify a minimum number of unique samples to process for each fragment. If sample shading is enabled, an implementation **must** invoke the fragment shader at least $\max(\text{VkPipelineMultisampleStateCreateInfo::minSampleShading} \times \text{VkPipelineMultisampleStateCreateInfo::rasterizationSamples}, 1)$ times per fragment. If `VkPipelineMultisampleStateCreateInfo::sampleShadingEnable` is `VK_TRUE`, sample shading is enabled.

If a fragment shader entry point **statically uses** an input variable decorated with a `BuiltIn` of `SampleId` or `SamplePosition`, sample shading is enabled and a value of `1.0` is used instead of `minSampleShading`. If a fragment shader entry point **statically uses** an input variable decorated with `Sample`, sample shading **may** be enabled and a value of `1.0` will be used instead of `minSampleShading` if it is.

NOTE

If a shader decorates an input variable with `Sample` and that value meaningfully impacts the output of a shader, sample shading will be enabled to ensure that the input is in fact interpolated per-sample. This is inherent to the specification and not spelled out here - if an application simply declares such a variable it is implementation-defined whether sample shading is enabled or not. It is possible to see the effects of this by using atomics in the shader or using a pipeline statistics query to query the number of fragment invocations, even if the shader itself does not use any per-sample variables.

If there are fewer fragment invocations than **covered samples**, implementations **may** include those samples in fragment shader invocations in any manner as long as covered samples are all shaded at least once, and each invocation that is not a **helper invocation** covers at least one sample.

26.7. Points

A point is drawn by generating a set of fragments in the shape of a square centered around the vertex of the point. Each vertex has an associated point size controlling the width/height of that square. The point size is taken from the (potentially clipped) shader built-in `PointSize` written by:

- the geometry shader, if active;
- the tessellation evaluation shader, if active and no geometry shader is active;
- the vertex shader, otherwise

and clamped to the implementation-dependent point size range `[pointSizeRange[0], pointSizeRange[1]]`. The value written to `PointSize` **must** be greater than zero.

Not all point sizes need be supported, but the size `1.0` **must** be supported. The range of supported sizes and the size of evenly-spaced gradations within that range are implementation-dependent. The range and gradations are obtained from the `pointSizeRange` and `pointSizeGranularity` members of `VkPhysicalDeviceLimits`. If, for instance, the size range is from `0.1` to `2.0` and the gradation size is `0.1`, then the sizes `0.1`, `0.2`, ..., `1.9`, `2.0` are supported. Additional point sizes **may** also be supported. There is no requirement that these sizes be equally spaced. If an unsupported size is requested, the nearest supported size is used instead.

26.7.1. Basic Point Rasterization

Point rasterization produces a fragment for each fragment area group of framebuffer pixels with one or more sample points that intersect a region centered at the point's (x_p, y_p) . This region is a square with side equal to the current point size. Coverage bits that correspond to sample points that intersect the region are 1, other coverage bits are 0. All fragments produced in rasterizing a point are assigned the same associated data, which are those of the vertex corresponding to the point. However, the fragment shader built-in `PointCoord` contains point sprite texture coordinates. The s and t point sprite texture coordinates vary from zero to one across the point horizontally left-to-right and vertically top-to-bottom, respectively. The following formulas are used to evaluate s and t :

$$s = \frac{1}{2} + \frac{\tilde{A}x_p - x_f!}{\text{size}}$$
$$t = \frac{1}{2} + \frac{\tilde{A}y_p - y_f!}{\text{size}}$$

where size is the point's size; (x_p, y_p) is the location at which the point sprite coordinates are evaluated - this **may** be the framebuffer coordinates of the fragment center, or the location of a sample; and (x_f, y_f) is the exact, unrounded framebuffer coordinate of the vertex for the point.

26.8. Line Segments

Line segment rasterization options are controlled by the `VkPipelineRasterizationLineStateCreateInfo` structure.

The `VkPipelineRasterizationLineStateCreateInfo` structure is defined as:

```
typedef struct VkPipelineRasterizationLineStateCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkLineRasterizationMode    lineRasterizationMode;
    VkBool32            stippledLineEnable;
    uint32_t            lineStippleFactor;
    uint16_t            lineStipplePattern;
} VkPipelineRasterizationLineStateCreateInfo;
```

```
// Provided by VK_KHR_line_rasterization
typedef VkPipelineRasterizationLineStateCreateInfo
VkPipelineRasterizationLineStateCreateInfoKHR;
```

```
// Provided by VK_EXT_line_rasterization
typedef VkPipelineRasterizationLineStateCreateInfo
VkPipelineRasterizationLineStateCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `lineRasterizationMode` is a `VkLineRasterizationMode` value selecting the style of line rasterization.
- `stippledLineEnable` enables `stippled line rasterization`.
- `lineStippleFactor` is the repeat factor used in stippled line rasterization.
- `lineStipplePattern` is the bit pattern used in stippled line rasterization.

If `stippledLineEnable` is `VK_FALSE`, the values of `lineStippleFactor` and `lineStipplePattern` are ignored.

Valid Usage

- VUID-VkPipelineRasterizationLineStateCreateInfo-lineRasterizationMode-02768
If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR`, then the `rectangularLines` feature **must** be enabled
- VUID-VkPipelineRasterizationLineStateCreateInfo-lineRasterizationMode-02769
If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM`, then the `bresenhamLines` feature **must** be enabled
- VUID-VkPipelineRasterizationLineStateCreateInfo-lineRasterizationMode-02770
If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH`, then the `smoothLines` feature **must** be enabled
- VUID-VkPipelineRasterizationLineStateCreateInfo-stippledLineEnable-02771
If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR`, then the `stippledRectangularLines` feature **must** be enabled
- VUID-VkPipelineRasterizationLineStateCreateInfo-stippledLineEnable-02772
If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM`, then the `stippledBresenhamLines` feature **must** be enabled
- VUID-VkPipelineRasterizationLineStateCreateInfo-stippledLineEnable-02773
If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH`, then the `stippledSmoothLines` feature **must** be enabled
- VUID-VkPipelineRasterizationLineStateCreateInfo-stippledLineEnable-02774
If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_DEFAULT`, then the `stippledRectangularLines` feature **must** be enabled and `VkPhysicalDeviceLimits::strictLines` **must** be `VK_TRUE`

Valid Usage (Implicit)

- VUID-VkPipelineRasterizationLineStateCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_LINE_STATE_CREATE_INFO`

- VUID-VkPipelineRasterizationLineStateCreateInfo-lineRasterizationMode-parameter **lineRasterizationMode** **must** be a valid [VkLineRasterizationMode](#) value

Possible values of [VkPipelineRasterizationLineStateCreateInfo::lineRasterizationMode](#), specifying the line rasterization mode, are:

```
typedef enum VkLineRasterizationMode {
    VK_LINE_RASTERIZATION_MODE_DEFAULT = 0,
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR = 1,
    VK_LINE_RASTERIZATION_MODE_BRESENHAM = 2,
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH = 3,
    // Provided by VK_EXT_line_rasterization
    VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT = VK_LINE_RASTERIZATION_MODE_DEFAULT,
    // Provided by VK_EXT_line_rasterization
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT =
VK_LINE_RASTERIZATION_MODE_RECTANGULAR,
    // Provided by VK_EXT_line_rasterization
    VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT = VK_LINE_RASTERIZATION_MODE_BRESENHAM,
    // Provided by VK_EXT_line_rasterization
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT =
VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH,
    // Provided by VK_KHR_line_rasterization
    VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR = VK_LINE_RASTERIZATION_MODE_DEFAULT,
    // Provided by VK_KHR_line_rasterization
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR =
VK_LINE_RASTERIZATION_MODE_RECTANGULAR,
    // Provided by VK_KHR_line_rasterization
    VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR = VK_LINE_RASTERIZATION_MODE_BRESENHAM,
    // Provided by VK_KHR_line_rasterization
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR =
VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH,
} VkLineRasterizationMode;
```

```
// Provided by VK_KHR_line_rasterization
typedef VkLineRasterizationMode VkLineRasterizationModeKHR;
```

```
// Provided by VK_EXT_line_rasterization
typedef VkLineRasterizationMode VkLineRasterizationModeEXT;
```

- **VK_LINE_RASTERIZATION_MODE_DEFAULT** is equivalent to **VK_LINE_RASTERIZATION_MODE_RECTANGULAR** if [VkPhysicalDeviceLimits::strictLines](#) is **VK_TRUE**, otherwise lines are drawn as non-**strictLines** parallelograms. Both of these modes are defined in [Basic Line Segment Rasterization](#).
- **VK_LINE_RASTERIZATION_MODE_RECTANGULAR** specifies lines drawn as if they were rectangles extruded from the line
- **VK_LINE_RASTERIZATION_MODE_BRESENHAM** specifies lines drawn by determining which pixel

diamonds the line intersects and exits, as defined in [Bresenham Line Segment Rasterization](#).

- `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH` specifies lines drawn if they were rectangles extruded from the line, with alpha falloff, as defined in [Smooth Lines](#).

To [dynamically set](#) the line width, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetLineWidth(
    VkCommandBuffer          commandBuffer,
    float                    lineWidth);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `lineWidth` is the width of rasterized line segments.

This command sets the line width for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_LINE_WIDTH` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::lineWidth` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetLineWidth-lineWidth-00788
If the `wideLines` feature is not enabled, `lineWidth` **must** be `1.0`

Valid Usage (Implicit)

- VUID-vkCmdSetLineWidth-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetLineWidth-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdSetLineWidth-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHIC S_BIT	State

Not all line widths need be supported for line segment rasterization, but width 1.0 antialiased segments **must** be provided. The range and gradations are obtained from the `lineWidthRange` and `lineWidthGranularity` members of `VkPhysicalDeviceLimits`. If, for instance, the size range is from 0.1 to 2.0 and the gradation size is 0.1, then the sizes 0.1, 0.2, ..., 1.9, 2.0 are supported. Additional line widths **may** also be supported. There is no requirement that these widths be equally spaced. If an unsupported width is requested, the nearest supported width is used instead.

26.8.1. Basic Line Segment Rasterization

If the `lineRasterizationMode` member of `VkPipelineRasterizationLineStateCreateInfo` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR`, rasterized line segments produce fragments which intersect a rectangle centered on the line segment. Two of the edges are parallel to the specified line segment; each is at a distance of one-half the current width from that segment in directions perpendicular to the direction of the line. The other two edges pass through the line endpoints and are perpendicular to the direction of the specified line segment. Coverage bits that correspond to sample points that intersect the rectangle are 1, other coverage bits are 0.

Next we specify how the data associated with each rasterized fragment are obtained. Let $\mathbf{p}_r = (x_d, y_d)$ be the framebuffer coordinates at which associated data are evaluated. This **may** be the center of a fragment or the location of a sample within the fragment. When `rasterizationSamples` is `VK_SAMPLE_COUNT_1_BIT`, the fragment center **must** be used. Let $\mathbf{p}_a = (x_a, y_a)$ and $\mathbf{p}_b = (x_b, y_b)$ be initial and final endpoints of the line segment, respectively. Set

$$t = \frac{(\mathbf{p}_r - \mathbf{p}_a) \cdot (\mathbf{p}_b - \mathbf{p}_a)}{\|\mathbf{p}_b - \mathbf{p}_a\|^2}$$

(Note that $t = 0$ at $\mathbf{p}_a$ and $t = 1$ at $\mathbf{p}_b$. Also note that this calculation projects the vector from $\mathbf{p}_a$ to $\mathbf{p}_r$ onto the line, and thus computes the normalized distance of the fragment along the line.)

If `strictLines` is `VK_TRUE`, line segments are rasterized using perspective or linear interpolation.

Perspective interpolation for a line segment interpolates two values in a manner that is correct when taking the perspective of the viewport into consideration, by way of the line segment's clip coordinates. An interpolated value f can be determined by

$$f = \frac{(1 - t)f_a / w_a + tf_b / w_b}{(1 - t) / w_a + t / w_b}$$

where f_a and f_b are the data associated with the starting and ending endpoints of the segment, respectively; w_a and w_b are the clip w coordinates of the starting and ending endpoints of the segment, respectively.

Linear interpolation for a line segment directly interpolates two values, and an interpolated value f can be determined by

$$f = (1 - t) f_a + t f_b$$

where f_a and f_b are the data associated with the starting and ending endpoints of the segment, respectively.

The clip coordinate w for a sample is determined using perspective interpolation. The depth value z for a sample is determined using linear interpolation. Interpolation of fragment shader input values are determined by [Interpolation decorations](#).

The above description documents the preferred method of line rasterization, and **must** be used when `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR`.

When `strictLines` is `VK_FALSE`, and when the `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_DEFAULT`, the edges of the lines are generated as a parallelogram surrounding the original line. The major axis is chosen by noting the axis in which there is the greatest distance between the line start and end points. If the difference is equal in both directions then the X axis is chosen as the major axis. Edges 2 and 3 are aligned to the minor axis and are centered on the endpoints of the line as in [Non strict lines](#), and each is `lineWidth` long. Edges 0 and 1 are parallel to the line and connect the endpoints of edges 2 and 3. Coverage bits that correspond to sample points that intersect the parallelogram are 1, other coverage bits are 0.

Samples that fall exactly on the edge of the parallelogram follow the polygon rasterization rules.

Interpolation occurs as if the parallelogram was decomposed into two triangles where each pair of vertices at each end of the line has identical attributes.

Figure 15. Non strict lines

Only when `strictLines` is `VK_FALSE` implementations **may** deviate from the non-strict line algorithm described above in the following ways:

- Implementations **may** instead interpolate each fragment according to the formula in [Basic Line Segment Rasterization](#) using the original line segment endpoints.
- Rasterization of non-antialiased non-strict line segments **may** be performed using the rules defined in [Bresenham Line Segment Rasterization](#).

26.8.2. Bresenham Line Segment Rasterization

If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM`, then the following rules replace the line rasterization rules defined in [Basic Line Segment Rasterization](#).

Non-strict lines **may** also follow these rasterization rules for non-antialiased lines.

Line segment rasterization begins by characterizing the segment as either *x-major* or *y-major*. *x-major* line segments have slope in the closed interval $[-1,1]$; all other line segments are *y-major* (slope is determined by the segment's endpoints). We specify rasterization only for *x-major* segments except in cases where the modifications for *y-major* segments are not self-evident.

Ideally, Vulkan uses a *diamond-exit* rule to determine those fragments that are produced by rasterizing a line segment. For each fragment f with center at framebuffer coordinates x_f and y_f , define a diamond-shaped region that is the intersection of four half planes:

$$R_f = \{(x, y) \mid |x - x_f| + |y - y_f| < \frac{1}{2}\}$$

Essentially, a line segment starting at p_a and ending at p_b produces those fragments f for which the segment intersects R_f , except if p_b is contained in R_f .

Figure 16. Visualization of Bresenham's algorithm

To avoid difficulties when an endpoint lies on a boundary of R_f we (in principle) perturb the supplied endpoints by a tiny amount. Let p_a and p_b have framebuffer coordinates (x_a, y_a) and (x_b, y_b) , respectively. Obtain the perturbed endpoints p_a' given by $(x_a, y_a) - (\epsilon, \epsilon^2)$ and p_b' given by $(x_b, y_b) - (\epsilon, \epsilon^2)$. Rasterizing the line segment starting at p_a and ending at p_b produces those fragments f for which the segment starting at p_a' and ending on p_b' intersects R_b , except if p_b' is contained in R_f . ϵ is chosen to be so small that rasterizing the line segment produces the same fragments when δ is substituted for ϵ for any $0 < \delta \leq \epsilon$.

When p_a and p_b lie on fragment centers, this characterization of fragments reduces to Bresenham's algorithm with one modification: lines produced in this description are "half-open", meaning that the final fragment (corresponding to p_b) is not drawn. This means that when rasterizing a series of connected line segments, shared endpoints will be produced only once rather than twice (as would occur with Bresenham's algorithm).

Implementations **may** use other line segment rasterization algorithms, subject to the following rules:

- The coordinates of a fragment produced by the algorithm **must** not deviate by more than one unit in either x or y framebuffer coordinates from a corresponding fragment produced by the diamond-exit rule.
- The total number of fragments produced by the algorithm **must** not differ from that produced by the diamond-exit rule by more than one.
- For an x-major line, two fragments that lie in the same framebuffer-coordinate column **must** not be produced (for a y-major line, two fragments that lie in the same framebuffer-coordinate row **must** not be produced).
- If two line segments share a common endpoint, and both segments are either x-major (both left-to-right or both right-to-left) or y-major (both bottom-to-top or both top-to-bottom), then rasterizing both segments **must** not produce duplicate fragments. Fragments also **must** not be omitted so as to interrupt continuity of the connected segments.

The actual width w of Bresenham lines is determined by rounding the line width to the nearest integer, clamping it to the implementation-dependent **LineWidthRange** (with both values rounded to the nearest integer), then clamping it to be no less than 1.

Bresenham line segments of width other than one are rasterized by offsetting them in the minor direction (for an x-major line, the minor direction is y, and for a y-major line, the minor direction is x) and producing a row or column of fragments in the minor direction. If the line segment has endpoints given by (x_0, y_0) and (x_1, y_1) in framebuffer coordinates, the segment with endpoints $(x_0, y_0 - \frac{w-1}{2})$ and $(x_1, y_1 - \frac{w-1}{2})$ is rasterized, but instead of a single fragment, a column of fragments of height w (a row of fragments of length w for a y-major segment) is produced at each x (y for y-major) location. The lowest fragment of this column is the fragment that would be produced by rasterizing the segment of width 1 with the modified coordinates.

The preferred method of attribute interpolation for a wide line is to generate the same attribute values for all fragments in the row or column described above, as if the adjusted line was used for interpolation and those values replicated to the other fragments, except for **FragCoord** which is interpolated as usual. Implementations **may** instead interpolate each fragment according to the formula in [Basic Line Segment Rasterization](#), using the original line segment endpoints.

When Bresenham lines are being rasterized, sample locations **may** all be treated as being at the pixel center (this **may** affect attribute and depth interpolation).

NOTE

The sample locations described above are **not** used for determining coverage, they are only used for things like attribute interpolation. The rasterization rules that determine coverage are defined in terms of whether the line intersects **pixels**, as opposed to the point sampling rules used for other primitive types. So these rules are independent of the sample locations. One consequence of this is that Bresenham lines cover the same pixels regardless of the number of rasterization samples, and cover all samples in those pixels (unless masked out or killed).

26.8.3. Line Stipple

If the `stippledLineEnable` member of `VkPipelineRasterizationLineStateCreateInfo` is `VK_TRUE`, then lines are rasterized with a *line stipple* determined by `lineStippleFactor` and `lineStipplePattern`. `lineStipplePattern` is an unsigned 16-bit integer that determines which fragments are to be drawn or discarded when the line is rasterized. `lineStippleFactor` is a count that is used to modify the effective line stipple by causing each bit in `lineStipplePattern` to be used `lineStippleFactor` times.

Line stippling discards certain fragments that are produced by rasterization. The masking is achieved using three parameters: the 16-bit line stipple pattern p , the line stipple factor r , and an integer stipple counter s . Let

$$b = \lfloor \frac{s}{r} \rfloor \bmod 16$$

Then a fragment is produced if the b 'th bit of p is 1, and discarded otherwise. The bits of p are numbered with 0 being the least significant and 15 being the most significant.

The initial value of s is zero. For `VK_LINE_RASTERIZATION_MODE_BRESENHAM` lines, s is incremented after production of each fragment of a line segment (fragments are produced in order, beginning at the starting point and working towards the ending point). For `VK_LINE_RASTERIZATION_MODE_RECTANGULAR` and `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH` lines, the rectangular region is subdivided into adjacent unit-length rectangles, and s is incremented once for each rectangle. Rectangles with a value of s such that the b 'th bit of p is zero are discarded. If the last rectangle in a line segment is shorter than unit-length, then the remainder **may** carry over to the next line segment in the line strip using the same value of s (this is the preferred behavior, for the stipple pattern to appear more consistent through the strip).

s is reset to 0 at the start of each strip (for line strips), and before every line segment in a group of independent segments.

If the line segment has been clipped, then the value of s at the beginning of the line segment is implementation-dependent.

To [dynamically set](#) the line stipple state, call:

```
// Provided by VK_KHR_line_rasterization
void vkCmdSetLineStippleKHR(
    VkCommandBuffer                      commandBuffer,
    uint32_t                             lineStippleFactor,
    uint16_t                             lineStipplePattern);
```

```
// Provided by VK_EXT_line_rasterization
void vkCmdSetLineStippleEXT(
    VkCommandBuffer                      commandBuffer,
    uint32_t                             lineStippleFactor,
    uint16_t                             lineStipplePattern);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `lineStippleFactor` is the repeat factor used in stippled line rasterization.
- `lineStipplePattern` is the bit pattern used in stippled line rasterization.

This command sets the line stipple state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_LINE_STIPPLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationLineStateCreateInfo::lineStippleFactor` and `VkPipelineRasterizationLineStateCreateInfo::lineStipplePattern` values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetLineStipple-lineStippleFactor-02776
`lineStippleFactor` **must** be in the range [1,256]

Valid Usage (Implicit)

- VUID-vkCmdSetLineStipple-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetLineStipple-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetLineStipple-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally

synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHIC S_BIT	State

26.8.4. Smooth Lines

If the `lineRasterizationMode` member of `VkPipelineRasterizationLineStateCreateInfo` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH`, then lines are considered to be rectangles using the same geometry as for `VK_LINE_RASTERIZATION_MODE_RECTANGULAR` lines. The rules for determining which pixels are covered are implementation-dependent, and **may** include nearby pixels where no sample locations are covered or where the rectangle does not intersect the pixel at all. For each pixel that is considered covered, the fragment computes a coverage value that approximates the area of the intersection of the rectangle with the pixel square, and this coverage value is multiplied into the color location 0's alpha value after fragment shading, as described in [Multisample Coverage](#).

NOTE

The details of the rasterization rules and area calculation are left intentionally vague, to allow implementations to generate coverage and values that are aesthetically pleasing.

26.9. Polygons

A polygon results from the decomposition of a triangle strip, triangle fan or a series of independent triangles. Like points and line segments, polygon rasterization is controlled by several variables in the `VkPipelineRasterizationStateCreateInfo` structure.

26.9.1. Basic Polygon Rasterization

The first step of polygon rasterization is to determine whether the triangle is *back-facing* or *front-facing*. This determination is made based on the sign of the (clipped or unclipped) polygon's area computed in framebuffer coordinates. One way to compute this area is:

$$a = -\frac{1}{2} \sum_{i=0}^{n-1} x_f^i y_f^{i+1} - x_f^{i+1} y_f^i$$

where x_f^i and y_f^i are the x and y framebuffer coordinates of the i th vertex of the n -vertex polygon (vertices are numbered starting at zero for the purposes of this computation) and $i+1$ is $(i+1) \bmod n$.

The interpretation of the sign of a is determined by the `VkPipelineRasterizationStateCreateInfo::frontFace` property of the currently active pipeline. Possible values are:

```
// Provided by VK_VERSION_1_0
typedef enum VkFrontFace {
    VK_FRONT_FACE_COUNTER_CLOCKWISE = 0,
    VK_FRONT_FACE_CLOCKWISE = 1,
} VkFrontFace;
```

- `VK_FRONT_FACE_COUNTER_CLOCKWISE` specifies that a triangle with positive area is considered front-facing.
- `VK_FRONT_FACE_CLOCKWISE` specifies that a triangle with negative area is considered front-facing.

Any triangle which is not front-facing is back-facing, including zero-area triangles.

To [dynamically set](#) the front face orientation, call:

```
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetFrontFaceEXT(
    VkCommandBuffer          commandBuffer,
    VkFrontFace              frontFace);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `frontFace` is a `VkFrontFace` value specifying the front-facing triangle orientation to be used for culling.

This command sets the front face orientation for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_FRONT_FACE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::frontFace` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetFrontFace-None-08971
At least one of the following **must** be true:
 - the `extendedDynamicState` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetFrontFace-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetFrontFace-frontFace-parameter
`frontFace` **must** be a valid `VkFrontFace` value
- VUID-vkCmdSetFrontFace-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`

- VUID-vkCmdSetFrontFace-commandBuffer-cmdpool

The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

Once the orientation of triangles is determined, they are culled according to the `VkPipelineRasterizationStateCreateInfo::cullMode` property of the currently active pipeline. Possible values are:

```
// Provided by VK_VERSION_1_0
typedef enum VkCullModeFlagBits {
    VK_CULL_MODE_NONE = 0,
    VK_CULL_MODE_FRONT_BIT = 0x00000001,
    VK_CULL_MODE_BACK_BIT = 0x00000002,
    VK_CULL_MODE_FRONT_AND_BACK = 0x00000003,
} VkCullModeFlagBits;
```

- `VK_CULL_MODE_NONE` specifies that no triangles are discarded
- `VK_CULL_MODE_FRONT_BIT` specifies that front-facing triangles are discarded
- `VK_CULL_MODE_BACK_BIT` specifies that back-facing triangles are discarded
- `VK_CULL_MODE_FRONT_AND_BACK` specifies that all triangles are discarded.

Following culling, fragments are produced for any triangles which have not been discarded.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkCullModeFlags;
```

`VkCullModeFlags` is a bitmask type for setting a mask of zero or more `VkCullModeFlagBits`.

To **dynamically set** the cull mode, call:

```
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetCullModeEXT(
    VkCommandBuffer                      commandBuffer,
    VkCullModeFlags                     cullMode);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `cullMode` specifies the cull mode property to use for drawing.

This command sets the cull mode for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_CULL_MODE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::cullMode` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetCullMode-None-08971
At least one of the following **must** be true:
 - the `extendedDynamicState` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetCullMode-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetCullMode-cullMode-parameter
`cullMode` **must** be a valid combination of `VkCullModeFlagBits` values
- VUID-vkCmdSetCullMode-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdSetCullMode-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHIC S_BIT	State

The rule for determining which fragments are produced by polygon rasterization is called *point sampling*. The two-dimensional projection obtained by taking the x and y framebuffer coordinates of the polygon's vertices is formed. Fragments are produced for any fragment area groups of pixels for which any sample points lie inside of this polygon. Coverage bits that correspond to sample points that satisfy the point sampling criteria are 1, other coverage bits are 0. Special treatment is given to a sample whose sample location lies on a polygon edge. In such a case, if two polygons lie on either side of a common edge (with identical endpoints) on which a sample point lies, then exactly one of the polygons **must** result in a covered sample for that fragment during rasterization. As for the data associated with each fragment produced by rasterizing a polygon, we begin by specifying how these values are produced for fragments in a triangle.

Barycentric coordinates are a set of three numbers, a, b, and c, each in the range [0,1], with $a + b + c = 1$. These coordinates uniquely specify any point p within the triangle or on the triangle's boundary as

$$p = a p_a + b p_b + c p_c$$

where p_a , p_b , and p_c are the vertices of the triangle. a, b, and c are determined by:

$$a = \frac{A(p p_b p_c)}{A(p_a p_b p_c)}, \quad b = \frac{A(p p_a p_c)}{A(p_a p_b p_c)}, \quad c = \frac{A(p p_a p_b)}{A(p_a p_b p_c)},$$

where $A(lmn)$ denotes the area in framebuffer coordinates of the triangle with vertices l, m, and n.

Denote an associated datum at p_a , p_b , or p_c as f_a , f_b , or f_c , respectively.

Perspective interpolation for a triangle interpolates three values in a manner that is correct when taking the perspective of the viewport into consideration, by way of the triangle's clip coordinates. An interpolated value f can be determined by

$$f = \frac{a f_a / w_a + b f_b / w_b + c f_c / w_c}{a / w_a + b / w_b + c / w_c}$$

where w_a , w_b , and w_c are the clip w coordinates of p_a , p_b , and p_c , respectively. a, b, and c are the barycentric coordinates of the location at which the data are produced.

Linear interpolation for a triangle directly interpolates three values, and an interpolated value f can be determined by

$$f = a f_a + b f_b + c f_c$$

where f_a , f_b , and f_c are the data associated with p_a , p_b , and p_c , respectively.

The clip coordinate w for a sample is determined using perspective interpolation. The depth value z for a sample is determined using linear interpolation. Interpolation of fragment shader input values are determined by [Interpolation decorations](#).

For a polygon with more than three edges, such as are produced by clipping a triangle, a convex combination of the values of the datum at the polygon's vertices **must** be used to obtain the value assigned to each fragment produced by the rasterization algorithm. That is, it **must** be the case that at every fragment

$$f = \sum_{i=1}^n a_i f_i$$

where n is the number of vertices in the polygon and f_i is the value of f at vertex i . For each i , $0 \leq a_i \leq 1$ and $\sum_{i=1}^n a_i = 1$. The values of a_i **may** differ from fragment to fragment, but at vertex i , $a_i = 1$ and $a_j = 0$ for $j \neq i$.

NOTE

One algorithm that achieves the required behavior is to triangulate a polygon (without adding any vertices) and then treat each triangle individually as already discussed. A scan-line rasterizer that linearly interpolates data along each edge and then linearly interpolates data across each horizontal span from edge to edge also satisfies the restrictions (in this case the numerator and denominator of [perspective interpolation](#) are iterated independently, and a division is performed for each fragment).

26.9.2. Polygon Mode

Possible values of the [VkPipelineRasterizationStateCreateInfo::polygonMode](#) property of the currently active pipeline, specifying the method of rasterization for polygons, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkPolygonMode {
    VK_POLYGON_MODE_FILL = 0,
    VK_POLYGON_MODE_LINE = 1,
    VK_POLYGON_MODE_POINT = 2,
} VkPolygonMode;
```

- [VK_POLYGON_MODE_POINT](#) specifies that polygon vertices are drawn as points.
- [VK_POLYGON_MODE_LINE](#) specifies that polygon edges are drawn as line segments.
- [VK_POLYGON_MODE_FILL](#) specifies that polygons are rendered using the polygon rasterization rules in this section.

These modes affect only the final rasterization of polygons: in particular, a polygon's vertices are shaded and the polygon is clipped and possibly culled before these modes are applied.

The point size of the final rasterization of polygons when `polygon mode` is `VK_POLYGON_MODE_POINT` is implementation-dependent, and the point size **may** either be `PointSize` or 1.0.

26.9.3. Depth Bias

The depth values of all fragments generated by the rasterization of a polygon **can** be biased (offset) by a single depth bias value o that is computed for that polygon.

Depth Bias Enable

The depth bias computation is enabled by the `depthBiasEnable` set with `vkCmdSetDepthBiasEnableEXT` and `vkCmdSetDepthBiasEnableEXT`, or the corresponding `VkPipelineRasterizationStateCreateInfo::depthBiasEnable` value used to create the currently active pipeline. If the depth bias enable is `VK_FALSE`, no bias is applied and the fragment's depth values are unchanged.

To [dynamically enable](#) whether to bias fragment depth values, call:

```
// Provided by VK_EXT_extended_dynamic_state2
void vkCmdSetDepthBiasEnableEXT(
    VkCommandBuffer          commandBuffer,
    VkBool32                 depthBiasEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBiasEnable` controls whether to bias fragment depth values.

This command sets the depth bias enable for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::depthBiasEnable` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDepthBiasEnable-None-08970
At least one of the following **must** be true:
 - the `extendedDynamicState2` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetDepthBiasEnable-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthBiasEnable-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetDepthBiasEnable-commandBuffer-cmdpool

The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

Depth Bias Computation

The depth bias depends on three parameters:

- `depthBiasSlopeFactor` scales the maximum depth slope m of the polygon
- `depthBiasConstantFactor` scales the parameter r of the depth attachment
- the scaled terms are summed to produce a value which is then clamped to a minimum or maximum value specified by `depthBiasClamp`

`depthBiasSlopeFactor`, `depthBiasConstantFactor`, and `depthBiasClamp` **can** each be positive, negative, or zero. These parameters are set as described for `vkCmdSetDepthBias` below.

The maximum depth slope m of a triangle is

$$m = \sqrt{\sum \left| \frac{\partial z_f}{\partial x_f} \right|^2 + \sum \left| \frac{\partial z_f}{\partial y_f} \right|^2}$$

where (x_f, y_f, z_f) is a point on the triangle. m **may** be approximated as

$$m = \max \left\| \frac{\partial z_f}{\partial x_f}, \left| \frac{\partial z_f}{\partial y_f} \right| \right\|.$$

r is the minimum resolvable difference that depends on the depth attachment representation. It is the smallest difference in a sample's depth z_f values that is guaranteed to remain distinct throughout polygon rasterization and in the depth attachment. All pairs of fragments generated by the rasterization of two polygons with otherwise identical vertices, but z_f values that differ by r , will have distinct depth values.

For fixed-point depth attachment representations, r is constant throughout the range of the entire depth attachment. Its value is implementation-dependent but **must** be at most

$$r = 2 \times 2^{-n}$$

where n is the number of bits used for the depth aspect.

For floating-point depth attachment, there is no single minimum resolvable difference. In this case, the minimum resolvable difference for a given polygon is dependent on the maximum exponent, e , in the range of z values spanned by the primitive. If n is the number of bits in the floating-point mantissa, the minimum resolvable difference, r , for the given primitive is defined as

$$r = 2^{e-n}$$

If no depth attachment is present, r is undefined.

The bias value o for a polygon is

$$o = \text{dbclamp}(m \times \text{depthBiasSlopeFactor} + r \times \text{depthBiasConstantFactor})$$

where $\text{dbclamp}(x) = \begin{cases} x & \text{depthBiasClamp} = 0 \text{ or NaN} \\ \min(x, \text{depthBiasClamp}) & \text{depthBiasClamp} > 0 \\ \max(x, \text{depthBiasClamp}) & \text{depthBiasClamp} < 0 \end{cases}$

m is computed as described above. If the depth attachment uses a fixed-point representation, m is a function of depth values in the range $[0,1]$, and o is applied to depth values in the same range.

Depth bias is applied to triangle topology primitives received by the rasterizer regardless of [polygon mode](#). Depth bias **may** also be applied to line and point topology primitives received by the rasterizer.

To [dynamically set](#) the depth bias parameters, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetDepthBias(
    VkCommandBuffer          commandBuffer,
    float                    depthBiasConstantFactor,
    float                    depthBiasClamp,
    float                    depthBiasSlopeFactor);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBiasConstantFactor` is a scalar factor controlling the constant depth value added to each fragment.
- `depthBiasClamp` is the maximum (or minimum) depth bias of a fragment.
- `depthBiasSlopeFactor` is a scalar factor applied to a fragment's slope in depth bias calculations.

This command sets the depth bias parameters for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BIAS` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineRasterizationStateCreateInfo::depthBiasConstantFactor`, `depthBiasClamp`, and `depthBiasSlopeFactor` values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDepthBias-depthBiasClamp-00790
If the `depthBiasClamp` feature is not enabled, `depthBiasClamp` **must** be `0.0`

Valid Usage (Implicit)

- VUID-vkCmdSetDepthBias-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthBias-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdSetDepthBias-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

26.9.4. Conservative Rasterization

If the `pNext` chain of `VkPipelineRasterizationStateCreateInfo` includes a `VkPipelineRasterizationConservativeStateCreateInfoEXT` structure, then that structure includes parameters controlling conservative rasterization.

`VkPipelineRasterizationConservativeStateCreateInfoEXT` is defined as:

```
// Provided by VK_EXT_conservative_rasterization
typedef struct VkPipelineRasterizationConservativeStateCreateInfoEXT {
    VkStructureType                sType;
    const void*                    pNext;
    VkPipelineRasterizationConservativeStateCreateFlagsEXT flags;
    VkConservativeRasterizationModeEXT
conservativeRasterizationMode;
    float
extraPrimitiveOverestimationSize;
} VkPipelineRasterizationConservativeStateCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `conservativeRasterizationMode` is the conservative rasterization mode to use.
- `extraPrimitiveOverestimationSize` is the extra size in pixels to increase the generating primitive during conservative rasterization at each of its edges in *X* and *Y* equally in screen space beyond the base overestimation specified in `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::primitiveOverestimationSize`. If `conservativeRasterizationMode` is not `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`, this value is ignored.

If this structure is not included in the `pNext` chain, `conservativeRasterizationMode` is considered to be `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`, and conservative rasterization is disabled.

Polygon rasterization **can** be made conservative by setting `conservativeRasterizationMode` to `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` or `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` in `VkPipelineRasterizationConservativeStateCreateInfoEXT`.

NOTE

If `conservativePointAndLineRasterization` is supported, conservative rasterization can be applied to line and point primitives, otherwise it must be disabled.

Valid Usage

- VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-extraPrimitiveOverestimationSize-01769
`extraPrimitiveOverestimationSize` **must** be in the range of `0.0` to `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::maxExtraPrimitiveOverestimationSize` inclusive

Valid Usage (Implicit)

- VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-sType-sType
`sType` **must** be

VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_CONSERVATIVE_STATE_CREATE_INFO_EXT

- VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-flags-zero-bitmask
flags must be 0
- VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-conservativeRasterizationMode-parameter
conservativeRasterizationMode must be a valid [VkConservativeRasterizationModeEXT](#) value

```
// Provided by VK_EXT_conservative_rasterization
typedef VkFlags VkPipelineRasterizationConservativeStateCreateFlagsEXT;
```

VkPipelineRasterizationConservativeStateCreateFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of [VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode](#), specifying the conservative rasterization mode are:

```
// Provided by VK_EXT_conservative_rasterization
typedef enum VkConservativeRasterizationModeEXT {
    VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT = 0,
    VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT = 1,
    VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT = 2,
} VkConservativeRasterizationModeEXT;
```

- **VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT** specifies that conservative rasterization is disabled and rasterization proceeds as normal.
- **VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT** specifies that conservative rasterization is enabled in overestimation mode.
- **VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT** specifies that conservative rasterization is enabled in underestimation mode.

When overestimate conservative rasterization is enabled, rather than evaluating coverage at individual sample locations, a determination is made whether any portion of the pixel (including its edges and corners) is covered by the primitive. If any portion of the pixel is covered, then all bits of the **coverage mask** for the fragment corresponding to that pixel are enabled.

For the purposes of evaluating which pixels are covered by the primitive, implementations **can** increase the size of the primitive by up to **VkPhysicalDeviceConservativeRasterizationPropertiesEXT::primitiveOverestimationSize** pixels at each of the primitive edges. This **may** increase the number of fragments generated by this primitive and represents an overestimation of the pixel coverage.

This overestimation size can be increased further by setting the **extraPrimitiveOverestimationSize** value above **0.0** in steps of **VkPhysicalDeviceConservativeRasterizationPropertiesEXT::extraPrimitiveOverestimationSizeGranularity** up to and including **VkPhysicalDeviceConservativeRasterizationPropertiesEXT::extraPrimitiveOverestimationSize**. This

may further increase the number of fragments generated by this primitive.

The actual precision of the overestimation size used for conservative rasterization **may** vary between implementations and produce results that only approximate the `primitiveOverestimationSize` and `extraPrimitiveOverestimationSizeGranularity` properties.

For triangles if `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` is enabled, fragments will be generated if the primitive area covers any portion of any pixel inside the fragment area, including their edges or corners. The tie-breaking rule described in [Basic Polygon Rasterization](#) does not apply during conservative rasterization and coverage is set for all fragments generated from shared edges of polygons. Degenerate triangles that evaluate to zero area after rasterization, even for pixels containing a vertex or edge of the zero-area polygon, will be culled if `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::degenerateTrianglesRasterized` is `VK_FALSE` or will generate fragments if `degenerateTrianglesRasterized` is `VK_TRUE`. The fragment input values for these degenerate triangles take their attribute and depth values from the provoking vertex. Degenerate triangles are considered backfacing and the application **can** enable backface culling if desired. Triangles that are zero area before rasterization **may** be culled regardless.

For lines if `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` is enabled, and the implementation sets `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativePointAndLineRasterization` to `VK_TRUE`, fragments will be generated if the line covers any portion of any pixel inside the fragment area, including their edges or corners. Degenerate lines that evaluate to zero length after rasterization will be culled if `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::degenerateLinesRasterized` is `VK_FALSE` or will generate fragments if `degenerateLinesRasterized` is `VK_TRUE`. The fragments input values for these degenerate lines take their attribute and depth values from the provoking vertex. Lines that are zero length before rasterization **may** be culled regardless.

For points if `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` is enabled, and the implementation sets `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativePointAndLineRasterization` to `VK_TRUE`, fragments will be generated if the point square covers any portion of any pixel inside the fragment area, including their edges or corners.

When underestimate conservative rasterization is enabled, rather than evaluating coverage at individual sample locations, a determination is made whether all of the pixel (including its edges and corners) is covered by the primitive. If the entire pixel is covered, then a fragment is generated with all bits of its `coverage mask` corresponding to the pixel enabled, otherwise the pixel is not considered covered even if some portion of the pixel is covered. The fragment is discarded if no pixels inside the fragment area are considered covered.

For triangles, if `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` is enabled, fragments will only be generated if any pixel inside the fragment area is fully covered by the generating primitive, including its edges and corners.

For lines, if `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` is enabled, fragments will be generated if any pixel inside the fragment area, including its edges and corners, are entirely covered by the line.

For points, if `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` is enabled, fragments will only

be generated if the point square covers the entirety of any pixel square inside the fragment area, including its edges or corners.

For both overestimate and underestimate conservative rasterization modes a fragment has all of its pixel squares fully covered by the generating primitive **must** set `FullyCoveredEXT` to `VK_TRUE` if the implementation enables the `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::fullyCoveredFragmentShaderInputVariable` feature.

When setting the `fragment shading rate` results in fragments covering multiple pixels, coverage for conservative rasterization is still evaluated on a per-pixel basis and may result in fragments with partial coverage. For fragment shader inputs decorated with `FullyCoveredEXT`, a fragment is considered fully covered if and only if all pixels in the fragment are fully covered by the generating primitive.

Chapter 27. Fragment Operations

Fragments produced by rasterization go through a number of operations to determine whether or how values produced by fragment shading are written to the framebuffer.

The following fragment operations adhere to [rasterization order](#), and are typically performed in this order:

1. [Discard rectangles test](#)
2. [Scissor test](#)
3. [Sample mask test](#)
4. Certain [Fragment shading](#) operations:
 - [Sample Mask Accesses](#)
 - [Depth Replacement](#)
 - [Stencil Reference Replacement](#)
 - [Interlocked Operations](#)
5. [Multisample coverage](#)
6. [Depth bounds test](#)
7. [Stencil test](#)
8. [Depth test](#)
9. [Sample counting](#)
10. [Coverage reduction](#)

The [coverage mask](#) generated by rasterization describes the initial coverage of each sample covered by the fragment. Fragment operations will update the coverage mask to add or subtract coverage where appropriate. If a fragment operation results in all bits of the coverage mask being 0, the fragment is discarded, and no further operations are performed.

When one of the fragment operations in this chapter is described as “replacing” a fragment shader output, that output is replaced unconditionally, even if no fragment shader previously wrote to that output.

If there is a [fragment shader](#) and it declares the [PostDepthCoverage](#) execution mode, the [sample mask test](#) is instead performed after the [depth test](#).

If there is a [fragment shader](#) and it declares the [EarlyFragmentTests](#) execution mode, [fragment shading](#) and [multisample coverage](#) operations **should** instead be performed after [sample counting](#), and [sample mask test](#) **may** instead be performed after [sample counting](#).

For a pipeline with the following properties:

- a fragment shader is specified
- the fragment shader does not write to storage resources;

- the fragment shader specifies the `DepthReplacing` execution mode; and
- either
 - the fragment shader specifies the `DepthUnchanged` execution mode;
 - the fragment shader specifies the `DepthLess` execution mode and the pipeline uses a `VkPipelineDepthStencilStateCreateInfo::depthCompareOp` of `VK_COMPARE_OP_GREATER` or `VK_COMPARE_OP_GREATER_OR_EQUAL`; or
 - the fragment shader specifies the `DepthGreater` execution mode and the pipeline uses a `VkPipelineDepthStencilStateCreateInfo::depthCompareOp` of `VK_COMPARE_OP_LESS` or `VK_COMPARE_OP_LESS_OR_EQUAL`

the implementation **may** perform `depth bounds test` before `fragment shading` and perform an additional `depth test` immediately after that using the interpolated depth value generated by rasterization.

Once all fragment operations have completed, fragment shader outputs for covered color attachment samples pass through `framebuffer operations`.

27.1. Discard Rectangles Test

The discard rectangle test compares the framebuffer coordinates (x_f, y_f) of each sample covered by a fragment against a set of *discard rectangles*.

Each discard rectangle is defined by a `VkRect2D`. These values are either set by the `VkPipelineDiscardRectangleStateCreateInfoEXT` structure during pipeline creation, or dynamically by the `vkCmdSetDiscardRectangleEXT` command.

A given sample is considered inside a discard rectangle if the x_f is in the range [`VkRect2D::offset.x`, `VkRect2D::offset.x + VkRect2D::extent.x`), and y_f is in the range [`VkRect2D::offset.y`, `VkRect2D::offset.y + VkRect2D::extent.y`). If the test is set to be inclusive, samples that are not inside any of the discard rectangles will have their coverage set to 0. If the test is set to be exclusive, samples that are inside any of the discard rectangles will have their coverage set to 0.

If no discard rectangles are specified, the coverage mask is unmodified by this operation.

The `VkPipelineDiscardRectangleStateCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_discard_rectangles
typedef struct VkPipelineDiscardRectangleStateCreateInfoEXT {
    VkStructureType           sType;
    const void*               pNext;
    VkPipelineDiscardRectangleStateCreateFlagsEXT flags;
    VkDiscardRectangleModeEXT discardRectangleMode;
    uint32_t                  discardRectangleCount;
    const VkRect2D*           pDiscardRectangles;
} VkPipelineDiscardRectangleStateCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `discardRectangleMode` is a `VkDiscardRectangleModeEXT` value determining whether the discard rectangle test is inclusive or exclusive.
- `discardRectangleCount` is the number of discard rectangles to use.
- `pDiscardRectangles` is a pointer to an array of `VkRect2D` structures defining discard rectangles.

If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state is enabled for a pipeline, the `pDiscardRectangles` member is ignored. If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` dynamic state is not enabled for the pipeline the presence of this structure in the `VkGraphicsPipelineCreateInfo` chain, and a `discardRectangleCount` greater than zero, implicitly enables discard rectangles in the pipeline, otherwise discard rectangles **must** be enabled or disabled by `vkCmdSetDiscardRectangleEnableEXT`. If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` dynamic state is enabled for the pipeline, the `discardRectangleMode` member is ignored, and the discard rectangle mode **must** be set by `vkCmdSetDiscardRectangleModeEXT`.

When this structure is included in the `pNext` chain of `VkGraphicsPipelineCreateInfo`, it defines parameters of the discard rectangle test. If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state is not enabled, and this structure is not included in the `pNext` chain, it is equivalent to specifying this structure with a `discardRectangleCount` of `0`. If all `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT`, `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT`, and `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` dynamic states are enabled, the application **can** omit this structure from the `pNext` chain of `VkGraphicsPipelineCreateInfo` and still use discard rectangles by setting all state dynamically. In this case `vkCmdSetDiscardRectangleEXT` **must** be called to set the discard rectangle for all indices `[0, maxDiscardRectangles)` before drawing with discard rectangles enabled. Individual discard rectangles **can** be made ineffective by setting their `VkRect2D::extent.width` and `VkRect2D::extent.height` to zero.

Valid Usage

- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-discardRectangleCount-00582
`discardRectangleCount` **must** be less than or equal to `VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles`

Valid Usage (Implicit)

- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_DISCARD_RECTANGLE_STATE_CREATE_INFO_EXT`
- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-flags-zero bitmask
`flags` **must** be `0`
- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-discardRectangleMode-parameter
`discardRectangleMode` **must** be a valid `VkDiscardRectangleModeEXT` value

```
// Provided by VK_EXT_discard_rectangles
typedef VkFlags VkPipelineDiscardRectangleStateCreateFlagsEXT;
```

`VkPipelineDiscardRectangleStateCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

`VkDiscardRectangleModeEXT` values are:

```
// Provided by VK_EXT_discard_rectangles
typedef enum VkDiscardRectangleModeEXT {
    VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT = 0,
    VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT = 1,
} VkDiscardRectangleModeEXT;
```

- `VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT` specifies that the discard rectangle test is inclusive.
- `VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT` specifies that the discard rectangle test is exclusive.

To dynamically set the discard rectangles, call:

```
// Provided by VK_EXT_discard_rectangles
void vkCmdSetDiscardRectangleEXT(
    VkCommandBuffer                commandBuffer,
    uint32_t                       firstDiscardRectangle,
    uint32_t                       discardRectangleCount,
    const VkRect2D*                pDiscardRectangles);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstDiscardRectangle` is the index of the first discard rectangle whose state is updated by the command.
- `discardRectangleCount` is the number of discard rectangles whose state are updated by the command.
- `pDiscardRectangles` is a pointer to an array of `VkRect2D` structures specifying discard rectangles.

The discard rectangle taken from element `i` of `pDiscardRectangles` replace the current state for the discard rectangle at index `firstDiscardRectangle + i`, for `i` in `[0, discardRectangleCount)`.

This command sets the discard rectangles for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDiscardRectangleStateCreateInfoEXT::pDiscardRectangles` values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDiscardRectangleEXT-firstDiscardRectangle-00585

The sum of `firstDiscardRectangle` and `discardRectangleCount` **must** be less than or equal to `VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles`

- VUID-vkCmdSetDiscardRectangleEXT-x-00587
The `x` and `y` member of `offset` in each `VkRect2D` element of `pDiscardRectangles` **must** be greater than or equal to `0`
- VUID-vkCmdSetDiscardRectangleEXT-offset-00588
Evaluation of `(offset.x + extent.width)` in each `VkRect2D` element of `pDiscardRectangles` **must** not cause a signed integer addition overflow
- VUID-vkCmdSetDiscardRectangleEXT-offset-00589
Evaluation of `(offset.y + extent.height)` in each `VkRect2D` element of `pDiscardRectangles` **must** not cause a signed integer addition overflow

Valid Usage (Implicit)

- VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDiscardRectangleEXT-pDiscardRectangles-parameter
`pDiscardRectangles` **must** be a valid pointer to an array of `discardRectangleCount` `VkRect2D` structures
- VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetDiscardRectangleEXT-discardRectangleCount-arraylength
`discardRectangleCount` **must** be greater than `0`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

To [dynamically set](#) whether discard rectangles are enabled, call:

```
// Provided by VK_EXT_discard_rectangles
void vkCmdSetDiscardRectangleEnableEXT(
    VkCommandBuffer          commandBuffer,
    VkBool32                 discardRectangleEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `discardRectangleEnable` specifies whether discard rectangles are enabled or not.

This command sets the discard rectangle enable for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is implied by the `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount` value used to create the currently active pipeline, where a non-zero `discardRectangleCount` implicitly enables discard rectangles, otherwise they are disabled.

Valid Usage

- VUID-vkCmdSetDiscardRectangleEnableEXT-specVersion-07851
The `VK_EXT_discard_rectangles` extension **must** be enabled, and the implementation **must** support at least `specVersion 2` of this extension

Valid Usage (Implicit)

- VUID-vkCmdSetDiscardRectangleEnableEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDiscardRectangleEnableEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetDiscardRectangleEnableEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

To [dynamically set](#) the discard rectangle mode, call:

```
// Provided by VK_EXT_discard_rectangles
void vkCmdSetDiscardRectangleModeEXT(
    VkCommandBuffer          commandBuffer,
    VkDiscardRectangleModeEXT discardRectangleMode);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `discardRectangleMode` specifies the discard rectangle mode for all discard rectangles, either inclusive or exclusive.

This command sets the discard rectangle mode for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleMode` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDiscardRectangleModeEXT-specVersion-07852
The `VK_EXT_discard_rectangles` extension **must** be enabled, and the implementation **must** support at least `specVersion 2` of this extension

Valid Usage (Implicit)

- VUID-vkCmdSetDiscardRectangleModeEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDiscardRectangleModeEXT-discardRectangleMode-parameter
`discardRectangleMode` **must** be a valid `VkDiscardRectangleModeEXT` value
- VUID-vkCmdSetDiscardRectangleModeEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetDiscardRectangleModeEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

27.2. Scissor Test

The scissor test compares the framebuffer coordinates (x_f, y_f) of each sample covered by a fragment against a *scissor rectangle* at the index equal to the fragment's `ViewportIndex`.

Each scissor rectangle is defined by a `VkRect2D`. These values are either set by the `VkPipelineViewportStateCreateInfo` structure during pipeline creation, or dynamically by the `vkCmdSetScissor` command.

A given sample is considered inside a scissor rectangle if x_f is in the range `[VkRect2D::offset.x, VkRect2D::offset.x + VkRect2D::extent.x)`, and y_f is in the range `[VkRect2D::offset.y, VkRect2D::offset.y + VkRect2D::extent.y)`. Samples with coordinates outside the scissor rectangle at the corresponding `ViewportIndex` will have their coverage set to 0.

To **dynamically set** the scissor rectangles, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetScissor(
    VkCommandBuffer          commandBuffer,
    uint32_t                 firstScissor,
    uint32_t                 scissorCount,
    const VkRect2D*          pScissors);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstScissor` is the index of the first scissor whose state is updated by the command.
- `scissorCount` is the number of scissors whose rectangles are updated by the command.
- `pScissors` is a pointer to an array of `VkRect2D` structures defining scissor rectangles.

The scissor rectangles taken from element i of `pScissors` replace the current state for the scissor index `firstScissor + i`, for i in `[0, scissorCount)`.

This command sets the scissor rectangles for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_SCISSOR` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportStateCreateInfo::pScissors` values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetScissor-firstScissor-00592
The sum of `firstScissor` and `scissorCount` **must** be between `1` and `VkPhysicalDeviceLimits::maxViewports`, inclusive
- VUID-vkCmdSetScissor-firstScissor-00593
If the `multiViewport` feature is not enabled, `firstScissor` **must** be `0`
- VUID-vkCmdSetScissor-scissorCount-00594
If the `multiViewport` feature is not enabled, `scissorCount` **must** be `1`
- VUID-vkCmdSetScissor-x-00595
The `x` and `y` members of `offset` member of any element of `pScissors` **must** be greater than or equal to `0`
- VUID-vkCmdSetScissor-offset-00596
Evaluation of `(offset.x + extent.width)` **must** not cause a signed integer addition overflow for any element of `pScissors`
- VUID-vkCmdSetScissor-offset-00597
Evaluation of `(offset.y + extent.height)` **must** not cause a signed integer addition overflow for any element of `pScissors`

Valid Usage (Implicit)

- VUID-vkCmdSetScissor-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetScissor-pScissors-parameter
`pScissors` **must** be a valid pointer to an array of `scissorCount` `VkRect2D` structures
- VUID-vkCmdSetScissor-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdSetScissor-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetScissor-scissorCount-arraylength
`scissorCount` **must** be greater than `0`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHIC S_BIT	State

27.3. Sample Mask Test

The sample mask test compares the `coverage mask` for a fragment with the *sample mask* defined by `VkPipelineMultisampleStateCreateInfo::pSampleMask`.

Each bit of the coverage mask is associated with a sample index as described in the [rasterization chapter](#). If the bit in `VkPipelineMultisampleStateCreateInfo::pSampleMask` which is associated with that same sample index is set to 0, the coverage mask bit is set to 0.

27.4. Fragment Shading

[Fragment shaders](#) are invoked for each fragment, or as [helper invocations](#).

Most operations in the fragment shader are not performed in [rasterization order](#), with exceptions called out in the following sections.

For fragment shaders invoked by fragments, the following rules apply:

- A fragment shader **must** not be executed if a [fragment operation](#) that executes before fragment shading discards the fragment.
- A fragment shader **may** not be executed if:
 - An implementation determines that another fragment shader, invoked by a subsequent primitive in [primitive order](#), overwrites all results computed by the shader (including writes to storage resources).
 - Any other [fragment operation](#) discards the fragment, and the shader does not write to any storage resources.
 - If a fragment shader statically computes the same values for different framebuffer locations, and does not write to any storage resources, multiple fragments **may** be shaded by one fragment shader invocation. This **may** affect `VK_QUERY_PIPELINE_STATISTIC_FRAGMENT_SHADER_INVOCATIONS_BIT` results, but **must** otherwise not be visible behavior to applications.
- Otherwise, at least one fragment shader **must** be executed.
 - If [sample shading](#) is enabled and multiple invocations per fragment are **required**,

additional invocations **must** be executed as specified.

- Each covered sample **must** be included in at least one fragment shader invocation.

If no fragment shader is included in the pipeline, no fragment shader is executed, and undefined values **may** be written to all color attachment outputs during this fragment operation.

NOTE

Multiple fragment shader invocations may be executed for the same fragment for any number of implementation-dependent reasons. When there is more than one fragment shader invocation per fragment, the association of samples to invocations is implementation-dependent. Stores and atomics performed by these additional invocations have the normal effect.

For example, if the subpass includes multiple views in its view mask, a fragment shader may be invoked separately for each view.

27.4.1. Sample Mask

Reading from the **SampleMask** built-in in the **Input** storage class will return the coverage mask for the current fragment as calculated by fragment operations that executed prior to fragment shading.

If **sample shading** is enabled, fragment shaders will only see values of **1** for samples being shaded - other bits will be **0**.

Each bit of the coverage mask is associated with a sample index as described in the **rasterization chapter**. If the bit in **SampleMask** which is associated with that same sample index is set to **0**, that coverage mask bit is set to **0**.

Values written to the **SampleMask** built-in in the **Output** storage class will be used by the **multisample coverage** operation, with the same encoding as the input built-in.

27.4.2. Shader Termination and Demotion

If a fragment shader is **terminated early** or **demoted to a helper invocation** by using **OpKill**, **OpTerminateInvocation**, or **OpDemoteToHelperInvocation**, samples covered by that shader invocation have their coverage mask bits set to **0**.

27.4.3. Depth Replacement

Writing to the **FragDepth** built-in will replace the fragment's calculated depth values for each sample in the input **SampleMask**. **Depth testing** performed after the fragment shader for this fragment will use this new value as z_f .

27.4.4. Stencil Reference Replacement

Writing to the **FragStencilRefEXT** built-in will replace the fragment's stencil reference value for each sample in the input **SampleMask**. **Stencil testing** performed after the fragment shader for this fragment will use this new value as s_f .

27.4.5. Interlocked Operations

`OpBeginInvocationInterlockEXT` and `OpEndInvocationInterlockEXT` define a section of a fragment shader which imposes additional ordering constraints on operations performed within them. These operations are defined as *interlocked operations*. How interlocked operations are ordered against other fragment shader invocations depends on the specified execution modes.

If the `ShadingRateInterlockOrderedEXT` execution mode is specified, any interlocked operations in a fragment shader **must** happen before interlocked operations in fragment shader invocations that execute later in [rasterization order](#) and cover at least one sample in the same fragment area, and **must** happen after interlocked operations in a fragment shader that executes earlier in [rasterization order](#) and cover at least one sample in the same fragment area.

If the `ShadingRateInterlockUnorderedEXT` execution mode is specified, any interlocked operations in a fragment shader **must** happen before or after interlocked operations in fragment shader invocations that execute earlier or later in [rasterization order](#) and cover at least one sample in the same fragment area.

If the `PixelInterlockOrderedEXT` execution mode is specified, any interlocked operations in a fragment shader **must** happen before interlocked operations in fragment shader invocations that execute later in [rasterization order](#) and cover at least one sample in the same pixel, and **must** happen after interlocked operations in a fragment shader that executes earlier in [rasterization order](#) and cover at least one sample in the same pixel.

If the `PixelInterlockUnorderedEXT` execution mode is specified, any interlocked operations in a fragment shader **must** happen before or after interlocked operations in fragment shader invocations that execute earlier or later in [rasterization order](#) and cover at least one sample in the same pixel.

If the `SampleInterlockOrderedEXT` execution mode is specified, any interlocked operations in a fragment shader **must** happen before interlocked operations in fragment shader invocations that execute later in [rasterization order](#) and cover at least one of the same samples, and **must** happen after interlocked operations in a fragment shader that executes earlier in [rasterization order](#) and cover at least one of the same samples.

If the `SampleInterlockUnorderedEXT` execution mode is specified, any interlocked operations in a fragment shader **must** happen before or after interlocked operations in fragment shader invocations that execute earlier or later in [rasterization order](#) and cover at least one of the same samples.

27.5. Multisample Coverage

If a fragment shader is active and its entry point's interface includes a built-in output variable decorated with `SampleMask`, the coverage mask is **ANDed** with the bits of the `SampleMask` built-in to generate a new coverage mask. If [sample shading](#) is enabled, bits written to `SampleMask` corresponding to samples that are not being shaded by the fragment shader invocation are ignored. If no fragment shader is active, or if the active fragment shader does not include `SampleMask` in its interface, the coverage mask is not modified.

Next, the fragment alpha value and coverage mask are modified based on the line coverage factor if the `lineRasterizationMode` member of the `VkPipelineRasterizationStateCreateInfo` structure is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH`, and the `alphaToCoverageEnable` and `alphaToOneEnable` members of the `VkPipelineMultisampleStateCreateInfo` structure.

All alpha values in this section refer only to the alpha component of the fragment shader output that has a `Location` and `Index` decoration of zero (see the [Fragment Output Interface](#) section). If that shader output has an integer or unsigned integer type, then these operations are skipped.

If the `lineRasterizationMode` member of the `VkPipelineRasterizationStateCreateInfo` structure is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH` and the fragment came from a line segment, then the alpha value is replaced by multiplying it by the coverage factor for the fragment computed during [smooth line rasterization](#).

If `alphaToCoverageEnable` is enabled, a temporary coverage mask is generated where each bit is determined by the fragment's alpha value, which is ANDed with the fragment coverage mask.

No specific algorithm is specified for converting the alpha value to a temporary coverage mask. It is intended that the number of 1's in this value be proportional to the alpha value (clamped to [0,1]), with all 1's corresponding to a value of 1.0 and all 0's corresponding to 0.0. The algorithm **may** be different at different framebuffer coordinates.

NOTE

Using different algorithms at different framebuffer coordinates **may** help to avoid artifacts caused by regular coverage sample locations.

Finally, if `alphaToOneEnable` is enabled, each alpha value is replaced by the maximum representable alpha value for fixed-point color attachments, or by 1.0 for floating-point attachments. Otherwise, the alpha values are not changed.

27.6. Depth and Stencil Operations

Pipeline state controlling the [depth bounds tests](#), [stencil test](#), and [depth test](#) is specified through the members of the `VkPipelineDepthStencilStateCreateInfo` structure.

The `VkPipelineDepthStencilStateCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineDepthStencilStateCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkPipelineDepthStencilStateCreateFlags flags;
    VkBool32                  depthTestEnable;
    VkBool32                  depthWriteEnable;
    VkCompareOp                depthCompareOp;
    VkBool32                  depthBoundsTestEnable;
    VkBool32                  stencilTestEnable;
    VkStencilOpState           front;
    VkStencilOpState           back;
    float                      minDepthBounds;
    float                      maxDepthBounds;
} VkPipelineDepthStencilStateCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `depthTestEnable` controls whether `depth testing` is enabled.
- `depthWriteEnable` controls whether `depth writes` are enabled when `depthTestEnable` is `VK_TRUE`. Depth writes are always disabled when `depthTestEnable` is `VK_FALSE`.
- `depthCompareOp` is a `VkCompareOp` value specifying the comparison operator to use in the `Depth Comparison` step of the `depth test`.
- `depthBoundsTestEnable` controls whether `depth bounds testing` is enabled.
- `stencilTestEnable` controls whether `stencil testing` is enabled.
- `front` and `back` are `VkStencilOpState` values controlling the corresponding parameters of the `stencil test`.
- `minDepthBounds` is the minimum depth bound used in the `depth bounds test`.
- `maxDepthBounds` is the maximum depth bound used in the `depth bounds test`.

Valid Usage

- VUID-VkPipelineDepthStencilStateCreateInfo-depthBoundsTestEnable-00598
If the `depthBounds` feature is not enabled, `depthBoundsTestEnable` **must** be `VK_FALSE`

Valid Usage (Implicit)

- VUID-VkPipelineDepthStencilStateCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_DEPTH_STENCIL_STATE_CREATE_INFO`
- VUID-VkPipelineDepthStencilStateCreateInfo-pNext-pNext
`pNext` **must** be `NULL`

- `VUID-VkPipelineDepthStencilStateCreateInfo-flags-zerobitmask`
`flags` **must** be `0`
- `VUID-VkPipelineDepthStencilStateCreateInfo-depthCompareOp-parameter`
`depthCompareOp` **must** be a valid `VkCompareOp` value
- `VUID-VkPipelineDepthStencilStateCreateInfo-front-parameter`
`front` **must** be a valid `VkStencilOpState` structure
- `VUID-VkPipelineDepthStencilStateCreateInfo-back-parameter`
`back` **must** be a valid `VkStencilOpState` structure

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineDepthStencilStateCreateFlags;
```

`VkPipelineDepthStencilStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

27.7. Depth Bounds Test

The depth bounds test compares the depth value z_a in the depth/stencil attachment at each sample's framebuffer coordinates (x_f, y_f) and `sample index` i against a set of *depth bounds*.

The depth bounds are determined by two floating-point values defining a minimum (`minDepthBounds`) and maximum (`maxDepthBounds`) depth value. These values are either set by the `VkPipelineDepthStencilStateCreateInfo` structure during pipeline creation, or dynamically by `vkCmdSetDepthBoundsTestEnableEXT` and `vkCmdSetDepthBounds`.

A given sample is considered within the depth bounds if z_a is in the range `[minDepthBounds, maxDepthBounds]`. Samples with depth attachment values outside of the depth bounds will have their coverage set to `0`.

If the depth bounds test is disabled, or if there is no depth attachment, the coverage mask is unmodified by this operation.

To `dynamically enable or disable` the depth bounds test, call:

```
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetDepthBoundsTestEnableEXT(
    VkCommandBuffer          commandBuffer,
    VkBool32                 depthBoundsTestEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBoundsTestEnable` specifies if the depth bounds test is enabled.

This command sets the depth bounds enable for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the

`VkPipelineDepthStencilStateCreateInfo::depthBoundsTestEnable` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDepthBoundsTestEnable-None-08971
At least one of the following **must** be true:
 - the `extendedDynamicState` feature is enabled
- VUID-vkCmdSetDepthBoundsTestEnable-depthBounds-10010
If the `depthBounds` feature is not enabled, `depthBoundsTestEnable` **must** be `VK_FALSE`

Valid Usage (Implicit)

- VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

To [dynamically set](#) the depth bounds range, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetDepthBounds(
    VkCommandBuffer          commandBuffer,
    float                    minDepthBounds,
    float                    maxDepthBounds);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `minDepthBounds` is the minimum depth bound.
- `maxDepthBounds` is the maximum depth bound.

This command sets the depth bounds range for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BOUNDS` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::minDepthBounds` and `VkPipelineDepthStencilStateCreateInfo::maxDepthBounds` values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDepthBounds-minDepthBounds-00600
If the `VK_EXT_depth_range_unrestricted` extension is not enabled `minDepthBounds` **must** be between `0.0` and `1.0`, inclusive
- VUID-vkCmdSetDepthBounds-maxDepthBounds-00601
If the `VK_EXT_depth_range_unrestricted` extension is not enabled `maxDepthBounds` **must** be between `0.0` and `1.0`, inclusive
- VUID-vkCmdSetDepthBounds-minDepthBounds-10912
`minDepthBounds` **must** be less than or equal to `maxDepthBounds`

Valid Usage (Implicit)

- VUID-vkCmdSetDepthBounds-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthBounds-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdSetDepthBounds-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHIC S_BIT	State

27.8. Stencil Test

The stencil test compares the stencil attachment value s_a in the depth/stencil attachment at each sample's framebuffer coordinates (x_f, y_f) and [sample index](#) i against a *stencil reference value*.

If the stencil test is not enabled, as specified by [vkCmdSetStencilTestEnableEXT](#) or [VkPipelineDepthStencilStateCreateInfo::stencilTestEnable](#), or if there is no stencil attachment, the coverage mask is unmodified by this operation.

The stencil test is controlled by one of two sets of stencil-related state, the front stencil state and the back stencil state. Stencil tests and writes use the back stencil state when processing fragments generated by [back-facing polygons](#), and the front stencil state when processing fragments generated by [front-facing polygons](#) or any other primitives.

The comparison operation performed is determined by the [VkCompareOp](#) value set by [vkCmdSetStencilOpEXT::compareOp](#), or by [VkStencilOpState::compareOp](#) during pipeline creation.

The compare mask s_c and stencil reference value s_r of the front or the back stencil state set determine arguments of the comparison operation. s_c is set by the [VkPipelineDepthStencilStateCreateInfo](#) structure during pipeline creation, or by the [vkCmdSetStencilCompareMask](#) command. s_r is set by [VkPipelineDepthStencilStateCreateInfo](#) or by [vkCmdSetStencilReference](#).

s_r and s_a are each independently combined with s_c using a bitwise **AND** operation to create masked reference and attachment values s'_r and s'_a . s'_r and s'_a are used as the *reference* and *test* values, respectively, in the operation specified by the [VkCompareOp](#).

If the comparison evaluates to false, the coverage for the sample is set to **0**.

A new stencil value s_g is generated according to a stencil operation defined by [VkStencilOp](#) parameters set by [vkCmdSetStencilOpEXT](#) or [VkPipelineDepthStencilStateCreateInfo](#). If the stencil test fails, **failOp** defines the stencil operation used. If the stencil test passes however, the stencil op used is based on the [depth test](#) - if it passes, [VkPipelineDepthStencilStateCreateInfo::passOp](#) is used, otherwise [VkPipelineDepthStencilStateCreateInfo::depthFailOp](#) is used.

The stencil attachment value s_a is then updated with the generated stencil value s_g according to the write mask s_w defined by **writeMask** in [VkPipelineDepthStencilStateCreateInfo::front](#) and [VkPipelineDepthStencilStateCreateInfo::back](#) as:

$$s_a = (s_a \oplus \neg s_w) \oplus (s_g \oplus s_w)$$

To **dynamically enable or disable** the stencil test, call:

```
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetStencilTestEnableEXT(
    VkCommandBuffer          commandBuffer,
    VkBool32                 stencilTestEnable);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **stencilTestEnable** specifies if the stencil test is enabled.

This command sets the stencil test enable for subsequent drawing commands when the graphics pipeline is created with **VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the **VkPipelineDepthStencilStateCreateInfo::stencilTestEnable** value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetStencilTestEnable-None-08971
At least one of the following **must** be true:
 - the **extendedDynamicState** feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetStencilTestEnable-commandBuffer-parameter
commandBuffer **must** be a valid **VkCommandBuffer** handle
- VUID-vkCmdSetStencilTestEnable-commandBuffer-recording
commandBuffer **must** be in the **recording state**
- VUID-vkCmdSetStencilTestEnable-commandBuffer-cmdpool
The **VkCommandPool** that **commandBuffer** was allocated from **must** support **VK_QUEUE_GRAPHICS_BIT** operations

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

To [dynamically set](#) the stencil operation, call:

```
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetStencilOpEXT(
    VkCommandBuffer          commandBuffer,
    VkStencilFaceFlags       faceMask,
    VkStencilOp               failOp,
    VkStencilOp               passOp,
    VkStencilOp               depthFailOp,
    VkCompareOp               compareOp);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `faceMask` is a bitmask of `VkStencilFaceFlagBits` specifying the set of stencil state for which to update the stencil operation.
- `failOp` is a `VkStencilOp` value specifying the action performed on samples that fail the stencil test.
- `passOp` is a `VkStencilOp` value specifying the action performed on samples that pass both the depth and stencil tests.
- `depthFailOp` is a `VkStencilOp` value specifying the action performed on samples that pass the stencil test and fail the depth test.
- `compareOp` is a `VkCompareOp` value specifying the comparison operator used in the stencil test.

This command sets the stencil operation for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_OP` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineDepthStencilStateCreateInfo::failOp`, `passOp`, `depthFailOp`, and `compareOp` values used to create the currently active pipeline, for both front and back faces.

Valid Usage

- VUID-vkCmdSetStencilOp-None-08971
At least one of the following **must** be true:
 - the `extendedDynamicState` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetStencilOp-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetStencilOp-faceMask-parameter
`faceMask` **must** be a valid combination of `VkStencilFaceFlagBits` values
- VUID-vkCmdSetStencilOp-faceMask-requiredbitmask
`faceMask` **must** not be 0
- VUID-vkCmdSetStencilOp-failOp-parameter
`failOp` **must** be a valid `VkStencilOp` value
- VUID-vkCmdSetStencilOp-passOp-parameter
`passOp` **must** be a valid `VkStencilOp` value
- VUID-vkCmdSetStencilOp-depthFailOp-parameter
`depthFailOp` **must** be a valid `VkStencilOp` value
- VUID-vkCmdSetStencilOp-compareOp-parameter
`compareOp` **must** be a valid `VkCompareOp` value
- VUID-vkCmdSetStencilOp-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetStencilOp-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

The `VkStencilOpState` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkStencilOpState {
    VkStencilOp    failOp;
    VkStencilOp    passOp;
    VkStencilOp    depthFailOp;
    VkCompareOp    compareOp;
    uint32_t       compareMask;
    uint32_t       writeMask;
    uint32_t       reference;
} VkStencilOpState;
```

- **failOp** is a [VkStencilOp](#) value specifying the action performed on samples that fail the stencil test.
- **passOp** is a [VkStencilOp](#) value specifying the action performed on samples that pass both the depth and stencil tests.
- **depthFailOp** is a [VkStencilOp](#) value specifying the action performed on samples that pass the stencil test and fail the depth test.
- **compareOp** is a [VkCompareOp](#) value specifying the comparison operator used in the stencil test.
- **compareMask** selects the bits of the unsigned integer stencil values participating in the stencil test.
- **writeMask** selects the bits of the unsigned integer stencil values updated by the stencil test in the stencil framebuffer attachment.
- **reference** is an integer stencil reference value that is used in the unsigned stencil comparison.

Valid Usage (Implicit)

- VUID-VkStencilOpState-failOp-parameter
failOp must be a valid [VkStencilOp](#) value
- VUID-VkStencilOpState-passOp-parameter
passOp must be a valid [VkStencilOp](#) value
- VUID-VkStencilOpState-depthFailOp-parameter
depthFailOp must be a valid [VkStencilOp](#) value
- VUID-VkStencilOpState-compareOp-parameter
compareOp must be a valid [VkCompareOp](#) value

To [dynamically set](#) the stencil compare mask, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetStencilCompareMask(
    VkCommandBuffer          commandBuffer,
    VkStencilFaceFlags        faceMask,
    uint32_t                  compareMask);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `faceMask` is a bitmask of `VkStencilFaceFlagBits` specifying the set of stencil state for which to update the compare mask.
- `compareMask` is the new value to use as the stencil compare mask.

This command sets the stencil compare mask for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkStencilOpState::compareMask` value used to create the currently active pipeline, for both front and back faces.

Valid Usage (Implicit)

- VUID-vkCmdSetStencilCompareMask-commandBuffer-parameter `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetStencilCompareMask-faceMask-parameter `faceMask` **must** be a valid combination of `VkStencilFaceFlagBits` values
- VUID-vkCmdSetStencilCompareMask-faceMask-requiredbitmask `faceMask` **must** not be 0
- VUID-vkCmdSetStencilCompareMask-commandBuffer-recording `commandBuffer` **must** be in the `recording` state
- VUID-vkCmdSetStencilCompareMask-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

`VkStencilFaceFlagBits` values are:

```
// Provided by VK_VERSION_1_0
typedef enum VkStencilFaceFlagBits {
    VK_STENCIL_FACE_FRONT_BIT = 0x00000001,
    VK_STENCIL_FACE_BACK_BIT = 0x00000002,
    VK_STENCIL_FACE_FRONT_AND_BACK = 0x00000003,
} VkStencilFaceFlagBits;
```

- `VK_STENCIL_FACE_FRONT_BIT` specifies that only the front set of stencil state is updated.
- `VK_STENCIL_FACE_BACK_BIT` specifies that only the back set of stencil state is updated.
- `VK_STENCIL_FACE_FRONT_AND_BACK` is the combination of `VK_STENCIL_FACE_FRONT_BIT` and `VK_STENCIL_FACE_BACK_BIT`, and specifies that both sets of stencil state are updated.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkStencilFaceFlags;
```

`VkStencilFaceFlags` is a bitmask type for setting a mask of zero or more `VkStencilFaceFlagBits`.

To [dynamically set](#) the stencil write mask, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetStencilWriteMask(
    VkCommandBuffer          commandBuffer,
    VkStencilFaceFlags       faceMask,
    uint32_t                 writeMask);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `faceMask` is a bitmask of `VkStencilFaceFlagBits` specifying the set of stencil state for which to update the write mask, as described above for `vkCmdSetStencilCompareMask`.
- `writeMask` is the new value to use as the stencil write mask.

This command sets the stencil write mask for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `writeMask` value used to create the currently active pipeline, for both `VkPipelineDepthStencilStateCreateInfo::front` and `VkPipelineDepthStencilStateCreateInfo::back` faces.

Valid Usage (Implicit)

- VUID-vkCmdSetStencilWriteMask-commandBuffer-parameter `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetStencilWriteMask-faceMask-parameter `faceMask` **must** be a valid combination of `VkStencilFaceFlagBits` values

- VUID-vkCmdSetStencilWriteMask-faceMask-requiredbitmask
faceMask must not be 0
- VUID-vkCmdSetStencilWriteMask-commandBuffer-recording
commandBuffer must be in the **recording state**
- VUID-vkCmdSetStencilWriteMask-commandBuffer-cmdpool
The **VkCommandPool** that **commandBuffer** was allocated from **must** support **VK_QUEUE_GRAPHICS_BIT** operations

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

To **dynamically set** the stencil reference value, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetStencilReference(
    VkCommandBuffer          commandBuffer,
    VkStencilFaceFlags       faceMask,
    uint32_t                 reference);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **faceMask** is a bitmask of **VkStencilFaceFlagBits** specifying the set of stencil state for which to update the reference value, as described above for **vkCmdSetStencilCompareMask**.
- **reference** is the new value to use as the stencil reference value.

This command sets the stencil reference value for subsequent drawing commands when the graphics pipeline is created with **VK_DYNAMIC_STATE_STENCIL_REFERENCE** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the **VkPipelineDepthStencilStateCreateInfo::reference** value used to create the currently active pipeline, for both front and back faces.

Valid Usage (Implicit)

- VUID-vkCmdSetStencilReference-commandBuffer-parameter **commandBuffer** **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdSetStencilReference-faceMask-parameter **faceMask** **must** be a valid combination of [VkStencilFaceFlagBits](#) values
- VUID-vkCmdSetStencilReference-faceMask-requiredbitmask **faceMask** **must** not be 0
- VUID-vkCmdSetStencilReference-commandBuffer-recording **commandBuffer** **must** be in the [recording state](#)
- VUID-vkCmdSetStencilReference-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support [VK_QUEUE_GRAPHICS_BIT](#) operations

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

Possible values of the **failOp**, **passOp**, and **depthFailOp** members of [VkStencilOpState](#), specifying what happens to the stored stencil value if this or certain subsequent tests fail or pass, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkStencilOp {
    VK_STENCIL_OP_KEEP = 0,
    VK_STENCIL_OP_ZERO = 1,
    VK_STENCIL_OP_REPLACE = 2,
    VK_STENCIL_OP_INCREMENT_AND_CLAMP = 3,
    VK_STENCIL_OP_DECREMENT_AND_CLAMP = 4,
    VK_STENCIL_OP_INVERT = 5,
    VK_STENCIL_OP_INCREMENT_AND_WRAP = 6,
    VK_STENCIL_OP_DECREMENT_AND_WRAP = 7,
} VkStencilOp;
```

- `VK_STENCIL_OP_KEEP` keeps the current value.
- `VK_STENCIL_OP_ZERO` sets the value to 0.
- `VK_STENCIL_OP_REPLACE` sets the value to *reference*.
- `VK_STENCIL_OP_INCREMENT_AND_CLAMP` increments the current value and clamps to the maximum representable unsigned value.
- `VK_STENCIL_OP_DECREMENT_AND_CLAMP` decrements the current value and clamps to 0.
- `VK_STENCIL_OP_INVERT` bitwise-inverts the current value.
- `VK_STENCIL_OP_INCREMENT_AND_WRAP` increments the current value and wraps to 0 when the maximum value would have been exceeded.
- `VK_STENCIL_OP_DECREMENT_AND_WRAP` decrements the current value and wraps to the maximum possible value when the value would go below 0.

For purposes of increment and decrement, the stencil bits are considered as an unsigned integer.

27.9. Depth Test

The depth test compares the depth value z_a in the depth/stencil attachment at each sample's framebuffer coordinates (x_f, y_f) and [sample index](#) i against the sample's depth value z_f . If there is no depth attachment then the depth test is skipped.

The depth test occurs in three stages, as detailed in the following sections.

27.9.1. Depth Clamping and Range Adjustment

If `VkPipelineRasterizationStateCreateInfo::depthClampEnable` is enabled, z_f is clamped to $[z_{\min}, z_{\max}]$, where $z_{\min} = \min(n, f)$, $z_{\max} = \max(n, f)$, and n and f are the `minDepth` and `maxDepth` depth range values of the viewport used by this fragment, respectively.

Following depth clamping:

- If z_f is not in the range $[z_{\min}, z_{\max}]$, then z_f is undefined following this step.
- If the depth attachment has a fixed-point format and z_f is not in the range $[0, 1]$, then z_f is undefined following this step.

27.9.2. Depth Comparison

If the depth test is not enabled, as specified by `vkCmdSetDepthTestEnableEXT` or `VkPipelineDepthStencilStateCreateInfo::depthTestEnable`, then this step is skipped.

The comparison operation performed is determined by the `VkCompareOp` value set by `vkCmdSetDepthCompareOpEXT`, or by `VkPipelineDepthStencilStateCreateInfo::depthCompareOp` during pipeline creation. z_f and z_a are used as the *reference* and *test* values, respectively, in the operation specified by the `VkCompareOp`.

If the comparison evaluates to false, the coverage for the sample is set to 0.

27.9.3. Depth Attachment Writes

If depth writes are enabled, as specified by `vkCmdSetDepthWriteEnableEXT` or `VkPipelineDepthStencilStateCreateInfo::depthWriteEnable`, and the comparison evaluated to true, the depth attachment value z_a is set to the sample's depth value z_f . If there is no depth attachment, no value is written.

To [dynamically enable or disable](#) the depth test, call:

```
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetDepthTestEnableEXT(
    VkCommandBuffer          commandBuffer,
    VkBool32                 depthTestEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthTestEnable` specifies if the depth test is enabled.

This command sets the depth test enable for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthTestEnable` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDepthTestEnable-None-08971
At least one of the following **must** be true:
 - the `extendedDynamicState` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetDepthTestEnable-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthTestEnable-commandBuffer-recording
`commandBuffer` **must** be in the [recording state](#)
- VUID-vkCmdSetDepthTestEnable-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally

synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHIC S_BIT	State

To [dynamically set](#) the depth compare operator, call:

```
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetDepthCompareOpEXT(
    VkCommandBuffer          commandBuffer,
    VkCompareOp              depthCompareOp);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthCompareOp` is a `VkCompareOp` value specifying the comparison operator used for the [Depth Comparison](#) step of the [depth test](#).

This command sets the depth comparison operator for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthCompareOp` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDepthCompareOp-None-08971
At least one of the following **must** be true:
 - the `extendedDynamicState` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetDepthCompareOp-commandBuffer-parameter `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthCompareOp-depthCompareOp-parameter `depthCompareOp` **must** be a valid `VkCompareOp` value
- VUID-vkCmdSetDepthCompareOp-commandBuffer-recording `commandBuffer` **must** be in the [recording state](#)
- VUID-vkCmdSetDepthCompareOp-commandBuffer-cmdpool

The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

To [dynamically set](#) the depth write enable, call:

```
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetDepthWriteEnableEXT(
    VkCommandBuffer          commandBuffer,
    VkBool32                 depthWriteEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthWriteEnable` specifies if depth writes are enabled.

This command sets the depth write enable for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthWriteEnable` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDepthWriteEnable-None-08971
At least one of the following **must** be true:
 - the `extendedDynamicState` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetDepthWriteEnable-commandBuffer-parameter

`commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetDepthWriteEnable-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state

- VUID-vkCmdSetDepthWriteEnable-commandBuffer-cmdpool

The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

27.10. Sample Counting

Occlusion queries use query pool entries to track the number of samples that pass all the per-fragment tests. The mechanism of collecting an occlusion query value is described in [Occlusion Queries](#).

The occlusion query sample counter increments by one for each sample with a coverage value of 1 in each fragment that survives all the per-fragment tests, including scissor, sample mask, alpha to coverage, stencil, and depth tests.

27.11. Coverage Reduction

Coverage reduction takes the coverage information for a fragment and converts that to a boolean coverage value for each color sample in each pixel covered by the fragment.

27.11.1. Pixel Coverage

Coverage for each pixel is first extracted from the total fragment coverage mask. This consists of `rasterizationSamples` unique coverage samples for each pixel in the fragment area, each with a unique `sample index`. If the fragment only contains a single pixel, coverage for the pixel is equivalent to the fragment coverage.

If the `fragment shading rate` is set, and the fragment covers multiple pixels, each pixel's coverage

consists of the coverage samples with a [pixel index](#) matching that pixel, and each sample retains its unique [sample index](#) *i*.

27.11.2. Color Sample Coverage

Once pixel coverage is determined, coverage for each individual color sample corresponding to that pixel is determined.

The number of `rasterizationSamples` is identical to the number of samples in the color attachments. A color sample is covered if the pixel coverage sample with the same [sample index](#) *i* is covered.

Chapter 28. The Framebuffer

28.1. Blending

Blending combines the incoming *source* fragment's R, G, B, and A values with the *destination* R, G, B, and A values of each sample stored in the framebuffer at the fragment's (x_f, y_f) location. If any components are missing in the framebuffer attachment, they are replaced as described in [Component Substitution](#). Blending is performed for each color sample covered by the fragment, rather than just once for each fragment.

Source and destination values are combined according to the [blend operation](#), quadruplets of source and destination weighting factors determined by the [blend factors](#), and a [blend constant](#), to obtain a new set of R, G, B, and A values, as described below.

Blending is computed and applied separately to each color attachment used by the subpass, with separate controls for each attachment.

Prior to performing the blend operation, signed and unsigned normalized fixed-point color components undergo an implied conversion to floating-point as specified by [Conversion from Normalized Fixed-Point to Floating-Point](#). Blending computations are treated as if carried out in floating-point, and basic blend operations are performed with a precision and dynamic range no lower than that used to represent destination components. [Advanced blending operations](#) are performed with a precision and dynamic range no lower than the smaller of that used to represent destination components or that used to represent 16-bit floating-point values.

NOTE

Blending is only defined for floating-point, UNORM, SNORM, and sRGB formats. Within those formats, the implementation may only support blending on some subset of them. Which formats support blending is indicated by `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`.

The pipeline blend state is included in the `VkPipelineColorBlendStateCreateInfo` structure during graphics pipeline creation:

The `VkPipelineColorBlendStateCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineColorBlendStateCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkPipelineColorBlendStateCreateFlags flags;
    VkBool32                  logicOpEnable;
    VkLogicOp                 logicOp;
    uint32_t                  attachmentCount;
    const VkPipelineColorBlendAttachmentState* pAttachments;
    float                     blendConstants[4];
} VkPipelineColorBlendStateCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `logicOpEnable` controls whether to apply `Logical Operations`.
- `logicOp` selects which logical operation to apply.
- `attachmentCount` is the number of `VkPipelineColorBlendAttachmentState` elements in `pAttachments`.
- `pAttachments` is a pointer to an array of `VkPipelineColorBlendAttachmentState` structures defining blend state for each color attachment.
- `blendConstants` is a pointer to an array of four values used as the R, G, B, and A components of the blend constant that are used in blending, depending on the `blend factor`.

Valid Usage

- VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-00605
If the `independentBlend` feature is not enabled, all elements of `pAttachments` **must** be identical
- VUID-VkPipelineColorBlendStateCreateInfo-logicOpEnable-00606
If the `logicOp` feature is not enabled, `logicOpEnable` **must** be `VK_FALSE`
- VUID-VkPipelineColorBlendStateCreateInfo-logicOpEnable-00607
If `logicOpEnable` is `VK_TRUE`, `logicOp` **must** be a valid `VkLogicOp` value
- VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-07353
If `attachmentCount` is not `0` `pAttachments` **must** be a valid pointer to an array of `attachmentCount` valid `VkPipelineColorBlendAttachmentState` structures

Valid Usage (Implicit)

- VUID-VkPipelineColorBlendStateCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_COLOR_BLEND_STATE_CREATE_INFO`
- VUID-VkPipelineColorBlendStateCreateInfo-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkPipelineColorBlendAdvancedStateCreateInfoEXT` or `VkPipelineColorWriteCreateInfoEXT`
- VUID-VkPipelineColorBlendStateCreateInfo-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkPipelineColorBlendStateCreateInfo-flags-zeroBitmask
`flags` **must** be `0`
- VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-parameter
If `attachmentCount` is not `0`, and `pAttachments` is not `NULL`, `pAttachments` **must** be a valid pointer to an array of `attachmentCount` valid `VkPipelineColorBlendAttachmentState` structures

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineColorBlendStateCreateFlags;
```

`VkPipelineColorBlendStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkPipelineColorBlendAttachmentState` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineColorBlendAttachmentState {
    VkBool32          blendEnable;
    VkBlendFactor      srcColorBlendFactor;
    VkBlendFactor      dstColorBlendFactor;
    VkBlendOp          colorBlendOp;
    VkBlendFactor      srcAlphaBlendFactor;
    VkBlendFactor      dstAlphaBlendFactor;
    VkBlendOp          alphaBlendOp;
    VkColorComponentFlags colorWriteMask;
} VkPipelineColorBlendAttachmentState;
```

- `blendEnable` controls whether blending is enabled for the corresponding color attachment. If blending is not enabled, the source fragment's color for that attachment is passed through unmodified.
- `srcColorBlendFactor` selects which blend factor is used to determine the source factors (S_r, S_g, S_b).
- `dstColorBlendFactor` selects which blend factor is used to determine the destination factors (D_r, D_g, D_b).
- `colorBlendOp` selects which blend operation is used to calculate the RGB values to write to the color attachment.
- `srcAlphaBlendFactor` selects which blend factor is used to determine the source factor S_a .
- `dstAlphaBlendFactor` selects which blend factor is used to determine the destination factor D_a .
- `alphaBlendOp` selects which blend operation is used to calculate the alpha values to write to the color attachment.
- `colorWriteMask` is a bitmask of `VkColorComponentFlagBits` specifying which of the R, G, B, and/or A components are enabled for writing, as described for the [Color Write Mask](#).

Valid Usage

- VUID-VkPipelineColorBlendAttachmentState-srcColorBlendFactor-00608
If the `dualSrcBlend` feature is not enabled, `srcColorBlendFactor` **must** not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`
- VUID-VkPipelineColorBlendAttachmentState-dstColorBlendFactor-00609
If the `dualSrcBlend` feature is not enabled, `dstColorBlendFactor` **must** not be

VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR,
VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA

- VUID-VkPipelineColorBlendAttachmentState-srcAlphaBlendFactor-00610
If the `dualSrcBlend` feature is not enabled, `srcAlphaBlendFactor` **must** not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`
- VUID-VkPipelineColorBlendAttachmentState-dstAlphaBlendFactor-00611
If the `dualSrcBlend` feature is not enabled, `dstAlphaBlendFactor` **must** not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`
- VUID-VkPipelineColorBlendAttachmentState-colorBlendOp-01406
If either of `colorBlendOp` or `alphaBlendOp` is an `advanced blend operation`, then `colorBlendOp` **must** equal `alphaBlendOp`
- VUID-VkPipelineColorBlendAttachmentState-advancedBlendIndependentBlend-01407
If `VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendIndependentBlend` is `VK_FALSE` and `colorBlendOp` is an `advanced blend operation`, then `colorBlendOp` **must** be the same for all attachments
- VUID-VkPipelineColorBlendAttachmentState-advancedBlendIndependentBlend-01408
If `VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendIndependentBlend` is `VK_FALSE` and `alphaBlendOp` is an `advanced blend operation`, then `alphaBlendOp` **must** be the same for all attachments
- VUID-VkPipelineColorBlendAttachmentState-advancedBlendAllOperations-01409
If `VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendAllOperations` is `VK_FALSE`, then `colorBlendOp` **must** not be `VK_BLEND_OP_ZERO_EXT`, `VK_BLEND_OP_SRC_EXT`, `VK_BLEND_OP_DST_EXT`, `VK_BLEND_OP_SRC_OVER_EXT`, `VK_BLEND_OP_DST_OVER_EXT`, `VK_BLEND_OP_SRC_IN_EXT`, `VK_BLEND_OP_DST_IN_EXT`, `VK_BLEND_OP_SRC_OUT_EXT`, `VK_BLEND_OP_DST_OUT_EXT`, `VK_BLEND_OP_SRC_ATOP_EXT`, `VK_BLEND_OP_DST_ATOP_EXT`, `VK_BLEND_OP_XOR_EXT`, `VK_BLEND_OP_INVERT_EXT`, `VK_BLEND_OP_INVERT_RGB_EXT`, `VK_BLEND_OP_LINEARODDGE_EXT`, `VK_BLEND_OP_LINEARBURN_EXT`, `VK_BLEND_OP_VIVIDLIGHT_EXT`, `VK_BLEND_OP_LINEARLIGHT_EXT`, `VK_BLEND_OP_PINLIGHT_EXT`, `VK_BLEND_OP_HARDMIX_EXT`, `VK_BLEND_OP_PLUS_EXT`, `VK_BLEND_OP_PLUS_CLAMPED_EXT`, `VK_BLEND_OP_PLUS_CLAMPED_ALPHA_EXT`, `VK_BLEND_OP_PLUS_DARKER_EXT`, `VK_BLEND_OP_MINUS_EXT`, `VK_BLEND_OP_MINUS_CLAMPED_EXT`, `VK_BLEND_OP_CONTRAST_EXT`, `VK_BLEND_OP_INVERT_OVG_EXT`, `VK_BLEND_OP_RED_EXT`, `VK_BLEND_OP_GREEN_EXT`, or `VK_BLEND_OP_BLUE_EXT`
- VUID-VkPipelineColorBlendAttachmentState-colorBlendOp-01410
If `colorBlendOp` or `alphaBlendOp` is an `advanced blend operation`, then `colorAttachmentCount` of the subpass this pipeline is compiled against **must** be less than or equal to `VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendMaxColorAttachments`

Valid Usage (Implicit)

- VUID-VkPipelineColorBlendAttachmentState-srcColorBlendFactor-parameter
`srcColorBlendFactor` **must** be a valid `VkBlendFactor` value

- VUID-VkPipelineColorBlendAttachmentState-dstColorBlendFactor-parameter **dstColorBlendFactor** must be a valid [VkBlendFactor](#) value
- VUID-VkPipelineColorBlendAttachmentState-colorBlendOp-parameter **colorBlendOp** must be a valid [VkBlendOp](#) value
- VUID-VkPipelineColorBlendAttachmentState-srcAlphaBlendFactor-parameter **srcAlphaBlendFactor** must be a valid [VkBlendFactor](#) value
- VUID-VkPipelineColorBlendAttachmentState-dstAlphaBlendFactor-parameter **dstAlphaBlendFactor** must be a valid [VkBlendFactor](#) value
- VUID-VkPipelineColorBlendAttachmentState-alphaBlendOp-parameter **alphaBlendOp** must be a valid [VkBlendOp](#) value
- VUID-VkPipelineColorBlendAttachmentState-colorWriteMask-parameter **colorWriteMask** must be a valid combination of [VkColorComponentFlagBits](#) values

28.1.1. Blend Factors

The source and destination color and alpha blending factors are selected from the enum:

```
// Provided by VK_VERSION_1_0
typedef enum VkBlendFactor {
    VK_BLEND_FACTOR_ZERO = 0,
    VK_BLEND_FACTOR_ONE = 1,
    VK_BLEND_FACTOR_SRC_COLOR = 2,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_COLOR = 3,
    VK_BLEND_FACTOR_DST_COLOR = 4,
    VK_BLEND_FACTOR_ONE_MINUS_DST_COLOR = 5,
    VK_BLEND_FACTOR_SRC_ALPHA = 6,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_ALPHA = 7,
    VK_BLEND_FACTOR_DST_ALPHA = 8,
    VK_BLEND_FACTOR_ONE_MINUS_DST_ALPHA = 9,
    VK_BLEND_FACTOR_CONSTANT_COLOR = 10,
    VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR = 11,
    VK_BLEND_FACTOR_CONSTANT_ALPHA = 12,
    VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA = 13,
    VK_BLEND_FACTOR_SRC_ALPHA_SATURATE = 14,
    VK_BLEND_FACTOR_SRC1_COLOR = 15,
    VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR = 16,
    VK_BLEND_FACTOR_SRC1_ALPHA = 17,
    VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA = 18,
} VkBlendFactor;
```

The semantics of the enum values are described in the table below:

Table 33. Blend Factors

VkBlendFactor	RGB Blend Factors (S_r, S_g, S_b) or (D_r, D_g, D_b)	Alpha Blend Factor (S_a or D_a)
VK_BLEND_FACTOR_ZERO	(0,0,0)	0
VK_BLEND_FACTOR_ONE	(1,1,1)	1
VK_BLEND_FACTOR_SRC_COLOR	(R_{s0}, G_{s0}, B_{s0})	A_{s0}
VK_BLEND_FACTOR_ONE_MINUS_SRC_COLOR	($1-R_{s0}, 1-G_{s0}, 1-B_{s0}$)	$1-A_{s0}$
VK_BLEND_FACTOR_DST_COLOR	(R_d, G_d, B_d)	A_d
VK_BLEND_FACTOR_ONE_MINUS_DST_COLOR	($1-R_d, 1-G_d, 1-B_d$)	$1-A_d$
VK_BLEND_FACTOR_SRC_ALPHA	(A_{s0}, A_{s0}, A_{s0})	A_{s0}
VK_BLEND_FACTOR_ONE_MINUS_SRC_ALPHA	($1-A_{s0}, 1-A_{s0}, 1-A_{s0}$)	$1-A_{s0}$
VK_BLEND_FACTOR_DST_ALPHA	(A_d, A_d, A_d)	A_d
VK_BLEND_FACTOR_ONE_MINUS_DST_ALPHA	($1-A_d, 1-A_d, 1-A_d$)	$1-A_d$
VK_BLEND_FACTOR_CONSTANT_COLOR	(R_c, G_c, B_c)	A_c
VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR	($1-R_c, 1-G_c, 1-B_c$)	$1-A_c$
VK_BLEND_FACTOR_CONSTANT_ALPHA	(A_c, A_c, A_c)	A_c
VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA	($1-A_c, 1-A_c, 1-A_c$)	$1-A_c$
VK_BLEND_FACTOR_SRC_ALPHA_SATURATE	(f, f, f); $f = \min(A_{s0}, 1-A_d)$	1
VK_BLEND_FACTOR_SRC1_COLOR	(R_{s1}, G_{s1}, B_{s1})	A_{s1}
VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR	($1-R_{s1}, 1-G_{s1}, 1-B_{s1}$)	$1-A_{s1}$
VK_BLEND_FACTOR_SRC1_ALPHA	(A_{s1}, A_{s1}, A_{s1})	A_{s1}
VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA	($1-A_{s1}, 1-A_{s1}, 1-A_{s1}$)	$1-A_{s1}$

In this table, the following conventions are used:

- R_{s0}, G_{s0}, B_{s0} and A_{s0} represent the first source color R, G, B, and A components, respectively, for the fragment output location corresponding to the color attachment being blended.
- R_{s1}, G_{s1}, B_{s1} and A_{s1} represent the second source color R, G, B, and A components, respectively, used in dual source blending modes, for the fragment output location corresponding to the color attachment being blended.
- R_d, G_d, B_d and A_d represent the R, G, B, and A components of the destination color. That is, the color currently in the corresponding color attachment for this fragment/sample.
- R_c, G_c, B_c and A_c represent the blend constant R, G, B, and A components, respectively.

To [dynamically set and change](#) the blend constants, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetBlendConstants(
    VkCommandBuffer                      commandBuffer,
    const float                          blendConstants[4]);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `blendConstants` is a pointer to an array of four values specifying the R_c , G_c , B_c , and A_c components of the blend constant color used in blending, depending on the `blend factor`.

This command sets blend constants for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_BLEND_CONSTANTS` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendStateCreateInfo::blendConstants` values used to create the currently active pipeline.

Valid Usage (Implicit)

- VUID-vkCmdSetBlendConstants-commandBuffer-parameter `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetBlendConstants-commandBuffer-recording `commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetBlendConstants-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

28.1.2. Dual-Source Blending

Blend factors that use the secondary color input ($R_{s1}, G_{s1}, B_{s1}, A_{s1}$) (`VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, and `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`) **may** consume implementation resources that could

otherwise be used for rendering to multiple color attachments. Therefore, the number of color attachments that **can** be used in a framebuffer **may** be lower when using dual-source blending.

Dual-source blending is only supported if the `dualSrcBlend` feature is enabled.

The maximum number of color attachments that **can** be used in a subpass when using dual-source blending functions is implementation-dependent and is reported as the `maxFragmentDualSrcAttachments` member of `VkPhysicalDeviceLimits`.

Color outputs **can** be bound to the first and second inputs of the blender using the `Index` decoration, as described in [Fragment Output Interface](#). If the second color input to the blender is not written in the shader, or if no output is bound to the second input of a blender, the value of the second input is undefined.

28.1.3. Blend Operations

Once the source and destination blend factors have been selected, they along with the source and destination components are passed to the blending operations. RGB and alpha components **can** use different operations. Possible values of `VkBlendOp`, specifying the operations, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkBlendOp {
    VK_BLEND_OP_ADD = 0,
    VK_BLEND_OP_SUBTRACT = 1,
    VK_BLEND_OP_REVERSE_SUBTRACT = 2,
    VK_BLEND_OP_MIN = 3,
    VK_BLEND_OP_MAX = 4,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_ZERO_EXT = 1000148000,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_EXT = 1000148001,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_EXT = 1000148002,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_OVER_EXT = 1000148003,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_OVER_EXT = 1000148004,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_IN_EXT = 1000148005,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_IN_EXT = 1000148006,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_OUT_EXT = 1000148007,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_OUT_EXT = 1000148008,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_ATOP_EXT = 1000148009,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_ATOP_EXT = 1000148010,
    // Provided by VK_EXT_blend_operation_advanced
```

```
VK_BLEND_OP_XOR_EXT = 1000148011,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_MULTIPLY_EXT = 1000148012,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_SCREEN_EXT = 1000148013,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_OVERLAY_EXT = 1000148014,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_DARKEN_EXT = 1000148015,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_LIGHTEN_EXT = 1000148016,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_COLOR Dodge_EXT = 1000148017,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_COLOR BURN_EXT = 1000148018,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_HARDLIGHT_EXT = 1000148019,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_SOFTLIGHT_EXT = 1000148020,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_DIFFERENCE_EXT = 1000148021,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_EXCLUSION_EXT = 1000148022,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_INVERT_EXT = 1000148023,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_INVERT_RGB_EXT = 1000148024,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_LINEAR Dodge_EXT = 1000148025,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_LINEAR BURN_EXT = 1000148026,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_VIVIDLIGHT_EXT = 1000148027,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_LINEARLIGHT_EXT = 1000148028,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_PINLIGHT_EXT = 1000148029,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_HARDMIX_EXT = 1000148030,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_HSL_HUE_EXT = 1000148031,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_HSL_SATURATION_EXT = 1000148032,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_HSL_COLOR_EXT = 1000148033,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_HSL_LUMINOSITY_EXT = 1000148034,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_PLUS_EXT = 1000148035,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_PLUS_CLAMPED_EXT = 1000148036,
```

```
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PLUS_CLAMPED_ALPHA_EXT = 1000148037,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PLUS_DARKER_EXT = 1000148038,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_MINUS_EXT = 1000148039,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_MINUS_CLAMPED_EXT = 1000148040,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_CONTRAST_EXT = 1000148041,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_INVERT_OVG_EXT = 1000148042,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_RED_EXT = 1000148043,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_GREEN_EXT = 1000148044,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_BLUE_EXT = 1000148045,
} VkBlendOp;
```

The semantics of the basic blend operations are described in the table below:

Table 34. Basic Blend Operations

VkBlendOp	RGB Components	Alpha Component
VK_BLEND_OP_ADD	$R = R_{s0} \times S_r + R_d \times D_r$ $G = G_{s0} \times S_g + G_d \times D_g$ $B = B_{s0} \times S_b + B_d \times D_b$	$A = A_{s0} \times S_a + A_d \times D_a$
VK_BLEND_OP_SUBTRACT	$R = R_{s0} \times S_r - R_d \times D_r$ $G = G_{s0} \times S_g - G_d \times D_g$ $B = B_{s0} \times S_b - B_d \times D_b$	$A = A_{s0} \times S_a - A_d \times D_a$
VK_BLEND_OP_REVERSE_SUBTRACT	$R = R_d \times D_r - R_{s0} \times S_r$ $G = G_d \times D_g - G_{s0} \times S_g$ $B = B_d \times D_b - B_{s0} \times S_b$	$A = A_d \times D_a - A_{s0} \times S_a$
VK_BLEND_OP_MIN	$R = \min(R_{s0}, R_d)$ $G = \min(G_{s0}, G_d)$ $B = \min(B_{s0}, B_d)$	$A = \min(A_{s0}, A_d)$
VK_BLEND_OP_MAX	$R = \max(R_{s0}, R_d)$ $G = \max(G_{s0}, G_d)$ $B = \max(B_{s0}, B_d)$	$A = \max(A_{s0}, A_d)$

In this table, the following conventions are used:

- R_{s0} , G_{s0} , B_{s0} and A_{s0} represent the first source color R, G, B, and A components, respectively.
- R_d , G_d , B_d and A_d represent the R, G, B, and A components of the destination color. That is, the color currently in the corresponding color attachment for this fragment/sample.
- S_r , S_g , S_b and S_a represent the source blend factor R, G, B, and A components, respectively.
- D_r , D_g , D_b and D_a represent the destination blend factor R, G, B, and A components, respectively.

The blending operation produces a new set of values R, G, B and A, which are written to the framebuffer attachment. If blending is not enabled for this attachment, then R, G, B and A are assigned R_{s0} , G_{s0} , B_{s0} and A_{s0} , respectively.

If the color attachment is fixed-point, the components of the source and destination values and blend factors are each clamped to [0,1] or [-1,1] respectively for an unsigned normalized or signed normalized color attachment prior to evaluating the blend operations. If the color attachment is floating-point, no clamping occurs.

If the [numeric format](#) of a framebuffer attachment uses sRGB encoding, the R, G, and B destination color values (after conversion from fixed-point to floating-point) are considered to be encoded for the sRGB color space and hence are linearized prior to their use in blending. Each R, G, and B component is converted from nonlinear to linear as described in the “sRGB EOTF” section of the [Khronos Data Format Specification](#). If the format is not sRGB, no linearization is performed.

If the [numeric format](#) of a framebuffer attachment uses sRGB encoding, then the final R, G and B values are converted into the nonlinear sRGB representation before being written to the framebuffer attachment as described in the “sRGB EOTF⁻¹” section of the Khronos Data Format

Specification.

If the [numeric format](#) of a framebuffer color attachment is not sRGB encoded then the resulting c_s values for R, G and B are unmodified. The value of A is never sRGB encoded. That is, the alpha component is always stored in memory as linear.

If the framebuffer color attachment is `VK_ATTACHMENT_UNUSED`, no writes are performed through that attachment. Writes are not performed to framebuffer color attachments greater than or equal to the `VkSubpassDescription::colorAttachmentCount` or `VkSubpassDescription2::colorAttachmentCount` value.

28.1.4. Advanced Blend Operations

The *advanced blend operations* are those listed in tables [f/X/Y/Z Advanced Blend Operations](#), [Hue-Saturation-Luminosity Advanced Blend Operations](#), and [Additional RGB Blend Operations](#).

If the `pNext` chain of `VkPipelineColorBlendStateCreateInfo` includes a `VkPipelineColorBlendAdvancedStateCreateInfoEXT` structure, then that structure includes parameters that affect advanced blend operations.

The `VkPipelineColorBlendAdvancedStateCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_blend_operation_advanced
typedef struct VkPipelineColorBlendAdvancedStateCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           srcPremultiplied;
    VkBool32           dstPremultiplied;
    VkBlendOverlapEXT  blendOverlap;
} VkPipelineColorBlendAdvancedStateCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcPremultiplied` specifies whether the source color of the blend operation is treated as premultiplied.
- `dstPremultiplied` specifies whether the destination color of the blend operation is treated as premultiplied.
- `blendOverlap` is a `VkBlendOverlapEXT` value specifying how the source and destination sample's coverage is correlated.

If this structure is not present, `srcPremultiplied` and `dstPremultiplied` are both considered to be `VK_TRUE`, and `blendOverlap` is considered to be `VK_BLEND_OVERLAP_UNCORRELATED_EXT`.

Valid Usage

- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-srcPremultiplied-01424
If the [non-premultiplied source color](#) property is not supported, `srcPremultiplied` **must** be

VK_TRUE

- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-dstPremultiplied-01425
If the **non-premultiplied destination color** property is not supported, **dstPremultiplied** must be VK_TRUE
- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-blendOverlap-01426
If the **correlated overlap** property is not supported, **blendOverlap** must be VK_BLEND_OVERLAP_UNCORRELATED_EXT

Valid Usage (Implicit)

- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-sType-sType
sType must be VK_STRUCTURE_TYPE_PIPELINE_COLOR_BLEND_ADVANCED_STATE_CREATE_INFO_EXT
- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-blendOverlap-parameter
blendOverlap must be a valid **VkBlendOverlapEXT** value

When using one of the operations in table [f/X/Y/Z Advanced Blend Operations](#) or [Hue-Saturation-Luminosity Advanced Blend Operations](#), blending is performed according to the following equations:

$$\begin{aligned} R &= f(R'_s, R'_d) * p_0(A_s, A_d) + Y * R'_s * p_1(A_s, A_d) + Z * R'_d * p_2(A_s, A_d) \\ G &= f(G'_s, G'_d) * p_0(A_s, A_d) + Y * G'_s * p_1(A_s, A_d) + Z * G'_d * p_2(A_s, A_d) \\ B &= f(B'_s, B'_d) * p_0(A_s, A_d) + Y * B'_s * p_1(A_s, A_d) + Z * B'_d * p_2(A_s, A_d) \\ A &= X * p_0(A_s, A_d) + Y * p_1(A_s, A_d) + Z * p_2(A_s, A_d) \end{aligned}$$

where the function *f* and terms *X*, *Y*, and *Z* are specified in the table. The *R*, *G*, and *B* components of the source color used for blending are derived according to **srcPremultiplied**. If **srcPremultiplied** is VK_TRUE, the fragment color components are considered to have been premultiplied by the *A* component prior to blending. The base source color (*R_s'*, *G_s'*, *B_s'*) is obtained by dividing through by the *A* component:

$$(R'_s, G'_s, B'_s) = \begin{cases} (0, 0, 0) & A_s = 0 \\ \left(\frac{R_s}{A_s}, \frac{G_s}{A_s}, \frac{B_s}{A_s}\right) & \text{otherwise} \end{cases}$$

If **srcPremultiplied** is VK_FALSE, the fragment color components are used as the base color:

$$(R'_s, G'_s, B'_s) = (R_s, G_s, B_s)$$

The *R*, *G*, and *B* components of the destination color used for blending are derived according to **dstPremultiplied**. If **dstPremultiplied** is VK_TRUE, the destination components are considered to have been premultiplied by the *A* component prior to blending. The base destination color (*R_d'*, *G_d'*, *B_d'*) is obtained by dividing through by the *A* component:

$$\{R_d', G_d', B_d'\} = \begin{cases} \{0, 0, 0\} & A_d = 0 \\ \{\frac{R_d}{A_d}, \frac{G_d}{A_d}, \frac{B_d}{A_d}\} & \text{otherwise} \end{cases}$$

If `dstPremultiplied` is `VK_FALSE`, the destination color components are used as the base color:

$$\{R_d', G_d', B_d'\} = \{R_d, G_d, B_d\}$$

When blending using advanced blend operations, we expect that the R, G, and B components of premultiplied source and destination color inputs be stored as the product of non-premultiplied R, G, and B component values and the A component of the color. If any R, G, or B component of a premultiplied input color is non-zero and the A component is zero, the color is considered ill-formed, and the corresponding component of the blend result is undefined.

All of the advanced blend operation formulas in this chapter compute the result as a premultiplied color. If `dstPremultiplied` is `VK_FALSE`, that result color's R, G, and B components are divided by the A component before being written to the framebuffer. If any R, G, or B component of the color is non-zero and the A component is zero, the result is considered ill-formed, and the corresponding component of the blend result is undefined. If all components are zero, that value is unchanged.

If the A component of any input or result color is less than zero, the color is considered ill-formed, and all components of the blend result are undefined.

The weighting functions p_0 , p_1 , and p_2 are defined in table [Advanced Blend Overlap Modes](#). In these functions, the A components of the source and destination colors are taken to indicate the portion of the pixel covered by the fragment (source) and the fragments previously accumulated in the pixel (destination). The functions p_0 , p_1 , and p_2 approximate the relative portion of the pixel covered by the intersection of the source and destination, covered only by the source, and covered only by the destination, respectively.

Possible values of `VkPipelineColorBlendAdvancedStateCreateInfoEXT::blendOverlap`, specifying the blend overlap functions, are:

```
// Provided by VK_EXT_blend_operation_advanced
typedef enum VkBlendOverlapEXT {
    VK_BLEND_OVERLAP_UNCORRELATED_EXT = 0,
    VK_BLEND_OVERLAP_DISJOINT_EXT = 1,
    VK_BLEND_OVERLAP_CONJOINT_EXT = 2,
} VkBlendOverlapEXT;
```

- `VK_BLEND_OVERLAP_UNCORRELATED_EXT` specifies that there is no correlation between the source and destination coverage.
- `VK_BLEND_OVERLAP_CONJOINT_EXT` specifies that the source and destination coverage are considered to have maximal overlap.
- `VK_BLEND_OVERLAP_DISJOINT_EXT` specifies that the source and destination coverage are considered to have minimal overlap.

Table 35. Advanced Blend Overlap Modes

Overlap Mode	Weighting Equations
VK_BLEND_OVERLAP_UNCORRELATED_EXT	$p_0(A_s, A_d) = A_s A_d$ $p_1(A_s, A_d) = A_s(1 - A_d)$ $p_2(A_s, A_d) = A_d(1 - A_s)$
VK_BLEND_OVERLAP_CONJOINT_EXT	$p_0(A_s, A_d) = \min(A_s, A_d)$ $p_1(A_s, A_d) = \max(A_s - A_d, 0)$ $p_2(A_s, A_d) = \max(A_d - A_s, 0)$
VK_BLEND_OVERLAP_DISJOINT_EXT	$p_0(A_s, A_d) = \max(A_s + A_d - 1, 0)$ $p_1(A_s, A_d) = \min(A_s, 1 - A_d)$ $p_2(A_s, A_d) = \min(A_d, 1 - A_s)$

Table 36. f/X/Y/Z Advanced Blend Operations

Mode	Blend Coefficients

When using one of the HSL blend operations in table [Hue-Saturation-Luminosity Advanced Blend Operations](#) as the blend operation, the RGB color components produced by the function f are effectively obtained by converting both the non-premultiplied source and destination colors to the HSL (hue, saturation, luminosity) color space, generating a new HSL color by selecting H, S, and L components from the source or destination according to the blend operation, and then converting the result back to RGB. In the equations below, a blended RGB color is produced according to the following pseudocode:

```

float minv3(vec3 c) {
    return min(min(c.r, c.g), c.b);
}
float maxv3(vec3 c) {
    return max(max(c.r, c.g), c.b);
}
float lumv3(vec3 c) {
    return dot(c, vec3(0.30, 0.59, 0.11));
}
float satv3(vec3 c) {
    return maxv3(c) - minv3(c);
}

// If any color components are outside [0,1], adjust the color to
// get the components in range.
vec3 ClipColor(vec3 color) {
    float lum = lumv3(color);
    float mincol = minv3(color);

```

```

float maxcol = maxv3(color);
if (mincol < 0.0) {
    color = lum + ((color-lum)*lum) / (lum-mincol);
}
if (maxcol > 1.0) {
    color = lum + ((color-lum)*(1-lum)) / (maxcol-lum);
}
return color;
}

// Take the base RGB color <cbase> and override its luminosity
// with that of the RGB color <clum>.
vec3 SetLum(vec3 cbase, vec3 clum) {
    float lbase = lumv3(cbase);
    float llum = lumv3(clum);
    float ldiff = llum - lbase;
    vec3 color = cbase + vec3(ldiff);
    return ClipColor(color);
}

// Take the base RGB color <cbase> and override its saturation with
// that of the RGB color <csat>. The override the luminosity of the
// result with that of the RGB color <clum>.
vec3 SetLumSat(vec3 cbase, vec3 csat, vec3 clum)
{
    float minbase = minv3(cbase);
    float sbase = satv3(cbase);
    float ssat = satv3(csat);
    vec3 color;
    if (sbase > 0) {
        // Equivalent (modulo rounding errors) to setting the
        // smallest (R,G,B) component to 0, the largest to <ssat>,
        // and interpolating the "middle" component based on its
        // original value relative to the smallest/largest.
        color = (cbase - minbase) * ssat / sbase;
    } else {
        color = vec3(0.0);
    }
    return SetLum(color, clum);
}

```

Table 37. Hue-Saturation-Luminosity Advanced Blend Operations

Mode	Result
VK_BLEND_OP_HSL_HUE_EXT	$\vec{X}, Y, Z = \vec{1}, 1, 1$ $f \vec{C}_s, C_d = \text{SetLumSat}(\vec{C}_s, C_d, C_d)$

VK_BLEND_OP_BLUE_EXT	$R_d' = R_d', G_d' = B_s', A_d' = A_d$

28.2. Logical Operations

The application **can** enable a *logical operation* between the fragment's color values and the existing value in the framebuffer attachment. This logical operation is applied prior to updating the framebuffer attachment. Logical operations are applied only for signed and unsigned integer and normalized integer framebuffers. Logical operations are not applied to floating-point or sRGB format color attachments.

Logical operations are controlled by the `logicOpEnable` and `logicOp` members of `VkPipelineColorBlendStateCreateInfo`. The `logicOp` state can also be controlled by `vkCmdSetLogicOpEXT` if graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. If `logicOpEnable` is `VK_TRUE`, then a logical operation selected by `logicOp` is applied between each color attachment and the fragment's corresponding output value, and blending of all attachments is treated as if it were disabled. Any attachments using color formats for which logical operations are not supported simply pass through the color values unmodified. The logical operation is applied independently for each of the red, green, blue, and alpha components. The `logicOp` is selected from the following operations:

```
// Provided by VK_VERSION_1_0
typedef enum VkLogicOp {
    VK_LOGIC_OP_CLEAR = 0,
    VK_LOGIC_OP_AND = 1,
    VK_LOGIC_OP_AND_REVERSE = 2,
    VK_LOGIC_OP_COPY = 3,
    VK_LOGIC_OP_AND_INVERTED = 4,
    VK_LOGIC_OP_NO_OP = 5,
    VK_LOGIC_OP_XOR = 6,
    VK_LOGIC_OP_OR = 7,
    VK_LOGIC_OP_NOR = 8,
    VK_LOGIC_OP_EQUIVALENT = 9,
    VK_LOGIC_OP_INVERT = 10,
    VK_LOGIC_OP_OR_REVERSE = 11,
    VK_LOGIC_OP_COPY_INVERTED = 12,
    VK_LOGIC_OP_OR_INVERTED = 13,
    VK_LOGIC_OP_NAND = 14,
    VK_LOGIC_OP_SET = 15,
} VkLogicOp;
```

The logical operations supported by Vulkan are summarized in the following table in which

- $\neg$ is bitwise invert,
- $\square$ is bitwise and,
- $\sqcup$ is bitwise or,
- $\oplus$ is bitwise exclusive or,
- s is the fragment's R_{s0} , G_{s0} , B_{s0} or A_{s0} component value for the fragment output corresponding to the color attachment being updated, and
- d is the color attachment's R, G, B or A component value:

Table 39. Logical Operations

Mode	Operation
VK_LOGIC_OP_CLEAR	0
VK_LOGIC_OP_AND	$s \square d$
VK_LOGIC_OP_AND_REVERSE	$s \square \neg d$
VK_LOGIC_OP_COPY	s
VK_LOGIC_OP_AND_INVERTED	$\neg s \square d$
VK_LOGIC_OP_NO_OP	d
VK_LOGIC_OP_XOR	$s \oplus d$
VK_LOGIC_OP_OR	$s \sqcup d$
VK_LOGIC_OP_NOR	$\neg (s \sqcup d)$
VK_LOGIC_OP_EQUIVALENT	$\neg (s \square d)$
VK_LOGIC_OP_INVERT	$\neg d$
VK_LOGIC_OP_OR_REVERSE	$s \sqcup \neg d$
VK_LOGIC_OP_COPY_INVERTED	$\neg s$
VK_LOGIC_OP_OR_INVERTED	$\neg s \sqcup d$
VK_LOGIC_OP_NAND	$\neg (s \square d)$
VK_LOGIC_OP_SET	all 1s

The result of the logical operation is then written to the color attachment as controlled by the component write mask, described in [Blend Operations](#).

To [dynamically set](#) the logical operation to apply for blend state, call:

```
// Provided by VK_EXT_extended_dynamic_state2
void vkCmdSetLogicOpEXT(
    VkCommandBuffer          commandBuffer,
    VkLogicOp                 logicOp);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `logicOp` specifies the logical operation to apply for blend state.

This command sets the logical operation for blend state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendStateCreateInfo::logicOp` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetLogicOpEXT-None-09422
At least one of the following **must** be true:
 - The `extendedDynamicState2LogicOp` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetLogicOpEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetLogicOpEXT-logicOp-parameter
`logicOp` **must** be a valid `VkLogicOp` value
- VUID-vkCmdSetLogicOpEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetLogicOpEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

28.3. Color Write Mask

Bits which **can** be set in `VkPipelineColorBlendAttachmentState::colorWriteMask`, determining whether the final color values R, G, B and A are written to the framebuffer attachment, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkColorComponentFlagBits {
    VK_COLOR_COMPONENT_R_BIT = 0x00000001,
    VK_COLOR_COMPONENT_G_BIT = 0x00000002,
    VK_COLOR_COMPONENT_B_BIT = 0x00000004,
    VK_COLOR_COMPONENT_A_BIT = 0x00000008,
} VkColorComponentFlagBits;
```

- `VK_COLOR_COMPONENT_R_BIT` specifies that the R value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- `VK_COLOR_COMPONENT_G_BIT` specifies that the G value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- `VK_COLOR_COMPONENT_B_BIT` specifies that the B value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- `VK_COLOR_COMPONENT_A_BIT` specifies that the A value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.

The color write mask operation is applied regardless of whether blending is enabled.

The color write mask operation is applied only if `Color Write Enable` is enabled for the respective attachment. Otherwise the color write mask is ignored and writes to all components of the attachment are disabled.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkColorComponentFlags;
```

`VkColorComponentFlags` is a bitmask type for setting a mask of zero or more `VkColorComponentFlagBits`.

28.4. Color Write Enable

The `VkPipelineColorWriteCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_color_write_enable
typedef struct VkPipelineColorWriteCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           attachmentCount;
    const VkBool32*    pColorWriteEnables;
} VkPipelineColorWriteCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `attachmentCount` is the number of `VkBool32` elements in `pColorWriteEnables`.
- `pColorWriteEnables` is a pointer to an array of per target attachment boolean values specifying whether color writes are enabled for the given attachment.

When this structure is included in the `pNext` chain of `VkPipelineColorBlendStateCreateInfo`, it defines per-attachment color write state. If this structure is not included in the `pNext` chain, it is equivalent to specifying this structure with `attachmentCount` equal to the `attachmentCount` member of `VkPipelineColorBlendStateCreateInfo`, and `pColorWriteEnables` pointing to an array of as many `VK_TRUE` values.

If the `colorWriteEnable` feature is not enabled, all `VkBool32` elements in the `pColorWriteEnables` array **must** be `VK_TRUE`.

Color Write Enable interacts with the [Color Write Mask](#) as follows:

- If `colorWriteEnable` is `VK_TRUE`, writes to the attachment are determined by the `colorWriteMask`.
- If `colorWriteEnable` is `VK_FALSE`, the `colorWriteMask` is ignored and writes to all components of the attachment are disabled. This is equivalent to specifying a `colorWriteMask` of 0.

Valid Usage

- VUID-VkPipelineColorWriteCreateInfoEXT-pAttachments-04801
If the `colorWriteEnable` feature is not enabled, all elements of `pColorWriteEnables` **must** be `VK_TRUE`
- VUID-VkPipelineColorWriteCreateInfoEXT-attachmentCount-07608
`attachmentCount` **must** be equal to the `attachmentCount` member of the `VkPipelineColorBlendStateCreateInfo` structure specified during pipeline creation
- VUID-VkPipelineColorWriteCreateInfoEXT-attachmentCount-06655
`attachmentCount` **must** be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`

Valid Usage (Implicit)

- VUID-VkPipelineColorWriteCreateInfoEXT-sType-sType

sType **must** be VK_STRUCTURE_TYPE_PIPELINE_COLOR_WRITE_CREATE_INFO_EXT

- VUID-VkPipelineColorWriteCreateInfoEXT-pColorWriteEnables-parameter
If attachmentCount is not 0, pColorWriteEnables **must** be a valid pointer to an array of attachmentCount VkBool32 values

To dynamically enable or disable writes to a color attachment, call:

```
// Provided by VK_EXT_color_write_enable
void vkCmdSetColorWriteEnableEXT(
    VkCommandBuffer      commandBuffer,
    uint32_t             attachmentCount,
    const VkBool32*       pColorWriteEnables);
```

- commandBuffer is the command buffer into which the command will be recorded.
- attachmentCount is the number of VkBool32 elements in pColorWriteEnables.
- pColorWriteEnables is a pointer to an array of per target attachment boolean values specifying whether color writes are enabled for the given attachment.

This command sets the color write enables for subsequent drawing commands when the graphics pipeline is created with VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineColorWriteCreateInfoEXT::pColorWriteEnables values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetColorWriteEnableEXT-None-04803
The colorWriteEnable feature **must** be enabled
- VUID-vkCmdSetColorWriteEnableEXT-attachmentCount-06656
attachmentCount **must** be less than or equal to the maxColorAttachments member of VkPhysicalDeviceLimits

Valid Usage (Implicit)

- VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-parameter
commandBuffer **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetColorWriteEnableEXT-pColorWriteEnables-parameter
pColorWriteEnables **must** be a valid pointer to an array of attachmentCount VkBool32 values
- VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-recording
commandBuffer **must** be in the recording state
- VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from **must** support

VK_QUEUE_GRAPHICS_BIT operations

- VUID-vkCmdSetColorWriteEnableEXT-attachmentCount-arraylength
attachmentCount **must** be greater than 0

Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHICS_BIT	State

Chapter 29. Dispatching Commands

The *dispatching commands* described in this chapter provoke work in a compute pipeline. Dispatching commands are recorded into a command buffer and when executed by a queue, will produce work which executes according to the bound compute pipeline. A compute pipeline **must** be bound to a command buffer before any dispatching commands are recorded in that command buffer.

To record a dispatch, call:

```
// Provided by VK_VERSION_1_0
void vkCmdDispatch(
    VkCommandBuffer          commandBuffer,
    uint32_t                 groupCountX,
    uint32_t                 groupCountY,
    uint32_t                 groupCountZ);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `groupCountX` is the number of local workgroups to dispatch in the X dimension.
- `groupCountY` is the number of local workgroups to dispatch in the Y dimension.
- `groupCountZ` is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of `groupCountX` × `groupCountY` × `groupCountZ` local workgroups is assembled.

Valid Usage

- VUID-vkCmdDispatch-magFilter-04553
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdDispatch-magFilter-09598
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`
- VUID-vkCmdDispatch-mipmapMode-04770
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDispatch-mipmapMode-09599
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`
- VUID-vkCmdDispatch-unnormlizedCoordinates-09635
If a `VkSampler` created with `unnormlizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` **must** be 1
- VUID-vkCmdDispatch-None-08609
If a `VkSampler` created with `unnormlizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `viewType` **must** be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`
- VUID-vkCmdDispatch-None-08610
If a `VkSampler` created with `unnormlizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name
- VUID-vkCmdDispatch-None-08611
If a `VkSampler` created with `unnormlizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values
- VUID-vkCmdDispatch-aspectMask-06478
If a `VkImageView` is sampled with `depth comparison`, the image view **must** have been created with an `aspectMask` that contains `VK_IMAGE_ASPECT_DEPTH_BIT`
- VUID-vkCmdDispatch-None-02691
If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`
- VUID-vkCmdDispatch-None-07888
If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's `format features` **must** contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`
- VUID-vkCmdDispatch-None-02692
If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`
- VUID-vkCmdDispatch-None-02693
If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it **must** not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`
- VUID-vkCmdDispatch-filterCubic-02694

Any [VkImageView](#) being sampled with [VK_FILTER_CUBIC_EXT](#) as a result of this command **must** have a [VkImageViewType](#) and format that supports cubic filtering, as specified by [VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic](#) returned by [vkGetPhysicalDeviceImageFormatProperties2](#)

- VUID-vkCmdDispatch-filterCubicMinmax-02695

Any [VkImageView](#) being sampled with [VK_FILTER_CUBIC_EXT](#) with a reduction mode of either [VK_SAMPLER_REDUCTION_MODE_MIN](#) or [VK_SAMPLER_REDUCTION_MODE_MAX](#) as a result of this command **must** have a [VkImageViewType](#) and format that supports cubic filtering together with minmax filtering, as specified by [VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax](#) returned by [vkGetPhysicalDeviceImageFormatProperties2](#)

- VUID-vkCmdDispatch-None-08600

For each set n that is statically used by a [bound shader](#), a descriptor set **must** have been bound to n at the same pipeline bind point, with a [VkPipelineLayout](#) that is compatible for set n , with the [VkPipelineLayout](#) used to create the current [VkPipeline](#), as described in [Pipeline Layout Compatibility](#)

- VUID-vkCmdDispatch-None-08601

For each push constant that is statically used by a [bound shader](#), a push constant value **must** have been set for the same pipeline bind point, with a [VkPipelineLayout](#) that is compatible for push constants, with the [VkPipelineLayout](#) used to create the current [VkPipeline](#), as described in [Pipeline Layout Compatibility](#)

- VUID-vkCmdDispatch-None-10068

For each array of resources that is used by a [bound shader](#), the indices used to access members of the array **must** be less than the descriptor count for the identified binding in the descriptor sets used by this command

- VUID-vkCmdDispatch-None-08114

Descriptors in each bound descriptor set, specified via [vkCmdBindDescriptorSets](#), **must** be valid as described by [descriptor validity](#) if they are statically used by a [bound shader](#)

- VUID-vkCmdDispatch-imageLayout-00344

If an image descriptor is accessed by a shader, the [VkImageLayout](#) **must** match the subresource accessible from the [VkImageView](#) as defined by the [image layout matching rules](#)

- VUID-vkCmdDispatch-None-08606

A valid pipeline **must** be bound to the pipeline bind point used by this command

- VUID-vkCmdDispatch-None-08608

There **must** not have been any calls to dynamic state setting commands for any state specified statically in the [VkPipeline](#) object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdDispatch-uniformBuffers-06935

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a uniform buffer, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatch-storageBuffers-06936

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a storage buffer, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatch-commandBuffer-02707

If [commandBuffer](#) is an unprotected command buffer and [protectedNoFault](#) is not supported, any resource accessed by [bound shaders](#) **must** not be a protected resource

- VUID-vkCmdDispatch-viewType-07752

If a [VkImageView](#) is accessed as a result of this command, then the image view's [viewType](#) **must** match the [Dim](#) operand of the [OpTypeImage](#) as described in [Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types](#)

- VUID-vkCmdDispatch-format-07753

If a [VkImageView](#) or [VkBufferView](#) is accessed as a result of this command, then the [numeric type](#) of the view's [format](#) and the [Sampled Type](#) operand of the [OpTypeImage](#) **must** match

- VUID-vkCmdDispatch-OpImageWrite-08795

If a [VkImageView](#) is accessed using [OpImageWrite](#) as a result of this command, then the [Type](#) of the [Texel](#) operand of that instruction **must** have at least as many components as the image view's format

- VUID-vkCmdDispatch-OpImageWrite-04469

If a [VkBufferView](#) is accessed using [OpImageWrite](#) as a result of this command, then the [Type](#) of the [Texel](#) operand of that instruction **must** have at least as many components as the buffer view's format

- VUID-vkCmdDispatch-SampledType-04470

If a [VkImageView](#) with a [VkFormat](#) that has a 64-bit component width is accessed as a result of this command, the [SampledType](#) of the [OpTypeImage](#) operand of that instruction **must** have a [Width](#) of 64

- VUID-vkCmdDispatch-SampledType-04471

If a [VkImageView](#) with a [VkFormat](#) that has a component width less than 64-bit is accessed as a result of this command, the [SampledType](#) of the [OpTypeImage](#) operand of that instruction **must** have a [Width](#) of 32

- VUID-vkCmdDispatch-SampledType-04472

If a [VkBufferView](#) with a [VkFormat](#) that has a 64-bit component width is accessed as a result of this command, the [SampledType](#) of the [OpTypeImage](#) operand of that instruction **must** have a [Width](#) of 64

- VUID-vkCmdDispatch-SampledType-04473

If a [VkBufferView](#) with a [VkFormat](#) that has a component width less than 64-bit is accessed as a result of this command, the [SampledType](#) of the [OpTypeImage](#) operand of that instruction **must** have a [Width](#) of 32

- VUID-vkCmdDispatch-sparseImageInt64Atomics-04474

If the [sparseImageInt64Atomics](#) feature is not enabled, [VkImage](#) objects created with the [VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT](#) flag **must** not be accessed by atomic instructions through an [OpTypeImage](#) with a [SampledType](#) with a [Width](#) of 64 by this command

- VUID-vkCmdDispatch-sparseImageInt64Atomics-04475
If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command
- VUID-vkCmdDispatch-None-07288
Any shader invocation executed by this command **must** `terminate`
- VUID-vkCmdDispatch-None-09600
If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, all image subresources identified by that descriptor **must** be in the image layout identified when the descriptor was written
- VUID-vkCmdDispatch-None-10672
this command **must** be called outside of a render pass instance
- VUID-vkCmdDispatch-commandBuffer-02712
If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, any resource written to by the `VkPipeline` object bound to the pipeline bind point used by this command **must** not be an unprotected resource
- VUID-vkCmdDispatch-commandBuffer-02713
If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, pipeline stages other than the framebuffer-space and compute stages in the `VkPipeline` object bound to the pipeline bind point used by this command **must** not write to any resource
- VUID-vkCmdDispatch-groupCountX-00386
`groupCountX` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]`
- VUID-vkCmdDispatch-groupCountY-00387
`groupCountY` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]`
- VUID-vkCmdDispatch-groupCountZ-00388
`groupCountZ` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]`

Valid Usage (Implicit)

- VUID-vkCmdDispatch-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdDispatch-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdDispatch-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_COMPUTE_BIT	Action

To record an indirect dispatching command, call:

```
// Provided by VK_VERSION_1_0
void vkCmdDispatchIndirect(
    VkCommandBuffer          commandBuffer,
    VkBuffer                 buffer,
    VkDeviceSize             offset);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `buffer` is the buffer containing dispatch parameters.
- `offset` is the byte offset into `buffer` where parameters begin.

`vkCmdDispatchIndirect` behaves similarly to `vkCmdDispatch` except that the parameters are read by the device from a buffer during execution. The parameters of the dispatch are encoded in a `VkDispatchIndirectCommand` structure taken from `buffer` starting at `offset`.

Valid Usage

- VUID-vkCmdDispatchIndirect-magFilter-04553
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdDispatchIndirect-magFilter-09598
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain

VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT

- VUID-vkCmdDispatchIndirect-mipmapMode-04770

If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDispatchIndirect-mipmapMode-09599

If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- VUID-vkCmdDispatchIndirect-unnormalizedCoordinates-09635

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` **must** be 1

- VUID-vkCmdDispatchIndirect-None-08609

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `viewType` **must** be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`

- VUID-vkCmdDispatchIndirect-None-08610

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name

- VUID-vkCmdDispatchIndirect-None-08611

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values

- VUID-vkCmdDispatchIndirect-aspectMask-06478

If a `VkImageView` is sampled with `depth comparison`, the image view **must** have been created with an `aspectMask` that contains `VK_IMAGE_ASPECT_DEPTH_BIT`

- VUID-vkCmdDispatchIndirect-None-02691

If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- VUID-vkCmdDispatchIndirect-None-07888

If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's `format` `features` **must** contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`

- VUID-vkCmdDispatchIndirect-None-02692

If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then

the image view's format features **must** contain
`VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- VUID-vkCmdDispatchIndirect-None-02693
If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it **must** not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`
- VUID-vkCmdDispatchIndirect-filterCubic-02694
Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`
- VUID-vkCmdDispatchIndirect-filterCubicMinmax-02695
Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`
- VUID-vkCmdDispatchIndirect-None-08600
For each set n that is statically used by a `bound shader`, a descriptor set **must** have been bound to n at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set n , with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in [Pipeline Layout Compatibility](#)
- VUID-vkCmdDispatchIndirect-None-08601
For each push constant that is statically used by a `bound shader`, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in [Pipeline Layout Compatibility](#)
- VUID-vkCmdDispatchIndirect-None-10068
For each array of resources that is used by a `bound shader`, the indices used to access members of the array **must** be less than the descriptor count for the identified binding in the descriptor sets used by this command
- VUID-vkCmdDispatchIndirect-None-08114
Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid as described by [descriptor validity](#) if they are statically used by a `bound shader`
- VUID-vkCmdDispatchIndirect-imageLayout-00344
If an image descriptor is accessed by a shader, the `VkImageLayout` **must** match the subresource accessible from the `VkImageView` as defined by the [image layout matching rules](#)
- VUID-vkCmdDispatchIndirect-None-08606
A valid pipeline **must** be bound to the pipeline bind point used by this command
- VUID-vkCmdDispatchIndirect-None-08608
There **must** not have been any calls to dynamic state setting commands for any state specified statically in the `VkPipeline` object bound to the pipeline bind point used by this

command, since that pipeline was bound

- VUID-vkCmdDispatchIndirect-uniformBuffers-06935

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a uniform buffer, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatchIndirect-storageBuffers-06936

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a storage buffer, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatchIndirect-commandBuffer-02707

If [commandBuffer](#) is an unprotected command buffer and [protectedNoFault](#) is not supported, any resource accessed by [bound shaders](#) **must** not be a protected resource

- VUID-vkCmdDispatchIndirect-viewType-07752

If a [VkImageView](#) is accessed as a result of this command, then the image view's [viewType](#) **must** match the [Dim](#) operand of the [OpTypeImage](#) as described in [Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types](#)

- VUID-vkCmdDispatchIndirect-format-07753

If a [VkImageView](#) or [VkBufferView](#) is accessed as a result of this command, then the [numeric type](#) of the view's [format](#) and the [Sampled Type](#) operand of the [OpTypeImage](#) **must** match

- VUID-vkCmdDispatchIndirect-OpImageWrite-08795

If a [VkImageView](#) is accessed using [OpImageWrite](#) as a result of this command, then the [Type](#) of the [Texel](#) operand of that instruction **must** have at least as many components as the image view's format

- VUID-vkCmdDispatchIndirect-OpImageWrite-04469

If a [VkBufferView](#) is accessed using [OpImageWrite](#) as a result of this command, then the [Type](#) of the [Texel](#) operand of that instruction **must** have at least as many components as the buffer view's format

- VUID-vkCmdDispatchIndirect-SampledType-04470

If a [VkImageView](#) with a [VkFormat](#) that has a 64-bit component width is accessed as a result of this command, the [SampledType](#) of the [OpTypeImage](#) operand of that instruction **must** have a [Width](#) of 64

- VUID-vkCmdDispatchIndirect-SampledType-04471

If a [VkImageView](#) with a [VkFormat](#) that has a component width less than 64-bit is accessed as a result of this command, the [SampledType](#) of the [OpTypeImage](#) operand of that instruction **must** have a [Width](#) of 32

- VUID-vkCmdDispatchIndirect-SampledType-04472

If a [VkBufferView](#) with a [VkFormat](#) that has a 64-bit component width is accessed as a result of this command, the [SampledType](#) of the [OpTypeImage](#) operand of that instruction **must** have a [Width](#) of 64

- VUID-vkCmdDispatchIndirect-SampledType-04473

If a [VkBufferView](#) with a [VkFormat](#) that has a component width less than 64-bit is accessed as a result of this command, the [SampledType](#) of the [OpTypeImage](#) operand of that instruction **must** have a [Width](#) of 32

- VUID-vkCmdDispatchIndirect-sparseImageInt64Atomics-04474

If the [sparseImageInt64Atomics](#) feature is not enabled, [VkImage](#) objects created with the [VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT](#) flag **must** not be accessed by atomic instructions through an [OpTypeImage](#) with a [SampledType](#) with a [Width](#) of 64 by this command

- VUID-vkCmdDispatchIndirect-sparseImageInt64Atomics-04475

If the [sparseImageInt64Atomics](#) feature is not enabled, [VkBuffer](#) objects created with the [VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT](#) flag **must** not be accessed by atomic instructions through an [OpTypeImage](#) with a [SampledType](#) with a [Width](#) of 64 by this command

- VUID-vkCmdDispatchIndirect-None-07288

Any shader invocation executed by this command **must** [terminate](#)

- VUID-vkCmdDispatchIndirect-None-09600

If a descriptor with type equal to any of [VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE](#), [VK_DESCRIPTOR_TYPE_STORAGE_IMAGE](#), or [VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT](#) is accessed as a result of this command, all image subresources identified by that descriptor **must** be in the image layout identified when the descriptor was written

- VUID-vkCmdDispatchIndirect-None-10672

this command **must** be called outside of a render pass instance

- VUID-vkCmdDispatchIndirect-buffer-02708

If [buffer](#) is non-sparse then it **must** be bound completely and contiguously to a single [VkDeviceMemory](#) object

- VUID-vkCmdDispatchIndirect-buffer-02709

[buffer](#) **must** have been created with the [VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT](#) bit set

- VUID-vkCmdDispatchIndirect-offset-02710

[offset](#) **must** be a multiple of 4

- VUID-vkCmdDispatchIndirect-commandBuffer-02711

[commandBuffer](#) **must** not be a protected command buffer

- VUID-vkCmdDispatchIndirect-offset-00407

The sum of [offset](#) and the size of [VkDispatchIndirectCommand](#) **must** be less than or equal to the size of [buffer](#)

Valid Usage (Implicit)

- VUID-vkCmdDispatchIndirect-commandBuffer-parameter

[commandBuffer](#) **must** be a valid [VkCommandBuffer](#) handle

- VUID-vkCmdDispatchIndirect-buffer-parameter

[buffer](#) **must** be a valid [VkBuffer](#) handle

- VUID-vkCmdDispatchIndirect-commandBuffer-recording

[commandBuffer](#) **must** be in the [recording state](#)

- VUID-vkCmdDispatchIndirect-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT` operations
- VUID-vkCmdDispatchIndirect-commonparent
Both of `buffer`, and `commandBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_COMPUTE_BIT	Action

The `VkDispatchIndirectCommand` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkDispatchIndirectCommand {
    uint32_t    x;
    uint32_t    y;
    uint32_t    z;
} VkDispatchIndirectCommand;
```

- `x` is the number of local workgroups to dispatch in the X dimension.
- `y` is the number of local workgroups to dispatch in the Y dimension.
- `z` is the number of local workgroups to dispatch in the Z dimension.

The members of `VkDispatchIndirectCommand` have the same meaning as the corresponding parameters of `vkCmdDispatch`.

Valid Usage

- VUID-VkDispatchIndirectCommand-x-00417
`x` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]`
- VUID-VkDispatchIndirectCommand-y-00418
`y` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]`

- VUID-VkDispatchIndirectCommand-z-00419
`z` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]`

To record a dispatch using non-zero base values for the components of `WorkgroupId`, call:

```
// Provided by VK_VERSION_1_1
void vkCmdDispatchBase(
    VkCommandBuffer          commandBuffer,
    uint32_t                 baseGroupX,
    uint32_t                 baseGroupY,
    uint32_t                 baseGroupZ,
    uint32_t                 groupCountX,
    uint32_t                 groupCountY,
    uint32_t                 groupCountZ);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `baseGroupX` is the start value for the X component of `WorkgroupId`.
- `baseGroupY` is the start value for the Y component of `WorkgroupId`.
- `baseGroupZ` is the start value for the Z component of `WorkgroupId`.
- `groupCountX` is the number of local workgroups to dispatch in the X dimension.
- `groupCountY` is the number of local workgroups to dispatch in the Y dimension.
- `groupCountZ` is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of `groupCountX × groupCountY × groupCountZ` local workgroups is assembled, with `WorkgroupId` values ranging from [`baseGroup*`, `baseGroup* + groupCount*`) in each component. `vkCmdDispatch` is equivalent to `vkCmdDispatchBase(0,0,0,groupCountX,groupCountY,groupCountZ)`.

Valid Usage

- VUID-vkCmdDispatchBase-magFilter-04553
 If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdDispatchBase-magFilter-09598
 If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`
- VUID-vkCmdDispatchBase-mipmapMode-04770
 If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`,

`reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDispatchBase-mipmapMode-09599

If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- VUID-vkCmdDispatchBase-unnormalizedCoordinates-09635

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` **must** be 1

- VUID-vkCmdDispatchBase-None-08609

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `viewType` **must** be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`

- VUID-vkCmdDispatchBase-None-08610

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name

- VUID-vkCmdDispatchBase-None-08611

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values

- VUID-vkCmdDispatchBase-aspectMask-06478

If a `VkImageView` is sampled with `depth comparison`, the image view **must** have been created with an `aspectMask` that contains `VK_IMAGE_ASPECT_DEPTH_BIT`

- VUID-vkCmdDispatchBase-None-02691

If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- VUID-vkCmdDispatchBase-None-07888

If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's `format` `features` **must** contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`

- VUID-vkCmdDispatchBase-None-02692

If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's `format` `features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- VUID-vkCmdDispatchBase-None-02693

If the [VK_EXT_filter_cubic](#) extension is not enabled and any [VkImageView](#) is sampled with [VK_FILTER_CUBIC_EXT](#) as a result of this command, it **must** not have a [VkImageViewType](#) of [VK_IMAGE_VIEW_TYPE_3D](#), [VK_IMAGE_VIEW_TYPE_CUBE](#), or [VK_IMAGE_VIEW_TYPE_CUBE_ARRAY](#)

- VUID-vkCmdDispatchBase-filterCubic-02694

Any [VkImageView](#) being sampled with [VK_FILTER_CUBIC_EXT](#) as a result of this command **must** have a [VkImageViewType](#) and format that supports cubic filtering, as specified by [VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic](#) returned by [vkGetPhysicalDeviceImageFormatProperties2](#)

- VUID-vkCmdDispatchBase-filterCubicMinmax-02695

Any [VkImageView](#) being sampled with [VK_FILTER_CUBIC_EXT](#) with a reduction mode of either [VK_SAMPLER_REDUCTION_MODE_MIN](#) or [VK_SAMPLER_REDUCTION_MODE_MAX](#) as a result of this command **must** have a [VkImageViewType](#) and format that supports cubic filtering together with minmax filtering, as specified by [VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax](#) returned by [vkGetPhysicalDeviceImageFormatProperties2](#)

- VUID-vkCmdDispatchBase-None-08600

For each set n that is statically used by a [bound shader](#), a descriptor set **must** have been bound to n at the same pipeline bind point, with a [VkPipelineLayout](#) that is compatible for set n , with the [VkPipelineLayout](#) used to create the current [VkPipeline](#), as described in [Pipeline Layout Compatibility](#)

- VUID-vkCmdDispatchBase-None-08601

For each push constant that is statically used by a [bound shader](#), a push constant value **must** have been set for the same pipeline bind point, with a [VkPipelineLayout](#) that is compatible for push constants, with the [VkPipelineLayout](#) used to create the current [VkPipeline](#), as described in [Pipeline Layout Compatibility](#)

- VUID-vkCmdDispatchBase-None-10068

For each array of resources that is used by a [bound shader](#), the indices used to access members of the array **must** be less than the descriptor count for the identified binding in the descriptor sets used by this command

- VUID-vkCmdDispatchBase-None-08114

Descriptors in each bound descriptor set, specified via [vkCmdBindDescriptorSets](#), **must** be valid as described by [descriptor validity](#) if they are statically used by a [bound shader](#)

- VUID-vkCmdDispatchBase-imageLayout-00344

If an image descriptor is accessed by a shader, the [VkImageLayout](#) **must** match the subresource accessible from the [VkImageView](#) as defined by the [image layout matching rules](#)

- VUID-vkCmdDispatchBase-None-08606

A valid pipeline **must** be bound to the pipeline bind point used by this command

- VUID-vkCmdDispatchBase-None-08608

There **must** not have been any calls to dynamic state setting commands for any state specified statically in the [VkPipeline](#) object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdDispatchBase-uniformBuffers-06935

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this

command accesses a uniform buffer, and the **robustBufferAccess** feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatchBase-storageBuffers-06936

If any stage of the **VkPipeline** object bound to the pipeline bind point used by this command accesses a storage buffer, and the **robustBufferAccess** feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatchBase-commandBuffer-02707

If **commandBuffer** is an unprotected command buffer and **protectedNoFault** is not supported, any resource accessed by **bound shaders** **must** not be a protected resource

- VUID-vkCmdDispatchBase-viewType-07752

If a **VkImageView** is accessed as a result of this command, then the image view's **viewType** **must** match the **Dim** operand of the **OpTypeImage** as described in [Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types](#)

- VUID-vkCmdDispatchBase-format-07753

If a **VkImageView** or **VkBufferView** is accessed as a result of this command, then the **numeric type** of the view's **format** and the **Sampled Type** operand of the **OpTypeImage** **must** match

- VUID-vkCmdDispatchBase-OpImageWrite-08795

If a **VkImageView** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the image view's format

- VUID-vkCmdDispatchBase-OpImageWrite-04469

If a **VkBufferView** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the buffer view's format

- VUID-vkCmdDispatchBase-SampledType-04470

If a **VkImageView** with a **VkFormat** that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 64

- VUID-vkCmdDispatchBase-SampledType-04471

If a **VkImageView** with a **VkFormat** that has a component width less than 64-bit is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 32

- VUID-vkCmdDispatchBase-SampledType-04472

If a **VkBufferView** with a **VkFormat** that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 64

- VUID-vkCmdDispatchBase-SampledType-04473

If a **VkBufferView** with a **VkFormat** that has a component width less than 64-bit is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 32

- VUID-vkCmdDispatchBase-sparseImageInt64Atomics-04474
If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command
- VUID-vkCmdDispatchBase-sparseImageInt64Atomics-04475
If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command
- VUID-vkCmdDispatchBase-None-07288
Any shader invocation executed by this command **must** `terminate`
- VUID-vkCmdDispatchBase-None-09600
If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, all image subresources identified by that descriptor **must** be in the image layout identified when the descriptor was written
- VUID-vkCmdDispatchBase-None-10672
this command **must** be called outside of a render pass instance
- VUID-vkCmdDispatchBase-commandBuffer-02712
If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, any resource written to by the `VkPipeline` object bound to the pipeline bind point used by this command **must** not be an unprotected resource
- VUID-vkCmdDispatchBase-commandBuffer-02713
If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, pipeline stages other than the framebuffer-space and compute stages in the `VkPipeline` object bound to the pipeline bind point used by this command **must** not write to any resource
- VUID-vkCmdDispatchBase-baseGroupX-00421
`baseGroupX` **must** be less than `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]`
- VUID-vkCmdDispatchBase-baseGroupY-00422
`baseGroupY` **must** be less than `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]`
- VUID-vkCmdDispatchBase-baseGroupZ-00423
`baseGroupZ` **must** be less than `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]`
- VUID-vkCmdDispatchBase-groupCountX-00424
`groupCountX` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]` minus `baseGroupX`
- VUID-vkCmdDispatchBase-groupCountY-00425
`groupCountY` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]` minus `baseGroupY`
- VUID-vkCmdDispatchBase-groupCountZ-00426
`groupCountZ` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]` minus `baseGroupZ`
- VUID-vkCmdDispatchBase-baseGroupX-00427

If any of `baseGroupX`, `baseGroupY`, or `baseGroupZ` are not zero, then the bound compute pipeline **must** have been created with the `VK_PIPELINE_CREATE_DISPATCH_BASE_BIT` flag

Valid Usage (Implicit)

- VUID-vkCmdDispatchBase-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdDispatchBase-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdDispatchBase-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_COMPUTE_BIT	Action

Chapter 30. Sparse Resources

As documented in [Resource Memory Association](#), [VkBuffer](#) and [VkImage](#) resources in Vulkan **must** be bound completely and contiguously to a single [VkDeviceMemory](#) object. This binding **must** be done before the resource is used, and the binding is immutable for the lifetime of the resource.

Sparse resources relax these restrictions and provide these additional features:

- Sparse resources **can** be bound non-contiguously to one or more [VkDeviceMemory](#) allocations.
- Sparse resources **can** be re-bound to different memory allocations over the lifetime of the resource.
- Sparse resources **can** have descriptors generated and used orthogonally with memory binding commands.

Sparse resources are not supported in Vulkan SC, due to complexity and the necessity of being able to update page table mappings at runtime [\[SCID-8\]](#). However, the sparse resource features, properties, resource creation flags, and definitions have been retained for completeness and compatibility.

All sparse resource [physical device features](#) **must** not be advertised as supported, and the related [physical device sparse properties](#) and [physical device limits](#) **must** be reported accordingly.

30.1. Sparse Resource Features

Sparse resources have several features that **must** be enabled explicitly at resource creation time. The features are enabled by including bits in the [flags](#) parameter of [VkImageCreateInfo](#) or [VkBufferCreateInfo](#). Each feature also has one or more corresponding feature enables specified in [VkPhysicalDeviceFeatures](#).

- The [sparseBinding](#) feature is the base, and provides the following capabilities:
 - Resources **can** be bound at some defined (sparse block) granularity.
 - The entire resource **must** be bound to memory before use regardless of regions actually accessed.
 - No specific mapping of image region to memory offset is defined, i.e. the location that each texel corresponds to in memory is implementation-dependent.
 - Sparse buffers have a well-defined mapping of buffer range to memory range, where an offset into a range of the buffer that is bound to a single contiguous range of memory corresponds to an identical offset within that range of memory.
 - Requested via the [VK_IMAGE_CREATE_SPARSE_BINDING_BIT](#) and [VK_BUFFER_CREATE_SPARSE_BINDING_BIT](#) bits.
 - A sparse image created using [VK_IMAGE_CREATE_SPARSE_BINDING_BIT](#) (but not [VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT](#)) supports all formats that non-sparse usage supports, and supports both [VK_IMAGE_TILING_OPTIMAL](#) and [VK_IMAGE_TILING_LINEAR](#) tiling.
- *Sparse Residency* builds on (and requires) the [sparseBinding](#) feature. It includes the following

capabilities:

- Resources do not have to be completely bound to memory before use on the device.
- Images have a prescribed sparse image block layout, allowing specific rectangular regions of the image to be bound to specific offsets in memory allocations.
- Consistency of access to unbound regions of the resource is defined by the absence or presence of `VkPhysicalDeviceSparseProperties::residencyNonResidentStrict`. If this property is present, accesses to unbound regions of the resource are well defined and behave as if the data bound is populated with all zeros; writes are discarded. When this property is absent, accesses are considered safe, but reads will return undefined values.
- Requested via the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` and `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` bits.
- Sparse residency support is advertised on a finer grain via the following features:
 - The `sparseResidencyBuffer` feature provides support for creating `VkBuffer` objects with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`.
 - The `sparseResidencyImage2D` feature provides support for creating 2D single-sampled `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
 - The `sparseResidencyImage3D` feature provides support for creating 3D `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
 - The `sparseResidency2Samples` feature provides support for creating 2D `VkImage` objects with 2 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
 - The `sparseResidency4Samples` feature provides support for creating 2D `VkImage` objects with 4 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
 - The `sparseResidency8Samples` feature provides support for creating 2D `VkImage` objects with 8 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
 - The `sparseResidency16Samples` feature provides support for creating 2D `VkImage` objects with 16 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

Implementations supporting `sparseResidencyImage2D` are only **required** to support sparse 2D, single-sampled images. Support for sparse 3D and MSAA images is **optional** and **can** be enabled via `sparseResidencyImage3D`, `sparseResidency2Samples`, `sparseResidency4Samples`, `sparseResidency8Samples`, and `sparseResidency16Samples`.

- A sparse image created using `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` supports all non-compressed color formats with power-of-two element size that non-sparse usage supports. Additional formats **may** also be supported and **can** be queried via `vkGetPhysicalDeviceSparseImageFormatProperties`. `VK_IMAGE_TILING_LINEAR` tiling is not supported.
- The `sparseResidencyAliased` feature provides the following capability that **can** be enabled per resource:

Allows physical memory ranges to be shared between multiple locations in the same sparse resource or between multiple sparse resources, with each binding of a memory location observing a consistent interpretation of the memory contents.

30.2. Sparse Resource API

The APIs related to sparse resources are grouped into the following categories:

- [Physical Device Features](#)
- [Physical Device Sparse Properties](#)

30.2.1. Physical Device Features

Some sparse-resource related features are reported and enabled in `VkPhysicalDeviceFeatures`. These features **must** be supported and enabled on the `VkDevice` object before applications **can** use them. See [Physical Device Features](#) for information on how to get and set enabled device features, and for more detailed explanations of these features.

Sparse Physical Device Features

- `sparseBinding`: Support for creating `VkBuffer` and `VkImage` objects with the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` and `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` flags, respectively.
- `sparseResidencyBuffer`: Support for creating `VkBuffer` objects with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag.
- `sparseResidencyImage2D`: Support for creating 2D single-sampled `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidencyImage3D`: Support for creating 3D `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidency2Samples`: Support for creating 2D `VkImage` objects with 2 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidency4Samples`: Support for creating 2D `VkImage` objects with 4 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidency8Samples`: Support for creating 2D `VkImage` objects with 8 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidency16Samples`: Support for creating 2D `VkImage` objects with 16 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidencyAliased`: Support for creating `VkBuffer` and `VkImage` objects with the `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` and `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` flags, respectively.

30.2.2. Physical Device Sparse Properties

Some features of the implementation are not possible to disable, and are reported to allow applications to alter their sparse resource usage accordingly. These read-only capabilities are reported in the `VkPhysicalDeviceProperties::sparseProperties` member, which is a `VkPhysicalDeviceSparseProperties` structure.

The `VkPhysicalDeviceSparseProperties` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceSparseProperties {
    VkBool32    residencyStandard2DBlockShape;
    VkBool32    residencyStandard2DMultisampleBlockShape;
    VkBool32    residencyStandard3DBlockShape;
    VkBool32    residencyAlignedMipSize;
    VkBool32    residencyNonResidentStrict;
} VkPhysicalDeviceSparseProperties;
```

- `residencyStandard2DBlockShape` **must** be `VK_FALSE` in Vulkan SC [\[SCID-8\]](#).
- `residencyStandard2DMultisampleBlockShape` **must** be `VK_FALSE` in Vulkan SC [\[SCID-8\]](#).
- `residencyStandard3DBlockShape` **must** be `VK_FALSE` in Vulkan SC [\[SCID-8\]](#).
- `residencyAlignedMipSize` **must** be `VK_FALSE` in Vulkan SC [\[SCID-8\]](#).
- `residencyNonResidentStrict` **must** be `VK_FALSE` in Vulkan SC [\[SCID-8\]](#).

Chapter 31. Window System Integration (WSI)

This chapter discusses the window system integration (WSI) between the Vulkan API and the various forms of displaying the results of rendering to a user. Since the Vulkan API **can** be used without displaying results, WSI is provided through the use of optional Vulkan extensions. This chapter provides an overview of WSI. See the appendix for additional details of each WSI extension, including which extensions **must** be enabled in order to use each of the functions described in this chapter.

31.1. WSI Platform

A platform is an abstraction for a window system, OS, etc. Some examples include MS Windows, Android, and Wayland. The Vulkan API **may** be integrated in a unique manner for each platform.

The Vulkan API does not define any type of platform object. Platform-specific WSI extensions are defined, each containing platform-specific functions for using WSI. Use of these extensions is guarded by preprocessor symbols as defined in the [Window System-Specific Header Control](#) appendix.

In order for an application to be compiled to use WSI with a given platform, it **must** either:

- `#define` the appropriate preprocessor symbol prior to including the `vulkan_sc.h` header file, or
- include `vulkan_sc_core.h` and any native platform headers, followed by the appropriate platform-specific header.

The preprocessor symbols and platform-specific headers are defined in the [Window System Extensions and Headers](#) table.

Each platform-specific extension is an instance extension. The application **must** enable instance extensions with `vkCreateInstance` before using them.

31.2. WSI Surface

Native platform surface or window objects are abstracted by surface objects, which are represented by `VkSurfaceKHR` handles:

```
// Provided by VK_KHR_surface
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSurfaceKHR)
```

The `VK_KHR_surface` extension declares the `VkSurfaceKHR` object, and provides a function for destroying `VkSurfaceKHR` objects. Separate platform-specific extensions each provide a function for creating a `VkSurfaceKHR` object for the respective platform. From the application's perspective this is an opaque handle, just like the handles of other Vulkan objects.

NOTE

On certain platforms, the Vulkan loader and ICDs **may** have conventions that treat

the handle as a pointer to a structure containing the platform-specific information about the surface. This will be described in the documentation for the loader-ICD interface, and in the `vk_icd.h` header file of the LoaderAndTools source-code repository. This does not affect the loader-layer interface; layers **may** wrap `VkSurfaceKHR` objects.

31.2.1. Platform-Independent Information

Once created, `VkSurfaceKHR` objects **can** be used in this and other extensions, in particular the `VK_KHR_swapchain` extension.

Several WSI functions return `VK_ERROR_SURFACE_LOST_KHR` if the surface becomes no longer available. After such an error, the surface (and any child swapchain, if one exists) **should** be destroyed, as there is no way to restore them to a not-lost state. Applications **may** attempt to create a new `VkSurfaceKHR` using the same native platform window object, but whether such re-creation will succeed is platform-dependent and **may** depend on the reason the surface became unavailable. A lost surface does not otherwise cause devices to be [lost](#).

To destroy a `VkSurfaceKHR` object, call:

```
// Provided by VK_KHR_surface
void vkDestroySurfaceKHR(
    VkInstance          instance,
    VkSurfaceKHR        surface,
    const VkAllocationCallbacks* pAllocator);
```

- `instance` is the instance used to create the surface.
- `surface` is the surface to destroy.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see [Memory Allocation](#)).

Destroying a `VkSurfaceKHR` merely severs the connection between Vulkan and the native surface, and does not imply destroying the native surface, closing a window, or similar behavior.

Valid Usage

Valid Usage (Implicit)

- VUID-vkDestroySurfaceKHR-instance-parameter
`instance` **must** be a valid `VkInstance` handle
- VUID-vkDestroySurfaceKHR-surface-parameter
If `surface` is not `VK_NULL_HANDLE`, `surface` **must** be a valid `VkSurfaceKHR` handle
- VUID-vkDestroySurfaceKHR-pAllocator-null
`pAllocator` **must** be `NULL`

- VUID-vkDestroySurfaceKHR-surface-parent

If **surface** is a valid handle, it **must** have been created, allocated, or retrieved from **instance**

Host Synchronization

- Host access to **surface** **must** be externally synchronized

31.3. Presenting Directly to Display Devices

In some environments applications **can** also present Vulkan rendering directly to display devices without using an intermediate windowing system. This **can** be useful for embedded applications, or implementing the rendering/presentation backend of a windowing system using Vulkan. The **VK_KHR_display** extension provides the functionality necessary to enumerate display devices and create **VkSurfaceKHR** objects that target displays.

31.3.1. Display Enumeration

Displays are represented by **VkDisplayKHR** handles:

```
// Provided by VK_KHR_display
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDisplayKHR)
```

Various functions are provided for enumerating the available display devices present on a Vulkan physical device. To query information about the available displays, call:

```
// Provided by VK_KHR_display
VkResult vkGetPhysicalDeviceDisplayPropertiesKHR(
    VkPhysicalDevice          physicalDevice,
    uint32_t*                 pPropertyCount,
    VkDisplayPropertiesKHR*    pProperties);
```

- **physicalDevice** is a physical device.
- **pPropertyCount** is a pointer to an integer related to the number of display devices available or queried, as described below.
- **pProperties** is either **NULL** or a pointer to an array of **VkDisplayPropertiesKHR** structures.

If **pProperties** is **NULL**, then the number of display devices available for **physicalDevice** is returned in **pPropertyCount**. Otherwise, **pPropertyCount** **must** point to a variable set by the application to the number of elements in the **pProperties** array, and on return the variable is overwritten with the number of structures actually written to **pProperties**. If the value of **pPropertyCount** is less than the number of display devices for **physicalDevice**, at most **pPropertyCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available properties were returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetPhysicalDeviceDisplayPropertiesKHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- `VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-physicalDevice-parameter` `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- `VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-pPropertyCount-parameter` `pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- `VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-pProperties-parameter`
If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkDisplayPropertiesKHR` structures

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkDisplayPropertiesKHR` structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplayPropertiesKHR {
    VkDisplayKHR          display;
    const char*           displayName;
    VkExtent2D            physicalDimensions;
    VkExtent2D            physicalResolution;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkBool32              planeReorderPossible;
    VkBool32              persistentContent;
} VkDisplayPropertiesKHR;
```

- `display` is a handle that is used to refer to the display described here. This handle will be valid for the lifetime of the Vulkan instance.
- `displayName` is `NULL` or a pointer to a null-terminated UTF-8 string containing the name of the display. Generally, this will be the name provided by the display's EDID. If `NULL`, no suitable name is available. If not `NULL`, the string pointed to **must** remain accessible and unmodified as

long as `display` is valid.

- `physicalDimensions` describes the physical width and height of the visible portion of the display, in millimeters.
- `physicalResolution` describes the physical, native, or preferred resolution of the display.

NOTE

For devices which have no natural value to return here, implementations **should** return the maximum resolution supported.

- `supportedTransforms` is a bitmask of `VkSurfaceTransformFlagBitsKHR` describing which transforms are supported by this display.
- `planeReorderPossible` tells whether the planes on this display **can** have their z order changed. If this is `VK_TRUE`, the application **can** re-arrange the planes on this display in any order relative to each other.
- `persistentContent` tells whether the display supports self-refresh/internal buffering. If this is true, the application **can** submit persistent present operations on swapchains created against this display.

NOTE

Persistent presents **may** have higher latency, and **may** use less power when the screen content is updated infrequently, or when only a portion of the screen needs to be updated in most frames.

To query information about the available displays, call:

```
// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayProperties2KHR(
    VkPhysicalDevice          physicalDevice,
    uint32_t*                 pPropertyCount,
    VkDisplayProperties2KHR*   pProperties);
```

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display devices available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayProperties2KHR` structures.

`vkGetPhysicalDeviceDisplayProperties2KHR` behaves similarly to `vkGetPhysicalDeviceDisplayPropertiesKHR`, with the ability to return extended information via chained output structures.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetPhysicalDeviceDisplayProperties2KHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-pPropertyCount-parameter
`pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-pProperties-parameter
If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkDisplayProperties2KHR` structures

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkDisplayProperties2KHR` structure is defined as:

```
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayProperties2KHR {
    VkStructureType    sType;
    void*              pNext;
    VkDisplayPropertiesKHR displayProperties;
} VkDisplayProperties2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `displayProperties` is a `VkDisplayPropertiesKHR` structure.

Valid Usage (Implicit)

- VUID-VkDisplayProperties2KHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_PROPERTIES_2_KHR`
- VUID-VkDisplayProperties2KHR-pNext-pNext
`pNext` **must** be `NULL`

Acquiring and Releasing Displays

On some platforms, access to displays is limited to a single process or native driver instance. On such platforms, some or all of the displays may not be available to Vulkan if they are already in use

by a native windowing system or other application.

To acquire permission to directly access a display in Vulkan on Windows 10, call:

```
// Provided by VK_NV_acquire_winrt_display
VkResult vkAcquireWinrtDisplayNV(
    VkPhysicalDevice      physicalDevice,
    VkDisplayKHR          display);
```

- **physicalDevice** The physical device the display is on.
- **display** The display the caller wishes to control in Vulkan.

All permissions necessary to control the display are granted to the Vulkan instance associated with **physicalDevice** until the display is released or the application is terminated. Permission to access the display **may** be revoked by events that cause Windows 10 itself to lose access to **display**. If this has happened, operations which require access to the display **must** fail with an appropriate error code. If permission to access **display** has already been acquired by another entity, the call **must** return the error code **VK_ERROR_INITIALIZATION_FAILED**.

NOTE	The Vulkan instance acquires control of a “winrt::Windows::Devices::Display::Core::DisplayTarget” by performing an operation equivalent to “winrt::Windows::Devices::Display::Core::DisplayManager.TryAcquireTarget()” on the “DisplayTarget”.

NOTE	One example of when Windows 10 loses access to a display is when the display is hot-unplugged.

NOTE	One example of when a display has already been acquired by another entity is when the Windows desktop compositor (DWM) is in control of the display. Beginning with Windows 10 version 2004 it is possible to cause DWM to release a display by using the “Advanced display settings” sub-page of the “Display settings” control panel. vkAcquireWinrtDisplayNV does not itself cause DWM to release a display; this action must be performed outside of Vulkan.

If **VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations** is **VK_TRUE**, **vkAcquireWinrtDisplayNV** **must** not return **VK_ERROR_OUT_OF_HOST_MEMORY**.

Valid Usage (Implicit)

- VUID-vkAcquireWinrtDisplayNV-physicalDevice-parameter **physicalDevice** **must** be a valid **VkPhysicalDevice** handle
- VUID-vkAcquireWinrtDisplayNV-display-parameter **display** **must** be a valid **VkDisplayKHR** handle
- VUID-vkAcquireWinrtDisplayNV-display-parent

`display` **must** have been created, allocated, or retrieved from `physicalDevice`

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

When acquiring displays on Windows 10, an application may also wish to enumerate and identify them using a native handle rather than a `VkDisplayKHR` handle.

To determine the `VkDisplayKHR` handle corresponding to a “`wintr::Windows::Devices::Display::Core::DisplayTarget`”, call:

```
// Provided by VK_NV_acquire_wintr_display
VkResult vkGetWintrDisplayNV(
    VkPhysicalDevice      physicalDevice,
    uint32_t              deviceRelativeId,
    VkDisplayKHR*         pDisplay);
```

- `physicalDevice` The physical device on which to query the display handle.
- `deviceRelativeId` The value of the “`AdapterRelativeId`” property of a “`DisplayTarget`” that is enumerated by a “`DisplayAdapter`” with an “`Id`” property matching the `deviceLUID` property of a `VkPhysicalDeviceIDProperties` for `physicalDevice`.
- `pDisplay` The corresponding `VkDisplayKHR` handle will be returned here.

If there is no `VkDisplayKHR` corresponding to `deviceRelativeId` on `physicalDevice`, `VK_NULL_HANDLE` **must** be returned in `pDisplay`.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetWintrDisplayNV` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkGetWintrDisplayNV-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetWintrDisplayNV-pDisplay-parameter

`pDisplay` **must** be a valid pointer to a `VkDisplayKHR` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

To release a previously acquired display, call:

```
// Provided by VK_EXT_direct_mode_display
VkResult vkReleaseDisplayEXT(
    VkPhysicalDevice      physicalDevice,
    VkDisplayKHR          display);
```

- `physicalDevice` The physical device the display is on.
- `display` The display to release control of.

Valid Usage (Implicit)

- VUID-vkReleaseDisplayEXT-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkReleaseDisplayEXT-display-parameter `display` **must** be a valid `VkDisplayKHR` handle
- VUID-vkReleaseDisplayEXT-display-parent `display` **must** have been created, allocated, or retrieved from `physicalDevice`

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

Display Planes

Images are presented to individual planes on a display. Devices **must** support at least one plane on each display. Planes **can** be stacked and blended to composite multiple images on one display. Devices **may** support only a fixed stacking order and fixed mapping between planes and displays, or they **may** allow arbitrary application-specified stacking orders and mappings between planes and displays. To query the properties of device display planes, call:

```
// Provided by VK_KHR_display
VkResult vkGetPhysicalDeviceDisplayPlanePropertiesKHR(
    VkPhysicalDevice          physicalDevice,
    uint32_t*                 pPropertyCount,
    VkDisplayPlanePropertiesKHR* pProperties);
```

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display planes available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayPlanePropertiesKHR` structures.

If `pProperties` is `NULL`, then the number of display planes available for `physicalDevice` is returned in `pPropertyCount`. Otherwise, `pPropertyCount` **must** point to a variable set by the application to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If the value of `pPropertyCount` is less than the number of display planes for `physicalDevice`, at most `pPropertyCount` structures will be written.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetPhysicalDeviceDisplayPlanePropertiesKHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pPropertyCount-parameter `pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pProperties-parameter
If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkDisplayPlanePropertiesKHR` structures

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkDisplayPlanePropertiesKHR` structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplayPlanePropertiesKHR {
    VkDisplayKHR    currentDisplay;
    uint32_t        currentStackIndex;
} VkDisplayPlanePropertiesKHR;
```

- `currentDisplay` is the handle of the display the plane is currently associated with. If the plane is not currently attached to any displays, this will be `VK_NULL_HANDLE`.
- `currentStackIndex` is the current z-order of the plane. This will be between 0 and the value returned by `vkGetPhysicalDeviceDisplayPlanePropertiesKHR` in `pPropertyCount`.

To query the properties of a device's display planes, call:

```
// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayPlaneProperties2KHR(
    VkPhysicalDevice    physicalDevice,
    uint32_t*           pPropertyCount,
    VkDisplayPlaneProperties2KHR* pProperties);
```

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display planes available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayPlaneProperties2KHR` structures.

`vkGetPhysicalDeviceDisplayPlaneProperties2KHR` behaves similarly to `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`, with the ability to return extended information via chained output structures.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetPhysicalDeviceDisplayPlaneProperties2KHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pPropertyCount-parameter **pPropertyCount** **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pProperties-parameter
If the value referenced by **pPropertyCount** is not 0, and **pProperties** is not `NULL`, **pProperties** **must** be a valid pointer to an array of **pPropertyCount** `VkDisplayPlaneProperties2KHR` structures

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkDisplayPlaneProperties2KHR` structure is defined as:

```
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneProperties2KHR {
    VkStructureType    sType;
    void*              pNext;
    VkDisplayPlanePropertiesKHR displayPlaneProperties;
} VkDisplayPlaneProperties2KHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **displayPlaneProperties** is a `VkDisplayPlanePropertiesKHR` structure.

Valid Usage (Implicit)

- VUID-VkDisplayPlaneProperties2KHR-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_PROPERTIES_2_KHR`
- VUID-VkDisplayPlaneProperties2KHR-pNext-pNext
pNext **must** be `NULL`

To determine which displays a plane is usable with, call

```
// Provided by VK_KHR_display
VkResult vkGetDisplayPlaneSupportedDisplaysKHR(
    VkPhysicalDevice          physicalDevice,
    uint32_t                  planeIndex,
    uint32_t*                  pDisplayCount,
    VkDisplayKHR*              pDisplays);
```

- **physicalDevice** is a physical device.
- **planeIndex** is the plane which the application wishes to use, and **must** be in the range [0, physical device plane count - 1].
- **pDisplayCount** is a pointer to an integer related to the number of displays available or queried, as described below.
- **pDisplays** is either **NULL** or a pointer to an array of **VkDisplayKHR** handles.

If **pDisplays** is **NULL**, then the number of displays usable with the specified **planeIndex** for **physicalDevice** is returned in **pDisplayCount**. Otherwise, **pDisplayCount** **must** point to a variable set by the application to the number of elements in the **pDisplays** array, and on return the variable is overwritten with the number of handles actually written to **pDisplays**. If the value of **pDisplayCount** is less than the number of usable display-plane pairs for **physicalDevice**, at most **pDisplayCount** handles will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available pairs were returned.

If **VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations** is **VK_TRUE**, **vkGetDisplayPlaneSupportedDisplaysKHR** **must** not return **VK_ERROR_OUT_OF_HOST_MEMORY**.

Valid Usage

- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-planeIndex-01249
planeIndex **must** be less than the number of display planes supported by the device as determined by calling **vkGetPhysicalDeviceDisplayPlanePropertiesKHR**

Valid Usage (Implicit)

- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-physicalDevice-parameter
physicalDevice **must** be a valid **VkPhysicalDevice** handle
- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplayCount-parameter
pDisplayCount **must** be a valid pointer to a **uint32_t** value
- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplays-parameter
If the value referenced by **pDisplayCount** is not 0, and **pDisplays** is not **NULL**, **pDisplays** **must** be a valid pointer to an array of **pDisplayCount** **VkDisplayKHR** handles

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

Additional properties of displays are queried using specialized query functions.

Display Modes

Display modes are represented by `VkDisplayModeKHR` handles:

```
// Provided by VK_KHR_display
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDisplayModeKHR)
```

Each display has one or more supported modes associated with it by default. These built-in modes are queried by calling:

```
// Provided by VK_KHR_display
VkResult vkGetDisplayModePropertiesKHR(
    VkPhysicalDevice    physicalDevice,
    VkDisplayModeKHR    display,
    uint32_t*           pPropertyCount,
    VkDisplayModePropertiesKHR* pProperties);
```

- `physicalDevice` is the physical device associated with `display`.
- `display` is the display to query.
- `pPropertyCount` is a pointer to an integer related to the number of display modes available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayModePropertiesKHR` structures.

If `pProperties` is `NULL`, then the number of display modes available on the specified `display` for `physicalDevice` is returned in `pPropertyCount`. Otherwise, `pPropertyCount` **must** point to a variable set by the application to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If the value of `pPropertyCount` is less than the number of display modes for `physicalDevice`, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that

not all the available display modes were returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetDisplayModePropertiesKHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkGetDisplayModePropertiesKHR-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetDisplayModePropertiesKHR-display-parameter `display` **must** be a valid `VkDisplayKHR` handle
- VUID-vkGetDisplayModePropertiesKHR-pPropertyCount-parameter `pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetDisplayModePropertiesKHR-pProperties-parameter
If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkDisplayModePropertiesKHR` structures
- VUID-vkGetDisplayModePropertiesKHR-display-parent `display` **must** have been created, allocated, or retrieved from `physicalDevice`

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkDisplayModePropertiesKHR` structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplayModePropertiesKHR {
    VkDisplayModeKHR          displayMode;
    VkDisplayModeParametersKHR parameters;
} VkDisplayModePropertiesKHR;
```

- `displayMode` is a handle to the display mode described in this structure. This handle will be valid for the lifetime of the Vulkan instance.

- `parameters` is a `VkDisplayModeParametersKHR` structure describing the display parameters associated with `displayMode`.

```
// Provided by VK_KHR_display
typedef VkFlags VkDisplayModeCreateFlagsKHR;
```

`VkDisplayModeCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

To query the properties of a device's built-in display modes, call:

```
// Provided by VK_KHR_get_display_properties2
VkResult vkGetDisplayModeProperties2KHR(
    VkPhysicalDevice      physicalDevice,
    VkDisplayKHR          display,
    uint32_t*             pPropertyCount,
    VkDisplayModeProperties2KHR* pProperties);
```

- `physicalDevice` is the physical device associated with `display`.
- `display` is the display to query.
- `pPropertyCount` is a pointer to an integer related to the number of display modes available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayModeProperties2KHR` structures.

`vkGetDisplayModeProperties2KHR` behaves similarly to `vkGetDisplayModePropertiesKHR`, with the ability to return extended information via chained output structures.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetDisplayModeProperties2KHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkGetDisplayModeProperties2KHR-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetDisplayModeProperties2KHR-display-parameter `display` **must** be a valid `VkDisplayKHR` handle
- VUID-vkGetDisplayModeProperties2KHR-pPropertyCount-parameter `pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetDisplayModeProperties2KHR-pProperties-parameter
If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkDisplayModeProperties2KHR` structures
- VUID-vkGetDisplayModeProperties2KHR-display-parent `display` **must** have been created, allocated, or retrieved from `physicalDevice`

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkDisplayModeProperties2KHR` structure is defined as:

```
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayModeProperties2KHR {
    VkStructureType    sType;
    void*              pNext;
    VkDisplayModePropertiesKHR displayModeProperties;
} VkDisplayModeProperties2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `displayModeProperties` is a `VkDisplayModePropertiesKHR` structure.

Valid Usage (Implicit)

- VUID-VkDisplayModeProperties2KHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_MODE_PROPERTIES_2_KHR`
- VUID-VkDisplayModeProperties2KHR-pNext-pNext
`pNext` **must** be `NULL`

The `VkDisplayModeParametersKHR` structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplayModeParametersKHR {
    VkExtent2D    visibleRegion;
    uint32_t      refreshRate;
} VkDisplayModeParametersKHR;
```

- `visibleRegion` is the 2D extents of the visible region.
- `refreshRate` is a `uint32_t` that is the number of times the display is refreshed each second

multiplied by 1000.

NOTE For example, a 60Hz display mode would report a **refreshRate** of 60,000.

Valid Usage

- VUID-VkDisplayModeParametersKHR-width-01990
The **width** member of **visibleRegion** **must** be greater than 0
- VUID-VkDisplayModeParametersKHR-height-01991
The **height** member of **visibleRegion** **must** be greater than 0
- VUID-VkDisplayModeParametersKHR-refreshRate-01992
refreshRate **must** be greater than 0

Additional modes **may** also be created by calling:

```
// Provided by VK_KHR_display
VkResult vkCreateDisplayModeKHR(
    VkPhysicalDevice          physicalDevice,
    VkDisplayKHR              display,
    const VkDisplayModeCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDisplayModeKHR*         pMode);
```

- **physicalDevice** is the physical device associated with **display**.
- **display** is the display to create an additional mode for.
- **pCreateInfo** is a pointer to a **VkDisplayModeCreateInfoKHR** structure describing the new mode to create.
- **pAllocator** is the allocator used for host memory allocated for the display mode object when there is no more specific allocator available (see **Memory Allocation**).
- **pMode** is a pointer to a **VkDisplayModeKHR** handle in which the mode created is returned.

If **VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations** is **VK_TRUE**, **vkCreateDisplayModeKHR** **must** not return **VK_ERROR_OUT_OF_HOST_MEMORY**.

Valid Usage (Implicit)

- VUID-vkCreateDisplayModeKHR-physicalDevice-parameter
physicalDevice **must** be a valid **VkPhysicalDevice** handle
- VUID-vkCreateDisplayModeKHR-display-parameter
display **must** be a valid **VkDisplayKHR** handle
- VUID-vkCreateDisplayModeKHR-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid **VkDisplayModeCreateInfoKHR** structure

- VUID-vkCreateDisplayModeKHR-pAllocator-null
`pAllocator` **must** be `NULL`
- VUID-vkCreateDisplayModeKHR-pMode-parameter
`pMode` **must** be a valid pointer to a `VkDisplayModeKHR` handle
- VUID-vkCreateDisplayModeKHR-display-parent
`display` **must** have been created, allocated, or retrieved from `physicalDevice`

Host Synchronization

- Host access to `display` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkDisplayModeCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplayModeCreateInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkDisplayModeCreateFlagsKHR flags;
    VkDisplayModeParametersKHR parameters;
} VkDisplayModeCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use, and **must** be zero.
- `parameters` is a `VkDisplayModeParametersKHR` structure describing the display parameters to use in creating the new mode. If the parameters are not compatible with the specified display, the implementation **must** return `VK_ERROR_INITIALIZATION_FAILED`.

Valid Usage (Implicit)

- VUID-VkDisplayModeCreateInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_MODE_CREATE_INFO_KHR`
- VUID-VkDisplayModeCreateInfoKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkDisplayModeCreateInfoKHR-flags-zeroBitmask
`flags` **must** be `0`
- VUID-VkDisplayModeCreateInfoKHR-parameters-parameter
`parameters` **must** be a valid `VkDisplayModeParametersKHR` structure

Applications that wish to present directly to a display **must** select which layer, or “plane” of the display they wish to target, and a mode to use with the display. Each display supports at least one plane. The capabilities of a given mode and plane combination are determined by calling:

```
// Provided by VK_KHR_display
VkResult vkGetDisplayPlaneCapabilitiesKHR(
    VkPhysicalDevice          physicalDevice,
    VkDisplayModeKHR          mode,
    uint32_t                  planeIndex,
    VkDisplayPlaneCapabilitiesKHR* pCapabilities);
```

- `physicalDevice` is the physical device associated with the display specified by `mode`
- `mode` is the display mode the application intends to program when using the specified plane. Note this parameter also implicitly specifies a display.
- `planeIndex` is the plane which the application intends to use with the display, and is less than the number of display planes supported by the device.
- `pCapabilities` is a pointer to a `VkDisplayPlaneCapabilitiesKHR` structure in which the capabilities are returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetDisplayPlaneCapabilitiesKHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkGetDisplayPlaneCapabilitiesKHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetDisplayPlaneCapabilitiesKHR-mode-parameter
`mode` **must** be a valid `VkDisplayModeKHR` handle
- VUID-vkGetDisplayPlaneCapabilitiesKHR-pCapabilities-parameter
`pCapabilities` **must** be a valid pointer to a `VkDisplayPlaneCapabilitiesKHR` structure
- VUID-vkGetDisplayPlaneCapabilitiesKHR-mode-parent

mode **must** have been created, allocated, or retrieved from **physicalDevice**

Host Synchronization

- Host access to **mode** **must** be externally synchronized

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_UNKNOWN**
- **VK_ERROR_VALIDATION_FAILED**

The **VkDisplayPlaneCapabilitiesKHR** structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplayPlaneCapabilitiesKHR {
    VkDisplayPlaneAlphaFlagsKHR    supportedAlpha;
    VkOffset2D                     minSrcPosition;
    VkOffset2D                     maxSrcPosition;
    VkExtent2D                     minSrcExtent;
    VkExtent2D                     maxSrcExtent;
    VkOffset2D                     minDstPosition;
    VkOffset2D                     maxDstPosition;
    VkExtent2D                     minDstExtent;
    VkExtent2D                     maxDstExtent;
} VkDisplayPlaneCapabilitiesKHR;
```

- **supportedAlpha** is a bitmask of **VkDisplayPlaneAlphaFlagBitsKHR** describing the supported alpha blending modes.
- **minSrcPosition** is the minimum source rectangle offset supported by this plane using the specified mode.
- **maxSrcPosition** is the maximum source rectangle offset supported by this plane using the specified mode. The **x** and **y** components of **maxSrcPosition** **must** each be greater than or equal to the **x** and **y** components of **minSrcPosition**, respectively.
- **minSrcExtent** is the minimum source rectangle size supported by this plane using the specified mode.
- **maxSrcExtent** is the maximum source rectangle size supported by this plane using the specified mode.

mode.

- `minDstPosition`, `maxDstPosition`, `minDstExtent`, `maxDstExtent` all have similar semantics to their corresponding `*Src*` equivalents, but apply to the output region within the mode rather than the input region within the source image. Unlike the `*Src*` offsets, `minDstPosition` and `maxDstPosition` **may** contain negative values.

The minimum and maximum position and extent fields describe the implementation limits, if any, as they apply to the specified display mode and plane. Vendors **may** support displaying a subset of a swapchain's presentable images on the specified display plane. This is expressed by returning `minSrcPosition`, `maxSrcPosition`, `minSrcExtent`, and `maxSrcExtent` values that indicate a range of possible positions and sizes which **may** be used to specify the region within the presentable images that source pixels will be read from when creating a swapchain on the specified display mode and plane.

Vendors **may** also support mapping the presentable images' content to a subset or superset of the visible region in the specified display mode. This is expressed by returning `minDstPosition`, `maxDstPosition`, `minDstExtent` and `maxDstExtent` values that indicate a range of possible positions and sizes which **may** be used to describe the region within the display mode that the source pixels will be mapped to.

Other vendors **may** support only a 1-1 mapping between pixels in the presentable images and the display mode. This **may** be indicated by returning (0,0) for `minSrcPosition`, `maxSrcPosition`, `minDstPosition`, and `maxDstPosition`, and (display mode width, display mode height) for `minSrcExtent`, `maxSrcExtent`, `minDstExtent`, and `maxDstExtent`.

The value `supportedAlpha` **must** contain at least one valid `VkDisplayPlaneAlphaFlagBitsKHR` bit.

These values indicate the limits of the implementation's individual fields. Not all combinations of values within the offset and extent ranges returned in `VkDisplayPlaneCapabilitiesKHR` are guaranteed to be supported. Presentation requests specifying unsupported combinations **may** fail.

To query the capabilities of a given mode and plane combination, call:

```
// Provided by VK_KHR_get_display_properties2
VkResult vkGetDisplayPlaneCapabilities2KHR(
    VkPhysicalDevice          physicalDevice,
    const VkDisplayPlaneInfo2KHR* pDisplayPlaneInfo,
    VkDisplayPlaneCapabilities2KHR* pCapabilities);
```

- `physicalDevice` is the physical device associated with `pDisplayPlaneInfo`.
- `pDisplayPlaneInfo` is a pointer to a `VkDisplayPlaneInfo2KHR` structure describing the plane and mode.
- `pCapabilities` is a pointer to a `VkDisplayPlaneCapabilities2KHR` structure in which the capabilities are returned.

`vkGetDisplayPlaneCapabilities2KHR` behaves similarly to `vkGetDisplayPlaneCapabilitiesKHR`, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetDisplayPlaneCapabilities2KHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkGetDisplayPlaneCapabilities2KHR-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetDisplayPlaneCapabilities2KHR-pDisplayPlaneInfo-parameter `pDisplayPlaneInfo` **must** be a valid pointer to a valid `VkDisplayPlaneInfo2KHR` structure
- VUID-vkGetDisplayPlaneCapabilities2KHR-pCapabilities-parameter `pCapabilities` **must** be a valid pointer to a `VkDisplayPlaneCapabilities2KHR` structure

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkDisplayPlaneInfo2KHR` structure is defined as:

```
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneInfo2KHR {
    VkStructureType    sType;
    const void*        pNext;
    VkDisplayModeKHR    mode;
    uint32_t            planeIndex;
} VkDisplayPlaneInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `mode` is the display mode the application intends to program when using the specified plane.

NOTE This parameter also implicitly specifies a display.

- `planeIndex` is the plane which the application intends to use with the display.

The members of `VkDisplayPlaneInfo2KHR` correspond to the arguments to `vkGetDisplayPlaneCapabilitiesKHR`, with `sType` and `pNext` added for extensibility.

Valid Usage (Implicit)

- VUID-VkDisplayPlaneInfo2KHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_INFO_2_KHR`
- VUID-VkDisplayPlaneInfo2KHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkDisplayPlaneInfo2KHR-mode-parameter
`mode` **must** be a valid `VkDisplayModeKHR` handle

Host Synchronization

- Host access to `mode` **must** be externally synchronized

The `VkDisplayPlaneCapabilities2KHR` structure is defined as:

```
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneCapabilities2KHR {
    VkStructureType    sType;
    void*              pNext;
    VkDisplayPlaneCapabilitiesKHR capabilities;
} VkDisplayPlaneCapabilities2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `capabilities` is a `VkDisplayPlaneCapabilitiesKHR` structure.

Valid Usage (Implicit)

- VUID-VkDisplayPlaneCapabilities2KHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_CAPABILITIES_2_KHR`
- VUID-VkDisplayPlaneCapabilities2KHR-pNext-pNext
`pNext` **must** be `NULL`

31.3.2. Display Control

To set the power state of a display, call:

```
// Provided by VK_EXT_display_control
VkResult vkDisplayPowerControlEXT(
    VkDevice          device,
    VkDisplayKHR      display,
    const VkDisplayPowerInfoEXT* pDisplayPowerInfo);
```

- **device** is a logical device associated with **display**.
- **display** is the display whose power state is modified.
- **pDisplayPowerInfo** is a pointer to a **VkDisplayPowerInfoEXT** structure specifying the new power state of **display**.

If **VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations** is **VK_TRUE**, **vkDisplayPowerControlEXT** **must** not return **VK_ERROR_OUT_OF_HOST_MEMORY**.

Valid Usage (Implicit)

- VUID-vkDisplayPowerControlEXT-device-parameter **device** **must** be a valid **VkDevice** handle
- VUID-vkDisplayPowerControlEXT-display-parameter **display** **must** be a valid **VkDisplayKHR** handle
- VUID-vkDisplayPowerControlEXT-pDisplayPowerInfo-parameter **pDisplayPowerInfo** **must** be a valid pointer to a valid **VkDisplayPowerInfoEXT** structure
- VUID-vkDisplayPowerControlEXT-commonparent
Both of **device**, and **display** **must** have been created, allocated, or retrieved from the same **VkPhysicalDevice**

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_UNKNOWN**
- **VK_ERROR_VALIDATION_FAILED**

The **VkDisplayPowerInfoEXT** structure is defined as:

```
// Provided by VK_EXT_display_control
typedef struct VkDisplayPowerInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkDisplayPowerStateEXT powerState;
} VkDisplayPowerInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `powerState` is a `VkDisplayPowerStateEXT` value specifying the new power state of the display.

Valid Usage (Implicit)

- VUID-VkDisplayPowerInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_POWER_INFO_EXT`
- VUID-VkDisplayPowerInfoEXT-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkDisplayPowerInfoEXT-powerState-parameter
`powerState` **must** be a valid `VkDisplayPowerStateEXT` value

Possible values of `VkDisplayPowerInfoEXT::powerState`, specifying the new power state of a display, are:

```
// Provided by VK_EXT_display_control
typedef enum VkDisplayPowerStateEXT {
    VK_DISPLAY_POWER_STATE_OFF_EXT = 0,
    VK_DISPLAY_POWER_STATE_SUSPEND_EXT = 1,
    VK_DISPLAY_POWER_STATE_ON_EXT = 2,
} VkDisplayPowerStateEXT;
```

- `VK_DISPLAY_POWER_STATE_OFF_EXT` specifies that the display is powered down.
- `VK_DISPLAY_POWER_STATE_SUSPEND_EXT` specifies that the display is put into a low power mode, from which it **may** be able to transition back to `VK_DISPLAY_POWER_STATE_ON_EXT` more quickly than if it were in `VK_DISPLAY_POWER_STATE_OFF_EXT`. This state **may** be the same as `VK_DISPLAY_POWER_STATE_OFF_EXT`.
- `VK_DISPLAY_POWER_STATE_ON_EXT` specifies that the display is powered on.

31.3.3. Display Surfaces

A complete display configuration includes a mode, one or more display planes and any parameters describing their behavior, and parameters describing some aspects of the images associated with those planes. Display surfaces describe the configuration of a single plane within a complete display configuration. To create a `VkSurfaceKHR` object for a display plane, call:

```
// Provided by VK_KHR_display
VkResult vkCreateDisplayPlaneSurfaceKHR(
    VkInstance                                instance,
    const VkDisplaySurfaceCreateInfoKHR*      pCreateInfo,
    const VkAllocationCallbacks*             pAllocator,
    VkSurfaceKHR*                             pSurface);
```

- **instance** is the instance corresponding to the physical device the targeted display is on.
- **pCreateInfo** is a pointer to a [VkDisplaySurfaceCreateInfoKHR](#) structure specifying which mode, plane, and other parameters to use, as described below.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see [Memory Allocation](#)).
- **pSurface** is a pointer to a [VkSurfaceKHR](#) handle in which the created surface is returned.

Valid Usage (Implicit)

- VUID-vkCreateDisplayPlaneSurfaceKHR-instance-parameter
instance **must** be a valid [VkInstance](#) handle
- VUID-vkCreateDisplayPlaneSurfaceKHR-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkDisplaySurfaceCreateInfoKHR](#) structure
- VUID-vkCreateDisplayPlaneSurfaceKHR-pAllocator-null
pAllocator **must** be **NULL**
- VUID-vkCreateDisplayPlaneSurfaceKHR-pSurface-parameter
pSurface **must** be a valid pointer to a [VkSurfaceKHR](#) handle

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_UNKNOWN**
- **VK_ERROR_VALIDATION_FAILED**

The [VkDisplaySurfaceCreateInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplaySurfaceCreateInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkDisplaySurfaceCreateFlagsKHR flags;
    VkDisplayModeKHR    displayMode;
    uint32_t            planeIndex;
    uint32_t            planeStackIndex;
    VkSurfaceTransformFlagBitsKHR transform;
    float               globalAlpha;
    VkDisplayPlaneAlphaFlagBitsKHR alphaMode;
    VkExtent2D          imageExtent;
} VkDisplaySurfaceCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use, and **must** be zero.
- `displayMode` is a `VkDisplayModeKHR` handle specifying the mode to use when displaying this surface.
- `planeIndex` is the plane on which this surface appears.
- `planeStackIndex` is the z-order of the plane.
- `transform` is a `VkSurfaceTransformFlagBitsKHR` value specifying the transformation to apply to images as part of the scanout operation.
- `globalAlpha` is the global alpha value. This value is ignored if `alphaMode` is not `VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR`.
- `alphaMode` is a `VkDisplayPlaneAlphaFlagBitsKHR` value specifying the type of alpha blending to use.
- `imageExtent` is the size of the presentable images to use with the surface.

NOTE

Creating a display surface **must** not modify the state of the displays, planes, or other resources it names. For example, it **must** not apply the specified mode to be set on the associated display. Application of display configuration occurs as a side effect of presenting to a display surface.

Valid Usage

- VUID-VkDisplaySurfaceCreateInfoKHR-planeIndex-01252
`planeIndex` **must** be less than the number of display planes supported by the device as determined by calling `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`
- VUID-VkDisplaySurfaceCreateInfoKHR-planeReorderPossible-01253
If the `planeReorderPossible` member of the `VkDisplayPropertiesKHR` structure returned by `vkGetPhysicalDeviceDisplayPropertiesKHR` for the display corresponding to `displayMode` is `VK_TRUE` then `planeStackIndex` **must** be less than the number of display planes supported

by the device as determined by calling `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`; otherwise `planeStackIndex` **must** equal the `currentStackIndex` member of `VkDisplayPlanePropertiesKHR` returned by `vkGetPhysicalDeviceDisplayPlanePropertiesKHR` for the display plane corresponding to `displayMode`

- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01254
If `alphaMode` is `VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR` then `globalAlpha` **must** be between 0 and 1, inclusive
- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01255
`alphaMode` **must** be one of the bits present in the `supportedAlpha` member of `VkDisplayPlaneCapabilitiesKHR` for the display plane corresponding to `displayMode`
- VUID-VkDisplaySurfaceCreateInfoKHR-transform-06740
`transform` **must** be one of the bits present in the `supportedTransforms` member of `VkDisplayPropertiesKHR` for the display corresponding to `displayMode`
- VUID-VkDisplaySurfaceCreateInfoKHR-width-01256
The `width` and `height` members of `imageExtent` **must** be less than or equal to `VkPhysicalDeviceLimits::maxImageDimension2D`

Valid Usage (Implicit)

- VUID-VkDisplaySurfaceCreateInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_SURFACE_CREATE_INFO_KHR`
- VUID-VkDisplaySurfaceCreateInfoKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkDisplaySurfaceCreateInfoKHR-flags-zeroBitmask
`flags` **must** be 0
- VUID-VkDisplaySurfaceCreateInfoKHR-displayMode-parameter
`displayMode` **must** be a valid `VkDisplayModeKHR` handle
- VUID-VkDisplaySurfaceCreateInfoKHR-transform-parameter
`transform` **must** be a valid `VkSurfaceTransformFlagBitsKHR` value
- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-parameter
`alphaMode` **must** be a valid `VkDisplayPlaneAlphaFlagBitsKHR` value

```
// Provided by VK_KHR_display
typedef VkFlags VkDisplaySurfaceCreateFlagsKHR;
```

`VkDisplaySurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

Bits which **can** be set in `VkDisplaySurfaceCreateInfoKHR::alphaMode`, specifying the type of alpha blending to use on a display, are:

```
// Provided by VK_KHR_display
typedef enum VkDisplayPlaneAlphaFlagBitsKHR {
    VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR = 0x00000001,
    VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR = 0x00000002,
    VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR = 0x00000004,
    VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_PREMULTIPLIED_BIT_KHR = 0x00000008,
} VkDisplayPlaneAlphaFlagBitsKHR;
```

- **VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR** specifies that the source image will be treated as opaque.
- **VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR** specifies that a global alpha value **must** be specified that will be applied to all pixels in the source image.
- **VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR** specifies that the alpha value will be determined by the alpha component of the source image's pixels. If the source format contains no alpha values, no blending will be applied. The source alpha values are not premultiplied into the source image's other color components.
- **VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_PREMULTIPLIED_BIT_KHR** is equivalent to **VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR**, except the source alpha values are assumed to be premultiplied into the source image's other color components.

```
// Provided by VK_KHR_display
typedef VkFlags VkDisplayPlaneAlphaFlagsKHR;
```

VkDisplayPlaneAlphaFlagsKHR is a bitmask type for setting a mask of zero or more **VkDisplayPlaneAlphaFlagBitsKHR**.

31.3.4. Presenting to Headless Surfaces

Vulkan rendering can be presented to a headless surface, where the presentation operation is a no-op producing no externally-visible result.

NOTE

Because there is no real presentation target, the headless presentation engine may be extended to impose an arbitrary or customizable set of restrictions and features. This makes it a useful portable test target for applications targeting a wide range of presentation engines where the actual target presentation engines might be scarce, unavailable or otherwise undesirable or inconvenient to use for general Vulkan application development.

The usual surface query mechanisms must be used to determine the actual restrictions and features of the implementation.

To create a headless **VkSurfaceKHR** object, call:

```
// Provided by VK_EXT_headless_surface
VkResult vkCreateHeadlessSurfaceEXT(
    VkInstance                                instance,
    const VkHeadlessSurfaceCreateInfoEXT*    pCreateInfo,
    const VkAllocationCallbacks*            pAllocator,
    VkSurfaceKHR*                            pSurface);
```

- **instance** is the instance to associate the surface with.
- **pCreateInfo** is a pointer to a [VkHeadlessSurfaceCreateInfoEXT](#) structure containing parameters affecting the creation of the surface object.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see [Memory Allocation](#)).
- **pSurface** is a pointer to a [VkSurfaceKHR](#) handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateHeadlessSurfaceEXT-instance-parameter **instance** **must** be a valid [VkInstance](#) handle
- VUID-vkCreateHeadlessSurfaceEXT-pCreateInfo-parameter **pCreateInfo** **must** be a valid pointer to a valid [VkHeadlessSurfaceCreateInfoEXT](#) structure
- VUID-vkCreateHeadlessSurfaceEXT-pAllocator-null **pAllocator** **must** be **NULL**
- VUID-vkCreateHeadlessSurfaceEXT-pSurface-parameter **pSurface** **must** be a valid pointer to a [VkSurfaceKHR](#) handle

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_UNKNOWN**
- **VK_ERROR_VALIDATION_FAILED**

The [VkHeadlessSurfaceCreateInfoEXT](#) structure is defined as:

```
// Provided by VK_EXT_headless_surface
typedef struct VkHeadlessSurfaceCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkHeadlessSurfaceCreateFlagsEXT flags;
} VkHeadlessSurfaceCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.

Valid Usage (Implicit)

- VUID-VkHeadlessSurfaceCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_HEADLESS_SURFACE_CREATE_INFO_EXT`
- VUID-VkHeadlessSurfaceCreateInfoEXT-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkHeadlessSurfaceCreateInfoEXT-flags-zero bitmask
`flags` **must** be 0

For headless surfaces, `currentExtent` is the reserved value (0xFFFFFFFF, 0xFFFFFFFF). Whatever the application sets a swapchain's `imageExtent` to will be the size of the surface, after the first image is presented.

```
// Provided by VK_EXT_headless_surface
typedef VkFlags VkHeadlessSurfaceCreateFlagsEXT;
```

`VkHeadlessSurfaceCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

31.4. Querying for WSI Support

Not all physical devices will include WSI support. Within a physical device, not all queue families will support presentation. WSI support and compatibility **can** be determined in a platform-neutral manner (which determines support for presentation to a particular surface object) and additionally **may** be determined in platform-specific manners (which determine support for presentation on the specified physical device but do not guarantee support for presentation to a particular surface object).

To determine whether a queue family of a physical device supports presentation to a given surface, call:

```
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceSupportKHR(
    VkPhysicalDevice          physicalDevice,
    uint32_t                  queueFamilyIndex,
    VkSurfaceKHR              surface,
    VkBool32*                 pSupported);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family.
- `surface` is the surface.
- `pSupported` is a pointer to a `VkBool32`. `VK_TRUE` indicates support, and `VK_FALSE` indicates no support.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetPhysicalDeviceSurfaceSupportKHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-queueFamilyIndex-01269 `queueFamilyIndex` **must** be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-surface-parameter `surface` **must** be a valid `VkSurfaceKHR` handle
- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-pSupported-parameter `pSupported` **must** be a valid pointer to a `VkBool32` value
- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-commonparent Both of `physicalDevice`, and `surface` **must** have been created, allocated, or retrieved from the same `VkInstance`

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

31.5. Surface Queries

The capabilities of a swapchain targeting a surface are the intersection of the capabilities of the WSI platform, the native window or display, and the physical device. The resulting capabilities **can** be obtained with the queries listed below in this section.

NOTE

In addition to the surface capabilities as obtained by surface queries below, swapchain images are also subject to ordinary image creation limits as reported by [vkGetPhysicalDeviceImageFormatProperties](#). As an application is instructed by the appropriate Valid Usage sections, both the surface capabilities and the image creation limits have to be satisfied whenever swapchain images are created.

31.5.1. Surface Capabilities

To query the basic capabilities of a surface, needed in order to create a swapchain, call:

```
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceCapabilitiesKHR(
    VkPhysicalDevice      physicalDevice,
    VkSurfaceKHR          surface,
    VkSurfaceCapabilitiesKHR* pSurfaceCapabilities);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for [vkCreateSwapchainKHR](#).
- `surface` is the surface that will be associated with the swapchain.
- `pSurfaceCapabilities` is a pointer to a [VkSurfaceCapabilitiesKHR](#) structure in which the capabilities are returned.

If [VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations](#) is `VK_TRUE`, `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-06211
`surface` **must** be supported by `physicalDevice`, as reported by [vkGetPhysicalDeviceSurfaceSupportKHR](#) or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-physicalDevice-parameter **physicalDevice** **must** be a valid [VkPhysicalDevice](#) handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-parameter **surface** **must** be a valid [VkSurfaceKHR](#) handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-pSurfaceCapabilities-parameter **pSurfaceCapabilities** **must** be a valid pointer to a [VkSurfaceCapabilitiesKHR](#) structure
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-commonparent
Both of **physicalDevice**, and **surface** **must** have been created, allocated, or retrieved from the same [VkInstance](#)

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_SURFACE_LOST_KHR](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkSurfaceCapabilitiesKHR](#) structure is defined as:

```
// Provided by VK_KHR_surface
typedef struct VkSurfaceCapabilitiesKHR {
    uint32_t          minImageCount;
    uint32_t          maxImageCount;
    VkExtent2D        currentExtent;
    VkExtent2D        minImageExtent;
    VkExtent2D        maxImageExtent;
    uint32_t          maxImageArrayLayers;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkSurfaceTransformFlagBitsKHR currentTransform;
    VkCompositeAlphaFlagsKHR supportedCompositeAlpha;
    VkImageUsageFlags supportedUsageFlags;
} VkSurfaceCapabilitiesKHR;
```

- **minImageCount** is the minimum number of images the specified device supports for a swapchain created for the surface, and will be at least one.
- **maxImageCount** is the maximum number of images the specified device supports for a swapchain

created for the surface, and will be either 0, or greater than or equal to `minImageCount`. A value of 0 means that there is no limit on the number of images, though there **may** be limits related to the total amount of memory used by presentable images.

- `currentExtent` is the current width and height of the surface, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface.
- `minImageExtent` contains the smallest valid swapchain extent for the surface on the specified device. The `width` and `height` of the extent will each be less than or equal to the corresponding `width` and `height` of `currentExtent`, unless `currentExtent` has the special value described above.
- `maxImageExtent` contains the largest valid swapchain extent for the surface on the specified device. The `width` and `height` of the extent will each be greater than or equal to the corresponding `width` and `height` of `minImageExtent`. The `width` and `height` of the extent will each be greater than or equal to the corresponding `width` and `height` of `currentExtent`, unless `currentExtent` has the special value described above.
- `maxImageArrayLayers` is the maximum number of layers presentable images **can** have for a swapchain created for this device and surface, and will be at least one.
- `supportedTransforms` is a bitmask of `VkSurfaceTransformFlagBitsKHR` indicating the presentation transforms supported for the surface on the specified device. At least one bit will be set.
- `currentTransform` is `VkSurfaceTransformFlagBitsKHR` value indicating the surface's current transform relative to the presentation engine's natural orientation.
- `supportedCompositeAlpha` is a bitmask of `VkCompositeAlphaFlagBitsKHR`, representing the alpha compositing modes supported by the presentation engine for the surface on the specified device, and at least one bit will be set. Opaque composition **can** be achieved in any alpha compositing mode by either using an image format that has no alpha component, or by ensuring that all pixels in the presentable images have an alpha value of 1.0.
- `supportedUsageFlags` is a bitmask of `VkImageUsageFlagBits` representing the ways the application **can** use the presentable images of a swapchain created with `VkPresentModeKHR` set to `VK_PRESENT_MODE_IMMEDIATE_KHR`, `VK_PRESENT_MODE_MAILBOX_KHR`, `VK_PRESENT_MODE_FIFO_KHR` or `VK_PRESENT_MODE_FIFO_RELAXED_KHR` for the surface on the specified device. `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` **must** be included in the set. Implementations **may** support additional usages.

NOTE	Supported usage flags of a presentable image when using <code>VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR</code> or <code>VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR</code> presentation mode are provided by <code>VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags</code> .

NOTE	Formulas such as <code>min(N, maxImageCount)</code> are not correct, since <code>maxImageCount</code> may be zero.

To query the basic capabilities of a surface defined by the core or extensions, call:

```
// Provided by VK_KHR_get_surface_capabilities2
VkResult vkGetPhysicalDeviceSurfaceCapabilities2KHR(
    VkPhysicalDevice          physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    VkSurfaceCapabilities2KHR* pSurfaceCapabilities);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- `pSurfaceInfo` is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.
- `pSurfaceCapabilities` is a pointer to a `VkSurfaceCapabilities2KHR` structure in which the capabilities are returned.

`vkGetPhysicalDeviceSurfaceCapabilities2KHR` behaves similarly to `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetPhysicalDeviceSurfaceCapabilities2KHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-06521
`pSurfaceInfo->surface` **must** be a valid `VkSurfaceKHR` handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-06522
`pSurfaceInfo->surface` **must** be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-parameter
`pSurfaceInfo` **must** be a valid pointer to a valid `VkPhysicalDeviceSurfaceInfo2KHR` structure
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceCapabilities-parameter
`pSurfaceCapabilities` **must** be a valid pointer to a `VkSurfaceCapabilities2KHR` structure

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkPhysicalDeviceSurfaceInfo2KHR` structure is defined as:

```
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkPhysicalDeviceSurfaceInfo2KHR {
    VkStructureType    sType;
    const void*        pNext;
    VkSurfaceKHR       surface;
} VkPhysicalDeviceSurfaceInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `surface` is the surface that will be associated with the swapchain.

The members of `VkPhysicalDeviceSurfaceInfo2KHR` correspond to the arguments to `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, with `sType` and `pNext` added for extensibility.

Valid Usage

- VUID-VkPhysicalDeviceSurfaceInfo2KHR-surface-07919
If `surface` is not `VK_NULL_HANDLE`, `surface` **must** be a valid `VkSurfaceKHR` handle

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSurfaceInfo2KHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SURFACE_INFO_2_KHR`
- VUID-VkPhysicalDeviceSurfaceInfo2KHR-pNext-pNext
`pNext` **must** be `NULL`

The `VkSurfaceCapabilities2KHR` structure is defined as:

```
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkSurfaceCapabilities2KHR {
    VkStructureType    sType;
    void*              pNext;
    VkSurfaceCapabilitiesKHR surfaceCapabilities;
} VkSurfaceCapabilities2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `surfaceCapabilities` is a `VkSurfaceCapabilitiesKHR` structure describing the capabilities of the specified surface.

Valid Usage (Implicit)

- VUID-VkSurfaceCapabilities2KHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_KHR`
- VUID-VkSurfaceCapabilities2KHR-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkSharedPresentSurfaceCapabilitiesKHR`
- VUID-VkSurfaceCapabilities2KHR-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique

The `VkSharedPresentSurfaceCapabilitiesKHR` structure is defined as:

```
// Provided by VK_KHR_shared_presentable_image
typedef struct VkSharedPresentSurfaceCapabilitiesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkImageUsageFlags  sharedPresentSupportedUsageFlags;
} VkSharedPresentSurfaceCapabilitiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `sharedPresentSupportedUsageFlags` is a bitmask of `VkImageUsageFlagBits` representing the ways the application **can** use the shared presentable image from a swapchain created with `VkPresentModeKHR` set to `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR` for the surface on the specified device. `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` **must** be included in the set but implementations **may** support additional usages.

Valid Usage (Implicit)

- VUID-VkSharedPresentSurfaceCapabilitiesKHR-sType-sType

sType **must** be `VK_STRUCTURE_TYPE_SHARED_PRESENT_SURFACE_CAPABILITIES_KHR`

To query the basic capabilities of a surface, needed in order to create a swapchain, call:

```
// Provided by VK_EXT_display_surface_counter
VkResult vkGetPhysicalDeviceSurfaceCapabilities2EXT(
    VkPhysicalDevice    physicalDevice,
    VkSurfaceKHR        surface,
    VkSurfaceCapabilities2EXT* pSurfaceCapabilities);
```

- **physicalDevice** is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- **surface** is the surface that will be associated with the swapchain.
- **pSurfaceCapabilities** is a pointer to a `VkSurfaceCapabilities2EXT` structure in which the capabilities are returned.

`vkGetPhysicalDeviceSurfaceCapabilities2EXT` behaves similarly to `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, with the ability to return extended information by adding extending structures to the **pNext** chain of its **pSurfaceCapabilities** parameter.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetPhysicalDeviceSurfaceCapabilities2EXT` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-surface-06211
surface **must** be supported by **physicalDevice**, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-physicalDevice-parameter
physicalDevice **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-surface-parameter
surface **must** be a valid `VkSurfaceKHR` handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-pSurfaceCapabilities-parameter
pSurfaceCapabilities **must** be a valid pointer to a `VkSurfaceCapabilities2EXT` structure
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-commonparent
Both of **physicalDevice**, and **surface** **must** have been created, allocated, or retrieved from the same `VkInstance`

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkSurfaceCapabilities2EXT` structure is defined as:

```
// Provided by VK_EXT_display_surface_counter
typedef struct VkSurfaceCapabilities2EXT {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           minImageCount;
    uint32_t           maxImageCount;
    VkExtent2D         currentExtent;
    VkExtent2D         minImageExtent;
    VkExtent2D         maxImageExtent;
    uint32_t           maxImageArrayLayers;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkSurfaceTransformFlagBitsKHR currentTransform;
    VkCompositeAlphaFlagsKHR supportedCompositeAlpha;
    VkImageUsageFlags  supportedUsageFlags;
    VkSurfaceCounterFlagsEXT supportedSurfaceCounters;
} VkSurfaceCapabilities2EXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `minImageCount` is the minimum number of images the specified device supports for a swapchain created for the surface, and will be at least one.
- `maxImageCount` is the maximum number of images the specified device supports for a swapchain created for the surface, and will be either 0, or greater than or equal to `minImageCount`. A value of 0 means that there is no limit on the number of images, though there **may** be limits related to the total amount of memory used by presentable images.
- `currentExtent` is the current width and height of the surface, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface.
- `minImageExtent` contains the smallest valid swapchain extent for the surface on the specified

device. The **width** and **height** of the extent will each be less than or equal to the corresponding **width** and **height** of **currentExtent**, unless **currentExtent** has the special value described above.

- **maxImageExtent** contains the largest valid swapchain extent for the surface on the specified device. The **width** and **height** of the extent will each be greater than or equal to the corresponding **width** and **height** of **minImageExtent**. The **width** and **height** of the extent will each be greater than or equal to the corresponding **width** and **height** of **currentExtent**, unless **currentExtent** has the special value described above.
- **maxImageArrayLayers** is the maximum number of layers presentable images **can** have for a swapchain created for this device and surface, and will be at least one.
- **supportedTransforms** is a bitmask of **VkSurfaceTransformFlagBitsKHR** indicating the presentation transforms supported for the surface on the specified device. At least one bit will be set.
- **currentTransform** is **VkSurfaceTransformFlagBitsKHR** value indicating the surface's current transform relative to the presentation engine's natural orientation.
- **supportedCompositeAlpha** is a bitmask of **VkCompositeAlphaFlagBitsKHR**, representing the alpha compositing modes supported by the presentation engine for the surface on the specified device, and at least one bit will be set. Opaque composition **can** be achieved in any alpha compositing mode by either using an image format that has no alpha component, or by ensuring that all pixels in the presentable images have an alpha value of 1.0.
- **supportedUsageFlags** is a bitmask of **VkImageUsageFlagBits** representing the ways the application **can** use the presentable images of a swapchain created with **VkPresentModeKHR** set to **VK_PRESENT_MODE_IMMEDIATE_KHR**, **VK_PRESENT_MODE_MAILBOX_KHR**, **VK_PRESENT_MODE_FIFO_KHR** or **VK_PRESENT_MODE_FIFO_RELAXED_KHR** for the surface on the specified device. **VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT** **must** be included in the set. Implementations **may** support additional usages.
- **supportedSurfaceCounters** is a bitmask of **VkSurfaceCounterFlagBitsEXT** indicating the supported surface counter types.

Valid Usage

- VUID-VkSurfaceCapabilities2EXT-supportedSurfaceCounters-01246
supportedSurfaceCounters **must** not include **VK_SURFACE_COUNTER_VBLANK_BIT_EXT** unless the surface queried is a **display surface**

Valid Usage (Implicit)

- VUID-VkSurfaceCapabilities2EXT-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_EXT**
- VUID-VkSurfaceCapabilities2EXT-pNext-pNext
pNext **must** be **NULL**

Bits which **can** be set in **VkSurfaceCapabilities2EXT::supportedSurfaceCounters**, indicating supported surface counter types, are:

```
// Provided by VK_EXT_display_surface_counter
typedef enum VkSurfaceCounterFlagBitsEXT {
    VK_SURFACE_COUNTER_VBLANK_BIT_EXT = 0x00000001,
    // VK_SURFACE_COUNTER_VBLANK_EXT is a legacy alias
    VK_SURFACE_COUNTER_VBLANK_EXT = VK_SURFACE_COUNTER_VBLANK_BIT_EXT,
} VkSurfaceCounterFlagBitsEXT;
```

- **VK_SURFACE_COUNTER_VBLANK_BIT_EXT** specifies a counter incrementing once every time a vertical blanking period occurs on the display associated with the surface.

```
// Provided by VK_EXT_display_surface_counter
typedef VkFlags VkSurfaceCounterFlagsEXT;
```

VkSurfaceCounterFlagsEXT is a bitmask type for setting a mask of zero or more **VkSurfaceCounterFlagBitsEXT**.

Bits which **may** be set in **VkSurfaceCapabilitiesKHR::supportedTransforms** indicating the presentation transforms supported for the surface on the specified device, and possible values of **VkSurfaceCapabilitiesKHR::currentTransform** indicating the surface's current transform relative to the presentation engine's natural orientation, are:

```
// Provided by VK_KHR_surface
typedef enum VkSurfaceTransformFlagBitsKHR {
    VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR = 0x00000001,
    VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR = 0x00000002,
    VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR = 0x00000004,
    VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR = 0x00000008,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR = 0x00000010,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR = 0x00000020,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR = 0x00000040,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR = 0x00000080,
    VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR = 0x00000100,
} VkSurfaceTransformFlagBitsKHR;
```

- **VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR** specifies that image content is presented without being transformed.
- **VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR** specifies that image content is rotated 90 degrees clockwise.
- **VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR** specifies that image content is rotated 180 degrees clockwise.
- **VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR** specifies that image content is rotated 270 degrees clockwise.
- **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR** specifies that image content is mirrored horizontally.

- `VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR` specifies that image content is mirrored horizontally, then rotated 90 degrees clockwise.
- `VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR` specifies that image content is mirrored horizontally, then rotated 180 degrees clockwise.
- `VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR` specifies that image content is mirrored horizontally, then rotated 270 degrees clockwise.
- `VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR` specifies that the presentation transform is not specified, and is instead determined by platform-specific considerations and mechanisms outside Vulkan.

```
// Provided by VK_KHR_display
typedef VkFlags VkSurfaceTransformFlagsKHR;
```

`VkSurfaceTransformFlagsKHR` is a bitmask type for setting a mask of zero or more `VkSurfaceTransformFlagBitsKHR`.

The `supportedCompositeAlpha` member is of type `VkCompositeAlphaFlagBitsKHR`, containing the following values:

```
// Provided by VK_KHR_surface
typedef enum VkCompositeAlphaFlagBitsKHR {
    VK_COMPOSITE_ALPHA_OPAQUE_BIT_KHR = 0x00000001,
    VK_COMPOSITE_ALPHA_PRE_MULTIPLIED_BIT_KHR = 0x00000002,
    VK_COMPOSITE_ALPHA_POST_MULTIPLIED_BIT_KHR = 0x00000004,
    VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR = 0x00000008,
} VkCompositeAlphaFlagBitsKHR;
```

These values are described as follows:

- `VK_COMPOSITE_ALPHA_OPAQUE_BIT_KHR`: The alpha component, if it exists, of the images is ignored in the compositing process. Instead, the image is treated as if it has a constant alpha of 1.0.
- `VK_COMPOSITE_ALPHA_PRE_MULTIPLIED_BIT_KHR`: The alpha component, if it exists, of the images is respected in the compositing process. The non-alpha components of the image are expected to already be multiplied by the alpha component by the application.
- `VK_COMPOSITE_ALPHA_POST_MULTIPLIED_BIT_KHR`: The alpha component, if it exists, of the images is respected in the compositing process. The non-alpha components of the image are not expected to already be multiplied by the alpha component by the application; instead, the compositor will multiply the non-alpha components of the image by the alpha component during compositing.
- `VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR`: The way in which the presentation engine treats the alpha component in the images is unknown to the Vulkan API. Instead, the application is responsible for setting the composite alpha blending mode using native window system commands. If the application does not set the blending mode using native window system commands, then a platform-specific default will be used.

```
// Provided by VK_KHR_surface
typedef VkFlags VkCompositeAlphaFlagsKHR;
```

`VkCompositeAlphaFlagsKHR` is a bitmask type for setting a mask of zero or more `VkCompositeAlphaFlagBitsKHR`.

31.5.2. Surface Format Support

To query the supported swapchain format-color space pairs for a surface, call:

```
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceFormatsKHR(
    VkPhysicalDevice          physicalDevice,
    VkSurfaceKHR              surface,
    uint32_t*                 pSurfaceFormatCount,
    VkSurfaceFormatKHR*       pSurfaceFormats);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- `surface` is the surface that will be associated with the swapchain.
- `pSurfaceFormatCount` is a pointer to an integer related to the number of format pairs available or queried, as described below.
- `pSurfaceFormats` is either `NULL` or a pointer to an array of `VkSurfaceFormatKHR` structures.

If `pSurfaceFormats` is `NULL`, then the number of format pairs supported for the given `surface` is returned in `pSurfaceFormatCount`. Otherwise, `pSurfaceFormatCount` **must** point to a variable set by the application to the number of elements in the `pSurfaceFormats` array, and on return the variable is overwritten with the number of structures actually written to `pSurfaceFormats`. If the value of `pSurfaceFormatCount` is less than the number of format pairs supported, at most `pSurfaceFormatCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available format pairs were returned.

The number of format pairs supported **must** be greater than or equal to 1. `pSurfaceFormats` **must** not contain an entry whose value for `format` is `VK_FORMAT_UNDEFINED`.

If `pSurfaceFormats` includes an entry whose value for `colorSpace` is `VK_COLOR_SPACE_SRGB_NONLINEAR_KHR` and whose value for `format` is a UNORM (or SRGB) format and the corresponding SRGB (or UNORM) format is a color renderable format for `VK_IMAGE_TILING_OPTIMAL`, then `pSurfaceFormats` **must** also contain an entry with the same value for `colorSpace` and `format` equal to the corresponding SRGB (or UNORM) format.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetPhysicalDeviceSurfaceFormatsKHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-06524
surface **must** be a valid [VkSurfaceKHR](#) handle
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-06525
surface **must** be supported by **physicalDevice**, as reported by [vkGetPhysicalDeviceSurfaceSupportKHR](#) or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-physicalDevice-parameter
physicalDevice **must** be a valid [VkPhysicalDevice](#) handle
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-parameter
If **surface** is not [VK_NULL_HANDLE](#), **surface** **must** be a valid [VkSurfaceKHR](#) handle
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-pSurfaceFormatCount-parameter
pSurfaceFormatCount **must** be a valid pointer to a [uint32_t](#) value
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-pSurfaceFormats-parameter
If the value referenced by **pSurfaceFormatCount** is not 0, and **pSurfaceFormats** is not [NULL](#), **pSurfaceFormats** **must** be a valid pointer to an array of **pSurfaceFormatCount** [VkSurfaceFormatKHR](#) structures
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-commonparent
Both of **physicalDevice**, and **surface** that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same [VkInstance](#)

Return Codes

Success

- [VK_INCOMPLETE](#)
- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_SURFACE_LOST_KHR](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkSurfaceFormatKHR](#) structure is defined as:

```
// Provided by VK_KHR_surface
typedef struct VkSurfaceFormatKHR {
    VkFormat          format;
    VkColorSpaceKHR   colorSpace;
} VkSurfaceFormatKHR;
```

- **format** is a [VkFormat](#) that is compatible with the specified surface.
- **colorSpace** is a presentation [VkColorSpaceKHR](#) that is compatible with the surface.

To query the supported swapchain format tuples for a surface, call:

```
// Provided by VK_KHR_get_surface_capabilities2
VkResult vkGetPhysicalDeviceSurfaceFormats2KHR(
    VkPhysicalDevice          physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    uint32_t*                 pSurfaceFormatCount,
    VkSurfaceFormat2KHR*      pSurfaceFormats);
```

- **physicalDevice** is the physical device that will be associated with the swapchain to be created, as described for [vkCreateSwapchainKHR](#).
- **pSurfaceInfo** is a pointer to a [VkPhysicalDeviceSurfaceInfo2KHR](#) structure describing the surface and other fixed parameters that would be consumed by [vkCreateSwapchainKHR](#).
- **pSurfaceFormatCount** is a pointer to an integer related to the number of format tuples available or queried, as described below.
- **pSurfaceFormats** is either **NULL** or a pointer to an array of [VkSurfaceFormat2KHR](#) structures.

[vkGetPhysicalDeviceSurfaceFormats2KHR](#) behaves similarly to [vkGetPhysicalDeviceSurfaceFormatsKHR](#), with the ability to be extended via **pNext** chains.

If **pSurfaceFormats** is **NULL**, then the number of format tuples supported for the given **surface** is returned in **pSurfaceFormatCount**. Otherwise, **pSurfaceFormatCount** **must** point to a variable set by the application to the number of elements in the **pSurfaceFormats** array, and on return the variable is overwritten with the number of structures actually written to **pSurfaceFormats**. If the value of **pSurfaceFormatCount** is less than the number of format tuples supported, at most **pSurfaceFormatCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available values were returned.

If [VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations](#) is **VK_TRUE**, [vkGetPhysicalDeviceSurfaceFormats2KHR](#) **must** not return **VK_ERROR_OUT_OF_HOST_MEMORY**.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-06521
pSurfaceInfo->surface **must** be a valid [VkSurfaceKHR](#) handle
- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-06522

`pSurfaceInfo->surface` **must** be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-parameter `pSurfaceInfo` **must** be a valid pointer to a valid `VkPhysicalDeviceSurfaceInfo2KHR` structure
- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceFormatCount-parameter `pSurfaceFormatCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceFormats-parameter
If the value referenced by `pSurfaceFormatCount` is not 0, and `pSurfaceFormats` is not `NULL`, `pSurfaceFormats` **must** be a valid pointer to an array of `pSurfaceFormatCount` `VkSurfaceFormat2KHR` structures

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkSurfaceFormat2KHR` structure is defined as:

```
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkSurfaceFormat2KHR {
    VkStructureType    sType;
    void*              pNext;
    VkSurfaceFormatKHR surfaceFormat;
} VkSurfaceFormat2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `surfaceFormat` is a `VkSurfaceFormatKHR` structure describing a format-color space pair that is compatible with the specified surface.

Valid Usage (Implicit)

- VUID-VkSurfaceFormat2KHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SURFACE_FORMAT_2_KHR`
- VUID-VkSurfaceFormat2KHR-pNext-pNext
`pNext` **must** be `NULL`

While the `format` of a presentable image refers to the encoding of each pixel, the `colorSpace` determines how the presentation engine interprets the pixel values. A color space in this document refers to a specific color space (defined by the chromaticities of its primaries and a white point in CIE Lab), and transfer functions indicating the mapping between the image data and the colorimetry with respect to the given color space.

Possible values of `VkSurfaceFormatKHR::colorSpace`, specifying the color spaces that a presentation engine can accept, are:

```

// Provided by VK_KHR_surface
typedef enum VkColorSpaceKHR {
    VK_COLOR_SPACE_SRGB_NONLINEAR_KHR = 0,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT = 1000104001,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT = 1000104002,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT = 1000104003,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DCI_P3_NONLINEAR_EXT = 1000104004,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_BT709_LINEAR_EXT = 1000104005,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_BT709_NONLINEAR_EXT = 1000104006,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_BT2020_LINEAR_EXT = 1000104007,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_HDR10_ST2084_EXT = 1000104008,
    // Provided by VK_EXT_swapchain_colorspace
    // VK_COLOR_SPACE_DOLBYVISION_EXT is legacy, but no reason was given in the API XML
    VK_COLOR_SPACE_DOLBYVISION_EXT = 1000104009,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_HDR10_HLG_EXT = 1000104010,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT = 1000104011,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_ADOBERGB_NONLINEAR_EXT = 1000104012,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_PASS_THROUGH_EXT = 1000104013,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_EXTENDED_SRGB_NONLINEAR_EXT = 1000104014,
} VkColorSpaceKHR;

```

- **VK_COLOR_SPACE_SRGB_NONLINEAR_KHR** specifies support for the images in sRGB color space, encoded according to the sRGB specification.
- **VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT** specifies support for the images in Display-P3 color space, encoded using a Display-P3 transfer function.
- **VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT** specifies support for the images in extended sRGB color space, encoded using a linear transfer function.
- **VK_COLOR_SPACE_EXTENDED_SRGB_NONLINEAR_EXT** specifies support for the images in extended sRGB color space, encoded according to the scRGB specification.
- **VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT** specifies support for the images in Display-P3 color space, encoded using a linear transfer function.
- **VK_COLOR_SPACE_DCI_P3_NONLINEAR_EXT** specifies support for the images in DCI-P3 color space, encoded according to the DCI-P3 specification. Note that values in such an image are interpreted as XYZ encoded color data by the presentation engine.

- `VK_COLOR_SPACE_BT709_LINEAR_EXT` specifies support for the images in BT709 color space, encoded using a linear transfer function.
- `VK_COLOR_SPACE_BT709_NONLINEAR_EXT` specifies support for the images in BT709 color space, encoded according to the BT709 specification.
- `VK_COLOR_SPACE_BT2020_LINEAR_EXT` specifies support for the images in BT2020 color space, encoded using a linear transfer function.
- `VK_COLOR_SPACE_HDR10_ST2084_EXT` specifies support for the images in HDR10 (BT2020) color space, encoded according to SMPTE ST2084 Perceptual Quantizer (PQ) specification.
- `VK_COLOR_SPACE_HDR10_HLG_EXT` specifies support for the images in HDR10 (BT2020) color space, encoded according to the Hybrid Log Gamma (HLG) specification.
- `VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT` specifies support for images in Adobe RGB color space, encoded using a linear transfer function.
- `VK_COLOR_SPACE_ADOBERGB_NONLINEAR_EXT` specifies support for the images in Adobe RGB color space, encoded according to the Adobe RGB specification (approximately Gamma 2.2).
- `VK_COLOR_SPACE_PASS_THROUGH_EXT` specifies that color components are used “as is”. This is intended to allow applications to supply data for color spaces not described here.

NOTE

In older versions of the `VK_EXT_swapchain_colorspace` extension, `VK_COLOR_SPACE_DOLBYVISION_EXT` was exposed. The intent was to indicate the presentation engine shall decode an image using the SMPTE ST 2084 Perceptual Quantizer (PQ) EOTF, and then apply a proprietary OOTF to process the image. However, Dolby Vision profile 8.4 describes an encoding using the Hybrid Log Gamma (HLG) OETF, and there is no swapchain extension for signaling Dolby Vision metadata to be used by a proprietary OOTF. This enum is legacy but is maintained for backwards compatibility.

NOTE

For a traditional “Linear” or non-gamma transfer function color space use `VK_COLOR_SPACE_PASS_THROUGH_EXT`.

The presentation engine interprets the pixel values of the R, G, and B components as having been encoded using an appropriate transfer function. Applications **should** ensure that the appropriate transfer function has been applied. `Texel encode` requires that all implementations implicitly apply the sRGB EOTF¹ on R, G, and B components when shaders write to an sRGB pixel format image, which is useful for sRGB color spaces. For sRGB color spaces with other pixel formats, or other non-linear color spaces, applications **can** apply the transfer function explicitly in a shader. The A channel is always interpreted as linearly encoded.

This extension defines enums for `VkColorSpaceKHR` that correspond to the following color spaces:

Table 40. Color Spaces and Attributes

Name	Red Primary	Green Primary	Blue Primary	White-point	Transfer function
DCI-P3	1.000, 0.000	0.000, 1.000	0.000, 0.000	0.3333, 0.3333	DCI P3

Name	Red Primary	Green Primary	Blue Primary	White-point	Transfer function
Display-P3	0.680, 0.320	0.265, 0.690	0.150, 0.060	0.3127, 0.3290 (D65)	Display-P3
BT709	0.640, 0.330	0.300, 0.600	0.150, 0.060	0.3127, 0.3290 (D65)	BT709
sRGB	0.640, 0.330	0.300, 0.600	0.150, 0.060	0.3127, 0.3290 (D65)	sRGB
extended sRGB	0.640, 0.330	0.300, 0.600	0.150, 0.060	0.3127, 0.3290 (D65)	scRGB
HDR10_ST2084	0.708, 0.292	0.170, 0.797	0.131, 0.046	0.3127, 0.3290 (D65)	ST2084 PQ
HDR10_HLG	0.708, 0.292	0.170, 0.797	0.131, 0.046	0.3127, 0.3290 (D65)	HLG
Adobe RGB	0.640, 0.330	0.210, 0.710	0.150, 0.060	0.3127, 0.3290 (D65)	Adobe RGB

The transfer functions are described in the “Transfer Functions” chapter of the [Khronos Data Format Specification](#).

Except Display-P3 OETF, which is:

$$E = \begin{cases} 1.055 \times L^{\frac{1}{2.4}} - 0.055 & \text{for } 0.0030186 \leq L \leq 1 \\ 12.92 \times L & \text{for } 0 \leq L < 0.0030186 \end{cases}$$

where L is the linear value of a color component and E is the encoded value (as stored in the image in memory).

NOTE For most uses, the sRGB OETF is equivalent.

31.5.3. Surface Presentation Mode Support

To query the supported presentation modes for a surface, call:

```
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfacePresentModesKHR(
    VkPhysicalDevice    physicalDevice,
    VkSurfaceKHR        surface,
    uint32_t*           pPresentModeCount,
    VkPresentModeKHR*   pPresentModes);
```

- **physicalDevice** is the physical device that will be associated with the swapchain to be created, as described for [vkCreateSwapchainKHR](#).

- **surface** is the surface that will be associated with the swapchain.
- **pPresentModeCount** is a pointer to an integer related to the number of presentation modes available or queried, as described below.
- **pPresentModes** is either **NULL** or a pointer to an array of **VkPresentModeKHR** values, indicating the supported presentation modes.

If **pPresentModes** is **NULL**, then the number of presentation modes supported for the given **surface** is returned in **pPresentModeCount**. Otherwise, **pPresentModeCount** **must** point to a variable set by the application to the number of elements in the **pPresentModes** array, and on return the variable is overwritten with the number of values actually written to **pPresentModes**. If the value of **pPresentModeCount** is less than the number of presentation modes supported, at most **pPresentModeCount** values will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available modes were returned.

If **VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations** is **VK_TRUE**, **vkGetPhysicalDeviceSurfacePresentModesKHR** **must** not return **VK_ERROR_OUT_OF_HOST_MEMORY**.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-06524
surface **must** be a valid **VkSurfaceKHR** handle
- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-06525
surface **must** be supported by **physicalDevice**, as reported by **vkGetPhysicalDeviceSurfaceSupportKHR** or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-physicalDevice-parameter
physicalDevice **must** be a valid **VkPhysicalDevice** handle
- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-parameter
If **surface** is not **VK_NULL_HANDLE**, **surface** **must** be a valid **VkSurfaceKHR** handle
- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-pPresentModeCount-parameter
pPresentModeCount **must** be a valid pointer to a **uint32_t** value
- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-pPresentModes-parameter
If the value referenced by **pPresentModeCount** is not **0**, and **pPresentModes** is not **NULL**, **pPresentModes** **must** be a valid pointer to an array of **pPresentModeCount** **VkPresentModeKHR** values
- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-commonparent
Both of **physicalDevice**, and **surface** that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same **VkInstance**

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

Possible values of elements of the `vkGetPhysicalDeviceSurfacePresentModesKHR::pPresentModes` array, indicating the supported presentation modes for a surface, are:

```
// Provided by VK_KHR_surface
typedef enum VkPresentModeKHR {
    VK_PRESENT_MODE_IMMEDIATE_KHR = 0,
    VK_PRESENT_MODE_MAILBOX_KHR = 1,
    VK_PRESENT_MODE_FIFO_KHR = 2,
    VK_PRESENT_MODE_FIFO_RELAXED_KHR = 3,
    // Provided by VK_KHR_shared_presentable_image
    VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR = 1000111000,
    // Provided by VK_KHR_shared_presentable_image
    VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR = 1000111001,
} VkPresentModeKHR;
```

- `VK_PRESENT_MODE_IMMEDIATE_KHR` specifies that the presentation engine does not wait for a vertical blanking period to update the current image, meaning this mode **may** result in visible tearing. No internal queuing of presentation requests is needed, as the requests are applied immediately.
- `VK_PRESENT_MODE_MAILBOX_KHR` specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing **cannot** be observed. An internal single-entry queue is used to hold pending presentation requests. If the queue is full when a new presentation request is received, the new request replaces the existing entry, and any images associated with the prior entry become available for reuse by the application. One request is removed from the queue and processed during each vertical blanking period in which the queue is non-empty.
- `VK_PRESENT_MODE_FIFO_KHR` specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing **cannot** be observed. An internal queue is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during each vertical blanking period in which the queue is non-empty. This is the only value of `presentMode`

that is **required** to be supported.

- **VK_PRESENT_MODE_FIFO_RELAXED_KHR** specifies that the presentation engine generally waits for the next vertical blanking period to update the current image. If a vertical blanking period has already passed since the last update of the current image then the presentation engine does not wait for another vertical blanking period for the update, meaning this mode **may** result in visible tearing in this case. This mode is useful for reducing visual stutter with an application that will mostly present a new image before the next vertical blanking period, but may occasionally be late, and present a new image just after the next vertical blanking period. An internal queue is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during or after each vertical blanking period in which the queue is non-empty.
- **VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR** specifies that the presentation engine and application have concurrent access to a single image, which is referred to as a *shared presentable image*. The presentation engine is only required to update the current image after a new presentation request is received. Therefore the application **must** make a presentation request whenever an update is required. However, the presentation engine **may** update the current image at any point, meaning this mode **may** result in visible tearing.
- **VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR** specifies that the presentation engine and application have concurrent access to a single image, which is referred to as a *shared presentable image*. The presentation engine periodically updates the current image on its regular refresh cycle. The application is only required to make one initial presentation request, after which the presentation engine **must** update the current image without any need for further presentation requests. The application **can** indicate the image contents have been updated by making a presentation request, but this does not guarantee the timing of when it will be updated. This mode **may** result in visible tearing if rendering to the image is not timed correctly.

The supported **VkImageUsageFlagBits** of the presentable images of a swapchain created for a surface **may** differ depending on the presentation mode, and can be determined as per the table below:

Table 41. Presentable Image Usage Queries

Presentation mode	Image usage flags
VK_PRESENT_MODE_IMMEDIATE_KHR	VkSurfaceCapabilitiesKHR::supportedUsageFlags
VK_PRESENT_MODE_MAILBOX_KHR	VkSurfaceCapabilitiesKHR::supportedUsageFlags
VK_PRESENT_MODE_FIFO_KHR	VkSurfaceCapabilitiesKHR::supportedUsageFlags
VK_PRESENT_MODE_FIFO_RELAXED_KHR	VkSurfaceCapabilitiesKHR::supportedUsageFlags
VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR	VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags
VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR	VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags

NOTE

For reference, the mode indicated by **VK_PRESENT_MODE_FIFO_KHR** is equivalent to the behavior of {wgl|glX|egl}SwapBuffers with a swap interval of 1, while the mode

indicated by `VK_PRESENT_MODE_FIFO_RELAXED_KHR` is equivalent to the behavior of `{wgl|glX}SwapBuffers` with a swap interval of -1 (from the `{WGL|GLX}_EXT_swap_control_tear` extensions).

31.6. Device Group Queries

A logical device that represents multiple physical devices **may** support presenting from images on more than one physical device, or combining images from multiple physical devices.

To query these capabilities, call:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain
VkResult vkGetDeviceGroupPresentCapabilitiesKHR(
    VkDevice device,
    VkDeviceGroupPresentCapabilitiesKHR* pDeviceGroupPresentCapabilities);
```

- `device` is the logical device.
- `pDeviceGroupPresentCapabilities` is a pointer to a `VkDeviceGroupPresentCapabilitiesKHR` structure in which the device's capabilities are returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetDeviceGroupPresentCapabilitiesKHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkGetDeviceGroupPresentCapabilitiesKHR-device-parameter `device` **must** be a valid `VkDevice` handle
- VUID-vkGetDeviceGroupPresentCapabilitiesKHR-pDeviceGroupPresentCapabilities-parameter `pDeviceGroupPresentCapabilities` **must** be a valid pointer to a `VkDeviceGroupPresentCapabilitiesKHR` structure

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkDeviceGroupPresentCapabilitiesKHR` structure is defined as:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain
typedef struct VkDeviceGroupPresentCapabilitiesKHR {
    VkStructureType    sType;
    void*              pNext;
    uint32_t            presentMask[VK_MAX_DEVICE_GROUP_SIZE];
    VkDeviceGroupPresentModeFlagsKHR    modes;
} VkDeviceGroupPresentCapabilitiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `presentMask` is an array of `VK_MAX_DEVICE_GROUP_SIZE` `uint32_t` masks, where the mask at element `i` is non-zero if physical device `i` has a presentation engine, and where bit `j` is set in element `i` if physical device `i` **can** present swapchain images from physical device `j`. If element `i` is non-zero, then bit `i` **must** be set.
- `modes` is a bitmask of `VkDeviceGroupPresentModeFlagBitsKHR` indicating which device group presentation modes are supported.

`modes` always has `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR` set.

The present mode flags are also used when presenting an image, in `VkDeviceGroupPresentInfoKHR::mode`.

If a device group only includes a single physical device, then `modes` **must** equal `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`.

Valid Usage (Implicit)

- VUID-VkDeviceGroupPresentCapabilitiesKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_CAPABILITIES_KHR`
- VUID-VkDeviceGroupPresentCapabilitiesKHR-pNext-pNext
`pNext` **must** be `NULL`

Bits which **may** be set in `VkDeviceGroupPresentCapabilitiesKHR::modes`, indicating which device group presentation modes are supported, are:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain
typedef enum VkDeviceGroupPresentModeFlagBitsKHR {
    VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR = 0x00000001,
    VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR = 0x00000002,
    VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR = 0x00000004,
    VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR = 0x00000008,
} VkDeviceGroupPresentModeFlagBitsKHR;
```

- `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR` specifies that any physical device with a presentation engine **can** present its own swapchain images.
- `VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR` specifies that any physical device with a presentation engine **can** present swapchain images from any physical device in its `presentMask`.
- `VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR` specifies that any physical device with a presentation engine **can** present the sum of swapchain images from any physical devices in its `presentMask`.
- `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR` specifies that multiple physical devices with a presentation engine **can** each present their own swapchain images.

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain
typedef VkFlags VkDeviceGroupPresentModeFlagsKHR;
```

`VkDeviceGroupPresentModeFlagsKHR` is a bitmask type for setting a mask of zero or more `VkDeviceGroupPresentModeFlagBitsKHR`.

Some surfaces **may** not be capable of using all the device group present modes.

To query the supported device group present modes for a particular surface, call:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain
VkResult vkGetDeviceGroupSurfacePresentModesKHR(
    VkDevice          device,
    VkSurfaceKHR      surface,
    VkDeviceGroupPresentModeFlagsKHR* pModes);
```

- `device` is the logical device.
- `surface` is the surface.
- `pModes` is a pointer to a `VkDeviceGroupPresentModeFlagsKHR` in which the supported device group present modes for the surface are returned.

The modes returned by this command are not invariant, and **may** change in response to the surface being moved, resized, or occluded. These modes **must** be a subset of the modes returned by `vkGetDeviceGroupPresentCapabilitiesKHR`.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetDeviceGroupSurfacePresentModesKHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-surface-06212
`surface` **must** be supported by all physical devices associated with `device`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-device-parameter **device** **must** be a valid [VkDevice](#) handle
- VUID-vkGetDeviceGroupSurfacePresentModesKHR-surface-parameter **surface** **must** be a valid [VkSurfaceKHR](#) handle
- VUID-vkGetDeviceGroupSurfacePresentModesKHR-pModes-parameter **pModes** **must** be a valid pointer to a [VkDeviceGroupPresentModeFlagsKHR](#) value
- VUID-vkGetDeviceGroupSurfacePresentModesKHR-commonparent Both of **device**, and **surface** **must** have been created, allocated, or retrieved from the same [VkInstance](#)

Host Synchronization

- Host access to **surface** **must** be externally synchronized

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_SURFACE_LOST_KHR](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

When using [VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR](#), the application **may** need to know which regions of the surface are used when presenting locally on each physical device. Presentation of swapchain images to this surface need only have valid contents in the regions returned by this command.

To query a set of rectangles used in presentation on the physical device, call:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain
VkResult vkGetPhysicalDevicePresentRectanglesKHR(
    VkPhysicalDevice      physicalDevice,
    VkSurfaceKHR          surface,
    uint32_t*             pRectCount,
    VkRect2D*             pRects);
```

- `physicalDevice` is the physical device.
- `surface` is the surface.
- `pRectCount` is a pointer to an integer related to the number of rectangles available or queried, as described below.
- `pRects` is either `NULL` or a pointer to an array of `VkRect2D` structures.

If `pRects` is `NULL`, then the number of rectangles used when presenting the given `surface` is returned in `pRectCount`. Otherwise, `pRectCount` **must** point to a variable set by the application to the number of elements in the `pRects` array, and on return the variable is overwritten with the number of structures actually written to `pRects`. If the value of `pRectCount` is less than the number of rectangles, at most `pRectCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available rectangles were returned.

The values returned by this command are not invariant, and **may** change in response to the surface being moved, resized, or occluded.

The rectangles returned by this command **must** not overlap.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetPhysicalDevicePresentRectanglesKHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-06211
`surface` **must** be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-parameter
`surface` **must** be a valid `VkSurfaceKHR` handle
- VUID-vkGetPhysicalDevicePresentRectanglesKHR-pRectCount-parameter
`pRectCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDevicePresentRectanglesKHR-pRects-parameter
If the value referenced by `pRectCount` is not `0`, and `pRects` is not `NULL`, `pRects` **must** be a valid pointer to an array of `pRectCount` `VkRect2D` structures
- VUID-vkGetPhysicalDevicePresentRectanglesKHR-commonparent
Both of `physicalDevice`, and `surface` **must** have been created, allocated, or retrieved from the same `VkInstance`

Host Synchronization

- Host access to **surface** **must** be externally synchronized

Return Codes

Success

- **VK_INCOMPLETE**
- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_UNKNOWN**
- **VK_ERROR_VALIDATION_FAILED**

31.7. WSI Swapchain

A swapchain object (a.k.a. swapchain) provides the ability to present rendering results to a surface. Swapchain objects are represented by **VkSwapchainKHR** handles:

```
// Provided by VK_KHR_swapchain
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSwapchainKHR)
```

A swapchain is an abstraction for an array of presentable images that are associated with a surface. The presentable images are represented by **VkImage** objects created by the platform. One image (which **can** be an array image for multiview/stereoscopic-3D surfaces) is displayed at a time, but multiple images **can** be queued for presentation. An application renders to the image, and then queues the image for presentation to the surface.

A native window **cannot** be associated with more than one non-retired swapchain at a time. Further, swapchains **cannot** be created for native windows that have a non-Vulkan graphics API surface associated with them.

NOTE

The presentation engine is an abstraction for the platform's compositor or display engine.

The presentation engine **may** be synchronous or asynchronous with respect to the application and/or logical device.

Some implementations **may** use the device's graphics queue or dedicated presentation hardware to perform presentation.

The presentable images of a swapchain are owned by the presentation engine. An application **can** acquire use of a presentable image from the presentation engine. Use of a presentable image **must** occur only after the image is returned by `vkAcquireNextImageKHR`, and before it is released by `vkQueuePresentKHR`. This includes transitioning the image layout and rendering commands.

An application **can** acquire use of a presentable image with `vkAcquireNextImageKHR`. After acquiring a presentable image and before modifying it, the application **must** use a synchronization primitive to ensure that the presentation engine has finished reading from the image. The application **can** then transition the image's layout, queue rendering commands to it, etc. Finally, the application presents the image with `vkQueuePresentKHR`, which releases the acquisition of the image.

The presentation engine controls the order in which presentable images are acquired for use by the application.

NOTE

This allows the platform to handle situations which require out-of-order return of images after presentation. At the same time, it allows the application to generate command buffers referencing all of the images in the swapchain at initialization time, rather than in its main loop.

Swapchains **cannot** be destroyed [SCID-4]. If `VkPhysicalDeviceVulkanSC10Properties::deviceDestroyFreesMemory` is `VK_TRUE`, the memory for swapchain images is returned to the system when the device is destroyed. Otherwise, it **may** not be returned to the system until the process is terminated.

How this all works is described below.

If a swapchain is created with `presentMode` set to either `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`, a single presentable image **can** be acquired, referred to as a shared presentable image. A shared presentable image **may** be concurrently accessed by the application and the presentation engine, without transitioning the image's layout after it is initially presented.

- With `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR`, the presentation engine is only required to update to the latest contents of a shared presentable image after a present. The application **must** call `vkQueuePresentKHR` to guarantee an update. However, the presentation engine **may** update from it at any time.
- With `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`, the presentation engine will automatically present the latest contents of a shared presentable image during every refresh cycle. The application is only required to make one initial call to `vkQueuePresentKHR`, after which the presentation engine will update from it without any need for further present calls. The application **can** indicate the image contents have been updated by calling `vkQueuePresentKHR`, but this does not guarantee the timing of when updates will occur.

The presentation engine **may** access a shared presentable image at any time after it is first presented. To avoid tearing, an application **should** coordinate access with the presentation engine. This requires presentation engine timing information through platform-specific mechanisms and ensuring that color attachment writes are made available during the portion of the presentation engine's refresh cycle they are intended for.

NOTE

The [VK_KHR_shared_presentable_image](#) extension does not provide functionality for determining the timing of the presentation engine's refresh cycles.

In order to query a swapchain's status when rendering to a shared presentable image, call:

```
// Provided by VK_KHR_shared_presentable_image
VkResult vkGetSwapchainStatusKHR(
    VkDevice          device,
    VkSwapchainKHR    swapchain);
```

- **device** is the device associated with **swapchain**.
- **swapchain** is the swapchain to query.

If [VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations](#) is **VK_TRUE**, **vkGetSwapchainStatusKHR** **must** not return **VK_ERROR_OUT_OF_HOST_MEMORY**.

Valid Usage (Implicit)

- VUID-vkGetSwapchainStatusKHR-device-parameter **device** **must** be a valid [VkDevice](#) handle
- VUID-vkGetSwapchainStatusKHR-swapchain-parameter **swapchain** **must** be a valid [VkSwapchainKHR](#) handle
- VUID-vkGetSwapchainStatusKHR-swapchain-parent **swapchain** **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **swapchain** **must** be externally synchronized

Return Codes

Success

- **VK_SUBOPTIMAL_KHR**
- **VK_SUCCESS**

Failure

- **VK_ERROR_DEVICE_LOST**
- **VK_ERROR_OUT_OF_DATE_KHR**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_SURFACE_LOST_KHR**

- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The possible return values for `vkGetSwapchainStatusKHR` **should** be interpreted as follows:

- `VK_SUCCESS` specifies the presentation engine is presenting the contents of the shared presentable image, as per the swapchain's `VkPresentModeKHR`.
- `VK_SUBOPTIMAL_KHR` the swapchain no longer matches the surface properties exactly, but the presentation engine is presenting the contents of the shared presentable image, as per the swapchain's `VkPresentModeKHR`.
- `VK_ERROR_OUT_OF_DATE_KHR` the surface has changed in such a way that it is no longer compatible with the swapchain.
- `VK_ERROR_SURFACE_LOST_KHR` the surface is no longer available.

NOTE

The swapchain state **may** be cached by implementations, so applications **should** regularly call `vkGetSwapchainStatusKHR` when using a swapchain with `VkPresentModeKHR` equal to `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`.

To create a swapchain, call:

```
// Provided by VK_KHR_swapchain
VkResult vkCreateSwapchainKHR(
    VkDevice                                device,
    const VkSwapchainCreateInfoKHR*         pCreateInfo,
    const VkAllocationCallbacks*            pAllocator,
    VkSwapchainKHR*                         pSwapchain);
```

- `device` is the device to create the swapchain for.
- `pCreateInfo` is a pointer to a `VkSwapchainCreateInfoKHR` structure specifying the parameters of the created swapchain.
- `pAllocator` is the allocator used for host memory allocated for the swapchain object when there is no more specific allocator available (see [Memory Allocation](#)).
- `pSwapchain` is a pointer to a `VkSwapchainKHR` handle in which the created swapchain object will be returned.

As mentioned above, if `vkCreateSwapchainKHR` succeeds, it will return a handle to a swapchain containing an array of at least `pCreateInfo->minImageCount` presentable images.

While acquired by the application, presentable images **can** be used in any way that equivalent non-presentable images **can** be used. A presentable image is equivalent to a non-presentable image created with the following `VkImageCreateInfo` parameters:

VkImageCreateInfo Field	Value
flags	VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT is set if VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR is set VK_IMAGE_CREATE_PROTECTED_BIT is set if VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR is set VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT and VK_IMAGE_CREATE_EXTENDED_USAGE_BIT_KHR are both set if VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR is set all other bits are unset
imageType	VK_IMAGE_TYPE_2D
format	pCreateInfo->imageFormat
extent	{pCreateInfo->imageExtent.width, pCreateInfo->imageExtent.height, 1}
mipLevels	1
arrayLayers	pCreateInfo->imageArrayLayers
samples	VK_SAMPLE_COUNT_1_BIT
tiling	VK_IMAGE_TILING_OPTIMAL
usage	pCreateInfo->imageUsage
sharingMode	pCreateInfo->imageSharingMode
queueFamilyIndexCount	pCreateInfo->queueFamilyIndexCount
pQueueFamilyIndices	pCreateInfo->pQueueFamilyIndices
initialLayout	VK_IMAGE_LAYOUT_UNDEFINED

The `pCreateInfo->surface` **must** not be destroyed until after the swapchain is destroyed.

If the native window referred to by `pCreateInfo->surface` is already associated with a Vulkan swapchain, `VK_ERROR_NATIVE_WINDOW_IN_USE_KHR` **must** be returned.

If the native window referred to by `pCreateInfo->surface` is already associated with a non-Vulkan graphics API surface, `VK_ERROR_NATIVE_WINDOW_IN_USE_KHR` **must** be returned.

The native window referred to by `pCreateInfo->surface` **must** not become associated with a non-Vulkan graphics API surface before all associated Vulkan swapchains have been destroyed.

`vkCreateSwapchainKHR` will return `VK_ERROR_DEVICE_LOST` if the logical device was lost. However, `VkSurfaceKHR` is not a child of any `VkDevice` and is not affected by the lost device. After successfully recreating a `VkDevice`, the same `VkSurfaceKHR` **can** be used to create a new `VkSwapchainKHR`, provided the previous one was destroyed.

When the [VkSurfaceKHR](#) in [VkSwapchainCreateInfoKHR](#) is a display surface, then the [VkDisplayModeKHR](#) in display surface's [VkDisplaySurfaceCreateInfoKHR](#) is associated with a particular [VkDisplayKHR](#). Swapchain creation **may** fail if that [VkDisplayKHR](#) is not acquired by the application. In this scenario [VK_ERROR_INITIALIZATION_FAILED](#) is returned.

If [VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations](#) is [VK_TRUE](#), [vkCreateSwapchainKHR](#) **must** not return [VK_ERROR_OUT_OF_HOST_MEMORY](#).

Valid Usage

- VUID-vkCreateSwapchainKHR-device-05068

The number of swapchains currently allocated from [device](#) plus 1 **must** be less than or equal to the total number of swapchains requested via [VkDeviceObjectReservationCreateInfo::swapchainRequestCount](#) specified when [device](#) was created

Valid Usage (Implicit)

- VUID-vkCreateSwapchainKHR-device-parameter
[device](#) **must** be a valid [VkDevice](#) handle
- VUID-vkCreateSwapchainKHR-pCreateInfo-parameter
[pCreateInfo](#) **must** be a valid pointer to a valid [VkSwapchainCreateInfoKHR](#) structure
- VUID-vkCreateSwapchainKHR-pAllocator-null
[pAllocator](#) **must** be [NULL](#)
- VUID-vkCreateSwapchainKHR-pSwapchain-parameter
[pSwapchain](#) **must** be a valid pointer to a [VkSwapchainKHR](#) handle
- VUID-vkCreateSwapchainKHR-device-queuecount
The device **must** have been created with at least [1](#) queue

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_DEVICE_LOST](#)
- [VK_ERROR_INITIALIZATION_FAILED](#)
- [VK_ERROR_NATIVE_WINDOW_IN_USE_KHR](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_SURFACE_LOST_KHR](#)
- [VK_ERROR_UNKNOWN](#)

- `VK_ERROR_VALIDATION_FAILED`

The `VkSwapchainCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_swapchain
typedef struct VkSwapchainCreateInfoKHR {
    VkStructureType           sType;
    const void*               pNext;
    VkSwapchainCreateFlagsKHR flags;
    VkSurfaceKHR              surface;
    uint32_t                  minImageCount;
    VkFormat                  imageFormat;
    VkColorSpaceKHR           imageColorSpace;
    VkExtent2D                imageExtent;
    uint32_t                  imageArrayLayers;
    VkImageUsageFlags         imageUsage;
    VkSharingMode              imageSharingMode;
    uint32_t                  queueFamilyIndexCount;
    const uint32_t*           pQueueFamilyIndices;
    VkSurfaceTransformFlagBitsKHR preTransform;
    VkCompositeAlphaFlagBitsKHR compositeAlpha;
    VkPresentModeKHR          presentMode;
    VkBool32                  clipped;
    VkSwapchainKHR            oldSwapchain;
} VkSwapchainCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkSwapchainCreateFlagBitsKHR` indicating parameters of the swapchain creation.
- `surface` is the surface onto which the swapchain will present images. If the creation succeeds, the swapchain becomes associated with `surface`.
- `minImageCount` is the minimum number of presentable images that the application needs. The implementation will either create the swapchain with at least that many images, or it will fail to create the swapchain.
- `imageFormat` is a `VkFormat` value specifying the format the swapchain image(s) will be created with.
- `imageColorSpace` is a `VkColorSpaceKHR` value specifying the way the swapchain interprets image data.
- `imageExtent` is the size (in pixels) of the swapchain image(s). The behavior is platform-dependent if the image extent does not match the surface's `currentExtent` as returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`.

NOTE

On some platforms, it is normal that `maxImageExtent` may become `(0, 0)`, for example when the window is minimized. In such a case, it is not possible to

create a swapchain due to the Valid Usage requirements .

- **imageArrayLayers** is the number of views in a multiview/stereo surface. For non-stereoscopic-3D applications, this value is 1.
- **imageUsage** is a bitmask of **VkImageUsageFlagBits** describing the intended usage of the (acquired) swapchain images.
- **imageSharingMode** is the sharing mode used for the image(s) of the swapchain.
- **queueFamilyIndexCount** is the number of queue families having access to the image(s) of the swapchain when **imageSharingMode** is **VK_SHARING_MODE_CONCURRENT**.
- **pQueueFamilyIndices** is a pointer to an array of queue family indices having access to the images(s) of the swapchain when **imageSharingMode** is **VK_SHARING_MODE_CONCURRENT**.
- **preTransform** is a **VkSurfaceTransformFlagBitsKHR** value describing the transform, relative to the presentation engine's natural orientation, applied to the image content prior to presentation. If it does not match the **currentTransform** value returned by **vkGetPhysicalDeviceSurfaceCapabilitiesKHR**, the presentation engine will transform the image content as part of the presentation operation.
- **compositeAlpha** is a **VkCompositeAlphaFlagBitsKHR** value indicating the alpha compositing mode to use when this surface is composited together with other surfaces on certain window systems.
- **presentMode** is the presentation mode the swapchain will use. A swapchain's present mode determines how incoming present requests will be processed and queued internally.
- **clipped** specifies whether the Vulkan implementation is allowed to discard rendering operations that affect regions of the surface that are not visible.
 - If **clipped** is **VK_TRUE**, the presentable images associated with the swapchain **may** not own all of their pixels. Pixels in the presentable images that correspond to regions of the target surface obscured by another window on the desktop, or subject to some other clipping mechanism will have undefined content when read back. Fragment shaders **may** not execute for these pixels, and thus any side effects they would have had will not occur. Setting **VK_TRUE** does not guarantee any clipping will occur, but allows more efficient presentation methods to be used on some platforms.
 - If **clipped** is **VK_FALSE**, presentable images associated with the swapchain will own all of the pixels they contain.

NOTE

Applications **should** set this value to **VK_TRUE** if they do not expect to read back the content of presentable images before presenting them or after reacquiring them, and if their fragment shaders do not have any side effects that require them to run for all pixels in the presentable image.

- **oldSwapchain** **must** be **VK_NULL_HANDLE** in Vulkan SC [SCID-4].

Valid Usage

- VUID-VkSwapchainCreateInfoKHR-surface-01270
surface **must** be a surface that is supported by the device as determined using

vkGetPhysicalDeviceSurfaceSupportKHR

- VUID-VkSwapchainCreateInfoKHR-minImageCount-01272
`minImageCount` **must** be less than or equal to the value returned in the `maxImageCount` member of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface if the returned `maxImageCount` is not zero
- VUID-VkSwapchainCreateInfoKHR-presentMode-02839
If `presentMode` is not `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` nor `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`, then `minImageCount` **must** be greater than or equal to the value returned in the `minImageCount` member of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface
- VUID-VkSwapchainCreateInfoKHR-minImageCount-01383
`minImageCount` **must** be 1 if `presentMode` is either `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`
- VUID-VkSwapchainCreateInfoKHR-imageFormat-01273
`imageFormat` and `imageColorSpace` **must** match the `format` and `colorSpace` members, respectively, of one of the `VkSurfaceFormatKHR` structures returned by `vkGetPhysicalDeviceSurfaceFormatsKHR` for the surface
- VUID-VkSwapchainCreateInfoKHR-pNext-07781
`imageExtent` **must** be between `minImageExtent` and `maxImageExtent`, inclusive, where `minImageExtent` and `maxImageExtent` are members of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface
- VUID-VkSwapchainCreateInfoKHR-imageExtent-01689
`imageExtent` members `width` and `height` **must** both be non-zero
- VUID-VkSwapchainCreateInfoKHR-imageArrayLayers-01275
`imageArrayLayers` **must** be greater than 0 and less than or equal to the `maxImageArrayLayers` member of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface
- VUID-VkSwapchainCreateInfoKHR-presentMode-01427
If `presentMode` is `VK_PRESENT_MODE_IMMEDIATE_KHR`, `VK_PRESENT_MODE_MAILBOX_KHR`, `VK_PRESENT_MODE_FIFO_KHR` or `VK_PRESENT_MODE_FIFO_RELAXED_KHR`, `imageUsage` **must** be a subset of the supported usage flags present in the `supportedUsageFlags` member of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for surface
- VUID-VkSwapchainCreateInfoKHR-imageUsage-01384
If `presentMode` is `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`, `imageUsage` **must** be a subset of the supported usage flags present in the `sharedPresentSupportedUsageFlags` member of the `VkSharedPresentSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilities2KHR` for surface
- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01277
If `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`, `pQueueFamilyIndices` **must** be a valid

pointer to an array of `queueFamilyIndexCount` `uint32_t` values

- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01278

If `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`, `queueFamilyIndexCount` **must** be greater than 1

- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01428

If `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`, each element of `pQueueFamilyIndices` **must** be unique and **must** be less than `pQueueFamilyPropertyCount` returned by either `vkGetPhysicalDeviceQueueFamilyProperties` or `vkGetPhysicalDeviceQueueFamilyProperties2` for the `physicalDevice` that was used to create `device`

- VUID-VkSwapchainCreateInfoKHR-preTransform-01279

`preTransform` **must** be one of the bits present in the `supportedTransforms` member of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface

- VUID-VkSwapchainCreateInfoKHR-compositeAlpha-01280

`compositeAlpha` **must** be one of the bits present in the `supportedCompositeAlpha` member of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface

- VUID-VkSwapchainCreateInfoKHR-presentMode-01281

`presentMode` **must** be one of the `VkPresentModeKHR` values returned by `vkGetPhysicalDeviceSurfacePresentModesKHR` for the surface

- VUID-VkSwapchainCreateInfoKHR-physicalDeviceCount-01429

`flags` **must** not contain `VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR`

- VUID-VkSwapchainCreateInfoKHR-oldSwapchain-05073

`oldSwapchain` **must** be `VK_NULL_HANDLE`

- VUID-VkSwapchainCreateInfoKHR-imageFormat-01778

The `implied image creation parameters` of the swapchain **must** be supported as reported by `vkGetPhysicalDeviceImageFormatProperties`

- VUID-VkSwapchainCreateInfoKHR-flags-03168

If `flags` contains `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR` then the `pNext` chain **must** include a `VkImageFormatListCreateInfo` structure with a `viewFormatCount` greater than zero and `pViewFormats` **must** have an element equal to `imageFormat`

- VUID-VkSwapchainCreateInfoKHR-pNext-04099

If a `VkImageFormatListCreateInfo` structure was included in the `pNext` chain and `VkImageFormatListCreateInfo::viewFormatCount` is not zero then all of the formats in `VkImageFormatListCreateInfo::pViewFormats` **must** be compatible with the `format` as described in the `compatibility table`

- VUID-VkSwapchainCreateInfoKHR-flags-04100

If `flags` does not contain `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR` and the `pNext` chain include a `VkImageFormatListCreateInfo` structure then `VkImageFormatListCreateInfo::viewFormatCount` **must** be 0 or 1

Valid Usage (Implicit)

- VUID-VkSwapchainCreateInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SWAPCHAIN_CREATE_INFO_KHR`
- VUID-VkSwapchainCreateInfoKHR-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkDeviceGroupSwapchainCreateInfoKHR`, `VkImageFormatListCreateInfo`, or `VkSwapchainCounterCreateInfoEXT`
- VUID-VkSwapchainCreateInfoKHR-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkSwapchainCreateInfoKHR-flags-parameter
`flags` **must** be a valid combination of `VkSwapchainCreateFlagBitsKHR` values
- VUID-VkSwapchainCreateInfoKHR-surface-parameter
`surface` **must** be a valid `VkSurfaceKHR` handle
- VUID-VkSwapchainCreateInfoKHR-imageFormat-parameter
`imageFormat` **must** be a valid `VkFormat` value
- VUID-VkSwapchainCreateInfoKHR-imageColorSpace-parameter
`imageColorSpace` **must** be a valid `VkColorSpaceKHR` value
- VUID-VkSwapchainCreateInfoKHR-imageUsage-parameter
`imageUsage` **must** be a valid combination of `VkImageUsageFlagBits` values
- VUID-VkSwapchainCreateInfoKHR-imageUsage-requiredbitmask
`imageUsage` **must** not be `0`
- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-parameter
`imageSharingMode` **must** be a valid `VkSharingMode` value
- VUID-VkSwapchainCreateInfoKHR-preTransform-parameter
`preTransform` **must** be a valid `VkSurfaceTransformFlagBitsKHR` value
- VUID-VkSwapchainCreateInfoKHR-compositeAlpha-parameter
`compositeAlpha` **must** be a valid `VkCompositeAlphaFlagBitsKHR` value
- VUID-VkSwapchainCreateInfoKHR-presentMode-parameter
`presentMode` **must** be a valid `VkPresentModeKHR` value
- VUID-VkSwapchainCreateInfoKHR-commonparent
Both of `oldSwapchain`, and `surface` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkInstance`

Host Synchronization

- Host access to `surface` **must** be externally synchronized

Bits which **can** be set in `VkSwapchainCreateInfoKHR::flags`, specifying parameters of swapchain creation, are:

```
// Provided by VK_KHR_swapchain
typedef enum VkSwapchainCreateFlagBitsKHR {
    // Provided by VK_VERSION_1_1 with VK_KHR_swapchain
    VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR = 0x00000001,
    // Provided by VK_VERSION_1_1 with VK_KHR_swapchain
    VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR = 0x00000002,
    // Provided by VK_KHR_swapchain_mutable_format
    VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR = 0x00000004,
} VkSwapchainCreateFlagBitsKHR;
```

- **VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR** specifies that images created from the swapchain (i.e. with the **swapchain** member of **VkImageSwapchainCreateInfoKHR** set to this swapchain's handle) **must** use **VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT**. This flag is not supported in Vulkan SC [SCID-8].
- **VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR** specifies that images created from the swapchain are protected images.
- **VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR** specifies that the images of the swapchain **can** be used to create a **VkImageView** with a different format than what the swapchain was created with. The list of allowed image view formats is specified by adding a **VkImageFormatListCreateInfo** structure to the **pNext** chain of **VkSwapchainCreateInfoKHR**. In addition, this flag also specifies that the swapchain **can** be created with usage flags that are not supported for the format the swapchain is created with but are supported for at least one of the allowed image view formats.

```
// Provided by VK_KHR_swapchain
typedef VkFlags VkSwapchainCreateFlagsKHR;
```

VkSwapchainCreateFlagsKHR is a bitmask type for setting a mask of zero or more **VkSwapchainCreateFlagBitsKHR**.

If the **pNext** chain of **VkSwapchainCreateInfoKHR** includes a **VkDeviceGroupSwapchainCreateInfoKHR** structure, then that structure includes a set of device group present modes that the swapchain **can** be used with.

The **VkDeviceGroupSwapchainCreateInfoKHR** structure is defined as:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain
typedef struct VkDeviceGroupSwapchainCreateInfoKHR {
    VkStructureType          sType;
    const void*              pNext;
    VkDeviceGroupPresentModeFlagsKHR modes;
} VkDeviceGroupSwapchainCreateInfoKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **modes** is a bitfield of modes that the swapchain **can** be used with.

If this structure is not present, `modes` is considered to be `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`.

Valid Usage (Implicit)

- VUID-VkDeviceGroupSwapchainCreateInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_SWAPCHAIN_CREATE_INFO_KHR`
- VUID-VkDeviceGroupSwapchainCreateInfoKHR-modes-parameter
`modes` **must** be a valid combination of `VkDeviceGroupPresentModeFlagBitsKHR` values
- VUID-VkDeviceGroupSwapchainCreateInfoKHR-modes-requiredbitmask
`modes` **must** not be `0`

To enable surface counters when creating a swapchain, add a `VkSwapchainCounterCreateInfoEXT` structure to the `pNext` chain of `VkSwapchainCreateInfoKHR`. `VkSwapchainCounterCreateInfoEXT` is defined as:

```
// Provided by VK_EXT_display_control
typedef struct VkSwapchainCounterCreateInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    VkSurfaceCounterFlagsEXT surfaceCounters;
} VkSwapchainCounterCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `surfaceCounters` is a bitmask of `VkSurfaceCounterFlagBitsEXT` specifying surface counters to enable for the swapchain.

Valid Usage

- VUID-VkSwapchainCounterCreateInfoEXT-surfaceCounters-01244
The bits in `surfaceCounters` **must** be supported by `VkSwapchainCreateInfoKHR::surface`, as reported by `vkGetPhysicalDeviceSurfaceCapabilities2EXT`

Valid Usage (Implicit)

- VUID-VkSwapchainCounterCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SWAPCHAIN_COUNTER_CREATE_INFO_EXT`
- VUID-VkSwapchainCounterCreateInfoEXT-surfaceCounters-parameter
`surfaceCounters` **must** be a valid combination of `VkSurfaceCounterFlagBitsEXT` values

The requested counters become active when the first presentation command for the associated

swapchain is processed by the presentation engine. To query the value of an active counter, use:

```
// Provided by VK_EXT_display_control
VkResult vkGetSwapchainCounterEXT(
    VkDevice          device,
    VkSwapchainKHR    swapchain,
    VkSurfaceCounterFlagBitsEXT counter,
    uint64_t*         pCounterValue);
```

- **device** is the [VkDevice](#) associated with **swapchain**.
- **swapchain** is the swapchain from which to query the counter value.
- **counter** is a [VkSurfaceCounterFlagBitsEXT](#) value specifying the counter to query.
- **pCounterValue** will return the current value of the counter.

If a counter is not available because the swapchain is out of date, the implementation **may** return [VK_ERROR_OUT_OF_DATE_KHR](#).

If [VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations](#) is [VK_TRUE](#), [vkGetSwapchainCounterEXT](#) **must** not return [VK_ERROR_OUT_OF_HOST_MEMORY](#).

Valid Usage

- VUID-vkGetSwapchainCounterEXT-swapchain-01245
One or more present commands on **swapchain** **must** have been processed by the presentation engine

Valid Usage (Implicit)

- VUID-vkGetSwapchainCounterEXT-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkGetSwapchainCounterEXT-swapchain-parameter
swapchain **must** be a valid [VkSwapchainKHR](#) handle
- VUID-vkGetSwapchainCounterEXT-counter-parameter
counter **must** be a valid [VkSurfaceCounterFlagBitsEXT](#) value
- VUID-vkGetSwapchainCounterEXT-pCounterValue-parameter
pCounterValue **must** be a valid pointer to a [uint64_t](#) value
- VUID-vkGetSwapchainCounterEXT-swapchain-parent
swapchain **must** have been created, allocated, or retrieved from **device**

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DATE_KHR`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

When the `VK_KHR_display_swapchain` extension is enabled, multiple swapchains that share presentable images are created by calling:

```
// Provided by VK_KHR_display_swapchain
VkResult vkCreateSharedSwapchainsKHR(
    VkDevice          device,
    uint32_t          swapchainCount,
    const VkSwapchainCreateInfoKHR* pCreateInfos,
    const VkAllocationCallbacks*   pAllocator,
    VkSwapchainKHR*    pSwapchains);
```

- `device` is the device to create the swapchains for.
- `swapchainCount` is the number of swapchains to create.
- `pCreateInfos` is a pointer to an array of `VkSwapchainCreateInfoKHR` structures specifying the parameters of the created swapchains.
- `pAllocator` is the allocator used for host memory allocated for the swapchain objects when there is no more specific allocator available (see [Memory Allocation](#)).
- `pSwapchains` is a pointer to an array of `VkSwapchainKHR` handles in which the created swapchain objects will be returned.

`vkCreateSharedSwapchainsKHR` is similar to `vkCreateSwapchainKHR`, except that it takes an array of `VkSwapchainCreateInfoKHR` structures, and returns an array of swapchain objects.

The swapchain creation parameters that affect the properties and number of presentable images **must** match between all the swapchains. If the displays used by any of the swapchains do not use the same presentable image layout or are incompatible in a way that prevents sharing images, swapchain creation will fail with the result code `VK_ERROR_INCOMPATIBLE_DISPLAY_KHR`. If any error occurs, no swapchains will be created. Images presented to multiple swapchains **must** be re-acquired from all of them before being modified. After destroying one or more of the swapchains, the remaining swapchains and the presentable images **can** continue to be used.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`,

`vkCreateSharedSwapchainsKHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkCreateSharedSwapchainsKHR-device-05068

The number of swapchains currently allocated from `device` plus `swapchainCount` **must** be less than or equal to the total number of swapchains requested via `VkDeviceObjectReservationCreateInfo::swapchainRequestCount` specified when `device` was created

Valid Usage (Implicit)

- VUID-vkCreateSharedSwapchainsKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCreateSharedSwapchainsKHR-pCreateInfos-parameter
`pCreateInfos` **must** be a valid pointer to an array of `swapchainCount` valid `VkSwapchainCreateInfoKHR` structures
- VUID-vkCreateSharedSwapchainsKHR-pAllocator-null
`pAllocator` **must** be `NULL`
- VUID-vkCreateSharedSwapchainsKHR-pSwapchains-parameter
`pSwapchains` **must** be a valid pointer to an array of `swapchainCount` `VkSwapchainKHR` handles
- VUID-vkCreateSharedSwapchainsKHR-device-queuecount
The device **must** have been created with at least `1` queue
- VUID-vkCreateSharedSwapchainsKHR-swapchainCount-arraylength
`swapchainCount` **must** be greater than `0`

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_INCOMPATIBLE_DISPLAY_KHR`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

To obtain the array of presentable images associated with a swapchain, call:

```
// Provided by VK_KHR_swapchain
VkResult vkGetSwapchainImagesKHR(
    VkDevice          device,
    VkSwapchainKHR    swapchain,
    uint32_t*         pSwapchainImageCount,
    VkImage*          pSwapchainImages);
```

- **device** is the device associated with **swapchain**.
- **swapchain** is the swapchain to query.
- **pSwapchainImageCount** is a pointer to an integer related to the number of presentable images available or queried, as described below.
- **pSwapchainImages** is either **NULL** or a pointer to an array of **VkImage** handles.

If **pSwapchainImages** is **NULL**, then the number of presentable images for **swapchain** is returned in **pSwapchainImageCount**. Otherwise, **pSwapchainImageCount** **must** point to a variable set by the application to the number of elements in the **pSwapchainImages** array, and on return the variable is overwritten with the number of structures actually written to **pSwapchainImages**. If the value of **pSwapchainImageCount** is less than the number of presentable images for **swapchain**, at most **pSwapchainImageCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available presentable images were returned.

If **VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations** is **VK_TRUE**, **vkGetSwapchainImagesKHR** **must** not return **VK_ERROR_OUT_OF_HOST_MEMORY**.

Valid Usage (Implicit)

- VUID-vkGetSwapchainImagesKHR-device-parameter **device** **must** be a valid **VkDevice** handle
- VUID-vkGetSwapchainImagesKHR-swapchain-parameter **swapchain** **must** be a valid **VkSwapchainKHR** handle
- VUID-vkGetSwapchainImagesKHR-pSwapchainImageCount-parameter **pSwapchainImageCount** **must** be a valid pointer to a **uint32_t** value
- VUID-vkGetSwapchainImagesKHR-pSwapchainImages-parameter
If the value referenced by **pSwapchainImageCount** is not 0, and **pSwapchainImages** is not **NULL**, **pSwapchainImages** **must** be a valid pointer to an array of **pSwapchainImageCount** **VkImage** handles
- VUID-vkGetSwapchainImagesKHR-swapchain-parent **swapchain** **must** have been created, allocated, or retrieved from **device**

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

NOTE

By knowing all presentable images used in the swapchain, the application can create command buffers that reference these images prior to entering its main rendering loop.

Images returned by `vkGetSwapchainImagesKHR` are fully backed by memory before they are passed to the application, as if they are each bound completely and contiguously to a single `VkDeviceMemory` object. All presentable images are initially in the `VK_IMAGE_LAYOUT_UNDEFINED` layout, thus before using presentable images, the application **must** transition them to a valid layout for the intended use.

Images **can** also be created by using `vkCreateImage` with `VkImageSwapchainCreateInfoKHR` and bound to swapchain memory using `vkBindImageMemory2` with `VkBindImageMemorySwapchainInfoKHR`. These images **can** be used anywhere swapchain images are used, and are useful in logical devices with multiple physical devices to create peer memory bindings of swapchain memory. These images and bindings have no effect on what memory is presented. Unlike images retrieved from `vkGetSwapchainImagesKHR`, these images **must** be destroyed with `vkDestroyImage`.

To acquire an available presentable image to use, and retrieve the index of that image, call:

```
// Provided by VK_KHR_swapchain
VkResult vkAcquireNextImageKHR(
    VkDevice           device,
    VkSwapchainKHR     swapchain,
    uint64_t           timeout,
    VkSemaphore        semaphore,
    VkFence             fence,
    uint32_t*          pImageIndex);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the non-retired swapchain from which an image is being acquired.
- `timeout` specifies how long the function waits, in nanoseconds, if no image is available.

- **semaphore** is `VK_NULL_HANDLE` or a semaphore to signal.
- **fence** is `VK_NULL_HANDLE` or a fence to signal.
- **pImageIndex** is a pointer to a `uint32_t` in which the index of the next image to use (i.e. an index into the array of images returned by `vkGetSwapchainImagesKHR`) is returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkAcquireNextImageKHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkAcquireNextImageKHR-swapchain-01285
swapchain **must** not be in the retired state
- VUID-vkAcquireNextImageKHR-semaphore-01286
If **semaphore** is not `VK_NULL_HANDLE`, it **must** be unsignaled
- VUID-vkAcquireNextImageKHR-semaphore-01779
If **semaphore** is not `VK_NULL_HANDLE`, it **must** not have any uncompleted signal or wait operations pending
- VUID-vkAcquireNextImageKHR-fence-01287
If **fence** is not `VK_NULL_HANDLE`, **fence** **must** be unsignaled
- VUID-vkAcquireNextImageKHR-fence-10066
If **fence** is not `VK_NULL_HANDLE`, **fence** **must** not be associated with any other queue command that has not yet completed execution on that queue
- VUID-vkAcquireNextImageKHR-semaphore-01780
semaphore and **fence** **must** not both be equal to `VK_NULL_HANDLE`
- VUID-vkAcquireNextImageKHR-surface-07783
If **forward progress** cannot be guaranteed for the **surface** used to create the **swapchain** member of **pAcquireInfo**, **timeout** **must** not be `UINT64_MAX`
- VUID-vkAcquireNextImageKHR-semaphore-03265
semaphore **must** have a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`

Valid Usage (Implicit)

- VUID-vkAcquireNextImageKHR-device-parameter
device **must** be a valid `VkDevice` handle
- VUID-vkAcquireNextImageKHR-swapchain-parameter
swapchain **must** be a valid `VkSwapchainKHR` handle
- VUID-vkAcquireNextImageKHR-semaphore-parameter
If **semaphore** is not `VK_NULL_HANDLE`, **semaphore** **must** be a valid `VkSemaphore` handle
- VUID-vkAcquireNextImageKHR-fence-parameter
If **fence** is not `VK_NULL_HANDLE`, **fence** **must** be a valid `VkFence` handle
- VUID-vkAcquireNextImageKHR-pImageIndex-parameter

`pImageIndex` **must** be a valid pointer to a `uint32_t` value

- `VUID-vkAcquireNextImageKHR-swapchain-parent`
`swapchain` **must** have been created, allocated, or retrieved from `device`
- `VUID-vkAcquireNextImageKHR-semaphore-parent`
If `semaphore` is a valid handle, it **must** have been created, allocated, or retrieved from `device`
- `VUID-vkAcquireNextImageKHR-fence-parent`
If `fence` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `swapchain` **must** be externally synchronized
- Host access to `semaphore` **must** be externally synchronized
- Host access to `fence` **must** be externally synchronized

Return Codes

Success

- `VK_NOT_READY`
- `VK_SUBOPTIMAL_KHR`
- `VK_SUCCESS`
- `VK_TIMEOUT`

Failure

- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DATE_KHR`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

If an image is acquired successfully, `vkAcquireNextImageKHR` **must** either return `VK_SUCCESS` or `VK_SUBOPTIMAL_KHR`. The implementation **may** return `VK_SUBOPTIMAL_KHR` if the swapchain no longer matches the surface properties exactly, but **can** still be used for presentation.

When successful, `vkAcquireNextImageKHR` acquires a presentable image from `swapchain` that an application **can** use, and sets `pImageIndex` to the index of that image within the swapchain. The presentation engine **may** not have finished reading from the image at the time it is acquired, so the application **must** use `semaphore` and/or `fence` to ensure that the image layout and contents are not

modified until the presentation engine reads have completed. Once `vkAcquireNextImageKHR` successfully acquires an image, the semaphore signal operation referenced by `semaphore`, if not `VK_NULL_HANDLE`, and the fence signal operation referenced by `fence`, if not `VK_NULL_HANDLE`, are submitted for execution. If `vkAcquireNextImageKHR` does not successfully acquire an image, `semaphore` and `fence` are unaffected. The order in which images are acquired is implementation-dependent, and **may** be different than the order the images were presented.

If `timeout` is zero, then `vkAcquireNextImageKHR` does not wait, and will either successfully acquire an image, or fail and return `VK_NOT_READY` if no image is available.

If the specified timeout period expires before an image is acquired, `vkAcquireNextImageKHR` returns `VK_TIMEOUT`. If `timeout` is `UINT64_MAX`, the timeout period is treated as infinite, and `vkAcquireNextImageKHR` will block until an image is acquired or an error occurs.

Let S be the number of images in `swapchain`. Let M be the value of `VkSurfaceCapabilitiesKHR::minImageCount`.

`vkAcquireNextImageKHR` **should** not be called if the number of images that the application has currently acquired is greater than S-M. If `vkAcquireNextImageKHR` is called when the number of images that the application has currently acquired is less than or equal to S-M, `vkAcquireNextImageKHR` **must** return in finite time with an allowed `VkResult` code.

NOTE

Returning a result in finite time guarantees that the implementation cannot deadlock an application, or suspend its execution indefinitely with correct API usage. Acquiring too many images at once may block indefinitely, which is covered by valid usage when attempting to use `UINT64_MAX`. For example, a scenario here is when a compositor holds on to images which are currently being presented, and there are not any vacant images left to be acquired.

If the swapchain images no longer match native surface properties, either `VK_SUBOPTIMAL_KHR` or `VK_ERROR_OUT_OF_DATE_KHR` **must** be returned. If `VK_ERROR_OUT_OF_DATE_KHR` is returned, no image is acquired and attempts to present previously acquired images to the swapchain will also fail with `VK_ERROR_OUT_OF_DATE_KHR`. Applications need to create a new swapchain for the surface to continue presenting if `VK_ERROR_OUT_OF_DATE_KHR` is returned.

NOTE

`VK_SUBOPTIMAL_KHR` **may** happen, for example, if the platform surface has been resized but the platform is able to scale the presented images to the new size to produce valid surface updates. It is up to the application to decide whether it prefers to continue using the current swapchain in this state, or to re-create the swapchain to better match the platform surface properties.

If device loss occurs (see [Lost Device](#)) before the timeout has expired, `vkAcquireNextImageKHR` **must** return in finite time with either one of the allowed success codes, or `VK_ERROR_DEVICE_LOST`.

If `semaphore` is not `VK_NULL_HANDLE`, the semaphore **must** be unsignaled, with no signal or wait operations pending. It will become signaled when the application **can** use the image.

NOTE

Use of `semaphore` allows rendering operations to be recorded and submitted before

the presentation engine has completed its use of the image.

If **fence** is not equal to **VK_NULL_HANDLE**, the fence **must** be unsignaled, with no signal operations pending. It will become signaled when the application **can** use the image.

NOTE

Applications **should** not rely on **vkAcquireNextImageKHR** blocking in order to meter their rendering speed. The implementation **may** return from this function immediately regardless of how many presentation requests are queued, and regardless of when queued presentation requests will complete relative to the call. Instead, applications **can** use **fence** to meter their frame generation work to match the presentation rate.

An application **must** wait until either the **semaphore** or **fence** is signaled before accessing the image's data.

NOTE

When the presentable image will be accessed by some stage S, the recommended idiom for ensuring correct synchronization is:

- The **VkSubmitInfo** used to submit the image layout transition for execution includes **vkAcquireNextImageKHR::semaphore** in its **pWaitSemaphores** member, with the corresponding element of **pWaitDstStageMask** including S.
- The **synchronization command** that performs any necessary image layout transition includes S in both the **srcStageMask** and **dstStageMask**.

After a successful return, the image indicated by **pImageIndex** and its data will be unmodified compared to when it was presented.

NOTE

Exclusive ownership of presentable images corresponding to a swapchain created with **VK_SHARING_MODE_EXCLUSIVE** as defined in **Resource Sharing** is not altered by a call to **vkAcquireNextImageKHR**. That means upon the first acquisition from such a swapchain presentable images are not owned by any queue family, while at subsequent acquisitions the presentable images remain owned by the queue family the image was previously presented on.

The possible return values for **vkAcquireNextImageKHR** depend on the **timeout** provided:

- **VK_SUCCESS** is returned if an image became available.
- **VK_ERROR_SURFACE_LOST_KHR** is returned if the surface becomes no longer available.
- **VK_NOT_READY** is returned if **timeout** is zero and no image was available.
- **VK_TIMEOUT** is returned if **timeout** is greater than zero and less than **UINT64_MAX**, and no image became available within the time allowed.
- **VK_SUBOPTIMAL_KHR** is returned if an image became available, and the swapchain no longer matches the surface properties exactly, but **can** still be used to present to the surface successfully.

NOTE

This **may** happen, for example, if the platform surface has been resized but the

platform is able to scale the presented images to the new size to produce valid surface updates. It is up to the application to decide whether it prefers to continue using the current swapchain indefinitely or temporarily in this state, or to re-create the swapchain to better match the platform surface properties.

- `VK_ERROR_OUT_OF_DATE_KHR` is returned if the surface has changed in such a way that it is no longer compatible with the swapchain, and further presentation requests using the swapchain will fail. Applications **must** query the new surface properties and recreate their swapchain if they wish to continue presenting to the surface.

If the native surface and presented image sizes no longer match, presentation **may** fail. If presentation does succeed, the mapping from the presented image to the native surface is implementation-defined. It is the application's responsibility to detect surface size changes and react appropriately. If presentation fails because of a mismatch in the surface and presented image sizes, a `VK_ERROR_OUT_OF_DATE_KHR` error will be returned.

NOTE

For example, consider a 4x3 window/surface that gets resized to be 3x4 (taller than wider). On some window systems, the portion of the window/surface that was previously and still is visible (the 3x3 part) will contain the same contents as before, while the remaining parts of the window will have undefined contents. Other window systems **may** squash/stretch the image to fill the new window size without any undefined contents, or apply some other mapping.

To acquire an available presentable image to use, and retrieve the index of that image, call:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain
VkResult vkAcquireNextImage2KHR(
    VkDevice device,
    const VkAcquireNextImageInfoKHR* pAcquireInfo,
    uint32_t* pImageIndex);
```

- `device` is the device associated with `swapchain`.
- `pAcquireInfo` is a pointer to a `VkAcquireNextImageInfoKHR` structure containing parameters of the acquire.
- `pImageIndex` is a pointer to a `uint32_t` value specifying the index of the next image to use.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkAcquireNextImage2KHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkAcquireNextImage2KHR-surface-07784

If **forward progress** cannot be guaranteed for the `surface` used to create `swapchain`, the `timeout` member of `pAcquireInfo` **must** not be `UINT64_MAX`

Valid Usage (Implicit)

- VUID-vkAcquireNextImage2KHR-device-parameter **device** must be a valid [VkDevice](#) handle
- VUID-vkAcquireNextImage2KHR-pAcquireInfo-parameter **pAcquireInfo** must be a valid pointer to a valid [VkAcquireNextImageInfoKHR](#) structure
- VUID-vkAcquireNextImage2KHR-pImageIndex-parameter **pImageIndex** must be a valid pointer to a [uint32_t](#) value

Return Codes

Success

- [VK_NOT_READY](#)
- [VK_SUBOPTIMAL_KHR](#)
- [VK_SUCCESS](#)
- [VK_TIMEOUT](#)

Failure

- [VK_ERROR_DEVICE_LOST](#)
- [VK_ERROR_OUT_OF_DATE_KHR](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_SURFACE_LOST_KHR](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkAcquireNextImageInfoKHR](#) structure is defined as:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain
typedef struct VkAcquireNextImageInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkSwapchainKHR     swapchain;
    uint64_t           timeout;
    VkSemaphore         semaphore;
    VkFence             fence;
    uint32_t           deviceMask;
} VkAcquireNextImageInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is [NULL](#) or a pointer to a structure extending this structure.

- **swapchain** is a non-retired swapchain from which an image is acquired.
- **timeout** specifies how long the function waits, in nanoseconds, if no image is available.
- **semaphore** is **VK_NULL_HANDLE** or a semaphore to signal.
- **fence** is **VK_NULL_HANDLE** or a fence to signal.
- **deviceMask** is a mask of physical devices for which the swapchain image will be ready to use when the semaphore or fence is signaled.

If **vkAcquireNextImageKHR** is used, the device mask is considered to include all physical devices in the logical device.

NOTE

vkAcquireNextImage2KHR signals at most one semaphore, even if the application requests waiting for multiple physical devices to be ready via the **deviceMask**. However, only a single physical device **can** wait on that semaphore, since the semaphore becomes unsignaled when the wait succeeds. For other physical devices to wait for the image to be ready, it is necessary for the application to submit semaphore signal operation(s) to that first physical device to signal additional semaphore(s) after the wait succeeds, which the other physical device(s) **can** wait upon.

Valid Usage

- VUID-VkAcquireNextImageInfoKHR-swapchain-01675
swapchain **must** not be in the retired state
- VUID-VkAcquireNextImageInfoKHR-semaphore-01288
If **semaphore** is not **VK_NULL_HANDLE**, it **must** be unsignaled
- VUID-VkAcquireNextImageInfoKHR-semaphore-01781
If **semaphore** is not **VK_NULL_HANDLE**, it **must** not have any uncompleted signal or wait operations pending
- VUID-VkAcquireNextImageInfoKHR-fence-01289
If **fence** is not **VK_NULL_HANDLE**, **fence** **must** be unsignaled
- VUID-VkAcquireNextImageInfoKHR-fence-10067
If **fence** is not **VK_NULL_HANDLE**, **fence** **must** not be associated with any other queue command that has not yet completed execution on that queue
- VUID-VkAcquireNextImageInfoKHR-semaphore-01782
semaphore and **fence** **must** not both be equal to **VK_NULL_HANDLE**
- VUID-VkAcquireNextImageInfoKHR-deviceMask-01290
deviceMask **must** be a valid device mask
- VUID-VkAcquireNextImageInfoKHR-deviceMask-01291
deviceMask **must** not be zero
- VUID-VkAcquireNextImageInfoKHR-semaphore-03266
semaphore **must** have a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_BINARY**

Valid Usage (Implicit)

- VUID-VkAcquireNextImageInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_ACQUIRE_NEXT_IMAGE_INFO_KHR`
- VUID-VkAcquireNextImageInfoKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkAcquireNextImageInfoKHR-swapchain-parameter
`swapchain` **must** be a valid `VkSwapchainKHR` handle
- VUID-VkAcquireNextImageInfoKHR-semaphore-parameter
If `semaphore` is not `VK_NULL_HANDLE`, `semaphore` **must** be a valid `VkSemaphore` handle
- VUID-VkAcquireNextImageInfoKHR-fence-parameter
If `fence` is not `VK_NULL_HANDLE`, `fence` **must** be a valid `VkFence` handle
- VUID-VkAcquireNextImageInfoKHR-commonparent
Each of `fence`, `semaphore`, and `swapchain` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `swapchain` **must** be externally synchronized
- Host access to `semaphore` **must** be externally synchronized
- Host access to `fence` **must** be externally synchronized

After queueing all rendering commands and transitioning the image to the correct layout, to queue an image for presentation, call:

```
// Provided by VK_KHR_swapchain
VkResult vkQueuePresentKHR(
    VkQueue queue,
    const VkPresentInfoKHR* pPresentInfo);
```

- `queue` is a queue that is capable of presentation to the target surface's platform on the same device as the image's swapchain.
- `pPresentInfo` is a pointer to a `VkPresentInfoKHR` structure specifying parameters of the presentation.

NOTE

There is no requirement for an application to present images in the same order that they were acquired - applications can arbitrarily present any image that is currently acquired.

NOTE

The origin of the native orientation of the surface coordinate system is not specified in the Vulkan specification; it depends on the platform. For most platforms the

origin is by default upper-left, meaning the pixel of the presented `VkImage` at coordinates (0,0) would appear at the upper left pixel of the platform surface (assuming `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR`, and the display standing the right way up).

The result codes `VK_ERROR_OUT_OF_DATE_KHR` and `VK_SUBOPTIMAL_KHR` have the same meaning when returned by `vkQueuePresentKHR` as they do when returned by `vkAcquireNextImageKHR`. If multiple swapchains are presented, the result code is determined by applying the following rules in order:

- If the device is lost, `VK_ERROR_DEVICE_LOST` is returned.
- If any of the target surfaces are no longer available the error `VK_ERROR_SURFACE_LOST_KHR` is returned.
- If any of the presents would have a result of `VK_ERROR_OUT_OF_DATE_KHR` if issued separately then `VK_ERROR_OUT_OF_DATE_KHR` is returned.
- If any of the presents would have a result of `VK_SUBOPTIMAL_KHR` if issued separately then `VK_SUBOPTIMAL_KHR` is returned.
- Otherwise `VK_SUCCESS` is returned.

Any writes to memory backing the images referenced by the `pImageIndices` and `pSwapchains` members of `pPresentInfo`, that are available before `vkQueuePresentKHR` is executed, are automatically made visible to the read access performed by the presentation engine. This automatic visibility operation for an image happens-after the semaphore signal operation, and happens-before the presentation engine accesses the image.

Presentation is a read-only operation that will not affect the content of the presentable images. Upon reacquiring the image and transitioning it away from the `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` layout, the contents will be the same as they were prior to transitioning the image to the present source layout and presenting it. However, if a mechanism other than Vulkan is used to modify the platform window associated with the swapchain, the content of all presentable images in the swapchain becomes undefined.

Calls to `vkQueuePresentKHR` **may** block, but **must** return in finite time. The processing of the presentation happens in issue order with other queue operations, but semaphores **must** be used to ensure that prior rendering and other commands in the specified queue complete before the presentation begins. The presentation command itself does not delay processing of subsequent commands on the queue. However, presentation requests sent to a particular queue are always performed in order. Exact presentation timing is controlled by the semantics of the presentation engine and native platform in use.

If an image is presented to a swapchain created from a display surface, the mode of the associated display will be updated, if necessary, to match the mode specified when creating the display surface. The mode switch and presentation of the specified image will be performed as one atomic operation.

Queueing an image for presentation defines a set of *queue operations*, including waiting on the semaphores and submitting a presentation request to the presentation engine. However, the scope of this set of queue operations does not include the actual processing of the image by the

presentation engine.

Regarding interaction with `vkQueueWaitIdle`, `vkQueuePresentKHR` behaves as if it signals a fence payload that is managed by the implementation and that has no associated `VkFence` handle. The fence will signal after all such queue operations have completed, and after the presentation engine has taken a reference to the payloads of all objects that the presentation engine accesses as part of the present operation. The fence **may** not wait for the present operation to complete.

If `vkQueuePresentKHR` fails to enqueue the corresponding set of queue operations, it **may** return `VK_ERROR_OUT_OF_HOST_MEMORY` or `VK_ERROR_OUT_OF_DEVICE_MEMORY`. If it does, the implementation **must** ensure that the state and contents of any resources or synchronization primitives referenced is unaffected by the call or its failure.

If `vkQueuePresentKHR` fails in such a way that the implementation is unable to make that guarantee, the implementation **must** return `VK_ERROR_DEVICE_LOST`.

However, if the presentation request is rejected by the presentation engine with an error `VK_ERROR_OUT_OF_DATE_KHR`, or `VK_ERROR_SURFACE_LOST_KHR`, the set of queue operations are still considered to be enqueued and thus any semaphore wait operation specified in `VkPresentInfoKHR` will execute when the corresponding queue operation is complete.

`vkQueuePresentKHR` releases the acquisition of the images referenced by `imageIndices`. The queue family corresponding to the queue `vkQueuePresentKHR` is executed on **must** have ownership of the presented images as defined in [Resource Sharing](#). `vkQueuePresentKHR` does not alter the queue family ownership, but the presented images **must** not be used again before they have been reacquired using `vkAcquireNextImageKHR`.

NOTE

The application **can** continue to present any acquired images from a retired swapchain as long as the swapchain has not entered a state that causes `vkQueuePresentKHR` to return `VK_ERROR_OUT_OF_DATE_KHR`.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkQueuePresentKHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkQueuePresentKHR-pSwapchains-01292
Each element of `pSwapchains` member of `pPresentInfo` **must** be a swapchain that is created for a surface for which presentation is supported from `queue` as determined using a call to `vkGetPhysicalDeviceSurfaceSupportKHR`
- VUID-vkQueuePresentKHR-pSwapchains-01293
If more than one member of `pSwapchains` was created from a display surface, all display surfaces referenced that refer to the same display **must** use the same display mode
- VUID-vkQueuePresentKHR-pWaitSemaphores-01294
When a semaphore wait operation referring to a binary semaphore defined by the elements of the `pWaitSemaphores` member of `pPresentInfo` executes on `queue`, there **must** be no other queues waiting on the same semaphore

- VUID-vkQueuePresentKHR-pWaitSemaphores-03267

All elements of the `pWaitSemaphores` member of `pPresentInfo` **must** be created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`

- VUID-vkQueuePresentKHR-pWaitSemaphores-03268

All elements of the `pWaitSemaphores` member of `pPresentInfo` **must** reference a semaphore signal operation that has been submitted for execution and any `semaphore signal operations` on which it depends **must** have also been submitted for execution

Valid Usage (Implicit)

- VUID-vkQueuePresentKHR-queue-parameter
`queue` **must** be a valid `VkQueue` handle
- VUID-vkQueuePresentKHR-pPresentInfo-parameter
`pPresentInfo` **must** be a valid pointer to a valid `VkPresentInfoKHR` structure

Host Synchronization

- Host access to `queue` **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
-	-	Any	-

Return Codes

Success

- `VK_SUBOPTIMAL_KHR`
- `VK_SUCCESS`

Failure

- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DATE_KHR`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkPresentInfoKHR` structure is defined as:

```
// Provided by VK_KHR_swapchain
typedef struct VkPresentInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           waitSemaphoreCount;
    const VkSemaphore* pWaitSemaphores;
    uint32_t           swapchainCount;
    const VkSwapchainKHR* pSwapchains;
    const uint32_t*     pImageIndices;
    VkResult*          pResults;
} VkPresentInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `waitSemaphoreCount` is the number of semaphores to wait for before issuing the present request. The number **may** be zero.
- `pWaitSemaphores` is `NULL` or a pointer to an array of `VkSemaphore` objects with `waitSemaphoreCount` entries, and specifies the semaphores to wait for before issuing the present request.
- `swapchainCount` is the number of swapchains being presented to by this command.
- `pSwapchains` is a pointer to an array of `VkSwapchainKHR` objects with `swapchainCount` entries.
- `pImageIndices` is a pointer to an array of indices into the array of each swapchain's presentable images, with `swapchainCount` entries. Each entry in this array identifies the image to present on the corresponding entry in the `pSwapchains` array.
- `pResults` is a pointer to an array of `VkResult` typed elements with `swapchainCount` entries. Applications that do not need per-swapchain results **can** use `NULL` for `pResults`. If non-`NULL`, each entry in `pResults` will be set to the `VkResult` for presenting the swapchain corresponding to the same index in `pSwapchains`.

Before an application **can** present an image, the image's layout **must** be transitioned to the `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` layout, or for a shared presentable image the `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` layout.

NOTE

When transitioning the image to the appropriate layout, there is no need to delay subsequent processing, or perform any visibility operations (as `vkQueuePresentKHR` performs automatic visibility operations). To achieve this, the `dstAccessMask` member of the `VkImageMemoryBarrier` **should** be `0`, and the `dstStageMask` parameter **should** be `VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT`.

Valid Usage

- VUID-VkPresentInfoKHR-pSwapchain-09231
Elements of `pSwapchain` **must** be unique

- VUID-VkPresentInfoKHR-pImageIndices-01430

Each element of **pImageIndices** **must** be the index of a presentable image acquired from the swapchain specified by the corresponding element of the **pSwapchains** array, and the presented image subresource **must** be in the **VK_IMAGE_LAYOUT_PRESENT_SRC_KHR** or **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR** layout at the time the operation is executed on a **VkDevice**

Valid Usage (Implicit)

- VUID-VkPresentInfoKHR-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_PRESENT_INFO_KHR**
- VUID-VkPresentInfoKHR-pNext-pNext
Each **pNext** member of any structure (including this one) in the **pNext** chain **must** be either **NULL** or a pointer to a valid instance of **VkDeviceGroupPresentInfoKHR**, **VkDisplayPresentInfoKHR**, or **VkPresentRegionsKHR**
- VUID-VkPresentInfoKHR-sType-unique
The **sType** value of each structure in the **pNext** chain **must** be unique
- VUID-VkPresentInfoKHR-pWaitSemaphores-parameter
If **waitSemaphoreCount** is not 0, **pWaitSemaphores** **must** be a valid pointer to an array of **waitSemaphoreCount** valid **VkSemaphore** handles
- VUID-VkPresentInfoKHR-pSwapchains-parameter
pSwapchains **must** be a valid pointer to an array of **swapchainCount** valid **VkSwapchainKHR** handles
- VUID-VkPresentInfoKHR-pImageIndices-parameter
pImageIndices **must** be a valid pointer to an array of **swapchainCount** **uint32_t** values
- VUID-VkPresentInfoKHR-pResults-parameter
If **pResults** is not **NULL**, **pResults** **must** be a valid pointer to an array of **swapchainCount** **VkResult** values
- VUID-VkPresentInfoKHR-swapchainCount-arraylength
swapchainCount **must** be greater than 0
- VUID-VkPresentInfoKHR-commonparent
Both of the elements of **pSwapchains**, and the elements of **pWaitSemaphores** that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same **VkDevice**

Host Synchronization

- Host access to each member of **pWaitSemaphores** **must** be externally synchronized
- Host access to each member of **pSwapchains** **must** be externally synchronized

When the **VK_KHR_incremental_present** extension is enabled, additional fields **can** be specified that

allow an application to specify that only certain rectangular regions of the presentable images of a swapchain are changed. This is an optimization hint that a presentation engine **may** use to only update the region of a surface that is actually changing. The application still **must** ensure that all pixels of a presented image contain the desired values, in case the presentation engine ignores this hint. An application **can** provide this hint by adding a `VkPresentRegionsKHR` structure to the `pNext` chain of the `VkPresentInfoKHR` structure.

The `VkPresentRegionsKHR` structure is defined as:

```
// Provided by VK_KHR_incremental_present
typedef struct VkPresentRegionsKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           swapchainCount;
    const VkPresentRegionKHR* pRegions;
} VkPresentRegionsKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchainCount` is the number of swapchains being presented to by this command.
- `pRegions` is `NULL` or a pointer to an array of `VkPresentRegionKHR` elements with `swapchainCount` entries. If not `NULL`, each element of `pRegions` contains the region that has changed since the last present to the swapchain in the corresponding entry in the `VkPresentInfoKHR::pSwapchains` array.

Valid Usage

- VUID-VkPresentRegionsKHR-swapchainCount-01260
`swapchainCount` **must** be the same value as `VkPresentInfoKHR::swapchainCount`, where `VkPresentInfoKHR` is included in the `pNext` chain of this `VkPresentRegionsKHR` structure

Valid Usage (Implicit)

- VUID-VkPresentRegionsKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PRESENT_REGIONS_KHR`
- VUID-VkPresentRegionsKHR-pRegions-parameter
If `pRegions` is not `NULL`, `pRegions` **must** be a valid pointer to an array of `swapchainCount` valid `VkPresentRegionKHR` structures
- VUID-VkPresentRegionsKHR-swapchainCount-arraylength
`swapchainCount` **must** be greater than 0

For a given image and swapchain, the region to present is specified by the `VkPresentRegionKHR` structure, which is defined as:

```
// Provided by VK_KHR_incremental_present
typedef struct VkPresentRegionKHR {
    uint32_t      rectangleCount;
    const VkRectLayerKHR* pRectangles;
} VkPresentRegionKHR;
```

- **rectangleCount** is the number of rectangles in **pRectangles**, or zero if the entire image has changed and should be presented.
- **pRectangles** is either **NULL** or a pointer to an array of **VkRectLayerKHR** structures. The **VkRectLayerKHR** structure is the framebuffer coordinates, plus layer, of a portion of a presentable image that has changed and **must** be presented. If non-**NULL**, each entry in **pRectangles** is a rectangle of the given image that has changed since the last image was presented to the given swapchain. The rectangles **must** be specified relative to **VkSurfaceCapabilitiesKHR::currentTransform**, regardless of the swapchain's **preTransform**. The presentation engine will apply the **preTransform** transformation to the rectangles, along with any further transformation it applies to the image content.

Valid Usage (Implicit)

- VUID-VkPresentRegionKHR-pRectangles-parameter
If **rectangleCount** is not 0, and **pRectangles** is not **NULL**, **pRectangles** **must** be a valid pointer to an array of **rectangleCount** valid **VkRectLayerKHR** structures

The **VkRectLayerKHR** structure is defined as:

```
// Provided by VK_KHR_incremental_present
typedef struct VkRectLayerKHR {
    VkOffset2D    offset;
    VkExtent2D    extent;
    uint32_t      layer;
} VkRectLayerKHR;
```

- **offset** is the origin of the rectangle, in pixels.
- **extent** is the size of the rectangle, in pixels.
- **layer** is the layer of the image. For images with only one layer, the value of **layer** **must** be 0.

Some platforms allow the size of a surface to change, and then scale the pixels of the image to fit the surface. **VkRectLayerKHR** specifies pixels of the swapchain's image(s), which will be constant for the life of the swapchain.

Valid Usage

- VUID-VkRectLayerKHR-offset-04864
The sum of **offset** and **extent**, after being transformed according to the **preTransform**

member of the [VkSwapchainCreateInfoKHR](#) structure, **must** be no greater than the [imageExtent](#) member of the [VkSwapchainCreateInfoKHR](#) structure passed to [vkCreateSwapchainKHR](#)

- VUID-VkRectLayerKHR-layer-01262

[layer](#) **must** be less than the [imageArrayLayers](#) member of the [VkSwapchainCreateInfoKHR](#) structure passed to [vkCreateSwapchainKHR](#)

When the [VK_KHR_display_swapchain](#) extension is enabled, additional fields **can** be specified when presenting an image to a swapchain by setting [VkPresentInfoKHR::pNext](#) to point to a [VkDisplayPresentInfoKHR](#) structure.

The [VkDisplayPresentInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_display_swapchain
typedef struct VkDisplayPresentInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkRect2D           srcRect;
    VkRect2D           dstRect;
    VkBool32           persistent;
} VkDisplayPresentInfoKHR;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [srcRect](#) is a rectangular region of pixels to present. It **must** be a subset of the image being presented. If [VkDisplayPresentInfoKHR](#) is not specified, this region will be assumed to be the entire presentable image.
- [dstRect](#) is a rectangular region within the visible region of the swapchain's display mode. If [VkDisplayPresentInfoKHR](#) is not specified, this region will be assumed to be the entire visible region of the swapchain's mode. If the specified rectangle is a subset of the display mode's visible region, content from display planes below the swapchain's plane will be visible outside the rectangle. If there are no planes below the swapchain's, the area outside the specified rectangle will be black. If portions of the specified rectangle are outside of the display's visible region, pixels mapping only to those portions of the rectangle will be discarded.
- [persistent](#): If this is [VK_TRUE](#), the display engine will enable buffered mode on displays that support it. This allows the display engine to stop sending content to the display until a new image is presented. The display will instead maintain a copy of the last presented image. This allows less power to be used, but **may** increase presentation latency. If [VkDisplayPresentInfoKHR](#) is not specified, persistent mode will not be used.

If the extent of the [srcRect](#) and [dstRect](#) are not equal, the presented pixels will be scaled accordingly.

Valid Usage

- VUID-VkDisplayPresentInfoKHR-srcRect-01257
`srcRect` **must** specify a rectangular region that is a subset of the image being presented
- VUID-VkDisplayPresentInfoKHR-dstRect-01258
`dstRect` **must** specify a rectangular region that is a subset of the `visibleRegion` parameter of the display mode the swapchain being presented uses
- VUID-VkDisplayPresentInfoKHR-persistentContent-01259
If the `persistentContent` member of the `VkDisplayPropertiesKHR` structure returned by `vkGetPhysicalDeviceDisplayPropertiesKHR` for the display the present operation targets is `VK_FALSE`, then `persistent` **must** be `VK_FALSE`

Valid Usage (Implicit)

- VUID-VkDisplayPresentInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_PRESENT_INFO_KHR`

If the `pNext` chain of `VkPresentInfoKHR` includes a `VkDeviceGroupPresentInfoKHR` structure, then that structure includes an array of device masks and a device group present mode.

The `VkDeviceGroupPresentInfoKHR` structure is defined as:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain
typedef struct VkDeviceGroupPresentInfoKHR {
    VkStructureType             sType;
    const void*                 pNext;
    uint32_t                    swapchainCount;
    const uint32_t*              pDeviceMasks;
    VkDeviceGroupPresentModeFlagsKHR mode;
} VkDeviceGroupPresentInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchainCount` is zero or the number of elements in `pDeviceMasks`.
- `pDeviceMasks` is a pointer to an array of device masks, one for each element of `VkPresentInfoKHR::pSwapchains`.
- `mode` is a `VkDeviceGroupPresentModeFlagsKHR` value specifying the device group present mode that will be used for this present.

If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`, then each element of `pDeviceMasks` selects which instance of the swapchain image is presented. Each element of `pDeviceMasks` **must** have exactly one bit set, and the corresponding physical device **must** have a presentation engine as reported by `VkDeviceGroupPresentCapabilitiesKHR`.

If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR`, then each element of `pDeviceMasks` selects which instance of the swapchain image is presented. Each element of `pDeviceMasks` **must** have exactly one bit set, and some physical device in the logical device **must** include that bit in its `VkDeviceGroupPresentCapabilitiesKHR::presentMask`.

If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR`, then each element of `pDeviceMasks` selects which instances of the swapchain image are component-wise summed and the sum of those images is presented. If the sum in any component is outside the representable range, the value of that component is undefined. Each element of `pDeviceMasks` **must** have a value for which all set bits are set in one of the elements of `VkDeviceGroupPresentCapabilitiesKHR::presentMask`.

If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR`, then each element of `pDeviceMasks` selects which instance(s) of the swapchain images are presented. For each bit set in each element of `pDeviceMasks`, the corresponding physical device **must** have a presentation engine as reported by `VkDeviceGroupPresentCapabilitiesKHR`.

If `VkDeviceGroupPresentInfoKHR` is not provided or `swapchainCount` is zero then the masks are considered to be 1. If `VkDeviceGroupPresentInfoKHR` is not provided, `mode` is considered to be `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`.

Valid Usage

- VUID-VkDeviceGroupPresentInfoKHR-swapchainCount-01297
`swapchainCount` **must** equal 0 or `VkPresentInfoKHR::swapchainCount`
- VUID-VkDeviceGroupPresentInfoKHR-mode-01298
If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`, then each element of `pDeviceMasks` **must** have exactly one bit set, and the corresponding element of `VkDeviceGroupPresentCapabilitiesKHR::presentMask` **must** be non-zero
- VUID-VkDeviceGroupPresentInfoKHR-mode-01299
If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR`, then each element of `pDeviceMasks` **must** have exactly one bit set, and some physical device in the logical device **must** include that bit in its `VkDeviceGroupPresentCapabilitiesKHR::presentMask`
- VUID-VkDeviceGroupPresentInfoKHR-mode-01300
If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR`, then each element of `pDeviceMasks` **must** have a value for which all set bits are set in one of the elements of `VkDeviceGroupPresentCapabilitiesKHR::presentMask`
- VUID-VkDeviceGroupPresentInfoKHR-mode-01301
If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR`, then for each bit set in each element of `pDeviceMasks`, the corresponding element of `VkDeviceGroupPresentCapabilitiesKHR::presentMask` **must** be non-zero
- VUID-VkDeviceGroupPresentInfoKHR-pDeviceMasks-01302
The value of each element of `pDeviceMasks` **must** be equal to the device mask passed in `VkAcquireNextImageInfoKHR::deviceMask` when the image index was last acquired
- VUID-VkDeviceGroupPresentInfoKHR-mode-01303
`mode` **must** have exactly one bit set, and that bit **must** have been included in `VkDeviceGroupSwapchainCreateInfoKHR::modes`

Valid Usage (Implicit)

- VUID-VkDeviceGroupPresentInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_INFO_KHR`
- VUID-VkDeviceGroupPresentInfoKHR-pDeviceMasks-parameter
If `swapchainCount` is not 0, `pDeviceMasks` **must** be a valid pointer to an array of `swapchainCount` `uint32_t` values
- VUID-VkDeviceGroupPresentInfoKHR-mode-parameter
`mode` **must** be a valid `VkDeviceGroupPresentModeFlagBitsKHR` value

31.8. HDR Metadata

This section describes how to improve color reproduction of content to better reproduce colors as seen on the display used to originally optimize the content.

To provide HDR metadata to an implementation, call:

```
// Provided by VK_EXT_hdr_metadata
void vkSetHdrMetadataEXT(
    VkDevice          device,
    uint32_t          swapchainCount,
    const VkSwapchainKHR* pSwapchains,
    const VkHdrMetadataEXT* pMetadata);
```

- `device` is the logical device where the swapchain(s) were created.
- `swapchainCount` is the number of swapchains included in `pSwapchains`.
- `pSwapchains` is a pointer to an array of `swapchainCount` `VkSwapchainKHR` handles.
- `pMetadata` is a pointer to an array of `swapchainCount` `VkHdrMetadataEXT` structures.

The metadata will be applied to the specified `VkSwapchainKHR` objects at the next `vkQueuePresentKHR` call using that `VkSwapchainKHR` object. The metadata will persist until a subsequent `vkSetHdrMetadataEXT` changes it.

Valid Usage (Implicit)

- VUID-vkSetHdrMetadataEXT-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkSetHdrMetadataEXT-pSwapchains-parameter
`pSwapchains` **must** be a valid pointer to an array of `swapchainCount` valid `VkSwapchainKHR` handles
- VUID-vkSetHdrMetadataEXT-pMetadata-parameter
`pMetadata` **must** be a valid pointer to an array of `swapchainCount` valid `VkHdrMetadataEXT` structures

- VUID-vkSetHdrMetadataEXT-swapchainCount-arraylength
`swapchainCount` **must** be greater than 0
- VUID-vkSetHdrMetadataEXT-pSwapchains-parent
Each element of `pSwapchains` **must** have been created, allocated, or retrieved from `device`

The `VkHdrMetadataEXT` structure is defined as:

```
// Provided by VK_EXT_hdr_metadata
typedef struct VkHdrMetadataEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkXYColorEXT       displayPrimaryRed;
    VkXYColorEXT       displayPrimaryGreen;
    VkXYColorEXT       displayPrimaryBlue;
    VkXYColorEXT       whitePoint;
    float              maxLuminance;
    float              minLuminance;
    float              maxContentLightLevel;
    float              maxFrameAverageLightLevel;
} VkHdrMetadataEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `displayPrimaryRed` is a `VkXYColorEXT` structure specifying the red primary of the display used to optimize the content
- `displayPrimaryGreen` is a `VkXYColorEXT` structure specifying the green primary of the display used to optimize the content
- `displayPrimaryBlue` is a `VkXYColorEXT` structure specifying the blue primary of the display used to optimize the content
- `whitePoint` is a `VkXYColorEXT` structure specifying the white-point of the display used to optimize the content
- `maxLuminance` is the maximum luminance of the display used to optimize the content in nits
- `minLuminance` is the minimum luminance of the display used to optimize the content in nits
- `maxContentLightLevel` is the value in nits of the desired luminance for the brightest pixels in the displayed image.
- `maxFrameAverageLightLevel` is the value in nits of the average luminance of the frame which has the brightest average luminance anywhere in the content.

If any of the above values are unknown, they **can** be set to 0.

NOTE	The meta-data provided here is intended to be used as defined in the SMPTE 2086, CTA 861.3 and CIE 15:2004 specifications. The validity and use of this data is outside the scope of Vulkan.

Valid Usage (Implicit)

- VUID-VkHdrMetadataEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_HDR_METADATA_EXT`
- VUID-VkHdrMetadataEXT-pNext-pNext
`pNext` **must** be `NULL`

The `VkXYColorEXT` structure is defined as:

```
// Provided by VK_EXT_hdr_metadata
typedef struct VkXYColorEXT {
    float    x;
    float    y;
} VkXYColorEXT;
```

- `x` is the x chromaticity coordinate.
- `y` is the y chromaticity coordinate.

Chromaticity coordinates are as specified in CIE 15:2004 “Calculation of chromaticity coordinates” (Section 7.3) and are limited to between 0 and 1 for real colors.

Chapter 32. Extending Vulkan

New functionality **may** be added to Vulkan via either new extensions or new versions of the core, or new versions of an extension in some cases.

This chapter describes how Vulkan is versioned, how compatibility is affected between different versions, and compatibility rules that are followed by the Vulkan Working Group.

32.1. Functionality Levels

Functionality in Vulkan is divided into several different levels; global, instance-level, physical-device-level, and device-level.

- [VkInstance](#) and any objects created from a [VkInstance](#) other than [VkPhysicalDevice](#) are instance-level.
- [VkPhysicalDevice](#) is the only physical-device-level object.
- [VkDevice](#) and any objects created from a [VkDevice](#) are device-level.

The level of a command is the same as the level of its first parameter - if the first parameter is not a [dispatchable handle](#), it is a global command. Different levels of functionality **may** be advertised in different ways.

32.2. Instance and Device Versions

Starting with Vulkan 1.1, there are separate versions advertised for the Vulkan instance, and for each device supported on the system. This allows a system with multiple devices to advertise all devices at their full capabilities, even if those devices do not support the same version of Vulkan.

The instance version indicates which global and instance-level functionality is supported, while each device version indicates the physical-device-level and device-level functionality supported.

The instance version **can** be queried by calling [vkEnumerateInstanceVersion](#). Querying for this function via [vkGetInstanceProcAddr](#) will return [NULL](#) on implementations that only support Vulkan 1.0 functionality.

The device version **can** be queried by calling [vkGetPhysicalDeviceProperties](#) or [vkGetPhysicalDeviceProperties2](#), and is returned in [VkPhysicalDeviceProperties::apiVersion](#), encoded as described in [Version Numbers](#).

32.3. Core Versions

The Vulkan Specification is regularly updated with bug fixes and clarifications. Occasionally new functionality is added to the core and at some point it is expected that there will be a desire to perform a large, breaking change to the API. In order to indicate to developers how and when these changes are made to the specification, and to provide a way to identify each set of changes, the Vulkan API maintains a version number.

32.3.1. Version Numbers

The Vulkan version number comprises four parts indicating the variant, major, minor and patch version of the Vulkan API Specification.

The *variant* indicates the variant of the Vulkan API supported by the implementation. This is always 1 for the Vulkan SC API. The Base Vulkan API is variant 0.

NOTE

A non-zero variant indicates the API is a variant of the Vulkan API and applications will typically need to be modified to run against it. The variant field was a later addition to the version number, added in version 1.2.175 of the Base Vulkan Specification.

The *major version* indicates a significant change in the API, which will encompass a wholly new version of the specification.

The *minor version* indicates the incorporation of new functionality into the core specification.

The *patch version* indicates bug fixes, clarifications, and language improvements have been incorporated into the specification.

Compatibility guarantees made about versions of the API sharing any of the same version numbers are documented in [Core Versions](#)

The version number is used in several places in the API. In each such use, the version numbers are packed into a 32-bit integer as follows:

- The variant is a 3-bit integer packed into bits 31-29.
- The major version is a 7-bit integer packed into bits 28-22.
- The minor version number is a 10-bit integer packed into bits 21-12.
- The patch version number is a 12-bit integer packed into bits 11-0.

VK_API_VERSION_VARIANT extracts the API variant number from a packed version number:

```
// Provided by VK_VERSION_1_0
#define VK_API_VERSION_VARIANT(version) ((uint32_t)(version) >> 29U)
```

VK_API_VERSION_MAJOR extracts the API major version number from a packed version number:

```
// Provided by VK_VERSION_1_0
#define VK_API_VERSION_MAJOR(version) (((uint32_t)(version) >> 22U) & 0x7FU)
```

VK_API_VERSION_MINOR extracts the API minor version number from a packed version number:

```
// Provided by VK_VERSION_1_0
#define VK_API_VERSION_MINOR(version) (((uint32_t)(version) >> 12U) & 0x3FFU)
```

VK_API_VERSION_PATCH extracts the API patch version number from a packed version number:

```
// Provided by VK_VERSION_1_0
#define VK_API_VERSION_PATCH(version) (((uint32_t)(version) & 0xFFU)
```

VK_MAKE_API_VERSION constructs an API version number.

```
// Provided by VK_VERSION_1_0
#define VK_MAKE_API_VERSION(variant, major, minor, patch) \
    (((uint32_t)(variant)) << 29U) | (((uint32_t)(major)) << 22U) | \
    (((uint32_t)(minor)) << 12U) | ((uint32_t)(patch)))
```

- **variant** is the variant number.
- **major** is the major version number.
- **minor** is the minor version number.
- **patch** is the patch version number.

VK_API_VERSION_1_0 returns the API version number for Vulkan 1.0.0.

```
// Provided by VK_VERSION_1_0
// Vulkan 1.0 version number
#define VK_API_VERSION_1_0 VK_MAKE_API_VERSION(0, 1, 0, 0)// Patch version should always be set to 0
```

VK_API_VERSION_1_1 returns the API version number for Vulkan 1.1.0.

```
// Provided by VK_VERSION_1_1
// Vulkan 1.1 version number
#define VK_API_VERSION_1_1 VK_MAKE_API_VERSION(0, 1, 1, 0)// Patch version should always be set to 0
```

VK_API_VERSION_1_2 returns the API version number for Vulkan 1.2.0.

```
// Provided by VK_VERSION_1_2
// Vulkan 1.2 version number
#define VK_API_VERSION_1_2 VK_MAKE_API_VERSION(0, 1, 2, 0)// Patch version should always be set to 0
```

VKSC_API_VARIANT returns the API variant number for Vulkan SC.

```
// Provided by VKSC_VERSION_1_0
// Vulkan SC variant number
#define VKSC_API_VARIANT 1
```

`VKSC_API_VERSION_1_0` returns the API version number for Vulkan SC 1.0.0.

```
// Provided by VKSC_VERSION_1_0
// Vulkan SC 1.0 version number
#define VKSC_API_VERSION_1_0 VK_MAKE_API_VERSION(VKSC_API_VARIANT, 1, 0, 0) // Patch
version should always be set to 0
```

32.4. Layers

When a layer is enabled, it inserts itself into the call chain for Vulkan commands the layer is interested in. Layers **can** be used for a variety of tasks that extend the base behavior of Vulkan beyond what is required by the specification - such as call logging, tracing, validation, or providing additional extensions.

NOTE

For example, an implementation is not expected to check that the value of enums used by the application fall within allowed ranges. Instead, a validation layer would do those checks and flag issues. This avoids a performance penalty during production use of the application because those layers would not be enabled in production.

NOTE

Vulkan layers **may** wrap object handles (i.e. return a different handle value to the application than that generated by the implementation). This is generally discouraged, as it increases the probability of incompatibilities with new extensions. The validation layers wrap handles in order to track the proper use and destruction of each object. See the [“Architecture of the Vulkan Loader Interfaces”](#) document for additional information.

To query the available layers, call:

```
// Provided by VK_VERSION_1_0
VkResult vkEnumerateInstanceLayerProperties(
    uint32_t*                pPropertyCount,
    VkLayerProperties*        pProperties);
```

- `pPropertyCount` is a pointer to an integer related to the number of layer properties available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkLayerProperties` structures.

If `pProperties` is `NULL`, then the number of layer properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` **must** point to a variable set by the application to the number of elements

in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of layer properties available, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

The list of available layers may change at any time due to actions outside of the Vulkan implementation, so two calls to `vkEnumerateInstanceLayerProperties` with the same parameters **may** return different results, or retrieve different `pPropertyCount` values or `pProperties` contents. Once an instance has been created, the layers enabled for that instance will continue to be enabled and valid for the lifetime of that instance, even if some of them become unavailable for future instances.

Valid Usage (Implicit)

- VUID-vkEnumerateInstanceLayerProperties-pPropertyCount-parameter
`pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkEnumerateInstanceLayerProperties-pProperties-parameter
If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkLayerProperties` structures

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkLayerProperties` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkLayerProperties {
    char        layerName[VK_MAX_EXTENSION_NAME_SIZE];
    uint32_t    specVersion;
    uint32_t    implementationVersion;
    char        description[VK_MAX_DESCRIPTION_SIZE];
} VkLayerProperties;
```

- `layerName` is an array of `VK_MAX_EXTENSION_NAME_SIZE` `char` containing a null-terminated UTF-8 string which is the name of the layer. Use this name in the `ppEnabledLayerNames` array passed in

the [VkInstanceCreateInfo](#) structure to enable this layer for an instance.

- **specVersion** is the Vulkan version the layer was written to, encoded as described in [Version Numbers](#).
- **implementationVersion** is the version of this layer. It is an integer, increasing with backward compatible changes.
- **description** is an array of **VK_MAX_DESCRIPTION_SIZE** **char** containing a null-terminated UTF-8 string which provides additional details that **can** be used by the application to identify the layer.

VK_MAX_EXTENSION_NAME_SIZE is the length in **char** values of an array containing a layer or extension name string, as returned in [VkLayerProperties::layerName](#), [VkExtensionProperties::extensionName](#), and other queries.

```
#define VK_MAX_EXTENSION_NAME_SIZE    256U
```

VK_MAX_DESCRIPTION_SIZE is the length in **char** values of an array containing a string with additional descriptive information about a query, as returned in [VkLayerProperties::description](#) and other queries.

```
#define VK_MAX_DESCRIPTION_SIZE    256U
```

To enable a layer, the name of the layer **should** be added to the **ppEnabledLayerNames** member of [VkInstanceCreateInfo](#) when creating a [VkInstance](#).

Loader implementations **may** provide mechanisms outside the Vulkan API for enabling specific layers. Layers enabled through such a mechanism are *implicitly enabled*, while layers enabled by including the layer name in the **ppEnabledLayerNames** member of [VkInstanceCreateInfo](#) are *explicitly enabled*. Implicitly enabled layers are loaded before explicitly enabled layers, such that implicitly enabled layers are closer to the application, and explicitly enabled layers are closer to the driver. Except where otherwise specified, implicitly enabled and explicitly enabled layers differ only in the way they are enabled, and the order in which they are loaded. Explicitly enabling a layer that is implicitly enabled results in this layer being loaded as an implicitly enabled layer; it has no additional effect.

To enumerate device layers, call:

WARNING

This functionality is superseded by [Vulkan Version 1.0](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
VkResult vkEnumerateDeviceLayerProperties(
    VkPhysicalDevice    physicalDevice,
    uint32_t*           pPropertyCount,
    VkLayerProperties*   pProperties);
```

- **physicalDevice** is the physical device that will be queried.

- `pPropertyCount` is a pointer to an integer related to the number of layer properties available or queried.
- `pProperties` is either `NULL` or a pointer to an array of `VkLayerProperties` structures.

Physical device layers are not supported. `pPropertyCount` will be 0, and `VK_SUCCESS` is returned.

Valid Usage (Implicit)

- `VUID-vkEnumerateDeviceLayerProperties-physicalDevice-parameter`
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- `VUID-vkEnumerateDeviceLayerProperties-pPropertyCount-parameter`
`pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- `VUID-vkEnumerateDeviceLayerProperties-pProperties-parameter`
If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkLayerProperties` structures

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `ppEnabledLayerNames` and `enabledLayerCount` members of `VkDeviceCreateInfo` are legacy and their values **must** be ignored by implementations. The sequence of layers active for a device will be exactly the sequence of layers enabled when the parent instance was created.

32.5. Extensions

Extensions **may** define new Vulkan commands, structures, and enumerants. For compilation purposes, the interfaces defined by registered extensions, including new structures and enumerants as well as function pointer types for new commands, are defined in the Khronos-supplied `vulkan_sc_core.h` together with the core API. However, commands defined by extensions **may** not be available for static linking - in which case function pointers to these commands **should** be queried at runtime as described in [Command Function Pointers](#). Extensions **may** be provided by layers as well as by a Vulkan implementation.

Because extensions **may** extend or change the behavior of the Vulkan API, extension authors **should** add support for their extensions to the Khronos validation layers. This is especially important for new commands whose parameters have been wrapped by the validation layers. See the [“Architecture of the Vulkan Loader Interfaces”](#) document for additional information.

NOTE

To enable an instance extension, the name of the extension **can** be added to the

`ppEnabledExtensionNames` member of `VkInstanceCreateInfo` when creating a `VkInstance`.

To enable a device extension, the name of the extension **can** be added to the `ppEnabledExtensionNames` member of `VkDeviceCreateInfo` when creating a `VkDevice`.

Physical-Device-Level functionality does not have any enabling mechanism and **can** be used as long as the `VkPhysicalDevice` supports the device extension as determined by `vkEnumerateDeviceExtensionProperties`.

Enabling an extension (with no further use of that extension) does not change the behavior of functionality exposed by the core Vulkan API or any other extension, other than making valid the use of the commands, enums and structures defined by that extension.

Valid Usage sections for individual commands and structures do not currently contain which extensions have to be enabled in order to make their use valid, although they might do so in the future. It is defined only in the [Valid Usage for Extensions](#) section.

32.5.1. Instance Extensions

Instance extensions add new [global or instance-level functionality](#) to the API, outside of the core specification. Instance extensions **may** also add [physical-device-level functionality](#).

To query the available instance extensions, call:

```
// Provided by VK_VERSION_1_0
VkResult vkEnumerateInstanceExtensionProperties(
    const char*           pLayerName,
    uint32_t*             pPropertyCount,
    VkExtensionProperties* pProperties);
```

- `pLayerName` is either `NULL` or a pointer to a null-terminated UTF-8 string naming the layer to retrieve extensions from.
- `pPropertyCount` is a pointer to an integer related to the number of extension properties available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkExtensionProperties` structures.

When `pLayerName` parameter is `NULL`, only extensions provided by the Vulkan implementation or by implicitly enabled layers are returned. When `pLayerName` is the name of a layer, the instance extensions provided by that layer are returned.

If `pProperties` is `NULL`, then the number of extensions properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` **must** point to a variable set by the application to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of extension properties available, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE`

will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

Because the list of available layers may change externally between calls to `vkEnumerateInstanceExtensionProperties`, two calls may retrieve different results if a `pLayerName` is available in one call but not in another. The extensions supported by a layer may also change between two calls, e.g. if the layer implementation is replaced by a different version between those calls.

Implementations **must** not advertise any pair of extensions that cannot be enabled together due to behavioral differences, or any extension that cannot be enabled against the advertised version.

Valid Usage (Implicit)

- VUID-vkEnumerateInstanceExtensionProperties-pLayerName-parameter
If `pLayerName` is not `NULL`, `pLayerName` **must** be a null-terminated UTF-8 string
- VUID-vkEnumerateInstanceExtensionProperties-pPropertyCount-parameter
`pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkEnumerateInstanceExtensionProperties-pProperties-parameter
If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkExtensionProperties` structures

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_LAYER_NOT_PRESENT`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

32.5.2. Device Extensions

Device extensions add new [device-level functionality](#) to the API, outside of the core specification. If Vulkan 1.1 is required by the extension, it **may** also add new [physical-device-level functionality](#).

To query the extensions available to a given physical device, call:

```
// Provided by VK_VERSION_1_0
VkResult vkEnumerateDeviceExtensionProperties(
    VkPhysicalDevice          physicalDevice,
    const char*               pLayerName,
    uint32_t*                 pPropertyCount,
    VkExtensionProperties*     pProperties);
```

- `physicalDevice` is the physical device that will be queried.
- `pLayerName` is either `NULL` or a pointer to a null-terminated UTF-8 string naming the layer to retrieve extensions from.
- `pPropertyCount` is a pointer to an integer related to the number of extension properties available or queried, and is treated in the same fashion as the `vkEnumerateInstanceExtensionProperties::pPropertyCount` parameter.
- `pProperties` is either `NULL` or a pointer to an array of `VkExtensionProperties` structures.

When `pLayerName` parameter is `NULL`, only extensions provided by the Vulkan implementation or by implicitly enabled layers are returned. When `pLayerName` is the name of a layer, the device extensions provided by that layer are returned.

Implementations **must** not advertise any pair of extensions that cannot be enabled together due to behavioral differences, or any extension that cannot be enabled against the advertised version.

NOTE Due to platform details on Android, `vkEnumerateDeviceExtensionProperties` may be called with `physicalDevice` equal to `NULL` during layer discovery. This behavior will only be observed by layer implementations, and not the underlying Vulkan driver.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkEnumerateDeviceExtensionProperties` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkEnumerateDeviceExtensionProperties-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkEnumerateDeviceExtensionProperties-pLayerName-parameter
If `pLayerName` is not `NULL`, `pLayerName` **must** be a null-terminated UTF-8 string
- VUID-vkEnumerateDeviceExtensionProperties-pPropertyCount-parameter
`pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkEnumerateDeviceExtensionProperties-pProperties-parameter
If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkExtensionProperties` structures

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_LAYER_NOT_PRESENT`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkExtensionProperties` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkExtensionProperties {
    char          extensionName[VK_MAX_EXTENSION_NAME_SIZE];
    uint32_t      specVersion;
} VkExtensionProperties;
```

- `extensionName` is an array of `VK_MAX_EXTENSION_NAME_SIZE` `char` containing a null-terminated UTF-8 string which is the name of the extension.
- `specVersion` is the version of this extension. It is an integer, incremented with backward compatible changes.

32.6. Extension Dependencies

Some extensions are dependent on other extensions, or on specific core API versions, to function. To enable extensions with dependencies, any *required extensions* **must** also be enabled through the same API mechanisms when creating an instance with `vkCreateInstance` or a device with `vkCreateDevice`. Each extension which has such dependencies documents them in the [appendix summarizing that extension](#).

If an extension is supported (as queried by `vkEnumerateInstanceExtensionProperties` or `vkEnumerateDeviceExtensionProperties`), then *required extensions* of that extension **must** also be supported for the same instance or physical device.

Any device extension that has an instance extension dependency that is not enabled by `vkCreateInstance` is considered to be unsupported, hence it **must** not be returned by `vkEnumerateDeviceExtensionProperties` for any `VkPhysicalDevice` child of the instance. Instance extensions do not have dependencies on device extensions.

If a required extension has been [promoted](#) to another extension or to a core API version, then as a

general rule, the dependency is also satisfied by the promoted extension or core version. This will be true so long as any features required by the original extension are also required or enabled by the promoted extension or core version. However, in some cases an extension is promoted while making some of its features optional in the promoted extension or core version. In this case, the dependency **may** not be satisfied. The only way to be certain is to look at the descriptions of the original dependency and the promoted version in the [Layers & Extensions](#) and [Core Revisions](#) appendices.

NOTE

There is metadata in `vk.xml` describing some aspects of promotion, especially `requires`, `promotedto` and `deprecatedby` attributes of `<extension>` tags. However, the metadata does not yet fully describe this scenario. In the future, we may extend the XML schema to describe the full set of extensions and versions satisfying a dependency. As discussed in more detail for [Promotion](#) below, when an extension is promoted it does not mean that a mechanical substitution of an extension API by the corresponding promoted API will work in exactly the same fashion; be supported at runtime; or even exist.

32.7. Compatibility Guarantees (Informative)

This section is marked as informal as there is no binding responsibility on implementations of the Vulkan API - these guarantees are however a contract between the Vulkan Working Group and developers using this Specification.

32.7.1. Core Versions

Each of the [major](#), [minor](#), and [patch versions](#) of the Vulkan specification provide different compatibility guarantees.

Patch Versions

A difference in the patch version indicates that a set of bug fixes or clarifications have been made to the Specification. Informative enums returned by Vulkan commands that will not affect the runtime behavior of a valid application may be added in a patch version (e.g. [VkVendorId](#)).

The specification's patch version is strictly increasing for a given major version of the specification; any change to a specification as described above will result in the patch version being increased by 1. Patch versions are applied to all minor versions, even if a given minor version is not affected by the provoking change.

Specifications with different patch versions but the same major and minor version are *fully compatible* with each other - such that a valid application written against one will work with an implementation of another.

NOTE

If a patch version includes a bug fix or clarification that could have a significant impact on developer expectations, these will be highlighted in the change log. Generally the Vulkan Working Group tries to avoid these kinds of changes, instead fixing them in either an extension or core version.

Minor Versions

Changes in the minor version of the specification indicate that new functionality has been added to the core specification. This will usually include new interfaces in the header, and **may** also include behavior changes and bug fixes. Core functionality **may** be marked as legacy in a minor version, but will not be obsoleted or removed.

The specification's minor version is strictly increasing for a given major version of the specification; any change to a specification as described above will result in the minor version being increased by 1. Changes that can be accommodated in a patch version will not increase the minor version.

Specifications with a lower minor version are *backwards compatible* with an implementation of a specification with a higher minor version for core functionality and extensions issued with the KHR vendor tag. Vendor and multi-vendor extensions are not guaranteed to remain functional across minor versions, though in general they are with few exceptions - see [Obsolescence](#) for more information.

Major Versions

A difference in the major version of specifications indicates a large set of changes which will likely include interface changes, behavioral changes, removal of [legacy functionality](#), and the modification, addition, or replacement of other functionality.

The specification's major version is monotonically increasing; any change to the specification as described above will result in the major version being increased. Changes that can be accommodated in a patch or minor version will not increase the major version.

The Vulkan Working Group intends to only issue a new major version of the Specification in order to realize significant improvements to the Vulkan API that will necessarily require breaking compatibility.

A new major version will likely include a wholly new version of the specification to be issued - which could include an overhaul of the versioning semantics for the minor and patch versions. The patch and minor versions of a specification are therefore not meaningful across major versions. If a major version of the specification includes similar versioning semantics, it is expected that the patch and the minor version will be reset to 0 for that major version.

32.7.2. Extensions

A KHR extension **must** be able to be enabled alongside any other KHR extension, and for any minor or patch version of the core Specification beyond the minimum version it requires. A multi-vendor extension **should** be able to be enabled alongside any KHR extension or other multi-vendor extension, and for any minor or patch version of the core Specification beyond the minimum version it requires. A vendor extension **should** be able to be enabled alongside any KHR extension, multi-vendor extension, or other vendor extension from the same vendor, and for any minor or patch version of the core Specification beyond the minimum version it requires. A vendor extension **may** be able to be enabled alongside vendor extensions from another vendor.

The one other exception to this is if a vendor or multi-vendor extension is [made obsolete](#) by either a

core version or another extension, which will be highlighted in the [extension appendix](#).

Promotion

Extensions, or features of an extension, **may** be promoted to a new [core version of the API](#), or a newer extension which an equal or greater number of implementors are in favor of.

NOTE

Structure and enumerated types defined in extensions that were promoted to core in a later version of Vulkan are defined in terms of the equivalent Vulkan core interfaces in that version and its successors. This affects the Vulkan Specification, the Vulkan header files, and the corresponding XML Registry.

When extension functionality is promoted, minor changes **may** be introduced, limited to the following:

- Naming
- Non-intrusive parameter changes
- [Feature advertisement/enablement](#)
- Combining structure parameters into larger structures
- Author ID suffixes changed or removed

NOTE

If extension functionality is promoted, there is no guarantee of direct compatibility, however it should require little effort to port code from the original feature to the promoted one.

The Vulkan Working Group endeavors to ensure that larger changes are marked as either [deprecated](#) or [obsoleted](#) as appropriate, and can do so retroactively if necessary.

Extensions that are promoted are listed as being promoted in their extension appendices, with reference to where they were promoted to.

When an extension is promoted, any backwards compatibility aliases which exist in the extension will **not** be promoted.

NOTE

As a hypothetical example, if the [VK_KHR_surface](#) extension were promoted to part of a future core version, the [VK_COLOR_SPACE_SRGB_NONLINEAR_KHR](#) token defined by that extension would be promoted to [VK_COLOR_SPACE_SRGB_NONLINEAR](#). However, the [VK_COLORSPACE_SRGB_NONLINEAR_KHR](#) token aliases [VK_COLOR_SPACE_SRGB_NONLINEAR_KHR](#). The [VK_COLORSPACE_SRGB_NONLINEAR_KHR](#) would not be promoted, because it is a backwards compatibility alias that exists only due to a naming mistake when the extension was initially published.

Deprecation

Extensions **may** be marked as [deprecated](#) when they are no longer intended to be used by applications under certain conditions. Generally, a new feature will become available to solve the

use case in another extension or core version of the API, but it is not guaranteed.

NOTE

Features that are intended to replace deprecated functionality have no guarantees of compatibility, and applications may require drastic modification in order to make use of the new features.

Extensions that are deprecated are listed as being deprecated in their extension appendices, with an explanation of the deprecation and any related features that are relevant.

Obsolescence

Occasionally, an extension will be marked as obsolete if a new version of the core API or a new extension is fundamentally incompatible with it. An obsoleted extension **must** not be used with the extension or core version that obsoleted it.

Extensions that are obsoleted are listed as being obsoleted in their extension appendices, with reference to what they were obsoleted by.

Aliases

When an extension is promoted or deprecated by a newer feature, some or all of its functionality **may** be replicated into the newer feature. Rather than duplication of all the documentation and definitions, the specification instead identifies the identical commands and types as *aliases* of one another. Each alias is mentioned together with the definition it aliases, with the older aliases marked as “equivalents”. Each alias of the same command has identical behavior, and each alias of the same type has identical meaning - they can be used interchangeably in an application with no compatibility issues.

NOTE

For promoted types, the aliased extension type is semantically identical to the new core type. The C99 headers simply `typedef` the older aliases to the promoted types.

For promoted command aliases, however, there are two separate command definitions, due to the fact that the C99 ABI has no way to alias command definitions without resorting to macros. Calling either command will produce identical behavior within the bounds of the specification, and should still invoke the same path in the implementation. Debug tools may use separate commands with different debug behavior; to write the appropriate command name to an output log, for instance.

Special Use Extensions

Some extensions exist only to support a specific purpose or specific class of application. These are referred to as “special use extensions”. Use of these extensions in applications not meeting the special use criteria is not recommended.

Special use cases are restricted, and only those defined below are used to describe extensions:

Table 42. Extension Special Use Cases

Special Use	XML Tag	Full Description
CAD support	cadsupport	Extension is intended to support specialized functionality used by CAD/CAM applications.
D3D support	d3demulation	Extension is intended to support D3D emulation layers, and applications ported from D3D, by adding functionality specific to D3D.
Developer tools	devtools	Extension is intended to support developer tools such as capture-replay libraries.
Debugging tools	debugging	Extension is intended for use by applications when debugging.
OpenGL / ES support	glesemulation	Extension is intended to support OpenGL and/or OpenGL ES emulation layers, and applications ported from those APIs, by adding functionality specific to those APIs.

Special use extensions are identified in the metadata for each such extension in the [Layers & Extensions](#) appendix, using the name in the “Special Use” column above.

Special use extensions are also identified in `vk.xml` with the short name in “XML Tag” column above, as described in the “API Extensions (`extension` tag)” section of the [registry schema documentation](#).

Chapter 33. Features

Features advertise additional functionality which **can** be enabled in the API. If a feature is *supported* by a physical device, it **must** be *enabled* when creating a [VkDevice](#) in order to use its associated functionality with that [VkDevice](#). If a feature is *unsupported*, that functionality **cannot** be used with that [VkDevice](#).

NOTE

Features are reported via the extensible structure [VkPhysicalDeviceFeatures2](#), which was added in the [VK_KHR_get_physical_device_properties2](#) extension and included in Vulkan 1.1. When new features are added in future Vulkan versions or extensions, each extension **should** introduce one new feature structure, if needed. This structure **can** be added to the [pNext](#) chain of the [VkPhysicalDeviceFeatures2](#) structure.

For convenience, new core versions of Vulkan **may** introduce new unified feature structures for features promoted from extensions. At the same time, the extension's original feature structure (if any) is also promoted to the core API, and is an alias of the extension's structure. This results in multiple names for the same feature: in the original extension's feature structure and the promoted structure alias, in the unified feature structure. When a feature was implicitly supported and enabled in the extension, but an explicit name was added during promotion, then the extension itself acts as an alias for the feature as listed in the table below.

All aliases of the same feature in the core API **must** be reported consistently: either all **must** be reported as supported, or none of them. When a promoted extension is available, any corresponding feature aliases **must** be supported.

Table 43. Extension Feature Aliases

Extension	Feature(s)

To query supported features, call:

WARNING

This functionality is superseded by [Vulkan Version 1.1](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceFeatures(
    VkPhysicalDevice          physicalDevice,
    VkPhysicalDeviceFeatures* pFeatures);
```

- [physicalDevice](#) is the physical device from which to query the supported features.
- [pFeatures](#) is a pointer to a [VkPhysicalDeviceFeatures](#) structure in which the physical device features are returned. For each feature, a value of [VK_TRUE](#) specifies that the feature is supported on this physical device, and [VK_FALSE](#) specifies that the feature is not supported.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFeatures-physicalDevice-parameter **physicalDevice** **must** be a valid [VkPhysicalDevice](#) handle
- VUID-vkGetPhysicalDeviceFeatures-pFeatures-parameter **pFeatures** **must** be a valid pointer to a [VkPhysicalDeviceFeatures](#) structure

Fine-grained features used by a logical device **must** be enabled at [VkDevice](#) creation time. If a feature is enabled that the physical device does not support, [VkDevice](#) creation will fail and return [VK_ERROR_FEATURE_NOT_PRESENT](#).

The fine-grained features are enabled by passing a pointer to the [VkPhysicalDeviceFeatures](#) structure via the [pEnabledFeatures](#) member of the [VkDeviceCreateInfo](#) structure that is passed into the [vkCreateDevice](#) call. If a member of [pEnabledFeatures](#) is [VK_TRUE](#) or [VK_FALSE](#), then the device will be created with the indicated feature enabled or disabled, respectively. Features **can** also be enabled by using the [VkPhysicalDeviceFeatures2](#) structure.

If an application wishes to enable all features supported by a device, it **can** simply pass in the [VkPhysicalDeviceFeatures](#) structure that was previously returned by [vkGetPhysicalDeviceFeatures](#). To disable an individual feature, the application **can** set the desired member to [VK_FALSE](#) in the same structure. Setting [pEnabledFeatures](#) to [NULL](#) and not including a [VkPhysicalDeviceFeatures2](#) in the [pNext](#) chain of [VkDeviceCreateInfo](#) is equivalent to setting all members of the structure to [VK_FALSE](#).

NOTE

Some features, such as [robustBufferAccess](#), **may** incur a runtime performance cost. Application writers **should** carefully consider the implications of enabling all supported features.

To query supported features defined by the core or extensions, call:

```
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceFeatures2(
    VkPhysicalDevice          physicalDevice,
    VkPhysicalDeviceFeatures2* pFeatures);
```

- **physicalDevice** is the physical device from which to query the supported features.
- **pFeatures** is a pointer to a [VkPhysicalDeviceFeatures2](#) structure in which the physical device features are returned.

Each structure in [pFeatures](#) and its [pNext](#) chain contains members corresponding to fine-grained features. Each structure in [pFeatures](#) and its [pNext](#) chain contains [VkBool32](#) members corresponding to fine-grained features. Each such member is returned with a [VK_TRUE](#) value indicating that feature is supported on this physical device, or a [VK_FALSE](#) value indicating it is unsupported.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFeatures2-physicalDevice-parameter **physicalDevice** must be a valid [VkPhysicalDevice](#) handle
- VUID-vkGetPhysicalDeviceFeatures2-pFeatures-parameter **pFeatures** must be a valid pointer to a [VkPhysicalDeviceFeatures2](#) structure

The [VkPhysicalDeviceFeatures2](#) structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceFeatures2 {
    VkStructureType    sType;
    void*              pNext;
    VkPhysicalDeviceFeatures  features;
} VkPhysicalDeviceFeatures2;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is [NULL](#) or a pointer to a structure extending this structure.
- **features** is a [VkPhysicalDeviceFeatures](#) structure describing the fine-grained features of the Vulkan 1.0 API.

The **pNext** chain of this structure is used to extend the structure with features defined by extensions. This structure **can** be used in [vkGetPhysicalDeviceFeatures2](#) or **can** be included in the **pNext** chain of a [VkDeviceCreateInfo](#) structure, in which case it controls which features are enabled in lieu of **pEnabledFeatures**.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFeatures2-sType-sType **sType** must be [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FEATURES_2](#)

The [VkPhysicalDeviceFeatures](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceFeatures {
    VkBool32    robustBufferAccess;
    VkBool32    fullDrawIndexUint32;
    VkBool32    imageCubeArray;
    VkBool32    independentBlend;
    VkBool32    geometryShader;
    VkBool32    tessellationShader;
    VkBool32    sampleRateShading;
    VkBool32    dualSrcBlend;
    VkBool32    logicOp;
    VkBool32    multiDrawIndirect;
```

```

VkBool32    drawIndirectFirstInstance;
VkBool32    depthClamp;
VkBool32    depthBiasClamp;
VkBool32    fillModeNonSolid;
VkBool32    depthBounds;
VkBool32    wideLines;
VkBool32    largePoints;
VkBool32    alphaToOne;
VkBool32    multiViewport;

VkBool32    textureCompressionETC2;
VkBool32    textureCompressionASTC_LDR;
VkBool32    textureCompressionBC;
VkBool32    occlusionQueryPrecise;
VkBool32    pipelineStatisticsQuery;
VkBool32    vertexPipelineStoresAndAtomics;
VkBool32    fragmentStoresAndAtomics;
VkBool32    shaderTessellationAndGeometryPointSize;
VkBool32    shaderImageGatherExtended;
VkBool32    shaderStorageImageExtendedFormats;
VkBool32    shaderStorageImageMultisample;
VkBool32    shaderStorageImageReadWithoutFormat;
VkBool32    shaderStorageImageWriteWithoutFormat;
VkBool32    shaderUniformBufferArrayDynamicIndexing;
VkBool32    shaderSampledImageArrayDynamicIndexing;
VkBool32    shaderStorageBufferArrayDynamicIndexing;
VkBool32    shaderStorageImageArrayDynamicIndexing;
VkBool32    shaderClipDistance;
VkBool32    shaderCullDistance;
VkBool32    shaderFloat64;
VkBool32    shaderInt64;
VkBool32    shaderInt16;
VkBool32    shaderResourceResidency;
VkBool32    shaderResourceMinLod;
VkBool32    sparseBinding;
VkBool32    sparseResidencyBuffer;
VkBool32    sparseResidencyImage2D;
VkBool32    sparseResidencyImage3D;
VkBool32    sparseResidency2Samples;
VkBool32    sparseResidency4Samples;
VkBool32    sparseResidency8Samples;
VkBool32    sparseResidency16Samples;
VkBool32    sparseResidencyAliased;
VkBool32    variableMultisampleRate;
VkBool32    inheritedQueries;
} VkPhysicalDeviceFeatures;

```

This structure describes the following features:

- **robustBufferAccess** enables [Robust Buffer Access](#) guarantees for shader buffer accesses.

- `fullDrawIndexUint32` specifies the full 32-bit range of indices is supported for indexed draw calls when using a `VkIndexType` of `VK_INDEX_TYPE_UINT32`. `maxDrawIndexedIndexValue` is the maximum index value that **may** be used (aside from the primitive restart index, which is always $2^{32}-1$ when the `VkIndexType` is `VK_INDEX_TYPE_UINT32`). If this feature is supported, `maxDrawIndexedIndexValue` **must** be $2^{32}-1$; otherwise it **must** be no smaller than $2^{24}-1$. See `maxDrawIndexedIndexValue`.
- `imageCubeArray` specifies whether image views with a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY` **can** be created, and that the corresponding `SampledCubeArray` and `ImageCubeArray` SPIR-V capabilities **can** be used in shader code.
- `independentBlend` specifies whether the `VkPipelineColorBlendAttachmentState` settings are controlled independently per-attachment. If this feature is not enabled, the `VkPipelineColorBlendAttachmentState` settings for all color attachments **must** be identical. Otherwise, a different `VkPipelineColorBlendAttachmentState` **can** be provided for each bound color attachment.
- `geometryShader` specifies whether geometry shaders are supported. If this feature is not enabled, the `VK_SHADER_STAGE_GEOMETRY_BIT` and `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT` enum values **must** not be used. This also specifies whether shader modules **can** declare the `Geometry` capability.
- `tessellationShader` specifies whether tessellation control and evaluation shaders are supported. If this feature is not enabled, the `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT`, `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`, and `VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_STATE_CREATE_INFO` enum values **must** not be used. This also specifies whether shader modules **can** declare the `Tessellation` capability.
- `sampleRateShading` specifies whether `Sample Shading` and multisample interpolation are supported. If this feature is not enabled, the `sampleShadingEnable` member of the `VkPipelineMultisampleStateCreateInfo` structure **must** be `VK_FALSE` and the `minSampleShading` member is ignored. This also specifies whether shader modules **can** declare the `SampleRateShading` capability.
- `dualSrcBlend` specifies whether blend operations which take two sources are supported. If this feature is not enabled, the `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, and `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA` enum values **must** not be used as source or destination blending factors. See [Dual-Source Blending](#).
- `logicOp` specifies whether logic operations are supported. If this feature is not enabled, the `logicOpEnable` member of the `VkPipelineColorBlendStateCreateInfo` structure **must** be `VK_FALSE`, and the `logicOp` member is ignored.
- `multiDrawIndirect` specifies whether multiple draw indirect is supported. If this feature is not enabled, the `drawCount` parameter to the `vkCmdDrawIndirect` and `vkCmdDrawIndexedIndirect` commands **must** be 0 or 1. The `maxDrawIndirectCount` member of the `VkPhysicalDeviceLimits` structure **must** also be 1 if this feature is not supported. See `maxDrawIndirectCount`.
- `drawIndirectFirstInstance` specifies whether indirect drawing calls support the `firstInstance` parameter. If this feature is not enabled, the `firstInstance` member of all `VkDrawIndirectCommand` and `VkDrawIndexedIndirectCommand` structures that are provided to the `vkCmdDrawIndirect` and `vkCmdDrawIndexedIndirect` commands **must** be 0.

- **depthClamp** specifies whether depth clamping is supported. If this feature is not enabled, the **depthClampEnable** member of the **VkPipelineRasterizationStateCreateInfo** structure **must** be **VK_FALSE**. Otherwise, setting **depthClampEnable** to **VK_TRUE** will enable depth clamping.
- **depthBiasClamp** specifies whether depth bias clamping is supported. If this feature is not enabled, the **depthBiasClamp** member of the **VkPipelineRasterizationStateCreateInfo** structure **must** be 0.0 unless the **VK_DYNAMIC_STATE_DEPTH_BIAS** dynamic state is enabled, in which case the **depthBiasClamp** parameter to **vkCmdSetDepthBias** **must** be 0.0.
- **fillModeNonSolid** specifies whether point and wireframe fill modes are supported. If this feature is not enabled, the **VK_POLYGON_MODE_POINT** and **VK_POLYGON_MODE_LINE** enum values **must** not be used.
- **depthBounds** specifies whether depth bounds tests are supported. If this feature is not enabled, the **depthBoundsTestEnable** member of the **VkPipelineDepthStencilStateCreateInfo** structure **must** be **VK_FALSE** unless the **VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE** dynamic state is enabled, in which case the **depthBoundsTestEnable** parameter to **vkCmdSetDepthBoundsTestEnableEXT** **must** be **VK_FALSE**. When **depthBoundsTestEnable** is **VK_FALSE**, the **minDepthBounds** and **maxDepthBounds** members of the **VkPipelineDepthStencilStateCreateInfo** structure are ignored.
- **wideLines** specifies whether lines with width other than 1.0 are supported. If this feature is not enabled, the **lineWidth** member of the **VkPipelineRasterizationStateCreateInfo** structure **must** be 1.0 unless the **VK_DYNAMIC_STATE_LINE_WIDTH** dynamic state is enabled, in which case the **lineWidth** parameter to **vkCmdSetLineWidth** **must** be 1.0. When this feature is supported, the range and granularity of supported line widths are indicated by the **lineWidthRange** and **lineWidthGranularity** members of the **VkPhysicalDeviceLimits** structure, respectively.
- **largePoints** specifies whether points with size greater than 1.0 are supported. If this feature is not enabled, only a point size of 1.0 written by a shader is supported. The range and granularity of supported point sizes are indicated by the **pointSizeRange** and **pointSizeGranularity** members of the **VkPhysicalDeviceLimits** structure, respectively.
- **alphaToOne** specifies whether the implementation is able to replace the alpha value of the fragment shader color output in the **Multisample Coverage** fragment operation. If this feature is not enabled, then the **alphaToOneEnable** member of the **VkPipelineMultisampleStateCreateInfo** structure **must** be **VK_FALSE**. Otherwise setting **alphaToOneEnable** to **VK_TRUE** will enable alpha-to-one behavior.
- **multiViewport** specifies whether more than one viewport is supported. If this feature is not enabled:
 - The **viewportCount** and **scissorCount** members of the **VkPipelineViewportStateCreateInfo** structure **must** be 1.
 - The **firstViewport** and **viewportCount** parameters to the **vkCmdSetViewport** command **must** be 0 and 1, respectively.
 - The **firstScissor** and **scissorCount** parameters to the **vkCmdSetScissor** command **must** be 0 and 1, respectively.
- **samplerAnisotropy** specifies whether anisotropic filtering is supported. If this feature is not enabled, the **anisotropyEnable** member of the **VkSamplerCreateInfo** structure **must** be **VK_FALSE**.
- **textureCompressionETC2** specifies whether all of the ETC2 and EAC compressed texture formats

are supported. If this feature is enabled, then the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`, `VK_FORMAT_FEATURE_BLIT_SRC_BIT` and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` features **must** be supported in `optimalTilingFeatures` for the following formats:

- `VK_FORMAT_ETC2_R8G8B8_UNORM_BLOCK`
- `VK_FORMAT_ETC2_R8G8B8_SRGB_BLOCK`
- `VK_FORMAT_ETC2_R8G8B8A1_UNORM_BLOCK`
- `VK_FORMAT_ETC2_R8G8B8A1_SRGB_BLOCK`
- `VK_FORMAT_ETC2_R8G8B8A8_UNORM_BLOCK`
- `VK_FORMAT_ETC2_R8G8B8A8_SRGB_BLOCK`
- `VK_FORMAT_EAC_R11_UNORM_BLOCK`
- `VK_FORMAT_EAC_R11_SNORM_BLOCK`
- `VK_FORMAT_EAC_R11G11_UNORM_BLOCK`
- `VK_FORMAT_EAC_R11G11_SNORM_BLOCK`

To query for additional properties, or if the feature is not enabled, `vkGetPhysicalDeviceFormatProperties` and `vkGetPhysicalDeviceImageFormatProperties` can be used to check for supported properties of individual formats as normal.

- `textureCompressionASTC_LDR` specifies whether all of the ASTC LDR compressed texture formats are supported. If this feature is enabled, then the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`, `VK_FORMAT_FEATURE_BLIT_SRC_BIT` and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` features **must** be supported in `optimalTilingFeatures` for the following formats:

- `VK_FORMAT_ASTC_4x4_UNORM_BLOCK`
- `VK_FORMAT_ASTC_4x4_SRGB_BLOCK`
- `VK_FORMAT_ASTC_5x4_UNORM_BLOCK`
- `VK_FORMAT_ASTC_5x4_SRGB_BLOCK`
- `VK_FORMAT_ASTC_5x5_UNORM_BLOCK`
- `VK_FORMAT_ASTC_5x5_SRGB_BLOCK`
- `VK_FORMAT_ASTC_6x5_UNORM_BLOCK`
- `VK_FORMAT_ASTC_6x5_SRGB_BLOCK`
- `VK_FORMAT_ASTC_6x6_UNORM_BLOCK`
- `VK_FORMAT_ASTC_6x6_SRGB_BLOCK`
- `VK_FORMAT_ASTC_8x5_UNORM_BLOCK`
- `VK_FORMAT_ASTC_8x5_SRGB_BLOCK`
- `VK_FORMAT_ASTC_8x6_UNORM_BLOCK`
- `VK_FORMAT_ASTC_8x6_SRGB_BLOCK`
- `VK_FORMAT_ASTC_8x8_UNORM_BLOCK`
- `VK_FORMAT_ASTC_8x8_SRGB_BLOCK`

- VK_FORMAT_ASTC_10x5_UNORM_BLOCK
- VK_FORMAT_ASTC_10x5_SRGB_BLOCK
- VK_FORMAT_ASTC_10x6_UNORM_BLOCK
- VK_FORMAT_ASTC_10x6_SRGB_BLOCK
- VK_FORMAT_ASTC_10x8_UNORM_BLOCK
- VK_FORMAT_ASTC_10x8_SRGB_BLOCK
- VK_FORMAT_ASTC_10x10_UNORM_BLOCK
- VK_FORMAT_ASTC_10x10_SRGB_BLOCK
- VK_FORMAT_ASTC_12x10_UNORM_BLOCK
- VK_FORMAT_ASTC_12x10_SRGB_BLOCK
- VK_FORMAT_ASTC_12x12_UNORM_BLOCK
- VK_FORMAT_ASTC_12x12_SRGB_BLOCK

To query for additional properties, or if the feature is not enabled, [vkGetPhysicalDeviceFormatProperties](#) and [vkGetPhysicalDeviceImageFormatProperties](#) **can** be used to check for supported properties of individual formats as normal.

- **textureCompressionBC** specifies whether all of the BC compressed texture formats are supported. If this feature is enabled, then the **VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT**, **VK_FORMAT_FEATURE_BLIT_SRC_BIT** and **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT** features **must** be supported in **optimalTilingFeatures** for the following formats:

- VK_FORMAT_BC1_RGB_UNORM_BLOCK
- VK_FORMAT_BC1_RGB_SRGB_BLOCK
- VK_FORMAT_BC1_RGBA_UNORM_BLOCK
- VK_FORMAT_BC1_RGBA_SRGB_BLOCK
- VK_FORMAT_BC2_UNORM_BLOCK
- VK_FORMAT_BC2_SRGB_BLOCK
- VK_FORMAT_BC3_UNORM_BLOCK
- VK_FORMAT_BC3_SRGB_BLOCK
- VK_FORMAT_BC4_UNORM_BLOCK
- VK_FORMAT_BC4_SNORM_BLOCK
- VK_FORMAT_BC5_UNORM_BLOCK
- VK_FORMAT_BC5_SNORM_BLOCK
- VK_FORMAT_BC6H_UFLOAT_BLOCK
- VK_FORMAT_BC6H_SFLOAT_BLOCK
- VK_FORMAT_BC7_UNORM_BLOCK
- VK_FORMAT_BC7_SRGB_BLOCK

To query for additional properties, or if the feature is not enabled, [vkGetPhysicalDeviceFormatProperties](#) and [vkGetPhysicalDeviceImageFormatProperties](#) **can** be used to check for supported properties of individual formats as normal.

- [occlusionQueryPrecise](#) specifies whether occlusion queries returning actual sample counts are supported. Occlusion queries are created in a [VkQueryPool](#) by specifying the [queryType](#) of [VK_QUERY_TYPE_OCCLUSION](#) in the [VkQueryPoolCreateInfo](#) structure which is passed to [vkCreateQueryPool](#). If this feature is enabled, queries of this type **can** enable [VK_QUERY_CONTROL_PRECISE_BIT](#) in the [flags](#) parameter to [vkCmdBeginQuery](#). If this feature is not supported, the implementation supports only boolean occlusion queries. When any samples are passed, boolean queries will return a non-zero result value, otherwise a result value of zero is returned. When this feature is enabled and [VK_QUERY_CONTROL_PRECISE_BIT](#) is set, occlusion queries will report the actual number of samples passed.
- [pipelineStatisticsQuery](#) specifies whether the pipeline statistics queries are supported. If this feature is not enabled, queries of type [VK_QUERY_TYPE_PIPELINE_STATISTICS](#) **cannot** be created, and none of the [VkQueryPipelineStatisticFlagBits](#) bits **can** be set in the [pipelineStatistics](#) member of the [VkQueryPoolCreateInfo](#) structure.
- [vertexPipelineStoresAndAtomics](#) specifies whether storage buffers and images support stores and atomic operations in the vertex, tessellation, and geometry shader stages. If this feature is not enabled, all storage image, storage texel buffer, and storage buffer variables used by these stages in shader modules **must** be decorated with the [NonWritable](#) decoration (or the [readonly](#) memory qualifier in GLSL).
- [fragmentStoresAndAtomics](#) specifies whether storage buffers and images support stores and atomic operations in the fragment shader stage. If this feature is not enabled, all storage image, storage texel buffer, and storage buffer variables used by the fragment stage in shader modules **must** be decorated with the [NonWritable](#) decoration (or the [readonly](#) memory qualifier in GLSL).
- [shaderTessellationAndGeometryPointSize](#) specifies whether the [PointSize](#) built-in decoration is available in the tessellation control, tessellation evaluation, and geometry shader stages. If this feature is not enabled, members decorated with the [PointSize](#) built-in decoration **must** not be read from or written to and all points written from a tessellation or geometry shader will have a size of 1.0. This also specifies whether shader modules **can** declare the [TessellationPointSize](#) capability for tessellation control and evaluation shaders, or if the shader modules **can** declare the [GeometryPointSize](#) capability for geometry shaders. An implementation supporting this feature **must** also support one or both of the [tessellationShader](#) or [geometryShader](#) features.
- [shaderImageGatherExtended](#) specifies whether the extended set of image gather instructions are available in shader code. If this feature is not enabled, the [OpImage*Gather](#) instructions do not support the [Offset](#) and [ConstOffsets](#) operands. This also specifies whether shader modules **can** declare the [ImageGatherExtended](#) capability.
- [shaderStorageImageExtendedFormats](#) specifies whether all the “storage image extended formats” below are supported; if this feature is supported, then the [VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT](#) **must** be supported in [optimalTilingFeatures](#) for the following formats:
 - [VK_FORMAT_R16G16_SFLOAT](#)
 - [VK_FORMAT_B10G11R11_UFLOAT_PACK32](#)
 - [VK_FORMAT_R16_SFLOAT](#)

- `VK_FORMAT_R16G16B16A16_UNORM`
- `VK_FORMAT_A2B10G10R10_UNORM_PACK32`
- `VK_FORMAT_R16G16_UNORM`
- `VK_FORMAT_R8G8_UNORM`
- `VK_FORMAT_R16_UNORM`
- `VK_FORMAT_R8_UNORM`
- `VK_FORMAT_R16G16B16A16_SNORM`
- `VK_FORMAT_R16G16_SNORM`
- `VK_FORMAT_R8G8_SNORM`
- `VK_FORMAT_R16_SNORM`
- `VK_FORMAT_R8_SNORM`
- `VK_FORMAT_R16G16_SINT`
- `VK_FORMAT_R8G8_SINT`
- `VK_FORMAT_R16_SINT`
- `VK_FORMAT_R8_SINT`
- `VK_FORMAT_A2B10G10R10_UINT_PACK32`
- `VK_FORMAT_R16G16_UINT`
- `VK_FORMAT_R8G8_UINT`
- `VK_FORMAT_R16_UINT`
- `VK_FORMAT_R8_UINT`

NOTE

`shaderStorageImageExtendedFormats` feature only adds a guarantee of format support, which is specified for the whole physical device. Therefore enabling or disabling the feature via `vkCreateDevice` has no practical effect.

To query for additional properties, or if the feature is not supported, `vkGetPhysicalDeviceFormatProperties` and `vkGetPhysicalDeviceImageFormatProperties` **can** be used to check for supported properties of individual formats, as usual rules allow.

`VK_FORMAT_R32G32_UINT`, `VK_FORMAT_R32G32_SINT`, and `VK_FORMAT_R32G32_SFLOAT` from `StorageImageExtendedFormats` SPIR-V capability, are already covered by core Vulkan **mandatory format support**.

- `shaderStorageImageMultisample` specifies whether multisampled storage images are supported. If this feature is not enabled, images that are created with a `usage` that includes `VK_IMAGE_USAGE_STORAGE_BIT` **must** be created with `samples` equal to `VK_SAMPLE_COUNT_1_BIT`. This also specifies whether shader modules **can** declare the `StorageImageMultisample` and `ImageMSArray` capabilities.
- `shaderStorageImageReadWithoutFormat` specifies whether storage images and storage texel buffers

require a format qualifier to be specified when reading.

- **shaderStorageImageWriteWithoutFormat** specifies whether storage images and storage texel buffers require a format qualifier to be specified when writing.
- **shaderUniformBufferArrayDynamicIndexing** specifies whether arrays of uniform buffers **can** be indexed by integer expressions that are dynamically uniform within either the subgroup or the invocation group in shader code. If this feature is not enabled, resources with a descriptor type of **VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER** or **VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC** **must** be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules **can** declare the **UniformBufferArrayDynamicIndexing** capability.
- **shaderSampledImageArrayDynamicIndexing** specifies whether arrays of samplers or sampled images **can** be indexed by integer expressions that are dynamically uniform within either the subgroup or the invocation group in shader code. If this feature is not enabled, resources with a descriptor type of **VK_DESCRIPTOR_TYPE_SAMPLER**, **VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER**, or **VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE** **must** be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules **can** declare the **SampledImageArrayDynamicIndexing** capability.
- **shaderStorageBufferArrayDynamicIndexing** specifies whether arrays of storage buffers **can** be indexed by integer expressions that are dynamically uniform within either the subgroup or the invocation group in shader code. If this feature is not enabled, resources with a descriptor type of **VK_DESCRIPTOR_TYPE_STORAGE_BUFFER** or **VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC** **must** be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules **can** declare the **StorageBufferArrayDynamicIndexing** capability.
- **shaderStorageImageArrayDynamicIndexing** specifies whether arrays of storage images **can** be indexed by integer expressions that are dynamically uniform within either the subgroup or the invocation group in shader code. If this feature is not enabled, resources with a descriptor type of **VK_DESCRIPTOR_TYPE_STORAGE_IMAGE** **must** be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules **can** declare the **StorageImageArrayDynamicIndexing** capability.
- **shaderClipDistance** specifies whether clip distances are supported in shader code. If this feature is not enabled, any members decorated with the **ClipDistance** built-in decoration **must** not be read from or written to in shader modules. This also specifies whether shader modules **can** declare the **ClipDistance** capability.
- **shaderCullDistance** specifies whether cull distances are supported in shader code. If this feature is not enabled, any members decorated with the **CullDistance** built-in decoration **must** not be read from or written to in shader modules. This also specifies whether shader modules **can** declare the **CullDistance** capability.
- **shaderFloat64** specifies whether 64-bit floats (doubles) are supported in shader code. If this feature is not enabled, 64-bit floating-point types **must** not be used in shader code. This also specifies whether shader modules **can** declare the **Float64** capability. Declaring and using 64-bit floats is enabled for all storage classes that SPIR-V allows with the **Float64** capability.
- **shaderInt64** specifies whether 64-bit integers (signed and unsigned) are supported in shader code. If this feature is not enabled, 64-bit integer types **must** not be used in shader code. This

also specifies whether shader modules **can** declare the **Int64** capability. Declaring and using 64-bit integers is enabled for all storage classes that SPIR-V allows with the **Int64** capability.

- **shaderInt16** specifies whether 16-bit integers (signed and unsigned) are supported in shader code. If this feature is not enabled, 16-bit integer types **must** not be used in shader code. This also specifies whether shader modules **can** declare the **Int16** capability. However, this only enables a subset of the storage classes that SPIR-V allows for the **Int16** SPIR-V capability: Declaring and using 16-bit integers in the **Private**, **Workgroup**, and **Function** storage classes is enabled, while declaring them in the interface storage classes (e.g., **UniformConstant**, **Uniform**, **StorageBuffer**, **Input**, **Output**, and **PushConstant**) is not enabled.
- **shaderResourceResidency** specifies whether image operations that return resource residency information are supported in shader code. If this feature is not enabled, the **OpImageSparse*** instructions **must** not be used in shader code. This also specifies whether shader modules **can** declare the **SparseResidency** capability. The feature requires at least one of the **sparseResidency*** features to be supported. This **must** be **VK_FALSE** in Vulkan SC [SCID-8].
- **shaderResourceMinLod** specifies whether image operations specifying the minimum resource LOD are supported in shader code. If this feature is not enabled, the **MinLod** image operand **must** not be used in shader code. This also specifies whether shader modules **can** declare the **MinLod** capability.
- **sparseBinding** specifies whether resource memory **can** be managed at opaque sparse block level instead of at the object level. If this feature is not enabled, resource memory **must** be bound only on a per-object basis using the **vkBindBufferMemory** and **vkBindImageMemory** commands. In this case, buffers and images **must** not be created with **VK_BUFFER_CREATE_SPARSE_BINDING_BIT** and **VK_IMAGE_CREATE_SPARSE_BINDING_BIT** set in the **flags** member of the **VkBufferCreateInfo** and **VkImageCreateInfo** structures, respectively. Otherwise resource memory **can** be managed as described in **Sparse Resource Features**. This **must** be **VK_FALSE** in Vulkan SC [SCID-8].
- **sparseResidencyBuffer** specifies whether the device **can** access partially resident buffers. If this feature is not enabled, buffers **must** not be created with **VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT** set in the **flags** member of the **VkBufferCreateInfo** structure. This **must** be **VK_FALSE** in Vulkan SC [SCID-8].
- **sparseResidencyImage2D** specifies whether the device **can** access partially resident 2D images with 1 sample per pixel. If this feature is not enabled, images with an **imageType** of **VK_IMAGE_TYPE_2D** and **samples** set to **VK_SAMPLE_COUNT_1_BIT** **must** not be created with **VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT** set in the **flags** member of the **VkImageCreateInfo** structure. This **must** be **VK_FALSE** in Vulkan SC [SCID-8].
- **sparseResidencyImage3D** specifies whether the device **can** access partially resident 3D images. If this feature is not enabled, images with an **imageType** of **VK_IMAGE_TYPE_3D** **must** not be created with **VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT** set in the **flags** member of the **VkImageCreateInfo** structure. This **must** be **VK_FALSE** in Vulkan SC [SCID-8].
- **sparseResidency2Samples** specifies whether the physical device **can** access partially resident 2D images with 2 samples per pixel. If this feature is not enabled, images with an **imageType** of **VK_IMAGE_TYPE_2D** and **samples** set to **VK_SAMPLE_COUNT_2_BIT** **must** not be created with **VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT** set in the **flags** member of the **VkImageCreateInfo** structure. This **must** be **VK_FALSE** in Vulkan SC [SCID-8].

- `sparseResidency4Samples` specifies whether the physical device **can** access partially resident 2D images with 4 samples per pixel. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_2D` and `samples` set to `VK_SAMPLE_COUNT_4_BIT` **must** not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the `flags` member of the `VkImageCreateInfo` structure. This **must** be `VK_FALSE` in Vulkan SC [SCID-8].
- `sparseResidency8Samples` specifies whether the physical device **can** access partially resident 2D images with 8 samples per pixel. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_2D` and `samples` set to `VK_SAMPLE_COUNT_8_BIT` **must** not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the `flags` member of the `VkImageCreateInfo` structure. This **must** be `VK_FALSE` in Vulkan SC [SCID-8].
- `sparseResidency16Samples` specifies whether the physical device **can** access partially resident 2D images with 16 samples per pixel. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_2D` and `samples` set to `VK_SAMPLE_COUNT_16_BIT` **must** not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the `flags` member of the `VkImageCreateInfo` structure. This **must** be `VK_FALSE` in Vulkan SC [SCID-8].
- `sparseResidencyAliased` specifies whether the physical device **can** correctly access data aliased into multiple locations. If this feature is not enabled, the `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` and `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` enum values **must** not be used in `flags` members of the `VkBufferCreateInfo` and `VkImageCreateInfo` structures, respectively. This **must** be `VK_FALSE` in Vulkan SC [SCID-8].
- `variableMultisampleRate` specifies whether all pipelines that will be bound to a command buffer during a subpass which uses no attachments **must** have the same value for `VkPipelineMultisampleStateCreateInfo::rasterizationSamples`. If set to `VK_TRUE`, the implementation supports variable multisample rates in a subpass which uses no attachments. If set to `VK_FALSE`, then all pipelines bound in such a subpass **must** have the same multisample rate. This has no effect in situations where a subpass uses any attachments.
- `inheritedQueries` specifies whether a secondary command buffer **may** be executed while a query is active.

The `VkPhysicalDeviceVulkan11Features` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceVulkan11Features {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           storageBuffer16BitAccess;
    VkBool32           uniformAndStorageBuffer16BitAccess;
    VkBool32           storagePushConstant16;
    VkBool32           storageInputOutput16;
    VkBool32           multiview;
    VkBool32           multiviewGeometryShader;
    VkBool32           multiviewTessellationShader;
    VkBool32           variablePointersStorageBuffer;
    VkBool32           variablePointers;
    VkBool32           protectedMemory;
    VkBool32           samplerYcbcrConversion;
    VkBool32           shaderDrawParameters;
} VkPhysicalDeviceVulkan11Features;
```

This structure describes the following features:

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **storageBuffer16BitAccess** specifies whether objects in the **StorageBuffer**, or **PhysicalStorageBuffer** storage class with the **Block** decoration **can** have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members **must** not be used in such objects. This also specifies whether shader modules **can** declare the **StorageBuffer16BitAccess** capability.
- **uniformAndStorageBuffer16BitAccess** specifies whether objects in the **Uniform** storage class with the **Block** decoration **can** have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members **must** not be used in such objects. This also specifies whether shader modules **can** declare the **UniformAndStorageBuffer16BitAccess** capability.
- **storagePushConstant16** specifies whether objects in the **PushConstant** storage class **can** have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or floating-point members **must** not be used in such objects. This also specifies whether shader modules **can** declare the **StoragePushConstant16** capability.
- **storageInputOutput16** specifies whether objects in the **Input** and **Output** storage classes **can** have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members **must** not be used in such objects. This also specifies whether shader modules **can** declare the **StorageInputOutput16** capability.
- **multiview** specifies whether the implementation supports multiview rendering within a render pass. If this feature is not enabled, the view mask of each subpass **must** always be zero.
- **multiviewGeometryShader** specifies whether the implementation supports multiview rendering within a render pass, with **geometry shaders**. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask **must** not include a geometry shader.

- `multiviewTessellationShader` specifies whether the implementation supports multiview rendering within a render pass, with `tessellation shaders`. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask **must** not include any tessellation shaders.
- `variablePointersStorageBuffer` specifies whether the implementation supports the SPIR-V `VariablePointersStorageBuffer` capability. When this feature is not enabled, shader modules **must** not declare the `SPV_KHR_variable_pointers` extension or the `VariablePointersStorageBuffer` capability.
- `variablePointers` specifies whether the implementation supports the SPIR-V `VariablePointers` capability. When this feature is not enabled, shader modules **must** not declare the `VariablePointers` capability.
- `protectedMemory` specifies whether `protected memory` is supported.
- `samplerYcbcrConversion` specifies whether the implementation supports `sampler Y'CBCR conversion`. If `samplerYcbcrConversion` is `VK_FALSE`, sampler Y'C_BC_R conversion is not supported, and samplers using sampler Y'C_BC_R conversion **must** not be used.
- `shaderDrawParameters` specifies whether the implementation supports the SPIR-V `DrawParameters` capability. When this feature is not enabled, shader modules **must** not declare the `SPV_KHR_shader_draw_parameters` extension or the `DrawParameters` capability.

If the `VkPhysicalDeviceVulkan11Features` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceVulkan11Features`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- `VOID-VkPhysicalDeviceVulkan11Features-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_1_FEATURES`

The `VkPhysicalDeviceVulkan12Features` structure is defined as:

} VkPhysicalDeviceVulkan12Features;

```

This structure describes the following features:

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **samplerMirrorClampToEdge** indicates whether the implementation supports the **VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE** sampler address mode. If this feature is not enabled, the **VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE** sampler address mode **must** not be used.

- `drawIndirectCount` indicates whether the implementation supports the `vkCmdDrawIndirectCount` and `vkCmdDrawIndexedIndirectCount` functions. If this feature is not enabled, these functions **must** not be used.
- `storageBuffer8BitAccess` indicates whether objects in the `StorageBuffer`, or `PhysicalStorageBuffer` storage class with the `Block` decoration **can** have 8-bit integer members. If this feature is not enabled, 8-bit integer members **must** not be used in such objects. This also indicates whether shader modules **can** declare the `StorageBuffer8BitAccess` capability.
- `uniformAndStorageBuffer8BitAccess` indicates whether objects in the `Uniform` storage class with the `Block` decoration **can** have 8-bit integer members. If this feature is not enabled, 8-bit integer members **must** not be used in such objects. This also indicates whether shader modules **can** declare the `UniformAndStorageBuffer8BitAccess` capability.
- `storagePushConstant8` indicates whether objects in the `PushConstant` storage class **can** have 8-bit integer members. If this feature is not enabled, 8-bit integer members **must** not be used in such objects. This also indicates whether shader modules **can** declare the `StoragePushConstant8` capability.
- `shaderBufferInt64Atomics` indicates whether shaders **can** perform 64-bit unsigned and signed integer atomic operations on buffers.
- `shaderSharedInt64Atomics` indicates whether shaders **can** perform 64-bit unsigned and signed integer atomic operations on shared memory.
- `shaderFloat16` indicates whether 16-bit floats (halves) are supported in shader code. This also indicates whether shader modules **can** declare the `Float16` capability. However, this only enables a subset of the storage classes that SPIR-V allows for the `Float16` SPIR-V capability: Declaring and using 16-bit floats in the `Private`, `Workgroup`, and `Function` storage classes is enabled, while declaring them in the interface storage classes (e.g., `UniformConstant`, `Uniform`, `StorageBuffer`, `Input`, `Output`, and `PushConstant`) is not enabled.
- `shaderInt8` indicates whether 8-bit integers (signed and unsigned) are supported in shader code. This also indicates whether shader modules **can** declare the `Int8` capability. However, this only enables a subset of the storage classes that SPIR-V allows for the `Int8` SPIR-V capability: Declaring and using 8-bit integers in the `Private`, `Workgroup`, and `Function` storage classes is enabled, while declaring them in the interface storage classes (e.g., `UniformConstant`, `Uniform`, `StorageBuffer`, `Input`, `Output`, and `PushConstant`) is not enabled.
- `descriptorIndexing` indicates whether the implementation supports the minimum set of descriptor indexing features as described in the [Feature Requirements](#) section. Enabling this feature when `vkCreateDevice` is called does not imply the other minimum descriptor indexing features are also enabled. Those other descriptor indexing features **must** be enabled individually as needed by the application.
- `shaderInputAttachmentArrayDynamicIndexing` indicates whether arrays of input attachments **can** be indexed by integer expressions that are dynamically uniform within either the subgroup or the invocation group in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` **must** be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `InputAttachmentArrayDynamicIndexing` capability.
- `shaderUniformTexelBufferArrayDynamicIndexing` indicates whether arrays of uniform texel buffers **can** be indexed by integer expressions that are dynamically uniform within either the

subgroup or the invocation group in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` **must** be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `UniformTexelBufferArrayDynamicIndexing` capability.

- `shaderStorageTexelBufferArrayDynamicIndexing` indicates whether arrays of storage texel buffers **can** be indexed by integer expressions that are dynamically uniform within either the subgroup or the invocation group in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` **must** be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `StorageTexelBufferArrayDynamicIndexing` capability.
- `shaderUniformBufferArrayNonUniformIndexing` indicates whether arrays of uniform buffers **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` **must** not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `UniformBufferArrayNonUniformIndexing` capability.
- `shaderSampledImageArrayNonUniformIndexing` indicates whether arrays of samplers or sampled images **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, or `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` **must** not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `SampledImageArrayNonUniformIndexing` capability.
- `shaderStorageBufferArrayNonUniformIndexing` indicates whether arrays of storage buffers **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` **must** not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `StorageBufferArrayNonUniformIndexing` capability.
- `shaderStorageImageArrayNonUniformIndexing` indicates whether arrays of storage images **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` **must** not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `StorageImageArrayNonUniformIndexing` capability.
- `shaderInputAttachmentArrayNonUniformIndexing` indicates whether arrays of input attachments **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` **must** not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `InputAttachmentArrayNonUniformIndexing` capability.
- `shaderUniformTexelBufferArrayNonUniformIndexing` indicates whether arrays of uniform texel buffers **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` **must** not be indexed by non-uniform integer expressions when aggregated into arrays in shader code.

This also indicates whether shader modules **can** declare the `UniformTexelBufferArrayNonUniformIndexing` capability.

- `shaderStorageTexelBufferArrayNonUniformIndexing` indicates whether arrays of storage texel buffers **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` **must** not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `StorageTexelBufferArrayNonUniformIndexing` capability.
- `descriptorBindingUniformBufferUpdateAfterBind` indicates whether the implementation supports updating uniform buffer descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` **must** not be used with `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`.
- `descriptorBindingSampledImageUpdateAfterBind` indicates whether the implementation supports updating sampled image descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` **must** not be used with `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, or `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`.
- `descriptorBindingStorageImageUpdateAfterBind` indicates whether the implementation supports updating storage image descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` **must** not be used with `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`.
- `descriptorBindingStorageBufferUpdateAfterBind` indicates whether the implementation supports updating storage buffer descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` **must** not be used with `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`.
- `descriptorBindingUniformTexelBufferUpdateAfterBind` indicates whether the implementation supports updating uniform texel buffer descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` **must** not be used with `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`.
- `descriptorBindingStorageTexelBufferUpdateAfterBind` indicates whether the implementation supports updating storage texel buffer descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` **must** not be used with `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`.
- `descriptorBindingUpdateUnusedWhilePending` indicates whether the implementation supports updating descriptors while the set is in use. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT` **must** not be used.
- `descriptorBindingPartiallyBound` indicates whether the implementation supports statically using a descriptor set binding in which some descriptors are not valid. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT` **must** not be used.
- `descriptorBindingVariableDescriptorCount` indicates whether the implementation supports descriptor sets with a variable-sized last binding. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT` **must** not be used.
- `runtimeDescriptorArray` indicates whether the implementation supports the SPIR-V

`RuntimeDescriptorArray` capability. If this feature is not enabled, descriptors **must** not be declared in runtime arrays.

- `samplerFilterMinmax` indicates whether the implementation supports a minimum set of required formats supporting min/max filtering as defined by the `filterMinmaxSingleComponentFormats` property minimum requirements. If this feature is not enabled, then `VkSamplerReductionModeCreateInfo` **must** only use `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`.
- `scalarBlockLayout` indicates that the implementation supports the layout of resource blocks in shaders using `scalar alignment`.
- `imagelessFramebuffer` indicates that the implementation supports specifying the image view for attachments at render pass begin time via `VkRenderPassAttachmentBeginInfo`.
- `uniformBufferStandardLayout` indicates that the implementation supports the same layouts for uniform buffers as for storage and other kinds of buffers. See `Standard Buffer Layout`.
- `shaderSubgroupExtendedTypes` is a boolean specifying whether subgroup operations can use 8-bit integer, 16-bit integer, 64-bit integer, 16-bit floating-point, and vectors of these types in `group operations` with `subgroup scope`, if the implementation supports the types.
- `separateDepthStencilLayouts` indicates whether the implementation supports a `VkImageMemoryBarrier` for a depth/stencil image with only one of `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT` set, and whether `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` can be used.
- `hostQueryReset` indicates that the implementation supports resetting queries from the host with `vkResetQueryPool`.
- `timelineSemaphore` indicates whether semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` are supported.
- `bufferDeviceAddress` indicates that the implementation supports accessing buffer memory in shaders as storage buffers via an address queried from `vkGetBufferDeviceAddress`.
- `bufferDeviceAddressCaptureReplay` indicates that the implementation supports saving and reusing buffer and device addresses, e.g. for trace capture and replay.
- `bufferDeviceAddressMultiDevice` indicates that the implementation supports the `bufferDeviceAddress` feature for logical devices created with multiple physical devices. If this feature is not supported, buffer addresses **must** not be queried on a logical device created with more than one physical device.
- `vulkanMemoryModel` indicates whether shader modules **can** declare the `VulkanMemoryModel` capability.
- `vulkanMemoryModelDeviceScope` indicates whether the Vulkan Memory Model can use `Device` scope synchronization. This also indicates whether shader modules **can** declare the `VulkanMemoryModelDeviceScope` capability.
- `vulkanMemoryModelAvailabilityVisibilityChains` indicates whether the Vulkan Memory Model can use `availability and visibility chains` with more than one element.
- `shaderOutputViewportIndex` indicates whether the implementation supports the `ShaderViewportIndex` SPIR-V capability enabling variables decorated with the `ViewportIndex` built-

in to be exported from vertex or tessellation evaluation shaders. If this feature is not enabled, the `ViewportIndex` built-in decoration **must** not be used on outputs in vertex or tessellation evaluation shaders.

- `shaderOutputLayer` indicates whether the implementation supports the `ShaderLayer` SPIR-V capability enabling variables decorated with the `Layer` built-in to be exported from vertex or tessellation evaluation shaders. If this feature is not enabled, the `Layer` built-in decoration **must** not be used on outputs in vertex or tessellation evaluation shaders.
- If `subgroupBroadcastDynamicId` is `VK_TRUE`, the “Id” operand of `OpGroupNonUniformBroadcast` **can** be dynamically uniform within a subgroup, and the “Index” operand of `OpGroupNonUniformQuadBroadcast` **can** be dynamically uniform within the derivative group. If it is `VK_FALSE`, these operands **must** be constants.

If the `VkPhysicalDeviceVulkan12Features` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceVulkan12Features`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceVulkan12Features-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_2_FEATURES`

The `VkPhysicalDeviceVariablePointersFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceVariablePointersFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           variablePointersStorageBuffer;
    VkBool32           variablePointers;
} VkPhysicalDeviceVariablePointersFeatures;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `variablePointersStorageBuffer` specifies whether the implementation supports the SPIR-V `VariablePointersStorageBuffer` capability. When this feature is not enabled, shader modules **must** not declare the `SPV_KHR_variable_pointers` extension or the `VariablePointersStorageBuffer` capability.
- `variablePointers` specifies whether the implementation supports the SPIR-V `VariablePointers` capability. When this feature is not enabled, shader modules **must** not declare the

`VariablePointers` capability.

If the `VkPhysicalDeviceVariablePointersFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceVariablePointersFeatures`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage

- VUID-VkPhysicalDeviceVariablePointersFeatures-variablePointers-01431
If `variablePointers` is enabled then `variablePointersStorageBuffer` **must** also be enabled

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVariablePointersFeatures-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VARIABLE_POINTERS_FEATURES`

The `VkPhysicalDeviceMultiviewFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceMultiviewFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           multiview;
    VkBool32           multiviewGeometryShader;
    VkBool32           multiviewTessellationShader;
} VkPhysicalDeviceMultiviewFeatures;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `multiview` specifies whether the implementation supports multiview rendering within a render pass. If this feature is not enabled, the view mask of each subpass **must** always be zero.
- `multiviewGeometryShader` specifies whether the implementation supports multiview rendering within a render pass, with `geometry shaders`. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask **must** not include a geometry shader.
- `multiviewTessellationShader` specifies whether the implementation supports multiview rendering within a render pass, with `tessellation shaders`. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask **must** not include any tessellation shaders.

If the `VkPhysicalDeviceMultiviewFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceMultiviewFeatures`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage

- VUID-VkPhysicalDeviceMultiviewFeatures-multiviewGeometryShader-00580
If `multiviewGeometryShader` is enabled then `multiview` **must** also be enabled
- VUID-VkPhysicalDeviceMultiviewFeatures-multiviewTessellationShader-00581
If `multiviewTessellationShader` is enabled then `multiview` **must** also be enabled

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMultiviewFeatures-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTIVIEW_FEATURES`

The `VkPhysicalDeviceShaderAtomicFloatFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_shader_atomic_float
typedef struct VkPhysicalDeviceShaderAtomicFloatFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           shaderBufferFloat32Atomics;
    VkBool32           shaderBufferFloat32AtomicAdd;
    VkBool32           shaderBufferFloat64Atomics;
    VkBool32           shaderBufferFloat64AtomicAdd;
    VkBool32           shaderSharedFloat32Atomics;
    VkBool32           shaderSharedFloat32AtomicAdd;
    VkBool32           shaderSharedFloat64Atomics;
    VkBool32           shaderSharedFloat64AtomicAdd;
    VkBool32           shaderImageFloat32Atomics;
    VkBool32           shaderImageFloat32AtomicAdd;
    VkBool32           sparseImageFloat32Atomics;
    VkBool32           sparseImageFloat32AtomicAdd;
} VkPhysicalDeviceShaderAtomicFloatFeaturesEXT;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderBufferFloat32Atomics` indicates whether shaders **can** perform 32-bit floating-point load, store and exchange atomic operations on storage buffers.

- `shaderBufferFloat32AtomicAdd` indicates whether shaders **can** perform 32-bit floating-point add atomic operations on storage buffers.
- `shaderBufferFloat64Atomics` indicates whether shaders **can** perform 64-bit floating-point load, store and exchange atomic operations on storage buffers.
- `shaderBufferFloat64AtomicAdd` indicates whether shaders **can** perform 64-bit floating-point add atomic operations on storage buffers.
- `shaderSharedFloat32Atomics` indicates whether shaders **can** perform 32-bit floating-point load, store and exchange atomic operations on shared memory.
- `shaderSharedFloat32AtomicAdd` indicates whether shaders **can** perform 32-bit floating-point add atomic operations on shared memory.
- `shaderSharedFloat64Atomics` indicates whether shaders **can** perform 64-bit floating-point load, store and exchange atomic operations on shared memory.
- `shaderSharedFloat64AtomicAdd` indicates whether shaders **can** perform 64-bit floating-point add atomic operations on shared memory.
- `shaderImageFloat32Atomics` indicates whether shaders **can** perform 32-bit floating-point load, store and exchange atomic image operations.
- `shaderImageFloat32AtomicAdd` indicates whether shaders **can** perform 32-bit floating-point add atomic image operations.
- `sparseImageFloat32Atomics` indicates whether 32-bit floating-point load, store and exchange atomic operations **can** be used on sparse images.
- `sparseImageFloat32AtomicAdd` indicates whether 32-bit floating-point add atomic operations **can** be used on sparse images.

If the `VkPhysicalDeviceShaderAtomicFloatFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceShaderAtomicFloatFeaturesEXT`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceShaderAtomicFloatFeaturesEXT-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ATOMIC_FLOAT_FEATURES_EXT`

The `VkPhysicalDeviceShaderAtomicInt64Features` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceShaderAtomicInt64Features {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           shaderBufferInt64Atomics;
    VkBool32           shaderSharedInt64Atomics;
} VkPhysicalDeviceShaderAtomicInt64Features;
```

This structure describes the following features:

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **shaderBufferInt64Atomics** indicates whether shaders **can** perform 64-bit unsigned and signed integer atomic operations on buffers.
- **shaderSharedInt64Atomics** indicates whether shaders **can** perform 64-bit unsigned and signed integer atomic operations on shared memory.

If the [VkPhysicalDeviceShaderAtomicInt64Features](#) structure is included in the **pNext** chain of the [VkPhysicalDeviceFeatures2](#) structure passed to [vkGetPhysicalDeviceFeatures2](#), it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a [VkDevice](#) with any features described by [VkPhysicalDeviceShaderAtomicInt64Features](#), it **must** add an instance of the structure, with the desired feature members set to **VK_TRUE**, to the **pNext** chain of [VkDeviceCreateInfo](#) when creating the [VkDevice](#).

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderAtomicInt64Features-sType-sType
sType must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ATOMIC_INT64_FEATURES**

The [VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT](#) structure is defined as:

```
// Provided by VK_EXT_shader_image_atomic_int64
typedef struct VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           shaderImageInt64Atomics;
    VkBool32           sparseImageInt64Atomics;
} VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT;
```

This structure describes the following features:

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **shaderImageInt64Atomics** indicates whether shaders **can** support 64-bit unsigned and signed

integer atomic operations on images.

- `sparseImageInt64Atomics` indicates whether 64-bit integer atomics **can** be used on sparse images.

If the `VkPhysicalDeviceShaderAtomicInt64FeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceShaderAtomicInt64FeaturesEXT`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT-sType-sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_IMAGE_ATOMIC_INT64_FEATURES_EXT`

The `VkPhysicalDevice8BitStorageFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDevice8BitStorageFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           storageBuffer8BitAccess;
    VkBool32           uniformAndStorageBuffer8BitAccess;
    VkBool32           storagePushConstant8;
} VkPhysicalDevice8BitStorageFeatures;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `storageBuffer8BitAccess` indicates whether objects in the `StorageBuffer`, or `PhysicalStorageBuffer` storage class with the `Block` decoration **can** have 8-bit integer members. If this feature is not enabled, 8-bit integer members **must** not be used in such objects. This also indicates whether shader modules **can** declare the `StorageBuffer8BitAccess` capability.
- `uniformAndStorageBuffer8BitAccess` indicates whether objects in the `Uniform` storage class with the `Block` decoration **can** have 8-bit integer members. If this feature is not enabled, 8-bit integer members **must** not be used in such objects. This also indicates whether shader modules **can** declare the `UniformAndStorageBuffer8BitAccess` capability.
- `storagePushConstant8` indicates whether objects in the `PushConstant` storage class **can** have 8-bit integer members. If this feature is not enabled, 8-bit integer members **must** not be used in such objects. This also indicates whether shader modules **can** declare the `StoragePushConstant8` capability.

If the `VkPhysicalDevice8BitStorageFeatures` structure is included in the `pNext` chain of the

`VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDevice8BitStorageFeatures`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- `VUID-VkPhysicalDevice8BitStorageFeatures-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_8BIT_STORAGE_FEATURES`

The `VkPhysicalDevice16BitStorageFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDevice16BitStorageFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           storageBuffer16BitAccess;
    VkBool32           uniformAndStorageBuffer16BitAccess;
    VkBool32           storagePushConstant16;
    VkBool32           storageInputOutput16;
} VkPhysicalDevice16BitStorageFeatures;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `storageBuffer16BitAccess` specifies whether objects in the `StorageBuffer`, or `PhysicalStorageBuffer` storage class with the `Block` decoration **can** have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members **must** not be used in such objects. This also specifies whether shader modules **can** declare the `StorageBuffer16BitAccess` capability.
- `uniformAndStorageBuffer16BitAccess` specifies whether objects in the `Uniform` storage class with the `Block` decoration **can** have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members **must** not be used in such objects. This also specifies whether shader modules **can** declare the `UniformAndStorageBuffer16BitAccess` capability.
- `storagePushConstant16` specifies whether objects in the `PushConstant` storage class **can** have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or floating-point members **must** not be used in such objects. This also specifies whether shader modules **can** declare the `StoragePushConstant16` capability.
- `storageInputOutput16` specifies whether objects in the `Input` and `Output` storage classes **can** have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members **must** not be used in such objects. This also specifies whether

shader modules **can** declare the `StorageInputOutput16` capability.

If the `VkPhysicalDevice16BitStorageFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDevice16BitStorageFeatures`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDevice16BitStorageFeatures-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_16BIT_STORAGE_FEATURES`

The `VkPhysicalDeviceShaderFloat16Int8Features` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceShaderFloat16Int8Features {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           shaderFloat16;
    VkBool32           shaderInt8;
} VkPhysicalDeviceShaderFloat16Int8Features;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderFloat16` indicates whether 16-bit floats (halves) are supported in shader code. This also indicates whether shader modules **can** declare the `Float16` capability. However, this only enables a subset of the storage classes that SPIR-V allows for the `Float16` SPIR-V capability: Declaring and using 16-bit floats in the `Private`, `Workgroup`, and `Function` storage classes is enabled, while declaring them in the interface storage classes (e.g., `UniformConstant`, `Uniform`, `StorageBuffer`, `Input`, `Output`, and `PushConstant`) is not enabled.
- `shaderInt8` indicates whether 8-bit integers (signed and unsigned) are supported in shader code. This also indicates whether shader modules **can** declare the `Int8` capability. However, this only enables a subset of the storage classes that SPIR-V allows for the `Int8` SPIR-V capability: Declaring and using 8-bit integers in the `Private`, `Workgroup`, and `Function` storage classes is enabled, while declaring them in the interface storage classes (e.g., `UniformConstant`, `Uniform`, `StorageBuffer`, `Input`, `Output`, and `PushConstant`) is not enabled.

If the `VkPhysicalDeviceShaderFloat16Int8Features` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceShaderFloat16Int8Features`, it **must** add

an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderFloat16Int8Features-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_FLOAT16_INT8_FEATURES`

The `VkPhysicalDeviceShaderClockFeaturesKHR` structure is defined as:

```
// Provided by VK_KHR_shader_clock
typedef struct VkPhysicalDeviceShaderClockFeaturesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           shaderSubgroupClock;
    VkBool32           shaderDeviceClock;
} VkPhysicalDeviceShaderClockFeaturesKHR;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderSubgroupClock` indicates whether shaders **can** perform `Subgroup` scoped clock reads.
- `shaderDeviceClock` indicates whether shaders **can** perform `Device` scoped clock reads.

If the `VkPhysicalDeviceShaderClockFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceShaderClockFeaturesKHR`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderClockFeaturesKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_CLOCK_FEATURES_KHR`

The `VkPhysicalDeviceSamplerYcbcrConversionFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceSamplerYcbcrConversionFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           samplerYcbcrConversion;
} VkPhysicalDeviceSamplerYcbcrConversionFeatures;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `samplerYcbcrConversion` specifies whether the implementation supports `sampler Y'CBCR conversion`. If `samplerYcbcrConversion` is `VK_FALSE`, sampler Y'C_BC_R conversion is not supported, and samplers using sampler Y'C_BC_R conversion **must** not be used.

If the `VkPhysicalDeviceSamplerYcbcrConversionFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceSamplerYcbcrConversionFeatures`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSamplerYcbcrConversionFeatures-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SAMPLER_YCBCR_CONVERSION_FEATURES`

The `VkPhysicalDeviceProtectedMemoryFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceProtectedMemoryFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           protectedMemory;
} VkPhysicalDeviceProtectedMemoryFeatures;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `protectedMemory` specifies whether `protected memory` is supported.

If the `VkPhysicalDeviceProtectedMemoryFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to

indicate whether each corresponding feature is supported. If the application wishes to use a [VkDevice](#) with any features described by [VkPhysicalDeviceProtectedMemoryFeatures](#), it **must** add an instance of the structure, with the desired feature members set to [VK_TRUE](#), to the [pNext](#) chain of [VkDeviceCreateInfo](#) when creating the [VkDevice](#).

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceProtectedMemoryFeatures-sType-sType
[sType](#) **must** be [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROTECTED_MEMORY_FEATURES](#)

The [VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT](#) structure is defined as:

```
// Provided by VK_EXT_blend_operation_advanced
typedef struct VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           advancedBlendCoherentOperations;
} VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT;
```

This structure describes the following feature:

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [advancedBlendCoherentOperations](#) specifies whether blending using [advanced blend operations](#) is guaranteed to execute atomically and in [primitive order](#). If this is [VK_TRUE](#), [VK_ACCESS_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT](#) is treated the same as [VK_ACCESS_COLOR_ATTACHMENT_READ_BIT](#), and advanced blending needs no additional synchronization over basic blending. If this is [VK_FALSE](#), then memory dependencies are required to guarantee order between two advanced blending operations that occur on the same sample.

If the [VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT](#) structure is included in the [pNext](#) chain of the [VkPhysicalDeviceFeatures2](#) structure passed to [vkGetPhysicalDeviceFeatures2](#), it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a [VkDevice](#) with any features described by [VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT](#), it **must** add an instance of the structure, with the desired feature members set to [VK_TRUE](#), to the [pNext](#) chain of [VkDeviceCreateInfo](#) when creating the [VkDevice](#).

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT-sType-sType
[sType](#) **must** be [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BLEND_OPERATION_ADVANCED_FEATURES_EXT](#)

The [VkPhysicalDeviceShaderDrawParametersFeatures](#) structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceShaderDrawParametersFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           shaderDrawParameters;
} VkPhysicalDeviceShaderDrawParametersFeatures;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderDrawParameters` specifies whether the implementation supports the SPIR-V `DrawParameters` capability. When this feature is not enabled, shader modules **must** not declare the `SPV_KHR_shader_draw_parameters` extension or the `DrawParameters` capability.

If the `VkPhysicalDeviceShaderDrawParametersFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceShaderDrawParametersFeatures`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderDrawParametersFeatures-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_DRAW_PARAMETERS_FEATURES`

The `VkPhysicalDeviceDescriptorIndexingFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceDescriptorIndexingFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           shaderInputAttachmentArrayDynamicIndexing;
    VkBool32           shaderUniformTexelBufferArrayDynamicIndexing;
    VkBool32           shaderStorageTexelBufferArrayDynamicIndexing;
    VkBool32           shaderUniformBufferArrayNonUniformIndexing;
    VkBool32           shaderSampledImageArrayNonUniformIndexing;
    VkBool32           shaderStorageBufferArrayNonUniformIndexing;
    VkBool32           shaderStorageImageArrayNonUniformIndexing;
    VkBool32           shaderInputAttachmentArrayNonUniformIndexing;
    VkBool32           shaderUniformTexelBufferArrayNonUniformIndexing;
    VkBool32           shaderStorageTexelBufferArrayNonUniformIndexing;
    VkBool32           descriptorBindingUniformBufferUpdateAfterBind;
    VkBool32           descriptorBindingSampledImageUpdateAfterBind;
    VkBool32           descriptorBindingStorageImageUpdateAfterBind;
    VkBool32           descriptorBindingStorageBufferUpdateAfterBind;
    VkBool32           descriptorBindingUniformTexelBufferUpdateAfterBind;
    VkBool32           descriptorBindingStorageTexelBufferUpdateAfterBind;
    VkBool32           descriptorBindingUpdateUnusedWhilePending;
    VkBool32           descriptorBindingPartiallyBound;
    VkBool32           descriptorBindingVariableDescriptorCount;
    VkBool32           runtimeDescriptorArray;
} VkPhysicalDeviceDescriptorIndexingFeatures;
```

This structure describes the following features:

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **shaderInputAttachmentArrayDynamicIndexing** indicates whether arrays of input attachments **can** be indexed by integer expressions that are dynamically uniform within either the subgroup or the invocation group in shader code. If this feature is not enabled, resources with a descriptor type of **VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT** **must** be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the **InputAttachmentArrayDynamicIndexing** capability.
- **shaderUniformTexelBufferArrayDynamicIndexing** indicates whether arrays of uniform texel buffers **can** be indexed by integer expressions that are dynamically uniform within either the subgroup or the invocation group in shader code. If this feature is not enabled, resources with a descriptor type of **VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER** **must** be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the **UniformTexelBufferArrayDynamicIndexing** capability.
- **shaderStorageTexelBufferArrayDynamicIndexing** indicates whether arrays of storage texel buffers **can** be indexed by integer expressions that are dynamically uniform within either the subgroup or the invocation group in shader code. If this feature is not enabled, resources with a descriptor type of **VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER** **must** be indexed only by constant

integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `StorageTexelBufferArrayDynamicIndexing` capability.

- `shaderUniformBufferArrayNonUniformIndexing` indicates whether arrays of uniform buffers **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` **must** not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `UniformBufferArrayNonUniformIndexing` capability.
- `shaderSampledImageArrayNonUniformIndexing` indicates whether arrays of samplers or sampled images **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, or `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` **must** not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `SampledImageArrayNonUniformIndexing` capability.
- `shaderStorageBufferArrayNonUniformIndexing` indicates whether arrays of storage buffers **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` **must** not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `StorageBufferArrayNonUniformIndexing` capability.
- `shaderStorageImageArrayNonUniformIndexing` indicates whether arrays of storage images **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` **must** not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `StorageImageArrayNonUniformIndexing` capability.
- `shaderInputAttachmentArrayNonUniformIndexing` indicates whether arrays of input attachments **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` **must** not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `InputAttachmentArrayNonUniformIndexing` capability.
- `shaderUniformTexelBufferArrayNonUniformIndexing` indicates whether arrays of uniform texel buffers **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` **must** not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `UniformTexelBufferArrayNonUniformIndexing` capability.
- `shaderStorageTexelBufferArrayNonUniformIndexing` indicates whether arrays of storage texel buffers **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` **must** not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `StorageTexelBufferArrayNonUniformIndexing` capability.

- `descriptorBindingUniformBufferUpdateAfterBind` indicates whether the implementation supports updating uniform buffer descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` **must** not be used with `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`.
- `descriptorBindingSampledImageUpdateAfterBind` indicates whether the implementation supports updating sampled image descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` **must** not be used with `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, or `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`.
- `descriptorBindingStorageImageUpdateAfterBind` indicates whether the implementation supports updating storage image descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` **must** not be used with `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`.
- `descriptorBindingStorageBufferUpdateAfterBind` indicates whether the implementation supports updating storage buffer descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` **must** not be used with `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`.
- `descriptorBindingUniformTexelBufferUpdateAfterBind` indicates whether the implementation supports updating uniform texel buffer descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` **must** not be used with `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`.
- `descriptorBindingStorageTexelBufferUpdateAfterBind` indicates whether the implementation supports updating storage texel buffer descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` **must** not be used with `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`.
- `descriptorBindingUpdateUnusedWhilePending` indicates whether the implementation supports updating descriptors while the set is in use. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT` **must** not be used.
- `descriptorBindingPartiallyBound` indicates whether the implementation supports statically using a descriptor set binding in which some descriptors are not valid. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT` **must** not be used.
- `descriptorBindingVariableDescriptorCount` indicates whether the implementation supports descriptor sets with a variable-sized last binding. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT` **must** not be used.
- `runtimeDescriptorArray` indicates whether the implementation supports the SPIR-V `RuntimeDescriptorArray` capability. If this feature is not enabled, descriptors **must** not be declared in runtime arrays.

If the `VkPhysicalDeviceDescriptorIndexingFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceDescriptorIndexingFeatures`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDescriptorIndexingFeatures-sType-sType
sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DESCRIPTOR_INDEXING_FEATURES

The `VkPhysicalDeviceVertexAttributeDivisorFeatures` structure is defined as:

```
typedef struct VkPhysicalDeviceVertexAttributeDivisorFeatures {  
    VkStructureType    sType;  
    void*              pNext;  
    VkBool32           vertexAttributeInstanceRateDivisor;  
    VkBool32           vertexAttributeInstanceRateZeroDivisor;  
} VkPhysicalDeviceVertexAttributeDivisorFeatures;
```

```
// Provided by VK_KHR_vertex_attribute_divisor  
typedef VkPhysicalDeviceVertexAttributeDivisorFeatures  
VkPhysicalDeviceVertexAttributeDivisorFeaturesKHR;
```

This structure describes the following features:

- sType is a `VkStructureType` value identifying this structure.
- pNext is `NULL` or a pointer to a structure extending this structure.
- vertexAttributeInstanceRateDivisor specifies whether vertex attribute fetching may be repeated in the case of instanced rendering.
- vertexAttributeInstanceRateZeroDivisor specifies whether a zero value for `VkVertexInputBindingDivisorDescriptionEXT::divisor` is supported.

If the `VkPhysicalDeviceVertexAttributeDivisorFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceVertexAttributeDivisorFeatures`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVertexAttributeDivisorFeatures-sType-sType
sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VERTEX_ATTRIBUTE_DIVISOR_FEATURES

The `VkPhysicalDeviceASTCDecodeFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_astc_decode_mode
typedef struct VkPhysicalDeviceASTCDecodeFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           decodeModeSharedExponent;
} VkPhysicalDeviceASTCDecodeFeaturesEXT;
```

This structure describes the following feature:

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **decodeModeSharedExponent** indicates whether the implementation supports decoding ASTC compressed formats to **VK_FORMAT_E5B9G9R9_UFLOAT_PACK32** internal precision.

If the [VkPhysicalDeviceASTCDecodeFeaturesEXT](#) structure is included in the **pNext** chain of the [VkPhysicalDeviceFeatures2](#) structure passed to [vkGetPhysicalDeviceFeatures2](#), it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a [VkDevice](#) with any features described by [VkPhysicalDeviceASTCDecodeFeaturesEXT](#), it **must** add an instance of the structure, with the desired feature members set to **VK_TRUE**, to the **pNext** chain of [VkDeviceCreateInfo](#) when creating the [VkDevice](#).

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceASTCDecodeFeaturesEXT-sType-sType
sType must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ASTC_DECODE_FEATURES_EXT**

The [VkPhysicalDeviceVulkanMemoryModelFeatures](#) structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceVulkanMemoryModelFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           vulkanMemoryModel;
    VkBool32           vulkanMemoryModelDeviceScope;
    VkBool32           vulkanMemoryModelAvailabilityVisibilityChains;
} VkPhysicalDeviceVulkanMemoryModelFeatures;
```

This structure describes the following features:

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **vulkanMemoryModel** indicates whether shader modules **can** declare the [VulkanMemoryModel](#) capability.
- **vulkanMemoryModelDeviceScope** indicates whether the Vulkan Memory Model can use [Device](#)

scope synchronization. This also indicates whether shader modules **can** declare the `VulkanMemoryModelDeviceScope` capability.

- `vulkanMemoryModelAvailabilityVisibilityChains` indicates whether the Vulkan Memory Model can use [availability and visibility chains](#) with more than one element.

If the `VkPhysicalDeviceVulkanMemoryModelFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceVulkanMemoryModelFeaturesKHR`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVulkanMemoryModelFeatures-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_MEMORY_MODEL_FEATURES`

The `VkPhysicalDeviceScalarBlockLayoutFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceScalarBlockLayoutFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           scalarBlockLayout;
} VkPhysicalDeviceScalarBlockLayoutFeatures;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `scalarBlockLayout` indicates that the implementation supports the layout of resource blocks in shaders using [scalar alignment](#).

If the `VkPhysicalDeviceScalarBlockLayoutFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceScalarBlockLayoutFeatures`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceScalarBlockLayoutFeatures-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SCALAR_BLOCK_LAYOUT_FEATURES`

The `VkPhysicalDeviceUniformBufferStandardLayoutFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceUniformBufferStandardLayoutFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           uniformBufferStandardLayout;
} VkPhysicalDeviceUniformBufferStandardLayoutFeatures;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `uniformBufferStandardLayout` indicates that the implementation supports the same layouts for uniform buffers as for storage and other kinds of buffers. See [Standard Buffer Layout](#).

If the `VkPhysicalDeviceUniformBufferStandardLayoutFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceUniformBufferStandardLayoutFeatures`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceUniformBufferStandardLayoutFeatures-sType-sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_UNIFORM_BUFFER_STANDARD_LAYOUT_FEATURES`

The `VkPhysicalDeviceDepthClipEnableFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_depth_clip_enable
typedef struct VkPhysicalDeviceDepthClipEnableFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           depthClipEnable;
} VkPhysicalDeviceDepthClipEnableFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `depthClipEnable` indicates that the implementation supports setting the depth clipping operation explicitly via the `VkPipelineRasterizationDepthClipStateCreateInfoEXT` pipeline state. Otherwise

depth clipping is only enabled when `VkPipelineRasterizationStateCreateInfo::depthClampEnable` is `VK_FALSE`.

If the `VkPhysicalDeviceDepthClipEnableFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceDepthClipEnableFeaturesEXT`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceDepthClipEnableFeaturesEXT-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEPTH_CLIP_ENABLE_FEATURES_EXT`

The `VkPhysicalDeviceBufferDeviceAddressFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceBufferDeviceAddressFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           bufferDeviceAddress;
    VkBool32           bufferDeviceAddressCaptureReplay;
    VkBool32           bufferDeviceAddressMultiDevice;
} VkPhysicalDeviceBufferDeviceAddressFeatures;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `bufferDeviceAddress` indicates that the implementation supports accessing buffer memory in shaders as storage buffers via an address queried from `vkGetBufferDeviceAddress`.
- `bufferDeviceAddressCaptureReplay` indicates that the implementation supports saving and reusing buffer and device addresses, e.g. for trace capture and replay.
- `bufferDeviceAddressMultiDevice` indicates that the implementation supports the `bufferDeviceAddress` feature for logical devices created with multiple physical devices. If this feature is not supported, buffer addresses **must** not be queried on a logical device created with more than one physical device.

NOTE

`bufferDeviceAddressMultiDevice` exists to allow certain legacy platforms to be able to support `bufferDeviceAddress` without needing to support shared GPU virtual addresses for multi-device configurations.

See `vkGetBufferDeviceAddress` for more information.

If the `VkPhysicalDeviceBufferDeviceAddressFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceBufferDeviceAddressFeatures`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceBufferDeviceAddressFeatures-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BUFFER_DEVICE_ADDRESS_FEATURES`

The `VkPhysicalDeviceImagelessFramebufferFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceImagelessFramebufferFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           imagelessFramebuffer;
} VkPhysicalDeviceImagelessFramebufferFeatures;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `imagelessFramebuffer` indicates that the implementation supports specifying the image view for attachments at render pass begin time via `VkRenderPassAttachmentBeginInfo`.

If the `VkPhysicalDeviceImagelessFramebufferFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceImagelessFramebufferFeatures`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceImagelessFramebufferFeatures-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGELESS_FRAMEBUFFER_FEATURES`

The `VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_fragment_shader_interlock
typedef struct VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           fragmentShaderSampleInterlock;
    VkBool32           fragmentShaderPixelInterlock;
    VkBool32           fragmentShaderShadingRateInterlock;
} VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fragmentShaderSampleInterlock` indicates that the implementation supports the `FragmentShaderSampleInterlockEXT` SPIR-V capability.
- `fragmentShaderPixelInterlock` indicates that the implementation supports the `FragmentShaderPixelInterlockEXT` SPIR-V capability.
- `fragmentShaderShadingRateInterlock` indicates that the implementation supports the `FragmentShaderShadingRateInterlockEXT` SPIR-V capability.

If the `VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- `VOID-VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADER_INTERLOCK_FEATURES_EXT`

The `VkPhysicalDeviceYcbcrImageArraysFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_ycbcr_image_arrays
typedef struct VkPhysicalDeviceYcbcrImageArraysFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           ycbcrImageArrays;
} VkPhysicalDeviceYcbcrImageArraysFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `ycbcrImageArrays` indicates that the implementation supports creating images with a format that requires `Y'CBCR conversion` and has multiple array layers.

If the `VkPhysicalDeviceYcbcrImageArraysFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceYcbcrImageArraysFeaturesEXT`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceYcbcrImageArraysFeaturesEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_YCBCR_IMAGE_ARRAYS_FEATURES_EXT`

The `VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           shaderSubgroupExtendedTypes;
} VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderSubgroupExtendedTypes` is a boolean specifying whether subgroup operations can use 8-bit integer, 16-bit integer, 64-bit integer, 16-bit floating-point, and vectors of these types in `group operations` with `subgroup scope`, if the implementation supports the types.

If the `VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_SUBGROUP_EXTENDED_TYPES_FEATURES`

The `VkPhysicalDeviceHostQueryResetFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceHostQueryResetFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           hostQueryReset;
} VkPhysicalDeviceHostQueryResetFeatures;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `hostQueryReset` indicates that the implementation supports resetting queries from the host with `vkResetQueryPool`.

If the `VkPhysicalDeviceHostQueryResetFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceHostQueryResetFeatures`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceHostQueryResetFeatures-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_HOST_QUERY_RESET_FEATURES`

The `VkPhysicalDeviceTimelineSemaphoreFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceTimelineSemaphoreFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           timelineSemaphore;
} VkPhysicalDeviceTimelineSemaphoreFeatures;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `timelineSemaphore` indicates whether semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` are supported.

If the `VkPhysicalDeviceTimelineSemaphoreFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceTimelineSemaphoreFeatures`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceTimelineSemaphoreFeatures-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TIMELINE_SEMAPHORE_FEATURES`

The `VkPhysicalDeviceExternalSciSyncFeaturesNV` structure is defined as:

```
// Provided by VK_NV_external_sci_sync
typedef struct VkPhysicalDeviceExternalSciSyncFeaturesNV {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           sciSyncFence;
    VkBool32           sciSyncSemaphore;
    VkBool32           sciSyncImport;
    VkBool32           sciSyncExport;
} VkPhysicalDeviceExternalSciSyncFeaturesNV;
```

The members of the `VkPhysicalDeviceExternalSciSyncFeaturesNV` structure describe the following features:

- `sciSyncFence` indicates whether external fences created with a handle type of `VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_OBJ_BIT_NV` and `VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_FENCE_BIT_NV` are supported for import and/or export.
- `sciSyncSemaphore` indicates whether external semaphores created with a handle type of `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SCI_SYNC_OBJ_BIT_NV` are supported for import and/or export.
- `sciSyncImport` indicates whether `NvSciSyncObj` import functionality is supported. If `sciSyncImport` is `VK_TRUE`, `VkFence` and/or `VkSemaphore` support importing `NvSciSyncObj` from applications. In this case, the application is responsible for the resource management of the `NvSciSyncObj`.
- `sciSyncExport` indicates whether `NvSciSyncObj` export functionality is supported. If `sciSyncExport` is `VK_TRUE`, `VkFence` and/or `VkSemaphore` support exporting `NvSciSyncObj` created by the driver to applications. In this case, the driver is responsible for the resource management of the `NvSciSyncObj`.

Table 44. Functionality Supported for `NvSciSync` Features

Features	<code>sciSyncImport</code>	<code>sciSyncExport</code>	Always supported ¹

sciSyncFence	vkImportFenceSciSyncFenceNV, vkImportFenceSciSyncObjNV	VkExportFenceSciSyncInfoNV	vkGetFenceSciSyncFenceNV, vkGetFenceSciSyncObjNV, vkGetPhysicalDeviceSciSyncAttributesNV (with VK_SCI_SYNC_PRIMITIVE_TYPE_FENCE_NV)
sciSyncSemaphore	vkImportSemaphoreSciSyncObjNV	VkExportSemaphoreSciSyncInfoNV	vkGetSemaphoreSciSyncObjNV, vkGetPhysicalDeviceSciSyncAttributesNV (with VK_SCI_SYNC_PRIMITIVE_TYPE_SEMAPHORE_NV)

1

Functionality in this column is always available.

The [Functionality supported for NvSciSync features](#) table summarizes the functionality enabled by the [VkPhysicalDeviceExternalSciSyncFeaturesNV](#) structure. There are two orthogonal pieces of functionality: fence and semaphore support; import and export support. Each entry in the body of the table summarizes the functionality that **can** be used when the given features are supported and enabled. This summarizes Valid Usage statements that are added elsewhere in this specification.

If the [VkPhysicalDeviceExternalSciSyncFeaturesNV](#) structure is included in the [pNext](#) chain of the [VkPhysicalDeviceFeatures2](#) structure passed to [vkGetPhysicalDeviceFeatures2](#), it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a [VkDevice](#) with any features described by [VkPhysicalDeviceExternalSciSyncFeaturesNV](#), it **must** add an instance of the structure, with the desired feature members set to [VK_TRUE](#), to the [pNext](#) chain of [VkDeviceCreateInfo](#) when creating the [VkDevice](#).

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalSciSyncFeaturesNV-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_SCI_SYNC_FEATURES_NV](#)

The [VkPhysicalDeviceExternalSciSync2FeaturesNV](#) structure is defined as:

```
// Provided by VK_NV_external_sci_sync2
typedef struct VkPhysicalDeviceExternalSciSync2FeaturesNV {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           sciSyncFence;
    VkBool32           sciSyncSemaphore2;
    VkBool32           sciSyncImport;
    VkBool32           sciSyncExport;
} VkPhysicalDeviceExternalSciSync2FeaturesNV;
```

The members of the `VkPhysicalDeviceExternalSciSync2FeaturesNV` structure describe the following features:

- `sciSyncFence` indicates whether external fences created with a handle type of `VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_OBJ_BIT_NV` and `VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_FENCE_BIT_NV` are supported for import and/or export.
- `sciSyncSemaphore2` indicates whether semaphore SciSync pools are supported and semaphores can be created from `NvSciSyncObj` via `VkSemaphoreSciSyncPoolNV` objects. In this case, the application is responsible for the resource management of the `NvSciSyncObj`.
- `sciSyncImport` indicates whether `NvSciSyncObj` import functionality is supported. If `sciSyncImport` is `VK_TRUE`, `VkFence` and/or `VkSemaphore` support importing `NvSciSyncObj` from applications. In this case, the application is responsible for the resource management of the `NvSciSyncObj`.
- `sciSyncExport` indicates whether `NvSciSyncObj` export functionality is supported. If `sciSyncExport` is `VK_TRUE`, `VkFence` supports exporting `NvSciSyncObj` created by the driver to applications. In this case, the driver is responsible for the resource management of the `NvSciSyncObj`.

Table 45. Functionality Supported for NvSciSync Features

Features	<code>sciSyncImport</code>	<code>sciSyncExport</code>	Always supported ¹
<code>sciSyncFence</code>	<code>vkImportFenceSciSyncFenceNV</code> , <code>vkImportFenceSciSyncObjNV</code>	<code>VkExportFenceSciSyncInfoNV</code>	<code>vkGetFenceSciSyncFenceNV</code> , <code>vkGetFenceSciSyncObjNV</code> , <code>vkGetPhysicalDeviceSciSyncAttributesNV</code> (with <code>VK_SCI_SYNC_PRIMITIVE_TYPE_FENCE_NV</code>)
<code>sciSyncSemaphore2</code>	<code>vkCreateSemaphoreSciSyncPoolNV</code> , <code>VkSemaphoreSciSyncCreateInfoNV</code>	n/a	<code>vkGetPhysicalDeviceSciSyncAttributesNV</code> (with <code>VK_SCI_SYNC_PRIMITIVE_TYPE_SEMAPHORE_NV</code>)

1

Functionality in this column is always available.

The [Functionality supported for NvSciSync features](#) table summarizes the functionality enabled by

the `VkPhysicalDeviceExternalSciSync2FeaturesNV` structure. There are two orthogonal pieces of functionality: fence and semaphore support; import and export support. Each entry in the body of the table summarizes the functionality that **can** be used when the given features are supported and enabled. This summarizes Valid Usage statements that are added elsewhere in this specification.

If the `VkPhysicalDeviceExternalSciSync2FeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceExternalSciSync2FeaturesNV`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalSciSync2FeaturesNV-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_SCI_SYNC_2_FEATURES_NV`

The `VkPhysicalDeviceExternalMemorySciBufFeaturesNV` structure is defined as:

```
// Provided by VK_NV_external_memory_sci_buf
typedef struct VkPhysicalDeviceExternalMemorySciBufFeaturesNV {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           sciBufImport;
    VkBool32           sciBufExport;
} VkPhysicalDeviceExternalMemorySciBufFeaturesNV;
```

```
// Provided by VK_NV_external_memory_sci_buf
typedef VkPhysicalDeviceExternalMemorySciBufFeaturesNV
VkPhysicalDeviceExternalSciBufFeaturesNV;
```

The members of the `VkPhysicalDeviceExternalMemorySciBufFeaturesNV` structure describe the following features:

- `sciBufImport` indicates whether `NvSciBufObj` import functionality is supported. If `sciBufImport` is `VK_TRUE`, `VkDeviceMemory` supports importing `NvSciBufObj` from applications. In this case, the application is responsible for the resource management of the `NvSciBufObj`.
- `sciBufExport` indicates whether `NvSciBufObj` export functionality is supported. If `sciBufExport` is `VK_TRUE`, `VkDeviceMemory` supports exporting `NvSciBufObj` created by the driver to applications. In this case, the driver is responsible for the resource management of the `NvSciBufObj`.

Table 46. Functionality Supported for NvSciBuf Features

Features	Functionality

sciBufImport	VkImportMemorySciBufInfoNV, vkGetPhysicalDeviceExternalMemorySciBufPropertiesNV
sciBufExport	VkExportMemorySciBufInfoNV
Always supported ¹	vkGetPhysicalDeviceSciBufAttributesNV, vkGetMemorySciBufNV,

1

Functionality in this row is always available.

The [Functionality supported for NvSciBuf features](#) table summarizes the functionality enabled by the [VkPhysicalDeviceExternalMemorySciBufFeaturesNV](#) structure. Each entry in the body of the table summarizes the functionality that **can** be used when the given features are supported and enabled. This summarizes Valid Usage statements that are added elsewhere in this specification.

If the [VkPhysicalDeviceExternalMemorySciBufFeaturesNV](#) structure is included in the [pNext](#) chain of the [VkPhysicalDeviceFeatures2](#) structure passed to [vkGetPhysicalDeviceFeatures2](#), it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a [VkDevice](#) with any features described by [VkPhysicalDeviceExternalMemorySciBufFeaturesNV](#), it **must** add an instance of the structure, with the desired feature members set to [VK_TRUE](#), to the [pNext](#) chain of [VkDeviceCreateInfo](#) when creating the [VkDevice](#).

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalMemorySciBufFeaturesNV-sType-sType
[sType](#) **must** be [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_MEMORY_SCI_BUF_FEATURES_NV](#)

The [VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX](#) structure is defined as:

```
// Provided by VK_QNX_external_memory_screen_buffer
typedef struct VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           screenBufferImport;
} VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX;
```

The members of the [VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX](#) structure describe the following features:

- [screenBufferImport](#) indicates whether QNX Screen buffer import functionality is supported. If [screenBufferImport](#) is [VK_TRUE](#), [VkDeviceMemory](#) supports importing [_screen_buffer](#) from applications. In this case, the application is responsible for the resource management of the [_screen_buffer](#).

Table 47. Functionality Supported for QNX Screen Buffer Features

Features	Functionality
<code>screenBufferImport</code>	<code>VkImportScreenBufferInfoQNX</code>
Always supported ¹	<code>vkGetScreenBufferPropertiesQNX</code> , <code>VkScreenBufferPropertiesQNX</code> , <code>VkScreenBufferFormatPropertiesQNX</code> , <code>VkExternalFormatQNX</code>

1

Functionality in this row is always available.

The [Functionality supported for QNX Screen buffer features](#) table summarizes the functionality enabled by the `VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX` structure. Each entry in the body of the table summarizes the functionality that **can** be used when the given features are supported and enabled. This summarizes Valid Usage statements that are added elsewhere in this specification.

If the `VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX-sType-sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_MEMORY_SCREEN_BUFFER_FEATURES_QNX`

The `VkPhysicalDeviceIndexTypeUint8Features` structure is defined as:

```
typedef struct VkPhysicalDeviceIndexTypeUint8Features {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           indexTypeUint8;
} VkPhysicalDeviceIndexTypeUint8Features;
```

```
// Provided by VK_KHR_index_type_uint8
typedef VkPhysicalDeviceIndexTypeUint8Features
VkPhysicalDeviceIndexTypeUint8FeaturesKHR;
```

```
// Provided by VK_EXT_index_type_uint8
typedef VkPhysicalDeviceIndexTypeUint8Features
VkPhysicalDeviceIndexTypeUint8FeaturesEXT;
```

This structure describes the following feature:

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **indexTypeUint8** indicates that **VK_INDEX_TYPE_UINT8** can be used with [vkCmdBindIndexBuffer](#).

If the [VkPhysicalDeviceIndexTypeUint8Features](#) structure is included in the **pNext** chain of the [VkPhysicalDeviceFeatures2](#) structure passed to [vkGetPhysicalDeviceFeatures2](#), it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a [VkDevice](#) with any features described by [VkPhysicalDeviceIndexTypeUint8Features](#), it **must** add an instance of the structure, with the desired feature members set to **VK_TRUE**, to the **pNext** chain of [VkDeviceCreateInfo](#) when creating the [VkDevice](#).

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceIndexTypeUint8Features-sType-sType
sType must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INDEX_TYPE_UINT8_FEATURES**

The [VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures](#) structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           separateDepthStencilLayouts;
} VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures;
```

This structure describes the following feature:

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **separateDepthStencilLayouts** indicates whether the implementation supports a [VkImageMemoryBarrier](#) for a depth/stencil image with only one of **VK_IMAGE_ASPECT_DEPTH_BIT** or **VK_IMAGE_ASPECT_STENCIL_BIT** set, and whether **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL**, **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL**, **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL**, or **VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL** can be used.

If the [VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures](#) structure is included in the **pNext** chain of the [VkPhysicalDeviceFeatures2](#) structure passed to [vkGetPhysicalDeviceFeatures2](#), it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a

[VkDevice](#) with any features described by [VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures](#), it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of [VkDeviceCreateInfo](#) when creating the [VkDevice](#).

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures-sType-sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SEPARATE_DEPTH_STENCIL_LAYOUTS_FEATURES`

The [VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures](#) structure is defined as:

```
typedef struct VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           shaderDemoteToHelperInvocation;
} VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures;
```

```
// Provided by VK_EXT_shader_demote_to_helper_invocation
typedef VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures
VkPhysicalDeviceShaderDemoteToHelperInvocationFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderDemoteToHelperInvocation` indicates whether the implementation supports the SPIR-V `DemoteToHelperInvocationEXT` capability.

If the [VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures](#) structure is included in the `pNext` chain of the [VkPhysicalDeviceFeatures2](#) structure passed to [vkGetPhysicalDeviceFeatures2](#), it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a [VkDevice](#) with any features described by [VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures](#), it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of [VkDeviceCreateInfo](#) when creating the [VkDevice](#).

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures-sType-sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_DEMOTE_TO_HELPER_INVOCATION_FEATURES`

The [VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT](#) structure is defined as:

```
// Provided by VK_EXT_texel_buffer_alignment
typedef struct VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           texelBufferAlignment;
} VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT;
```

This structure describes the following feature:

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **texelBufferAlignment** indicates whether the implementation uses more specific alignment requirements advertised in [VkPhysicalDeviceTexelBufferAlignmentProperties](#) rather than [VkPhysicalDeviceLimits::minTexelBufferOffsetAlignment](#).

If the [VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT](#) structure is included in the **pNext** chain of the [VkPhysicalDeviceFeatures2](#) structure passed to [vkGetPhysicalDeviceFeatures2](#), it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a [VkDevice](#) with any features described by [VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT](#), it **must** add an instance of the structure, with the desired feature members set to **VK_TRUE**, to the **pNext** chain of [VkDeviceCreateInfo](#) when creating the [VkDevice](#).

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT-sType-sType
sType must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TEXEL_BUFFER_ALIGNMENT_FEATURES_EXT**

The [VkPhysicalDeviceTextureCompressionASTCHDRFeatures](#) structure is defined as:

```
typedef struct VkPhysicalDeviceTextureCompressionASTCHDRFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           textureCompressionASTC_HDR;
} VkPhysicalDeviceTextureCompressionASTCHDRFeatures;
```

```
// Provided by VK_EXT_texture_compression_astc_hdr
typedef VkPhysicalDeviceTextureCompressionASTCHDRFeatures
VkPhysicalDeviceTextureCompressionASTCHDRFeaturesEXT;
```

This structure describes the following feature:

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.

- `textureCompressionASTC_HDR` indicates whether all of the ASTC HDR compressed texture formats are supported. If this feature is enabled, then the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`, `VK_FORMAT_FEATURE_BLIT_SRC_BIT` and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` features **must** be supported in `optimalTilingFeatures` for the following formats:

- `VK_FORMAT_ASTC_4x4_SFLOAT_BLOCK`
- `VK_FORMAT_ASTC_5x4_SFLOAT_BLOCK`
- `VK_FORMAT_ASTC_5x5_SFLOAT_BLOCK`
- `VK_FORMAT_ASTC_6x5_SFLOAT_BLOCK`
- `VK_FORMAT_ASTC_6x6_SFLOAT_BLOCK`
- `VK_FORMAT_ASTC_8x5_SFLOAT_BLOCK`
- `VK_FORMAT_ASTC_8x6_SFLOAT_BLOCK`
- `VK_FORMAT_ASTC_8x8_SFLOAT_BLOCK`
- `VK_FORMAT_ASTC_10x5_SFLOAT_BLOCK`
- `VK_FORMAT_ASTC_10x6_SFLOAT_BLOCK`
- `VK_FORMAT_ASTC_10x8_SFLOAT_BLOCK`
- `VK_FORMAT_ASTC_10x10_SFLOAT_BLOCK`
- `VK_FORMAT_ASTC_12x10_SFLOAT_BLOCK`
- `VK_FORMAT_ASTC_12x12_SFLOAT_BLOCK`

To query for additional properties, or if the feature is not enabled, `vkGetPhysicalDeviceFormatProperties` and `vkGetPhysicalDeviceImageFormatProperties` **can** be used to check for supported properties of individual formats as normal.

If the `VkPhysicalDeviceTextureCompressionASTCHDRFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceTextureCompressionASTCHDRFeatures`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceTextureCompressionASTCHDRFeatures-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TEXTURE_COMPRESSION_ASTC_HDR_FEATURES`

The `VkPhysicalDeviceLineRasterizationFeatures` structure is defined as:

```
typedef struct VkPhysicalDeviceLineRasterizationFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32            rectangularLines;
    VkBool32            bresenhamLines;
    VkBool32            smoothLines;
    VkBool32            stippledRectangularLines;
    VkBool32            stippledBresenhamLines;
    VkBool32            stippledSmoothLines;
} VkPhysicalDeviceLineRasterizationFeatures;
```

```
// Provided by VK_KHR_line_rasterization
typedef VkPhysicalDeviceLineRasterizationFeatures
VkPhysicalDeviceLineRasterizationFeaturesKHR;
```

```
// Provided by VK_EXT_line_rasterization
typedef VkPhysicalDeviceLineRasterizationFeatures
VkPhysicalDeviceLineRasterizationFeaturesEXT;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `rectangularLines` indicates whether the implementation supports [rectangular line rasterization](#).
- `bresenhamLines` indicates whether the implementation supports [Bresenham-style line rasterization](#).
- `smoothLines` indicates whether the implementation supports [smooth line rasterization](#).
- `stippledRectangularLines` indicates whether the implementation supports [stippled line rasterization](#) with `VK_LINE_RASTERIZATION_MODE_RECTANGULAR` lines.
- `stippledBresenhamLines` indicates whether the implementation supports [stippled line rasterization](#) with `VK_LINE_RASTERIZATION_MODE_BRESENHAM` lines.
- `stippledSmoothLines` indicates whether the implementation supports [stippled line rasterization](#) with `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH` lines.

If the `VkPhysicalDeviceLineRasterizationFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceLineRasterizationFeatures`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceLineRasterizationFeatures-sType-sType
sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINE_RASTERIZATION_FEATURES

The `VkPhysicalDeviceSubgroupSizeControlFeatures` structure is defined as:

```
typedef struct VkPhysicalDeviceSubgroupSizeControlFeatures {  
    VkStructureType    sType;  
    void*              pNext;  
    VkBool32           subgroupSizeControl;  
    VkBool32           computeFullSubgroups;  
} VkPhysicalDeviceSubgroupSizeControlFeatures;
```

```
// Provided by VK_EXT_subgroup_size_control  
typedef VkPhysicalDeviceSubgroupSizeControlFeatures  
VkPhysicalDeviceSubgroupSizeControlFeaturesEXT;
```

This structure describes the following features:

- sType is a `VkStructureType` value identifying this structure.
- pNext is `NULL` or a pointer to a structure extending this structure.
- subgroupSizeControl indicates whether the implementation supports controlling shader subgroup sizes via the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag and the `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure.
- computeFullSubgroups indicates whether the implementation supports requiring full subgroups in compute shaders via the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` flag.

If the `VkPhysicalDeviceSubgroupSizeControlFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceSubgroupSizeControlFeatures`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSubgroupSizeControlFeatures-sType-sType
sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBGROUP_SIZE_CONTROL_FEATURES

The `VkPhysicalDeviceExtendedDynamicStateFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_extended_dynamic_state
typedef struct VkPhysicalDeviceExtendedDynamicStateFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           extendedDynamicState;
} VkPhysicalDeviceExtendedDynamicStateFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `extendedDynamicState` indicates that the implementation supports the following dynamic states:
 - `VK_DYNAMIC_STATE_CULL_MODE`
 - `VK_DYNAMIC_STATE_FRONT_FACE`
 - `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY`
 - `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT`
 - `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT`
 - `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE`
 - `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE`
 - `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE`
 - `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP`
 - `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE`
 - `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE`
 - `VK_DYNAMIC_STATE_STENCIL_OP`

If the `VkPhysicalDeviceExtendedDynamicStateFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceExtendedDynamicStateFeaturesEXT`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExtendedDynamicStateFeaturesEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTENDED_DYNAMIC_STATE_FEATURES_EXT`

The `VkPhysicalDeviceExtendedDynamicState2FeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_extended_dynamic_state2
typedef struct VkPhysicalDeviceExtendedDynamicState2FeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           extendedDynamicState2;
    VkBool32           extendedDynamicState2LogicOp;
    VkBool32           extendedDynamicState2PatchControlPoints;
} VkPhysicalDeviceExtendedDynamicState2FeaturesEXT;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `extendedDynamicState2` indicates that the implementation supports the following dynamic states:
 - `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE`
 - `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE`
 - `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE`
- `extendedDynamicState2LogicOp` indicates that the implementation supports the following dynamic state:
 - `VK_DYNAMIC_STATE_LOGIC_OP_EXT`
- `extendedDynamicState2PatchControlPoints` indicates that the implementation supports the following dynamic state:
 - `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT`

If the `VkPhysicalDeviceExtendedDynamicState2FeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceExtendedDynamicState2FeaturesEXT`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExtendedDynamicState2FeaturesEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTENDED_DYNAMIC_STATE_2_FEATURES_EXT`

The `VkPhysicalDeviceGlobalPriorityQueryFeatures` structure is defined as:

```
typedef struct VkPhysicalDeviceGlobalPriorityQueryFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           globalPriorityQuery;
} VkPhysicalDeviceGlobalPriorityQueryFeatures;
```

```
// Provided by VK_KHR_global_priority
typedef VkPhysicalDeviceGlobalPriorityQueryFeatures
VkPhysicalDeviceGlobalPriorityQueryFeaturesKHR;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `globalPriorityQuery` indicates whether the implementation supports the ability to query global queue priorities.

If the `VkPhysicalDeviceGlobalPriorityQueryFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceGlobalPriorityQueryFeatures`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceGlobalPriorityQueryFeatures-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GLOBAL_PRIORITY_QUERY_FEATURES`

The `VkPhysicalDeviceRobustness2FeaturesKHR` structure is defined as:

```
typedef struct VkPhysicalDeviceRobustness2FeaturesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           robustBufferAccess2;
    VkBool32           robustImageAccess2;
    VkBool32           nullDescriptor;
} VkPhysicalDeviceRobustness2FeaturesKHR;
```

```
// Provided by VK_EXT_robustness2
typedef VkPhysicalDeviceRobustness2FeaturesKHR VkPhysicalDeviceRobustness2FeaturesEXT;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `robustBufferAccess2` enables `Robust Buffer Access 2` guarantees for shader buffer accesses.
- `robustImageAccess2` enables `Robust Image Access 2` guarantees for shader image accesses.
- `nullDescriptor` indicates whether descriptors **can** be written with a `VK_NULL_HANDLE` resource or view, which are considered valid to access and act as if the descriptor were bound to nothing.

If the `VkPhysicalDeviceRobustness2FeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceRobustness2FeaturesKHR`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage

- VUID-VkPhysicalDeviceRobustness2FeaturesKHR-robustBufferAccess2-04000
If `robustBufferAccess2` is enabled then `robustBufferAccess` **must** also be enabled

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceRobustness2FeaturesKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ROBUSTNESS_2_FEATURES_KHR`

`nullDescriptor` support requires the `VK_KHR_robustness2` or `VK_EXT_robustness2` extension.

The `VkPhysicalDeviceImageRobustnessFeatures` structure is defined as:

```
typedef struct VkPhysicalDeviceImageRobustnessFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           robustImageAccess;
} VkPhysicalDeviceImageRobustnessFeatures;
```

```
// Provided by VK_EXT_image_robustness
typedef VkPhysicalDeviceImageRobustnessFeatures
VkPhysicalDeviceImageRobustnessFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `robustImageAccess` enables [Robust Image Access](#) guarantees for shader image accesses.

If the `VkPhysicalDeviceImageRobustnessFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceImageRobustnessFeatures`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceImageRobustnessFeatures-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_ROBUSTNESS_FEATURES`

The `VkPhysicalDeviceShaderTerminateInvocationFeatures` structure is defined as:

```
typedef struct VkPhysicalDeviceShaderTerminateInvocationFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           shaderTerminateInvocation;
} VkPhysicalDeviceShaderTerminateInvocationFeatures;
```

```
// Provided by VK_KHR_shader_terminate_invocation
typedef VkPhysicalDeviceShaderTerminateInvocationFeatures
VkPhysicalDeviceShaderTerminateInvocationFeaturesKHR;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderTerminateInvocation` specifies whether the implementation supports SPIR-V modules that use the `SPV_KHR_terminate_invocation` extension.

If the `VkPhysicalDeviceShaderTerminateInvocationFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceShaderTerminateInvocationFeatures`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderTerminateInvocationFeatures-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_TERMINATE_INVOCATION_FEATURES`

The `VkPhysicalDeviceCustomBorderColorFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_custom_border_color
typedef struct VkPhysicalDeviceCustomBorderColorFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           customBorderColors;
    VkBool32           customBorderColorWithoutFormat;
} VkPhysicalDeviceCustomBorderColorFeaturesEXT;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `customBorderColors` indicates that the implementation supports providing a `borderColor` value with one of the following values at sampler creation time:
 - `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT`
 - `VK_BORDER_COLOR_INT_CUSTOM_EXT`
- `customBorderColorWithoutFormat` indicates that explicit formats are not required for custom border colors and the value of the `format` member of the `VkSamplerCustomBorderColorCreateInfoEXT` structure **may** be `VK_FORMAT_UNDEFINED`. If this feature bit is not set, applications **must** provide the `VkFormat` of the image view(s) being sampled by this sampler in the `format` member of the `VkSamplerCustomBorderColorCreateInfoEXT` structure.

If the `VkPhysicalDeviceCustomBorderColorFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceCustomBorderColorFeaturesEXT`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceCustomBorderColorFeaturesEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CUSTOM_BORDER_COLOR_FEATURES_EXT`

The `VkPhysicalDeviceVulkanSC10Features` structure is defined as:

```
// Provided by VKSC_VERSION_1_0
typedef struct VkPhysicalDeviceVulkanSC10Features {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           shaderAtomicInstructions;
} VkPhysicalDeviceVulkanSC10Features;
```

This structure describes the following features:

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **shaderAtomicInstructions** indicates whether this implementation supports shaders which use the SPIR-V *OpAtomic** instructions.

If the [VkPhysicalDeviceVulkanSC10Features](#) structure is included in the **pNext** chain of the [VkPhysicalDeviceFeatures2](#) structure passed to [vkGetPhysicalDeviceFeatures2](#), it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a [VkDevice](#) with any features described by [VkPhysicalDeviceVulkanSC10Features](#), it **must** add an instance of the structure, with the desired feature members set to **VK_TRUE**, to the **pNext** chain of [VkDeviceCreateInfo](#) when creating the [VkDevice](#).

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVulkanSC10Features-sType-sType
sType must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_SC_1_0_FEATURES**

The [VkPhysicalDevicePerformanceQueryFeaturesKHR](#) structure is defined as:

```
// Provided by VK_KHR_performance_query
typedef struct VkPhysicalDevicePerformanceQueryFeaturesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           performanceCounterQueryPools;
    VkBool32           performanceCounterMultipleQueryPools;
} VkPhysicalDevicePerformanceQueryFeaturesKHR;
```

This structure describes the following features:

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **performanceCounterQueryPools** indicates whether the implementation supports performance counter query pools.
- **performanceCounterMultipleQueryPools** indicates whether the implementation supports using multiple performance query pools in a primary command buffer and secondary command

buffers executed within it.

If the `VkPhysicalDevicePerformanceQueryFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDevicePerformanceQueryFeaturesKHR`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDevicePerformanceQueryFeaturesKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PERFORMANCE_QUERY_FEATURES_KHR`

The `VkPhysicalDevice4444FormatsFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_4444_formats
typedef struct VkPhysicalDevice4444FormatsFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           formatA4R4G4B4;
    VkBool32           formatA4B4G4R4;
} VkPhysicalDevice4444FormatsFeaturesEXT;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `formatA4R4G4B4` indicates that the implementation **must** support using a `VkFormat` of `VK_FORMAT_A4R4G4B4_UNORM_PACK16_EXT` with at least the following `VkFormatFeatureFlagBits`:
 - `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`
 - `VK_FORMAT_FEATURE_BLIT_SRC_BIT`
 - `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- `formatA4B4G4R4` indicates that the implementation **must** support using a `VkFormat` of `VK_FORMAT_A4B4G4R4_UNORM_PACK16_EXT` with at least the following `VkFormatFeatureFlagBits`:
 - `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`
 - `VK_FORMAT_FEATURE_BLIT_SRC_BIT`
 - `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

If the `VkPhysicalDevice4444FormatsFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDevice4444FormatsFeaturesEXT`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of

[VkDeviceCreateInfo](#) when creating the [VkDevice](#).

Valid Usage (Implicit)

- VUID-VkPhysicalDevice4444FormatsFeaturesEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_4444_FORMATS_FEATURES_EXT`

The `VkPhysicalDeviceSynchronization2Features` structure is defined as:

```
typedef struct VkPhysicalDeviceSynchronization2Features {  
    VkStructureType    sType;  
    void*              pNext;  
    VkBool32           synchronization2;  
} VkPhysicalDeviceSynchronization2Features;
```

```
// Provided by VK_KHR_synchronization2  
typedef VkPhysicalDeviceSynchronization2Features  
VkPhysicalDeviceSynchronization2FeaturesKHR;
```

This structure describes the following feature:

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `synchronization2` indicates whether the implementation supports the new set of synchronization commands introduced in [VK_KHR_synchronization2](#).

If the `VkPhysicalDeviceSynchronization2Features` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a [VkDevice](#) with any features described by `VkPhysicalDeviceSynchronization2Features`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the [VkDevice](#).

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSynchronization2Features-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SYNCHRONIZATION_2_FEATURES`

The `VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_vertex_input_dynamic_state
typedef struct VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           vertexInputDynamicState;
} VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT;
```

This structure describes the following feature:

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **vertexInputDynamicState** indicates that the implementation supports the following dynamic states:
 - **VK_DYNAMIC_STATE_VERTEX_INPUT_EXT**

If the [VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT](#) structure is included in the **pNext** chain of the [VkPhysicalDeviceFeatures2](#) structure passed to [vkGetPhysicalDeviceFeatures2](#), it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a [VkDevice](#) with any features described by [VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT](#), it **must** add an instance of the structure, with the desired feature members set to **VK_TRUE**, to the **pNext** chain of [VkDeviceCreateInfo](#) when creating the [VkDevice](#).

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT-sType-sType **must** be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VERTEX_INPUT_DYNAMIC_STATE_FEATURES_EXT**

The [VkPhysicalDeviceFragmentShadingRateFeaturesKHR](#) structure is defined as:

```
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPhysicalDeviceFragmentShadingRateFeaturesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           pipelineFragmentShadingRate;
    VkBool32           primitiveFragmentShadingRate;
    VkBool32           attachmentFragmentShadingRate;
} VkPhysicalDeviceFragmentShadingRateFeaturesKHR;
```

This structure describes the following features:

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **pipelineFragmentShadingRate** indicates that the implementation supports the [pipeline fragment](#)

shading rate.

- `primitiveFragmentShadingRate` indicates that the implementation supports the [primitive fragment shading rate](#).
- `attachmentFragmentShadingRate` indicates that the implementation supports the [attachment fragment shading rate](#).

If the `VkPhysicalDeviceFragmentShadingRateFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceFragmentShadingRateFeaturesKHR`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentShadingRateFeaturesKHR-sType-sType `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE_FEATURES_KHR`

The `VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_ycbcr_2plane_444_formats
typedef struct VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           ycbcr2plane444Formats;
} VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `ycbcr2plane444Formats` indicates that the implementation supports the following 2-plane 444 Y'C_BR formats:
 - `VK_FORMAT_G8_B8R8_2PLANE_444_UNORM`
 - `VK_FORMAT_G10X6_B10X6R10X6_2PLANE_444_UNORM_3PACK16`
 - `VK_FORMAT_G12X4_B12X4R12X4_2PLANE_444_UNORM_3PACK16`
 - `VK_FORMAT_G16_B16R16_2PLANE_444_UNORM`

If the `VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT-sType-sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_YCBCR_2_PLANE_444_FORMATS_FEATURES_EXT`

The `VkPhysicalDeviceColorWriteEnableFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_color_write_enable
typedef struct VkPhysicalDeviceColorWriteEnableFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           colorWriteEnable;
} VkPhysicalDeviceColorWriteEnableFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `colorWriteEnable` indicates that the implementation supports the dynamic state `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT`.

If the `VkPhysicalDeviceColorWriteEnableFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. If the application wishes to use a `VkDevice` with any features described by `VkPhysicalDeviceColorWriteEnableFeaturesEXT`, it **must** add an instance of the structure, with the desired feature members set to `VK_TRUE`, to the `pNext` chain of `VkDeviceCreateInfo` when creating the `VkDevice`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceColorWriteEnableFeaturesEXT-sType-sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COLOR_WRITE_ENABLE_FEATURES_EXT`

33.1. Feature Requirements

All Vulkan graphics implementations **must** support the following features:

- If Vulkan 1.0 is supported, `robustBufferAccess` **must** be supported
- If Vulkan 1.1 is supported, the following features **must** be supported:
 - `multiview` if Vulkan SC 1.0 is not advertised (see [SCID-8])
 - `storageBuffer16BitAccess` if `uniformAndStorageBuffer16BitAccess` is supported
 - `shaderDrawParameters` if `VK_KHR_shader_draw_parameters` is supported

- If Vulkan 1.2 is supported, the following features **must** be supported:
 - `subgroupBroadcastDynamicId`
 - `imagelessFramebuffer`
 - `uniformBufferStandardLayout`
 - `shaderSubgroupExtendedTypes`
 - `separateDepthStencilLayouts`
 - `hostQueryReset`
 - `timelineSemaphore` if Vulkan SC 1.0 is not advertised (see [\[SCID-8\]](#))
 - `samplerMirrorClampToEdge` if `VK_KHR_sampler_mirror_clamp_to_edge` is supported
 - `drawIndirectCount` if `VK_KHR_draw_indirect_count` is supported
 - `storageBuffer8BitAccess` if `uniformAndStorageBuffer8BitAccess` is supported
 - `shaderInt64` if `shaderSharedInt64Atomics` or `shaderBufferInt64Atomics` are supported
 - `descriptorIndexing` if `VK_EXT_descriptor_indexing` is supported
 - `shaderSampledImageArrayDynamicIndexing` if `descriptorIndexing` is supported
 - `shaderStorageBufferArrayDynamicIndexing` if `descriptorIndexing` is supported
 - `shaderUniformTexelBufferArrayDynamicIndexing` if `descriptorIndexing` is supported
 - `shaderStorageTexelBufferArrayDynamicIndexing` if `descriptorIndexing` is supported
 - `shaderSampledImageArrayNonUniformIndexing` if `descriptorIndexing` is supported
 - `shaderStorageBufferArrayNonUniformIndexing` if `descriptorIndexing` is supported
 - `shaderUniformTexelBufferArrayNonUniformIndexing` if `descriptorIndexing` is supported
 - `descriptorBindingSampledImageUpdateAfterBind` if `descriptorIndexing` is supported
 - `descriptorBindingStorageImageUpdateAfterBind` if `descriptorIndexing` is supported
 - `descriptorBindingStorageBufferUpdateAfterBind` if `descriptorIndexing` is supported
 - `descriptorBindingUniformTexelBufferUpdateAfterBind` if `descriptorIndexing` is supported
 - `descriptorBindingStorageTexelBufferUpdateAfterBind` if `descriptorIndexing` is supported
 - `descriptorBindingUpdateUnusedWhilePending` if `descriptorIndexing` is supported
 - `descriptorBindingPartiallyBound` if `descriptorIndexing` is supported
 - `runtimeDescriptorArray` if `descriptorIndexing` is supported
 - `shaderOutputViewportIndex` if `VK_EXT_shader_viewport_index_layer` is supported
 - `shaderOutputLayer` if `VK_EXT_shader_viewport_index_layer` is supported
 - `samplerFilterMinmax` if `VK_EXT_sampler_filter_minmax` is supported
- If Vulkan SC 1.0 is supported, `vulkanMemoryModel` **must** be supported if Vulkan 1.2 is supported
- If `VK_KHR_performance_query` is supported, `performanceCounterQueryPools` **must** be supported
- If `VK_KHR_shader_clock` is supported, `shaderSubgroupClock` **must** be supported
- If `VK_KHR_global_priority` is supported, `globalPriorityQuery` **must** be supported

- If `VK_KHR_shader_terminate_invocation` is supported, `shaderTerminateInvocation` **must** be supported
- If `VK_KHR_fragment_shading_rate` is supported, `pipelineFragmentShadingRate` **must** be supported
- If `VK_KHR_synchronization2` is supported, `synchronization2` **must** be supported
- If `VK_KHR_vertex_attribute_divisor` is supported, `vertexAttributeInstanceRateDivisor` **must** be supported
- If `VK_KHR_index_type_uint8` is supported, `indexTypeUint8` **must** be supported
- If `VK_KHR_line_rasterization` is supported, at least one of `rectangularLines`, `bresenhamLines`, `smoothLines`, `stippledRectangularLines`, `stippledBresenhamLines`, or `stippledSmoothLines` **must** be supported
- If `VK_EXT_texture_compression_astc_hdr` is supported, `textureCompressionASTC_HDR` **must** be supported
- If `VK_EXT_depth_clip_enable` is supported, `depthClipEnable` **must** be supported
- If `VK_EXT_subgroup_size_control` is supported, the following features **must** be supported:
 - `subgroupSizeControl`
 - `computeFullSubgroups`
- If `VK_EXT_shader_image_atomic_int64` is supported, the following features **must** be supported:
 - `shaderInt64`
 - `shaderImageInt64Atomics`
- If `VK_EXT_fragment_shader_interlock` is supported, at least one of `fragmentShaderSampleInterlock`, `fragmentShaderPixelInterlock`, or `fragmentShaderShadingRateInterlock` **must** be supported
- If `VK_EXT_ycbcr_image_arrays` is supported, `ycbcrImageArrays` **must** be supported
- If `VK_EXT_line_rasterization` is supported, at least one of `rectangularLines`, `bresenhamLines`, `smoothLines`, `stippledRectangularLines`, `stippledBresenhamLines`, or `stippledSmoothLines` **must** be supported
- If `VK_EXT_shader_atomic_float` is supported, the following features **must** be supported:
 - at least one of `shaderBufferFloat32Atomics`, `shaderBufferFloat32AtomicAdd`, `shaderBufferFloat64Atomics`, `shaderBufferFloat64AtomicAdd`, `shaderSharedFloat32Atomics`, `shaderSharedFloat32AtomicAdd`, `shaderSharedFloat64Atomics`, `shaderSharedFloat64AtomicAdd`, `shaderImageFloat32Atomics`, or `shaderImageFloat32AtomicAdd`
 - `shaderImageFloat32Atomics` if `sparseImageFloat32Atomics` is supported
 - `shaderImageFloat32AtomicAdd` if `sparseImageFloat32AtomicAdd` is supported
- If `VK_EXT_index_type_uint8` is supported, `indexTypeUint8` **must** be supported
- If `VK_EXT_extended_dynamic_state` is supported, `extendedDynamicState` **must** be supported
- If `VK_EXT_shader_demote_to_helper_invocation` is supported, `shaderDemoteToHelperInvocation` **must** be supported
- If `VK_EXT_texel_buffer_alignment` is supported, `texelBufferAlignment` **must** be supported
- If `VK_EXT_robustness2` is supported, at least one of `robustBufferAccess2`, `robustImageAccess2`, or

`nullDescriptor` **must** be supported

- If `VK_EXT_custom_border_color` is supported, `customBorderColors` **must** be supported
- If `VK_EXT_ycbcr_2plane_444_formats` is supported, `ycbcr2plane444Formats` **must** be supported
- If `VK_EXT_image_robustness` is supported, `robustImageAccess` **must** be supported
- If `VK_EXT_4444_formats` is supported, `formatA4R4G4B4` **must** be supported
- If `VK_EXT_vertex_input_dynamic_state` is supported, `vertexInputDynamicState` **must** be supported
- If `VK_NV_external_sci_sync` is supported, the following features **must** be supported:
 - at least one of `sciSyncFence` or `sciSyncSemaphore`
 - at least one of `sciSyncImport` or `sciSyncExport`
- If `VK_NV_external_memory_sci_buf` is supported, at least one of `sciBufImport` or `sciBufExport` **must** be supported
- If `VK_EXT_extended_dynamic_state2` is supported, `extendedDynamicState2` **must** be supported
- If `VK_EXT_color_write_enable` is supported, `colorWriteEnable` **must** be supported
- If `VK_NV_external_sci_sync2` is supported, the following features **must** be supported:
 - at least one of `VkPhysicalDeviceExternalSciSync2FeaturesNV::sciSyncFence` or `sciSyncSemaphore2`
 - at least one of `VkPhysicalDeviceExternalSciSync2FeaturesNV::sciSyncImport` or `VkPhysicalDeviceExternalSciSync2FeaturesNV::sciSyncExport`
- If `VK_QNX_external_memory_screen_buffer` is supported, `screenBufferImport` **must** be supported

All other features defined in the Specification are **optional**.

Chapter 34. Limits

Limits are implementation-dependent minimums, maximums, and other device characteristics that an application **may** need to be aware of.

NOTE

Limits are reported via the basic [VkPhysicalDeviceLimits](#) structure as well as the extensible structure [VkPhysicalDeviceProperties2](#), which was added in [VK_KHR_get_physical_device_properties2](#) and included in Vulkan 1.1. When limits are added in future Vulkan versions or extensions, each extension **should** introduce one new limit structure, if needed. This structure **can** be added to the [pNext](#) chain of the [VkPhysicalDeviceProperties2](#) structure.

The [VkPhysicalDeviceLimits](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceLimits {
    uint32_t          maxImageDimension1D;
    uint32_t          maxImageDimension2D;
    uint32_t          maxImageDimension3D;
    uint32_t          maxImageDimensionCube;
    uint32_t          maxImageArrayLayers;
    uint32_t          maxTexelBufferElements;
    uint32_t          maxUniformBufferRange;
    uint32_t          maxStorageBufferRange;
    uint32_t          maxPushConstantsSize;
    uint32_t          maxMemoryAllocationCount;
    uint32_t          maxSamplerAllocationCount;
    VkDeviceSize      bufferImageGranularity;
    VkDeviceSize      sparseAddressSpaceSize;
    uint32_t          maxBoundDescriptorSets;
    uint32_t          maxPerStageDescriptorSamplers;
    uint32_t          maxPerStageDescriptorUniformBuffers;
    uint32_t          maxPerStageDescriptorStorageBuffers;
    uint32_t          maxPerStageDescriptorSampledImages;
    uint32_t          maxPerStageDescriptorStorageImages;
    uint32_t          maxPerStageDescriptorInputAttachments;
    uint32_t          maxPerStageResources;
    uint32_t          maxDescriptorSetSamplers;
    uint32_t          maxDescriptorSetUniformBuffers;
    uint32_t          maxDescriptorSetUniformBuffersDynamic;
    uint32_t          maxDescriptorSetStorageBuffers;
    uint32_t          maxDescriptorSetStorageBuffersDynamic;
    uint32_t          maxDescriptorSetSampledImages;
    uint32_t          maxDescriptorSetStorageImages;
    uint32_t          maxDescriptorSetInputAttachments;
    uint32_t          maxVertexInputAttributes;
    uint32_t          maxVertexInputBindings;
    uint32_t          maxVertexInputAttributeOffset;
    uint32_t          maxVertexInputBindingStride;
```

uint32_t	maxVertexOutputComponents;

} VkPhysicalDeviceLimits;

```

The `VkPhysicalDeviceLimits` are properties of the physical device. These are available in the `limits` member of the `VkPhysicalDeviceProperties` structure which is returned from `vkGetPhysicalDeviceProperties`.

- `maxImageDimension1D` is the largest dimension (`width`) that is guaranteed to be supported for all images created with an `imageType` of `VK_IMAGE_TYPE_1D`. Some combinations of image parameters (format, usage, etc.) **may** allow support for larger dimensions, which **can** be queried using `vkGetPhysicalDeviceImageFormatProperties`.
- `maxImageDimension2D` is the largest dimension (`width` or `height`) that is guaranteed to be supported for all images created with an `imageType` of `VK_IMAGE_TYPE_2D` and without `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT` set in `flags`. Some combinations of image parameters (format, usage, etc.) **may** allow support for larger dimensions, which **can** be queried using `vkGetPhysicalDeviceImageFormatProperties`.
- `maxImageDimension3D` is the largest dimension (`width`, `height`, or `depth`) that is guaranteed to be supported for all images created with an `imageType` of `VK_IMAGE_TYPE_3D`. Some combinations of image parameters (format, usage, etc.) **may** allow support for larger dimensions, which **can** be queried using `vkGetPhysicalDeviceImageFormatProperties`.
- `maxImageDimensionCube` is the largest dimension (`width` or `height`) that is guaranteed to be supported for all images created with an `imageType` of `VK_IMAGE_TYPE_2D` and with `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT` set in `flags`. Some combinations of image parameters (format, usage, etc.) **may** allow support for larger dimensions, which **can** be queried using `vkGetPhysicalDeviceImageFormatProperties`.
- `maxImageArrayLayers` is the maximum number of layers (`arrayLayers`) for an image.

- `maxTexelBufferElements` is the maximum number of addressable texels for a buffer view created on a buffer which was created with the `VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT` or `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT` set in the `usage` member of the `VkBufferCreateInfo` structure.
- `maxUniformBufferRange` is the maximum value that **can** be specified in the `range` member of a `VkDescriptorBufferInfo` structure passed to `vkUpdateDescriptorSets` for descriptors of type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`.
- `maxStorageBufferRange` is the maximum value that **can** be specified in the `range` member of a `VkDescriptorBufferInfo` structure passed to `vkUpdateDescriptorSets` for descriptors of type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`.
- `maxPushConstantsSize` is the maximum size, in bytes, of the pool of push constant memory. For each of the push constant ranges indicated by the `pPushConstantRanges` member of the `VkPipelineLayoutCreateInfo` structure, $(\text{offset} + \text{size})$ **must** be less than or equal to this limit.
- `maxMemoryAllocationCount` is the maximum number of device memory allocations, as created by `vkAllocateMemory`, which **can** simultaneously exist.
- `maxSamplerAllocationCount` is the maximum number of sampler objects, as created by `vkCreateSampler`, which **can** simultaneously exist on a device.
- `bufferImageGranularity` is the granularity, in bytes, at which buffer or linear image resources, and optimal image resources **can** be bound to adjacent offsets in the same `VkDeviceMemory` object without aliasing. See [Buffer-Image Granularity](#) for more details.
- `sparseAddressSpaceSize` is the total amount of address space available, in bytes, for sparse memory resources. This is an upper bound on the sum of the sizes of all sparse resources, regardless of whether any memory is bound to them.
- `maxBoundDescriptorSets` is the maximum number of descriptor sets that **can** be simultaneously used by a pipeline. All `DescriptorSet` decorations in shader modules **must** have a value less than `maxBoundDescriptorSets`. See [Descriptor Sets](#).
- `maxPerStageDescriptorSamplers` is the maximum number of samplers that **can** be accessible to a single shader stage in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_SAMPLER` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. A descriptor is accessible to a shader stage when the `stageFlags` member of the `VkDescriptorSetLayoutBinding` structure has the bit for that shader stage set. See [Sampler](#) and [Combined Image Sampler](#).
- `maxPerStageDescriptorUniformBuffers` is the maximum number of uniform buffers that **can** be accessible to a single shader stage in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. A descriptor is accessible to a shader stage when the `stageFlags` member of the `VkDescriptorSetLayoutBinding` structure has the bit for that shader stage set. See [Uniform Buffer](#) and [Dynamic Uniform Buffer](#).
- `maxPerStageDescriptorStorageBuffers` is the maximum number of storage buffers that **can** be

accessible to a single shader stage in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. A descriptor is accessible to a pipeline shader stage when the `stageFlags` member of the `VkDescriptorSetLayoutBinding` structure has the bit for that shader stage set. See [Storage Buffer](#) and [Dynamic Storage Buffer](#).

- `maxPerStageDescriptorSampledImages` is the maximum number of sampled images that **can** be accessible to a single shader stage in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, or `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. A descriptor is accessible to a pipeline shader stage when the `stageFlags` member of the `VkDescriptorSetLayoutBinding` structure has the bit for that shader stage set. See [Combined Image Sampler](#), [Sampled Image](#), and [Uniform Texel Buffer](#).
- `maxPerStageDescriptorStorageImages` is the maximum number of storage images that **can** be accessible to a single shader stage in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. A descriptor is accessible to a pipeline shader stage when the `stageFlags` member of the `VkDescriptorSetLayoutBinding` structure has the bit for that shader stage set. See [Storage Image](#), and [Storage Texel Buffer](#).
- `maxPerStageDescriptorInputAttachments` is the maximum number of input attachments that **can** be accessible to a single shader stage in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. A descriptor is accessible to a pipeline shader stage when the `stageFlags` member of the `VkDescriptorSetLayoutBinding` structure has the bit for that shader stage set. These are only supported for the fragment stage. See [Input Attachment](#).
- `maxPerStageResources` is the maximum number of resources that **can** be accessible to a single shader stage in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`, `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`, `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`, `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`, `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. For the fragment shader stage the framebuffer color attachments also count against this limit.
- `maxDescriptorSetSamplers` is the maximum number of samplers that **can** be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_SAMPLER` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See [Sampler](#) and [Combined Image Sampler](#).

- `maxDescriptorSetUniformBuffers` is the maximum number of uniform buffers that **can** be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See [Uniform Buffer](#) and [Dynamic Uniform Buffer](#).
- `maxDescriptorSetUniformBuffersDynamic` is the maximum number of dynamic uniform buffers that **can** be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See [Dynamic Uniform Buffer](#).
- `maxDescriptorSetStorageBuffers` is the maximum number of storage buffers that **can** be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See [Storage Buffer](#) and [Dynamic Storage Buffer](#).
- `maxDescriptorSetStorageBuffersDynamic` is the maximum number of dynamic storage buffers that **can** be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See [Dynamic Storage Buffer](#).
- `maxDescriptorSetSampledImages` is the maximum number of sampled images that **can** be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, or `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See [Combined Image Sampler](#), [Sampled Image](#), and [Uniform Texel Buffer](#).
- `maxDescriptorSetStorageImages` is the maximum number of storage images that **can** be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See [Storage Image](#), and [Storage Texel Buffer](#).
- `maxDescriptorSetInputAttachments` is the maximum number of input attachments that **can** be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See [Input Attachment](#).
- `maxVertexInputAttributes` is the maximum number of vertex input attributes that **can** be specified for a graphics pipeline. These are described in the array of `VkVertexInputAttributeDescription` structures that are provided at graphics pipeline creation time via the `pVertexAttributeDescriptions` member of the `VkPipelineVertexInputStateCreateInfo` structure. See [Vertex Attributes](#) and [Vertex Input Description](#).

- `maxVertexInputBindings` is the maximum number of vertex buffers that **can** be specified for providing vertex attributes to a graphics pipeline. These are described in the array of `VkVertexInputBindingDescription` structures that are provided at graphics pipeline creation time via the `pVertexBindingDescriptions` member of the `VkPipelineVertexInputStateCreateInfo` structure. The `binding` member of `VkVertexInputBindingDescription` **must** be less than this limit. See [Vertex Input Description](#).
- `maxVertexInputAttributeOffset` is the maximum vertex input attribute offset that **can** be added to the vertex input binding stride. The `offset` member of the `VkVertexInputAttributeDescription` structure **must** be less than or equal to this limit. See [Vertex Input Description](#).
- `maxVertexInputBindingStride` is the maximum vertex input binding stride that **can** be specified in a vertex input binding. The `stride` member of the `VkVertexInputBindingDescription` structure **must** be less than or equal to this limit. See [Vertex Input Description](#).
- `maxVertexOutputComponents` is the maximum number of components of output variables which **can** be output by a vertex shader. See [Vertex Shaders](#).
- `maxTessellationGenerationLevel` is the maximum tessellation generation level supported by the fixed-function tessellation primitive generator. See [Tessellation](#).
- `maxTessellationPatchSize` is the maximum patch size, in vertices, of patches that **can** be processed by the tessellation control shader and tessellation primitive generator. The `patchControlPoints` member of the `VkPipelineTessellationStateCreateInfo` structure specified at pipeline creation time and the value provided in the `OutputVertices` execution mode of shader modules **must** be less than or equal to this limit. See [Tessellation](#).
- `maxTessellationControlPerVertexInputComponents` is the maximum number of components of input variables which **can** be provided as per-vertex inputs to the tessellation control shader stage.
- `maxTessellationControlPerVertexOutputComponents` is the maximum number of components of per-vertex output variables which **can** be output from the tessellation control shader stage.
- `maxTessellationControlPerPatchOutputComponents` is the maximum number of components of per-patch output variables which **can** be output from the tessellation control shader stage.
- `maxTessellationControlTotalOutputComponents` is the maximum total number of components of per-vertex and per-patch output variables which **can** be output from the tessellation control shader stage.
- `maxTessellationEvaluationInputComponents` is the maximum number of components of input variables which **can** be provided as per-vertex inputs to the tessellation evaluation shader stage.
- `maxTessellationEvaluationOutputComponents` is the maximum number of components of per-vertex output variables which **can** be output from the tessellation evaluation shader stage.
- `maxGeometryShaderInvocations` is the maximum invocation count supported for instanced geometry shaders. The value provided in the `Invocations` execution mode of shader modules **must** be less than or equal to this limit. See [Geometry Shading](#).
- `maxGeometryInputComponents` is the maximum number of components of input variables which **can** be provided as inputs to the geometry shader stage.
- `maxGeometryOutputComponents` is the maximum number of components of output variables which

can be output from the geometry shader stage.

- **maxGeometryOutputVertices** is the maximum number of vertices which **can** be emitted by any geometry shader.
- **maxGeometryTotalOutputComponents** is the maximum total number of components of output variables, across all emitted vertices, which **can** be output from the geometry shader stage.
- **maxFragmentInputComponents** is the maximum number of components of input variables which **can** be provided as inputs to the fragment shader stage.
- **maxFragmentOutputAttachments** is the maximum number of output attachments which **can** be written to by the fragment shader stage.
- **maxFragmentDualSrcAttachments** is the maximum number of output attachments which **can** be written to by the fragment shader stage when blending is enabled and one of the dual source blend modes is in use. See [Dual-Source Blending](#) and **dualSrcBlend**.
- **maxFragmentCombinedOutputResources** is the total number of storage buffers, storage images, and output **Location** decorated color attachments (described in [Fragment Output Interface](#)) which **can** be used in the fragment shader stage.
- **maxComputeSharedMemorySize** is the maximum total storage size, in bytes, available for variables declared with the **Workgroup** storage class in shader modules (or with the **shared** storage qualifier in GLSL) in the compute shader stage.
- **maxComputeWorkGroupCount**[3] is the maximum number of local workgroups that **can** be dispatched by a single dispatching command. These three values represent the maximum number of local workgroups for the X, Y, and Z dimensions, respectively. The workgroup count parameters to the dispatching commands **must** be less than or equal to the corresponding limit. See [Dispatching Commands](#).
- **maxComputeWorkGroupInvocations** is the maximum total number of compute shader invocations in a single local workgroup. The product of the X, Y, and Z sizes, as specified by the **LocalSize** execution mode in shader modules or by the object decorated by the **WorkgroupSize** decoration, **must** be less than or equal to this limit.
- **maxComputeWorkGroupSize**[3] is the maximum size of a local compute workgroup, per dimension. These three values represent the maximum local workgroup size in the X, Y, and Z dimensions, respectively. The **x**, **y**, and **z** sizes, as specified by the **LocalSize** execution mode or by the object decorated by the **WorkgroupSize** decoration in shader modules, **must** be less than or equal to the corresponding limit.
- **subPixelPrecisionBits** is the number of bits of subpixel precision in framebuffer coordinates x_f and y_f . See [Rasterization](#).
- **subTexelPrecisionBits** is the number of bits of precision in the division along an axis of an image used for minification and magnification filters. $2^{\text{subTexelPrecisionBits}}$ is the actual number of divisions along each axis of the image represented. Sub-texel values calculated during image sampling will snap to these locations when generating the filtered results.
- **mipmapPrecisionBits** is the number of bits of division that the LOD calculation for mipmap fetching get snapped to when determining the contribution from each mip level to the mip filtered results. $2^{\text{mipmapPrecisionBits}}$ is the actual number of divisions.
- **maxDrawIndexedIndexValue** is the maximum index value that **can** be used for indexed draw calls

when using 32-bit indices. This excludes the primitive restart index value of 0xFFFFFFFF. See [fullDrawIndexUint32](#).

- **maxDrawIndirectCount** is the maximum draw count that is supported for indirect drawing calls. See [multiDrawIndirect](#).
- **maxSamplerLodBias** is the maximum absolute sampler LOD bias. The sum of the **mipLodBias** member of the [VkSamplerCreateInfo](#) structure and the **Bias** operand of image sampling operations in shader modules (or 0 if no **Bias** operand is provided to an image sampling operation) are clamped to the range $[-\text{maxSamplerLodBias}, +\text{maxSamplerLodBias}]$. See [\[samplers-mipLodBias\]](#).
- **maxSamplerAnisotropy** is the maximum degree of sampler anisotropy. The maximum degree of anisotropic filtering used for an image sampling operation is the minimum of the **maxAnisotropy** member of the [VkSamplerCreateInfo](#) structure and this limit. See [\[samplers-maxAnisotropy\]](#).
- **maxViewports** is the maximum number of active viewports. The **viewportCount** member of the [VkPipelineViewportStateCreateInfo](#) structure that is provided at pipeline creation **must** be less than or equal to this limit.
- **maxViewportDimensions[2]** are the maximum viewport dimensions in the X (width) and Y (height) dimensions, respectively. The maximum viewport dimensions **must** be greater than or equal to the largest image which **can** be created and used as a framebuffer attachment. See [Controlling the Viewport](#).
- **viewportBoundsRange[2]** is the [minimum, maximum] range that the corners of a viewport **must** be contained in. This range **must** be at least $[-2 \times \text{size}, 2 \times \text{size} - 1]$, where **size** = $\max(\text{maxViewportDimensions}[0], \text{maxViewportDimensions}[1])$. See [Controlling the Viewport](#).

NOTE

The intent of the **viewportBoundsRange** limit is to allow a maximum sized viewport to be arbitrarily shifted relative to the output target as long as at least some portion intersects. This would give a bounds limit of $[-\text{size} + 1, 2 \times \text{size} - 1]$ which would allow all possible non-empty-set intersections of the output target and the viewport. Since these numbers are typically powers of two, picking the signed number range using the smallest possible number of bits ends up with the specified range.

- **viewportSubPixelBits** is the number of bits of subpixel precision for viewport bounds. The subpixel precision that floating-point viewport bounds are interpreted at is given by this limit.
- **minMemoryMapAlignment** is the minimum **required** alignment, in bytes, of host visible memory allocations within the host address space. When mapping a memory allocation with [vkMapMemory](#), subtracting **offset** bytes from the returned pointer will always produce an integer multiple of this limit. See [Host Access to Device Memory Objects](#). The value **must** be a power of two.
- **minTexelBufferOffsetAlignment** is the minimum **required** alignment, in bytes, for the **offset** member of the [VkBufferViewCreateInfo](#) structure for texel buffers. The value **must** be a power of two. If the **texelBufferAlignment** feature is enabled, this limit is equivalent to the maximum of the **uniformTexelBufferOffsetAlignmentBytes** and **storageTexelBufferOffsetAlignmentBytes** members of [VkPhysicalDeviceTexelBufferAlignmentProperties](#), but smaller alignment is **optionally** allowed by **storageTexelBufferOffsetSingleTexelAlignment** and

`uniformTexelBufferOffsetSingleTexelAlignment`. If the `texelBufferAlignment` feature is not enabled, `VkBufferViewCreateInfo::offset` **must** be a multiple of this value.

- `minUniformBufferOffsetAlignment` is the minimum **required** alignment, in bytes, for the `offset` member of the `VkDescriptorBufferInfo` structure for uniform buffers. When a descriptor of type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` is updated, the `offset` **must** be an integer multiple of this limit. Similarly, dynamic offsets for uniform buffers **must** be multiples of this limit. The value **must** be a power of two.
- `minStorageBufferOffsetAlignment` is the minimum **required** alignment, in bytes, for the `offset` member of the `VkDescriptorBufferInfo` structure for storage buffers. When a descriptor of type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` is updated, the `offset` **must** be an integer multiple of this limit. Similarly, dynamic offsets for storage buffers **must** be multiples of this limit. The value **must** be a power of two.
- `minTexelOffset` is the minimum offset value for the `ConstOffset` image operand of any of the `OpImageSample*` or `OpImageFetch*` image instructions.
- `maxTexelOffset` is the maximum offset value for the `ConstOffset` image operand of any of the `OpImageSample*` or `OpImageFetch*` image instructions.
- `minTexelGatherOffset` is the minimum offset value for the `Offset`, `ConstOffset`, or `ConstOffsets` image operands of any of the `OpImage*Gather` image instructions.
- `maxTexelGatherOffset` is the maximum offset value for the `Offset`, `ConstOffset`, or `ConstOffsets` image operands of any of the `OpImage*Gather` image instructions.
- `minInterpolationOffset` is the base minimum (inclusive) negative offset value for the `Offset` operand of the `InterpolateAtOffset` extended instruction.
- `maxInterpolationOffset` is the base maximum (inclusive) positive offset value for the `Offset` operand of the `InterpolateAtOffset` extended instruction.
- `subPixelInterpolationOffsetBits` is the number of fractional bits that the `x` and `y` offsets to the `InterpolateAtOffset` extended instruction **may** be rounded to as fixed-point values.
- `maxFramebufferWidth` is the maximum width for a framebuffer. The `width` member of the `VkFramebufferCreateInfo` structure **must** be less than or equal to this limit.
- `maxFramebufferHeight` is the maximum height for a framebuffer. The `height` member of the `VkFramebufferCreateInfo` structure **must** be less than or equal to this limit.
- `maxFramebufferLayers` is the maximum layer count for a layered framebuffer. The `layers` member of the `VkFramebufferCreateInfo` structure **must** be less than or equal to this limit.
- `framebufferColorSampleCounts` is a bitmask¹ of `VkSampleCountFlagBits` indicating the color sample counts that are supported for all framebuffer color attachments with floating- or fixed-point formats. For color attachments with integer formats, see `framebufferIntegerColorSampleCounts`.
- `framebufferDepthSampleCounts` is a bitmask¹ of `VkSampleCountFlagBits` indicating the supported depth sample counts for all framebuffer depth/stencil attachments, when the format includes a depth component.
- `framebufferStencilSampleCounts` is a bitmask¹ of `VkSampleCountFlagBits` indicating the supported stencil sample counts for all framebuffer depth/stencil attachments, when the format includes a stencil component.

- `framebufferNoAttachmentsSampleCounts` is a bitmask¹ of `VkSampleCountFlagBits` indicating the supported sample counts for a [subpass which uses no attachments](#).
- `maxColorAttachments` is the maximum number of color attachments that **can** be used by a subpass in a render pass. The `colorAttachmentCount` member of the `VkSubpassDescription` or `VkSubpassDescription2` structure **must** be less than or equal to this limit.
- `sampledImageColorSampleCounts` is a bitmask¹ of `VkSampleCountFlagBits` indicating the sample counts supported for all 2D images created with `VK_IMAGE_TILING_OPTIMAL`, `usage` containing `VK_IMAGE_USAGE_SAMPLED_BIT`, and a non-integer color format.
- `sampledImageIntegerSampleCounts` is a bitmask¹ of `VkSampleCountFlagBits` indicating the sample counts supported for all 2D images created with `VK_IMAGE_TILING_OPTIMAL`, `usage` containing `VK_IMAGE_USAGE_SAMPLED_BIT`, and an integer color format.
- `sampledImageDepthSampleCounts` is a bitmask¹ of `VkSampleCountFlagBits` indicating the sample counts supported for all 2D images created with `VK_IMAGE_TILING_OPTIMAL`, `usage` containing `VK_IMAGE_USAGE_SAMPLED_BIT`, and a depth format.
- `sampledImageStencilSampleCounts` is a bitmask¹ of `VkSampleCountFlagBits` indicating the sample counts supported for all 2D images created with `VK_IMAGE_TILING_OPTIMAL`, `usage` containing `VK_IMAGE_USAGE_SAMPLED_BIT`, and a stencil format.
- `storageImageSampleCounts` is a bitmask¹ of `VkSampleCountFlagBits` indicating the sample counts supported for all 2D images created with `VK_IMAGE_TILING_OPTIMAL`, and `usage` containing `VK_IMAGE_USAGE_STORAGE_BIT`.
- `maxSampleMaskWords` is the maximum number of array elements of a variable decorated with the `SampleMask` built-in decoration.
- `timestampComputeAndGraphics` specifies support for timestamps on all graphics and compute queues. If this limit is `VK_TRUE`, all queues that advertise the `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT` in the `VkQueueFamilyProperties::queueFlags` support `VkQueueFamilyProperties::timestampValidBits` of at least 36. See [Timestamp Queries](#).
- `timestampPeriod` is the number of nanoseconds **required** for a timestamp query to be incremented by 1. See [Timestamp Queries](#).
- `maxClipDistances` is the maximum number of clip distances that **can** be used in a single shader stage. The size of any array declared with the `ClipDistance` built-in decoration in a shader module **must** be less than or equal to this limit.
- `maxCullDistances` is the maximum number of cull distances that **can** be used in a single shader stage. The size of any array declared with the `CullDistance` built-in decoration in a shader module **must** be less than or equal to this limit.
- `maxCombinedClipAndCullDistances` is the maximum combined number of clip and cull distances that **can** be used in a single shader stage. The sum of the sizes of all arrays declared with the `ClipDistance` and `CullDistance` built-in decoration used by a single shader stage in a shader module **must** be less than or equal to this limit.
- `discreteQueuePriorities` is the number of discrete priorities that **can** be assigned to a queue based on the value of each member of `VkDeviceQueueCreateInfo::pQueuePriorities`. This **must** be at least 2, and levels **must** be spread evenly over the range, with at least one level at 1.0, and another at 0.0. See [Queue Priority](#).

- `pointSizeRange[2]` is the range `[minimum,maximum]` of supported sizes for points. Values written to variables decorated with the `PointSize` built-in decoration are clamped to this range.
- `lineWidthRange[2]` is the range `[minimum,maximum]` of supported widths for lines. Values specified by the `lineWidth` member of the `VkPipelineRasterizationStateCreateInfo` or the `lineWidth` parameter to `vkCmdSetLineWidth` are clamped to this range.
- `pointSizeGranularity` is the granularity of supported point sizes. Not all point sizes in the range defined by `pointSizeRange` are supported. This limit specifies the granularity (or increment) between successive supported point sizes.
- `lineWidthGranularity` is the granularity of supported line widths. Not all line widths in the range defined by `lineWidthRange` are supported. This limit specifies the granularity (or increment) between successive supported line widths.
- `strictLines` specifies whether lines are rasterized according to the preferred method of rasterization. If set to `VK_FALSE`, lines **may** be rasterized under a relaxed set of rules. If set to `VK_TRUE`, lines are rasterized as per the strict definition. See [Basic Line Segment Rasterization](#).
- `standardSampleLocations` specifies whether rasterization uses the standard sample locations as documented in [Multisampling](#). If set to `VK_TRUE`, the implementation uses the documented sample locations. If set to `VK_FALSE`, the implementation **may** use different sample locations.
- `optimalBufferCopyOffsetAlignment` is the optimal buffer offset alignment in bytes for `vkCmdCopyBufferToImage2KHR`, `vkCmdCopyBufferToImage`, `vkCmdCopyImageToBuffer2KHR`, and `vkCmdCopyImageToBuffer`. The per texel alignment requirements are enforced, but applications **should** use the optimal alignment for optimal performance and power use. The value **must** be a power of two.
- `optimalBufferCopyRowPitchAlignment` is the optimal buffer row pitch alignment in bytes for `vkCmdCopyBufferToImage2KHR`, `vkCmdCopyBufferToImage`, `vkCmdCopyImageToBuffer2KHR`, and `vkCmdCopyImageToBuffer`. Row pitch is the number of bytes between texels with the same X coordinate in adjacent rows (Y coordinates differ by one). The per texel alignment requirements are enforced, but applications **should** use the optimal alignment for optimal performance and power use. The value **must** be a power of two.
- `nonCoherentAtomSize` is the size and alignment in bytes that bounds concurrent access to [host-mapped device memory](#). The value **must** be a power of two.

1

For all bitmasks of `VkSampleCountFlagBits`, the sample count limits defined above represent the minimum supported sample counts for each image type. Individual images **may** support additional sample counts, which are queried using `vkGetPhysicalDeviceImageFormatProperties` as described in [Supported Sample Counts](#).

Bits which **may** be set in the sample count limits returned by `VkPhysicalDeviceLimits`, as well as in other queries and structures representing image sample counts, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkSampleCountFlagBits {
    VK_SAMPLE_COUNT_1_BIT = 0x00000001,
    VK_SAMPLE_COUNT_2_BIT = 0x00000002,
    VK_SAMPLE_COUNT_4_BIT = 0x00000004,
    VK_SAMPLE_COUNT_8_BIT = 0x00000008,
    VK_SAMPLE_COUNT_16_BIT = 0x00000010,
    VK_SAMPLE_COUNT_32_BIT = 0x00000020,
    VK_SAMPLE_COUNT_64_BIT = 0x00000040,
} VkSampleCountFlagBits;
```

- `VK_SAMPLE_COUNT_1_BIT` specifies an image with one sample per pixel.
- `VK_SAMPLE_COUNT_2_BIT` specifies an image with 2 samples per pixel.
- `VK_SAMPLE_COUNT_4_BIT` specifies an image with 4 samples per pixel.
- `VK_SAMPLE_COUNT_8_BIT` specifies an image with 8 samples per pixel.
- `VK_SAMPLE_COUNT_16_BIT` specifies an image with 16 samples per pixel.
- `VK_SAMPLE_COUNT_32_BIT` specifies an image with 32 samples per pixel.
- `VK_SAMPLE_COUNT_64_BIT` specifies an image with 64 samples per pixel.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkSampleCountFlags;
```

`VkSampleCountFlags` is a bitmask type for setting a mask of zero or more `VkSampleCountFlagBits`.

The `VkPhysicalDeviceMultiviewProperties` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceMultiviewProperties {
    VkStructureType    sType;
    void*              pNext;
    uint32_t            maxMultiviewViewCount;
    uint32_t            maxMultiviewInstanceIndex;
} VkPhysicalDeviceMultiviewProperties;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxMultiviewViewCount` is one greater than the maximum view index that **can** be used in a subpass.
- `maxMultiviewInstanceIndex` is the maximum valid value of instance index allowed to be generated by a drawing command recorded within a subpass of a multiview render pass instance.

If the `VkPhysicalDeviceMultiviewProperties` structure is included in the `pNext` chain of the

`VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceMultiviewProperties-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTIVIEW_PROPERTIES`

The `VkPhysicalDeviceFloatControlsProperties` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceFloatControlsProperties {
    VkStructureType    sType;
    void*              pNext;
    VkShaderFloatControlsIndependence  denormBehaviorIndependence;
    VkShaderFloatControlsIndependence  roundingModeIndependence;
    VkBool32           shaderSignedZeroInfNanPreserveFloat16;
    VkBool32           shaderSignedZeroInfNanPreserveFloat32;
    VkBool32           shaderSignedZeroInfNanPreserveFloat64;
    VkBool32           shaderDenormPreserveFloat16;
    VkBool32           shaderDenormPreserveFloat32;
    VkBool32           shaderDenormPreserveFloat64;
    VkBool32           shaderDenormFlushToZeroFloat16;
    VkBool32           shaderDenormFlushToZeroFloat32;
    VkBool32           shaderDenormFlushToZeroFloat64;
    VkBool32           shaderRoundingModeRTEFloat16;
    VkBool32           shaderRoundingModeRTEFloat32;
    VkBool32           shaderRoundingModeRTEFloat64;
    VkBool32           shaderRoundingModeRTZFloat16;
    VkBool32           shaderRoundingModeRTZFloat32;
    VkBool32           shaderRoundingModeRTZFloat64;
} VkPhysicalDeviceFloatControlsProperties;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `denormBehaviorIndependence` is a `VkShaderFloatControlsIndependence` value indicating whether, and how, denorm behavior can be set independently for different bit widths.
- `roundingModeIndependence` is a `VkShaderFloatControlsIndependence` value indicating whether, and how, rounding modes can be set independently for different bit widths.
- `shaderSignedZeroInfNanPreserveFloat16` is a boolean value indicating whether sign of a zero, Nans and $\pm\infty$ **can** be preserved in 16-bit floating-point computations. It also indicates whether the `SignedZeroInfNanPreserve` execution mode **can** be used for 16-bit floating-point types.
- `shaderSignedZeroInfNanPreserveFloat32` is a boolean value indicating whether sign of a zero, Nans and $\pm\infty$ **can** be preserved in 32-bit floating-point computations. It also indicates whether the `SignedZeroInfNanPreserve` execution mode **can** be used for 32-bit floating-point types.

- `shaderSignedZeroInfNanPreserveFloat64` is a boolean value indicating whether sign of a zero, Nans and $\pm\infty$ **can** be preserved in 64-bit floating-point computations. It also indicates whether the `SignedZeroInfNanPreserve` execution mode **can** be used for 64-bit floating-point types.
- `shaderDenormPreserveFloat16` is a boolean value indicating whether denormals **can** be preserved in 16-bit floating-point computations. It also indicates whether the `DenormPreserve` execution mode **can** be used for 16-bit floating-point types.
- `shaderDenormPreserveFloat32` is a boolean value indicating whether denormals **can** be preserved in 32-bit floating-point computations. It also indicates whether the `DenormPreserve` execution mode **can** be used for 32-bit floating-point types.
- `shaderDenormPreserveFloat64` is a boolean value indicating whether denormals **can** be preserved in 64-bit floating-point computations. It also indicates whether the `DenormPreserve` execution mode **can** be used for 64-bit floating-point types.
- `shaderDenormFlushToZeroFloat16` is a boolean value indicating whether denormals **can** be flushed to zero in 16-bit floating-point computations. It also indicates whether the `DenormFlushToZero` execution mode **can** be used for 16-bit floating-point types.
- `shaderDenormFlushToZeroFloat32` is a boolean value indicating whether denormals **can** be flushed to zero in 32-bit floating-point computations. It also indicates whether the `DenormFlushToZero` execution mode **can** be used for 32-bit floating-point types.
- `shaderDenormFlushToZeroFloat64` is a boolean value indicating whether denormals **can** be flushed to zero in 64-bit floating-point computations. It also indicates whether the `DenormFlushToZero` execution mode **can** be used for 64-bit floating-point types.
- `shaderRoundingModeRTEFloat16` is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 16-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTE` execution mode **can** be used for 16-bit floating-point types.
- `shaderRoundingModeRTEFloat32` is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 32-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTE` execution mode **can** be used for 32-bit floating-point types.
- `shaderRoundingModeRTEFloat64` is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 64-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTE` execution mode **can** be used for 64-bit floating-point types.
- `shaderRoundingModeRTZFloat16` is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 16-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTZ` execution mode **can** be used for 16-bit floating-point types.
- `shaderRoundingModeRTZFloat32` is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 32-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTZ` execution mode **can** be used for 32-bit floating-point types.
- `shaderRoundingModeRTZFloat64` is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 64-bit floating-point arithmetic and

conversion instructions. It also indicates whether the `RoundingModeRTZ` execution mode **can** be used for 64-bit floating-point types.

If the `VkPhysicalDeviceFloatControlsProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceFloatControlsProperties-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FLOAT_CONTROLS_PROPERTIES`

Values which **may** be returned in the `denormBehaviorIndependence` and `roundingModeIndependence` fields of `VkPhysicalDeviceFloatControlsProperties` are:

```
// Provided by VK_VERSION_1_2
typedef enum VkShaderFloatControlsIndependence {
    VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_32_BIT_ONLY = 0,
    VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_ALL = 1,
    VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_NONE = 2,
} VkShaderFloatControlsIndependence;
```

- `VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_32_BIT_ONLY` specifies that shader float controls for 32-bit floating-point **can** be set independently; other bit widths **must** be set identically to each other.
- `VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_ALL` specifies that shader float controls for all bit widths **can** be set independently.
- `VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_NONE` specifies that shader float controls for all bit widths **must** be set identically.

The `VkPhysicalDeviceDiscardRectanglePropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_discard_rectangles
typedef struct VkPhysicalDeviceDiscardRectanglePropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           maxDiscardRectangles;
} VkPhysicalDeviceDiscardRectanglePropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxDiscardRectangles` is the maximum number of active discard rectangles that **can** be specified.

If the `VkPhysicalDeviceDiscardRectanglePropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDiscardRectanglePropertiesEXT-sType-sType
sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DISCARD_RECTANGLE_PROPERTIES_EXT

The `VkPhysicalDeviceSampleLocationsPropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_sample_locations
typedef struct VkPhysicalDeviceSampleLocationsPropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkSampleCountFlags sampleLocationSampleCounts;
    VkExtent2D         maxSampleLocationGridSize;
    float              sampleLocationCoordinateRange[2];
    uint32_t           sampleLocationSubPixelBits;
    VkBool32           variableSampleLocations;
} VkPhysicalDeviceSampleLocationsPropertiesEXT;
```

- sType is a `VkStructureType` value identifying this structure.
- pNext is `NULL` or a pointer to a structure extending this structure.
- sampleLocationSampleCounts is a bitmask of `VkSampleCountFlagBits` indicating the sample counts supporting custom sample locations.
- maxSampleLocationGridSize is the maximum size of the pixel grid in which sample locations **can** vary that is supported for all sample counts in sampleLocationSampleCounts.
- sampleLocationCoordinateRange[2] is the range of supported sample location coordinates.
- sampleLocationSubPixelBits is the number of bits of subpixel precision for sample locations.
- variableSampleLocations specifies whether the sample locations used by all pipelines that will be bound to a command buffer during a subpass **must** match. If set to `VK_TRUE`, the implementation supports variable sample locations in a subpass. If set to `VK_FALSE`, then the sample locations **must** stay constant in each subpass.

If the `VkPhysicalDeviceSampleLocationsPropertiesEXT` structure is included in the pNext chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSampleLocationsPropertiesEXT-sType-sType
sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SAMPLE_LOCATIONS_PROPERTIES_EXT

The `VkPhysicalDeviceExternalMemoryHostPropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_external_memory_host
typedef struct VkPhysicalDeviceExternalMemoryHostPropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkDeviceSize        minImportedHostPointerAlignment;
} VkPhysicalDeviceExternalMemoryHostPropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `minImportedHostPointerAlignment` is the minimum **required** alignment, in bytes, for the base address and size of host pointers that **can** be imported to a Vulkan memory object. The value **must** be a power of two.

If the `VkPhysicalDeviceExternalMemoryHostPropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalMemoryHostPropertiesEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_MEMORY_HOST_PROPERTIES_EXT`

The `VkPhysicalDevicePointClippingProperties` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDevicePointClippingProperties {
    VkStructureType    sType;
    void*              pNext;
    VkPointClippingBehavior    pointClippingBehavior;
} VkPhysicalDevicePointClippingProperties;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pointClippingBehavior` is a `VkPointClippingBehavior` value specifying the point clipping behavior supported by the implementation.

If the `VkPhysicalDevicePointClippingProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDevicePointClippingProperties-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_POINT_CLIPPING_PROPERTIES`

The `VkPhysicalDeviceSubgroupProperties` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceSubgroupProperties {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           subgroupSize;
    VkShaderStageFlags supportedStages;
    VkSubgroupFeatureFlags supportedOperations;
    VkBool32           quadOperationsInAllStages;
} VkPhysicalDeviceSubgroupProperties;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `subgroupSize` is the default number of invocations in each subgroup. `subgroupSize` is at least 1 if any of the physical device's queues support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`. `subgroupSize` is a power-of-two.
- `supportedStages` is a bitfield of `VkShaderStageFlagBits` describing the shader stages that `group operations` with `subgroup scope` are supported in. `supportedStages` will have the `VK_SHADER_STAGE_COMPUTE_BIT` bit set if any of the physical device's queues support `VK_QUEUE_COMPUTE_BIT`.
- `supportedOperations` is a bitmask of `VkSubgroupFeatureFlagBits` specifying the sets of `group operations` with `subgroup scope` supported on this device. `supportedOperations` will have the `VK_SUBGROUP_FEATURE_BASIC_BIT` bit set if any of the physical device's queues support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`.
- `quadOperationsInAllStages` is a boolean specifying whether `quad group operations` are available in all stages, or are restricted to fragment and compute stages.

If the `VkPhysicalDeviceSubgroupProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

If `supportedOperations` includes `VK_SUBGROUP_FEATURE_QUAD_BIT`, `subgroupSize` **must** be greater than or equal to 4.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSubgroupProperties-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBGROUP_PROPERTIES`

Bits which **can** be set in `VkPhysicalDeviceSubgroupProperties::supportedOperations` and `VkPhysicalDeviceVulkan11Properties::subgroupSupportedOperations` to specify supported `group operations` with `subgroup scope` are:

```
// Provided by VK_VERSION_1_1
typedef enum VkSubgroupFeatureFlagBits {
    VK_SUBGROUP_FEATURE_BASIC_BIT = 0x00000001,
    VK_SUBGROUP_FEATURE_VOTE_BIT = 0x00000002,
    VK_SUBGROUP_FEATURE_ARITHMETIC_BIT = 0x00000004,
    VK_SUBGROUP_FEATURE_BALLOT_BIT = 0x00000008,
    VK_SUBGROUP_FEATURE_SHUFFLE_BIT = 0x00000010,
    VK_SUBGROUP_FEATURE_SHUFFLE_RELATIVE_BIT = 0x00000020,
    VK_SUBGROUP_FEATURE_CLUSTERED_BIT = 0x00000040,
    VK_SUBGROUP_FEATURE_QUAD_BIT = 0x00000080,
} VkSubgroupFeatureFlagBits;
```

- `VK_SUBGROUP_FEATURE_BASIC_BIT` specifies the device will accept SPIR-V shader modules containing the `GroupNonUniform` capability.
- `VK_SUBGROUP_FEATURE_VOTE_BIT` specifies the device will accept SPIR-V shader modules containing the `GroupNonUniformVote` capability.
- `VK_SUBGROUP_FEATURE_ARITHMETIC_BIT` specifies the device will accept SPIR-V shader modules containing the `GroupNonUniformArithmetic` capability.
- `VK_SUBGROUP_FEATURE_BALLOT_BIT` specifies the device will accept SPIR-V shader modules containing the `GroupNonUniformBallot` capability.
- `VK_SUBGROUP_FEATURE_SHUFFLE_BIT` specifies the device will accept SPIR-V shader modules containing the `GroupNonUniformShuffle` capability.
- `VK_SUBGROUP_FEATURE_SHUFFLE_RELATIVE_BIT` specifies the device will accept SPIR-V shader modules containing the `GroupNonUniformShuffleRelative` capability.
- `VK_SUBGROUP_FEATURE_CLUSTERED_BIT` specifies the device will accept SPIR-V shader modules containing the `GroupNonUniformClustered` capability.
- `VK_SUBGROUP_FEATURE_QUAD_BIT` specifies the device will accept SPIR-V shader modules containing the `GroupNonUniformQuad` capability.

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkSubgroupFeatureFlags;
```

`VkSubgroupFeatureFlags` is a bitmask type for setting a mask of zero or more `VkSubgroupFeatureFlagBits`.

The `VkPhysicalDeviceSubgroupSizeControlProperties` structure is defined as:

```
typedef struct VkPhysicalDeviceSubgroupSizeControlProperties {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           minSubgroupSize;
    uint32_t           maxSubgroupSize;
    uint32_t           maxComputeWorkgroupSubgroups;
    VkShaderStageFlags requiredSubgroupSizeStages;
} VkPhysicalDeviceSubgroupSizeControlProperties;
```

```
// Provided by VK_EXT_subgroup_size_control
typedef VkPhysicalDeviceSubgroupSizeControlProperties
VkPhysicalDeviceSubgroupSizeControlPropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `minSubgroupSize` is the minimum subgroup size supported by this device. `minSubgroupSize` is at least one if any of the physical device's queues support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`. `minSubgroupSize` is a power-of-two. `minSubgroupSize` is less than or equal to `maxSubgroupSize`. `minSubgroupSize` is less than or equal to `subgroupSize`.
- `maxSubgroupSize` is the maximum subgroup size supported by this device. `maxSubgroupSize` is at least one if any of the physical device's queues support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`. `maxSubgroupSize` is a power-of-two. `maxSubgroupSize` is greater than or equal to `minSubgroupSize`. `maxSubgroupSize` is greater than or equal to `subgroupSize`.
- `maxComputeWorkgroupSubgroups` is the maximum number of subgroups supported by the implementation within a workgroup.
- `requiredSubgroupSizeStages` is a bitfield of what shader stages support having a required subgroup size specified.

If the `VkPhysicalDeviceSubgroupSizeControlProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

If `VkPhysicalDeviceSubgroupProperties::supportedOperations` includes `VK_SUBGROUP_FEATURE_QUAD_BIT`, `minSubgroupSize` **must** be greater than or equal to 4.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSubgroupSizeControlProperties-sType-sType `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBGROUP_SIZE_CONTROL_PROPERTIES`

The `VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_blend_operation_advanced
typedef struct VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           advancedBlendMaxColorAttachments;
    VkBool32           advancedBlendIndependentBlend;
    VkBool32           advancedBlendNonPremultipliedSrcColor;
    VkBool32           advancedBlendNonPremultipliedDstColor;
    VkBool32           advancedBlendCorrelatedOverlap;
    VkBool32           advancedBlendAllOperations;
} VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `advancedBlendMaxColorAttachments` is one greater than the highest color attachment index that **can** be used in a render pass instance, for a pipeline that uses an [advanced blend operation](#).
- `advancedBlendIndependentBlend` specifies whether advanced blend operations **can** vary per-attachment.
- `advancedBlendNonPremultipliedSrcColor` specifies whether the source color **can** be treated as non-premultiplied. If this is `VK_FALSE`, then `VkPipelineColorBlendAdvancedStateCreateInfoEXT::srcPremultiplied` **must** be `VK_TRUE`.
- `advancedBlendNonPremultipliedDstColor` specifies whether the destination color **can** be treated as non-premultiplied. If this is `VK_FALSE`, then `VkPipelineColorBlendAdvancedStateCreateInfoEXT::dstPremultiplied` **must** be `VK_TRUE`.
- `advancedBlendCorrelatedOverlap` specifies whether the overlap mode **can** be treated as correlated. If this is `VK_FALSE`, then `VkPipelineColorBlendAdvancedStateCreateInfoEXT::blendOverlap` **must** be `VK_BLEND_OVERLAP_UNCORRELATED_EXT`.
- `advancedBlendAllOperations` specifies whether all advanced blend operation enums are supported. See the valid usage of `VkPipelineColorBlendAttachmentState`.

If the `VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT-sType-sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BLEND_OPERATION_ADVANCED_PROPERTIES_EXT`

The `VkPhysicalDeviceVertexAttributeDivisorProperties` structure is defined as:

```
typedef struct VkPhysicalDeviceVertexAttributeDivisorProperties {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           maxVertexAttribDivisor;
    VkBool32           supportsNonZeroFirstInstance;
} VkPhysicalDeviceVertexAttributeDivisorProperties;
```

```
// Provided by VK_KHR_vertex_attribute_divisor
typedef VkPhysicalDeviceVertexAttributeDivisorProperties
VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxVertexAttribDivisor` is the maximum value of the number of instances that will repeat the value of vertex attribute data when instanced rendering is enabled.
- `supportsNonZeroFirstInstance` specifies whether a non-zero value for the `firstInstance` parameter of `drawing commands` is supported when `VkVertexInputBindingDivisorDescription::divisor` is not 1.

If the `VkPhysicalDeviceVertexAttributeDivisorProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVertexAttributeDivisorProperties-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VERTEX_ATTRIBUTE_DIVISOR_PROPERTIES`

The `VkPhysicalDeviceSamplerFilterMinmaxProperties` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceSamplerFilterMinmaxProperties {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           filterMinmaxSingleComponentFormats;
    VkBool32           filterMinmaxImageComponentMapping;
} VkPhysicalDeviceSamplerFilterMinmaxProperties;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `filterMinmaxSingleComponentFormats` is a boolean value indicating whether a minimum set of required formats support min/max filtering.

- `filterMinmaxImageComponentMapping` is a boolean value indicating whether the implementation supports non-identity component mapping of the image when doing min/max filtering.

If the `VkPhysicalDeviceSamplerFilterMinmaxProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

If `filterMinmaxSingleComponentFormats` is `VK_TRUE`, the following formats **must** support the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT` feature with `VK_IMAGE_TILING_OPTIMAL`, if they support `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`:

- `VK_FORMAT_R8_UNORM`
- `VK_FORMAT_R8_SNORM`
- `VK_FORMAT_R16_UNORM`
- `VK_FORMAT_R16_SNORM`
- `VK_FORMAT_R16_SFLOAT`
- `VK_FORMAT_R32_SFLOAT`
- `VK_FORMAT_D16_UNORM`
- `VK_FORMAT_X8_D24_UNORM_PACK32`
- `VK_FORMAT_D32_SFLOAT`
- `VK_FORMAT_D16_UNORM_S8_UINT`
- `VK_FORMAT_D24_UNORM_S8_UINT`
- `VK_FORMAT_D32_SFLOAT_S8_UINT`

If the format is a depth/stencil format, this bit only specifies that the depth aspect (not the stencil aspect) of an image of this format supports min/max filtering, and that min/max filtering of the depth aspect is supported when depth compare is disabled in the sampler.

If `filterMinmaxImageComponentMapping` is `VK_FALSE` the component mapping of the image view used with min/max filtering **must** have been created with the `r` component set to the `identity swizzle`. Only the `r` component of the sampled image value is defined and the other component values are undefined. If `filterMinmaxImageComponentMapping` is `VK_TRUE` this restriction does not apply and image component mapping works as normal.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSamplerFilterMinmaxProperties-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SAMPLER_FILTER_MINMAX_PROPERTIES`

The `VkPhysicalDeviceProtectedMemoryProperties` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceProtectedMemoryProperties {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           protectedNoFault;
} VkPhysicalDeviceProtectedMemoryProperties;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `protectedNoFault` specifies how an implementation behaves when an application attempts to write to unprotected memory in a protected queue operation, read from protected memory in an unprotected queue operation, or perform a query in a protected queue operation. If this limit is `VK_TRUE`, such writes will be discarded or have undefined values written, reads and queries will return undefined values. If this limit is `VK_FALSE`, applications **must** not perform these operations. See [Protected Memory Access Rules](#) for more information.

If the `VkPhysicalDeviceProtectedMemoryProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceProtectedMemoryProperties-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROTECTED_MEMORY_PROPERTIES`

The `VkPhysicalDeviceMaintenance3Properties` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceMaintenance3Properties {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           maxPerSetDescriptors;
    VkDeviceSize        maxMemoryAllocationSize;
} VkPhysicalDeviceMaintenance3Properties;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxPerSetDescriptors` is a maximum number of descriptors (summed over all descriptor types) in a single descriptor set that is guaranteed to satisfy any implementation-dependent constraints on the size of a descriptor set itself. Applications **can** query whether a descriptor set that goes beyond this limit is supported using `vkGetDescriptorSetLayoutSupport`.
- `maxMemoryAllocationSize` is the maximum size of a memory allocation that **can** be created, even if there is more space available in the heap. If `VkMemoryAllocateInfo::allocationSize` is larger

the error `VK_ERROR_OUT_OF_DEVICE_MEMORY` **may** be returned.

If the `VkPhysicalDeviceMaintenance3Properties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceMaintenance3Properties-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MAINTENANCE_3_PROPERTIES`

The `VkPhysicalDeviceDescriptorIndexingProperties` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceDescriptorIndexingProperties {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           maxUpdateAfterBindDescriptorsInAllPools;
    VkBool32           shaderUniformBufferArrayNonUniformIndexingNative;
    VkBool32           shaderSampledImageArrayNonUniformIndexingNative;
    VkBool32           shaderStorageBufferArrayNonUniformIndexingNative;
    VkBool32           shaderStorageImageArrayNonUniformIndexingNative;
    VkBool32           shaderInputAttachmentArrayNonUniformIndexingNative;
    VkBool32           robustBufferAccessUpdateAfterBind;
    VkBool32           quadDivergentImplicitLod;
    uint32_t           maxPerStageDescriptorUpdateAfterBindSamplers;
    uint32_t           maxPerStageDescriptorUpdateAfterBindUniformBuffers;
    uint32_t           maxPerStageDescriptorUpdateAfterBindStorageBuffers;
    uint32_t           maxPerStageDescriptorUpdateAfterBindSampledImages;
    uint32_t           maxPerStageDescriptorUpdateAfterBindStorageImages;
    uint32_t           maxPerStageDescriptorUpdateAfterBindInputAttachments;
    uint32_t           maxPerStageUpdateAfterBindResources;
    uint32_t           maxDescriptorSetUpdateAfterBindSamplers;
    uint32_t           maxDescriptorSetUpdateAfterBindUniformBuffers;
    uint32_t           maxDescriptorSetUpdateAfterBindUniformBuffersDynamic;
    uint32_t           maxDescriptorSetUpdateAfterBindStorageBuffers;
    uint32_t           maxDescriptorSetUpdateAfterBindStorageBuffersDynamic;
    uint32_t           maxDescriptorSetUpdateAfterBindSampledImages;
    uint32_t           maxDescriptorSetUpdateAfterBindStorageImages;
    uint32_t           maxDescriptorSetUpdateAfterBindInputAttachments;
} VkPhysicalDeviceDescriptorIndexingProperties;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxUpdateAfterBindDescriptorsInAllPools` is the maximum number of descriptors (summed over all descriptor types) that **can** be created across all pools that are created with the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` bit set. Pool creation **may** fail when this limit

is exceeded, or when the space this limit represents is unable to satisfy a pool creation due to fragmentation.

- `shaderUniformBufferArrayNonUniformIndexingNative` is a boolean value indicating whether uniform buffer descriptors natively support non-uniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that non-uniformly indexes an array of uniform buffers **may** execute multiple times in order to access all the descriptors.
- `shaderSampledImageArrayNonUniformIndexingNative` is a boolean value indicating whether sampler and image descriptors natively support non-uniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that non-uniformly indexes an array of samplers or images **may** execute multiple times in order to access all the descriptors.
- `shaderStorageBufferArrayNonUniformIndexingNative` is a boolean value indicating whether storage buffer descriptors natively support non-uniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that non-uniformly indexes an array of storage buffers **may** execute multiple times in order to access all the descriptors.
- `shaderStorageImageArrayNonUniformIndexingNative` is a boolean value indicating whether storage image descriptors natively support non-uniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that non-uniformly indexes an array of storage images **may** execute multiple times in order to access all the descriptors.
- `shaderInputAttachmentArrayNonUniformIndexingNative` is a boolean value indicating whether input attachment descriptors natively support non-uniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that non-uniformly indexes an array of input attachments **may** execute multiple times in order to access all the descriptors.
- `robustBufferAccessUpdateAfterBind` is a boolean value indicating whether `robustBufferAccess` **can** be enabled on a device simultaneously with `descriptorBindingUniformBufferUpdateAfterBind`, `descriptorBindingStorageBufferUpdateAfterBind`, `descriptorBindingUniformTexelBufferUpdateAfterBind`, and/or `descriptorBindingStorageTexelBufferUpdateAfterBind`. If this is `VK_FALSE`, then either `robustBufferAccess` **must** be disabled or all of these update-after-bind features **must** be disabled.
- `quadDivergentImplicitLod` is a boolean value indicating whether implicit LOD calculations for image operations have well-defined results when the image and/or sampler objects used for the instruction are not uniform within a quad. See [Derivative Image Operations](#).
- `maxPerStageDescriptorUpdateAfterBindSamplers` is similar to `maxPerStageDescriptorSamplers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxPerStageDescriptorUpdateAfterBindUniformBuffers` is similar to `maxPerStageDescriptorUniformBuffers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxPerStageDescriptorUpdateAfterBindStorageBuffers` is similar to `maxPerStageDescriptorStorageBuffers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxPerStageDescriptorUpdateAfterBindSampledImages` is similar to `maxPerStageDescriptorSampledImages` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

- `maxPerStageDescriptorUpdateAfterBindStorageImages` is similar to `maxPerStageDescriptorStorageImages` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxPerStageDescriptorUpdateAfterBindInputAttachments` is similar to `maxPerStageDescriptorInputAttachments` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxPerStageUpdateAfterBindResources` is similar to `maxPerStageResources` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetUpdateAfterBindSamplers` is similar to `maxDescriptorSetSamplers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetUpdateAfterBindUniformBuffers` is similar to `maxDescriptorSetUniformBuffers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetUpdateAfterBindUniformBuffersDynamic` is similar to `maxDescriptorSetUniformBuffersDynamic` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set. While an application **can** allocate dynamic uniform buffer descriptors from a pool created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT`, bindings for these descriptors **must** not be present in any descriptor set layout that includes bindings created with `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`.
- `maxDescriptorSetUpdateAfterBindStorageBuffers` is similar to `maxDescriptorSetStorageBuffers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetUpdateAfterBindStorageBuffersDynamic` is similar to `maxDescriptorSetStorageBuffersDynamic` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set. While an application **can** allocate dynamic storage buffer descriptors from a pool created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT`, bindings for these descriptors **must** not be present in any descriptor set layout that includes bindings created with `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`.
- `maxDescriptorSetUpdateAfterBindSampledImages` is similar to `maxDescriptorSetSampledImages` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetUpdateAfterBindStorageImages` is similar to `maxDescriptorSetStorageImages` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetUpdateAfterBindInputAttachments` is similar to `maxDescriptorSetInputAttachments` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

If the `VkPhysicalDeviceDescriptorIndexingProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with

each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDescriptorIndexingProperties-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DESCRIPTOR_INDEXING_PROPERTIES`

The `VkPhysicalDeviceConservativeRasterizationPropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_conservative_rasterization
typedef struct VkPhysicalDeviceConservativeRasterizationPropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    float               primitiveOverestimationSize;
    float               maxExtraPrimitiveOverestimationSize;
    float               extraPrimitiveOverestimationSizeGranularity;
    VkBool32            primitiveUnderestimation;
    VkBool32            conservativePointAndLineRasterization;
    VkBool32            degenerateTrianglesRasterized;
    VkBool32            degenerateLinesRasterized;
    VkBool32            fullyCoveredFragmentShaderInputVariable;
    VkBool32            conservativeRasterizationPostDepthCoverage;
} VkPhysicalDeviceConservativeRasterizationPropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `primitiveOverestimationSize` is the size in pixels the generating primitive is increased at each of its edges during conservative rasterization overestimation mode. Even with a size of 0.0, conservative rasterization overestimation rules still apply and if any part of the pixel rectangle is covered by the generating primitive, fragments are generated for the entire pixel. However implementations **may** make the pixel coverage area even more conservative by increasing the size of the generating primitive.
- `maxExtraPrimitiveOverestimationSize` is the maximum size in pixels of extra overestimation the implementation supports in the pipeline state. A value of 0.0 means the implementation does not support any additional overestimation of the generating primitive during conservative rasterization. A value above 0.0 allows the application to further increase the size of the generating primitive during conservative rasterization overestimation.
- `extraPrimitiveOverestimationSizeGranularity` is the granularity of extra overestimation that can be specified in the pipeline state between 0.0 and `maxExtraPrimitiveOverestimationSize` inclusive. A value of 0.0 means the implementation can use the smallest representable non-zero value in the screen space pixel fixed-point grid.
- `primitiveUnderestimation` is `VK_TRUE` if the implementation supports the `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` conservative rasterization mode in addition to `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`. Otherwise the implementation only supports `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`.

- `conservativePointAndLineRasterization` is `VK_TRUE` if the implementation supports conservative rasterization of point and line primitives as well as triangle primitives. Otherwise the implementation only supports triangle primitives.
- `degenerateTrianglesRasterized` is `VK_FALSE` if the implementation culls primitives generated from triangles that become zero area after they are quantized to the fixed-point rasterization pixel grid. `degenerateTrianglesRasterized` is `VK_TRUE` if these primitives are not culled and the provoking vertex attributes and depth value are used for the fragments. The primitive area calculation is done on the primitive generated from the clipped triangle if applicable. Zero area primitives are backfacing and the application **can** enable backface culling if desired.
- `degenerateLinesRasterized` is `VK_FALSE` if the implementation culls lines that become zero length after they are quantized to the fixed-point rasterization pixel grid. `degenerateLinesRasterized` is `VK_TRUE` if zero length lines are not culled and the provoking vertex attributes and depth value are used for the fragments.
- `fullyCoveredFragmentShaderInputVariable` is `VK_TRUE` if the implementation supports the SPIR-V builtin fragment shader input variable `FullyCoveredEXT` specifying that conservative rasterization is enabled and the fragment area is fully covered by the generating primitive.
- `conservativeRasterizationPostDepthCoverage` is `VK_TRUE` if the implementation supports conservative rasterization with the `PostDepthCoverage` execution mode enabled. Otherwise the `PostDepthCoverage` execution mode **must** not be used when conservative rasterization is enabled.

If the `VkPhysicalDeviceConservativeRasterizationPropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceConservativeRasterizationPropertiesEXT-sType-sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CONSERVATIVE_RASTERIZATION_PROPERTIES_EXT`

The `VkPhysicalDeviceDepthStencilResolveProperties` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceDepthStencilResolveProperties {
    VkStructureType    sType;
    void*              pNext;
    VkResolveModeFlags supportedDepthResolveModes;
    VkResolveModeFlags supportedStencilResolveModes;
    VkBool32           independentResolveNone;
    VkBool32           independentResolve;
} VkPhysicalDeviceDepthStencilResolveProperties;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `supportedDepthResolveModes` is a bitmask of `VkResolveModeFlagBits` indicating the set of supported depth resolve modes. A value of `VK_RESOLVE_MODE_NONE` indicates that depth resolve operations are disallowed [SCID-8]. If any bits are set then `VK_RESOLVE_MODE_SAMPLE_ZERO_BIT` **must** be included in the set but implementations **may** support additional modes.
- `supportedStencilResolveModes` is a bitmask of `VkResolveModeFlagBits` indicating the set of supported stencil resolve modes. A value of `VK_RESOLVE_MODE_NONE` indicates that stencil resolve operations are disallowed [SCID-8]. If any bits are set then `VK_RESOLVE_MODE_SAMPLE_ZERO_BIT` **must** be included in the set but implementations **may** support additional modes. `VK_RESOLVE_MODE_AVERAGE_BIT` **must** not be included in the set.
- `independentResolveNone` is `VK_TRUE` if the implementation supports setting the depth and stencil resolve modes to different values when one of those modes is `VK_RESOLVE_MODE_NONE`. Otherwise the implementation only supports setting both modes to the same value.
- `independentResolve` is `VK_TRUE` if the implementation supports all combinations of the supported depth and stencil resolve modes, including setting either depth or stencil resolve mode to `VK_RESOLVE_MODE_NONE`. An implementation that supports `independentResolve` **must** also support `independentResolveNone`.

If the `VkPhysicalDeviceDepthStencilResolveProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceDepthStencilResolveProperties-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEPTH_STENCIL_RESOLVE_PROPERTIES`

The `VkPhysicalDevicePerformanceQueryPropertiesKHR` structure is defined as:

```
// Provided by VK_KHR_performance_query
typedef struct VkPhysicalDevicePerformanceQueryPropertiesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           allowCommandBufferQueryCopies;
} VkPhysicalDevicePerformanceQueryPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `allowCommandBufferQueryCopies` is `VK_TRUE` if the performance query pools are allowed to be used with `vkCmdCopyQueryPoolResults`.

If the `VkPhysicalDevicePerformanceQueryPropertiesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDevicePerformanceQueryPropertiesKHR-sType-sType
sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PERFORMANCE_QUERY_PROPERTIES_KHR

The `VkPhysicalDeviceTexelBufferAlignmentProperties` structure is defined as:

```
typedef struct VkPhysicalDeviceTexelBufferAlignmentProperties {  
    VkStructureType    sType;  
    void*              pNext;  
    VkDeviceSize       storageTexelBufferOffsetAlignmentBytes;  
    VkBool32           storageTexelBufferOffsetSingleTexelAlignment;  
    VkDeviceSize       uniformTexelBufferOffsetAlignmentBytes;  
    VkBool32           uniformTexelBufferOffsetSingleTexelAlignment;  
} VkPhysicalDeviceTexelBufferAlignmentProperties;
```

```
// Provided by VK_EXT_texel_buffer_alignment  
typedef VkPhysicalDeviceTexelBufferAlignmentProperties  
VkPhysicalDeviceTexelBufferAlignmentPropertiesEXT;
```

- sType is a `VkStructureType` value identifying this structure.
- pNext is `NULL` or a pointer to a structure extending this structure.
- storageTexelBufferOffsetAlignmentBytes is a byte alignment that is sufficient for a storage texel buffer of any format. The value **must** be a power of two.
- storageTexelBufferOffsetSingleTexelAlignment indicates whether single texel alignment is sufficient for a storage texel buffer of any format.
- uniformTexelBufferOffsetAlignmentBytes is a byte alignment that is sufficient for a uniform texel buffer of any format. The value **must** be a power of two.
- uniformTexelBufferOffsetSingleTexelAlignment indicates whether single texel alignment is sufficient for a uniform texel buffer of any format.

If the `VkPhysicalDeviceTexelBufferAlignmentProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

If the single texel alignment property is `VK_FALSE`, then the buffer view's offset **must** be aligned to the corresponding byte alignment value. If the single texel alignment property is `VK_TRUE`, then the buffer view's offset **must** be aligned to the lesser of the corresponding byte alignment value or the size of a single texel, based on `VkBufferViewCreateInfo::format`. If the size of a single texel is a multiple of three bytes, then the size of a single component of the format is used instead.

These limits **must** not advertise a larger alignment than the `required` maximum minimum value of `VkPhysicalDeviceLimits::minTexelBufferOffsetAlignment`, for any format that supports use as a texel buffer.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceTexelBufferAlignmentProperties-sType-sType
sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TEXEL_BUFFER_ALIGNMENT_PROPERTIES

The `VkPhysicalDeviceTimelineSemaphoreProperties` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceTimelineSemaphoreProperties {
    VkStructureType    sType;
    void*              pNext;
    uint64_t           maxTimelineSemaphoreValueDifference;
} VkPhysicalDeviceTimelineSemaphoreProperties;
```

- sType is a `VkStructureType` value identifying this structure.
- pNext is `NULL` or a pointer to a structure extending this structure.
- maxTimelineSemaphoreValueDifference indicates the maximum difference allowed by the implementation between the current value of a timeline semaphore and any pending signal or wait operations.

If the `VkPhysicalDeviceTimelineSemaphoreProperties` structure is included in the pNext chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceTimelineSemaphoreProperties-sType-sType
sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TIMELINE_SEMAPHORE_PROPERTIES

The `VkPhysicalDeviceLineRasterizationProperties` structure is defined as:

```
typedef struct VkPhysicalDeviceLineRasterizationProperties {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           lineSubPixelPrecisionBits;
} VkPhysicalDeviceLineRasterizationProperties;
```

```
// Provided by VK_KHR_line_rasterization
typedef VkPhysicalDeviceLineRasterizationProperties
VkPhysicalDeviceLineRasterizationPropertiesKHR;
```

```
// Provided by VK_EXT_line_rasterization
typedef VkPhysicalDeviceLineRasterizationProperties
VkPhysicalDeviceLineRasterizationPropertiesEXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **lineSubPixelPrecisionBits** is the number of bits of subpixel precision in framebuffer coordinates x_f and y_f when rasterizing [line segments](#).

If the [VkPhysicalDeviceLineRasterizationProperties](#) structure is included in the **pNext** chain of the [VkPhysicalDeviceProperties2](#) structure passed to [vkGetPhysicalDeviceProperties2](#), it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceLineRasterizationProperties-sType-sType **sType must** be [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINE_RASTERIZATION_PROPERTIES](#)

The [VkPhysicalDeviceRobustness2PropertiesKHR](#) structure is defined as:

```
typedef struct VkPhysicalDeviceRobustness2PropertiesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkDeviceSize        robustStorageBufferAccessSizeAlignment;
    VkDeviceSize        robustUniformBufferAccessSizeAlignment;
} VkPhysicalDeviceRobustness2PropertiesKHR;
```

```
// Provided by VK_EXT_robustness2
typedef VkPhysicalDeviceRobustness2PropertiesKHR
VkPhysicalDeviceRobustness2PropertiesEXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **robustStorageBufferAccessSizeAlignment** is the number of bytes that the range of a storage buffer descriptor is rounded up to when used for bounds-checking when the [robustBufferAccess2](#) feature is enabled. This value **must** be either 1 or 4.
- **robustUniformBufferAccessSizeAlignment** is the number of bytes that the range of a uniform buffer descriptor is rounded up to when used for bounds-checking when the [robustBufferAccess2](#) feature is enabled. This value **must** be a power of two in the range [1, 256].

If the [VkPhysicalDeviceRobustness2PropertiesKHR](#) structure is included in the **pNext** chain of the [VkPhysicalDeviceProperties2](#) structure passed to [vkGetPhysicalDeviceProperties2](#), it is filled in with

each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceRobustness2PropertiesKHR-sType-sType **sType must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ROBUSTNESS_2_PROPERTIES_KHR`

The `VkPhysicalDeviceFragmentShadingRatePropertiesKHR` structure is defined as:

```
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPhysicalDeviceFragmentShadingRatePropertiesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkExtent2D         minFragmentShadingRateAttachmentTexelSize;
    VkExtent2D         maxFragmentShadingRateAttachmentTexelSize;
    uint32_t           maxFragmentShadingRateAttachmentTexelSizeAspectRatio;
    VkBool32           primitiveFragmentShadingRateWithMultipleViewports;
    VkBool32           layeredShadingRateAttachments;
    VkBool32           fragmentShadingRateNonTrivialCombinerOps;
    VkExtent2D         maxFragmentSize;
    uint32_t           maxFragmentSizeAspectRatio;
    uint32_t           maxFragmentShadingRateCoverageSamples;
    VkSampleCountFlagBits maxFragmentShadingRateRasterizationSamples;
    VkBool32           fragmentShadingRateWithShaderDepthStencilWrites;
    VkBool32           fragmentShadingRateWithSampleMask;
    VkBool32           fragmentShadingRateWithShaderSampleMask;
    VkBool32           fragmentShadingRateWithConservativeRasterization;
    VkBool32           fragmentShadingRateWithFragmentShaderInterlock;
    VkBool32           fragmentShadingRateWithCustomSampleLocations;
    VkBool32           fragmentShadingRateStrictMultiplyCombiner;
} VkPhysicalDeviceFragmentShadingRatePropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `minFragmentShadingRateAttachmentTexelSize` indicates minimum supported width and height of the portion of the framebuffer corresponding to each texel in a fragment shading rate attachment. Each value **must** be less than or equal to the values in `maxFragmentShadingRateAttachmentTexelSize`. Each value **must** be a power-of-two. It **must** be (0,0) if the `attachmentFragmentShadingRate` feature is not supported.
- `maxFragmentShadingRateAttachmentTexelSize` indicates maximum supported width and height of the portion of the framebuffer corresponding to each texel in a fragment shading rate attachment. Each value **must** be greater than or equal to the values in `minFragmentShadingRateAttachmentTexelSize`. Each value **must** be a power-of-two. It **must** be (0,0) if the `attachmentFragmentShadingRate` feature is not supported.
- `maxFragmentShadingRateAttachmentTexelSizeAspectRatio` indicates the maximum ratio between the width and height of the portion of the framebuffer corresponding to each texel in a

fragment shading rate attachment. `maxFragmentShadingRateAttachmentTexelSizeAspectRatio` **must** be a power-of-two value, and **must** be less than or equal to $\max(\text{maxFragmentShadingRateAttachmentTexelSize.width} / \text{minFragmentShadingRateAttachmentTexelSize.height}, \text{maxFragmentShadingRateAttachmentTexelSize.height} / \text{minFragmentShadingRateAttachmentTexelSize.width})$. It **must** be 0 if the `attachmentFragmentShadingRate` feature is not supported.

- `primitiveFragmentShadingRateWithMultipleViewports` specifies whether the `primitive fragment shading rate` **can** be used when multiple viewports are used. If this value is `VK_FALSE`, only a single viewport **must** be used, and applications **must** not write to the `ViewportIndex` built-in when setting `PrimitiveShadingRateKHR`. It **must** be `VK_FALSE` if the `shaderOutputViewportIndex` feature, or the `geometryShader` feature is not supported, or if the `primitiveFragmentShadingRate` feature is not supported.
- `layeredShadingRateAttachments` specifies whether a shading rate attachment image view **can** be created with multiple layers. If this value is `VK_FALSE`, when creating an image view with a `usage` that includes `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`, `layerCount` **must** be 1. It **must** be `VK_FALSE` if the `multiview` feature, the `shaderOutputViewportIndex` feature, or the `geometryShader` feature is not supported, or if the `attachmentFragmentShadingRate` feature is not supported.
- `fragmentShadingRateNonTrivialCombinerOps` specifies whether `VkFragmentShadingRateCombinerOpKHR` `enums` other than `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` or `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR` **can** be used. It **must** be `VK_FALSE` unless either the `primitiveFragmentShadingRate` or `attachmentFragmentShadingRate` feature is supported.
- `maxFragmentSize` indicates the maximum supported width and height of a fragment. Its `width` and `height` members **must** both be power-of-two values. This limit is purely informational, and is not validated.
- `maxFragmentSizeAspectRatio` indicates the maximum ratio between the width and height of a fragment. `maxFragmentSizeAspectRatio` **must** be a power-of-two value, and **must** be less than or equal to the maximum of the `width` and `height` members of `maxFragmentSize`. This limit is purely informational, and is not validated.
- `maxFragmentShadingRateCoverageSamples` specifies the maximum number of coverage samples supported in a single fragment. `maxFragmentShadingRateCoverageSamples` **must** be less than or equal to the product of the `width` and `height` members of `maxFragmentSize`, and the sample count reported by `maxFragmentShadingRateRasterizationSamples`. `maxFragmentShadingRateCoverageSamples` **must** be less than or equal to `maxSampleMaskWords` × 32 if `fragmentShadingRateWithShaderSampleMask` is supported. This limit is purely informational, and is not validated.
- `maxFragmentShadingRateRasterizationSamples` is a `VkSampleCountFlagBits` value specifying the maximum sample rate supported when a fragment covers multiple pixels. This limit is purely informational, and is not validated.
- `fragmentShadingRateWithShaderDepthStencilWrites` specifies whether the implementation supports writing `FragDepth` or `FragStencilRefEXT` from a fragment shader for multi-pixel fragments. If this value is `VK_FALSE`, writing to those built-ins will clamp the fragment shading rate to (1,1).

- `fragmentShadingRateWithSampleMask` specifies whether the implementation supports setting valid bits of `VkPipelineMultisampleStateCreateInfo::pSampleMask` to 0 for multi-pixel fragments. If this value is `VK_FALSE`, zeroing valid bits in the sample mask will clamp the fragment shading rate to (1,1).
- `fragmentShadingRateWithShaderSampleMask` specifies whether the implementation supports reading or writing `SampleMask` for multi-pixel fragments. If this value is `VK_FALSE`, using that built-in will clamp the fragment shading rate to (1,1).
- `fragmentShadingRateWithConservativeRasterization` specifies whether `conservative rasterization` is supported for multi-pixel fragments. It **must** be `VK_FALSE` if `VK_EXT_conservative_rasterization` is not supported. If this value is `VK_FALSE`, using `conservative rasterization` will clamp the fragment shading rate to (1,1).
- `fragmentShadingRateWithFragmentShaderInterlock` specifies whether `fragment shader interlock` is supported for multi-pixel fragments. It **must** be `VK_FALSE` if `VK_EXT_fragment_shader_interlock` is not supported. If this value is `VK_FALSE`, using `fragment shader interlock` will clamp the fragment shading rate to (1,1).
- `fragmentShadingRateWithCustomSampleLocations` specifies whether `custom sample locations` are supported for multi-pixel fragments. It **must** be `VK_FALSE` if `VK_EXT_sample_locations` is not supported. If this value is `VK_FALSE`, using `custom sample locations` will clamp the fragment shading rate to (1,1).
- `fragmentShadingRateStrictMultiplyCombiner` specifies whether `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR` accurately performs a multiplication or not. Implementations where this value is `VK_FALSE` will instead combine rates with an addition. If `fragmentShadingRateNonTrivialCombinerOps` is `VK_FALSE`, implementations **must** report this as `VK_FALSE`. If `fragmentShadingRateNonTrivialCombinerOps` is `VK_TRUE`, implementations **should** report this as `VK_TRUE`.

NOTE

Multiplication of the combiner rates using the fragment width/height in linear space is equivalent to an addition of those values in log2 space. Some implementations inadvertently implemented an addition in linear space due to unclear requirements originating outside of this specification. This resulted in `fragmentShadingRateStrictMultiplyCombiner` being added. Fortunately, this only affects situations where a rate of 1 in either dimension is combined with another rate of 1. All other combinations result in the exact same result as if multiplication was performed in linear space due to the clamping logic, and the fact that both the sum and product of 2 and 2 are equal. In many cases, this limit will not affect the correct operation of applications.

If the `VkPhysicalDeviceFragmentShadingRatePropertiesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These properties are related to `fragment shading rates`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentShadingRatePropertiesKHR-sType-sType

sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE_PROPERTIES_KHR`

The `VkPhysicalDeviceCustomBorderColorPropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_custom_border_color
typedef struct VkPhysicalDeviceCustomBorderColorPropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           maxCustomBorderColorSamplers;
} VkPhysicalDeviceCustomBorderColorPropertiesEXT;
```

- `maxCustomBorderColorSamplers` indicates the maximum number of samplers with custom border colors which **can** simultaneously exist on a device.

If the `VkPhysicalDeviceCustomBorderColorPropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceCustomBorderColorPropertiesEXT-sType-sType
sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CUSTOM_BORDER_COLOR_PROPERTIES_EXT`

34.1. Limit Requirements

The following table specifies the **required** minimum/maximum for all Vulkan graphics implementations. Where a limit corresponds to a fine-grained device feature which is **optional**, the feature name is listed with two **required** limits, one when the feature is supported and one when it is not supported. If an implementation supports a feature, the limits reported are the same whether or not the feature is enabled.

Table 48. Required Limit Types

Type	Limit	Feature
<code>uint32_t</code>	<code>maxImageDimension1D</code>	-
<code>uint32_t</code>	<code>maxImageDimension2D</code>	-
<code>uint32_t</code>	<code>maxImageDimension3D</code>	-
<code>uint32_t</code>	<code>maxImageDimensionCube</code>	-

<code>maxCallbackFaultCount</code>	-	1	min
<code>maxCommandPoolCommandBuffers</code>	-	256	min
<code>maxCommandBufferSize</code>	-	2^{20}	min

1

The **Limit Type** column specifies the limit is either the minimum limit all implementations **must** support, the maximum limit all implementations **must** support, or the exact value all implementations **must** support. For bitmasks a minimum limit is the least bits all implementations **must** set, but they **may** have additional bits set beyond this minimum.

2

The `maxPerStageResources` **must** be at least the smallest of the following:

- the sum of the `maxPerStageDescriptorUniformBuffers`, `maxPerStageDescriptorStorageBuffers`, `maxPerStageDescriptorSampledImages`, `maxPerStageDescriptorStorageImages`, `maxPerStageDescriptorInputAttachments`, `maxColorAttachments` limits, or
- 128.

It **may** not be possible to reach this limit in every stage.

3

See `maxViewportDimensions` for the **required** relationship to other limits.

4

See `viewportBoundsRange` for the **required** relationship to other limits.

5

The values `minInterpolationOffset` and `maxInterpolationOffset` describe the closed interval of supported interpolation offsets: `[minInterpolationOffset, maxInterpolationOffset]`. The ULP is determined by `subPixelInterpolationOffsetBits`. If `subPixelInterpolationOffsetBits` is 4, this provides increments of $(1/2^4) = 0.0625$, and thus the range of supported interpolation offsets would be `[-0.5, 0.4375]`.

6

The point size ULP is determined by `pointSizeGranularity`. If the `pointSizeGranularity` is 0.125, the range of supported point sizes **must** be at least `[1.0, 63.875]`.

7

The line width ULP is determined by `lineWidthGranularity`. If the `lineWidthGranularity` is 0.0625, the range of supported line widths **must** be at least `[1.0, 7.9375]`.

8

The minimum `maxDescriptorSet*` limit is n times the corresponding *specification* minimum `maxPerStageDescriptor*` limit, where n is the number of shader stages supported by the `VkPhysicalDevice`. If all shader stages are supported, $n = 6$ (vertex, tessellation control, tessellation evaluation, geometry, fragment, compute).

9

The `UpdateAfterBind` descriptor limits **must** each be greater than or equal to the corresponding `non-UpdateAfterBind` limit.

11

`maxFramebufferAttachments` **must** be greater than or equal to two times `maxColorAttachments` (for color and resolve attachments) plus one (for the depth/stencil attachment), or else **must** be equal to $2^{32}-1$.

34.2. Additional Multisampling Capabilities

To query additional multisampling capabilities which **may** be supported for a specific sample count, beyond the minimum capabilities described for [Limits](#) above, call:

```
// Provided by VK_EXT_sample_locations
void vkGetPhysicalDeviceMultisamplePropertiesEXT(
    VkPhysicalDevice          physicalDevice,
    VkSampleCountFlagBits    samples,
    VkMultisamplePropertiesEXT* pMultisampleProperties);
```

- `physicalDevice` is the physical device from which to query the additional multisampling capabilities.
- `samples` is a `VkSampleCountFlagBits` value specifying the sample count to query capabilities for.
- `pMultisampleProperties` is a pointer to a `VkMultisamplePropertiesEXT` structure in which information about additional multisampling capabilities specific to the sample count is returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceMultisamplePropertiesEXT-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceMultisamplePropertiesEXT-samples-parameter `samples` **must** be a valid `VkSampleCountFlagBits` value
- VUID-vkGetPhysicalDeviceMultisamplePropertiesEXT-pMultisampleProperties-parameter `pMultisampleProperties` **must** be a valid pointer to a `VkMultisamplePropertiesEXT` structure

The `VkMultisamplePropertiesEXT` structure is defined as

```
// Provided by VK_EXT_sample_locations
typedef struct VkMultisamplePropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkExtent2D         maxSampleLocationGridSize;
} VkMultisamplePropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxSampleLocationGridSize` is the maximum size of the pixel grid in which sample locations **can** vary.

Valid Usage (Implicit)

- VUID-VkMultisamplePropertiesEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_MULTISAMPLE_PROPERTIES_EXT`
- VUID-VkMultisamplePropertiesEXT-pNext-pNext
`pNext` **must** be `NULL`

If the sample count for which additional multisampling capabilities are requested using `vkGetPhysicalDeviceMultisamplePropertiesEXT` is set in `sampleLocationSampleCounts` the `width` and `height` members of `VkMultisamplePropertiesEXT::maxSampleLocationGridSize` **must** be greater than or equal to the corresponding members of `maxSampleLocationGridSize`, respectively, otherwise both members **must** be `0`.

Chapter 35. Formats

Supported buffer and image formats **may** vary across implementations. A minimum set of format features are guaranteed, but others **must** be explicitly queried before use to ensure they are supported by the implementation.

The features for the set of formats ([VkFormat](#)) supported by the implementation are queried individually using the [vkGetPhysicalDeviceFormatProperties](#) command.

35.1. Format Definition

The following image formats **can** be passed to, and **may** be returned from Vulkan commands. The memory required to store each format is discussed with that format, and also summarized in the [Representation and Texel Block Size](#) section and the [Compatible formats](#) table.

```
// Provided by VK_VERSION_1_0
typedef enum VkFormat {
    VK_FORMAT_UNDEFINED = 0,
    VK_FORMAT_R4G4_UNORM_PACK8 = 1,
    VK_FORMAT_R4G4B4A4_UNORM_PACK16 = 2,
    VK_FORMAT_B4G4R4A4_UNORM_PACK16 = 3,
    VK_FORMAT_R5G6B5_UNORM_PACK16 = 4,

- **VK_FORMAT_UNDEFINED** specifies that the format is not specified.
- **VK_FORMAT_R4G4_UNORM_PACK8** specifies a two-component, 8-bit packed unsigned normalized format that has a 4-bit R component in bits 4..7, and a 4-bit G component in bits 0..3.
- **VK_FORMAT_R4G4B4A4_UNORM_PACK16** specifies a four-component, 16-bit packed unsigned normalized format that has a 4-bit R component in bits 12..15, a 4-bit G component in bits 8..11, a 4-bit B component in bits 4..7, and a 4-bit A component in bits 0..3.
- **VK_FORMAT_B4G4R4A4_UNORM_PACK16** specifies a four-component, 16-bit packed unsigned normalized format that has a 4-bit B component in bits 12..15, a 4-bit G component in bits 8..11, a 4-bit R component in bits 4..7, and a 4-bit A component in bits 0..3.
- **VK_FORMAT_A4R4G4B4_UNORM_PACK16** specifies a four-component, 16-bit packed unsigned normalized format that has a 4-bit A component in bits 12..15, a 4-bit R component in bits 8..11, a 4-bit G component in bits 4..7, and a 4-bit B component in bits 0..3.
- **VK_FORMAT_A4B4G4R4_UNORM_PACK16** specifies a four-component, 16-bit packed unsigned normalized format that has a 4-bit A component in bits 12..15, a 4-bit B component in bits 8..11, a 4-bit G component in bits 4..7, and a 4-bit R component in bits 0..3.
- **VK_FORMAT_R5G6B5_UNORM_PACK16** specifies a three-component, 16-bit packed unsigned normalized format that has a 5-bit R component in bits 11..15, a 6-bit G component in bits 5..10, and a 5-bit B

component in bits 0..4.

- **VK_FORMAT_B5G6R5_UNORM_PACK16** specifies a three-component, 16-bit packed unsigned normalized format that has a 5-bit B component in bits 11..15, a 6-bit G component in bits 5..10, and a 5-bit R component in bits 0..4.
- **VK_FORMAT_R5G5B5A1_UNORM_PACK16** specifies a four-component, 16-bit packed unsigned normalized format that has a 5-bit R component in bits 11..15, a 5-bit G component in bits 6..10, a 5-bit B component in bits 1..5, and a 1-bit A component in bit 0.
- **VK_FORMAT_B5G5R5A1_UNORM_PACK16** specifies a four-component, 16-bit packed unsigned normalized format that has a 5-bit B component in bits 11..15, a 5-bit G component in bits 6..10, a 5-bit R component in bits 1..5, and a 1-bit A component in bit 0.
- **VK_FORMAT_A1R5G5B5_UNORM_PACK16** specifies a four-component, 16-bit packed unsigned normalized format that has a 1-bit A component in bit 15, a 5-bit R component in bits 10..14, a 5-bit G component in bits 5..9, and a 5-bit B component in bits 0..4.
- **VK_FORMAT_R8_UNORM** specifies a one-component, 8-bit unsigned normalized format that has a single 8-bit R component.
- **VK_FORMAT_R8_SNORM** specifies a one-component, 8-bit signed normalized format that has a single 8-bit R component.
- **VK_FORMAT_R8_USCALED** specifies a one-component, 8-bit unsigned scaled integer format that has a single 8-bit R component.
- **VK_FORMAT_R8_SSCALED** specifies a one-component, 8-bit signed scaled integer format that has a single 8-bit R component.
- **VK_FORMAT_R8_UINT** specifies a one-component, 8-bit unsigned integer format that has a single 8-bit R component.
- **VK_FORMAT_R8_SINT** specifies a one-component, 8-bit signed integer format that has a single 8-bit R component.
- **VK_FORMAT_R8_SRGB** specifies a one-component, 8-bit unsigned normalized format that has a single 8-bit R component stored with sRGB nonlinear encoding.
- **VK_FORMAT_R8G8_UNORM** specifies a two-component, 16-bit unsigned normalized format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.
- **VK_FORMAT_R8G8_SNORM** specifies a two-component, 16-bit signed normalized format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.
- **VK_FORMAT_R8G8_USCALED** specifies a two-component, 16-bit unsigned scaled integer format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.
- **VK_FORMAT_R8G8_SSCALED** specifies a two-component, 16-bit signed scaled integer format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.
- **VK_FORMAT_R8G8_UINT** specifies a two-component, 16-bit unsigned integer format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.
- **VK_FORMAT_R8G8_SINT** specifies a two-component, 16-bit signed integer format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.
- **VK_FORMAT_R8G8_SRGB** specifies a two-component, 16-bit unsigned normalized format that has an 8-bit R component stored with sRGB nonlinear encoding in byte 0, and an 8-bit G component

stored with sRGB nonlinear encoding in byte 1.

- **VK_FORMAT_R8G8B8_UNORM** specifies a three-component, 24-bit unsigned normalized format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.
- **VK_FORMAT_R8G8B8_SNORM** specifies a three-component, 24-bit signed normalized format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.
- **VK_FORMAT_R8G8B8_USCALED** specifies a three-component, 24-bit unsigned scaled format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.
- **VK_FORMAT_R8G8B8_SSCALED** specifies a three-component, 24-bit signed scaled format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.
- **VK_FORMAT_R8G8B8_UINT** specifies a three-component, 24-bit unsigned integer format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.
- **VK_FORMAT_R8G8B8_SINT** specifies a three-component, 24-bit signed integer format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.
- **VK_FORMAT_R8G8B8_SRGB** specifies a three-component, 24-bit unsigned normalized format that has an 8-bit R component stored with sRGB nonlinear encoding in byte 0, an 8-bit G component stored with sRGB nonlinear encoding in byte 1, and an 8-bit B component stored with sRGB nonlinear encoding in byte 2.
- **VK_FORMAT_B8G8R8_UNORM** specifies a three-component, 24-bit unsigned normalized format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.
- **VK_FORMAT_B8G8R8_SNORM** specifies a three-component, 24-bit signed normalized format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.
- **VK_FORMAT_B8G8R8_USCALED** specifies a three-component, 24-bit unsigned scaled format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.
- **VK_FORMAT_B8G8R8_SSCALED** specifies a three-component, 24-bit signed scaled format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.
- **VK_FORMAT_B8G8R8_UINT** specifies a three-component, 24-bit unsigned integer format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.
- **VK_FORMAT_B8G8R8_SINT** specifies a three-component, 24-bit signed integer format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.
- **VK_FORMAT_B8G8R8_SRGB** specifies a three-component, 24-bit unsigned normalized format that has an 8-bit B component stored with sRGB nonlinear encoding in byte 0, an 8-bit G component stored with sRGB nonlinear encoding in byte 1, and an 8-bit R component stored with sRGB nonlinear encoding in byte 2.
- **VK_FORMAT_R8G8B8A8_UNORM** specifies a four-component, 32-bit unsigned normalized format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.
- **VK_FORMAT_R8G8B8A8_SNORM** specifies a four-component, 32-bit signed normalized format that has

an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.

- **VK_FORMAT_R8G8B8A8_USCALED** specifies a four-component, 32-bit unsigned scaled format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.
- **VK_FORMAT_R8G8B8A8_SSCALED** specifies a four-component, 32-bit signed scaled format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.
- **VK_FORMAT_R8G8B8A8_UINT** specifies a four-component, 32-bit unsigned integer format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.
- **VK_FORMAT_R8G8B8A8_SINT** specifies a four-component, 32-bit signed integer format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.
- **VK_FORMAT_R8G8B8A8_SRGB** specifies a four-component, 32-bit unsigned normalized format that has an 8-bit R component stored with sRGB nonlinear encoding in byte 0, an 8-bit G component stored with sRGB nonlinear encoding in byte 1, an 8-bit B component stored with sRGB nonlinear encoding in byte 2, and an 8-bit A component in byte 3.
- **VK_FORMAT_B8G8R8A8_UNORM** specifies a four-component, 32-bit unsigned normalized format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.
- **VK_FORMAT_B8G8R8A8_SNORM** specifies a four-component, 32-bit signed normalized format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.
- **VK_FORMAT_B8G8R8A8_USCALED** specifies a four-component, 32-bit unsigned scaled format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.
- **VK_FORMAT_B8G8R8A8_SSCALED** specifies a four-component, 32-bit signed scaled format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.
- **VK_FORMAT_B8G8R8A8_UINT** specifies a four-component, 32-bit unsigned integer format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.
- **VK_FORMAT_B8G8R8A8_SINT** specifies a four-component, 32-bit signed integer format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.
- **VK_FORMAT_B8G8R8A8_SRGB** specifies a four-component, 32-bit unsigned normalized format that has an 8-bit B component stored with sRGB nonlinear encoding in byte 0, an 8-bit G component stored with sRGB nonlinear encoding in byte 1, an 8-bit R component stored with sRGB nonlinear encoding in byte 2, and an 8-bit A component in byte 3.
- **VK_FORMAT_A8B8G8R8_UNORM_PACK32** specifies a four-component, 32-bit packed unsigned normalized format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.

- **VK_FORMAT_A8B8G8R8_SNORM_PACK32** specifies a four-component, 32-bit packed signed normalized format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.
- **VK_FORMAT_A8B8G8R8_USCALED_PACK32** specifies a four-component, 32-bit packed unsigned scaled integer format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.
- **VK_FORMAT_A8B8G8R8_SSCALED_PACK32** specifies a four-component, 32-bit packed signed scaled integer format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.
- **VK_FORMAT_A8B8G8R8_UINT_PACK32** specifies a four-component, 32-bit packed unsigned integer format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.
- **VK_FORMAT_A8B8G8R8_SINT_PACK32** specifies a four-component, 32-bit packed signed integer format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.
- **VK_FORMAT_A8B8G8R8_SRGB_PACK32** specifies a four-component, 32-bit packed unsigned normalized format that has an 8-bit A component in bits 24..31, an 8-bit B component stored with sRGB nonlinear encoding in bits 16..23, an 8-bit G component stored with sRGB nonlinear encoding in bits 8..15, and an 8-bit R component stored with sRGB nonlinear encoding in bits 0..7.
- **VK_FORMAT_A2R10G10B10_UNORM_PACK32** specifies a four-component, 32-bit packed unsigned normalized format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.
- **VK_FORMAT_A2R10G10B10_SNORM_PACK32** specifies a four-component, 32-bit packed signed normalized format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.
- **VK_FORMAT_A2R10G10B10_USCALED_PACK32** specifies a four-component, 32-bit packed unsigned scaled integer format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.
- **VK_FORMAT_A2R10G10B10_SSCALED_PACK32** specifies a four-component, 32-bit packed signed scaled integer format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.
- **VK_FORMAT_A2R10G10B10_UINT_PACK32** specifies a four-component, 32-bit packed unsigned integer format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.
- **VK_FORMAT_A2R10G10B10_SINT_PACK32** specifies a four-component, 32-bit packed signed integer format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.
- **VK_FORMAT_A2B10G10R10_UNORM_PACK32** specifies a four-component, 32-bit packed unsigned normalized format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.
- **VK_FORMAT_A2B10G10R10_SNORM_PACK32** specifies a four-component, 32-bit packed signed normalized format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.

- **VK_FORMAT_A2B10G10R10_USCALED_PACK32** specifies a four-component, 32-bit packed unsigned scaled integer format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.
- **VK_FORMAT_A2B10G10R10_SSCALED_PACK32** specifies a four-component, 32-bit packed signed scaled integer format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.
- **VK_FORMAT_A2B10G10R10_UINT_PACK32** specifies a four-component, 32-bit packed unsigned integer format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.
- **VK_FORMAT_A2B10G10R10_SINT_PACK32** specifies a four-component, 32-bit packed signed integer format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.
- **VK_FORMAT_R16_UNORM** specifies a one-component, 16-bit unsigned normalized format that has a single 16-bit R component.
- **VK_FORMAT_R16_SNORM** specifies a one-component, 16-bit signed normalized format that has a single 16-bit R component.
- **VK_FORMAT_R16_USCALED** specifies a one-component, 16-bit unsigned scaled integer format that has a single 16-bit R component.
- **VK_FORMAT_R16_SSCALED** specifies a one-component, 16-bit signed scaled integer format that has a single 16-bit R component.
- **VK_FORMAT_R16_UINT** specifies a one-component, 16-bit unsigned integer format that has a single 16-bit R component.
- **VK_FORMAT_R16_SINT** specifies a one-component, 16-bit signed integer format that has a single 16-bit R component.
- **VK_FORMAT_R16_SFLOAT** specifies a one-component, 16-bit signed floating-point format that has a single 16-bit R component.
- **VK_FORMAT_R16G16_UNORM** specifies a two-component, 32-bit unsigned normalized format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- **VK_FORMAT_R16G16_SNORM** specifies a two-component, 32-bit signed normalized format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- **VK_FORMAT_R16G16_USCALED** specifies a two-component, 32-bit unsigned scaled integer format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- **VK_FORMAT_R16G16_SSCALED** specifies a two-component, 32-bit signed scaled integer format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- **VK_FORMAT_R16G16_UINT** specifies a two-component, 32-bit unsigned integer format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- **VK_FORMAT_R16G16_SINT** specifies a two-component, 32-bit signed integer format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- **VK_FORMAT_R16G16_SFLOAT** specifies a two-component, 32-bit signed floating-point format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- **VK_FORMAT_R16G16B16_UNORM** specifies a three-component, 48-bit unsigned normalized format that

has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.

- **VK_FORMAT_R16G16B16_SNORM** specifies a three-component, 48-bit signed normalized format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- **VK_FORMAT_R16G16B16_USCALED** specifies a three-component, 48-bit unsigned scaled integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- **VK_FORMAT_R16G16B16_SSCALED** specifies a three-component, 48-bit signed scaled integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- **VK_FORMAT_R16G16B16_UINT** specifies a three-component, 48-bit unsigned integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- **VK_FORMAT_R16G16B16_SINT** specifies a three-component, 48-bit signed integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- **VK_FORMAT_R16G16B16_SFLOAT** specifies a three-component, 48-bit signed floating-point format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- **VK_FORMAT_R16G16B16A16_UNORM** specifies a four-component, 64-bit unsigned normalized format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.
- **VK_FORMAT_R16G16B16A16_SNORM** specifies a four-component, 64-bit signed normalized format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.
- **VK_FORMAT_R16G16B16A16_USCALED** specifies a four-component, 64-bit unsigned scaled integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.
- **VK_FORMAT_R16G16B16A16_SSCALED** specifies a four-component, 64-bit signed scaled integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.
- **VK_FORMAT_R16G16B16A16_UINT** specifies a four-component, 64-bit unsigned integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.
- **VK_FORMAT_R16G16B16A16_SINT** specifies a four-component, 64-bit signed integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.
- **VK_FORMAT_R16G16B16A16_SFLOAT** specifies a four-component, 64-bit signed floating-point format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.
- **VK_FORMAT_R32_UINT** specifies a one-component, 32-bit unsigned integer format that has a single

32-bit R component.

- **VK_FORMAT_R32_SINT** specifies a one-component, 32-bit signed integer format that has a single 32-bit R component.
- **VK_FORMAT_R32_SFLOAT** specifies a one-component, 32-bit signed floating-point format that has a single 32-bit R component.
- **VK_FORMAT_R32G32_UINT** specifies a two-component, 64-bit unsigned integer format that has a 32-bit R component in bytes 0..3, and a 32-bit G component in bytes 4..7.
- **VK_FORMAT_R32G32_SINT** specifies a two-component, 64-bit signed integer format that has a 32-bit R component in bytes 0..3, and a 32-bit G component in bytes 4..7.
- **VK_FORMAT_R32G32_SFLOAT** specifies a two-component, 64-bit signed floating-point format that has a 32-bit R component in bytes 0..3, and a 32-bit G component in bytes 4..7.
- **VK_FORMAT_R32G32B32_UINT** specifies a three-component, 96-bit unsigned integer format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, and a 32-bit B component in bytes 8..11.
- **VK_FORMAT_R32G32B32_SINT** specifies a three-component, 96-bit signed integer format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, and a 32-bit B component in bytes 8..11.
- **VK_FORMAT_R32G32B32_SFLOAT** specifies a three-component, 96-bit signed floating-point format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, and a 32-bit B component in bytes 8..11.
- **VK_FORMAT_R32G32B32A32_UINT** specifies a four-component, 128-bit unsigned integer format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, a 32-bit B component in bytes 8..11, and a 32-bit A component in bytes 12..15.
- **VK_FORMAT_R32G32B32A32_SINT** specifies a four-component, 128-bit signed integer format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, a 32-bit B component in bytes 8..11, and a 32-bit A component in bytes 12..15.
- **VK_FORMAT_R32G32B32A32_SFLOAT** specifies a four-component, 128-bit signed floating-point format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, a 32-bit B component in bytes 8..11, and a 32-bit A component in bytes 12..15.
- **VK_FORMAT_R64_UINT** specifies a one-component, 64-bit unsigned integer format that has a single 64-bit R component.
- **VK_FORMAT_R64_SINT** specifies a one-component, 64-bit signed integer format that has a single 64-bit R component.
- **VK_FORMAT_R64_SFLOAT** specifies a one-component, 64-bit signed floating-point format that has a single 64-bit R component.
- **VK_FORMAT_R64G64_UINT** specifies a two-component, 128-bit unsigned integer format that has a 64-bit R component in bytes 0..7, and a 64-bit G component in bytes 8..15.
- **VK_FORMAT_R64G64_SINT** specifies a two-component, 128-bit signed integer format that has a 64-bit R component in bytes 0..7, and a 64-bit G component in bytes 8..15.
- **VK_FORMAT_R64G64_SFLOAT** specifies a two-component, 128-bit signed floating-point format that has a 64-bit R component in bytes 0..7, and a 64-bit G component in bytes 8..15.

- **VK_FORMAT_R64G64B64_UINT** specifies a three-component, 192-bit unsigned integer format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, and a 64-bit B component in bytes 16..23.
- **VK_FORMAT_R64G64B64_SINT** specifies a three-component, 192-bit signed integer format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, and a 64-bit B component in bytes 16..23.
- **VK_FORMAT_R64G64B64_SFLOAT** specifies a three-component, 192-bit signed floating-point format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, and a 64-bit B component in bytes 16..23.
- **VK_FORMAT_R64G64B64A64_UINT** specifies a four-component, 256-bit unsigned integer format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, a 64-bit B component in bytes 16..23, and a 64-bit A component in bytes 24..31.
- **VK_FORMAT_R64G64B64A64_SINT** specifies a four-component, 256-bit signed integer format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, a 64-bit B component in bytes 16..23, and a 64-bit A component in bytes 24..31.
- **VK_FORMAT_R64G64B64A64_SFLOAT** specifies a four-component, 256-bit signed floating-point format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, a 64-bit B component in bytes 16..23, and a 64-bit A component in bytes 24..31.
- **VK_FORMAT_B10G11R11_UFLOAT_PACK32** specifies a three-component, 32-bit packed unsigned floating-point format that has a 10-bit B component in bits 22..31, an 11-bit G component in bits 11..21, an 11-bit R component in bits 0..10. See [Unsigned 10-Bit Floating-Point Numbers](#) and [Unsigned 11-Bit Floating-Point Numbers](#).
- **VK_FORMAT_E5B9G9R9_UFLOAT_PACK32** specifies a three-component, 32-bit packed unsigned floating-point format that has a 5-bit shared exponent in bits 27..31, a 9-bit B component mantissa in bits 18..26, a 9-bit G component mantissa in bits 9..17, and a 9-bit R component mantissa in bits 0..8.
- **VK_FORMAT_D16_UNORM** specifies a one-component, 16-bit unsigned normalized format that has a single 16-bit depth component.
- **VK_FORMAT_X8_D24_UNORM_PACK32** specifies a two-component, 32-bit format that has 24 unsigned normalized bits in the depth component and, **optionally**, 8 bits that are unused.
- **VK_FORMAT_D32_SFLOAT** specifies a one-component, 32-bit signed floating-point format that has 32 bits in the depth component.
- **VK_FORMAT_S8_UINT** specifies a one-component, 8-bit unsigned integer format that has 8 bits in the stencil component.
- **VK_FORMAT_D16_UNORM_S8_UINT** specifies a two-component, 24-bit format that has 16 unsigned normalized bits in the depth component and 8 unsigned integer bits in the stencil component.
- **VK_FORMAT_D24_UNORM_S8_UINT** specifies a two-component, 32-bit packed format that has 8 unsigned integer bits in the stencil component, and 24 unsigned normalized bits in the depth component.
- **VK_FORMAT_D32_SFLOAT_S8_UINT** specifies a two-component format that has 32 signed float bits in the depth component and 8 unsigned integer bits in the stencil component. There are **optionally** 24 bits that are unused.
- **VK_FORMAT_BC1_RGB_UNORM_BLOCK** specifies a three-component, block-compressed format where

each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data. This format has no alpha and is considered opaque.

- **VK_FORMAT_BC1_RGB_SRGB_BLOCK** specifies a three-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data with sRGB nonlinear encoding. This format has no alpha and is considered opaque.
- **VK_FORMAT_BC1_RGBA_UNORM_BLOCK** specifies a four-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data, and provides 1 bit of alpha.
- **VK_FORMAT_BC1_RGBA_SRGB_BLOCK** specifies a four-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data with sRGB nonlinear encoding, and provides 1 bit of alpha.
- **VK_FORMAT_BC2_UNORM_BLOCK** specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values.
- **VK_FORMAT_BC2_SRGB_BLOCK** specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values with sRGB nonlinear encoding.
- **VK_FORMAT_BC3_UNORM_BLOCK** specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values.
- **VK_FORMAT_BC3_SRGB_BLOCK** specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values with sRGB nonlinear encoding.
- **VK_FORMAT_BC4_UNORM_BLOCK** specifies a one-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized red texel data.
- **VK_FORMAT_BC4_SNORM_BLOCK** specifies a one-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of signed normalized red texel data.
- **VK_FORMAT_BC5_UNORM_BLOCK** specifies a two-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RG texel data with the first 64 bits encoding red values followed by 64 bits encoding green values.
- **VK_FORMAT_BC5_SNORM_BLOCK** specifies a two-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of signed normalized RG texel data with the first 64 bits encoding red values followed by 64 bits encoding green values.
- **VK_FORMAT_BC6H_UFLOAT_BLOCK** specifies a three-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned floating-point RGB texel data.
- **VK_FORMAT_BC6H_SFLOAT_BLOCK** specifies a three-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of signed floating-point RGB texel data.
- **VK_FORMAT_BC7_UNORM_BLOCK** specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel

data.

- **VK_FORMAT_BC7_SRGB_BLOCK** specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- **VK_FORMAT_ETC2_R8G8B8_UNORM_BLOCK** specifies a three-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data. This format has no alpha and is considered opaque.
- **VK_FORMAT_ETC2_R8G8B8_SRGB_BLOCK** specifies a three-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data with sRGB nonlinear encoding. This format has no alpha and is considered opaque.
- **VK_FORMAT_ETC2_R8G8B8A1_UNORM_BLOCK** specifies a four-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data, and provides 1 bit of alpha.
- **VK_FORMAT_ETC2_R8G8B8A1_SRGB_BLOCK** specifies a four-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data with sRGB nonlinear encoding, and provides 1 bit of alpha.
- **VK_FORMAT_ETC2_R8G8B8A8_UNORM_BLOCK** specifies a four-component, ETC2 compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values.
- **VK_FORMAT_ETC2_R8G8B8A8_SRGB_BLOCK** specifies a four-component, ETC2 compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values with sRGB nonlinear encoding applied.
- **VK_FORMAT_EAC_R11_UNORM_BLOCK** specifies a one-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized red texel data.
- **VK_FORMAT_EAC_R11_SNORM_BLOCK** specifies a one-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of signed normalized red texel data.
- **VK_FORMAT_EAC_R11G11_UNORM_BLOCK** specifies a two-component, ETC2 compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RG texel data with the first 64 bits encoding red values followed by 64 bits encoding green values.
- **VK_FORMAT_EAC_R11G11_SNORM_BLOCK** specifies a two-component, ETC2 compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of signed normalized RG texel data with the first 64 bits encoding red values followed by 64 bits encoding green values.
- **VK_FORMAT_ASTC_4x4_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data.
- **VK_FORMAT_ASTC_4x4_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- **VK_FORMAT_ASTC_4x4_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of signed floating-point RGBA texel

data.

- **VK_FORMAT_ASTC_5x4_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×4 rectangle of unsigned normalized RGBA texel data.
- **VK_FORMAT_ASTC_5x4_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×4 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- **VK_FORMAT_ASTC_5x4_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×4 rectangle of signed floating-point RGBA texel data.
- **VK_FORMAT_ASTC_5x5_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×5 rectangle of unsigned normalized RGBA texel data.
- **VK_FORMAT_ASTC_5x5_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×5 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- **VK_FORMAT_ASTC_5x5_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×5 rectangle of signed floating-point RGBA texel data.
- **VK_FORMAT_ASTC_6x5_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6×5 rectangle of unsigned normalized RGBA texel data.
- **VK_FORMAT_ASTC_6x5_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6×5 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- **VK_FORMAT_ASTC_6x5_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6×5 rectangle of signed floating-point RGBA texel data.
- **VK_FORMAT_ASTC_6x6_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6×6 rectangle of unsigned normalized RGBA texel data.
- **VK_FORMAT_ASTC_6x6_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6×6 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- **VK_FORMAT_ASTC_6x6_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6×6 rectangle of signed floating-point RGBA texel data.
- **VK_FORMAT_ASTC_8x5_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×5 rectangle of unsigned normalized RGBA texel data.
- **VK_FORMAT_ASTC_8x5_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×5 rectangle of unsigned normalized RGBA

texel data with sRGB nonlinear encoding applied to the RGB components.

- **VK_FORMAT_ASTC_8x5_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 8×5 rectangle of signed floating-point RGBA texel data.
- **VK_FORMAT_ASTC_8x6_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×6 rectangle of unsigned normalized RGBA texel data.
- **VK_FORMAT_ASTC_8x6_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×6 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- **VK_FORMAT_ASTC_8x6_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 8×6 rectangle of signed floating-point RGBA texel data.
- **VK_FORMAT_ASTC_8x8_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×8 rectangle of unsigned normalized RGBA texel data.
- **VK_FORMAT_ASTC_8x8_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×8 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- **VK_FORMAT_ASTC_8x8_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 8×8 rectangle of signed floating-point RGBA texel data.
- **VK_FORMAT_ASTC_10x5_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×5 rectangle of unsigned normalized RGBA texel data.
- **VK_FORMAT_ASTC_10x5_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×5 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- **VK_FORMAT_ASTC_10x5_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×5 rectangle of signed floating-point RGBA texel data.
- **VK_FORMAT_ASTC_10x6_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×6 rectangle of unsigned normalized RGBA texel data.
- **VK_FORMAT_ASTC_10x6_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×6 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- **VK_FORMAT_ASTC_10x6_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×6 rectangle of signed floating-point RGBA texel data.
- **VK_FORMAT_ASTC_10x8_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×8 rectangle of unsigned normalized RGBA

texel data.

- **VK_FORMAT_ASTC_10x8_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×8 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- **VK_FORMAT_ASTC_10x8_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×8 rectangle of signed floating-point RGBA texel data.
- **VK_FORMAT_ASTC_10x10_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×10 rectangle of unsigned normalized RGBA texel data.
- **VK_FORMAT_ASTC_10x10_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×10 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- **VK_FORMAT_ASTC_10x10_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×10 rectangle of signed floating-point RGBA texel data.
- **VK_FORMAT_ASTC_12x10_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×10 rectangle of unsigned normalized RGBA texel data.
- **VK_FORMAT_ASTC_12x10_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×10 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- **VK_FORMAT_ASTC_12x10_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×10 rectangle of signed floating-point RGBA texel data.
- **VK_FORMAT_ASTC_12x12_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×12 rectangle of unsigned normalized RGBA texel data.
- **VK_FORMAT_ASTC_12x12_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×12 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- **VK_FORMAT_ASTC_12x12_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×12 rectangle of signed floating-point RGBA texel data.
- **VK_FORMAT_G8B8G8R8_422_UNORM** specifies a four-component, 32-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each *i* coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has an 8-bit G component for the even *i* coordinate in byte 0, an 8-bit B component in byte 1, an 8-bit G component for the odd *i* coordinate in byte 2, and an 8-bit R component in byte 3. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.

- **VK_FORMAT_B8G8R8G8_422_UNORM** specifies a four-component, 32-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has an 8-bit B component in byte 0, an 8-bit G component for the even i coordinate in byte 1, an 8-bit R component in byte 2, and an 8-bit G component for the odd i coordinate in byte 3. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.
- **VK_FORMAT_G8_B8_R8_3PLANE_420_UNORM** specifies an unsigned normalized *multi-planar format* that has an 8-bit G component in plane 0, an 8-bit B component in plane 1, and an 8-bit R component in plane 2. The horizontal and vertical dimensions of the R and B planes are halved relative to the image dimensions, and each R and B component is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$ and $\lfloor j_G \times 0.5 \rfloor = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using **VK_IMAGE_ASPECT_PLANE_0_BIT** for the G plane, **VK_IMAGE_ASPECT_PLANE_1_BIT** for the B plane, and **VK_IMAGE_ASPECT_PLANE_2_BIT** for the R plane. This format only supports images with a width and height that is a multiple of two.
- **VK_FORMAT_G8_B8R8_2PLANE_420_UNORM** specifies an unsigned normalized *multi-planar format* that has an 8-bit G component in plane 0, and a two-component, 16-bit BR plane 1 consisting of an 8-bit B component in byte 0 and an 8-bit R component in byte 1. The horizontal and vertical dimensions of the BR plane are halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$ and $\lfloor j_G \times 0.5 \rfloor = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using **VK_IMAGE_ASPECT_PLANE_0_BIT** for the G plane, and **VK_IMAGE_ASPECT_PLANE_1_BIT** for the BR plane. This format only supports images with a width and height that is a multiple of two.
- **VK_FORMAT_G8_B8_R8_3PLANE_422_UNORM** specifies an unsigned normalized *multi-planar format* that has an 8-bit G component in plane 0, an 8-bit B component in plane 1, and an 8-bit R component in plane 2. The horizontal dimension of the R and B plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using **VK_IMAGE_ASPECT_PLANE_0_BIT** for the G plane, **VK_IMAGE_ASPECT_PLANE_1_BIT** for the B plane, and **VK_IMAGE_ASPECT_PLANE_2_BIT** for the R plane. This format only supports images with a width that is a multiple of two.
- **VK_FORMAT_G8_B8R8_2PLANE_422_UNORM** specifies an unsigned normalized *multi-planar format* that has an 8-bit G component in plane 0, and a two-component, 16-bit BR plane 1 consisting of an 8-bit B component in byte 0 and an 8-bit R component in byte 1. The horizontal dimension of the BR plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using **VK_IMAGE_ASPECT_PLANE_0_BIT** for the G plane, and **VK_IMAGE_ASPECT_PLANE_1_BIT** for the BR plane. This format only supports images with a width that is a multiple of two.
- **VK_FORMAT_G8_B8_R8_3PLANE_444_UNORM** specifies an unsigned normalized *multi-planar format* that has an 8-bit G component in plane 0, an 8-bit B component in plane 1, and an 8-bit R component in plane 2. Each plane has the same dimensions and each R, G and B component contributes to a

single texel. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, `VK_IMAGE_ASPECT_PLANE_1_BIT` for the B plane, and `VK_IMAGE_ASPECT_PLANE_2_BIT` for the R plane.

- `VK_FORMAT_R10X6_UNORM_PACK16` specifies a one-component, 16-bit unsigned normalized format that has a single 10-bit R component in the top 10 bits of a 16-bit word, with the bottom 6 bits unused.
- `VK_FORMAT_R10X6G10X6_UNORM_2PACK16` specifies a two-component, 32-bit unsigned normalized format that has a 10-bit R component in the top 10 bits of the word in bytes 0..1, and a 10-bit G component in the top 10 bits of the word in bytes 2..3, with the bottom 6 bits of each word unused.
- `VK_FORMAT_R10X6G10X6B10X6A10X6_UNORM_4PACK16` specifies a four-component, 64-bit unsigned normalized format that has a 10-bit R component in the top 10 bits of the word in bytes 0..1, a 10-bit G component in the top 10 bits of the word in bytes 2..3, a 10-bit B component in the top 10 bits of the word in bytes 4..5, and a 10-bit A component in the top 10 bits of the word in bytes 6..7, with the bottom 6 bits of each word unused.
- `VK_FORMAT_G10X6B10X6G10X6R10X6_422_UNORM_4PACK16` specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has a 10-bit G component for the even i coordinate in the top 10 bits of the word in bytes 0..1, a 10-bit B component in the top 10 bits of the word in bytes 2..3, a 10-bit G component for the odd i coordinate in the top 10 bits of the word in bytes 4..5, and a 10-bit R component in the top 10 bits of the word in bytes 6..7, with the bottom 6 bits of each word unused. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.
- `VK_FORMAT_B10X6G10X6R10X6G10X6_422_UNORM_4PACK16` specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has a 10-bit B component in the top 10 bits of the word in bytes 0..1, a 10-bit G component for the even i coordinate in the top 10 bits of the word in bytes 2..3, a 10-bit R component in the top 10 bits of the word in bytes 4..5, and a 10-bit G component for the odd i coordinate in the top 10 bits of the word in bytes 6..7, with the bottom 6 bits of each word unused. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.
- `VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_420_UNORM_3PACK16` specifies an unsigned normalized *multi-planar format* that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, a 10-bit B component in the top 10 bits of each 16-bit word of plane 1, and a 10-bit R component in the top 10 bits of each 16-bit word of plane 2, with the bottom 6 bits of each word unused. The horizontal and vertical dimensions of the R and B planes are halved relative to the image dimensions, and each R and B component is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$ and $\lfloor j_G \times 0.5 \rfloor = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using

`VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, `VK_IMAGE_ASPECT_PLANE_1_BIT` for the B plane, and `VK_IMAGE_ASPECT_PLANE_2_BIT` for the R plane. This format only supports images with a width and height that is a multiple of two.

- `VK_FORMAT_G10X6_B10X6R10X6_2PLANE_420_UNORM_3PACK16` specifies an unsigned normalized *multi-planar format* that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 10-bit B component in the top 10 bits of the word in bytes 0..1, and a 10-bit R component in the top 10 bits of the word in bytes 2..3, with the bottom 6 bits of each word unused. The horizontal and vertical dimensions of the BR plane are halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$ and $\lfloor j_G \times 0.5 \rfloor = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane. This format only supports images with a width and height that is a multiple of two.
- `VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_422_UNORM_3PACK16` specifies an unsigned normalized *multi-planar format* that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, a 10-bit B component in the top 10 bits of each 16-bit word of plane 1, and a 10-bit R component in the top 10 bits of each 16-bit word of plane 2, with the bottom 6 bits of each word unused. The horizontal dimension of the R and B plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, `VK_IMAGE_ASPECT_PLANE_1_BIT` for the B plane, and `VK_IMAGE_ASPECT_PLANE_2_BIT` for the R plane. This format only supports images with a width that is a multiple of two.
- `VK_FORMAT_G10X6_B10X6R10X6_2PLANE_422_UNORM_3PACK16` specifies an unsigned normalized *multi-planar format* that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 10-bit B component in the top 10 bits of the word in bytes 0..1, and a 10-bit R component in the top 10 bits of the word in bytes 2..3, with the bottom 6 bits of each word unused. The horizontal dimension of the BR plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane. This format only supports images with a width that is a multiple of two.
- `VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_444_UNORM_3PACK16` specifies an unsigned normalized *multi-planar format* that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, a 10-bit B component in the top 10 bits of each 16-bit word of plane 1, and a 10-bit R component in the top 10 bits of each 16-bit word of plane 2, with the bottom 6 bits of each word unused. Each plane has the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, `VK_IMAGE_ASPECT_PLANE_1_BIT` for the B plane, and `VK_IMAGE_ASPECT_PLANE_2_BIT` for the R plane.
- `VK_FORMAT_R12X4_UNORM_PACK16` specifies a one-component, 16-bit unsigned normalized format that has a single 12-bit R component in the top 12 bits of a 16-bit word, with the bottom 4 bits unused.
- `VK_FORMAT_R12X4G12X4_UNORM_2PACK16` specifies a two-component, 32-bit unsigned normalized

format that has a 12-bit R component in the top 12 bits of the word in bytes 0..1, and a 12-bit G component in the top 12 bits of the word in bytes 2..3, with the bottom 4 bits of each word unused.

- **VK_FORMAT_R12X4G12X4B12X4A12X4_UNORM_4PACK16** specifies a four-component, 64-bit unsigned normalized format that has a 12-bit R component in the top 12 bits of the word in bytes 0..1, a 12-bit G component in the top 12 bits of the word in bytes 2..3, a 12-bit B component in the top 12 bits of the word in bytes 4..5, and a 12-bit A component in the top 12 bits of the word in bytes 6..7, with the bottom 4 bits of each word unused.
- **VK_FORMAT_G12X4B12X4G12X4R12X4_422_UNORM_4PACK16** specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has a 12-bit G component for the even i coordinate in the top 12 bits of the word in bytes 0..1, a 12-bit B component in the top 12 bits of the word in bytes 2..3, a 12-bit G component for the odd i coordinate in the top 12 bits of the word in bytes 4..5, and a 12-bit R component in the top 12 bits of the word in bytes 6..7, with the bottom 4 bits of each word unused. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.
- **VK_FORMAT_B12X4G12X4R12X4G12X4_422_UNORM_4PACK16** specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has a 12-bit B component in the top 12 bits of the word in bytes 0..1, a 12-bit G component for the even i coordinate in the top 12 bits of the word in bytes 2..3, a 12-bit R component in the top 12 bits of the word in bytes 4..5, and a 12-bit G component for the odd i coordinate in the top 12 bits of the word in bytes 6..7, with the bottom 4 bits of each word unused. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.
- **VK_FORMAT_G12X4_B12X4_R12X4_3PLANE_420_UNORM_3PACK16** specifies an unsigned normalized *multi-planar format* that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, a 12-bit B component in the top 12 bits of each 16-bit word of plane 1, and a 12-bit R component in the top 12 bits of each 16-bit word of plane 2, with the bottom 4 bits of each word unused. The horizontal and vertical dimensions of the R and B planes are halved relative to the image dimensions, and each R and B component is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$ and $\lfloor j_G \times 0.5 \rfloor = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using **VK_IMAGE_ASPECT_PLANE_0_BIT** for the G plane, **VK_IMAGE_ASPECT_PLANE_1_BIT** for the B plane, and **VK_IMAGE_ASPECT_PLANE_2_BIT** for the R plane. This format only supports images with a width and height that is a multiple of two.
- **VK_FORMAT_G12X4_B12X4R12X4_2PLANE_420_UNORM_3PACK16** specifies an unsigned normalized *multi-planar format* that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 12-bit B component in the top 12 bits of the word in bytes 0..1, and a 12-bit R component in the top 12 bits of the word in bytes 2..3, with the bottom 4 bits of each word unused. The horizontal and vertical dimensions of the BR plane

are halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$ and $\lfloor j_G \times 0.5 \rfloor = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane. This format only supports images with a width and height that is a multiple of two.

- `VK_FORMAT_G12X4_B12X4_R12X4_3PLANE_422_UNORM_3PACK16` specifies an unsigned normalized *multi-planar format* that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, a 12-bit B component in the top 12 bits of each 16-bit word of plane 1, and a 12-bit R component in the top 12 bits of each 16-bit word of plane 2, with the bottom 4 bits of each word unused. The horizontal dimension of the R and B plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, `VK_IMAGE_ASPECT_PLANE_1_BIT` for the B plane, and `VK_IMAGE_ASPECT_PLANE_2_BIT` for the R plane. This format only supports images with a width that is a multiple of two.
- `VK_FORMAT_G12X4_B12X4R12X4_2PLANE_422_UNORM_3PACK16` specifies an unsigned normalized *multi-planar format* that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 12-bit B component in the top 12 bits of the word in bytes 0..1, and a 12-bit R component in the top 12 bits of the word in bytes 2..3, with the bottom 4 bits of each word unused. The horizontal dimension of the BR plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane. This format only supports images with a width that is a multiple of two.
- `VK_FORMAT_G12X4_B12X4_R12X4_3PLANE_444_UNORM_3PACK16` specifies an unsigned normalized *multi-planar format* that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, a 12-bit B component in the top 12 bits of each 16-bit word of plane 1, and a 12-bit R component in the top 12 bits of each 16-bit word of plane 2, with the bottom 4 bits of each word unused. Each plane has the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, `VK_IMAGE_ASPECT_PLANE_1_BIT` for the B plane, and `VK_IMAGE_ASPECT_PLANE_2_BIT` for the R plane.
- `VK_FORMAT_G16B16G16R16_422_UNORM` specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has a 16-bit G component for the even i coordinate in the word in bytes 0..1, a 16-bit B component in the word in bytes 2..3, a 16-bit G component for the odd i coordinate in the word in bytes 4..5, and a 16-bit R component in the word in bytes 6..7. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.
- `VK_FORMAT_B16G16R16G16_422_UNORM` specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the

image. This format has a 16-bit B component in the word in bytes 0..1, a 16-bit G component for the even i coordinate in the word in bytes 2..3, a 16-bit R component in the word in bytes 4..5, and a 16-bit G component for the odd i coordinate in the word in bytes 6..7. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.

- **VK_FORMAT_G16_B16_R16_3PLANE_420_UNORM** specifies an unsigned normalized *multi-planar format* that has a 16-bit G component in each 16-bit word of plane 0, a 16-bit B component in each 16-bit word of plane 1, and a 16-bit R component in each 16-bit word of plane 2. The horizontal and vertical dimensions of the R and B planes are halved relative to the image dimensions, and each R and B component is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$ and $\lfloor j_G \times 0.5 \rfloor = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using **VK_IMAGE_ASPECT_PLANE_0_BIT** for the G plane, **VK_IMAGE_ASPECT_PLANE_1_BIT** for the B plane, and **VK_IMAGE_ASPECT_PLANE_2_BIT** for the R plane. This format only supports images with a width and height that is a multiple of two.
- **VK_FORMAT_G16_B16R16_2PLANE_420_UNORM** specifies an unsigned normalized *multi-planar format* that has a 16-bit G component in each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 16-bit B component in the word in bytes 0..1, and a 16-bit R component in the word in bytes 2..3. The horizontal and vertical dimensions of the BR plane are halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$ and $\lfloor j_G \times 0.5 \rfloor = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using **VK_IMAGE_ASPECT_PLANE_0_BIT** for the G plane, and **VK_IMAGE_ASPECT_PLANE_1_BIT** for the BR plane. This format only supports images with a width and height that is a multiple of two.
- **VK_FORMAT_G16_B16_R16_3PLANE_422_UNORM** specifies an unsigned normalized *multi-planar format* that has a 16-bit G component in each 16-bit word of plane 0, a 16-bit B component in each 16-bit word of plane 1, and a 16-bit R component in each 16-bit word of plane 2. The horizontal dimension of the R and B plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using **VK_IMAGE_ASPECT_PLANE_0_BIT** for the G plane, **VK_IMAGE_ASPECT_PLANE_1_BIT** for the B plane, and **VK_IMAGE_ASPECT_PLANE_2_BIT** for the R plane. This format only supports images with a width that is a multiple of two.
- **VK_FORMAT_G16_B16R16_2PLANE_422_UNORM** specifies an unsigned normalized *multi-planar format* that has a 16-bit G component in each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 16-bit B component in the word in bytes 0..1, and a 16-bit R component in the word in bytes 2..3. The horizontal dimension of the BR plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using **VK_IMAGE_ASPECT_PLANE_0_BIT** for the G plane, and **VK_IMAGE_ASPECT_PLANE_1_BIT** for the BR plane. This format only supports images with a width that is a multiple of two.
- **VK_FORMAT_G16_B16_R16_3PLANE_444_UNORM** specifies an unsigned normalized *multi-planar format* that has a 16-bit G component in each 16-bit word of plane 0, a 16-bit B component in each 16-bit word of plane 1, and a 16-bit R component in each 16-bit word of plane 2. Each plane has the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via

[vkGetImageSubresourceLayout](#), using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, `VK_IMAGE_ASPECT_PLANE_1_BIT` for the B plane, and `VK_IMAGE_ASPECT_PLANE_2_BIT` for the R plane.

- `VK_FORMAT_G8_B8R8_2PLANE_444_UNORM` specifies an unsigned normalized *multi-planar format* that has an 8-bit G component in plane 0, and a two-component, 16-bit BR plane 1 consisting of an 8-bit B component in byte 0 and an 8-bit R component in byte 1. Both planes have the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane.
- `VK_FORMAT_G10X6_B10X6R10X6_2PLANE_444_UNORM_3PACK16` specifies an unsigned normalized *multi-planar format* that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 10-bit B component in the top 10 bits of the word in bytes 0..1, and a 10-bit R component in the top 10 bits of the word in bytes 2..3, the bottom 6 bits of each word unused. Both planes have the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane.
- `VK_FORMAT_G12X4_B12X4R12X4_2PLANE_444_UNORM_3PACK16` specifies an unsigned normalized *multi-planar format* that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 12-bit B component in the top 12 bits of the word in bytes 0..1, and a 12-bit R component in the top 12 bits of the word in bytes 2..3, the bottom 4 bits of each word unused. Both planes have the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane.
- `VK_FORMAT_G16_B16R16_2PLANE_444_UNORM` specifies an unsigned normalized *multi-planar format* that has a 16-bit G component in each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 16-bit B component in the word in bytes 0..1, and a 16-bit R component in the word in bytes 2..3. Both planes have the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane.

35.1.1. Compatible Formats of Planes of Multi-Planar Formats

Individual planes of [multi-planar formats](#) are size-compatible with single-plane color formats if they occupy the same number of bits per texel block, and are compatible with those formats if they have the same block extent.

In the following table, individual planes of a *multi-planar* format are compatible with the format listed against the relevant plane index for that multi-planar format, and any format compatible with the listed single-plane format according to [Format Compatibility Classes](#). These planes are also [size-compatible](#) with any format that is [size-compatible](#) with the listed single-plane format.

Table 50. Plane Format Compatibility Table

Plane	Compatible format for plane	Width relative to the width w of the plane with the largest dimensions	Height relative to the height h of the plane with the largest dimensions
VK_FORMAT_G8_B8_R8_3PLANE_420_UNORM			
0	VK_FORMAT_R8_UNORM	w	h
1	VK_FORMAT_R8_UNORM	$w/2$	$h/2$
2	VK_FORMAT_R8_UNORM	$w/2$	$h/2$
VK_FORMAT_G8_B8R8_2PLANE_420_UNORM			
0	VK_FORMAT_R8_UNORM	w	h
1	VK_FORMAT_R8G8_UNORM	$w/2$	$h/2$
VK_FORMAT_G8_B8_R8_3PLANE_422_UNORM			
0	VK_FORMAT_R8_UNORM	w	h
1	VK_FORMAT_R8_UNORM	$w/2$	h
2	VK_FORMAT_R8_UNORM	$w/2$	h
VK_FORMAT_G8_B8R8_2PLANE_422_UNORM			
0	VK_FORMAT_R8_UNORM	w	h
1	VK_FORMAT_R8G8_UNORM	$w/2$	h
VK_FORMAT_G8_B8_R8_3PLANE_444_UNORM			
0	VK_FORMAT_R8_UNORM	w	h

35.1.2. Multi-Planar Format Image Aspect

When using [VkImageAspectFlagBits](#) to select a plane of a [multi-planar format](#), the following are the valid options:

- Two planes
 - VK_IMAGE_ASPECT_PLANE_0_BIT
 - VK_IMAGE_ASPECT_PLANE_1_BIT
- Three planes
 - VK_IMAGE_ASPECT_PLANE_0_BIT
 - VK_IMAGE_ASPECT_PLANE_1_BIT
 - VK_IMAGE_ASPECT_PLANE_2_BIT

35.1.3. Packed Formats

For the purposes of address alignment when accessing buffer memory containing vertex attribute or texel data, the following formats are considered *packed* - components of the texels or attributes are stored in bitfields packed into one or more 8-, 16-, or 32-bit fundamental data type.

- **Packed into 8-bit data types:**
 - `VK_FORMAT_R4G4_UNORM_PACK8`
- **Packed into 16-bit data types:**
 - `VK_FORMAT_R4G4B4A4_UNORM_PACK16`
 - `VK_FORMAT_B4G4R4A4_UNORM_PACK16`
 - `VK_FORMAT_R5G6B5_UNORM_PACK16`
 - `VK_FORMAT_B5G6R5_UNORM_PACK16`
 - `VK_FORMAT_R5G5B5A1_UNORM_PACK16`
 - `VK_FORMAT_B5G5R5A1_UNORM_PACK16`
 - `VK_FORMAT_A1R5G5B5_UNORM_PACK16`
 - `VK_FORMAT_R10X6_UNORM_PACK16`
 - `VK_FORMAT_R10X6G10X6_UNORM_2PACK16`
 - `VK_FORMAT_R10X6G10X6B10X6A10X6_UNORM_4PACK16`
 - `VK_FORMAT_G10X6B10X6G10X6R10X6_422_UNORM_4PACK16`
 - `VK_FORMAT_B10X6G10X6R10X6G10X6_422_UNORM_4PACK16`
 - `VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_420_UNORM_3PACK16`
 - `VK_FORMAT_G10X6_B10X6R10X6_2PLANE_420_UNORM_3PACK16`
 - `VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_422_UNORM_3PACK16`
 - `VK_FORMAT_G10X6_B10X6R10X6_2PLANE_422_UNORM_3PACK16`
 - `VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_444_UNORM_3PACK16`
 - `VK_FORMAT_R12X4_UNORM_PACK16`
 - `VK_FORMAT_R12X4G12X4_UNORM_2PACK16`
 - `VK_FORMAT_R12X4G12X4B12X4A12X4_UNORM_4PACK16`
 - `VK_FORMAT_G12X4B12X4G12X4R12X4_422_UNORM_4PACK16`
 - `VK_FORMAT_B12X4G12X4R12X4G12X4_422_UNORM_4PACK16`
 - `VK_FORMAT_G12X4_B12X4_R12X4_3PLANE_420_UNORM_3PACK16`
 - `VK_FORMAT_G12X4_B12X4R12X4_2PLANE_420_UNORM_3PACK16`
 - `VK_FORMAT_G12X4_B12X4_R12X4_3PLANE_422_UNORM_3PACK16`
 - `VK_FORMAT_G12X4_B12X4R12X4_2PLANE_422_UNORM_3PACK16`
 - `VK_FORMAT_G12X4_B12X4_R12X4_3PLANE_444_UNORM_3PACK16`
 - `VK_FORMAT_G10X6_B10X6R10X6_2PLANE_444_UNORM_3PACK16`

- VK_FORMAT_G12X4_B12X4R12X4_2PLANE_444_UNORM_3PACK16
- VK_FORMAT_A4R4G4B4_UNORM_PACK16
- VK_FORMAT_A4B4G4R4_UNORM_PACK16
- **Packed into 32-bit data types:**
 - VK_FORMAT_A8B8G8R8_UNORM_PACK32
 - VK_FORMAT_A8B8G8R8_SNORM_PACK32
 - VK_FORMAT_A8B8G8R8_USCALED_PACK32
 - VK_FORMAT_A8B8G8R8_SSCALED_PACK32
 - VK_FORMAT_A8B8G8R8_UINT_PACK32
 - VK_FORMAT_A8B8G8R8_SINT_PACK32
 - VK_FORMAT_A8B8G8R8_SRGB_PACK32
 - VK_FORMAT_A2R10G10B10_UNORM_PACK32
 - VK_FORMAT_A2R10G10B10_SNORM_PACK32

 - VK_FORMAT_E5B9G9R9_UFLOAT_PACK32
 - VK_FORMAT_X8_D24_UNORM_PACK32

35.1.4. Identification of Formats

A “format” is represented by a single enum value. The name of a format is usually built up by using the following pattern:

```
VK_FORMAT_{component-format|compression-scheme}_{numeric-format}
```

The component-format indicates either the size of the R, G, B, and A components (if they are present) in the case of a color format, or the size of the depth (D) and stencil (S) components (if they are present) in the case of a depth/stencil format (see below). An X indicates a component that is

unused, but **may** be present for padding.

Table 51. Interpretation of Numeric Format

Numeric format	Type-Declaration instructions	Numeric type	Description
UNORM	OpTypeFloat	floating-point	The components are unsigned normalized values in the range [0,1]
SNORM	OpTypeFloat	floating-point	The components are signed normalized values in the range [-1,1]
USCALED	OpTypeFloat	floating-point	The components are unsigned integer values that get converted to floating-point in the range [0,2 ⁿ -1]
SSCALED	OpTypeFloat	floating-point	The components are signed integer values that get converted to floating-point in the range [-2 ⁿ⁻¹ ,2 ⁿ⁻¹ -1]
UINT	OpTypeInt	unsigned integer	The components are unsigned integer values in the range [0,2 ⁿ -1]
SINT	OpTypeInt	signed integer	The components are signed integer values in the range [-2 ⁿ⁻¹ ,2 ⁿ⁻¹ -1]
UFLOAT	OpTypeFloat	floating-point	The components are unsigned floating-point numbers (used by packed, shared exponent, and some compressed formats)
SFLOAT	OpTypeFloat	floating-point	The components are signed floating-point numbers
SRGB	OpTypeFloat	floating-point	The R, G, and B components are unsigned normalized values that represent values using sRGB nonlinear encoding, while the A component (if one exists) is a regular unsigned normalized value
n is the number of bits in the component.			

The suffix **_PACKnn** indicates that the format is packed into an underlying type with **nn** bits. The suffix **_mPACKnn** is a short-hand that indicates that the format has **m** groups of components (which may or may not be stored in separate *planes*) that are each packed into an underlying type with **nn** bits.

The suffix **_BLOCK** indicates that the format is a block-compressed format, with the representation of multiple texels encoded interdependently within a region.

Table 52. Interpretation of Compression Scheme

Compression scheme	Description
BC	Block Compression. See Block-Compressed Image Formats .
ETC2	Ericsson Texture Compression. See ETC Compressed Image Formats .
EAC	ETC2 Alpha Compression. See ETC Compressed Image Formats .

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	← Byte		
R		G		VK_FORMAT_R16G16_*														
R		G		B		VK_FORMAT_R16G16B16_*												
R		G		B		A		VK_FORMAT_R16G16B16A16_*										
G ₀		B		G ₁		R		VK_FORMAT_G10X6B10X6G10X6R10X6_4PACK16_422_UNORM										
								VK_FORMAT_G12X4B12X4G12X4R12X4_4PACK16_422_UNORM										
								VK_FORMAT_G16B16G16R16_UNORM										
B		G ₀		R		G ₁		VK_FORMAT_B10X6G10X6R10X6G10X6_4PACK16_422_UNORM										
								VK_FORMAT_B12X4G12X4R12X4G12X4_4PACK16_422_UNORM										
								VK_FORMAT_B16G16R16G16_422_UNORM										
R			VK_FORMAT_R32_*															
R			G				VK_FORMAT_R32G32_*											
R			G				B				VK_FORMAT_R32G32B32_*							
R			G				B				A			VK_FORMAT_R32G32B32A32_*				
R							VK_FORMAT_R64_*											
R							G							VK_FORMAT_R64G64_*				
VK_FORMAT_R64G64B64_* as VK_FORMAT_R64G64_* but with B in bytes 16-23																		
VK_FORMAT_R64G64B64A64_* as VK_FORMAT_R64G64B64_* but with A in bytes 24-31																		

Packed formats store multiple components within one underlying type. The bit representation is that the first component specified in the name of the format is in the most-significant bits and the last component specified is in the least-significant bits of the underlying type. The in-memory ordering of bytes comprising the underlying type is determined by the host endianness.

35.1.6. Depth/Stencil Formats

Depth/stencil formats are considered opaque and need not be stored in the exact number of bits per texel or component ordering indicated by the format enum. However, implementations **must** not substitute a different depth or stencil precision than is described in the format (e.g. D16 **must** not be implemented as D24 or D32).

35.1.7. Format Compatibility Classes

Uncompressed color formats are *compatible* with each other if they occupy the same number of bits per texel block . Compressed color formats are compatible with each other if the only difference between them is the [numeric format](#) of the uncompressed texels. Each depth/stencil format is only compatible with itself. In the [following](#) table, all the formats in the same row are compatible. Each format has a defined *texel block extent* specifying how many texels each texel block represents in each dimension.

Table 57. Compatible Formats

Class, Texel Block Size, Texel Block Extent, # Texels/Block	Formats
8-bit Block size 1 byte 1x1x1 block extent 1 texel/block	VK_FORMAT_R4G4_UNORM_PACK8, VK_FORMAT_R8_UNORM, VK_FORMAT_R8_SNORM, VK_FORMAT_R8_USCALED, VK_FORMAT_R8_SSCALED, VK_FORMAT_R8_UINT, VK_FORMAT_R8_SINT, VK_FORMAT_R8_SRGB

Size Compatibility

Color formats with the same texel block size are considered *size-compatible*. If two size-compatible formats have different block extents (i.e. for compressed formats), then an image with size $A \times B \times C$

in one format with a block extent of $a \times b \times c$ can be represented as an image with size $X \times Y \times Z$ in the other format with block extent $x \times y \times z$ at the ratio between the block extents for each format, where

$$\lceil A/a \rceil = \lceil X/x \rceil$$

$$\lceil B/b \rceil = \lceil Y/y \rceil$$

$$\lceil C/c \rceil = \lceil Z/z \rceil$$

NOTE

For example, a 7x3 image in the `VK_FORMAT_ASTC_8x5_UNORM_BLOCK` format can be represented as a 1x1 `VK_FORMAT_R64G64_UINT` image.

Images created with the `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` flag can have size-compatible views created from them to enable access via different size-compatible formats. Image views created in this way will be sized to match the expectations of the block extents noted above.

Copy operations are able to copy between size-compatible formats in different resources to enable manipulation of data in different formats. The extent used in these copy operations always matches the source image, and is resized to the expectations of the block extents noted above for the destination image.

35.2. Format Properties

To query supported format features which are properties of the physical device, call:

WARNING

This functionality is superseded by [Vulkan Version 1.1](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceFormatProperties(
    VkPhysicalDevice    physicalDevice,
    VkFormat             format,
    VkFormatProperties*  pFormatProperties);
```

- `physicalDevice` is the physical device from which to query the format properties.
- `format` is the format whose properties are queried.
- `pFormatProperties` is a pointer to a `VkFormatProperties` structure in which physical device properties for `format` are returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFormatProperties-physicalDevice-parameter

`physicalDevice` **must** be a valid `VkPhysicalDevice` handle

- `vkGetPhysicalDeviceFormatProperties-format-parameter`
`format` **must** be a valid `VkFormat` value
- `vkGetPhysicalDeviceFormatProperties-pFormatProperties-parameter`
`pFormatProperties` **must** be a valid pointer to a `VkFormatProperties` structure

The `VkFormatProperties` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkFormatProperties {
    VkFormatFeatureFlags    linearTilingFeatures;
    VkFormatFeatureFlags    optimalTilingFeatures;
    VkFormatFeatureFlags    bufferFeatures;
} VkFormatProperties;
```

- `linearTilingFeatures` is a bitmask of `VkFormatFeatureFlagBits` specifying features supported by images created with a `tiling` parameter of `VK_IMAGE_TILING_LINEAR`.
- `optimalTilingFeatures` is a bitmask of `VkFormatFeatureFlagBits` specifying features supported by images created with a `tiling` parameter of `VK_IMAGE_TILING_OPTIMAL`.
- `bufferFeatures` is a bitmask of `VkFormatFeatureFlagBits` specifying features supported by buffers.

NOTE

If no format feature flags are supported, the format itself is not supported, and images of that format cannot be created.

If `format` is block-compressed, [requires sampler Y'C_BC_R conversion](#), or is a depth/stencil format then `bufferFeatures` **must** not support any features for the format.

If `format` is not a multi-plane format then `linearTilingFeatures` and `optimalTilingFeatures` **must** not contain `VK_FORMAT_FEATURE_DISJOINT_BIT`.

Bits which **can** be set in the `VkFormatProperties` features `linearTilingFeatures`, `optimalTilingFeatures`, `VkDrmFormatModifierPropertiesEXT::drmFormatModifierTilingFeatures`, and `bufferFeatures` are:

```

// Provided by VK_VERSION_1_0
typedef enum VkFormatFeatureFlagBits {
    VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT = 0x00000001,
    VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT = 0x00000002,

    VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR = 0x40000000,
} VkFormatFeatureFlagBits;

```

These values **may** be set in `linearTilingFeatures`, `optimalTilingFeatures`, and `VkDrmFormatModifierPropertiesEXT::drmFormatModifierTilingFeatures`, specifying that the features

are supported by [images](#) or [image views](#) or [sampler Y'C_BC_R conversion objects](#) created with the queried `vkGetPhysicalDeviceFormatProperties::format:`

- `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT` specifies that an image view **can** be [sampled from](#).
- `VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT` specifies that an image view **can** be used as a [storage image](#).
- `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT` specifies that an image view **can** be used as storage image that supports atomic operations.
- `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` specifies that an image view **can** be used as a framebuffer color attachment and as an input attachment.
- `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT` specifies that an image view **can** be used as a framebuffer color attachment that supports blending.
- `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT` specifies that an image view **can** be used as a framebuffer depth/stencil attachment and as an input attachment.
- `VK_FORMAT_FEATURE_BLIT_SRC_BIT` specifies that an image **can** be used as `srcImage` for the `vkCmdBlitImage2KHR` and `vkCmdBlitImage` commands.
- `VK_FORMAT_FEATURE_BLIT_DST_BIT` specifies that an image **can** be used as `dstImage` for the `vkCmdBlitImage2KHR` and `vkCmdBlitImage` commands.
- `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` specifies that if `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT` is also set, an image view **can** be used with a sampler that has either of `magFilter` or `minFilter` set to `VK_FILTER_LINEAR`, or `mipmapMode` set to `VK_SAMPLER_MIPMAP_MODE_LINEAR`. If `VK_FORMAT_FEATURE_BLIT_SRC_BIT` is also set, an image can be used as the `srcImage` to `vkCmdBlitImage2KHR` and `vkCmdBlitImage` with a `filter` of `VK_FILTER_LINEAR`. This bit **must** only be exposed for formats that also support the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT` or `VK_FORMAT_FEATURE_BLIT_SRC_BIT`.

If the format being queried is a depth/stencil format, this bit only specifies that the depth aspect (not the stencil aspect) of an image of this format supports linear filtering, and that linear filtering of the depth aspect is supported whether depth compare is enabled in the sampler or not. Where depth comparison is supported it **may** be linear filtered whether this bit is present or not, but where this bit is not present the filtered value **may** be computed in an implementation-dependent manner which differs from the normal rules of linear filtering. The resulting value **must** be in the range [0,1] and **should** be proportional to, or a weighted average of, the number of comparison passes or failures.

- `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT` specifies that an image **can** be used as a source image for [copy commands](#). If the application `apiVersion` is Vulkan 1.0 and `VK_KHR_maintenance1` is not supported, `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT` is implied to be set when the format feature flag is not 0.
- `VK_FORMAT_FEATURE_TRANSFER_DST_BIT` specifies that an image **can** be used as a destination image for [copy commands](#) and [clear commands](#). If the application `apiVersion` is Vulkan 1.0 and `VK_KHR_maintenance1` is not supported, `VK_FORMAT_FEATURE_TRANSFER_DST_BIT` is implied to be set when the format feature flag is not 0.
- `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT` specifies `VkImage` **can** be used as a sampled

image with a min or max [VkSamplerReductionMode](#). This bit **must** only be exposed for formats that also support the [VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT](#).

- [VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT](#) specifies that [VkImage](#) **can** be used with a sampler that has either of [magFilter](#) or [minFilter](#) set to [VK_FILTER_CUBIC_EXT](#), or be the source image for a blit with [filter](#) set to [VK_FILTER_CUBIC_EXT](#). This bit **must** only be exposed for formats that also support the [VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT](#). If the format being queried is a depth/stencil format, this only specifies that the depth aspect is cubic filterable.
- [VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT](#) specifies that an application **can** define a [sampler Y'C_BC_R conversion](#) using this format as a source, and that an image of this format **can** be used with a [VkSamplerYcbcrConversionCreateInfo](#) [xChromaOffset](#) and/or [yChromaOffset](#) of [VK_CHROMA_LOCATION_MIDPOINT](#). Otherwise both [xChromaOffset](#) and [yChromaOffset](#) **must** be [VK_CHROMA_LOCATION_COSITED_EVEN](#). If a format does not incorporate chroma downsampling (it is not a “422” or “420” format) but the implementation supports sampler Y'C_BC_R conversion for this format, the implementation **must** set [VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT](#).
- [VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT](#) specifies that an application **can** define a [sampler Y'C_BC_R conversion](#) using this format as a source, and that an image of this format **can** be used with a [VkSamplerYcbcrConversionCreateInfo](#) [xChromaOffset](#) and/or [yChromaOffset](#) of [VK_CHROMA_LOCATION_COSITED_EVEN](#). Otherwise both [xChromaOffset](#) and [yChromaOffset](#) **must** be [VK_CHROMA_LOCATION_MIDPOINT](#). If neither [VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT](#) nor [VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT](#) is set, the application **must** not define a [sampler Y'C_BC_R conversion](#) using this format as a source.
- [VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT](#) specifies that an application **can** define a [sampler Y'C_BC_R conversion](#) using this format as a source with [chromaFilter](#) set to [VK_FILTER_LINEAR](#).
- [VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_SEPARATE_RECONSTRUCTION_FILTER_BIT](#) specifies that the format can have different chroma, min, and mag filters.
- [VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT](#) specifies that reconstruction is explicit, as described in [Chroma Reconstruction](#). If this bit is not present, reconstruction is implicit by default.
- [VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT](#) specifies that reconstruction **can** be forcibly made explicit by setting [VkSamplerYcbcrConversionCreateInfo::forceExplicitReconstruction](#) to [VK_TRUE](#). If the format being queried supports [VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT](#) it **must** also support [VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT](#).
- [VK_FORMAT_FEATURE_DISJOINT_BIT](#) specifies that a multi-planar image **can** have the [VK_IMAGE_CREATE_DISJOINT_BIT](#) set during image creation. An implementation **must** not set [VK_FORMAT_FEATURE_DISJOINT_BIT](#) for *single-plane formats*.
- [VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR](#) specifies that an image view **can** be used as a [fragment shading rate attachment](#). An implementation **must** not set this feature for formats with a [numeric format](#) other than [UINT](#), or set it as a buffer feature.

The following bits **may** be set in `bufferFeatures`, specifying that the features are supported by `buffers` or `buffer views` created with the queried `vkGetPhysicalDeviceFormatProperties::format`:

- `VK_FORMAT_FEATURE_UNIFORM_TEXEL_BUFFER_BIT` specifies that the format **can** be used to create a buffer view that **can** be bound to a `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` descriptor.
- `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT` specifies that the format **can** be used to create a buffer view that **can** be bound to a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor.
- `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT` specifies that atomic operations are supported on `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` with this format.
- `VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT` specifies that the format **can** be used as a vertex attribute format (`VkVertexInputAttributeDescription::format`).

NOTE

`VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT` and `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT` are only intended to be advertised for single-component formats, since SPIR-V atomic operations require a scalar type.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkFormatFeatureFlags;
```

`VkFormatFeatureFlags` is a bitmask type for setting a mask of zero or more `VkFormatFeatureFlagBits`.

To query supported format features which are properties of the physical device, call:

```
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceFormatProperties2(
    VkPhysicalDevice          physicalDevice,
    VkFormat                  format,
    VkFormatProperties2*      pFormatProperties);
```

- `physicalDevice` is the physical device from which to query the format properties.
- `format` is the format whose properties are queried.
- `pFormatProperties` is a pointer to a `VkFormatProperties2` structure in which physical device properties for `format` are returned.

`vkGetPhysicalDeviceFormatProperties2` behaves similarly to `vkGetPhysicalDeviceFormatProperties`, with the ability to return extended information in a `pNext` chain of output structures.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFormatProperties2-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceFormatProperties2-format-parameter `format` **must** be a valid `VkFormat` value

- VUID-vkGetPhysicalDeviceFormatProperties2-pFormatProperties-parameter **pFormatProperties** **must** be a valid pointer to a [VkFormatProperties2](#) structure

The [VkFormatProperties2](#) structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkFormatProperties2 {
    VkStructureType    sType;
    void*              pNext;
    VkFormatProperties  formatProperties;
} VkFormatProperties2;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **formatProperties** is a [VkFormatProperties](#) structure describing features supported by the requested format.

Valid Usage (Implicit)

- VUID-VkFormatProperties2-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_FORMAT_PROPERTIES_2**
- VUID-VkFormatProperties2-pNext-pNext
Each **pNext** member of any structure (including this one) in the **pNext** chain **must** be either **NULL** or a pointer to a valid instance of [VkDrmFormatModifierPropertiesList2EXT](#) or [VkDrmFormatModifierPropertiesListEXT](#)
- VUID-VkFormatProperties2-sType-unique
The **sType** value of each structure in the **pNext** chain **must** be unique

To obtain the list of [Linux DRM format modifiers](#) compatible with a [VkFormat](#), add a [VkDrmFormatModifierPropertiesListEXT](#) structure to the **pNext** chain of [VkFormatProperties2](#).

The [VkDrmFormatModifierPropertiesListEXT](#) structure is defined as:

```
// Provided by VK_EXT_image_drm_format_modifier
typedef struct VkDrmFormatModifierPropertiesListEXT {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           drmFormatModifierCount;
    VkDrmFormatModifierPropertiesEXT* pDrmFormatModifierProperties;
} VkDrmFormatModifierPropertiesListEXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.

- `drmFormatModifierCount` is an inout parameter related to the number of modifiers compatible with the `format`, as described below.
- `pDrmFormatModifierProperties` is either `NULL` or a pointer to an array of `VkDrmFormatModifierPropertiesEXT` structures.

If `pDrmFormatModifierProperties` is `NULL`, then the function returns in `drmFormatModifierCount` the number of modifiers compatible with the queried `format`. Otherwise, the application **must** set `drmFormatModifierCount` to the length of the array `pDrmFormatModifierProperties`; the function will write at most `drmFormatModifierCount` elements to the array, and will return in `drmFormatModifierCount` the number of elements written.

Among the elements in array `pDrmFormatModifierProperties`, each returned `drmFormatModifier` **must** be unique.

Valid Usage (Implicit)

- `VUID-VkDrmFormatModifierPropertiesListEXT-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_DRM_FORMAT_MODIFIER_PROPERTIES_LIST_EXT`

The `VkDrmFormatModifierPropertiesEXT` structure describes properties of a `VkFormat` when that format is combined with a `Linux DRM format modifier`. These properties, like those of `VkFormatProperties2`, are independent of any particular image.

The `VkDrmFormatModifierPropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_image_drm_format_modifier
typedef struct VkDrmFormatModifierPropertiesEXT {
    uint64_t          drmFormatModifier;
    uint32_t          drmFormatModifierPlaneCount;
    VkFormatFeatureFlags  drmFormatModifierTilingFeatures;
} VkDrmFormatModifierPropertiesEXT;
```

- `drmFormatModifier` is a *Linux DRM format modifier*.
- `drmFormatModifierPlaneCount` is the number of *memory planes* in any image created with `format` and `drmFormatModifier`. An image's *memory planecount* is distinct from its *format planecount*, as explained below.
- `drmFormatModifierTilingFeatures` is a bitmask of `VkFormatFeatureFlagBits` that are supported by any image created with `format` and `drmFormatModifier`.

The returned `drmFormatModifierTilingFeatures` **must** contain at least one bit.

The implementation **must** not return `DRM_FORMAT_MOD_INVALID` in `drmFormatModifier`.

An image's *memory planecount* (as returned by `drmFormatModifierPlaneCount`) is distinct from its *format planecount* (in the sense of `multi-planar format`). In `VkImageAspectFlags`, each `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT` represents a *memory plane* and each

`VK_IMAGE_ASPECT_PLANE_i_BIT` a *format plane*.

An image's set of *format planes* is an ordered partition of the image's **content** into separable groups of format components. The ordered partition is encoded in the name of each `VkFormat`. For example, `VK_FORMAT_G8_B8R8_2PLANE_420_UNORM` contains two *format planes*; the first plane contains the green component and the second plane contains the blue component and red component. If the format name does not contain `PLANE`, then the format contains a single plane; for example, `VK_FORMAT_R8G8B8A8_UNORM`. Some commands, such as `vkCmdCopyBufferToImage`, do not operate on all format components in the image, but instead operate only on the *format planes* explicitly chosen by the application and operate on each *format plane* independently.

An image's set of *memory planes* is an ordered partition of the image's **memory** rather than the image's **content**. Each *memory plane* is a contiguous range of memory. The union of an image's *memory planes* is not necessarily contiguous.

If an image is *linear*, then the partition is the same for *memory planes* and for *format planes*. Therefore, if the returned `drmFormatModifier` is `DRM_FORMAT_MOD_LINEAR`, then `drmFormatModifierPlaneCount` **must** equal the *format plane*count, and `drmFormatModifierTilingFeatures` **must** be identical to the `VkFormatProperties2::formatProperties.linearTilingFeatures` returned in the same `pNext` chain.

If an image is *non-linear*, then the partition of the image's **memory** into *memory planes* is implementation-specific and **may** be unrelated to the partition of the image's **content** into *format planes*. For example, consider an image whose *format* is `VK_FORMAT_G8_B8_R8_3PLANE_420_UNORM`, *tiling* is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, whose `drmFormatModifier` is not `DRM_FORMAT_MOD_LINEAR`, and `flags` lacks `VK_IMAGE_CREATE_DISJOINT_BIT`. The image has 3 *format planes*, and commands such `vkCmdCopyBufferToImage` act on each *format plane* independently as if the data of each *format plane* were separable from the data of the other planes. In a straightforward implementation, the implementation **may** store the image's content in 3 adjacent *memory planes* where each *memory plane* corresponds exactly to a *format plane*. However, the implementation **may** also store the image's content in a single *memory plane* where all format components are combined using an implementation-private block-compressed format; or the implementation **may** store the image's content in a collection of 7 adjacent *memory planes* using an implementation-private sharding technique. Because the image is non-linear and non-disjoint, the implementation has much freedom when choosing the image's placement in memory.

The *memory plane*count applies to function parameters and structures only when the API specifies an explicit requirement on `drmFormatModifierPlaneCount`. In all other cases, the *memory plane*count is ignored.

35.2.1. Potential Format Features

Some *valid usage conditions* depend on the format features supported by a `VkImage` whose `VkImageTiling` is unknown. In such cases the exact `VkFormatFeatureFlagBits` supported by the `VkImage` cannot be determined, so the valid usage conditions are expressed in terms of the *potential format features* of the `VkImage` format.

The *potential format features* of a `VkFormat` are defined as follows:

- The union of `VkFormatFeatureFlagBits` supported when the `VkImageTiling` is `VK_IMAGE_TILING_OPTIMAL`, `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, or `VK_IMAGE_TILING_LINEAR` if `VkFormat` is not `VK_FORMAT_UNDEFINED`
- `VkScreenBufferFormatPropertiesQNX::formatFeatures` of a valid external format if `VkFormat` is `VK_FORMAT_UNDEFINED`

35.3. Required Format Support

Implementations **must** support at least the following set of features on the listed formats. For images, these features **must** be supported for every `VkImageType` (including arrayed and cube variants) unless otherwise noted. These features are supported on existing formats without needing to advertise an extension or needing to explicitly enable them. Support for additional functionality beyond the requirements listed here is queried using the `vkGetPhysicalDeviceFormatProperties` command.

NOTE

Unless otherwise excluded below, the required formats are supported for all `VkImageCreateFlags` values as long as those flag values are otherwise allowed.

The following tables show which feature bits **must** be supported for each format. Formats that are required to support `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT` **must** also support `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT` and `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`.

Table 58. Key for Format Feature Tables

The `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`, `VK_FORMAT_FEATURE_BLIT_SRC_BIT` and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` features **must** be supported in `optimalTilingFeatures` for all the formats in at least one of: this table, [Mandatory Format Support: BC Compressed Formats With VkImageType VK_IMAGE_TYPE_2D](#) and `VK_IMAGE_TYPE_3D`, or [Mandatory Format Support: ETC2 and EAC Compressed Formats With VkImageType VK_IMAGE_TYPE_2D](#).

If cubic filtering is supported, `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT` **must** be supported for the following image view types:

- `VK_IMAGE_VIEW_TYPE_2D`
- `VK_IMAGE_VIEW_TYPE_2D_ARRAY`

for the following formats:

- `VK_FORMAT_R4G4_UNORM_PACK8`
- `VK_FORMAT_R4G4B4A4_UNORM_PACK16`
- `VK_FORMAT_B4G4R4A4_UNORM_PACK16`
- `VK_FORMAT_R5G6B5_UNORM_PACK16`
- `VK_FORMAT_B5G6R5_UNORM_PACK16`
- `VK_FORMAT_R5G5B5A1_UNORM_PACK16`
- `VK_FORMAT_B5G5R5A1_UNORM_PACK16`
- `VK_FORMAT_A1R5G5B5_UNORM_PACK16`
- `VK_FORMAT_R8_UNORM`
- `VK_FORMAT_R8_SNORM`
- `VK_FORMAT_R8_SRGB`
- `VK_FORMAT_R8G8_UNORM`
- `VK_FORMAT_R8G8_SNORM`
- `VK_FORMAT_R8G8_SRGB`
- `VK_FORMAT_R8G8B8_UNORM`
- `VK_FORMAT_R8G8B8_SNORM`
- `VK_FORMAT_R8G8B8_SRGB`

- `VK_FORMAT_B8G8R8_UNORM`
- `VK_FORMAT_B8G8R8_SNORM`
- `VK_FORMAT_B8G8R8_SRGB`
- `VK_FORMAT_R8G8B8A8_UNORM`
- `VK_FORMAT_R8G8B8A8_SNORM`
- `VK_FORMAT_R8G8B8A8_SRGB`
- `VK_FORMAT_B8G8R8A8_UNORM`
- `VK_FORMAT_B8G8R8A8_SNORM`
- `VK_FORMAT_B8G8R8A8_SRGB`
- `VK_FORMAT_A8B8G8R8_UNORM_PACK32`
- `VK_FORMAT_A8B8G8R8_SNORM_PACK32`
- `VK_FORMAT_A8B8G8R8_SRGB_PACK32`

If ETC compressed formats are supported, `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT` **must** be supported for the following image view types:

- `VK_IMAGE_VIEW_TYPE_2D`
- `VK_IMAGE_VIEW_TYPE_2D_ARRAY`

for the following additional formats:

- `VK_FORMAT_ETC2_R8G8B8_UNORM_BLOCK`
- `VK_FORMAT_ETC2_R8G8B8_SRGB_BLOCK`
- `VK_FORMAT_ETC2_R8G8B8A1_UNORM_BLOCK`
- `VK_FORMAT_ETC2_R8G8B8A1_SRGB_BLOCK`
- `VK_FORMAT_ETC2_R8G8B8A8_UNORM_BLOCK`
- `VK_FORMAT_ETC2_R8G8B8A8_SRGB_BLOCK`

If cubic filtering is supported for any other formats, the following image view types **must** be supported for those formats:

- `VK_IMAGE_VIEW_TYPE_2D`
- `VK_IMAGE_VIEW_TYPE_2D_ARRAY`

To be used with `VkImageView` with `subresourceRange.aspectMask` equal to `VK_IMAGE_ASPECT_COLOR_BIT`, `sampler Y'CBCR conversion` **must** be enabled for the following formats:

VK_FORMAT_G16B16G16R16_422_UNORM	1																		
VK_FORMAT_B16G16R16G16_422_UNORM	1																		
VK_FORMAT_G16_B16_R16_3PLANE_420_UNORM	3																		
VK_FORMAT_G16_B16R16_2PLANE_420_UNORM	2																		
VK_FORMAT_G16_B16_R16_3PLANE_422_UNORM	3																		
VK_FORMAT_G16_B16R16_2PLANE_422_UNORM	2																		
VK_FORMAT_G16_B16_R16_3PLANE_444_UNORM	3																		
VK_FORMAT_G8_B8R8_2PLANE_444_UNORM	2																		
VK_FORMAT_G10X6_B10X6R10X6_2PLANE_444_UNORM_3PACK16	2																		
VK_FORMAT_G12X4_B12X4R12X4_2PLANE_444_UNORM_3PACK16	2																		
VK_FORMAT_G16_B16R16_2PLANE_444_UNORM	2																		
Format features marked † must be supported for optimalTilingFeatures with VkImageType VK_IMAGE_TYPE_2D if the VkPhysicalDevice supports the VkPhysicalDeviceSamplerYcbcrConversionFeatures feature.																			

Implementations are not required to support the [VK_IMAGE_CREATE_SPARSE_BINDING_BIT](#), [VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT](#), or [VK_IMAGE_CREATE_SPARSE_ALIASED_BIT](#) [VkImageCreateFlags](#) for the above formats that require [sampler Y'C_BC_R conversion](#). To determine whether the implementation supports sparse image creation flags with these formats use [vkGetPhysicalDeviceImageFormatProperties](#) or [vkGetPhysicalDeviceImageFormatProperties2](#).

[VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR](#) **must** be supported for the following formats if the [attachmentFragmentShadingRate](#) feature is supported:

- [VK_FORMAT_R8_UINT](#)

35.3.1. Formats Without Shader Storage Format

The device-level features for using a storage image or a storage texel buffer with an image format of [Unknown](#), [shaderStorageImageReadWithoutFormat](#) and [shaderStorageImageWriteWithoutFormat](#), only apply to the following formats:

- [VK_FORMAT_R8G8B8A8_UNORM](#)
- [VK_FORMAT_R8G8B8A8_SNORM](#)
- [VK_FORMAT_R8G8B8A8_UINT](#)
- [VK_FORMAT_R8G8B8A8_SINT](#)
- [VK_FORMAT_R32_UINT](#)
- [VK_FORMAT_R32_SINT](#)
- [VK_FORMAT_R32_SFLOAT](#)
- [VK_FORMAT_R32G32_UINT](#)
- [VK_FORMAT_R32G32_SINT](#)

- VK_FORMAT_R32G32_SFLOAT
- VK_FORMAT_R32G32B32A32_UINT
- VK_FORMAT_R32G32B32A32_SINT
- VK_FORMAT_R32G32B32A32_SFLOAT
- VK_FORMAT_R16G16B16A16_UINT
- VK_FORMAT_R16G16B16A16_SINT
- VK_FORMAT_R16G16B16A16_SFLOAT
- VK_FORMAT_R16G16_SFLOAT
- VK_FORMAT_B10G11R11_UFLOAT_PACK32
- VK_FORMAT_R16_SFLOAT
- VK_FORMAT_R16G16B16A16_UNORM
- VK_FORMAT_A2B10G10R10_UNORM_PACK32
- VK_FORMAT_R16G16_UNORM
- VK_FORMAT_R8G8_UNORM
- VK_FORMAT_R16_UNORM
- VK_FORMAT_R8_UNORM
- VK_FORMAT_R16G16B16A16_SNORM
- VK_FORMAT_R16G16_SNORM
- VK_FORMAT_R8G8_SNORM
- VK_FORMAT_R16_SNORM
- VK_FORMAT_R8_SNORM
- VK_FORMAT_R16G16_SINT
- VK_FORMAT_R8G8_SINT
- VK_FORMAT_R16_SINT
- VK_FORMAT_R8_SINT
- VK_FORMAT_A2B10G10R10_UINT_PACK32
- VK_FORMAT_R16G16_UINT
- VK_FORMAT_R8G8_UINT
- VK_FORMAT_R16_UINT
- VK_FORMAT_R8_UINT

NOTE

This list of formats is the union of required storage formats from [Required Format Support](#) section and formats listed in [shaderStorageImageExtendedFormats](#).

35.3.2. Format Feature Dependent Usage Flags

Certain resource usage flags depend on support for the corresponding format feature flag for the format in question. The following tables list the [VkBufferUsageFlagBits](#) and [VkImageUsageFlagBits](#) that have such dependencies, and the format feature flags they depend on. Additional restrictions, including, but not limited to, further required format feature flags specific to the particular use of the resource **may** apply, as described in the respective sections of this specification.

Table 73. Format Feature Dependent Buffer Usage Flags

Buffer usage flag	Required format feature flag
VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT	VK_FORMAT_FEATURE_UNIFORM_TEXEL_BUFFER_BIT
VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT	VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT
VK_BUFFER_USAGE_VERTEX_BUFFER_BIT	VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT

Table 74. Format Feature Dependent Image Usage Flags

Image usage flag	Required format feature flag
VK_IMAGE_USAGE_SAMPLED_BIT	VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT
VK_IMAGE_USAGE_STORAGE_BIT	VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT
VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT	VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT
VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT	VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT
VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT	VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT
VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR	VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

Chapter 36. Additional Capabilities

This chapter describes additional capabilities beyond the minimum capabilities described in the [Limits](#) and [Formats](#) chapters, including:

- [Additional Image Capabilities](#)
- [Additional Buffer Capabilities](#)
- [Optional Semaphore Capabilities](#)
- [Optional Fence Capabilities](#)
- [Timestamp Calibration Capabilities](#)

36.1. Additional Image Capabilities

Additional image capabilities, such as larger dimensions or additional sample counts for certain image types, or additional capabilities for *linear* tiling format images, are described in this section.

To query additional capabilities specific to image types, call:

WARNING

This functionality is superseded by [Vulkan Version 1.1](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
VkResult vkGetPhysicalDeviceImageFormatProperties(
    VkPhysicalDevice    physicalDevice,
    VkFormat             format,
    VkImageType         type,
    VkImageTiling        tiling,
    VkImageUsageFlags    usage,
    VkImageCreateFlags    flags,
    VkImageFormatProperties* pImageFormatProperties);
```

- `physicalDevice` is the physical device from which to query the image capabilities.
- `format` is a [VkFormat](#) value specifying the image format, corresponding to [VkImageCreateInfo::format](#).
- `type` is a [VkImageType](#) value specifying the image type, corresponding to [VkImageCreateInfo::imageType](#).
- `tiling` is a [VkImageTiling](#) value specifying the image tiling, corresponding to [VkImageCreateInfo::tiling](#).
- `usage` is a bitmask of [VkImageUsageFlagBits](#) specifying the intended usage of the image, corresponding to [VkImageCreateInfo::usage](#).
- `flags` is a bitmask of [VkImageCreateFlagBits](#) specifying additional parameters of the image, corresponding to [VkImageCreateInfo::flags](#).
- `pImageFormatProperties` is a pointer to a [VkImageFormatProperties](#) structure in which

capabilities are returned.

The `format`, `type`, `tiling`, `usage`, and `flags` parameters correspond to parameters that would be consumed by `vkCreateImage` (as members of `VkImageCreateInfo`).

If `format` is not a supported image format, or if the combination of `format`, `type`, `tiling`, `usage`, and `flags` is not supported for images, then `vkGetPhysicalDeviceImageFormatProperties` returns `VK_ERROR_FORMAT_NOT_SUPPORTED`.

The limitations on an image format that are reported by `vkGetPhysicalDeviceImageFormatProperties` have the following property: if `usage1` and `usage2` of type `VkImageUsageFlags` are such that the bits set in `usage1` are a subset of the bits set in `usage2`, and `flags1` and `flags2` of type `VkImageCreateFlags` are such that the bits set in `flags1` are a subset of the bits set in `flags2`, then the limitations for `usage1` and `flags1` **must** be no more strict than the limitations for `usage2` and `flags2`, for all values of `format`, `type`, and `tiling`.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetPhysicalDeviceImageFormatProperties` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkGetPhysicalDeviceImageFormatProperties-tiling-02248
`tiling` **must** not be `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`. (Use `vkGetPhysicalDeviceImageFormatProperties2` instead)

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceImageFormatProperties-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceImageFormatProperties-format-parameter
`format` **must** be a valid `VkFormat` value
- VUID-vkGetPhysicalDeviceImageFormatProperties-type-parameter
`type` **must** be a valid `VkImageType` value
- VUID-vkGetPhysicalDeviceImageFormatProperties-tiling-parameter
`tiling` **must** be a valid `VkImageTiling` value
- VUID-vkGetPhysicalDeviceImageFormatProperties-usage-parameter
`usage` **must** be a valid combination of `VkImageUsageFlagBits` values
- VUID-vkGetPhysicalDeviceImageFormatProperties-usage-requiredbitmask
`usage` **must** not be `0`
- VUID-vkGetPhysicalDeviceImageFormatProperties-flags-parameter
`flags` **must** be a valid combination of `VkImageCreateFlagBits` values
- VUID-vkGetPhysicalDeviceImageFormatProperties-pImageFormatProperties-parameter
`pImageFormatProperties` **must** be a valid pointer to a `VkImageFormatProperties` structure

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_FORMAT_NOT_SUPPORTED`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkImageFormatProperties` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkImageFormatProperties {
    VkExtent3D          maxExtent;
    uint32_t            maxMipLevels;
    uint32_t            maxArrayLayers;
    VkSampleCountFlags  sampleCounts;
    VkDeviceSize        maxResourceSize;
} VkImageFormatProperties;
```

- `maxExtent` are the maximum image dimensions. See the [Allowed Extent Values](#) section below for how these values are constrained by `type`.
- `maxMipLevels` is the maximum number of mipmap levels. `maxMipLevels` **must** be equal to the number of levels in the complete mipmap chain based on the `maxExtent.width`, `maxExtent.height`, and `maxExtent.depth`, except when one of the following conditions is true, in which case it **may** instead be 1:
 - `vkGetPhysicalDeviceImageFormatProperties::tiling` was `VK_IMAGE_TILING_LINEAR`
 - `VkPhysicalDeviceImageFormatInfo2::tiling` was `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`
 - the `VkPhysicalDeviceImageFormatInfo2::pNext` chain included a `VkPhysicalDeviceExternalImageFormatInfo` structure with a handle type included in the `handleTypes` member for which mipmap image support is not required
 - image `format` is one of the [formats that require a sampler Y'C_BC_R conversion](#)
- `maxArrayLayers` is the maximum number of array layers. `maxArrayLayers` **must** be no less than `VkPhysicalDeviceLimits::maxImageArrayLayers`, except when one of the following conditions is true, in which case it **may** instead be 1:
 - `tiling` is `VK_IMAGE_TILING_LINEAR`
 - `tiling` is `VK_IMAGE_TILING_OPTIMAL` and `type` is `VK_IMAGE_TYPE_3D`
 - `format` is one of the [formats that require a sampler Y'C_BC_R conversion](#)

- If `tiling` is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `maxArrayLayers` **must** not be 0.
- `sampleCounts` is a bitmask of `VkSampleCountFlagBits` specifying all the supported sample counts for this image as described [below](#).
- `maxResourceSize` is an upper bound on the total image size in bytes, inclusive of all image subresources. Implementations **may** have an address space limit on total size of a resource, which is advertised by this property. `maxResourceSize` **must** be at least 2^{31} .

NOTE

There is no mechanism to query the size of an image before creating it, to compare that size against `maxResourceSize`. If an application attempts to create an image that exceeds this limit, the creation will fail and `vkCreateImage` will return `VK_ERROR_OUT_OF_DEVICE_MEMORY`. While the advertised limit **must** be at least 2^{31} , it **may** not be possible to create an image that approaches that size, particularly for `VK_IMAGE_TYPE_1D`.

If the combination of parameters to `vkGetPhysicalDeviceImageFormatProperties` is not supported by the implementation for use in `vkCreateImage`, then all members of `VkImageFormatProperties` will be filled with zero.

NOTE

Filling `VkImageFormatProperties` with zero for unsupported formats is an exception to the usual rule that output structures have undefined contents on error. This exception was unintentional, but is preserved for backwards compatibility.

To query additional capabilities specific to image types, call:

```
// Provided by VK_VERSION_1_1
VkResult vkGetPhysicalDeviceImageFormatProperties2(
    VkPhysicalDevice          physicalDevice,
    const VkPhysicalDeviceImageFormatInfo2* pImageFormatInfo,
    VkImageFormatProperties2* pImageFormatProperties);
```

- `physicalDevice` is the physical device from which to query the image capabilities.
- `pImageFormatInfo` is a pointer to a `VkPhysicalDeviceImageFormatInfo2` structure describing the parameters that would be consumed by `vkCreateImage`.
- `pImageFormatProperties` is a pointer to a `VkImageFormatProperties2` structure in which capabilities are returned.

`vkGetPhysicalDeviceImageFormatProperties2` behaves similarly to `vkGetPhysicalDeviceImageFormatProperties`, with the ability to return extended information in a `pNext` chain of output structures.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetPhysicalDeviceImageFormatProperties2` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceImageFormatProperties2-physicalDevice-parameter

`physicalDevice` **must** be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceImageFormatProperties2-pImageFormatInfo-parameter `pImageFormatInfo` **must** be a valid pointer to a valid `VkPhysicalDeviceImageFormatInfo2` structure
- VUID-vkGetPhysicalDeviceImageFormatProperties2-pImageFormatProperties-parameter `pImageFormatProperties` **must** be a valid pointer to a `VkImageFormatProperties2` structure

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_FORMAT_NOT_SUPPORTED`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkPhysicalDeviceImageFormatInfo2` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceImageFormatInfo2 {
    VkStructureType    sType;
    const void*        pNext;
    VkFormat            format;
    VkImageType         type;
    VkImageTiling        tiling;
    VkImageUsageFlags   usage;
    VkImageCreateFlags   flags;
} VkPhysicalDeviceImageFormatInfo2;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure. The `pNext` chain of `VkPhysicalDeviceImageFormatInfo2` is used to provide additional image parameters to `vkGetPhysicalDeviceImageFormatProperties2`.
- `format` is a `VkFormat` value indicating the image format, corresponding to `VkImageCreateInfo::format`.
- `type` is a `VkImageType` value indicating the image type, corresponding to `VkImageCreateInfo::imageType`.
- `tiling` is a `VkImageTiling` value indicating the image tiling, corresponding to `VkImageCreateInfo::tiling`.

- **usage** is a bitmask of `VkImageUsageFlagBits` indicating the intended usage of the image, corresponding to `VkImageCreateInfo::usage`.
- **flags** is a bitmask of `VkImageCreateFlagBits` indicating additional parameters of the image, corresponding to `VkImageCreateInfo::flags`.

The members of `VkPhysicalDeviceImageFormatInfo2` correspond to the arguments to `vkGetPhysicalDeviceImageFormatProperties`, with **sType** and **pNext** added for extensibility.

Valid Usage

- VUID-VkPhysicalDeviceImageFormatInfo2-tiling-02249
tiling **must** be `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` if and only if the **pNext** chain includes `VkPhysicalDeviceImageDrmFormatModifierInfoEXT`
- VUID-VkPhysicalDeviceImageFormatInfo2-tiling-02313
If **tiling** is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` and **flags** contains `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`, then the **pNext** chain **must** include a `VkImageFormatListCreateInfo` structure with non-zero **viewFormatCount**

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceImageFormatInfo2-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_FORMAT_INFO_2`
- VUID-VkPhysicalDeviceImageFormatInfo2-pNext-pNext
Each **pNext** member of any structure (including this one) in the **pNext** chain **must** be either `NULL` or a pointer to a valid instance of `VkImageFormatListCreateInfo`, `VkImageStencilUsageCreateInfo`, `VkPhysicalDeviceExternalImageFormatInfo`, `VkPhysicalDeviceImageDrmFormatModifierInfoEXT`, or `VkPhysicalDeviceImageViewImageFormatInfoEXT`
- VUID-VkPhysicalDeviceImageFormatInfo2-sType-unique
The **sType** value of each structure in the **pNext** chain **must** be unique
- VUID-VkPhysicalDeviceImageFormatInfo2-format-parameter
format **must** be a valid `VkFormat` value
- VUID-VkPhysicalDeviceImageFormatInfo2-type-parameter
type **must** be a valid `VkImageType` value
- VUID-VkPhysicalDeviceImageFormatInfo2-tiling-parameter
tiling **must** be a valid `VkImageTiling` value
- VUID-VkPhysicalDeviceImageFormatInfo2-usage-parameter
usage **must** be a valid combination of `VkImageUsageFlagBits` values
- VUID-VkPhysicalDeviceImageFormatInfo2-usage-requiredbitmask
usage **must** not be `0`
- VUID-VkPhysicalDeviceImageFormatInfo2-flags-parameter
flags **must** be a valid combination of `VkImageCreateFlagBits` values

The `VkImageFormatProperties2` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkImageFormatProperties2 {
    VkStructureType    sType;
    void*              pNext;
    VkImageFormatProperties    imageFormatProperties;
} VkImageFormatProperties2;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure. The `pNext` chain of `VkImageFormatProperties2` is used to allow the specification of additional capabilities to be returned from `vkGetPhysicalDeviceImageFormatProperties2`.
- `imageFormatProperties` is a `VkImageFormatProperties` structure in which capabilities are returned.

If the combination of parameters to `vkGetPhysicalDeviceImageFormatProperties2` is not supported by the implementation for use in `vkCreateImage`, then all members of `imageFormatProperties` will be filled with zero.

NOTE

Filling `imageFormatProperties` with zero for unsupported formats is an exception to the usual rule that output structures have undefined contents on error. This exception was unintentional, but is preserved for backwards compatibility. This exception only applies to `imageFormatProperties`, not `sType`, `pNext`, or any structures chained from `pNext`.

Valid Usage (Implicit)

- VUID-VkImageFormatProperties2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_FORMAT_PROPERTIES_2`
- VUID-VkImageFormatProperties2-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkExternalImageFormatProperties`, `VkFilterCubicImageViewImageFormatPropertiesEXT`, or `VkSamplerYcbcrConversionImageFormatProperties`
- VUID-VkImageFormatProperties2-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique

To determine the image capabilities compatible with an external memory handle type, add a `VkPhysicalDeviceExternalImageFormatInfo` structure to the `pNext` chain of the `VkPhysicalDeviceImageFormatInfo2` structure and a `VkExternalImageFormatProperties` structure to the `pNext` chain of the `VkImageFormatProperties2` structure.

The `VkPhysicalDeviceExternalImageFormatInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceExternalImageFormatInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
} VkPhysicalDeviceExternalImageFormatInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the memory handle type that will be used with the memory associated with the image.

If `handleType` is 0, `vkGetPhysicalDeviceImageFormatProperties2` will behave as if `VkPhysicalDeviceExternalImageFormatInfo` was not present, and `VkExternalImageFormatProperties` will be ignored.

If `handleType` is not compatible with the `format`, `type`, `tiling`, `usage`, and `flags` specified in `VkPhysicalDeviceImageFormatInfo2`, then `vkGetPhysicalDeviceImageFormatProperties2` returns `VK_ERROR_FORMAT_NOT_SUPPORTED`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalImageFormatInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_IMAGE_FORMAT_INFO`
- VUID-VkPhysicalDeviceExternalImageFormatInfo-handleType-parameter
If `handleType` is not 0, `handleType` **must** be a valid `VkExternalMemoryHandleTypeFlagBits` value

Possible values of `VkPhysicalDeviceExternalImageFormatInfo::handleType`, specifying an external memory handle type, are:

```

// Provided by VK_VERSION_1_1
typedef enum VkExternalMemoryHandleTypeFlagBits {
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT = 0x00000001,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT = 0x00000002,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT = 0x00000004,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT = 0x00000008,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT = 0x00000010,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT = 0x00000020,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT = 0x00000040,
// Provided by VK_EXT_external_memory_dma_buf
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT = 0x00000200,
// Provided by VK_EXT_external_memory_host
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT = 0x00000080,
// Provided by VK_EXT_external_memory_host
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT = 0x00000100,
// Provided by VK_NV_external_memory_sci_buf
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCI_BUF_BIT_NV = 0x00002000,
// Provided by VK_QNX_external_memory_screen_buffer
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX = 0x00004000,
} VkExternalMemoryHandleTypeFlagBits;

```

- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT** specifies a POSIX file descriptor handle that has only limited valid usage outside of Vulkan and other compatible APIs. It **must** be compatible with the POSIX system calls **dup**, **dup2**, **close**, and the non-standard system call **dup3**. Additionally, it **must** be transportable over a socket using an **SCM_RIGHTS** control message. It owns a reference to the underlying memory resource represented by its Vulkan memory object.
- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT** specifies an NT handle that has only limited valid usage outside of Vulkan and other compatible APIs. It **must** be compatible with the functions **DuplicateHandle**, **CloseHandle**, **CompareObjectHandles**, **GetHandleInformation**, and **SetHandleInformation**. It owns a reference to the underlying memory resource represented by its Vulkan memory object.
- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT** specifies a global share handle that has only limited valid usage outside of Vulkan and other compatible APIs. It is not compatible with any native APIs. It does not own a reference to the underlying memory resource represented by its Vulkan memory object, and will therefore become invalid when all Vulkan memory objects associated with it are destroyed.
- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT** specifies an NT handle returned by **IDXGIResource1::CreateSharedHandle** referring to a Direct3D 10 or 11 texture resource. It owns a reference to the memory used by the Direct3D resource.
- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT** specifies a global share handle returned by **IDXGIResource::GetSharedHandle** referring to a Direct3D 10 or 11 texture resource. It does not own a reference to the underlying Direct3D resource, and will therefore become invalid when all Vulkan memory objects and Direct3D resources associated with it are destroyed.
- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT** specifies an NT handle returned by **ID3D12Device::CreateSharedHandle** referring to a Direct3D 12 heap resource. It owns a reference to the resources used by the Direct3D heap.

- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT` specifies an NT handle returned by `ID3D12Device::CreateSharedHandle` referring to a Direct3D 12 committed resource. It owns a reference to the memory used by the Direct3D resource.
- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT` specifies a host pointer returned by a host memory allocation command. It does not own a reference to the underlying memory resource, and will therefore become invalid if the host memory is freed.
- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT` specifies a host pointer to *host mapped foreign memory*. It does not own a reference to the underlying memory resource, and will therefore become invalid if the foreign memory is unmapped or otherwise becomes no longer available.
- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT` is a file descriptor for a Linux `dma_buf`. It owns a reference to the underlying memory resource represented by its Vulkan memory object.
- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCI_BUF_BIT_NV` specifies a volatile memory object (`NvSciBufObj`) that is backed by a buffer and shareable across various hardware engines including the CPU, and software (intra-process and inter-process) and hardware (system memory) operating domains.
- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX` specifies a `_screen_buffer` object defined by the QNX SDP. See [QNX Screen Buffer](#) for more details of this handle type.

Some external memory handle types can only be shared within the same underlying physical device and/or the same driver version, as defined in the following table:

Table 75. External Memory Handle Types Compatibility

Handle type	VkPhysicalDeviceIDProperties::driverUUID	VkPhysicalDeviceIDProperties::deviceUUID
VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT	Must match	Must match
VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT	Must match	Must match
VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT	Must match	Must match
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT	Must match	Must match
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT	Must match	Must match
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT	Must match	Must match
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT	Must match	Must match
VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT	No restriction	No restriction
VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT	No restriction	No restriction
VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT	No restriction	No restriction
VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCI_BUF_BIT_NV	No restriction	No restriction
VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX	No restriction	No restriction

NOTE

The above table does not restrict the drivers and devices with which [VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT](#) and [VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT](#) **may** be shared, as these handle types inherently mean memory that does not come from the same device, as they import memory from the host or a foreign device, respectively.

NOTE

Even though the above table does not restrict the drivers and devices with which [VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT](#) **may** be shared, query mechanisms exist in the Vulkan API that prevent the import of incompatible dma-bufs (such as [vkGetMemoryFdPropertiesKHR](#)) and that prevent incompatible usage of dma-bufs (such as [VkPhysicalDeviceExternalBufferInfo](#) and [VkPhysicalDeviceExternalImageFormatInfo](#)).

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkExternalMemoryHandleTypeFlags;
```

`VkExternalMemoryHandleTypeFlags` is a bitmask type for setting a mask of zero or more `VkExternalMemoryHandleTypeFlagBits`.

The `VkExternalImageFormatProperties` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExternalImageFormatProperties {
    VkStructureType          sType;
    void*                    pNext;
    VkExternalMemoryProperties externalMemoryProperties;
} VkExternalImageFormatProperties;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `externalMemoryProperties` is a `VkExternalMemoryProperties` structure specifying various capabilities of the external handle type when used with the specified image creation parameters.

Valid Usage (Implicit)

- VUID-VkExternalImageFormatProperties-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_EXTERNAL_IMAGE_FORMAT_PROPERTIES`

The `VkExternalMemoryProperties` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExternalMemoryProperties {
    VkExternalMemoryFeatureFlags    externalMemoryFeatures;
    VkExternalMemoryHandleTypeFlags exportFromImportedHandleTypes;
    VkExternalMemoryHandleTypeFlags compatibleHandleTypes;
} VkExternalMemoryProperties;
```

- `externalMemoryFeatures` is a bitmask of `VkExternalMemoryFeatureFlagBits` specifying the features of `handleType`.
- `exportFromImportedHandleTypes` is a bitmask of `VkExternalMemoryHandleTypeFlagBits` specifying which types of imported handle `handleType` **can** be exported from.
- `compatibleHandleTypes` is a bitmask of `VkExternalMemoryHandleTypeFlagBits` specifying handle types which **can** be specified at the same time as `handleType` when creating an image compatible with external memory.

`compatibleHandleTypes` **must** include at least `handleType`. Inclusion of a handle type in

`compatibleHandleTypes` does not imply the values returned in `VkImageFormatProperties2` will be the same when `VkPhysicalDeviceExternalImageFormatInfo::handleType` is set to that type. The application is responsible for querying the capabilities of all handle types intended for concurrent use in a single image and intersecting them to obtain the compatible set of capabilities.

Bits which **may** be set in `VkExternalMemoryProperties::externalMemoryFeatures`, specifying features of an external memory handle type, are:

```
// Provided by VK_VERSION_1_1
typedef enum VkExternalMemoryFeatureFlagBits {
    VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT = 0x00000001,
    VK_EXTERNAL_MEMORY_FEATURE_EXPORTABLE_BIT = 0x00000002,
    VK_EXTERNAL_MEMORY_FEATURE_IMPORTABLE_BIT = 0x00000004,
} VkExternalMemoryFeatureFlagBits;
```

- `VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT` specifies that images or buffers created with the specified parameters and handle type **must** use the mechanisms defined by `VkMemoryDedicatedRequirements` and `VkMemoryDedicatedAllocateInfo` to create (or import) a dedicated allocation for the image or buffer.
- `VK_EXTERNAL_MEMORY_FEATURE_EXPORTABLE_BIT` specifies that handles of this type **can** be exported from Vulkan memory objects.
- `VK_EXTERNAL_MEMORY_FEATURE_IMPORTABLE_BIT` specifies that handles of this type **can** be imported as Vulkan memory objects.

Because their semantics in external APIs roughly align with that of an image or buffer with a dedicated allocation in Vulkan, implementations are **required** to report `VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT` for the following external handle types:

- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT`
- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT`
- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT`
- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX` for images only

Implementations **must** not report `VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT` for buffers with external handle type `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX`. Implementations **must** not report `VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT` for images or buffers with external handle type `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT`, or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT`.

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkExternalMemoryFeatureFlags;
```

`VkExternalMemoryFeatureFlags` is a bitmask type for setting a mask of zero or more `VkExternalMemoryFeatureFlagBits`.

To query the image capabilities that are compatible with a `Linux DRM format modifier`, set

VkPhysicalDeviceImageFormatInfo2::tiling to VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT and add a VkPhysicalDeviceImageDrmFormatModifierInfoEXT structure to the pNext chain of VkPhysicalDeviceImageFormatInfo2.

The VkPhysicalDeviceImageDrmFormatModifierInfoEXT structure is defined as:

```
// Provided by VK_EXT_image_drm_format_modifier
typedef struct VkPhysicalDeviceImageDrmFormatModifierInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    uint64_t           drmFormatModifier;
    VkSharingMode       sharingMode;
    uint32_t           queueFamilyIndexCount;
    const uint32_t*     pQueueFamilyIndices;
} VkPhysicalDeviceImageDrmFormatModifierInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- drmFormatModifier is the image's Linux DRM format modifier, corresponding to VkImageDrmFormatModifierExplicitCreateInfoEXT::drmFormatModifier or to VkImageDrmFormatModifierListCreateInfoEXT::pDrmFormatModifiers.
- sharingMode specifies how the image will be accessed by multiple queue families.
- queueFamilyIndexCount is the number of entries in the pQueueFamilyIndices array.
- pQueueFamilyIndices is a pointer to an array of queue families that will access the image. It is ignored if sharingMode is not VK_SHARING_MODE_CONCURRENT.

If the drmFormatModifier is incompatible with the parameters specified in VkPhysicalDeviceImageFormatInfo2 and its pNext chain, then vkGetPhysicalDeviceImageFormatProperties2 returns VK_ERROR_FORMAT_NOT_SUPPORTED. The implementation **must** support the query of any drmFormatModifier, including unknown and invalid modifier values.

Valid Usage

- VUID-VkPhysicalDeviceImageDrmFormatModifierInfoEXT-sharingMode-02314
If sharingMode is VK_SHARING_MODE_CONCURRENT, then pQueueFamilyIndices **must** be a valid pointer to an array of queueFamilyIndexCount uint32_t values
- VUID-VkPhysicalDeviceImageDrmFormatModifierInfoEXT-sharingMode-02315
If sharingMode is VK_SHARING_MODE_CONCURRENT, then queueFamilyIndexCount **must** be greater than 1
- VUID-VkPhysicalDeviceImageDrmFormatModifierInfoEXT-sharingMode-02316
If sharingMode is VK_SHARING_MODE_CONCURRENT, each element of pQueueFamilyIndices **must** be unique and **must** be less than the pQueueFamilyPropertyCount returned by vkGetPhysicalDeviceQueueFamilyProperties2 for the physicalDevice that was used to create device

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceImageDrmFormatModifierInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_DRM_FORMAT_MODIFIER_INFO_EXT`
- VUID-VkPhysicalDeviceImageDrmFormatModifierInfoEXT-sharingMode-parameter
`sharingMode` **must** be a valid `VkSharingMode` value

To determine the number of combined image samplers required to support a `multi-planar` format, add `VkSamplerYcbcrConversionImageFormatProperties` to the `pNext` chain of the `VkImageFormatProperties2` structure in a call to `vkGetPhysicalDeviceImageFormatProperties2`.

The `VkSamplerYcbcrConversionImageFormatProperties` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkSamplerYcbcrConversionImageFormatProperties {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           combinedImageSamplerDescriptorCount;
} VkSamplerYcbcrConversionImageFormatProperties;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `combinedImageSamplerDescriptorCount` is the number of combined image sampler descriptors that the implementation uses to access the format.

Valid Usage (Implicit)

- VUID-VkSamplerYcbcrConversionImageFormatProperties-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SAMPLER_YCBCR_CONVERSION_IMAGE_FORMAT_PROPERTIES`

`combinedImageSamplerDescriptorCount` is a number between 1 and the number of planes in the format. A descriptor set layout binding with immutable Y'C_BC_R conversion samplers will have a maximum `combinedImageSamplerDescriptorCount` which is the maximum across all formats supported by its samplers of the `combinedImageSamplerDescriptorCount` for each format. Descriptor sets with that layout will internally use that maximum `combinedImageSamplerDescriptorCount` descriptors for each descriptor in the binding. This expanded number of descriptors will be consumed from the descriptor pool when a descriptor set is allocated, and counts towards the `maxDescriptorSetSamplers`, `maxDescriptorSetSampledImages`, `maxPerStageDescriptorSamplers`, and `maxPerStageDescriptorSampledImages` limits.

NOTE

All descriptors in a binding use the same maximum `combinedImageSamplerDescriptorCount` descriptors to allow implementations to use a uniform stride for dynamic indexing of the descriptors in the binding.

For example, consider a descriptor set layout binding with two descriptors and immutable samplers for [multi-planar formats](#) that have [VkSamplerYcbcrConversionImageFormatProperties::combinedImageSamplerDescriptorCount](#) values of 2 and 3 respectively. There are two descriptors in the binding and the maximum [combinedImageSamplerDescriptorCount](#) is 3, so descriptor sets with this layout consume 6 descriptors from the descriptor pool. To create a descriptor pool that allows allocating four descriptor sets with this layout, [descriptorCount](#) must be at least 24.

To determine if cubic filtering can be used with a given image format and a given image view type add a [VkPhysicalDeviceImageViewImageFormatInfoEXT](#) structure to the [pNext](#) chain of the [VkPhysicalDeviceImageFormatInfo2](#) structure, and a [VkFilterCubicImageViewImageFormatPropertiesEXT](#) structure to the [pNext](#) chain of the [VkImageFormatProperties2](#) structure.

The [VkPhysicalDeviceImageViewImageFormatInfoEXT](#) structure is defined as:

```
// Provided by VK_EXT_filter_cubic
typedef struct VkPhysicalDeviceImageViewImageFormatInfoEXT {
    VkStructureType    sType;
    void*              pNext;
    VkImageViewType    imageViewType;
} VkPhysicalDeviceImageViewImageFormatInfoEXT;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [imageViewType](#) is a [VkImageViewType](#) value specifying the type of the image view.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceImageViewImageFormatInfoEXT-sType-sType [sType](#) **must** be [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_VIEW_IMAGE_FORMAT_INFO_EXT](#)
- VUID-VkPhysicalDeviceImageViewImageFormatInfoEXT-imageViewType-parameter [imageViewType](#) **must** be a valid [VkImageViewType](#) value

The [VkFilterCubicImageViewImageFormatPropertiesEXT](#) structure is defined as:

```
// Provided by VK_EXT_filter_cubic
typedef struct VkFilterCubicImageViewImageFormatPropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           filterCubic;
    VkBool32           filterCubicMinmax;
} VkFilterCubicImageViewImageFormatPropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `filterCubic` tells if image format, image type and image view type **can** be used with cubic filtering. This field is set by the implementation. An application-specified value is ignored.
- `filterCubicMinmax` tells if image format, image type and image view type **can** be used with cubic filtering and minmax filtering. This field is set by the implementation. An application-specified value is ignored.

Valid Usage (Implicit)

- VUID-VkFilterCubicImageViewImageFormatPropertiesEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_FILTER_CUBIC_IMAGE_VIEW_IMAGE_FORMAT_PROPERTIES_EXT`

Valid Usage

- VUID-VkFilterCubicImageViewImageFormatPropertiesEXT-pNext-02627
If the `pNext` chain of the `VkImageFormatProperties2` structure includes a `VkFilterCubicImageViewImageFormatPropertiesEXT` structure, the `pNext` chain of the `VkPhysicalDeviceImageFormatInfo2` structure **must** include a `VkPhysicalDeviceImageFormatInfoEXT` structure with an `imageViewType` that is compatible with `imageType`

36.1.1. Supported Sample Counts

`vkGetPhysicalDeviceImageFormatProperties` returns a bitmask of `VkSampleCountFlagBits` in `sampleCounts` specifying the supported sample counts for the image parameters.

`sampleCounts` will be `VK_SAMPLE_COUNT_1_BIT` if at least one of the following conditions is true:

- `tiling` is `VK_IMAGE_TILING_LINEAR`
- `type` is not `VK_IMAGE_TYPE_2D`
- `flags` contains `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT`
- Neither the `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` flag nor the `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT` flag in `VkFormatProperties::optimalTilingFeatures` returned by `vkGetPhysicalDeviceFormatProperties` is set
- `VkPhysicalDeviceExternalImageFormatInfo::handleType` is an external handle type for which multisampled image support is not required.
- `format` is one of the `formats that require a sampler Y'CBCR conversion`
- `usage` contains `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

Otherwise, the bits set in `sampleCounts` will be the sample counts supported for the specified values of `usage` and `format`. For each bit set in `usage`, the supported sample counts relate to the limits in `VkPhysicalDeviceLimits` as follows:

- If `usage` includes `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` and `format` is a floating- or fixed-point color format, a superset of `VkPhysicalDeviceLimits::framebufferColorSampleCounts`
- If `usage` includes `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` and `format` is an integer format, a superset of `VkPhysicalDeviceVulkan12Properties::framebufferIntegerColorSampleCounts`
- If `usage` includes `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, and `format` includes a depth component, a superset of `VkPhysicalDeviceLimits::framebufferDepthSampleCounts`
- If `usage` includes `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, and `format` includes a stencil component, a superset of `VkPhysicalDeviceLimits::framebufferStencilSampleCounts`
- If `usage` includes `VK_IMAGE_USAGE_SAMPLED_BIT`, and `format` includes a color component, a superset of `VkPhysicalDeviceLimits::sampledImageColorSampleCounts`
- If `usage` includes `VK_IMAGE_USAGE_SAMPLED_BIT`, and `format` includes a depth component, a superset of `VkPhysicalDeviceLimits::sampledImageDepthSampleCounts`
- If `usage` includes `VK_IMAGE_USAGE_SAMPLED_BIT`, and `format` is an integer format, a superset of `VkPhysicalDeviceLimits::sampledImageIntegerSampleCounts`
- If `usage` includes `VK_IMAGE_USAGE_STORAGE_BIT`, a superset of `VkPhysicalDeviceLimits::storageImageSampleCounts`

If multiple bits are set in `usage`, `sampleCounts` will be the intersection of the per-usage values described above.

If none of the bits described above are set in `usage`, then there is no corresponding limit in `VkPhysicalDeviceLimits`. In this case, `sampleCounts` **must** include at least `VK_SAMPLE_COUNT_1_BIT`.

36.1.2. Allowed Extent Values Based on Image Type

Implementations **may** support extent values larger than the [required minimum/maximum values](#) for certain types of images. `VkImageFormatProperties::maxExtent` for each type is subject to the constraints below.

NOTE

Implementations **must** support images with dimensions up to the [required minimum/maximum values](#) for all types of images. It follows that the query for additional capabilities **must** return extent values that are at least as large as the required values.

For `VK_IMAGE_TYPE_1D`:

- `maxExtent.width` $\geq$ `VkPhysicalDeviceLimits::maxImageDimension1D`
- `maxExtent.height` = 1
- `maxExtent.depth` = 1

For `VK_IMAGE_TYPE_2D` when `flags` does not contain `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT`:

- `maxExtent.width` $\geq$ `VkPhysicalDeviceLimits::maxImageDimension2D`
- `maxExtent.height` $\geq$ `VkPhysicalDeviceLimits::maxImageDimension2D`
- `maxExtent.depth` = 1

For `VK_IMAGE_TYPE_2D` when `flags` contains `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT`:

- `maxExtent.width` $\geq$ `VkPhysicalDeviceLimits::maxImageDimensionCube`
- `maxExtent.height` $\geq$ `VkPhysicalDeviceLimits::maxImageDimensionCube`
- `maxExtent.depth` = 1

For `VK_IMAGE_TYPE_3D`:

- `maxExtent.width` $\geq$ `VkPhysicalDeviceLimits::maxImageDimension3D`
- `maxExtent.height` $\geq$ `VkPhysicalDeviceLimits::maxImageDimension3D`
- `maxExtent.depth` $\geq$ `VkPhysicalDeviceLimits::maxImageDimension3D`

36.2. Additional Buffer Capabilities

To query the external handle types supported by buffers, call:

```
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceExternalBufferProperties(
    VkPhysicalDevice          physicalDevice,
    const VkPhysicalDeviceExternalBufferInfo* pExternalBufferInfo,
    VkExternalBufferProperties* pExternalBufferProperties);
```

- `physicalDevice` is the physical device from which to query the buffer capabilities.
- `pExternalBufferInfo` is a pointer to a `VkPhysicalDeviceExternalBufferInfo` structure describing the parameters that would be consumed by `vkCreateBuffer`.
- `pExternalBufferProperties` is a pointer to a `VkExternalBufferProperties` structure in which capabilities are returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceExternalBufferProperties-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceExternalBufferProperties-pExternalBufferInfo-parameter `pExternalBufferInfo` **must** be a valid pointer to a valid `VkPhysicalDeviceExternalBufferInfo` structure
- VUID-vkGetPhysicalDeviceExternalBufferProperties-pExternalBufferProperties-parameter `pExternalBufferProperties` **must** be a valid pointer to a `VkExternalBufferProperties` structure

The `VkPhysicalDeviceExternalBufferInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceExternalBufferInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkBufferCreateFlags       flags;
    VkBufferUsageFlags        usage;
    VkExternalMemoryHandleTypeFlagBits handleType;
} VkPhysicalDeviceExternalBufferInfo;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of [VkBufferCreateFlagBits](#) describing additional parameters of the buffer, corresponding to [VkBufferCreateInfo::flags](#).
- **usage** is a bitmask of [VkBufferUsageFlagBits](#) describing the intended usage of the buffer, corresponding to [VkBufferCreateInfo::usage](#).
- **handleType** is a [VkExternalMemoryHandleTypeFlagBits](#) value specifying the memory handle type that will be used with the memory associated with the buffer.

Only usage flags representable in [VkBufferUsageFlagBits](#) are returned in this structure's **usage**.

Valid Usage

- VUID-VkPhysicalDeviceExternalBufferInfo-None-09499
usage must be a valid combination of [VkBufferUsageFlagBits](#) values
- VUID-VkPhysicalDeviceExternalBufferInfo-None-09500
usage must not be 0

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalBufferInfo-sType-sType
sType must be [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_BUFFER_INFO](#)
- VUID-VkPhysicalDeviceExternalBufferInfo-pNext-pNext
pNext must be **NULL**
- VUID-VkPhysicalDeviceExternalBufferInfo-flags-parameter
flags must be a valid combination of [VkBufferCreateFlagBits](#) values
- VUID-VkPhysicalDeviceExternalBufferInfo-handleType-parameter
handleType must be a valid [VkExternalMemoryHandleTypeFlagBits](#) value

The [VkExternalBufferProperties](#) structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExternalBufferProperties {
    VkStructureType      sType;
    void*                pNext;
    VkExternalMemoryProperties externalMemoryProperties;
} VkExternalBufferProperties;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `externalMemoryProperties` is a `VkExternalMemoryProperties` structure specifying various capabilities of the external handle type when used with the specified buffer creation parameters.

Valid Usage (Implicit)

- VUID-VkExternalBufferProperties-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_EXTERNAL_BUFFER_PROPERTIES`
- VUID-VkExternalBufferProperties-pNext-pNext
`pNext` **must** be `NULL`

36.3. Optional Semaphore Capabilities

Semaphores **may** support import and export of their `payload` to external handles. To query the external handle types supported by semaphores, call:

```
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceExternalSemaphoreProperties(
    VkPhysicalDevice          physicalDevice,
    const VkPhysicalDeviceExternalSemaphoreInfo* pExternalSemaphoreInfo,
    VkExternalSemaphoreProperties* pExternalSemaphoreProperties);
```

- `physicalDevice` is the physical device from which to query the semaphore capabilities.
- `pExternalSemaphoreInfo` is a pointer to a `VkPhysicalDeviceExternalSemaphoreInfo` structure describing the parameters that would be consumed by `vkCreateSemaphore`.
- `pExternalSemaphoreProperties` is a pointer to a `VkExternalSemaphoreProperties` structure in which capabilities are returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceExternalSemaphoreProperties-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceExternalSemaphoreProperties-pExternalSemaphoreInfo-

parameter
pExternalSemaphoreInfo **must** be a valid pointer to a valid **VkPhysicalDeviceExternalSemaphoreInfo** structure

- VUID-vkGetPhysicalDeviceExternalSemaphoreProperties-pExternalSemaphoreProperties-parameter
pExternalSemaphoreProperties **must** be a valid pointer to a **VkExternalSemaphoreProperties** structure

The **VkPhysicalDeviceExternalSemaphoreInfo** structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceExternalSemaphoreInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkPhysicalDeviceExternalSemaphoreInfo;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **handleType** is a **VkExternalSemaphoreHandleTypeFlagBits** value specifying the external semaphore handle type for which capabilities will be returned.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalSemaphoreInfo-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_SEMAPHORE_INFO**
- VUID-VkPhysicalDeviceExternalSemaphoreInfo-pNext-pNext
pNext **must** be **NULL** or a pointer to a valid instance of **VkSemaphoreTypeCreateInfo**
- VUID-VkPhysicalDeviceExternalSemaphoreInfo-sType-unique
The **sType** value of each structure in the **pNext** chain **must** be unique
- VUID-VkPhysicalDeviceExternalSemaphoreInfo-handleType-parameter
handleType **must** be a valid **VkExternalSemaphoreHandleTypeFlagBits** value

Bits which **may** be set in **VkPhysicalDeviceExternalSemaphoreInfo::handleType**, specifying an external semaphore handle type, are:

```
// Provided by VK_VERSION_1_1
typedef enum VkExternalSemaphoreHandleTypeFlagBits {
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT = 0x00000001,
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT = 0x00000002,
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT = 0x00000004,
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT = 0x00000008,
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT = 0x00000010,
    // Provided by VK_NV_external_sci_sync
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SCI_SYNC_OBJ_BIT_NV = 0x00000020,
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D11_FENCE_BIT =
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT,
} VkExternalSemaphoreHandleTypeFlagBits;
```

- **VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT** specifies a POSIX file descriptor handle that has only limited valid usage outside of Vulkan and other compatible APIs. It **must** be compatible with the POSIX system calls **dup**, **dup2**, **close**, and the non-standard system call **dup3**. Additionally, it **must** be transportable over a socket using an **SCM_RIGHTS** control message. It owns a reference to the underlying synchronization primitive represented by its Vulkan semaphore object.
- **VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT** specifies an NT handle that has only limited valid usage outside of Vulkan and other compatible APIs. It **must** be compatible with the functions **DuplicateHandle**, **CloseHandle**, **CompareObjectHandles**, **GetHandleInformation**, and **SetHandleInformation**. It owns a reference to the underlying synchronization primitive represented by its Vulkan semaphore object.
- **VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT** specifies a global share handle that has only limited valid usage outside of Vulkan and other compatible APIs. It is not compatible with any native APIs. It does not own a reference to the underlying synchronization primitive represented by its Vulkan semaphore object, and will therefore become invalid when all Vulkan semaphore objects associated with it are destroyed.
- **VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT** specifies an NT handle returned by **ID3D12Device::CreateSharedHandle** referring to a Direct3D 12 fence, or **ID3D11Device5::CreateFence** referring to a Direct3D 11 fence. It owns a reference to the underlying synchronization primitive associated with the Direct3D fence.
- **VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D11_FENCE_BIT** is an alias of **VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT** with the same meaning. It is provided for convenience and code clarity when interacting with D3D11 fences.
- **VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT** specifies a POSIX file descriptor handle to a Linux Sync File or Android Fence object. It can be used with any native API accepting a valid sync file or fence as input. It owns a reference to the underlying synchronization primitive associated with the file descriptor. Implementations which support importing this handle type **must** accept any type of sync or fence FD supported by the native system they are running on.
- **VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SCI_SYNC_OBJ_BIT_NV** specifies a synchronization object (**NvSciSyncObj**) shareable across various hardware engines including the CPU and software (intra-process and inter-process) operating domains and perform signal and wait operations.

NOTE | Handles of type **VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT** generated by the

implementation may represent either Linux Sync Files or Android Fences at the implementation's discretion. Applications **should** only use operations defined for both types of file descriptors, unless they know via means external to Vulkan the type of the file descriptor, or are prepared to deal with the system-defined operation failures resulting from using the wrong type.

Some external semaphore handle types can only be shared within the same underlying physical device and/or the same driver version, as defined in the following table:

Table 76. External Semaphore Handle Types Compatibility

Handle type	VkPhysicalDeviceIDProperties::driverUUID	VkPhysicalDeviceIDProperties::deviceUUID
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT	Must match	Must match
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT	Must match	Must match
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT	Must match	Must match
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT	Must match	Must match
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT	No restriction	No restriction
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SCI_SYNC_OBJ_BIT_NV	No restriction	No restriction

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkExternalSemaphoreHandleTypeFlags;
```

`VkExternalSemaphoreHandleTypeFlags` is a bitmask type for setting a mask of zero or more `VkExternalSemaphoreHandleTypeFlagBits`.

The `VkExternalSemaphoreProperties` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExternalSemaphoreProperties {
    VkStructureType           sType;
    void*                     pNext;
    VkExternalSemaphoreHandleTypeFlags exportFromImportedHandleTypes;
    VkExternalSemaphoreHandleTypeFlags compatibleHandleTypes;
    VkExternalSemaphoreFeatureFlags externalSemaphoreFeatures;
} VkExternalSemaphoreProperties;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `exportFromImportedHandleTypes` is a bitmask of `VkExternalSemaphoreHandleTypeFlagBits` specifying which types of imported handle `handleType` **can** be exported from.
- `compatibleHandleTypes` is a bitmask of `VkExternalSemaphoreHandleTypeFlagBits` specifying handle types which **can** be specified at the same time as `handleType` when creating a semaphore.
- `externalSemaphoreFeatures` is a bitmask of `VkExternalSemaphoreFeatureFlagBits` describing the features of `handleType`.

If `handleType` is not supported by the implementation, then `VkExternalSemaphoreProperties::externalSemaphoreFeatures` will be zero.

Valid Usage (Implicit)

- `VUID-VkExternalSemaphoreProperties-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_EXTERNAL_SEMAPHORE_PROPERTIES`
- `VUID-VkExternalSemaphoreProperties-pNext-pNext`
`pNext` **must** be `NULL`

Bits which **may** be set in `VkExternalSemaphoreProperties::externalSemaphoreFeatures`, specifying the features of an external semaphore handle type, are:

```
// Provided by VK_VERSION_1_1
typedef enum VkExternalSemaphoreFeatureFlagBits {
    VK_EXTERNAL_SEMAPHORE_FEATURE_EXPORTABLE_BIT = 0x00000001,
    VK_EXTERNAL_SEMAPHORE_FEATURE_IMPORTABLE_BIT = 0x00000002,
} VkExternalSemaphoreFeatureFlagBits;
```

- `VK_EXTERNAL_SEMAPHORE_FEATURE_EXPORTABLE_BIT` specifies that handles of this type **can** be exported from Vulkan semaphore objects.
- `VK_EXTERNAL_SEMAPHORE_FEATURE_IMPORTABLE_BIT` specifies that handles of this type **can** be imported as Vulkan semaphore objects.

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkExternalSemaphoreFeatureFlags;
```

`VkExternalSemaphoreFeatureFlags` is a bitmask type for setting a mask of zero or more `VkExternalSemaphoreFeatureFlagBits`.

36.4. Optional Fence Capabilities

Fences **may** support import and export of their `payload` to external handles. To query the external handle types supported by fences, call:

```
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceExternalFenceProperties(
    VkPhysicalDevice          physicalDevice,
    const VkPhysicalDeviceExternalFenceInfo* pExternalFenceInfo,
    VkExternalFenceProperties* pExternalFenceProperties);
```

- `physicalDevice` is the physical device from which to query the fence capabilities.
- `pExternalFenceInfo` is a pointer to a `VkPhysicalDeviceExternalFenceInfo` structure describing the

parameters that would be consumed by [vkCreateFence](#).

- [pExternalFenceProperties](#) is a pointer to a [VkExternalFenceProperties](#) structure in which capabilities are returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceExternalFenceProperties-physicalDevice-parameter [physicalDevice](#) **must** be a valid [VkPhysicalDevice](#) handle
- VUID-vkGetPhysicalDeviceExternalFenceProperties-pExternalFenceInfo-parameter [pExternalFenceInfo](#) **must** be a valid pointer to a valid [VkPhysicalDeviceExternalFenceInfo](#) structure
- VUID-vkGetPhysicalDeviceExternalFenceProperties-pExternalFenceProperties-parameter [pExternalFenceProperties](#) **must** be a valid pointer to a [VkExternalFenceProperties](#) structure

The [VkPhysicalDeviceExternalFenceInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceExternalFenceInfo {
    VkStructureType             sType;
    const void*                 pNext;
    VkExternalFenceHandleTypeFlagBits handleType;
} VkPhysicalDeviceExternalFenceInfo;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [handleType](#) is a [VkExternalFenceHandleTypeFlagBits](#) value specifying an external fence handle type for which capabilities will be returned.

NOTE

Handles of type [VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT](#) generated by the implementation may represent either Linux Sync Files or Android Fences at the implementation's discretion. Applications **should** only use operations defined for both types of file descriptors, unless they know via means external to Vulkan the type of the file descriptor, or are prepared to deal with the system-defined operation failures resulting from using the wrong type.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalFenceInfo-sType-sType [sType](#) **must** be [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_FENCE_INFO](#)
- VUID-VkPhysicalDeviceExternalFenceInfo-pNext-pNext [pNext](#) **must** be [NULL](#)
- VUID-VkPhysicalDeviceExternalFenceInfo-handleType-parameter

`handleType` **must** be a valid `VkExternalFenceHandleTypeFlagBits` value

Bits which **may** be set in

- `VkPhysicalDeviceExternalFenceInfo::handleType`
- `VkExternalFenceProperties::exportFromImportedHandleTypes`
- `VkExternalFenceProperties::compatibleHandleTypes`

indicate external fence handle types, and are:

```
// Provided by VK_VERSION_1_1
typedef enum VkExternalFenceHandleTypeFlagBits {
    VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_FD_BIT = 0x00000001,
    VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT = 0x00000002,
    VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT = 0x00000004,
    VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT = 0x00000008,
    // Provided by VK_NV_external_sci_sync, VK_NV_external_sci_sync2
    VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_OBJ_BIT_NV = 0x00000010,
    // Provided by VK_NV_external_sci_sync, VK_NV_external_sci_sync2
    VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_FENCE_BIT_NV = 0x00000020,
} VkExternalFenceHandleTypeFlagBits;
```

- `VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_FD_BIT` specifies a POSIX file descriptor handle that has only limited valid usage outside of Vulkan and other compatible APIs. It **must** be compatible with the POSIX system calls `dup`, `dup2`, `close`, and the non-standard system call `dup3`. Additionally, it **must** be transportable over a socket using an `SCM_RIGHTS` control message. It owns a reference to the underlying synchronization primitive represented by its Vulkan fence object.
- `VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT` specifies an NT handle that has only limited valid usage outside of Vulkan and other compatible APIs. It **must** be compatible with the functions `DuplicateHandle`, `CloseHandle`, `CompareObjectHandles`, `GetHandleInformation`, and `SetHandleInformation`. It owns a reference to the underlying synchronization primitive represented by its Vulkan fence object.
- `VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT` specifies a global share handle that has only limited valid usage outside of Vulkan and other compatible APIs. It is not compatible with any native APIs. It does not own a reference to the underlying synchronization primitive represented by its Vulkan fence object, and will therefore become invalid when all Vulkan fence objects associated with it are destroyed.
- `VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT` specifies a POSIX file descriptor handle to a Linux Sync File or Android Fence. It can be used with any native API accepting a valid sync file or fence as input. It owns a reference to the underlying synchronization primitive associated with the file descriptor. Implementations which support importing this handle type **must** accept any type of sync or fence FD supported by the native system they are running on.
- `VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_OBJ_BIT_NV` specifies a synchronization object (`NvSciSyncObj`) shareable across various hardware engines including the CPU and software (intra-process and inter-process) operating domains and perform signal and wait operations.

- `VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_FENCE_BIT_NV` specifies a structure of `NvSciSyncFence` that is a snapshot of a synchronization object's underlying primitive and represents its possible state.

Some external fence handle types can only be shared within the same underlying physical device and/or the same driver version, as defined in the following table:

Table 77. External Fence Handle Types Compatibility

Handle type	VkPhysicalDeviceIDProperties::driverUUID	VkPhysicalDeviceIDProperties::deviceUUID
VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_FD_BIT	Must match	Must match
VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT	Must match	Must match
VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT	Must match	Must match
VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT	No restriction	No restriction
VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_OBJ_BIT_NV	Must match	Must match
VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_FENCE_BIT_NV	Must match	Must match

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkExternalFenceHandleTypeFlags;
```

`VkExternalFenceHandleTypeFlags` is a bitmask type for setting a mask of zero or more `VkExternalFenceHandleTypeFlagBits`.

The `VkExternalFenceProperties` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExternalFenceProperties {
    VkStructureType           sType;
    void*                     pNext;
    VkExternalFenceHandleTypeFlags exportFromImportedHandleTypes;
    VkExternalFenceHandleTypeFlags compatibleHandleTypes;
    VkExternalFenceFeatureFlags externalFenceFeatures;
} VkExternalFenceProperties;
```

- `exportFromImportedHandleTypes` is a bitmask of `VkExternalFenceHandleTypeFlagBits` indicating which types of imported handle `handleType` **can** be exported from.
- `compatibleHandleTypes` is a bitmask of `VkExternalFenceHandleTypeFlagBits` specifying handle types which **can** be specified at the same time as `handleType` when creating a fence.
- `externalFenceFeatures` is a bitmask of `VkExternalFenceFeatureFlagBits` indicating the features of `handleType`.

If `handleType` is not supported by the implementation, then `VkExternalFenceProperties::externalFenceFeatures` will be zero.

Valid Usage (Implicit)

- VUID-VkExternalFenceProperties-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_EXTERNAL_FENCE_PROPERTIES`
- VUID-VkExternalFenceProperties-pNext-pNext
`pNext` **must** be `NULL`

Bits which **may** be set in `VkExternalFenceProperties::externalFenceFeatures`, indicating features of a fence external handle type, are:

```
// Provided by VK_VERSION_1_1
typedef enum VkExternalFenceFeatureFlagBits {
    VK_EXTERNAL_FENCE_FEATURE_EXPORTABLE_BIT = 0x00000001,
    VK_EXTERNAL_FENCE_FEATURE_IMPORTABLE_BIT = 0x00000002,
} VkExternalFenceFeatureFlagBits;
```

- `VK_EXTERNAL_FENCE_FEATURE_EXPORTABLE_BIT` specifies handles of this type **can** be exported from Vulkan fence objects.
- `VK_EXTERNAL_FENCE_FEATURE_IMPORTABLE_BIT` specifies handles of this type **can** be imported to Vulkan fence objects.

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkExternalFenceFeatureFlags;
```

`VkExternalFenceFeatureFlags` is a bitmask type for setting a mask of zero or more `VkExternalFenceFeatureFlagBits`.

36.5. Timestamp Calibration Capabilities

To query the set of time domains for which a physical device supports timestamp calibration, call:

```
// Provided by VK_KHR_calibrated_timestamps
VkResult vkGetPhysicalDeviceCalibrateableTimeDomainsKHR(
    VkPhysicalDevice          physicalDevice,
    uint32_t*                 pTimeDomainCount,
    VkTimeDomainKHR*          pTimeDomains);
```

- `physicalDevice` is the physical device from which to query the set of calibrateable time domains.
- `pTimeDomainCount` is a pointer to an integer related to the number of calibrateable time domains available or queried, as described below.
- `pTimeDomains` is either `NULL` or a pointer to an array of `VkTimeDomainKHR` values, indicating the supported calibrateable time domains.

If `pTimeDomains` is `NULL`, then the number of calibrateable time domains supported for the given `physicalDevice` is returned in `pTimeDomainCount`. Otherwise, `pTimeDomainCount` **must** point to a variable set by the application to the number of elements in the `pTimeDomains` array, and on return the variable is overwritten with the number of values actually written to `pTimeDomains`. If the value of `pTimeDomainCount` is less than the number of calibrateable time domains supported, at most `pTimeDomainCount` values will be written to `pTimeDomains`, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available time domains were returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetPhysicalDeviceCalibrateableTimeDomainsKHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceCalibrateableTimeDomainsKHR-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceCalibrateableTimeDomainsKHR-pTimeDomainCount-parameter `pTimeDomainCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceCalibrateableTimeDomainsKHR-pTimeDomains-parameter
If the value referenced by `pTimeDomainCount` is not `0`, and `pTimeDomains` is not `NULL`, `pTimeDomains` **must** be a valid pointer to an array of `pTimeDomainCount` `VkTimeDomainKHR` values

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

36.6. Object Refresh Capabilities

To query the set of object types that require periodic refreshing, call:

```
// Provided by VK_KHR_object_refresh
VkResult vkGetPhysicalDeviceRefreshableObjectTypesKHR(
    VkPhysicalDevice          physicalDevice,
    uint32_t*                 pRefreshableObjectTypeCount,
    VkObjectType*             pRefreshableObjectTypes);
```

- **physicalDevice** is the physical device from which to query the set of refreshable object types.
- **pRefreshableObjectTypeCount** is a pointer to an integer related to the number of refreshable object types available or queried, as described below.
- **pRefreshableObjectTypes** is either **NULL** or a pointer to an array of **VkObjectType** values, indicating the supported refreshable object types.

If **pRefreshableObjectTypes** is **NULL**, then the number of refreshable object types supported for the given **physicalDevice** is returned in **pRefreshableObjectTypeCount**. Otherwise, **pRefreshableObjectTypeCount** **must** point to a variable set by the application to the number of elements in the **pRefreshableObjectTypes** array, and on return the variable is overwritten with the number of object types actually written to **pRefreshableObjectTypes**. If the value of **pRefreshableObjectTypeCount** is less than the number of refreshable object types supported, at most **pRefreshableObjectTypeCount** object types will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available object types were returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceRefreshableObjectTypesKHR-physicalDevice-parameter **physicalDevice** **must** be a valid **VkPhysicalDevice** handle
- VUID-vkGetPhysicalDeviceRefreshableObjectTypesKHR-pRefreshableObjectTypeCount-parameter **pRefreshableObjectTypeCount** **must** be a valid pointer to a **uint32_t** value
- VUID-vkGetPhysicalDeviceRefreshableObjectTypesKHR-pRefreshableObjectTypes-parameter

If the value referenced by **pRefreshableObjectTypeCount** is not **0**, and **pRefreshableObjectTypes** is not **NULL**, **pRefreshableObjectTypes** **must** be a valid pointer to an array of **pRefreshableObjectTypeCount** **VkObjectType** values

Return Codes

Success

- **VK_INCOMPLETE**
- **VK_SUCCESS**

Failure

- **VK_ERROR_UNKNOWN**
- **VK_ERROR_VALIDATION_FAILED**

Chapter 37. Debugging

To aid developers in tracking down errors in the application's use of Vulkan, particularly in combination with an external debugger or profiler, *debugging extensions* may be available.

The [VkObjectType](#) enumeration defines values, each of which corresponds to a specific Vulkan handle type. These values **can** be used to associate debug information with a particular type of object through one or more extensions.

```

// Provided by VK_VERSION_1_0
typedef enum VkObjectType {
    VK_OBJECT_TYPE_UNKNOWN = 0,
    VK_OBJECT_TYPE_INSTANCE = 1,
    VK_OBJECT_TYPE_PHYSICAL_DEVICE = 2,
    VK_OBJECT_TYPE_DEVICE = 3,
    VK_OBJECT_TYPE_QUEUE = 4,
    VK_OBJECT_TYPE_SEMAPHORE = 5,
    VK_OBJECT_TYPE_COMMAND_BUFFER = 6,
    VK_OBJECT_TYPE_FENCE = 7,
    VK_OBJECT_TYPE_DEVICE_MEMORY = 8,
    VK_OBJECT_TYPE_BUFFER = 9,
    VK_OBJECT_TYPE_IMAGE = 10,
    VK_OBJECT_TYPE_EVENT = 11,
    VK_OBJECT_TYPE_QUERY_POOL = 12,
    VK_OBJECT_TYPE_BUFFER_VIEW = 13,
    VK_OBJECT_TYPE_IMAGE_VIEW = 14,
    VK_OBJECT_TYPE_SHADER_MODULE = 15,
    VK_OBJECT_TYPE_PIPELINE_CACHE = 16,
    VK_OBJECT_TYPE_PIPELINE_LAYOUT = 17,
    VK_OBJECT_TYPE_RENDER_PASS = 18,
    VK_OBJECT_TYPE_PIPELINE = 19,
    VK_OBJECT_TYPE_DESCRIPTOR_SET_LAYOUT = 20,
    VK_OBJECT_TYPE_SAMPLER = 21,
    VK_OBJECT_TYPE_DESCRIPTOR_POOL = 22,
    VK_OBJECT_TYPE_DESCRIPTOR_SET = 23,
    VK_OBJECT_TYPE_FRAMEBUFFER = 24,
    VK_OBJECT_TYPE_COMMAND_POOL = 25,
    // Provided by VK_VERSION_1_1
    VK_OBJECT_TYPE_SAMPLER_YCBCR_CONVERSION = 1000156000,
    // Provided by VK_KHR_surface
    VK_OBJECT_TYPE_SURFACE_KHR = 1000000000,
    // Provided by VK_KHR_swapchain
    VK_OBJECT_TYPE_SWAPCHAIN_KHR = 1000001000,
    // Provided by VK_KHR_display
    VK_OBJECT_TYPE_DISPLAY_KHR = 1000002000,
    // Provided by VK_KHR_display
    VK_OBJECT_TYPE_DISPLAY_MODE_KHR = 1000002001,
    // Provided by VK_EXT_debug_utils
    VK_OBJECT_TYPE_DEBUG_UTILS_MESSENGER_EXT = 1000128000,
    // Provided by VK_NV_external_sci_sync2
    VK_OBJECT_TYPE_SEMAPHORE_SCI_SYNC_POOL_NV = 1000489000,
} VkObjectType;

```

Table 78. **VkObjectType** and Vulkan Handle Relationship

VkObjectType	Vulkan Handle Type
VK_OBJECT_TYPE_UNKNOWN	Unknown/Undefined Handle
VK_OBJECT_TYPE_INSTANCE	VkInstance

VkObjectType	Vulkan Handle Type
VK_OBJECT_TYPE_PHYSICAL_DEVICE	VkPhysicalDevice
VK_OBJECT_TYPE_DEVICE	VkDevice
VK_OBJECT_TYPE_QUEUE	VkQueue
VK_OBJECT_TYPE_SEMAPHORE	VkSemaphore
VK_OBJECT_TYPE_COMMAND_BUFFER	VkCommandBuffer
VK_OBJECT_TYPE_FENCE	VkFence
VK_OBJECT_TYPE_DEVICE_MEMORY	VkDeviceMemory
VK_OBJECT_TYPE_BUFFER	VkBuffer
VK_OBJECT_TYPE_IMAGE	VkImage
VK_OBJECT_TYPE_EVENT	VkEvent
VK_OBJECT_TYPE_QUERY_POOL	VkQueryPool
VK_OBJECT_TYPE_BUFFER_VIEW	VkBufferView
VK_OBJECT_TYPE_IMAGE_VIEW	VkImageView
VK_OBJECT_TYPE_PIPELINE_CACHE	VkPipelineCache
VK_OBJECT_TYPE_PIPELINE_LAYOUT	VkPipelineLayout
VK_OBJECT_TYPE_RENDER_PASS	VkRenderPass
VK_OBJECT_TYPE_PIPELINE	VkPipeline
VK_OBJECT_TYPE_DESCRIPTOR_SET_LAYOUT	VkDescriptorSetLayout
VK_OBJECT_TYPE_SAMPLER	VkSampler
VK_OBJECT_TYPE_DESCRIPTOR_POOL	VkDescriptorPool
VK_OBJECT_TYPE_DESCRIPTOR_SET	VkDescriptorSet
VK_OBJECT_TYPE_FRAMEBUFFER	VkFramebuffer
VK_OBJECT_TYPE_COMMAND_POOL	VkCommandPool
VK_OBJECT_TYPE_SAMPLER_YCBCR_CONVERSION	VkSamplerYcbcrConversion
VK_OBJECT_TYPE_SURFACE_KHR	VkSurfaceKHR
VK_OBJECT_TYPE_SWAPCHAIN_KHR	VkSwapchainKHR
VK_OBJECT_TYPE_DISPLAY_KHR	VkDisplayKHR
VK_OBJECT_TYPE_DISPLAY_MODE_KHR	VkDisplayModeKHR
VK_OBJECT_TYPE_DEBUG_UTILS_MESSENGER_EXT	VkDebugUtilsMessengerEXT

If this Specification was generated with any such extensions included, they will be described in the remainder of this chapter.

37.1. Debug Utilities

Vulkan provides flexible debugging utilities for debugging an application.

The [Object Debug Annotation](#) section describes how to associate either a name or binary data with a specific Vulkan object.

The [Queue Labels](#) section describes how to annotate and group the work submitted to a queue.

The [Command Buffer Labels](#) section describes how to associate logical elements of the scene with commands in a [VkCommandBuffer](#).

The [Debug Messengers](#) section describes how to create debug messenger objects associated with an application supplied callback to capture debug messages from a variety of Vulkan components.

37.1.1. Object Debug Annotation

It can be useful for an application to provide its own content relative to a specific Vulkan object.

The following commands allow application developers to associate application-defined information with Vulkan objects. These commands are device-level commands but they **may** reference instance-level objects (such as [VkInstance](#)) and physical device-level objects (such as [VkPhysicalDevice](#)) with a few restrictions: * The data for the corresponding object **may** still be available after the [VkDevice](#) used in the corresponding API call to set it is destroyed, but access to this data is not guaranteed and should be avoided. * Subsequent calls to change the data of the same object across multiple [VkDevice](#) objects, **may** result in the data being changed to the most recent version for all [VkDevice](#) objects and not just the [VkDevice](#) used in the most recent API call.

Object Naming

An object can be given an application-defined name by calling:

```
// Provided by VK_EXT_debug_utils
VkResult vkSetDebugUtilsObjectNameEXT(
    VkDevice device,
    const VkDebugUtilsObjectNameInfoEXT* pNameInfo);
```

- [device](#) is the device that is associated with the named object passed in via [objectHandle](#).
- [pNameInfo](#) is a pointer to a [VkDebugUtilsObjectNameInfoEXT](#) structure specifying parameters of the name to set on the object.

Valid Usage

- VUID-vkSetDebugUtilsObjectNameEXT-pNameInfo-02587
[pNameInfo->objectType](#) **must** not be [VK_OBJECT_TYPE_UNKNOWN](#)
- VUID-vkSetDebugUtilsObjectNameEXT-pNameInfo-02588
[pNameInfo->objectHandle](#) **must** not be [VK_NULL_HANDLE](#)

- VUID-vkSetDebugUtilsObjectNameEXT-pNameInfo-07872
If `pNameInfo->objectHandle` is the valid handle of an instance-level object, the `VkDevice` identified by `device` **must** be a descendent of the same `VkInstance` as the object identified by `pNameInfo->objectHandle`
- VUID-vkSetDebugUtilsObjectNameEXT-pNameInfo-07873
If `pNameInfo->objectHandle` is the valid handle of a physical-device-level object, the `VkDevice` identified by `device` **must** be a descendant of the same `VkPhysicalDevice` as the object identified by `pNameInfo->objectHandle`
- VUID-vkSetDebugUtilsObjectNameEXT-pNameInfo-07874
If `pNameInfo->objectHandle` is the valid handle of a device-level object, that object **must** be a descendent of the `VkDevice` identified by `device`

Valid Usage (Implicit)

- VUID-vkSetDebugUtilsObjectNameEXT-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkSetDebugUtilsObjectNameEXT-pNameInfo-parameter
`pNameInfo` **must** be a valid pointer to a valid `VkDebugUtilsObjectNameInfoEXT` structure

Host Synchronization

- Host access to `pNameInfo->objectHandle` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkDebugUtilsObjectNameInfoEXT` structure is defined as:

```
// Provided by VK_EXT_debug_utils
typedef struct VkDebugUtilsObjectNameInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkObjectType        objectType;
    uint64_t           objectHandle;
    const char*         pObjectName;
} VkDebugUtilsObjectNameInfoEXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **objectType** is a [VkObjectType](#) specifying the type of the object to be named.
- **objectHandle** is the object to be named.
- **pObjectName** is either **NULL** or a null-terminated UTF-8 string specifying the name to apply to **objectHandle**.

Applications **may** change the name associated with an object simply by calling **vkSetDebugUtilsObjectNameEXT** again with a new string. If **pObjectName** is either **NULL** or an empty string, then any previously set name is removed.

Valid Usage

- VUID-VkDebugUtilsObjectNameInfoEXT-objectType-02589
If **objectType** is **VK_OBJECT_TYPE_UNKNOWN**, **objectHandle** **must** not be [VK_NULL_HANDLE](#)
- VUID-VkDebugUtilsObjectNameInfoEXT-objectType-02590
If **objectType** is not **VK_OBJECT_TYPE_UNKNOWN**, **objectHandle** **must** be [VK_NULL_HANDLE](#) or a valid Vulkan handle of the type associated with **objectType** as defined in the [VkObjectType](#) and [Vulkan Handle Relationship](#) table

Valid Usage (Implicit)

- VUID-VkDebugUtilsObjectNameInfoEXT-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_DEBUG_UTILS_OBJECT_NAME_INFO_EXT**
- VUID-VkDebugUtilsObjectNameInfoEXT-objectType-parameter
objectType **must** be a valid [VkObjectType](#) value
- VUID-VkDebugUtilsObjectNameInfoEXT-pObjectName-parameter
If **pObjectName** is not **NULL**, **pObjectName** **must** be a null-terminated UTF-8 string

Object Data Association

In addition to setting a name for an object, debugging and validation layers **may** have uses for additional binary data on a per-object basis that have no other place in the Vulkan API.

For example, a `VkShaderModule` could have additional debugging data attached to it to aid in offline shader tracing.

Additional data can be attached to an object by calling `vkSetDebugUtilsObjectTagEXT` as defined below.

```
// Provided by VK_EXT_debug_utils
VkResult vkSetDebugUtilsObjectTagEXT(
    VkDevice device,
    const VkDebugUtilsObjectTagInfoEXT* pTagInfo);
```

- `device` is the device that created the object.
- `pTagInfo` is a pointer to a `VkDebugUtilsObjectTagInfoEXT` structure specifying parameters of the tag to attach to the object.

Valid Usage

- VUID-vkSetDebugUtilsObjectTagEXT-pNameInfo-07875
If `pNameInfo->objectHandle` is the valid handle of an instance-level object, the `VkDevice` identified by `device` **must** be a descendent of the same `VkInstance` as the object identified by `pNameInfo->objectHandle`
- VUID-vkSetDebugUtilsObjectTagEXT-pNameInfo-07876
If `pNameInfo->objectHandle` is the valid handle of a physical-device-level object, the `VkDevice` identified by `device` **must** be a descendant of the same `VkPhysicalDevice` as the object identified by `pNameInfo->objectHandle`
- VUID-vkSetDebugUtilsObjectTagEXT-pNameInfo-07877
If `pNameInfo->objectHandle` is the valid handle of a device-level object, that object **must** be a descendent of the `VkDevice` identified by `device`

Valid Usage (Implicit)

- VUID-vkSetDebugUtilsObjectTagEXT-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkSetDebugUtilsObjectTagEXT-pTagInfo-parameter
`pTagInfo` **must** be a valid pointer to a valid `VkDebugUtilsObjectTagInfoEXT` structure

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkDebugUtilsObjectTagInfoEXT` structure is defined as:

```
// Provided by VK_EXT_debug_utils
typedef struct VkDebugUtilsObjectTagInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkObjectType        objectType;
    uint64_t            objectHandle;
    uint64_t            tagName;
    size_t              tagSize;
    const void*        pTag;
} VkDebugUtilsObjectTagInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `objectType` is a `VkObjectType` specifying the type of the object to be named.
- `objectHandle` is the object to be tagged.
- `tagName` is a numerical identifier of the tag.
- `tagSize` is the number of bytes of data to attach to the object.
- `pTag` is a pointer to an array of `tagSize` bytes containing the data to be associated with the object.

The `tagName` parameter gives a name or identifier to the type of data being tagged. This can be used by debugging layers to easily filter for only data that can be used by that implementation.

Valid Usage

- VUID-VkDebugUtilsObjectTagInfoEXT-objectType-01908
`objectType` **must** not be `VK_OBJECT_TYPE_UNKNOWN`
- VUID-VkDebugUtilsObjectTagInfoEXT-objectHandle-01910
`objectHandle` **must** be a valid Vulkan handle of the type associated with `objectType` as defined in the `VkObjectType` and `Vulkan Handle Relationship` table

Valid Usage (Implicit)

- VUID-VkDebugUtilsObjectTagInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEBUG_UTILS_OBJECT_TAG_INFO_EXT`
- VUID-VkDebugUtilsObjectTagInfoEXT-pNext-pNext
`pNext` **must** be `NULL`

- VUID-VkDebugUtilsObjectTagInfoEXT-objectType-parameter **objectType** must be a valid [VkObjectType](#) value
- VUID-VkDebugUtilsObjectTagInfoEXT-pTag-parameter **pTag** must be a valid pointer to an array of **tagSize** bytes
- VUID-VkDebugUtilsObjectTagInfoEXT-tagSize-arraylength **tagSize** must be greater than 0

Host Synchronization

- Host access to **objectHandle** must be externally synchronized

37.1.2. Queue Labels

All Vulkan work is submitted using queues. It is possible for an application to use multiple queues, each containing multiple command buffers, when performing work. It can be useful to identify which queue, or even where in a queue, something has occurred.

To begin identifying a region using a debug label inside a queue, you may use the [vkQueueBeginDebugUtilsLabelEXT](#) command.

Then, when the region of interest has passed, you may end the label region using [vkQueueEndDebugUtilsLabelEXT](#).

Additionally, a single debug label may be inserted at any time using [vkQueueInsertDebugUtilsLabelEXT](#).

A queue debug label region is opened by calling:

```
// Provided by VK_EXT_debug_utils
void vkQueueBeginDebugUtilsLabelEXT(
    VkQueue queue,
    const VkDebugUtilsLabelEXT* pLabelInfo);
```

- **queue** is the queue in which to start a debug label region.
- **pLabelInfo** is a pointer to a [VkDebugUtilsLabelEXT](#) structure specifying parameters of the label region to open.

Valid Usage (Implicit)

- VUID-vkQueueBeginDebugUtilsLabelEXT-queue-parameter **queue** must be a valid [VkQueue](#) handle
- VUID-vkQueueBeginDebugUtilsLabelEXT-pLabelInfo-parameter **pLabelInfo** must be a valid pointer to a valid [VkDebugUtilsLabelEXT](#) structure

Host Synchronization

- Host access to **queue** **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
-	-	Any	-

The `VkDebugUtilsLabelEXT` structure is defined as:

```
// Provided by VK_EXT_debug_utils
typedef struct VkDebugUtilsLabelEXT {
    VkStructureType    sType;
    const void*        pNext;
    const char*        pLabelName;
    float              color[4];
} VkDebugUtilsLabelEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pLabelName` is a pointer to a null-terminated UTF-8 string containing the name of the label.
- `color` is an optional RGBA color value that can be associated with the label. A particular implementation **may** choose to ignore this color value. The values contain RGBA values in order, in the range 0.0 to 1.0. If all elements in `color` are 0.0, then it is ignored.

Valid Usage (Implicit)

- VUID-VkDebugUtilsLabelEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEBUG_UTILS_LABEL_EXT`
- VUID-VkDebugUtilsLabelEXT-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkDebugUtilsLabelEXT-pLabelName-parameter
`pLabelName` **must** be a null-terminated UTF-8 string

A queue debug label region is closed by calling:

```
// Provided by VK_EXT_debug_utils
void vkQueueEndDebugUtilsLabelEXT(
    VkQueue                                     queue);
```

- **queue** is the queue in which a debug label region should be closed.

The calls to `vkQueueBeginDebugUtilsLabelEXT` and `vkQueueEndDebugUtilsLabelEXT` **must** be matched and balanced.

Valid Usage

- VUID-vkQueueEndDebugUtilsLabelEXT-None-01911
There **must** be an outstanding `vkQueueBeginDebugUtilsLabelEXT` command prior to the `vkQueueEndDebugUtilsLabelEXT` on the queue

Valid Usage (Implicit)

- VUID-vkQueueEndDebugUtilsLabelEXT-queue-parameter
queue **must** be a valid `VkQueue` handle

Host Synchronization

- Host access to **queue** **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
-	-	Any	-

A single label can be inserted into a queue by calling:

```
// Provided by VK_EXT_debug_utils
void vkQueueInsertDebugUtilsLabelEXT(
    VkQueue                                     queue,
    const VkDebugUtilsLabelEXT*                pLabelInfo);
```

- **queue** is the queue into which a debug label will be inserted.
- **pLabelInfo** is a pointer to a `VkDebugUtilsLabelEXT` structure specifying parameters of the label to insert.

Valid Usage (Implicit)

- VUID-vkQueueInsertDebugUtilsLabelEXT-queue-parameter
queue **must** be a valid [VkQueue](#) handle
- VUID-vkQueueInsertDebugUtilsLabelEXT-pLabelInfo-parameter
pLabelInfo **must** be a valid pointer to a valid [VkDebugUtilsLabelEXT](#) structure

Host Synchronization

- Host access to **queue** **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
-	-	Any	-

37.1.3. Command Buffer Labels

Typical Vulkan applications will submit many command buffers in each frame, with each command buffer containing a large number of individual commands. Being able to logically annotate regions of command buffers that belong together as well as hierarchically subdivide the frame is important to a developer's ability to navigate the commands viewed holistically.

To identify the beginning of a debug label region in a command buffer, [vkCmdBeginDebugUtilsLabelEXT](#) **can** be used as defined below.

To indicate the end of a debug label region in a command buffer, [vkCmdEndDebugUtilsLabelEXT](#) **can** be used.

To insert a single command buffer debug label inside of a command buffer, [vkCmdInsertDebugUtilsLabelEXT](#) **can** be used as defined below.

A command buffer debug label region can be opened by calling:

```
// Provided by VK_EXT_debug_utils
void vkCmdBeginDebugUtilsLabelEXT(
    VkCommandBuffer                commandBuffer,
    const VkDebugUtilsLabelEXT*    pLabelInfo);
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **pLabelInfo** is a pointer to a [VkDebugUtilsLabelEXT](#) structure specifying parameters of the label region to open.

Valid Usage (Implicit)

- VUID-vkCmdBeginDebugUtilsLabelEXT-commandBuffer-parameter `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdBeginDebugUtilsLabelEXT-pLabelInfo-parameter `pLabelInfo` **must** be a valid pointer to a valid `VkDebugUtilsLabelEXT` structure
- VUID-vkCmdBeginDebugUtilsLabelEXT-commandBuffer-recording `commandBuffer` **must** be in the `recording` state
- VUID-vkCmdBeginDebugUtilsLabelEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, `VK_QUEUE_GRAPHICS_BIT`, or `VK_QUEUE_TRANSFER_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_TRANSFER_BIT	Action State

A command buffer label region can be closed by calling:

```
// Provided by VK_EXT_debug_utils
void vkCmdEndDebugUtilsLabelEXT(
    VkCommandBuffer                commandBuffer);
```

- `commandBuffer` is the command buffer into which the command is recorded.

An application **may** open a debug label region in one command buffer and close it in another, or otherwise split debug label regions across multiple command buffers or multiple queue submissions. When viewed from the linear series of submissions to a single queue, the calls to `vkCmdBeginDebugUtilsLabelEXT` and `vkCmdEndDebugUtilsLabelEXT` **must** be matched and balanced.

There **can** be problems reporting command buffer debug labels during the recording process because command buffers **may** be recorded out of sequence with the resulting execution order. Since the recording order **may** be different, a solitary command buffer **may** have an inconsistent view of the debug label regions by itself. Therefore, if an issue occurs during the recording of a command buffer, and the environment requires returning debug labels, the implementation **may** return only those labels it is aware of. This is true even if the implementation is aware of only the debug labels within the command buffer being actively recorded.

Valid Usage

- VUID-vkCmdEndDebugUtilsLabelEXT-commandBuffer-01912
There **must** be an outstanding `vkCmdBeginDebugUtilsLabelEXT` command prior to the `vkCmdEndDebugUtilsLabelEXT` on the queue that `commandBuffer` is submitted to
- VUID-vkCmdEndDebugUtilsLabelEXT-commandBuffer-01913
If `commandBuffer` is a secondary command buffer, there **must** be an outstanding `vkCmdBeginDebugUtilsLabelEXT` command recorded to `commandBuffer` that has not previously been ended by a call to `vkCmdEndDebugUtilsLabelEXT`

Valid Usage (Implicit)

- VUID-vkCmdEndDebugUtilsLabelEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdEndDebugUtilsLabelEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdEndDebugUtilsLabelEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, `VK_QUEUE_GRAPHICS_BIT`, or `VK_QUEUE_TRANSFER_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_TRANSFER_BIT	Action State

A single debug label can be inserted into a command buffer by calling:

```
// Provided by VK_EXT_debug_utils
void vkCmdInsertDebugUtilsLabelEXT(
    VkCommandBuffer          commandBuffer,
    const VkDebugUtilsLabelEXT* pLabelInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `pLabelInfo` is a pointer to a `VkDebugUtilsLabelEXT` structure specifying parameters of the label to insert.

Valid Usage (Implicit)

- VUID-vkCmdInsertDebugUtilsLabelEXT-commandBuffer-parameter `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdInsertDebugUtilsLabelEXT-pLabelInfo-parameter `pLabelInfo` **must** be a valid pointer to a valid `VkDebugUtilsLabelEXT` structure
- VUID-vkCmdInsertDebugUtilsLabelEXT-commandBuffer-recording `commandBuffer` **must** be in the `recording state`
- VUID-vkCmdInsertDebugUtilsLabelEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, `VK_QUEUE_GRAPHICS_BIT`, or `VK_QUEUE_TRANSFER_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_TRANSFER_BIT	Action

37.1.4. Debug Messengers

Vulkan allows an application to register multiple callbacks with any Vulkan component wishing to report debug information. Some callbacks may log the information to a file, others may cause a debug break point or other application-defined behavior. A primary producer of callback messages are the validation layers. An application **can** register callbacks even when no validation layers are enabled, but they will only be called for the Vulkan loader and, if implemented, other layer and driver events.

A `VkDebugUtilsMessengerEXT` is a messenger object which handles passing along debug messages to a provided debug callback.

```
// Provided by VK_EXT_debug_utils
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDebugUtilsMessengerEXT)
```

The debug messenger will provide detailed feedback on the application's use of Vulkan when events of interest occur. When an event of interest does occur, the debug messenger will submit a debug message to the debug callback that was provided during its creation. Additionally, the debug messenger is responsible with filtering out debug messages that the callback is not interested in and will only provide desired debug messages.

A debug messenger triggers a debug callback with a debug message when an event of interest occurs. To create a debug messenger which will trigger a debug callback, call:

```
// Provided by VK_EXT_debug_utils
VkResult vkCreateDebugUtilsMessengerEXT(
    VkInstance          instance,
    const VkDebugUtilsMessengerCreateInfoEXT* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDebugUtilsMessengerEXT* pMessenger);
```

- `instance` is the instance the messenger will be used with.
- `pCreateInfo` is a pointer to a `VkDebugUtilsMessengerCreateInfoEXT` structure containing the

callback pointer, as well as defining conditions under which this messenger will trigger the callback.

- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.
- **pMessenger** is a pointer to a [VkDebugUtilsMessengerEXT](#) handle in which the created object is returned.

Valid Usage (Implicit)

- VUID-vkCreateDebugUtilsMessengerEXT-instance-parameter **instance** **must** be a valid [VkInstance](#) handle
- VUID-vkCreateDebugUtilsMessengerEXT-pCreateInfo-parameter **pCreateInfo** **must** be a valid pointer to a valid [VkDebugUtilsMessengerCreateInfoEXT](#) structure
- VUID-vkCreateDebugUtilsMessengerEXT-pAllocator-null **pAllocator** **must** be **NULL**
- VUID-vkCreateDebugUtilsMessengerEXT-pMessenger-parameter **pMessenger** **must** be a valid pointer to a [VkDebugUtilsMessengerEXT](#) handle

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_UNKNOWN**
- **VK_ERROR_VALIDATION_FAILED**

The application **must** ensure that [vkCreateDebugUtilsMessengerEXT](#) is not executed in parallel with any Vulkan command that is also called with **instance** or child of **instance** as the dispatchable argument.

The definition of [VkDebugUtilsMessengerCreateInfoEXT](#) is:

```
// Provided by VK_EXT_debug_utils
typedef struct VkDebugUtilsMessengerCreateInfoEXT {
    VkStructureType           sType;
    const void*               pNext;
    VkDebugUtilsMessengerCreateFlagsEXT flags;
    VkDebugUtilsMessageSeverityFlagsEXT messageSeverity;
    VkDebugUtilsMessageTypeFlagsEXT messageType;
    PFN_vkDebugUtilsMessengerCallbackEXT pfnUserCallback;
    void*                     pUserData;
} VkDebugUtilsMessengerCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is `0` and is reserved for future use.
- `messageSeverity` is a bitmask of `VkDebugUtilsMessageSeverityFlagBitsEXT` specifying which severity of event(s) will cause this callback to be called.
- `messageType` is a bitmask of `VkDebugUtilsMessageTypeFlagBitsEXT` specifying which type of event(s) will cause this callback to be called.
- `pfnUserCallback` is the application callback function to call.
- `pUserData` is user data to be passed to the callback.

For each `VkDebugUtilsMessengerEXT` that is created the `VkDebugUtilsMessengerCreateInfoEXT::messageSeverity` and `VkDebugUtilsMessengerCreateInfoEXT::messageType` determine when that `VkDebugUtilsMessengerCreateInfoEXT::pfnUserCallback` is called. The process to determine if the user's `pfnUserCallback` is triggered when an event occurs is as follows:

1. The implementation will perform a bitwise AND of the event's `VkDebugUtilsMessageSeverityFlagBitsEXT` with the `messageSeverity` provided during creation of the `VkDebugUtilsMessengerEXT` object.
 - a. If the value is 0, the message is skipped.
2. The implementation will perform bitwise AND of the event's `VkDebugUtilsMessageTypeFlagBitsEXT` with the `messageType` provided during the creation of the `VkDebugUtilsMessengerEXT` object.
 - a. If the value is 0, the message is skipped.
3. The callback will trigger a debug message for the current event

The callback will come directly from the component that detected the event, unless some other layer intercepts the calls for its own purposes (filter them in a different way, log to a system error log, etc.).

An application **can** receive multiple callbacks if multiple `VkDebugUtilsMessengerEXT` objects are created. A callback will always be executed in the same thread as the originating Vulkan call.

A callback **can** be called from multiple threads simultaneously (if the application is making Vulkan

calls from multiple threads).

Valid Usage (Implicit)

- VUID-VkDebugUtilsMessengerCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEBUG_UTILS_MESSENGER_CREATE_INFO_EXT`
- VUID-VkDebugUtilsMessengerCreateInfoEXT-flags-zerobitmask
`flags` **must** be `0`
- VUID-VkDebugUtilsMessengerCreateInfoEXT-messageSeverity-parameter
`messageSeverity` **must** be a valid combination of `VkDebugUtilsMessageSeverityFlagBitsEXT` values
- VUID-VkDebugUtilsMessengerCreateInfoEXT-messageSeverity-requiredbitmask
`messageSeverity` **must** not be `0`
- VUID-VkDebugUtilsMessengerCreateInfoEXT-messageType-parameter
`messageType` **must** be a valid combination of `VkDebugUtilsMessageTypeFlagBitsEXT` values
- VUID-VkDebugUtilsMessengerCreateInfoEXT-messageType-requiredbitmask
`messageType` **must** not be `0`
- VUID-VkDebugUtilsMessengerCreateInfoEXT-pfnUserCallback-parameter
`pfnUserCallback` **must** be a valid `PFN_vkDebugUtilsMessengerCallbackEXT` value

```
// Provided by VK_EXT_debug_utils
typedef VkFlags VkDebugUtilsMessengerCreateFlagsEXT;
```

`VkDebugUtilsMessengerCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

Bits which **can** be set in `VkDebugUtilsMessengerCreateInfoEXT::messageSeverity`, specifying event severities which cause a debug messenger to call the callback, are:

```
// Provided by VK_EXT_debug_utils
typedef enum VkDebugUtilsMessageSeverityFlagBitsEXT {
    VK_DEBUG_UTILS_MESSAGE_SEVERITY_VERBOSE_BIT_EXT = 0x00000001,
    VK_DEBUG_UTILS_MESSAGE_SEVERITY_INFO_BIT_EXT = 0x00000010,
    VK_DEBUG_UTILS_MESSAGE_SEVERITY_WARNING_BIT_EXT = 0x00000100,
    VK_DEBUG_UTILS_MESSAGE_SEVERITY_ERROR_BIT_EXT = 0x00001000,
} VkDebugUtilsMessageSeverityFlagBitsEXT;
```

- `VK_DEBUG_UTILS_MESSAGE_SEVERITY_VERBOSE_BIT_EXT` specifies the most verbose output indicating all diagnostic messages from the Vulkan loader, layers, and drivers should be captured.
- `VK_DEBUG_UTILS_MESSAGE_SEVERITY_INFO_BIT_EXT` specifies an informational message such as resource details that may be handy when debugging an application.
- `VK_DEBUG_UTILS_MESSAGE_SEVERITY_WARNING_BIT_EXT` specifies use of Vulkan that **may** expose an

application bug. Such cases may not be immediately harmful, such as a fragment shader outputting to a location with no attachment. Other cases **may** point to behavior that is almost certainly bad when unintended such as using an image whose memory has not been filled. In general if you see a warning but you know that the behavior is intended/desired, then simply ignore the warning.

- `VK_DEBUG_UTILS_MESSAGE_SEVERITY_ERROR_BIT_EXT` specifies that the application has violated a valid usage condition of the specification.

The values of `VkDebugUtilsMessageSeverityFlagBitsEXT` are sorted based on severity. The higher the flag value, the more severe the message. This allows for simple boolean operation comparisons when looking at `VkDebugUtilsMessageSeverityFlagBitsEXT` values.

For example:

NOTE

```
if (messageSeverity >=
VK_DEBUG_UTILS_MESSAGE_SEVERITY_WARNING_BIT_EXT) {
    // Do something for warnings and errors
}
```

In addition, space has been left between the enums to allow for later addition of new severities in between the existing values.

```
// Provided by VK_EXT_debug_utils
typedef VkFlags VkDebugUtilsMessageSeverityFlagsEXT;
```

`VkDebugUtilsMessageSeverityFlagsEXT` is a bitmask type for setting a mask of zero or more `VkDebugUtilsMessageSeverityFlagBitsEXT`.

Bits which **can** be set in `VkDebugUtilsMessengerCreateInfoEXT::messageType`, specifying event types which cause a debug messenger to call the callback, are:

```
// Provided by VK_EXT_debug_utils
typedef enum VkDebugUtilsMessageTypeFlagBitsEXT {
    VK_DEBUG_UTILS_MESSAGE_TYPE_GENERAL_BIT_EXT = 0x00000001,
    VK_DEBUG_UTILS_MESSAGE_TYPE_VALIDATION_BIT_EXT = 0x00000002,
    VK_DEBUG_UTILS_MESSAGE_TYPE_PERFORMANCE_BIT_EXT = 0x00000004,
} VkDebugUtilsMessageTypeFlagBitsEXT;
```

- `VK_DEBUG_UTILS_MESSAGE_TYPE_GENERAL_BIT_EXT` specifies that some general event has occurred. This is typically a non-specification, non-performance event.
- `VK_DEBUG_UTILS_MESSAGE_TYPE_VALIDATION_BIT_EXT` specifies that something has occurred during validation against the Vulkan specification that may indicate invalid behavior.
- `VK_DEBUG_UTILS_MESSAGE_TYPE_PERFORMANCE_BIT_EXT` specifies a potentially non-optimal use of Vulkan, e.g. using `vkCmdClearColorImage` when setting `VkAttachmentDescription::loadOp` to

`VK_ATTACHMENT_LOAD_OP_CLEAR` would have worked.

```
// Provided by VK_EXT_debug_utils
typedef VkFlags VkDebugUtilsMessageTypeFlagsEXT;
```

`VkDebugUtilsMessageTypeFlagsEXT` is a bitmask type for setting a mask of zero or more `VkDebugUtilsMessageTypeFlagBitsEXT`.

The prototype for the `VkDebugUtilsMessengerCreateInfoEXT::pfnUserCallback` function implemented by the application is:

```
// Provided by VK_EXT_debug_utils
typedef VkBool32 (VKAPI_PTR *PFN_vkDebugUtilsMessengerCallbackEXT)(
    VkDebugUtilsMessageSeverityFlagBitsEXT    messageSeverity,
    VkDebugUtilsMessageTypeFlagsEXT           messageTypes,
    const VkDebugUtilsMessengerCallbackDataEXT* pCallbackData,
    void*                                       pUserData);
```

- `messageSeverity` specifies the `VkDebugUtilsMessageSeverityFlagBitsEXT` that triggered this callback.
- `messageTypes` is a bitmask of `VkDebugUtilsMessageTypeFlagBitsEXT` specifying which type of event(s) triggered this callback.
- `pCallbackData` contains all the callback related data in the `VkDebugUtilsMessengerCallbackDataEXT` structure.
- `pUserData` is the user data provided when the `VkDebugUtilsMessengerEXT` was created.

The callback returns a `VkBool32`, which is interpreted in a layer-specified manner. The application **should** always return `VK_FALSE`. The `VK_TRUE` value is reserved for use in layer development.

Valid Usage

- VUID-PFN_vkDebugUtilsMessengerCallbackEXT-None-04769
The callback **must** not make calls to any Vulkan commands

The definition of `VkDebugUtilsMessengerCallbackDataEXT` is:

```
// Provided by VK_EXT_debug_utils
typedef struct VkDebugUtilsMessengerCallbackDataEXT {
    VkStructureType           sType;
    const void*               pNext;
    VkDebugUtilsMessengerCallbackDataFlagsEXT flags;
    const char*               pMessageIdName;
    int32_t                   messageIdNumber;
    const char*               pMessage;
    uint32_t                  queueLabelCount;
    const VkDebugUtilsLabelEXT* pQueueLabels;
    uint32_t                  cmdBufLabelCount;
    const VkDebugUtilsLabelEXT* pCmdBufLabels;
    uint32_t                  objectCount;
    const VkDebugUtilsObjectNameInfoEXT* pObjects;
} VkDebugUtilsMessengerCallbackDataEXT;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is `0` and is reserved for future use.
- `pMessageIdName` is `NULL` or a null-terminated UTF-8 string that identifies the particular message ID that is associated with the provided message. If the message corresponds to a validation layer message, then this string will be the VUID.
- `messageIdNumber` is the ID number of the triggering message. If the message corresponds to a validation layer message, then this number is an internal hash of the VUID.
- `pMessage` is a null-terminated UTF-8 string detailing the trigger conditions. If the message corresponds to a validation layer message, then this will contain the main message with the specification text and link.
- `queueLabelCount` is a count of items contained in the `pQueueLabels` array.
- `pQueueLabels` is `NULL` or a pointer to an array of [VkDebugUtilsLabelEXT](#) active in the current [VkQueue](#) at the time the callback was triggered. Refer to [Queue Labels](#) for more information.
- `cmdBufLabelCount` is a count of items contained in the `pCmdBufLabels` array.
- `pCmdBufLabels` is `NULL` or a pointer to an array of [VkDebugUtilsLabelEXT](#) active in the current [VkCommandBuffer](#) at the time the callback was triggered. Refer to [Command Buffer Labels](#) for more information.
- `objectCount` is a count of items contained in the `pObjects` array.
- `pObjects` is a pointer to an array of [VkDebugUtilsObjectNameInfoEXT](#) objects related to the detected issue. The array is roughly in order of importance, but the 0th element is always guaranteed to be the most important object for this message.

NOTE This structure should only be considered valid during the lifetime of the triggered callback.

Since adding queue and command buffer labels behaves like pushing and popping onto a stack, the

order of both `pQueueLabels` and `pCmdBufLabels` is based on the order the labels were defined. The result is that the first label in either `pQueueLabels` or `pCmdBufLabels` will be the first defined (and therefore the oldest) while the last label in each list will be the most recent.

NOTE

`pQueueLabels` will only be non-NULL if one of the objects in `pObjects` can be related directly to a defined `VkQueue` which has had one or more labels associated with it.

Likewise, `pCmdBufLabels` will only be non-NULL if one of the objects in `pObjects` can be related directly to a defined `VkCommandBuffer` which has had one or more labels associated with it. Additionally, while command buffer labels allow for beginning and ending across different command buffers, the debug messaging framework **cannot** guarantee that labels in `pCmdBufLabels` will contain those defined outside of the associated command buffer. This is partially due to the fact that the association of one command buffer with another may not have been defined at the time the debug message is triggered.

Valid Usage (Implicit)

- VUID-VkDebugUtilsMessengerCallbackDataEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEBUG_UTILS_MESSENGER_CALLBACK_DATA_EXT`
- VUID-VkDebugUtilsMessengerCallbackDataEXT-pNext-pNext
`pNext` **must** be NULL
- VUID-VkDebugUtilsMessengerCallbackDataEXT-flags-zerobitmask
`flags` **must** be 0
- VUID-VkDebugUtilsMessengerCallbackDataEXT-pMessageIdName-parameter
If `pMessageIdName` is not NULL, `pMessageIdName` **must** be a null-terminated UTF-8 string
- VUID-VkDebugUtilsMessengerCallbackDataEXT-pMessage-parameter
If `pMessage` is not NULL, `pMessage` **must** be a null-terminated UTF-8 string
- VUID-VkDebugUtilsMessengerCallbackDataEXT-pQueueLabels-parameter
If `queueLabelCount` is not 0, `pQueueLabels` **must** be a valid pointer to an array of `queueLabelCount` valid `VkDebugUtilsLabelEXT` structures
- VUID-VkDebugUtilsMessengerCallbackDataEXT-pCmdBufLabels-parameter
If `cmdBufLabelCount` is not 0, `pCmdBufLabels` **must** be a valid pointer to an array of `cmdBufLabelCount` valid `VkDebugUtilsLabelEXT` structures
- VUID-VkDebugUtilsMessengerCallbackDataEXT-pObjects-parameter
If `objectCount` is not 0, `pObjects` **must** be a valid pointer to an array of `objectCount` valid `VkDebugUtilsObjectNameInfoEXT` structures

```
// Provided by VK_EXT_debug_utils
typedef VkFlags VkDebugUtilsMessengerCallbackDataFlagsEXT;
```

`VkDebugUtilsMessengerCallbackDataFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

To intentionally submit a debug message, call:

```
// Provided by VK_EXT_debug_utils
void vkSubmitDebugUtilsMessageEXT(
    VkInstance                                instance,
    VkDebugUtilsMessageSeverityFlagBitsEXT    messageSeverity,
    VkDebugUtilsMessageTypeFlagsEXT           messageTypes,
    const VkDebugUtilsMessengerCallbackDataEXT* pCallbackData);
```

- **instance** is the debug stream's **VkInstance**.
- **messageSeverity** is a **VkDebugUtilsMessageSeverityFlagBitsEXT** value specifying the severity of this event/message.
- **messageTypes** is a bitmask of **VkDebugUtilsMessageTypeFlagBitsEXT** specifying which type of event(s) to identify with this message.
- **pCallbackData** contains all the callback related data in the **VkDebugUtilsMessengerCallbackDataEXT** structure.

The call will propagate through the layers and generate callback(s) as indicated by the message's flags. The parameters are passed on to the callback in addition to the **pUserData** value that was defined at the time the messenger was registered.

Valid Usage

- VUID-vkSubmitDebugUtilsMessageEXT-objectType-02591
The **objectType** member of each element of **pCallbackData->pObjects** **must** not be **VK_OBJECT_TYPE_UNKNOWN**

Valid Usage (Implicit)

- VUID-vkSubmitDebugUtilsMessageEXT-instance-parameter
instance **must** be a valid **VkInstance** handle
- VUID-vkSubmitDebugUtilsMessageEXT-messageSeverity-parameter
messageSeverity **must** be a valid **VkDebugUtilsMessageSeverityFlagBitsEXT** value
- VUID-vkSubmitDebugUtilsMessageEXT-messageTypes-parameter
messageTypes **must** be a valid combination of **VkDebugUtilsMessageTypeFlagBitsEXT** values
- VUID-vkSubmitDebugUtilsMessageEXT-messageTypes-requiredbitmask
messageTypes **must** not be **0**
- VUID-vkSubmitDebugUtilsMessageEXT-pCallbackData-parameter
pCallbackData **must** be a valid pointer to a valid **VkDebugUtilsMessengerCallbackDataEXT** structure

To destroy a **VkDebugUtilsMessengerEXT** object, call:

```
// Provided by VK_EXT_debug_utils
void vkDestroyDebugUtilsMessengerEXT(
    VkInstance                                  instance,
    VkDebugUtilsMessengerEXT                   messenger,
    const VkAllocationCallbacks*               pAllocator);
```

- **instance** is the instance where the callback was created.
- **messenger** is the [VkDebugUtilsMessengerEXT](#) object to destroy. **messenger** is an externally synchronized object and **must** not be used on more than one thread at a time. This means that **vkDestroyDebugUtilsMessengerEXT** **must** not be called when a callback is active.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage (Implicit)

- VUID-vkDestroyDebugUtilsMessengerEXT-instance-parameter
instance **must** be a valid [VkInstance](#) handle
- VUID-vkDestroyDebugUtilsMessengerEXT-messenger-parameter
If **messenger** is not [VK_NULL_HANDLE](#), **messenger** **must** be a valid [VkDebugUtilsMessengerEXT](#) handle
- VUID-vkDestroyDebugUtilsMessengerEXT-pAllocator-null
pAllocator **must** be [NULL](#)
- VUID-vkDestroyDebugUtilsMessengerEXT-messenger-parent
If **messenger** is a valid handle, it **must** have been created, allocated, or retrieved from **instance**

Host Synchronization

- Host access to **messenger** **must** be externally synchronized

The application **must** ensure that [vkDestroyDebugUtilsMessengerEXT](#) is not executed in parallel with any Vulkan command that is also called with **instance** or child of **instance** as the dispatchable argument.

37.2. Fault Handling

The fault handling mechanism provides a method for the implementation to pass fault information to the application. A fault indicates that an issue has occurred with the host or device that could impact the implementation's ability to function correctly. It consists of a [VkFaultData](#) structure that is used to communicate information about the fault between the implementation and the application, with two methods to obtain the data. The application **can** obtain the fault data from the implementation using [vkGetFaultData](#). Alternatively, the implementation **can** directly call a pre-registered fault handler function ([PFN_vkFaultCallbackFunction](#)) in the application when a fault occurs.

The `VkFaultData` structure provides categories the implementation **must** set to provide basic information on a fault. These allow the implementation to provide a coarse classification of a fault to the application. As the potential faults that could occur will vary between different platforms, it is expected that an implementation would also provide additional implementation-specific data on the fault, enabling the application to take appropriate action.

The implementation **must** also define whether a particular fault results in the fault callback function being called, is communicated via `vkGetFaultData`, or both. This will be decided by several factors including:

- the severity of the fault,
- the application's ability to handle the fault, and
- how the application should handle the fault.

The implementation **must** document the implementation-specific fault data, how the faults are communicated, and expected responses from the application for each of the faults that it **can** report.

37.2.1. Fault Data

The information on a single fault is returned using the `VkFaultData` structure. The `VkFaultData` structure is defined as:

```
// Provided by VKSC_VERSION_1_0
typedef struct VkFaultData {
    VkStructureType    sType;
    void*              pNext;
    VkFaultLevel       faultLevel;
    VkFaultType        faultType;
} VkFaultData;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure that provides implementation-specific data on the fault.
- `faultLevel` is a `VkFaultLevel` that provides the severity of the fault.
- `faultType` is a `VkFaultType` that provides the type of the fault.

To retrieve implementation-specific fault data, `pNext` **can** point to one or more implementation-defined fault structures or `NULL` to not retrieve implementation-specific data.

Valid Usage

- VUID-VkFaultData-pNext-05019
`pNext` **must** be `NULL` or a valid pointer to an implementation-specific structure

Valid Usage (Implicit)

- VUID-VkFaultData-sType-sType
sType **must** be VK_STRUCTURE_TYPE_FAULT_DATA

Possible values of `VkFaultData::faultLevel`, specifying the fault severity, are:

```
// Provided by VKSC_VERSION_1_0
typedef enum VkFaultLevel {
    VK_FAULT_LEVEL_UNASSIGNED = 0,
    VK_FAULT_LEVEL_CRITICAL = 1,
    VK_FAULT_LEVEL_RECOVERABLE = 2,
    VK_FAULT_LEVEL_WARNING = 3,
} VkFaultLevel;
```

- `VK_FAULT_LEVEL_UNASSIGNED` A fault level has not been assigned.
- `VK_FAULT_LEVEL_CRITICAL` A fault that **cannot** be recovered by the application.
- `VK_FAULT_LEVEL_RECOVERABLE` A fault that **can** be recovered by the application.
- `VK_FAULT_LEVEL_WARNING` A fault that indicates a non-optimal condition has occurred, but no recovery is necessary at this point.

Possible values of `VkFaultData::faultType`, specifying the fault type, are:

```
// Provided by VKSC_VERSION_1_0
typedef enum VkFaultType {
    VK_FAULT_TYPE_INVALID = 0,
    VK_FAULT_TYPE_UNASSIGNED = 1,
    VK_FAULT_TYPE_IMPLEMENTATION = 2,
    VK_FAULT_TYPE_SYSTEM = 3,
    VK_FAULT_TYPE_PHYSICAL_DEVICE = 4,
    VK_FAULT_TYPE_COMMAND_BUFFER_FULL = 5,
    VK_FAULT_TYPE_INVALID_API_USAGE = 6,
} VkFaultType;
```

- `VK_FAULT_TYPE_INVALID` The fault data does not contain a valid fault.
- `VK_FAULT_TYPE_UNASSIGNED` A fault type has not been assigned.
- `VK_FAULT_TYPE_IMPLEMENTATION` Implementation-defined fault.
- `VK_FAULT_TYPE_SYSTEM` A fault occurred in the system components.
- `VK_FAULT_TYPE_PHYSICAL_DEVICE` A fault occurred with the physical device.
- `VK_FAULT_TYPE_COMMAND_BUFFER_FULL` Command buffer memory was exhausted before `vkEndCommandBuffer` was called.
- `VK_FAULT_TYPE_INVALID_API_USAGE` Invalid usage of the API was detected by the implementation.

37.2.2. Querying Fault Status

To query the number of current faults and obtain the fault data, call [vkGetFaultData](#).

```
// Provided by VKSC_VERSION_1_0
VkResult vkGetFaultData(
    VkDevice                device,
    VkFaultQueryBehavior    faultQueryBehavior,
    VkBool32*               pUnrecordedFaults,
    uint32_t*               pFaultCount,
    VkFaultData*            pFaults);
```

- **device** is the logical device to obtain faults from.
- **faultQueryBehavior** is a [VkFaultQueryBehavior](#) that specifies the types of faults to obtain from the implementation, and how those faults should be handled.
- **pUnrecordedFaults** is a return boolean that specifies if the logged fault information is incomplete and does not contain entries for all faults that have been detected by the implementation and **may** be reported via [vkGetFaultData](#).
- **pFaultCount** is a pointer to an integer that specifies the number of fault entries.
- **pFaults** is either **NULL** or a pointer to an array of **pFaultCount** [VkFaultData](#) structures to be updated with the recorded fault data.

Access to fault data is internally synchronized, meaning [vkGetFaultData](#) **can** be called from multiple threads simultaneously.

The implementation **must** not record more than **maxQueryFaultCount** faults to be reported by [vkGetFaultData](#).

pUnrecordedFaults is **VK_TRUE** if the implementation has detected one or more faults since the last successful retrieval of fault data using this command, but was unable to record fault information for all faults. Otherwise, **pUnrecordedFaults** is **VK_FALSE**.

If **pFaults** is **NULL**, then the number of faults with the specified **faultQueryBehavior** characteristics associated with **device** is returned in **pFaultCount**, and **pUnrecordedFaults** is set as indicated above. Otherwise, **pFaultCount** **must** point to a variable set by the application to the number of elements in the **pFaults** array, and on return the variable is overwritten with the number of faults actually written to **pFaults**. If **pFaultCount** is less than the number of recorded **device** faults with the specified **faultQueryBehavior** characteristics, at most **pFaultCount** faults will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available faults were returned.

If **VK_SUCCESS** is returned, the fault information stored by the implementation for the faults that were returned will be handled as specified by **faultQueryBehavior**. Otherwise, the stored fault information is not modified.

For each filled **pFaults** entry, if **pNext** is not **NULL**, the implementation will fill in any implementation-specific structures applicable to that fault that are included in the **pNext** chain.

NOTE

In order to simplify the application logic, an application could have a static allocation sized to `maxQueryFaultCount` which it passes in to each call of `vkGetFaultData`. This allows an application to obtain all the faults available at this time in a single call to `vkGetFaultData`. Furthermore, under this usage pattern, the command will never return `VK_INCOMPLETE`.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetFaultData` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkGetFaultData-pFaultCount-05020
`pFaultCount` **must** be less than or equal to `maxQueryFaultCount`

Valid Usage (Implicit)

- VUID-vkGetFaultData-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetFaultData-faultQueryBehavior-parameter
`faultQueryBehavior` **must** be a valid `VkFaultQueryBehavior` value
- VUID-vkGetFaultData-pUnrecordedFaults-parameter
`pUnrecordedFaults` **must** be a valid pointer to a `VkBool32` value
- VUID-vkGetFaultData-pFaultCount-parameter
`pFaultCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetFaultData-pFaults-parameter
If the value referenced by `pFaultCount` is not 0, and `pFaults` is not `NULL`, `pFaults` **must** be a valid pointer to an array of `pFaultCount` `VkFaultData` structures

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

Possible values that **can** be set in `VkFaultQueryBehavior`, specifying which faults to return, are:

```
// Provided by VKSC_VERSION_1_0
typedef enum VkFaultQueryBehavior {
    VK_FAULT_QUERY_BEHAVIOR_GET_AND_CLEAR_ALL_FAULTS = 0,
} VkFaultQueryBehavior;
```

- **VK_FAULT_QUERY_BEHAVIOR_GET_AND_CLEAR_ALL_FAULTS** All fault types and severities are reported and are cleared from the internal fault storage after retrieval.

37.2.3. Fault Callback

The **VkFaultCallbackInfo** structure allows an application to register a function at device creation that the implementation can call to report faults when they occur. A callback function is registered by attaching a valid **VkFaultCallbackInfo** structure to the **pNext** chain of the **VkDeviceCreateInfo** structure. The callback function is only called by the implementation during a call to the API, using the same thread that is making the API call. The **VkFaultCallbackInfo** structure provides the function pointer to be called by the implementation, and optionally, application memory to store fault data.

The **VkFaultCallbackInfo** structure is defined as:

```
// Provided by VKSC_VERSION_1_0
typedef struct VkFaultCallbackInfo {
    VkStructureType      sType;
    const void*          pNext;
    uint32_t             faultCount;
    VkFaultData*          pFaults;
    PFN_vkFaultCallbackFunction pfnFaultCallback;
} VkFaultCallbackInfo;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or pointer to a structure extending this structure.
- **faultCount** is the number of reported faults in the array pointed to by **pFaults**.
- **pFaults** is either **NULL** or a pointer to an array of **faultCount** **VkFaultData** structures.
- **pfnFaultCallback** is a function pointer to the fault handler function that will be called by the implementation when a fault occurs.

If provided, the implementation **may** make use of the **pFaults** array to return fault data to the application when using the fault callback.

NOTE

Prior to Vulkan SC 1.0.11, the application was required to provide the **pFaults** array for fault callback data. This proved to be unwieldy for both applications and implementations and it was made optional as of version 1.0.11. It is expected that most implementations will ignore this and use stack or other preallocated memory for fault callback parameters.

If provided, the application memory referenced by **pFaults** **must** remain accessible throughout the lifetime of the logical device that was created with this structure.

NOTE

The memory pointed to by **pFaults** will be updated by the implementation and should not be used or accessed by the application outside of the fault handling function pointed to by **pfnFaultCallback**. This restriction also applies to any implementation-specific structure chained to an element of **pFaults** by **pNext**.

It is expected that implementations will maintain separate storage for fault information and populate the array pointed to by **pFaults** ahead of calling the fault callback function.

Valid Usage

- VUID-VkFaultCallbackInfo-faultCount-05138
faultCount **must** either be 0, or equal to **VkPhysicalDeviceVulkanSC10Properties::maxCallbackFaultCount**

Valid Usage (Implicit)

- VUID-VkFaultCallbackInfo-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_FAULT_CALLBACK_INFO**
- VUID-VkFaultCallbackInfo-pFaults-parameter
If **faultCount** is not 0, and **pFaults** is not NULL, **pFaults** **must** be a valid pointer to an array of **faultCount** **VkFaultData** structures
- VUID-VkFaultCallbackInfo-pfnFaultCallback-parameter
pfnFaultCallback **must** be a valid **PFN_vkFaultCallbackFunction** value

The function pointer **PFN_vkFaultCallbackFunction** is defined as:

```
// Provided by VKSC_VERSION_1_0
typedef void (VKAPI_PTR *PFN_vkFaultCallbackFunction)(
    VkBool32                unrecordedFaults,
    uint32_t                faultCount,
    const VkFaultData*      pFaults);
```

- **unrecordedFaults** is a boolean that specifies if the supplied fault information is incomplete and does not contain entries for all faults that have been detected by the implementation and **may** be reported via **PFN_vkFaultCallbackFunction** since the last call to this callback.
- **faultCount** will contain the number of reported faults in the array pointed to by **pFaults**.
- **pFaults** will point to an array of **faultCount** **VkFaultData** structures containing the fault information.

An implementation **must** only make calls to **pfnFaultCallback** during the execution of an API

command. An implementation **must** only make calls into the application-provided fault callback from the same thread that called the API command. The implementation **should** not synchronize calls to the callback. If synchronization is needed, the callback **must** provide it.

The fault callback **must** not call any Vulkan commands.

It is implementation-dependent whether faults reported by this callback are also reported via [vkGetFaultData](#), but each unique fault will be reported by at most one callback.

Appendix A: Vulkan Environment for SPIR-V

Shaders for Vulkan are defined by the [Khronos SPIR-V Specification](#) as well as the [Khronos SPIR-V Extended Instructions for GLSL](#) Specification. This appendix defines additional SPIR-V requirements applying to Vulkan shaders.

Versions and Formats

A Vulkan 1.2 implementation **must** support the 1.0, 1.1, 1.2, 1.3, 1.4, and 1.5 versions of SPIR-V and the 1.0 version of the SPIR-V Extended Instructions for GLSL.

A SPIR-V module is interpreted as a series of 32-bit words in host endianness, with literal strings packed as described in section 2.2 of the SPIR-V Specification. The first few words of the SPIR-V module **must** be a magic number and a SPIR-V version number, as described in section 2.3 of the SPIR-V Specification.

Capabilities

The [table below](#) lists the set of SPIR-V capabilities that **may** be supported in Vulkan implementations. The application **must** not select a pipeline cache entry, which was created by passing a SPIR-V module using any of these capabilities to the [offline pipeline cache compiler](#), in a [vkCreate*Pipelines](#) command unless one of the following conditions is met for the [VkDevice](#) specified in the [device](#) parameter of the [vkCreate*Pipelines](#) command:

- The corresponding field in the table is blank.
- Any corresponding Vulkan feature is enabled.
- Any corresponding Vulkan extension is enabled.
- Any corresponding Vulkan property is supported.
- The corresponding core version is supported (as returned by [VkPhysicalDeviceProperties::apiVersion](#)).

The application **must** not select a pipeline cache entry, which was created by passing a SPIR-V module containing any of the following to the [offline pipeline cache compiler](#), containing any of the following in a `vkCreate*Pipelines` command:

- any `OpCapability` not listed above,
- an unsupported capability, or
- a capability which corresponds to a Vulkan feature or extension which has not been enabled.

SPIR-V Extensions

The [following table](#) lists SPIR-V extensions that implementations **may** support. The application **must** not select a pipeline cache entry, which was created by passing a SPIR-V module using any of the following SPIR-V extensions to the [offline pipeline cache compiler](#), in a `vkCreate*Pipelines` command unless one of the following conditions is met for the `VkDevice` specified in the `device` parameter of the `vkCreate*Pipelines` command:

- Any corresponding Vulkan extension is enabled.
- The corresponding core version is supported (as returned by `VkPhysicalDeviceProperties::apiVersion`).

Validation Rules Within a Module

Pipeline cache entries **must** have been compiled with the [offline pipeline cache compiler](#) using

SPIR-V modules that conform to the following rules:

Standalone SPIR-V Validation

The following rules **can** be validated with only the SPIR-V module itself. They do not depend on knowledge of the implementation and its capabilities or knowledge of runtime information, such as enabled features.

Valid Usage

- VUID-StandaloneSpirv-None-04633
Every entry point **must** have no return value and accept no arguments
- VUID-StandaloneSpirv-None-04634
The static function-call graph for an entry point **must** not contain cycles; that is, static recursion is not allowed
- VUID-StandaloneSpirv-None-04635
The **Logical** or **PhysicalStorageBuffer64** addressing model **must** be selected
- VUID-StandaloneSpirv-None-04636
Scope for execution **must** be limited to **Workgroup** or **Subgroup**
- VUID-StandaloneSpirv-None-04637
If the **Scope** for execution is **Workgroup**, then it **must** only be used in the task, mesh, tessellation control, or compute **Execution Model**
- VUID-StandaloneSpirv-None-04638
Scope for memory **must** be limited to **Device**, **QueueFamily**, **Workgroup**, **ShaderCallKHR**, **Subgroup**, or **Invocation**
- VUID-StandaloneSpirv-ExecutionModel-07320
If the **Execution Model** is **TessellationControl**, and the **MemoryModel** is **GLSL450**, the **Scope** for memory **must** not be **Workgroup**
- VUID-StandaloneSpirv-None-07321
If the **Scope** for memory is **Workgroup**, then it **must** only be used in the task, mesh, tessellation control, or compute **Execution Model**
- VUID-StandaloneSpirv-None-04640
If the **Scope** for memory is **ShaderCallKHR**, then it **must** only be used in ray generation, intersection, closest hit, any-hit, miss, and callable **Execution Model**
- VUID-StandaloneSpirv-None-04641
If the **Scope** for memory is **Invocation**, then **MemorySemantics** **must** use **Relaxed** memory order
- VUID-StandaloneSpirv-None-04642
Scope for **group operations** **must** be limited to **Subgroup**
- VUID-StandaloneSpirv-SubgroupVoteKHR-07951
If none of the **SubgroupVoteKHR**, **GroupNonUniform**, or **SubgroupBallotKHR** capabilities are declared, **Scope** for memory **must** not be **Subgroup**
- VUID-StandaloneSpirv-None-04643

Storage Class **must** be limited to UniformConstant, Input, Uniform, Output, Workgroup, Private, Function, PushConstant, Image, StorageBuffer, RayPayloadKHR, IncomingRayPayloadKHR, HitAttributeKHR, CallableDataKHR, IncomingCallableDataKHR, ShaderRecordBufferKHR, PhysicalStorageBuffer, or TileImageEXT

- VUID-StandaloneSpirv-None-04644

If the Storage Class is Output, then it **must** not be used in the GLCompute, RayGenerationKHR, IntersectionKHR, AnyHitKHR, ClosestHitKHR, MissKHR, or CallableKHR Execution Model

- VUID-StandaloneSpirv-None-04645

If the Storage Class is Workgroup, then it **must** only be used in the task, mesh, or compute Execution Model

- VUID-StandaloneSpirv-None-08720

If the Storage Class is TileImageEXT, then it **must** only be used in the fragment execution model

- VUID-StandaloneSpirv-MemorySemantics-10865

MemorySemantics **must** have at most one non-relaxed memory order bit set (Acquire, Release, or AcquireRelease)

- VUID-StandaloneSpirv-MemorySemantics-10866

MemorySemantics with SequentiallyConsistent memory order **must** not be used in the Vulkan API

- VUID-StandaloneSpirv-MemorySemantics-10867

MemorySemantics **must** not use Acquire or AcquireRelease memory order with OpAtomicStore

- VUID-StandaloneSpirv-MemorySemantics-10868

MemorySemantics **must** not use Release or AcquireRelease memory order with OpAtomicLoad

- VUID-StandaloneSpirv-MemorySemantics-10869

MemorySemantics **must** not use Relaxed memory order with OpMemoryBarrier

- VUID-StandaloneSpirv-MemorySemantics-10870

MemorySemantics with a non-relaxed memory order (Acquire, Release, or AcquireRelease) **must** have at least one Vulkan-supported storage class semantics bit set (UniformMemory, WorkgroupMemory, ImageMemory, or OutputMemory)

- VUID-StandaloneSpirv-MemorySemantics-10871

MemorySemantics with at least one Vulkan-supported storage class semantics bit set (UniformMemory, WorkgroupMemory, ImageMemory, or OutputMemory) **must** use a non-relaxed memory order (Acquire, Release, or AcquireRelease)

- VUID-StandaloneSpirv-MemorySemantics-10872

MemorySemantics with MakeAvailable bit set **must** use Release or AcquireRelease memory order

- VUID-StandaloneSpirv-MemorySemantics-10873

MemorySemantics with MakeVisible bit set **must** use Acquire or AcquireRelease memory order

- VUID-StandaloneSpirv-MemorySemantics-10874

MemorySemantics with Volatile bit set **must** not be used with barrier instructions (OpControlBarrier or OpMemoryBarrier)

- VUID-StandaloneSpirv-UnequalMemorySemantics-10875
UnequalMemorySemantics of OpAtomicCompareExchange **must** not use Release or AcquireRelease memory order
- VUID-StandaloneSpirv-UnequalMemorySemantics-10876
UnequalMemorySemantics of OpAtomicCompareExchange **must** not use a stronger memory order than the corresponding EqualMemorySemantics
- VUID-StandaloneSpirv-UnequalMemorySemantics-10877
UnequalMemorySemantics of OpAtomicCompareExchange **must** not have any Vulkan-supported storage class semantics bit set (UniformMemory, WorkgroupMemory, ImageMemory, or OutputMemory) unless this bit is also set in the corresponding EqualMemorySemantics
- VUID-StandaloneSpirv-UnequalMemorySemantics-10878
UnequalMemorySemantics of OpAtomicCompareExchange **must** not have MakeVisible bit set unless this bit is also set in the corresponding EqualMemorySemantics
- VUID-StandaloneSpirv-UnequalMemorySemantics-10879
UnequalMemorySemantics of OpAtomicCompareExchange **must** have Volatile bit set if and only if this bit is also set in the corresponding EqualMemorySemantics
- VUID-StandaloneSpirv-OpVariable-04651
Any variable with an Initializer operand **must** have Output, Private, Function, or Workgroup as its Storage Class operand
- VUID-StandaloneSpirv-OpVariable-04734
Any variable with an Initializer operand and Workgroup as its Storage Class operand **must** use OpConstantNull as the initializer
- VUID-StandaloneSpirv-OpReadClockKHR-04652
Scope for OpReadClockKHR **must** be limited to Subgroup or Device
- VUID-StandaloneSpirv-OriginLowerLeft-04653
The OriginLowerLeft Execution Mode **must** not be used; fragment entry points **must** declare OriginUpperLeft
- VUID-StandaloneSpirv-PixelCenterInteger-04654
The PixelCenterInteger Execution Mode **must** not be used (pixels are always centered at half-integer coordinates)
- VUID-StandaloneSpirv-UniformConstant-04655
Any variable in the UniformConstant Storage Class **must** be typed as either OpTypeImage, OpTypeSampler, OpTypeSampledImage, OpTypeAccelerationStructureKHR, OpTypeTensorARM or an array of one of these types
- VUID-StandaloneSpirv-Uniform-06807
Any variable in the Uniform or StorageBuffer Storage Class **must** be typed as OpTypeStruct or an array of this type
- VUID-StandaloneSpirv-PushConstant-06808
Any variable in the PushConstant Storage Class **must** be typed as OpTypeStruct
- VUID-StandaloneSpirv-OpTypeImage-04656
OpTypeImage **must** declare a scalar 32-bit float, 64-bit integer, or 32-bit integer type for the “Sampled Type” (RelaxedPrecision can be applied to a sampling instruction and to the variable holding the result of a sampling instruction)

- VUID-StandaloneSpirv-OpTypeImage-04657
OpTypeImage **must** have a “Sampled” operand of 1 (sampled image) or 2 (storage image)
- VUID-StandaloneSpirv-OpTypeSampledImage-06671
OpTypeSampledImage **must** have a **OpTypeImage** with a “Sampled” operand of 1 (sampled image)
- VUID-StandaloneSpirv-Image-04965
The **SPIR-V Type** of the **Image Format** operand of an **OpTypeImage** **must** match the **Sampled Type**, as defined in **Image Format and Type Matching**
- VUID-StandaloneSpirv-OpImageTexelPointer-04658
If an **OpImageTexelPointer** is used in an atomic operation, the image type of the **image** parameter to **OpImageTexelPointer** **must** have an image format of **R64i**, **R64ui**, **R32f**, **R32i**, or **R32ui**
- VUID-StandaloneSpirv-OpImageQuerySizeLod-04659
OpImageQuerySizeLod, **OpImageQueryLod**, and **OpImageQueryLevels** **must** only consume an “Image” operand whose type has its “Sampled” operand set to 1
- VUID-StandaloneSpirv-OpTypeImage-09638
An **OpTypeImage** **must** not have a “Dim” operand of **Rect**
- VUID-StandaloneSpirv-OpTypeImage-06214
An **OpTypeImage** with a “Dim” operand of **SubpassData** **must** have an “Arrayed” operand of 0 (non-arrayed) and a “Sampled” operand of 2 (storage image)
- VUID-StandaloneSpirv-SubpassData-04660
The (u,v) coordinates used for a **SubpassData** **must** be the <id> of a constant vector (0,0)
- VUID-StandaloneSpirv-OpTypeImage-06924
Objects of types **OpTypeImage**, **OpTypeSampler**, **OpTypeSampledImage**, **OpTypeAccelerationStructureKHR**, **OpTypeTensorARM**, and arrays of these types **must** not be stored to or modified
- VUID-StandaloneSpirv-Uniform-06925
Any variable in the **Uniform Storage Class** decorated as **Block** **must** not be stored to or modified
- VUID-StandaloneSpirv-Offset-04865
Any image instruction which uses an **Offset**, **ConstOffset**, or **ConstOffsets** image operand, **must** only consume a “Sampled Image” operand whose type has its “Sampled” operand set to 1
- VUID-StandaloneSpirv-OpImageGather-04664
The “Component” operand of **OpImageGather**, and **OpImageSparseGather** **must** be the <id> of a constant instruction
- VUID-StandaloneSpirv-OpImage-04777
OpImage*Dref* instructions **must** not consume an image whose **Dim** is 3D
- VUID-StandaloneSpirv-None-04667
Structure types **must** not contain opaque types
- VUID-StandaloneSpirv-BuiltIn-04668
Any **BuiltIn** decoration not listed in **Built-In Variables** **must** not be used

- VUID-StandaloneSpirv-OpEntryPoint-09658
For a given **OpEntryPoint**, any **BuiltIn** decoration **must** not be used more than once by the **Input** interface
- VUID-StandaloneSpirv-OpEntryPoint-09659
For a given **OpEntryPoint**, any **BuiltIn** decoration **must** not be used more than once by the **Output** interface
- VUID-StandaloneSpirv-Location-06672
The **Location** or **Component** decorations **must** only be used with the **Input**, **Output**, **RayPayloadKHR**, **IncomingRayPayloadKHR**, **HitAttributeKHR**, **HitObjectAttributeNV**, **CallableDataKHR**, **IncomingCallableDataKHR**, or **ShaderRecordBufferKHR** storage classes
- VUID-StandaloneSpirv-Location-04915
The **Location** or **Component** decorations **must** not be used with **BuiltIn**
- VUID-StandaloneSpirv-Location-04916
The **Location** decorations **must** be used on **user-defined variables**
- VUID-StandaloneSpirv-Location-04917
If a **user-defined variable** is not a pointer to a **Block** decorated **OpTypeStruct**, then the variable **must** have a **Location** decoration
- VUID-StandaloneSpirv-Location-04918
If a **user-defined variable** has a **Location** decoration, and the variable is a pointer to a **OpTypeStruct**, then the members of that structure **must** not have **Location** decorations
- VUID-StandaloneSpirv-Location-04919
If a **user-defined variable** does not have a **Location** decoration, and the variable is a pointer to a **Block** decorated **OpTypeStruct**, then each member of the struct **must** have a **Location** decoration
- VUID-StandaloneSpirv-Component-04920
The **Component** decoration value **must** not be greater than 3
- VUID-StandaloneSpirv-Component-04921
If the **Component** decoration is used on a variable that has a **OpTypeVector** type with a **Component Type** with a **Width** that is less than or equal to 32, the sum of its **Component Count** and the **Component** decoration value **must** be less than or equal to 4
- VUID-StandaloneSpirv-Component-04922
If the **Component** decoration is used on a variable that has a **OpTypeVector** type with a **Component Type** with a **Width** that is equal to 64, the sum of two times its **Component Count** and the **Component** decoration value **must** be less than or equal to 4
- VUID-StandaloneSpirv-Component-04923
The **Component** decorations value **must** not be 1 or 3 for scalar or two-component 64-bit data types
- VUID-StandaloneSpirv-Component-07703
The **Component** decorations **must** not be used for a 64-bit vector type with more than two components
- VUID-StandaloneSpirv-Component-10583
The **Component** decorations **must** not be used with any type that is not a scalar, vector, array of scalars or vectors, or an array of arrays of scalars or vectors

- VUID-StandaloneSpirv-Execution-10584
If the **Execution Model** of an entry point is not **TessellationControl** or **Geometry**, its interface definition **must** not include any variables in the **Input** storage class decorated with **Component** that are arrays of arrays of scalars or vectors
- VUID-StandaloneSpirv-Execution-10585
If the **Execution Model** of an entry point is not **MeshNV**, its interface definition **must** not include any variables in the **Output** storage class decorated with **Component** that are arrays of arrays of scalars or vectors
- VUID-StandaloneSpirv-Output-10586
Variables in the **Output** storage class in the **Vertex**, **TessellationControl**, **TessellationEvaluation**, or **Geometry** execution model **must** not have overlapping **Component** and **Location** decorations as defined by [Location and Component Assignment](#)
- VUID-StandaloneSpirv-Output-10587
Variables in the **Output** storage class in the **Fragment** execution model **must** not have both identical **Index** decorations and overlapping **Component** and **Location** decorations as defined by [Location and Component Assignment](#)
- VUID-StandaloneSpirv-Input-10588
Variables in the **Input** storage class in the **TessellationControl**, **TessellationEvaluation**, **Geometry**, or **Fragment** execution model **must** not have overlapping **Component** and **Location** decorations as defined by [Location and Component Assignment](#)
- VUID-StandaloneSpirv-Input-10604
Any variable in the **Input** storage class in the **Fragment** execution model **must** not have an assigned **Location** shared with another variable with different decorations for **PerVertexKHR**, **Flat**, **NoPerspective**, **Sample**, or **Centroid**
- VUID-StandaloneSpirv-Input-09557
The pointers of any **Input** or **Output** [Interface user-defined variables](#) **must** not contain any **PhysicalStorageBuffer Storage Class** pointers
- VUID-StandaloneSpirv-None-10684
All variables **must** have valid explicit layout decorations [as described in Shader Interfaces](#)
- VUID-StandaloneSpirv-GLSLShared-04669
The **GLSLShared** and **GLSLPacked** decorations **must** not be used
- VUID-StandaloneSpirv-TessLevelInner-10880
Any variable decorated with **TessLevelInner** or **TessLevelOuter** **must** also be decorated with **Patch**
- VUID-StandaloneSpirv-Flat-04670
The **Flat**, **NoPerspective**, **Sample**, and **Centroid** decorations **must** only be used on variables with the **Output** or **Input Storage Class**
- VUID-StandaloneSpirv-Flat-06201
The **Flat**, **NoPerspective**, **Sample**, and **Centroid** decorations **must** not be used on variables with the **Output** storage class in a fragment shader
- VUID-StandaloneSpirv-Flat-06202
The **Flat**, **NoPerspective**, **Sample**, and **Centroid** decorations **must** not be used on variables with the **Input** storage class in a vertex shader

- VUID-StandaloneSpirv-PerVertexKHR-06777
The **PerVertexKHR** decoration **must** only be used on variables with the **Input Storage Class** in a fragment shader
- VUID-StandaloneSpirv-Flat-04744
Any variable with integer or double-precision floating-point type and with **Input Storage Class** in a fragment shader, **must** be decorated **Flat**
- VUID-StandaloneSpirv-ViewportRelativeNV-04672
The **ViewportRelativeNV** decoration **must** only be used on a variable decorated with **Layer** in the vertex, tessellation evaluation, or geometry shader stages
- VUID-StandaloneSpirv-ViewportRelativeNV-04673
The **ViewportRelativeNV** decoration **must** not be used unless a variable decorated with one of **ViewportIndex** or **ViewportMaskNV** is also statically used by the same **OpEntryPoint**
- VUID-StandaloneSpirv-ViewportMaskNV-04674
The **ViewportMaskNV** and **ViewportIndex** decorations **must** not both be statically used by one or more **OpEntryPoint**'s that form the **pre-rasterization shader stages** of a graphics pipeline
- VUID-StandaloneSpirv-FPRoundingMode-04675
Rounding modes other than round-to-nearest-even and round-towards-zero **must** not be used for the **FPRoundingMode** decoration
- VUID-StandaloneSpirv-Invariant-04677
Variables decorated with **Invariant** and variables with structure types that have any members decorated with **Invariant** **must** be in the **Output** or **Input Storage Class**, **Invariant** used on an **Input Storage Class** variable or structure member has no effect
- VUID-StandaloneSpirv-VulkanMemoryModel-04678
If the **VulkanMemoryModel** capability is not declared, the **Volatile** decoration **must** be used on any variable declaration that includes one of the **SMIDNV**, **WarpIDNV**, **SubgroupSize**, **SubgroupLocalInvocationId**, **SubgroupEqMask**, **SubgroupGeMask**, **SubgroupGtMask**, **SubgroupLeMask**, or **SubgroupLtMask BuiltIn** decorations when used in the ray generation, closest hit, miss, intersection, or callable shaders, or with the **RayTmaxKHR BuiltIn** decoration when used in an intersection shader
- VUID-StandaloneSpirv-VulkanMemoryModel-04679
If the **VulkanMemoryModel** capability is declared, the **OpLoad** instruction **must** use **MemorySemantics** with the **Volatile** flag when it accesses into any variable that includes one of the **SMIDNV**, **WarpIDNV**, **SubgroupSize**, **SubgroupLocalInvocationId**, **SubgroupEqMask**, **SubgroupGeMask**, **SubgroupGtMask**, **SubgroupLeMask**, or **SubgroupLtMask BuiltIn** decorations when used in the ray generation, closest hit, miss, intersection, or callable shaders, or with the **RayTmaxKHR BuiltIn** decoration when used in an intersection shader
- VUID-StandaloneSpirv-OpTypeRuntimeArray-04680
OpTypeRuntimeArray **must** only be instantiated by a variable as:
 - the last member of a **Block**-decorated **OpTypeStruct** in **StorageBuffer** or **PhysicalStorageBuffer** storage **Storage Class**
 - **BufferBlock**-decorated **OpTypeStruct** in the **Uniform** storage **Storage Class**
 - the outermost dimension of an arrayed variable in the **StorageBuffer**, **Uniform**, or **UniformConstant** storage **Storage Class**

- the `NodePayloadAMD` storage `Storage Class` when the `CoalescingAMD` Execution Mode is specified
- VUID-StandaloneSpirv-OpArrayLength-11805
`OpArrayLength` **must** not be used with an `OpTypeRuntimeArray` that is the last member of a `Block`-decorated `OpTypeStruct` in the `Uniform` storage `Storage Class`
- VUID-StandaloneSpirv-Function-04681
A type *T* that is an array sized with a specialization constant **must** neither be, nor be contained in, the type *T2* of a variable *V*, unless either: a) *T* is equal to *T2*, b) *V* is declared in the `Function`, or `Private Storage Class`, c) *V* is a non-Block variable in the `Workgroup Storage Class`, or d) *V* is an interface variable with an additional level of arrayness, as described in interface matching, and *T* is the member type of the array type *T2*
- VUID-StandaloneSpirv-OpControlBarrier-04682
If `OpControlBarrier` is used in ray generation, intersection, any-hit, closest hit, miss, fragment, vertex, tessellation evaluation, or geometry shaders, the execution Scope **must** be `Subgroup`
- VUID-StandaloneSpirv-None-10685
For each compute shader entry point, either a `TileShadingRateQCOM`, `LocalSize`, or `LocalSizeId Execution Mode`, or an object decorated with the `WorkgroupSize` decoration **must** be specified
- VUID-StandaloneSpirv-DerivativeGroupQuadsNV-04684
For compute shaders using the `DerivativeGroupQuadsNV` execution mode, the first two dimensions of the local workgroup size **must** be a multiple of two
- VUID-StandaloneSpirv-DerivativeGroupLinearNV-04778
For compute shaders using the `DerivativeGroupLinearNV` execution mode, the product of the dimensions of the local workgroup size **must** be a multiple of four
- VUID-StandaloneSpirv-DerivativeGroupQuadsKHR-10151
For compute, mesh, or task shaders using the `DerivativeGroupQuadsKHR` execution mode, the first two dimensions of the local workgroup size **must** be a multiple of two
- VUID-StandaloneSpirv-DerivativeGroupLinearKHR-10152
For compute, mesh, or task shaders using the `DerivativeGroupLinearKHR` execution mode, the product of the dimensions of the local workgroup size **must** be a multiple of four
- VUID-StandaloneSpirv-OpGroupNonUniformBallotBitCount-04685
If `OpGroupNonUniformBallotBitCount` is used, the group operation **must** be limited to `Reduce`, `InclusiveScan`, or `ExclusiveScan`
- VUID-StandaloneSpirv-None-04686
The *Pointer* operand of all atomic instructions **must** have a `Storage Class` limited to `Uniform`, `Workgroup`, `Image`, `StorageBuffer`, `PhysicalStorageBuffer`, or `TaskPayloadWorkgroupEXT`
- VUID-StandaloneSpirv-Offset-04687
Output variables or block members decorated with `Offset` that have a 64-bit type, or a composite type containing a 64-bit type, **must** specify an `Offset` value aligned to a 8 byte boundary
- VUID-StandaloneSpirv-Offset-04689
The size of any output block containing any member decorated with `Offset` that is a 64-bit

type **must** be a multiple of 8

- VUID-StandaloneSpirv-Offset-04690

The first member of an output block specifying a **Offset** decoration **must** specify a **Offset** value that is aligned to an 8 byte boundary if that block contains any member decorated with **Offset** and is a 64-bit type

- VUID-StandaloneSpirv-Offset-04691

Output variables or block members decorated with **Offset** that have a 32-bit type, or a composite type contains a 32-bit type, **must** specify an **Offset** value aligned to a 4 byte boundary

- VUID-StandaloneSpirv-Offset-04692

Output variables, blocks or block members decorated with **Offset** **must** only contain base types that have components that are either 32-bit or 64-bit in size

- VUID-StandaloneSpirv-Offset-04716

Only variables or block members in the output interface decorated with **Offset** **can** be captured for transform feedback, and those variables or block members **must** also be decorated with **XfbBuffer** and **XfbStride**, or inherit **XfbBuffer** and **XfbStride** decorations from a block containing them

- VUID-StandaloneSpirv-XfbBuffer-04693

All variables or block members in the output interface of the entry point being compiled decorated with a specific **XfbBuffer** value **must** all be decorated with identical **XfbStride** values

- VUID-StandaloneSpirv-Stream-04694

If any variables or block members in the output interface of the entry point being compiled are decorated with **Stream**, then all variables belonging to the same **XfbBuffer** **must** specify the same **Stream** value

- VUID-StandaloneSpirv-XfbBuffer-04696

For any two variables or block members in the output interface of the entry point being compiled with the same **XfbBuffer** value, the ranges determined by the **Offset** decoration and the size of the type **must** not overlap

- VUID-StandaloneSpirv-XfbBuffer-04697

All block members in the output interface of the entry point being compiled that are in the same block and have a declared or inherited **XfbBuffer** decoration **must** specify the same **XfbBuffer** value

- VUID-StandaloneSpirv-RayPayloadKHR-04698

RayPayloadKHR Storage Class **must** only be used in ray generation, closest hit or miss shaders

- VUID-StandaloneSpirv-IncomingRayPayloadKHR-04699

IncomingRayPayloadKHR Storage Class **must** only be used in closest hit, any-hit, or miss shaders

- VUID-StandaloneSpirv-IncomingRayPayloadKHR-04700

There **must** be at most one variable with the **IncomingRayPayloadKHR Storage Class** in the input interface of an entry point

- VUID-StandaloneSpirv-HitAttributeKHR-04701

HitAttributeKHR Storage Class **must** only be used in intersection, any-hit, or closest hit shaders

- VUID-StandaloneSpirv-HitAttributeKHR-04702
There **must** be at most one variable with the **HitAttributeKHR Storage Class** in the input interface of an entry point
- VUID-StandaloneSpirv-HitAttributeKHR-04703
A variable with **HitAttributeKHR Storage Class** **must** only be written to in an intersection shader
- VUID-StandaloneSpirv-CallableDataKHR-04704
CallableDataKHR Storage Class **must** only be used in ray generation, closest hit, miss, and callable shaders
- VUID-StandaloneSpirv-IncomingCallableDataKHR-04705
IncomingCallableDataKHR Storage Class **must** only be used in callable shaders
- VUID-StandaloneSpirv-IncomingCallableDataKHR-04706
There **must** be at most one variable with the **IncomingCallableDataKHR Storage Class** in the input interface of an entry point
- VUID-StandaloneSpirv-ShaderRecordBufferKHR-07119
ShaderRecordBufferKHR Storage Class **must** only be used in ray generation, intersection, any-hit, closest hit, callable, or miss shaders
- VUID-StandaloneSpirv-Base-07650
The **Base** operand of **OpPtrAccessChain** or **OpUntypedPtrAccessChainKHR** **must** have a storage class of **Workgroup**, **StorageBuffer**, or **PhysicalStorageBuffer**
- VUID-StandaloneSpirv-Base-07651
If the **Base** operand of **OpPtrAccessChain** or **OpUntypedPtrAccessChainKHR** has a **Workgroup Storage Class**, then the **VariablePointers** capability **must** be declared
- VUID-StandaloneSpirv-Base-07652
If the **Base** operand of **OpPtrAccessChain** or **OpUntypedPtrAccessChainKHR** has a **StorageBuffer Storage Class**, then the **VariablePointers** or **VariablePointersStorageBuffer** capability **must** be declared
- VUID-StandaloneSpirv-OpUntypedVariableKHR-11167
Any **OpUntypedVariableKHR** **must** have a **Data Type** operand specified
- VUID-StandaloneSpirv-PhysicalStorageBuffer64-04708
If the **PhysicalStorageBuffer64** addressing model is enabled, all instructions that support memory access operands and that use a physical pointer **must** include the **Aligned** operand
- VUID-StandaloneSpirv-PhysicalStorageBuffer64-04709
If the **PhysicalStorageBuffer64** addressing model is enabled, any access chain instruction that accesses into a **RowMajor** matrix **must** only be used as the **Pointer** operand to **OpLoad** or **OpStore**
- VUID-StandaloneSpirv-PhysicalStorageBuffer64-04710
If the **PhysicalStorageBuffer64** addressing model is enabled, **OpConvertUToPtr** and **OpConvertPtrToU** **must** use an integer type whose **Width** is 64

- VUID-StandaloneSpirv-PhysicalStorageBuffer64-06314
If the **PhysicalStorageBuffer64** addressing model is enabled any load or store through a physical pointer type **must** have an **Aligned** operand which is a multiple of the size of the largest scalar type in the pointed-to type
- VUID-StandaloneSpirv-OpTypeForwardPointer-04711
OpTypeForwardPointer **must** have a **Storage Class** of **PhysicalStorageBuffer**
- VUID-StandaloneSpirv-None-04745
All block members in a variable with a **Storage Class** of **PushConstant** declared as an array **must** only be accessed by dynamically uniform indices
- VUID-StandaloneSpirv-OpVariable-06673
There **must** not be more than one variable in the **PushConstant Storage Class** listed in the **Interface** for each **OpEntryPoint**
- VUID-StandaloneSpirv-OpEntryPoint-06674
Each **OpEntryPoint** **must** not statically use more than one variable in the **PushConstant Storage Class**
- VUID-StandaloneSpirv-OpEntryPoint-08721
Each **OpEntryPoint** **must** not have more than one **Input** variable assigned the same **Component** word inside a **Location** slot, either explicitly or implicitly
- VUID-StandaloneSpirv-OpEntryPoint-08722
Each **OpEntryPoint** **must** not have more than one **Output** variable assigned the same **Component** word inside a **Location** slot, either explicitly or implicitly
- VUID-StandaloneSpirv-Result-04780
The **Result Type** operand of any **OpImageRead** or **OpImageSparseRead** instruction **must** be a vector of four components
- VUID-StandaloneSpirv-PushConstant-06675
Any variable in the **PushConstant** or **StorageBuffer** storage class **must** be decorated as **Block**
- VUID-StandaloneSpirv-Uniform-06676
Any variable in the **Uniform Storage Class** **must** be decorated as **Block** or **BufferBlock**
- VUID-StandaloneSpirv-UniformConstant-06677
Any variable in the **UniformConstant**, **StorageBuffer**, or **Uniform Storage Class** **must** be decorated with **DescriptorSet** and **Binding**
- VUID-StandaloneSpirv-InputAttachmentIndex-06678
Variables decorated with **InputAttachmentIndex** **must** be in the **UniformConstant Storage Class**
- VUID-StandaloneSpirv-DescriptorSet-06491
If a variable is decorated by **DescriptorSet** or **Binding**, the **Storage Class** **must** correspond to an entry in **Shader Resource and Storage Class Correspondence**
- VUID-StandaloneSpirv-Input-06778
Variables with a **Storage Class** of **Input** in a fragment shader stage that are decorated with **PerVertexKHR** **must** be declared as arrays
- VUID-StandaloneSpirv-MeshEXT-07102
The module **must** not contain both an entry point that uses the **TaskEXT** or **MeshEXT**

Execution Model and an entry point that uses the **TaskNV** or **MeshNV Execution Model**

- VUID-StandaloneSpirv-MeshEXT-07106
In mesh shaders using the **MeshEXT Execution Model** **OpSetMeshOutputsEXT** **must** be called before any outputs are written
- VUID-StandaloneSpirv-MeshEXT-07107
In mesh shaders using the **MeshEXT Execution Model** all variables declared as output **must** not be read from
- VUID-StandaloneSpirv-MeshEXT-07108
In mesh shaders using the **MeshEXT Execution Model** for **OpSetMeshOutputsEXT** instructions, the “Vertex Count” and “Primitive Count” operands **must** not depend on **ViewIndex**
- VUID-StandaloneSpirv-MeshEXT-07109
In mesh shaders using the **MeshEXT Execution Model** variables decorated with **PrimitivePointIndicesEXT**, **PrimitiveLineIndicesEXT**, or **PrimitiveTriangleIndicesEXT** declared as an array **must** not be accessed by indices that depend on **ViewIndex**
- VUID-StandaloneSpirv-MeshEXT-07110
In mesh shaders using the **MeshEXT Execution Model** any values stored in variables decorated with **PrimitivePointIndicesEXT**, **PrimitiveLineIndicesEXT**, or **PrimitiveTriangleIndicesEXT** **must** not depend on **ViewIndex**
- VUID-StandaloneSpirv-MeshEXT-07111
In mesh shaders using the **MeshEXT Execution Model** variables in workgroup or private **Storage Class** declared as or containing a composite type **must** not be accessed by indices that depend on **ViewIndex**
- VUID-StandaloneSpirv-MeshEXT-07330
In mesh shaders using the **MeshEXT Execution Model** the **OutputVertices Execution Mode** **must** be greater than 0
- VUID-StandaloneSpirv-MeshEXT-07331
In mesh shaders using the **MeshEXT Execution Model** the **OutputPrimitivesEXT Execution Mode** **must** be greater than 0
- VUID-StandaloneSpirv-Input-07290
Variables with a **Storage Class** of **Input** or **Output** and a type of **OpTypeBool** **must** be decorated with the **BuiltIn** decoration
- VUID-StandaloneSpirv-TileImageEXT-08723
The tile image variable declarations **must** obey the constraints on the **TileImageEXT Storage Class** and the **Location** decoration described in **Fragment Tile Image Interface**
- VUID-StandaloneSpirv-None-08724
The **TileImageEXT Storage Class** **must** only be used for declaring tile image variables
- VUID-StandaloneSpirv-Pointer-08973
The **Storage Class** of the **Pointer** operand to **OpCooperativeMatrixLoadKHR** or **OpCooperativeMatrixStoreKHR** **must** be limited to **Workgroup**, **StorageBuffer**, or **PhysicalStorageBuffer**
- VUID-StandaloneSpirv-OpTypeFloat-10370
Variables with a type of **OpTypeFloat** and an encoding of **BFloat16KHR** **must** not be declared with a **Storage Class** of **Input** or **Output**

- VUID-StandaloneSpirv-UniformBufferArrayDynamicIndexing-10127
If the **UniformBufferArrayDynamicIndexing** capability is not declared, and an instruction accesses memory through a uniform buffer, the uniform buffer through which that memory is accessed **must** be determined by **constant integral expressions**
- VUID-StandaloneSpirv-SampledImageArrayDynamicIndexing-10128
If the **SampledImageArrayDynamicIndexing** capability is not declared, and an instruction accesses memory through a sampled image or sampler, the sampled image or sampler through which that memory is accessed **must** be determined by **constant integral expressions**
- VUID-StandaloneSpirv-StorageBufferArrayDynamicIndexing-10129
If the **StorageBufferArrayDynamicIndexing** capability is not declared, and an instruction accesses memory through a storage buffer, the storage buffer through which that memory is accessed **must** be determined by **constant integral expressions**
- VUID-StandaloneSpirv-StorageImageArrayDynamicIndexing-10130
If the **StorageImageArrayDynamicIndexing** capability is not declared, and an instruction accesses memory through a storage image, the storage image through which that memory is accessed **must** be determined by **constant integral expressions**
- VUID-StandaloneSpirv-InputAttachmentArrayDynamicIndexing-10131
If the **InputAttachmentArrayDynamicIndexing** capability is not declared, and an instruction accesses memory through an input attachment, the input attachment through which that memory is accessed **must** be determined by **constant integral expressions**
- VUID-StandaloneSpirv-UniformTexelBufferArrayDynamicIndexing-10132
If the **UniformTexelBufferArrayDynamicIndexing** capability is not declared, and an instruction accesses memory through a uniform texel buffer, the uniform texel buffer through which that memory is accessed **must** be determined by **constant integral expressions**
- VUID-StandaloneSpirv-StorageTexelBufferArrayDynamicIndexing-10133
If the **StorageTexelBufferArrayDynamicIndexing** capability is not declared, and an instruction accesses memory through a storage texel buffer, the storage texel buffer through which that memory is accessed **must** be determined by **constant integral expressions**
- VUID-StandaloneSpirv-TileShadingQCOM-10686
TileShadingQCOM capability **must** not be enabled in any stage other than compute or fragment
- VUID-StandaloneSpirv-Execution-10687
Execution Mode NonCoherentTileAttachmentReadQCOM **must** not be used in any stage other than fragment
- VUID-StandaloneSpirv-Execution-10688
Execution Mode TileShadingRateQCOM **must** not be used in any stage other than compute
- VUID-StandaloneSpirv-TileAttachmentQCOM-10689
If the **TileAttachmentQCOM Storage Class** is used, the **TileShadingQCOM** capability **must** be enabled
- VUID-StandaloneSpirv-NonCoherentTileAttachmentReadQCOM-10690

If the `NonCoherentTileAttachmentReadQCOM` Execution Mode is used, the `TileShadingQCOM` capability **must** be enabled

- VUID-StandaloneSpirv-TileShadingRateQCOM-10691

If the `TileShadingRateQCOM` Execution Mode is used, the `TileShadingQCOM` capability **must** be enabled

- VUID-StandaloneSpirv-TileShadingRateQCOM-10692

If the `TileShadingRateQCOM` Execution Mode is used, `LocalSize` and `LocalSizeId` Execution Mode **must** not be specified

- VUID-StandaloneSpirv-OpTypeImage-10693

`OpTypeImage` variables in the `TileAttachmentQCOM` Storage Class **must** have `Dim` equal to 2D

- VUID-StandaloneSpirv-OpTypeImage-10694

`OpTypeImage` variables in the `TileAttachmentQCOM` Storage Class **must** `Sampled` equal to 1 or 2

- VUID-StandaloneSpirv-TileAttachmentQCOM-10695

Any variable in the `TileAttachmentQCOM` Storage Class **must** be decorated with `DescriptorSet` and `Binding`

- VUID-StandaloneSpirv-TileAttachmentQCOM-10696

Any variable in the `TileAttachmentQCOM` Storage Class **must** not be decorated with `Component` decoration

- VUID-StandaloneSpirv-TileAttachmentQCOM-10697

An `OpTypeImage` variables in the `TileAttachmentQCOM` Storage Class **must** not be consumed by an `OpImageQuery*` instruction

- VUID-StandaloneSpirv-OpTypeFloat-10823

Variables with a type of `OpTypeFloat` and an encoding of `Float8E4M3EXT` or `Float8E5M2EXT` **must** not be declared with a `Storage Class` of `Input` or `Output`

- VUID-StandaloneSpirv-OpGraphInputARM-09931

The `InputIndex` and `ElementIndex` operands to `OpGraphInputARM` **must** be the <id> of a constant instruction

- VUID-StandaloneSpirv-OpGraphSetOutputARM-09932

The `OutputIndex` and `ElementIndex` operands to `OpGraphSetOutputARM` **must** be the <id> of a constant instruction

Runtime SPIR-V Validation

The following rules **must** be validated at runtime. These rules depend on knowledge of the implementation and its capabilities and knowledge of runtime information, such as enabled features.

Valid Usage

- VUID-RuntimeSpirv-vulkanMemoryModel-06265

If the `vulkanMemoryModel` feature is enabled and the `vulkanMemoryModelDeviceScope` feature is not enabled, `Device` memory scope **must** not be used

- VUID-RuntimeSpirv-vulkanMemoryModel-06266
If the `vulkanMemoryModel` feature is not enabled, `QueueFamily` memory scope **must** not be used
- VUID-RuntimeSpirv-shaderSubgroupClock-06267
If the `shaderSubgroupClock` feature is not enabled, the `Subgroup` scope **must** not be used for `OpReadClockKHR`
- VUID-RuntimeSpirv-shaderDeviceClock-06268
If the `shaderDeviceClock` feature is not enabled, the `Device` scope **must** not be used for `OpReadClockKHR`
- VUID-RuntimeSpirv-OpTypeImage-06269
If the `shaderStorageImageWriteWithoutFormat` feature is not enabled, any variable created with a “Type” of `OpTypeImage` that has a “Sampled” operand of 2 and an “Image Format” operand of `Unknown` **must** be decorated with `NonWritable`
- VUID-RuntimeSpirv-OpTypeImage-06270
If the `shaderStorageImageReadWithoutFormat` feature is not enabled, any variable created with a “Type” of `OpTypeImage` that has a “Sampled” operand of 2 and an “Image Format” operand of `Unknown` **must** be decorated with `NonReadable`
- VUID-RuntimeSpirv-None-09558
Any variable created with a “Type” of `OpTypeImage` that has a “Dim” operand of `SubpassData` **must** be decorated with `InputAttachmentIndex`
- VUID-RuntimeSpirv-OpImageWrite-07112
`OpImageWrite` to any `Image` whose `Image Format` is not `Unknown` **must** have the `Texel` operand contain at least as many components as the corresponding `VkFormat` as given in the [SPIR-V Image Format compatibility table](#)
- VUID-RuntimeSpirv-Location-06272
The sum of `Location` and the number of locations the variable it decorates consumes **must** be less than or equal to the value for the matching `Execution Model` defined in [Shader Input and Output Locations](#)
- VUID-RuntimeSpirv-Location-06428
The maximum number of storage buffers, storage images, and output `Location` decorated color attachments written to in the `Fragment Execution Model` **must** be less than or equal to `maxFragmentCombinedOutputResources`
- VUID-RuntimeSpirv-UniformBufferArrayNonUniformIndexing-10134
If the `UniformBufferArrayNonUniformIndexing` capability is not declared, and an instruction accesses memory through a uniform buffer, the uniform buffer through which that memory is accessed **must** be dynamically uniform within the invocation group or subgroup
- VUID-RuntimeSpirv-SampledImageArrayNonUniformIndexing-10135
If the `SampledImageArrayNonUniformIndexing` capability is not declared, and an instruction accesses memory through a sampled image or sampler, the sampled image or sampler through which that memory is accessed **must** be dynamically uniform within the invocation group or subgroup
- VUID-RuntimeSpirv-StorageBufferArrayNonUniformIndexing-10136

If the `StorageBufferArrayNonUniformIndexing` capability is not declared, and an instruction accesses memory through a storage buffer, the storage buffer through which that memory is accessed **must** be dynamically uniform within the invocation group or subgroup

- VUID-RuntimeSpirv-StorageImageArrayNonUniformIndexing-10137

If the `StorageImageArrayNonUniformIndexing` capability is not declared, and an instruction accesses memory through a storage image, the storage image through which that memory is accessed **must** be dynamically uniform within the invocation group or subgroup

- VUID-RuntimeSpirv-InputAttachmentArrayNonUniformIndexing-10138

If the `InputAttachmentArrayNonUniformIndexing` capability is not declared, and an instruction accesses memory through an input attachment, the input attachment through which that memory is accessed **must** be dynamically uniform within the invocation group or subgroup

- VUID-RuntimeSpirv-UniformTexelBufferArrayNonUniformIndexing-10139

If the `UniformTexelBufferArrayNonUniformIndexing` capability is not declared, and an instruction accesses memory through a uniform texel buffer, the uniform texel buffer through which that memory is accessed **must** be dynamically uniform within the invocation group or subgroup

- VUID-RuntimeSpirv-StorageTexelBufferArrayNonUniformIndexing-10140

If the `StorageTexelBufferArrayNonUniformIndexing` capability is not declared, and an instruction accesses memory through a storage texel buffer, the storage texel buffer through which that memory is accessed **must** be dynamically uniform within the invocation group or subgroup

- VUID-RuntimeSpirv-subgroupSize-10141

If the `effective subgroup size` is 1, the `UniformBufferArrayNonUniformIndexing` capability is not declared, and an instruction accesses memory through a uniform buffer, the uniform buffer through which that memory is accessed **must** be dynamically uniform within the invocation group

- VUID-RuntimeSpirv-subgroupSize-10142

If the `effective subgroup size` is 1, the `SampledImageArrayNonUniformIndexing` capability is not declared, and an instruction accesses memory through a sampled image or sampler, the sampled image or sampler through which that memory is accessed **must** be dynamically uniform within the invocation group

- VUID-RuntimeSpirv-subgroupSize-10143

If the `effective subgroup size` is 1, the `StorageBufferArrayNonUniformIndexing` capability is not declared, and an instruction accesses memory through a storage buffer, the storage buffer through which that memory is accessed **must** be dynamically uniform within the invocation group

- VUID-RuntimeSpirv-subgroupSize-10144

If the `effective subgroup size` is 1, the `StorageImageArrayNonUniformIndexing` capability is not declared, and an instruction accesses memory through a storage image, the storage image through which that memory is accessed **must** be dynamically uniform within the invocation group

- VUID-RuntimeSpirv-subgroupSize-10145

If the `effective subgroup size` is 1, the `InputAttachmentArrayNonUniformIndexing` capability is

not declared, and an instruction accesses memory through an input attachment, the input attachment through which that memory is accessed **must** be dynamically uniform within the invocation group

- VUID-RuntimeSpirv-subgroupSize-10146

If the **effective subgroup size** is 1, the **UniformTexelBufferArrayNonUniformIndexing** capability is not declared, and an instruction accesses memory through a uniform texel buffer, the uniform texel buffer through which that memory is accessed **must** be dynamically uniform within the invocation group

- VUID-RuntimeSpirv-subgroupSize-10147

If the **effective subgroup size** is 1, the **StorageTexelBufferArrayNonUniformIndexing** capability is not is not declared, and an instruction accesses memory through a storage texel buffer, the storage texel buffer through which that memory is accessed **must** be dynamically uniform within the invocation group

- VUID-RuntimeSpirv-None-10148

If an instruction accesses memory through any resource, the **effective subgroup size** is 1, and the resource through which that memory is accessed is not uniform within the invocation group, then the operand corresponding to that resource (e.g. the pointer or sampled image operand) **must** be decorated with **NonUniform**

- VUID-RuntimeSpirv-subgroupSize-10149

If an instruction accesses memory through any resource, the **effective subgroup size** is greater than 1, and the resource through which that memory is accessed is not uniform within the invocation group, and not uniform within the subgroup, then the operand corresponding to that resource (e.g. the pointer or sampled image operand) **must** be decorated with **NonUniform**

- VUID-RuntimeSpirv-None-06275

shaderSubgroupExtendedTypes **must** be enabled for **group operations** to use 8-bit integer, 16-bit integer, 64-bit integer, 16-bit floating-point, and vectors of these types

- VUID-RuntimeSpirv-subgroupBroadcastDynamicId-06276

If **subgroupBroadcastDynamicId** is **VK_TRUE**, and the shader module version is 1.5 or higher, the “Index” for **OpGroupNonUniformQuadBroadcast** **must** be dynamically uniform within the derivative group. Otherwise, “Index” **must** be a constant

- VUID-RuntimeSpirv-subgroupBroadcastDynamicId-06277

If **subgroupBroadcastDynamicId** is **VK_TRUE**, and the shader module version is 1.5 or higher, the “Id” for **OpGroupNonUniformBroadcast** **must** be dynamically uniform within the subgroup. Otherwise, “Id” **must** be a constant

- VUID-RuntimeSpirv-None-06284

shaderBufferFloat32Atomics, or **shaderBufferFloat32AtomicAdd**, or **shaderBufferFloat64Atomics**, or **shaderBufferFloat64AtomicAdd**, **must** be enabled for floating-point atomic operations to be supported on a *Pointer* with a **Storage Class** of **StorageBuffer**

- VUID-RuntimeSpirv-None-06285

shaderSharedFloat32Atomics, or **shaderSharedFloat32AtomicAdd**, or **shaderSharedFloat64Atomics**, or **shaderSharedFloat64AtomicAdd**, **must** be enabled for floating-point atomic operations to be supported on a *Pointer* with a **Storage Class** of

Workgroup

- VUID-RuntimeSpirv-None-06286
`shaderImageFloat32Atomics`, or `shaderImageFloat32AtomicAdd`, **must** be enabled for 32-bit floating-point atomic operations to be supported on a *Pointer* with a *Storage Class* of *Image*
- VUID-RuntimeSpirv-None-06287
`sparseImageFloat32Atomics`, or `sparseImageFloat32AtomicAdd`, **must** be enabled for 32-bit floating-point atomics to be supported on sparse images
- VUID-RuntimeSpirv-None-06288
`shaderImageInt64Atomics` **must** be enabled for 64-bit integer atomic operations to be supported on a *Pointer* with a *Storage Class* of *Image*
- VUID-RuntimeSpirv-denormBehaviorIndependence-06289
If `denormBehaviorIndependence` is `VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_32_BIT_ONLY`, then the entry point **must** use the same denormals *Execution Mode* for both 16-bit and 64-bit floating-point types
- VUID-RuntimeSpirv-denormBehaviorIndependence-06290
If `denormBehaviorIndependence` is `VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_NONE`, then the entry point **must** use the same denormals *Execution Mode* for all floating-point types
- VUID-RuntimeSpirv-roundingModeIndependence-06291
If `roundingModeIndependence` is `VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_32_BIT_ONLY`, then the entry point **must** use the same rounding *Execution Mode* for both 16-bit and 64-bit floating-point types
- VUID-RuntimeSpirv-roundingModeIndependence-06292
If `roundingModeIndependence` is `VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_NONE`, then the entry point **must** use the same rounding *Execution Mode* for all floating-point types
- VUID-RuntimeSpirv-shaderSignedZeroInfNanPreserveFloat16-06293
If `shaderSignedZeroInfNanPreserveFloat16` is `VK_FALSE`, then *SignedZeroInfNanPreserve* for 16-bit floating-point type **must** not be used
- VUID-RuntimeSpirv-shaderSignedZeroInfNanPreserveFloat32-06294
If `shaderSignedZeroInfNanPreserveFloat32` is `VK_FALSE`, then *SignedZeroInfNanPreserve* for 32-bit floating-point type **must** not be used
- VUID-RuntimeSpirv-shaderSignedZeroInfNanPreserveFloat64-06295
If `shaderSignedZeroInfNanPreserveFloat64` is `VK_FALSE`, then *SignedZeroInfNanPreserve* for 64-bit floating-point type **must** not be used
- VUID-RuntimeSpirv-shaderDenormPreserveFloat16-06296
If `shaderDenormPreserveFloat16` is `VK_FALSE`, then *DenormPreserve* for 16-bit floating-point type **must** not be used
- VUID-RuntimeSpirv-shaderDenormPreserveFloat32-06297
If `shaderDenormPreserveFloat32` is `VK_FALSE`, then *DenormPreserve* for 32-bit floating-point type **must** not be used
- VUID-RuntimeSpirv-shaderDenormPreserveFloat64-06298
If `shaderDenormPreserveFloat64` is `VK_FALSE`, then *DenormPreserve* for 64-bit floating-point type **must** not be used

- VUID-RuntimeSpirv-shaderDenormFlushToZeroFloat16-06299
If `shaderDenormFlushToZeroFloat16` is `VK_FALSE`, then `DenormFlushToZero` for 16-bit floating-point type **must** not be used
- VUID-RuntimeSpirv-shaderDenormFlushToZeroFloat32-06300
If `shaderDenormFlushToZeroFloat32` is `VK_FALSE`, then `DenormFlushToZero` for 32-bit floating-point type **must** not be used
- VUID-RuntimeSpirv-shaderDenormFlushToZeroFloat64-06301
If `shaderDenormFlushToZeroFloat64` is `VK_FALSE`, then `DenormFlushToZero` for 64-bit floating-point type **must** not be used
- VUID-RuntimeSpirv-shaderRoundingModeRTEFloat16-06302
If `shaderRoundingModeRTEFloat16` is `VK_FALSE`, then `RoundingModeRTE` for 16-bit floating-point type **must** not be used
- VUID-RuntimeSpirv-shaderRoundingModeRTEFloat32-06303
If `shaderRoundingModeRTEFloat32` is `VK_FALSE`, then `RoundingModeRTE` for 32-bit floating-point type **must** not be used
- VUID-RuntimeSpirv-shaderRoundingModeRTEFloat64-06304
If `shaderRoundingModeRTEFloat64` is `VK_FALSE`, then `RoundingModeRTE` for 64-bit floating-point type **must** not be used
- VUID-RuntimeSpirv-shaderRoundingModeRTZFloat16-06305
If `shaderRoundingModeRTZFloat16` is `VK_FALSE`, then `RoundingModeRTZ` for 16-bit floating-point type **must** not be used
- VUID-RuntimeSpirv-shaderRoundingModeRTZFloat32-06306
If `shaderRoundingModeRTZFloat32` is `VK_FALSE`, then `RoundingModeRTZ` for 32-bit floating-point type **must** not be used
- VUID-RuntimeSpirv-shaderRoundingModeRTZFloat64-06307
If `shaderRoundingModeRTZFloat64` is `VK_FALSE`, then `RoundingModeRTZ` for 64-bit floating-point type **must** not be used
- VUID-RuntimeSpirv-PhysicalStorageBuffer64-06315
If the `PhysicalStorageBuffer64` addressing model is enabled the pointer value of a memory access instruction **must** be at least as aligned as specified by the `Aligned` memory access operand
- VUID-RuntimeSpirv-None-10980
Objects containing 8-bit integer or 8-bit floating-point elements **must** not have storage class of **Input** or **Output**
- VUID-RuntimeSpirv-None-06335
`shaderBufferFloat32Atomics`, or `shaderBufferFloat32AtomicAdd`, or `shaderSharedFloat32Atomics`, or `shaderSharedFloat32AtomicAdd`, or `shaderImageFloat32Atomics`, or `shaderImageFloat32AtomicAdd` **must** be enabled for 32-bit floating-point atomic operations
- VUID-RuntimeSpirv-None-06336
`shaderBufferFloat64Atomics`, or `shaderBufferFloat64AtomicAdd`, or `shaderSharedFloat64Atomics`, or `shaderSharedFloat64AtomicAdd` **must** be enabled for 64-bit floating-point atomic operations

- VUID-RuntimeSpirv-NonWritable-06340
If the `fragmentStoresAndAtomics` feature is not enabled, then all storage image, storage texel buffer, and storage buffer variables in the fragment stage **must** be decorated with the `NonWritable` decoration
- VUID-RuntimeSpirv-NonWritable-06341
If the `vertexPipelineStoresAndAtomics` feature is not enabled, then all storage image, storage texel buffer, and storage buffer variables in the vertex, tessellation, and geometry stages **must** be decorated with the `NonWritable` decoration
- VUID-RuntimeSpirv-OpAtomic-05091
If the `shaderAtomicInstructions` feature is not enabled, the SPIR-V Atomic Instructions listed in 3.37.18 (`OpAtomic*`) **must** not be used [SCID-1]
- VUID-RuntimeSpirv-None-06342
If `subgroupQuadOperationsInAllStages` is `VK_FALSE`, then `quad subgroup operations` **must** not be used except for in fragment and compute stages
- VUID-RuntimeSpirv-None-06343
`Group operations` with `subgroup scope` **must** not be used if the shader stage is not in `subgroupSupportedStages`
- VUID-RuntimeSpirv-Offset-06344
The first element of the `Offset` operand of `InterpolateAtOffset` **must** be greater than or equal to:
$$\text{frag}_{\text{width}} \times \text{minInterpolationOffset}$$

where $\text{frag}_{\text{width}}$ is the width of the current fragment in pixels
- VUID-RuntimeSpirv-Offset-06345
The first element of the `Offset` operand of `InterpolateAtOffset` **must** be less than or equal to
$$\text{frag}_{\text{width}} \times (\text{maxInterpolationOffset} + \text{ULP}) - \text{ULP}$$

where $\text{frag}_{\text{width}}$ is the width of the current fragment in pixels and $\text{ULP} = 1 / 2^{\text{subPixelInterpolationOffsetBits}}$
- VUID-RuntimeSpirv-Offset-06346
The second element of the `Offset` operand of `InterpolateAtOffset` **must** be greater than or equal to
$$\text{frag}_{\text{height}} \times \text{minInterpolationOffset}$$

where $\text{frag}_{\text{height}}$ is the height of the current fragment in pixels
- VUID-RuntimeSpirv-Offset-06347
The second element of the `Offset` operand of `InterpolateAtOffset` **must** be less than or equal to
$$\text{frag}_{\text{height}} \times (\text{maxInterpolationOffset} + \text{ULP}) - \text{ULP}$$

where $\text{frag}_{\text{height}}$ is the height of the current fragment in pixels and $\text{ULP} = 1 / 2^{\text{subPixelInterpolationOffsetBits}}$
- VUID-RuntimeSpirv-x-06429
In compute shaders using the `GLCompute Execution Model` the `x` size in `LocalSize` or `LocalSizeId` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupSize[0]`
- VUID-RuntimeSpirv-y-06430

In compute shaders using the `GLCompute Execution Model` the `y` size in `LocalSize` or `LocalSizeId` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupSize[1]`

- VUID-RuntimeSpirv-z-06431

In compute shaders using the `GLCompute Execution Model` the `z` size in `LocalSize` or `LocalSizeId` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupSize[2]`

- VUID-RuntimeSpirv-x-06432

In compute shaders using the `GLCompute Execution Model` the product of `x` size, `y` size, and `z` size in `LocalSize` or `LocalSizeId` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupInvocations`

- VUID-RuntimeSpirv-LocalSizeId-06433

The `Execution Mode LocalSizeId` **must** not be used

- VUID-RuntimeSpirv-OpTypeVector-06816

Any `OpTypeVector` output interface variables **must** not have a higher `Component Count` than a matching `OpTypeVector` input interface variable

- VUID-RuntimeSpirv-OpEntryPoint-08743

Any `user-defined variables` shared between the `OpEntryPoint` of two shader stages, and declared with `Input` as its `Storage Class` for the subsequent shader stage, **must** have all `Location` slots and `Component` words declared in the preceding shader stage's `OpEntryPoint` with `Output` as the `Storage Class`

- VUID-RuntimeSpirv-OpEntryPoint-07754

Any `user-defined variables` between the `OpEntryPoint` of two shader stages **must** have the same type and width for each `Component`

- VUID-RuntimeSpirv-OpVariable-08746

Any variable, `Block`-decorated `OpTypeStruct`, or `Block`-decorated `OpTypeStruct` members shared between the `OpEntryPoint` of two shader stages **must** have matching decorations as defined in `interface matching`

- VUID-RuntimeSpirv-Workgroup-06530

The sum of size in bytes for variables and `padding` in the `Workgroup Storage Class` in the `GLCompute Execution Model` **must** be less than or equal to `maxComputeSharedMemorySize`

- VUID-RuntimeSpirv-OpVariable-06373

Any variable with `Workgroup` as its `Storage Class` **must** not have an `Initializer` operand

- VUID-RuntimeSpirv-Offset-10213

Image operand `Offset` **must** only be used with `OpImage*Gather` instructions

- VUID-RuntimeSpirv-OpImage-06376

If an `OpImage*Gather` operation has an image operand of `Offset`, `ConstOffset`, or `ConstOffsets` the offset value **must** be greater than or equal to `minTexelGatherOffset`

- VUID-RuntimeSpirv-OpImage-06377

If an `OpImage*Gather` operation has an image operand of `Offset`, `ConstOffset`, or `ConstOffsets` the offset value **must** be less than or equal to `maxTexelGatherOffset`

- VUID-RuntimeSpirv-OpImageSample-06435

If an `OpImageSample*` or `OpImageFetch*` operation has an image operand of `ConstOffset` then

the offset value **must** be greater than or equal to `minTexelOffset`

- VUID-RuntimeSpirv-OpImageSample-06436

If an `OpImageSample*` or `OpImageFetch*` operation has an image operand of `ConstOffset` then the offset value **must** be less than or equal to `maxTexelOffset`

- VUID-RuntimeSpirv-samples-08725

If an `OpTypeImage` has an `MS` operand 0, its bound image **must** have been created with `VkImageCreateInfo::samples` as `VK_SAMPLE_COUNT_1_BIT`

- VUID-RuntimeSpirv-samples-08726

If an `OpTypeImage` has an `MS` operand 1, its bound image **must** not have been created with `VkImageCreateInfo::samples` as `VK_SAMPLE_COUNT_1_BIT`

- VUID-RuntimeSpirv-OpEntryPoint-08727

Each `OpEntryPoint` **must** not have more than one variable decorated with `InputAttachmentIndex` per image aspect of the attachment image bound to it, either explicitly or implicitly as described by [input attachment interface](#)

- VUID-RuntimeSpirv-MeshEXT-09218

In mesh shaders using the `MeshEXT` or `MeshNV Execution Model` and the `OutputPoints Execution Mode`, if the number of output points is greater than 0, a `PointSize` decorated variable **must** be written to for each output point

- VUID-RuntimeSpirv-protectedNoFault-09645

If `protectedNoFault` is not supported, the `Storage Class` of the `PhysicalStorageBuffer` **must** not be used if the buffer being accessed is `protected`

- VUID-RuntimeSpirv-None-10715

If a `VkSampler` object that enables `sampler YBCR conversion` is accessed in a shader, both the sampler and image accessed **must** be determined by [constant integral expressions](#)

- VUID-RuntimeSpirv-None-10716

If a `VkSampler` object that enables `sampler YBCR conversion` is statically used, it **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions

- VUID-RuntimeSpirv-OpImage-10717

An `OpImage` instruction **must** not be used on a `VkSampler` object that enables `sampler YBCR conversion`

- VUID-RuntimeSpirv-ConstOffset-10718

If a `VkSampler` object that enables `sampler YBCR conversion` is statically used, it **must** not use the `ConstOffset` or `Offset` operands

- VUID-RuntimeSpirv-None-10824

The `Base` operand of any `OpBitCount`, `OpBitReverse`, `OpBitFieldInsert`, `OpBitFieldSExtract`, or `OpBitFieldUExtract` instruction **must** be a 32-bit integer scalar or a vector of 32-bit integers

- VUID-RuntimeSpirv-None-10834

[Buffer indexing calculations](#) **must** not wrap 32 bits

- VUID-RuntimeSpirv-OpArrayLength-11807

`OpArrayLength` result type **must** be a 32-bit integer type

Precision and Operation of SPIR-V Instructions

The following rules apply to operations on all floating-point values:

- Positive and negative infinities and positive and negative zeros are generated as dictated by [IEEE 754](#) for the specified encoding, but subject to the precisions allowed by each operation for a given encoding, as specified in [Precision of Individual Operations](#).
- Signaling NaNs are not required to be generated and exceptions are never raised. Signaling NaN **may** be converted to quiet NaNs values by any floating-point instruction.
- The set of operations `OpPhi`, `OpSelect`, `OpFunctionCall`, `OpReturnValue`, `OpVectorExtractDynamic`, `OpVectorInsertDynamic`, `OpVectorShuffle`, `OpCompositeConstruct`, `OpCompositeExtract`, `OpCompositeInsert`, `OpTranspose`, `OpCopyObject`, `OpCopyLogical`, `OpCopyMemory`, `OpGroupNonUniformBroadcast`, `OpGroupNonUniformBroadcastFirst`, `OpGroupNonUniformShuffle`, `OpGroupNonUniformShuffleXor`, `OpGroupNonUniformShuffleUp`, `OpGroupNonUniformShuffleDown`, `OpGroupNonUniformQuadBroadcast`, `OpGroupNonUniformQuadSwap`, `OpAtomicLoad`, `OpAtomicStore`, `OpAtomicExchange`, `OpStore`, and `OpLoad` are referred to as *bit-preserving operations*.
- By default, the implementation **may** perform optimizations on half, single, or double-precision floating-point instructions that ignore sign of a zero, or assume that arguments and results are not NaNs or infinities. If the entry point is declared with the `SignedZeroInfNanPreserve Execution Mode`, then NaNs, infinities, and the sign of zero **must** not be ignored.
 - All bit-preserving operations except `OpLoad` from the `Input Storage Class` in the fragment shader stage **must** respect the `SignedZeroInfNanPreserve Execution Mode`.
 - The following core SPIR-V instructions **must** respect the `SignedZeroInfNanPreserve Execution Mode`: `OpFConvert`, `OpFNegate`, `OpFAdd`, `OpFSub`, `OpFMul`, `OpFDiv`, `OpIsNan`, `OpIsInf`, `OpVectorTimesScalar`, `OpMatrixTimesScalar`, `OpVectorTimesMatrix`, `OpMatrixTimesVector`, `OpMatrixTimesMatrix`, `OpOuterProduct`, `OpDot`, `OpFOrdEqual`, `OpFUnordEqual`, `OpFOrdNotEqual`, `OpFUnordNotEqual`, `OpFOrdLessThan`, `OpFUnordLessThan`, `OpFOrdGreaterThan`, `OpFUnordGreaterThan`, `OpFOrdLessThanEqual`, `OpFUnordLessThanEqual`, `OpFOrdGreaterThanEqual`, `OpFUnordGreaterThanEqual`, `OpGroupNonUniformAlIEqual`, `OpGroupNonUniformFMin`, `OpGroupNonUniformFMax`, `OpAtomicCompareExchange`, `OpAtomicCompareExchangeWeak`, `OpDPdx`, `OpDPdy`, `OpFwidth`, `OpDPdxFine`, `OpDPdyFine`, `OpFwidthFine`, `OpDPdxCoarse`, `OpDPdyCoarse`, and `OpFwidthCoarse`.
- All bit-preserving operations and the following instructions **must** not flush denormalized values: `OpConstant`, `OpConstantComposite`, `OpSpecConstant`, `OpSpecConstantComposite`, and `OpBitcast`.
- Denormalized values are supported.
 - By default any denormalized floating-point value input into a shader or potentially generated by any instruction (except those listed above) or any extended instructions for GLSL in a shader **may** be flushed to zero.
 - If the entry point is declared with the `DenormFlushToZero Execution Mode` then for the affected instructions the denormalized result **must** be flushed to zero and the denormalized operands **may** be flushed to zero. Denormalized values obtained via unpacking an integer into a vector of values with smaller bit width and interpreting those values as floating-point numbers **must** be flushed to zero.
 - When denormal values are being flushed, the result of an operation **may** be considered

denormal whenever the infinitely precise result is non-zero and of smaller magnitude than the smallest normal value, even if rounding would otherwise give a normal result.

- The following core SPIR-V instructions **must** respect the **DenormFlushToZero Execution Mode**: **OpSpecConstantOp** (with opcode **OpFConvert**), **OpFConvert**, **OpFNegate**, **OpFAdd**, **OpFSub**, **OpFMul**, **OpFDiv**, **OpFRem**, **OpFMod**, **OpVectorTimesScalar**, **OpMatrixTimesScalar**, **OpVectorTimesMatrix**, **OpMatrixTimesVector**, **OpMatrixTimesMatrix**, **OpOuterProduct**, **OpDot**, **OpGroupNonUniformFMin**, **OpGroupNonUniformFMax**, **OpAtomicFAddEXT**, **OpDPdx**, **OpDPdy**, **OpFwidth**, **OpDPdxFine**, **OpDPdyFine**, **OpFwidthFine**, **OpDPdxCoarse**, **OpDPdyCoarse**, **OpFwidthCoarse**; and the following extended instructions for GLSL: **Round**, **RoundEven**, **Trunc**, **FAbs**, **Floor**, **Ceil**, **Fract**, **Radians**, **Degrees**, **Sin**, **Cos**, **Tan**, **Asin**, **Acos**, **Atan**, **Sinh**, **Cosh**, **Tanh**, **Asinh**, **Acosh**, **Atanh**, **Atan2**, **Pow**, **Exp**, **Log**, **Exp2**, **Log2**, **Sqrt**, **InverseSqrt**, **Determinant**, **MatrixInverse**, **Modf**, **ModfStruct**, **FMin**, **FMax**, **FClamp**, **FMix**, **Step**, **SmoothStep**, **Fma**, **UnpackHalf2x16**, **Length**, **Distance**, **Cross**, **Normalize**, **FaceForward**, **Reflect**, **Refract**, **NMin**, **NMax**, and **NClamp**.
- The following core SPIR-V instructions **must** respect the **DenormPreserve Execution Mode** for floating-point values with an **IEEE 754** encoding: **OpSpecConstantOp**, **OpFConvert**, **OpFNegate**, **OpFAdd**, **OpFSub**, **OpFMul**, **OpVectorTimesScalar**, **OpMatrixTimesScalar**, **OpVectorTimesMatrix**, **OpMatrixTimesVector**, **OpMatrixTimesMatrix**, **OpOuterProduct**, **OpDot**, **OpFOrdEqual**, **OpFUnordEqual**, **OpFOrdNotEqual**, **OpFUnordNotEqual**, **OpFOrdLessThan**, **OpFUnordLessThan**, **OpFOrdGreaterThan**, **OpFUnordGreaterThan**, **OpFOrdLessThanEqual**, **OpFUnordLessThanEqual**, **OpFOrdGreaterThanEqual**, **OpFUnordGreaterThanEqual**, **OpGroupNonUniformAllEqual**, **OpGroupNonUniformFMin**, **OpGroupNonUniformFMax**, **OpAtomicCompareExchange**, **OpAtomicCompareExchangeWeak**, **OpAtomicFAddEXT**, **OpDPdx**, **OpDPdy**, **OpFwidth**, **OpDPdxFine**, **OpDPdyFine**, **OpFwidthFine**, **OpDPdxCoarse**, **OpDPdyCoarse**, **OpFwidthCoarse**; and the following extended instructions for GLSL: **FAbs**, **FSign**, **Radians**, **Degrees**, **FMin**, **FMax**, **FClamp**, **FMix**, **Fma**, **PackHalf2x16**, **PackDouble2x32**, **UnpackHalf2x16**, **UnpackDouble2x32**, **NMin**, **NMax**, and **NClamp**.

The precision of double-precision instructions is at least that of single precision.

The precision of individual operations is defined in **Precision of Individual Operations**. Subject to the constraints below, however, implementations **may** reorder or combine operations, resulting in expressions exhibiting different precisions than might be expected from the constituent operations.

Evaluation of Expressions

Implementations **may** rearrange floating-point operations using any of the mathematical properties governing the expressions in precise arithmetic, even where the floating-point operations do not share these properties. This includes, but is not limited to, associativity and distributivity, and **may** involve a different number of rounding steps than would occur if the operations were not rearranged. In shaders that use the **SignedZeroInfNanPreserve Execution Mode** the values **must** be preserved if they are generated after any rearrangement but the **Execution Mode** does not change which rearrangements are valid. This rearrangement **can** be prevented for particular operations by using the **NoContraction** decoration.

NOTE

For example, in the absence of the **NoContraction** decoration implementations are allowed to implement $a + b - a$ and $\frac{a \times b}{a}$ as b . The **SignedZeroInfNanPreserve** does not prevent these transformations, even though they may overflow to infinity or NaN when evaluated in floating-point.

If the **NoContraction** decoration is applied then operations may not be rearranged, so, for example, $a + a - a$ must account for possible overflow to infinity. If infinities are not preserved then the expression may be replaced with a , since the replacement is exact when overflow does not occur and infinities may be replaced with undefined values. If both **NoContraction** and **SignedZeroInfNanPreserve** are used then the result must be infinity for sufficiently large a .

Precision of Individual Operations

The precision of individual operations is defined either in terms of rounding (correctly rounded), as an error bound in ULP, or as inherited from a formula as follows:

Correct Result

Operations that are described as returning the “correct result” will return the infinitely precise result which, due to the nature of the operation, will not need rounding.

Correctly Rounded

Operations described as “correctly rounded” will return the infinitely precise result, x , rounded so as to be representable in floating-point. If the entry point is declared with the **RoundingModeRTE** or the **RoundingModeRTZ Execution Mode** then this is done according to [IEEE 754](#) “roundTiesToEven” or “roundTowardZero” rounding directions, respectively.

Otherwise, they are rounded with [implementation-defined rounding mode](#).

Correctly Rounded with Implementation-Defined Rounding Mode

Operations described as “correctly rounded with implementation-defined rounding mode” will return the infinitely precise result, x , rounded so as to be representable in floating-point. If x is exactly representable then x will be returned. Otherwise, either the floating-point value closest to and no less than x or the value closest to and no greater than x will be returned. Which value is chosen is implementation-defined.

ULP

Where an error bound of n ULP (units in the last place) is given, for an operation with infinitely precise result x the value returned **must** be in the range $[x - n \times \text{ulp}(x), x + n \times \text{ulp}(x)]$. The function $\text{ulp}(x)$ is defined as follows:

If there exist non-equal, finite floating-point numbers a and b such that $a \leq x \leq b$ then $\text{ulp}(x)$ is the minimum possible distance between such numbers, $\text{ulp}(x) = \min_{a, b} |b - a|$. If such numbers do not exist then $\text{ulp}(x)$ is defined to be the difference between the two non-equal, finite floating-point numbers nearest to x .

Where the range of allowed return values includes any value of magnitude larger than that of the largest representable finite floating-point number, operations **may**, additionally, return either an infinity of the appropriate sign or the finite number with the largest magnitude of the appropriate sign. If the infinitely precise result of the operation is not mathematically defined then the value returned is undefined.

Inherited From ...

Where an operation's precision is described as being inherited from a formula, the result returned **must** be at least as accurate as the result of computing an approximation to x using a formula equivalent to the given formula applied to the supplied inputs. Specifically, the formula given may be transformed using the mathematical associativity, commutativity and distributivity of the operators involved to yield an equivalent formula. The SPIR-V precision rules, when applied to each such formula and the given input values, define a range of permitted values. If NaN is one of the permitted values then the operation may return any result, otherwise let the largest permitted value in any of the ranges be $F_{\max}$ and the smallest be $F_{\min}$. The operation **must** return a value in the range $[x - E, x + E]$ where $E = \max\{\tilde{A}|x - F_{\min}|, |x - F_{\max}|\}$. If the entry point is declared with the **DenormPreserve Execution Mode**, then denormals **must** be preserved throughout the formula. Otherwise, any intermediate denormal value(s) while evaluating the formula **may** be flushed to zero. If the entry point is declared with the **DenormFlushToZero** execution mode, then denormal final results **must** be flushed to zero.

For IEEE754 half- (16 bit) and single- (32 bit) precision instructions, precisions are **required** to be at least as follows:

Table 81. Precision of Core SPIR-V Instructions

Instruction	Single precision, unless decorated with RelaxedPrecision	Half precision
OpFNegate	Correct result.	
OpFAdd	Correctly rounded.	
OpFSub	Correctly rounded.	
OpFMul, OpVectorTimesScalar, OpMatrixTimesScalar	Correctly rounded.	
OpMatrixTimesVector	Inherited from $X_{j=0}^{n-1} M_{ij} \times v_j$.	
OpVectorTimesMatrix	Inherited from $X_{j=0}^{n-1} v_j \times M_{ji}$.	
OpMatrixTimesMatrix	Inherited from $X_{k=0}^{n-1} M_{ik} \times N_{kj}$.	
OpOuterProduct	Correctly rounded.	
OpFmaKHR	Correctly rounded.	
OpDot(x, y)	Inherited from $X_{i=0}^{n-1} x_i \times y_i$.	
OpIsNan, OpIsInf	Correct result.	
OpFOrdEqual, OpFUnordEqual	Correct result.	
OpFOrdNotEqual, OpFUnordNotEqual	Correct result.	
OpFOrdLessThan, OpFUnordLessThan	Correct result.	
OpFOrdGreaterThan, OpFUnordGreaterThan	Correct result.	

Instruction	Single precision, unless decorated with RelaxedPrecision	Half precision
OpFOrdLessThanEqual, OpFUnordLessThanEqual	Correct result.	
OpFOrdGreaterThanEqual, OpFUnordGreaterThanEqual	Correct result.	
OpGroupNonUniformAllEqual	Correct result.	
OpGroupNonUniformFMin, OpGroupNonUniformFMax	Correct result.	
OpFDiv(x,y)	2.5 ULP for $ y = 0$ or $ y $ in the range $[2^{-126}, 2^{126}]$.	2.5 ULP for $ y = 0$ or $ y $ in the range $[2^{-14}, 2^{14}]$.
OpFRem(x,y)	Inherited from $x - y \times \text{trunc}(x/y)$.	
OpFMod(x,y)	Inherited from $x - y \times \text{floor}(x/y)$.	
OpQuantizeToF16	Correctly rounded with implementation defined rounding mode.	
conversions between types	Correctly rounded.	
OpAtomicCompareExchange, OpAtomicCompareExchangeWeak	Correct result.	
OpAtomicFAddEXT	Return value correct result, value in memory correctly rounded.	
OpDPdx, OpDPdy, OpFwidth	Correctly rounded.	
OpDPdxCoarse, OpDPdyCoarse, OpFwidthCoarse	Correctly rounded.	
OpDPdxFine, OpDPdyFine, OpFwidthFine	Correctly rounded.	

NOTE

The **OpFRem** and **OpFMod** instructions use cheap approximations of remainder, and the error can be large due to the discontinuity in `trunc()` and `floor()`. This can produce mathematically unexpected results in some cases, such as `FMod(x,x)` computing `x` rather than `0`, and can also cause the result to have a different sign than the infinitely precise result.

Table 82. Precision of GLSL.std.450 Instructions

Instruction	Single precision, unless decorated with RelaxedPrecision	Half precision
fma()	Inherited from OpFMul followed by OpFAdd .	
exp(x), exp2(x)	$3 + 2 \times x $ ULP.	$1 + 2 \times x $ ULP.
log(), log2()	3 ULP outside the range $[0.5, 2.0]$. Absolute error $< 2^{-21}$ inside the range $[0.5, 2.0]$.	3 ULP outside the range $[0.5, 2.0]$. Absolute error $< 2^{-7}$ inside the range $[0.5, 2.0]$.
pow(x, y)	Inherited from $\text{exp2}(y \times \text{log2}(x))$.	

Instruction	Single precision, unless decorated with RelaxedPrecision	Half precision
<code>sqrt()</code>	Inherited from 1.0 / <code>inversesqrt()</code> .	
<code>inversesqrt()</code>	2 ULP.	
<code>radians(x)</code>	Inherited from $x \times C_{\pi\_180}$, where C_{π_180} is a correctly rounded approximation to $\frac{\pi}{180}$.	
<code>degrees(x)</code>	Inherited from $x \times C_{180\_pi}$, where C_{180_pi} is a correctly rounded approximation to $\frac{180}{\pi}$.	
<code>sin()</code>	Absolute error $\leq 2^{-11}$ inside the range $[-\pi, \pi]$.	Absolute error $\leq 2^{-7}$ inside the range $[-\pi, \pi]$.
<code>cos()</code>	Absolute error $\leq 2^{-11}$ inside the range $[-\pi, \pi]$.	Absolute error $\leq 2^{-7}$ inside the range $[-\pi, \pi]$.
<code>tan()</code>	Inherited from $\frac{\sin}{\cos}$.	
<code>asin(x)</code>	Inherited from <code>atan2(x, sqrt(1.0 - x * x))</code> .	
<code>acos(x)</code>	Inherited from <code>atan2(sqrt(1.0 - x * x), x)</code> .	
<code>atan(), atan2()</code>	4096 ULP	5 ULP.
<code>sinh(x)</code>	Inherited from $(\exp(x) - \exp(-x)) \times 0.5$.	
<code>cosh(x)</code>	Inherited from $(\exp(x) + \exp(-x)) \times 0.5$.	
<code>tanh()</code>	Inherited from $\frac{\sinh}{\cosh}$.	
<code>asinh(x)</code>	Inherited from <code>log(x + sqrt(x * x + 1.0))</code> .	
<code>acosh(x)</code>	Inherited from <code>log(x + sqrt(x * x - 1.0))</code> .	
<code>atanh(x)</code>	Inherited from <code>log((1.0 + x) / (1.0 - x))</code> $\times 0.5$.	
<code>frexp()</code>	Correct result.	
<code>ldexp()</code>	Correctly rounded.	
<code>length(x)</code>	Inherited from <code>sqrt(dot(x, x))</code> .	
<code>distance(x, y)</code>	Inherited from <code>length(x - y)</code> .	
<code>cross()</code>	Inherited from <code>OpFSub(OpFMul, OpFMul)</code> .	
<code>normalize(x)</code>	Inherited from <code>x * inversesqrt(dot(x, x))</code> .	
<code>faceforward(N, I, NRef)</code>	Inherited from <code>dot(NRef, I) < 0.0 ? N : -N</code> .	
<code>reflect(x, y)</code>	Inherited from <code>x - 2.0 * dot(y, x) * y</code> .	
<code>refract(I, N, eta)</code>	Inherited from <code>k < 0.0 ? 0.0 : eta * I - (eta * dot(N, I) + sqrt(k)) * N</code> , where <code>k = 1 - eta * eta * (1.0 - dot(N, I) * dot(N, I))</code> .	
<code>round</code>	Correctly rounded.	
<code>roundEven</code>	Correctly rounded.	
<code>trunc</code>	Correctly rounded.	

Instruction	Single precision, unless decorated with RelaxedPrecision	Half precision
<code>fabs</code>	Correct result.	
<code>fsign</code>	Correct result.	
<code>floor</code>	Correctly rounded.	
<code>ceil</code>	Correctly rounded.	
<code>fract</code>	Correctly rounded.	
<code>modf</code>	Correctly rounded.	
<code>fmin</code>	Correct result.	
<code>fmax</code>	Correct result.	
<code>fcamp</code>	Correct result.	
<code>fmix(x, y, a)</code>	Inherited from $x \times (1.0 - a) + y \times a$.	
<code>step</code>	Correctly rounded.	
<code>smoothStep(edge0, edge1, x)</code>	Inherited from $t \times t \times (3.0 - 2.0 \times t)$, where $t = clamp(\frac{x - edge0}{edge1 - edge0}, 0.0, 1.0)$.	
<code>nmin</code>	Correct result.	
<code>nmax</code>	Correct result.	
<code>ncamp</code>	Correct result.	
<code>packHalf2x16</code>	Correctly rounded with implementation defined rounding mode.	

GLSL.std.450 extended instructions specifically defined in terms of the above instructions inherit the above errors. GLSL.std.450 extended instructions not listed above and not defined in terms of the above have undefined precision.

If either operand to `OpSRem` and `OpSMod` instructions is negative the result is undefined.

NOTE While the `OpSRem` and `OpSMod` instructions are supported by the Vulkan environment, they require non-negative values and thus do not enable additional functionality beyond what `OpUMod` provides.

Buffer Indexing Calculations

Pipelines and shaders **may** be compiled to use 32-bit integer arithmetic to compute byte offsets (e.g. based on `OpAccessChain` instructions) within a physical storage buffer or buffer, limiting the accessible range to 4GB. For physical storage buffers, the base address is a 64-bit value and the implicit base plus offset calculation uses 64-bit addition.

NOTE Note that `OpAccessChain` indices are always treated as signed, so a 32-bit index can only address 2GB if the `ArrayStride` is 1.

The offset calculations that have the 4GB limit include:

- **OpAccessChain** and **OpPtrAccessChain** - the total offset summed over all indices multiplied by strides, including spanning multiple access chain instructions that lead to a given memory access.

Signedness of SPIR-V Image Accesses

SPIR-V associates a signedness with all integer image accesses. This is required in certain parts of the SPIR-V and the Vulkan image access pipeline to ensure defined results. The signedness is determined from a combination of the access instruction's **Image Operands** and the underlying image's **Sampled Type** as follows:

1. If the instruction's **Image Operands** contains the **SignExtend** operand then the access is signed.
2. If the instruction's **Image Operands** contains the **ZeroExtend** operand then the access is unsigned.
3. Otherwise, the image accesses signedness matches that of the **Sampled Type** of the **OpTypeImage** being accessed.

Image Format and Type Matching

When specifying the **Image Format** of an **OpTypeImage**, the converted bit width and type, as shown in the table below, **must** match the **Sampled Type**. The signedness **must** match the **signedness of any access** to the image.

NOTE

Formatted accesses are always converted from a shader readable type to the resource's format or vice versa via **Texel Decode** for reads and **Texel Encode** for writes. As such, the bit width and format below do not necessarily match 1:1 with what might be expected for some formats.

For a given **Image Format**, the **Sampled Type** **must** be the type described in the *Type* column of the below table, with its **Literal Width** set to that in the *Bit Width* column. Every access that is made to the image **must** have a signedness equal to that in the *Signedness* column (where applicable).

Image Format	Type-Declaration instructions	Bit Width	Signedness

Appendix B: Memory Model

NOTE

This memory model describes synchronizations provided by all implementations; however, some of the synchronizations defined require extra features to be supported by the implementation. See [VkPhysicalDeviceVulkanMemoryModelFeatures](#).

Agent

Operation is a general term for any task that is executed on the system.

NOTE

An operation is by definition something that is executed. Thus if an instruction is skipped due to control flow, it does not constitute an operation.

Each operation is executed by a particular *agent*. Possible agents include each:

- fixed-function stage of the pipeline,
- shader invocation, or
- host thread.

Memory Location

A *memory location* identifies unique storage for 8 bits of data. Memory operations access a *set of memory locations* consisting of one or more memory locations at a time, e.g. an operation accessing a 32-bit integer in memory would read/write a set of four memory locations. Memory operations that access whole aggregates **may** access any padding bytes between elements or members, but no padding bytes at the end of the aggregate. Two sets of memory locations *overlap* if the intersection of their sets of memory locations is non-empty. A memory operation **must** not affect memory at a memory location not within its set of memory locations.

Memory locations for buffers and images are explicitly allocated in [VkDeviceMemory](#) objects , and are implicitly allocated for SPIR-V variables in each shader invocation .

Allocation

The values stored in newly allocated memory locations are determined by a SPIR-V variable's initializer, if present, or else are undefined. At the time an allocation is created there have been no [memory operations](#) to any of its memory locations. The initialization is not considered to be a memory operation.

NOTE

For tessellation control shader output variables, a consequence of initialization not being considered a memory operation is that some implementations may need to insert a barrier between the initialization of the output variables and any reads of those variables.

Memory Operation

For an operation A and memory location M:

- A *reads* M if and only if the data stored in M is an input to A.
- A *writes* M if and only if the data output from A is stored to M.
- A *accesses* M if and only if it either reads or writes (or both) M.

NOTE

A write whose value is the same as what was already in those memory locations is still considered to be a write and has all the same effects.

Reference

A *reference* is an object that a particular agent **can** use to access a set of memory locations. On the host, a reference is a host virtual address. On the device, a reference is:

- The descriptor that a variable is bound to, for variables in Image, Uniform, or StorageBuffer storage classes. If the variable is an array (or array of arrays, etc.) then each element of the array **may** be a unique reference.
- The address range for a buffer in **PhysicalStorageBuffer** storage class, where the base of the address range is queried with **vkGetBufferDeviceAddress** and the length of the range is the size of the buffer.
- The variable itself for variables in other storage classes.

Two memory accesses through distinct references **may** require availability and visibility operations as defined [below](#).

Program-Order

A *dynamic instance* of an instruction is defined in SPIR-V (<https://registry.khronos.org/spir-v/specs/unified1/SPIRV.html#DynamicInstance>) as a way of referring to a particular execution of a static instruction. Program-order is an ordering on dynamic instances of instructions executed by a single shader invocation:

- (Basic block): If instructions A and B are in the same basic block, and A is listed in the module before B, then the n'th dynamic instance of A is program-ordered before the n'th dynamic instance of B.
- (Branch): The dynamic instance of a branch or switch instruction is program-ordered before the dynamic instance of the OpLabel instruction to which it transfers control.
- (Call entry): The dynamic instance of an **OpFunctionCall** instruction is program-ordered before the dynamic instances of the **OpFunctionParameter** instructions and the body of the called function.
- (Call exit): The dynamic instance of the instruction following an **OpFunctionCall** instruction is program-ordered after the dynamic instance of the return instruction executed by the called function.

- (Transitive Closure): If dynamic instance A of any instruction is program-ordered before dynamic instance B of any instruction and B is program-ordered before dynamic instance C of any instruction then A is program-ordered before C.
- (Complete definition): No other dynamic instances are program-ordered.

For instructions executed on the host, the source language defines the program-order relation (e.g. as “sequenced-before”).

Scope

Atomic and barrier instructions include scopes which identify sets of shader invocations that **must** obey the requested ordering and atomicity rules of the operation, as defined below.

The various scopes are described in detail in [the Shaders chapter](#).

Atomic Operation

An *atomic operation* on the device is any SPIR-V operation whose name begins with **OpAtomic**. An atomic operation on the host is any operation performed with an `std::atomic` typed object.

Each atomic operation has a memory [scope](#) and a [semantics](#). Informally, the scope determines which other agents it is atomic with respect to, and the [semantics](#) constrains its ordering against other memory accesses.

Device atomic operations have explicit scopes and semantics. Each host atomic operation implicitly uses the **CrossDevice** scope, and uses a memory semantics equivalent to a C++ `std::memory_order` value of `relaxed`, `acquire`, `release`, `acq_rel`, or `seq_cst`.

Two atomic operations A and B are *potentially-mutually-ordered* if and only if all of the following are true:

- They access the same set of memory locations.
- They use the same reference.
- A is in the instance of B’s memory scope.
- B is in the instance of A’s memory scope.
- A and B are not the same operation (irreflexive).

Two atomic operations A and B are *mutually-ordered* if and only if they are potentially-mutually-ordered and any of the following are true:

- A and B are both device operations.
- A and B are both host operations.

NOTE

If two atomic operations are not mutually-ordered, and if their sets of memory locations overlap, then each **must** be synchronized against the other as if they were non-atomic operations.

Scoped Modification Order

For a given atomic write A, all atomic writes that are mutually-ordered with A occur in an order known as A's *scoped modification order*. A's scoped modification order relates no other operations.

NOTE

Invocations outside the instance of A's memory scope **may** observe the values at A's set of memory locations becoming visible to it in an order that disagrees with the scoped modification order.

NOTE

It is valid to have non-atomic operations or atomics in a different scope instance to the same set of memory locations, as long as they are synchronized against each other as if they were non-atomic (if they are not, it is treated as a [data race](#)). That means this definition of A's scoped modification order could include atomic operations that occur much later, after intervening non-atomics. That is a bit non-intuitive, but it helps to keep this definition simple and non-circular.

Memory Semantics

Non-atomic memory operations, by default, **may** be observed by one agent in a different order than they were written by another agent.

Atomics and some synchronization operations include *memory semantics*, which are flags that constrain the order in which other memory accesses (including non-atomic memory accesses and [availability and visibility operations](#)) performed by the same agent **can** be observed by other agents, or **can** observe accesses by other agents.

Host instructions that include semantics are some `std::atomic` methods and memory fences. Device instructions that include semantics are `OpAtomic*`, `OpControlBarrier`, `OpMemoryBarrier`, and `OpMemoryNamedBarrier`.

Vulkan supports the following memory semantics:

- Relaxed: No constraints on order of other memory accesses.
- Acquire: A memory read with this semantic performs an *acquire operation*. A memory barrier with this semantic is an *acquire barrier*.
- Release: A memory write with this semantic performs a *release operation*. A memory barrier with this semantic is a *release barrier*.
- AcquireRelease: A memory read-modify-write operation with this semantic performs both an acquire operation and a release operation, and inherits the limitations on ordering from both of those operations. A memory barrier with this semantic is both a release and acquire barrier.

SequentiallyConsistent memory semantics is not supported and **must** not be used.

NOTE

SPIR-V does not support “consume” semantics on the device.

The memory semantics operand **can** also include *storage class semantics* flags which indicate the storage classes constrained by the synchronization. Vulkan supports the following SPIR-V storage

class semantics flags:

- UniformMemory
- WorkgroupMemory
- ImageMemory
- OutputMemory

The remaining storage class semantics flags (SubgroupMemory, CrossWorkgroupMemory, and AtomicCounterMemory) are ignored.

Each SPIR-V memory operation accesses a single storage class. Semantics in synchronization operations can include a combination of storage classes.

The UniformMemory storage class semantic applies to accesses to memory in the PhysicalStorageBuffer, Uniform and StorageBuffer storage classes. The WorkgroupMemory storage class semantic applies to accesses to memory in the Workgroup storage class. The ImageMemory storage class semantic applies to accesses to memory in the Image storage class. The OutputMemory storage class semantic applies to accesses to memory in the Output storage class.

NOTE

Informally, these constraints limit how memory operations can be reordered, and these limits apply not only to the order of accesses as performed in the agent that executes the instruction, but also to the order the effects of writes become visible to all other agents within the same instance of the instruction's memory scope.

NOTE

Release and acquire operations in different threads **can** act as synchronization operations, to guarantee that writes that happened before the release are visible after the acquire. (This is not a formal definition, just an Informative forward reference.)

NOTE

The OutputMemory storage class semantic is only useful in tessellation control shaders, which is the only execution model where output variables are shared between invocations.

The memory semantics operand **can** also include availability and visibility flags, which apply availability and visibility operations as described in [availability and visibility](#). The availability/visibility flags are:

- MakeAvailable: Semantics **must** be Release or AcquireRelease. Performs an availability operation before the release operation or barrier.
- MakeVisible: Semantics **must** be Acquire or AcquireRelease. Performs a visibility operation after the acquire operation or barrier.

The specifics of these operations are defined in [Availability and Visibility Semantics](#).

Host atomic operations **may** support a different list of memory semantics and synchronization operations, depending on the host architecture and source language.

Release Sequence

After an atomic operation A performs a release operation on a set of memory locations M, the *release sequence headed by A* is the longest continuous subsequence of A's scoped modification order that consists of:

- the atomic operation A as its first element
- atomic read-modify-write operations on M by any agent

NOTE

The atomics in the last bullet **must** be mutually-ordered with A by virtue of being in A's scoped modification order.

NOTE

This intentionally omits “atomic writes to M performed by the same agent that performed A”, which is present in the corresponding C++ definition.

Synchronizes-With

Synchronizes-with is a relation between operations, where each operation is either an atomic operation or a memory barrier (aka fence on the host).

If A and B are atomic operations, then A synchronizes-with B if and only if all of the following are true:

- A performs a release operation
- B performs an acquire operation
- A and B are mutually-ordered
- B reads a value written by A or by an operation in the release sequence headed by A

`OpControlBarrier`, `OpMemoryBarrier`, and `OpMemoryNamedBarrier` are *memory barrier* instructions in SPIR-V.

If A is a release barrier and B is an atomic operation that performs an acquire operation, then A synchronizes-with B if and only if all of the following are true:

- there exists an atomic write X (with any memory semantics)
- A is program-ordered before X
- X and B are mutually-ordered
- B reads a value written by X or by an operation in the release sequence headed by X
 - If X is relaxed, it is still considered to head a hypothetical release sequence for this rule
- A and B are in the instance of each other's memory scopes
- X's storage class is in A's semantics.

If A is an atomic operation that performs a release operation and B is an acquire barrier, then A synchronizes-with B if and only if all of the following are true:

- there exists an atomic read X (with any memory semantics)
- X is program-ordered before B
- X and A are mutually-ordered
- X reads a value written by A or by an operation in the release sequence headed by A
- A and B are in the instance of each other's memory scopes
- X's storage class is in B's semantics.

If A is a release barrier and B is an acquire barrier, then A synchronizes-with B if all of the following are true:

- there exists an atomic write X (with any memory semantics)
- A is program-ordered before X
- there exists an atomic read Y (with any memory semantics)
- Y is program-ordered before B
- X and Y are mutually-ordered
- Y reads the value written by X or by an operation in the release sequence headed by X
 - If X is relaxed, it is still considered to head a hypothetical release sequence for this rule
- A and B are in the instance of each other's memory scopes
- X's and Y's storage class is in A's and B's semantics.
 - NOTE: X and Y **must** have the same storage class, because they are mutually ordered.

If A is a release barrier, B is an acquire barrier, and C is a control barrier (where A **can** equal C, and B **can** equal C), then A synchronizes-with B if all of the following are true:

- A is program-ordered before (or equals) C
- C is program-ordered before (or equals) B
- A and B are in the instance of each other's memory scopes
- A and B are in the instance of C's execution scope

NOTE

This is similar to the barrier-barrier synchronization above, but with a control barrier filling the role of the relaxed atomics.

Let F be an ordering of fragment shader invocations, such that invocation F_1 is ordered before invocation F_2 if and only if F_1 and F_2 overlap as described in [Fragment Shader Interlock](#) and F_1 executes the interlocked code before F_2 .

If A is an `OpEndInvocationInterlockEXT` instruction and B is an `OpBeginInvocationInterlockEXT` instruction, then A synchronizes-with B if the agent that executes A is ordered before the agent that executes B in F. A and B are both considered to have `FragmentInterlock` memory scope and semantics of UniformMemory and ImageMemory, and A is considered to have Release semantics and B is considered to have Acquire semantics.

NOTE

`OpBeginInvocationInterlockEXT` and `OpBeginInvocationInterlockEXT` do not perform implicit availability or visibility operations. Usually, shaders using fragment shader interlock will declare the relevant resources as `coherent` to get implicit `per-instruction availability and visibility operations`.

No other release and acquire barriers synchronize-with each other.

System-Synchronizes-With

System-synchronizes-with is a relation between arbitrary operations on the device or host. Certain operations system-synchronize-with each other, which informally means the first operation occurs before the second and that the synchronization is performed without using application-visible memory accesses.

If there is an `execution dependency` between two operations A and B, then the operation in the first synchronization scope system-synchronizes-with the operation in the second synchronization scope.

NOTE

This covers all Vulkan synchronization primitives, including device operations executing before a synchronization primitive is signaled, wait operations happening before subsequent device operations, signal operations happening before host operations that wait on them, and host operations happening before `vkQueueSubmit`. The list is spread throughout the synchronization chapter, and is not repeated here.

System-synchronizes-with implicitly includes all storage class semantics and has `CrossDevice` scope.

If A system-synchronizes-with B, we also say A is *system-synchronized-before* B and B is *system-synchronized-after* A.

Private vs. Non-Private

By default, non-atomic memory operations are treated as *private*, meaning such a memory operation is not intended to be used for communication with other agents.

Non-private memory operations are intended to be used for communication with other agents. Atomic operations are always considered *non-private*.

Memory operations with the `NonPrivatePointer`, `NonPrivateTexel` bit set are treated as *non-private*

More precisely, for private memory operations to be `Location-Ordered` between distinct agents requires using system-synchronizes-with rather than shader-based synchronization. Private memory operations still obey program-order.

Inter-Thread-Happens-Before

Let SC be a non-empty set of storage class semantics. Then (using template syntax) operation A *inter-thread-happens-before*<SC> operation B if and only if any of the following is true:

- A system-synchronizes-with B
- A synchronizes-with B, and both A and B have all of SC in their semantics
- A is an operation on memory in a storage class in SC or that has all of SC in its semantics, B is a release barrier or release atomic with all of SC in its semantics, and A is program-ordered before B
- A is an acquire barrier or acquire atomic with all of SC in its semantics, B is an operation on memory in a storage class in SC or that has all of SC in its semantics, and A is program-ordered before B
- A and B are both host operations and A inter-thread-happens-before B as defined in the host language specification
- A inter-thread-happens-before<SC> some X and X inter-thread-happens-before<SC> B

Happens-Before

Operation A *happens-before* operation B if and only if any of the following is true:

- A is program-ordered before B
- A inter-thread-happens-before<SC> B for some set of storage classes SC

Happens-after is defined similarly.

NOTE

Unlike C++, happens-before is not always sufficient for a write to be visible to a read. Additional [availability and visibility](#) operations **may** be required for writes to be [visible-to](#) other memory accesses.

NOTE

Happens-before is not transitive, but each of program-order and inter-thread-happens-before<SC> are transitive. These can be thought of as covering the “single-threaded” case and the “multi-threaded” case, and it is not necessary (and not valid) to form chains between the two.

Availability and Visibility

Availability and *visibility* are states of a write operation, which (informally) track how far the write has permeated the system, i.e. which agents and references are able to observe the write. Availability state is per *memory domain*. Visibility state is per (agent,reference) pair. Availability and visibility states are per-memory location for each write.

Memory domains are named according to the agents whose memory accesses use the domain. Domains used by shader invocations are organized hierarchically into multiple smaller memory domains which correspond to the different [scopes](#). Each memory domain is considered the *dual* of a scope, and vice versa. The memory domains defined in Vulkan include:

- *host* - accessible by host agents
- *device* - accessible by all device agents for a particular device

- *shader* - accessible by shader agents for a particular device, corresponding to the **Device** scope
- *queue family instance* - accessible by shader agents in a single queue family, corresponding to the **QueueFamily** scope.
- *fragment interlock instance* - accessible by fragment shader agents that **overlap**, corresponding to the **FragmentInterlock** scope.
- *workgroup instance* - accessible by shader agents in the same workgroup, corresponding to the **Workgroup** scope.
- *subgroup instance* - accessible by shader agents in the same subgroup, corresponding to the **Subgroup** scope.

The memory domains are nested in the order listed above, with memory domains later in the list nested in the domains earlier in the list.

NOTE

Memory domains do not correspond to storage classes or device-local and host-local **VkDeviceMemory** allocations, rather they indicate whether a write can be made visible only to agents in the same subgroup, same workgroup, in overlapping fragment shader invocation, in any shader invocation, or anywhere on the device, or host. The shader, queue family instance, fragment interlock instance, workgroup instance, and subgroup instance domains are only used for shader-based availability/visibility operations, in other cases writes can be made available from/visible to the shader via the device domain.

Availability operations, *visibility operations*, and *memory domain operations* alter the state of the write operations that happen-before them, and which are included in their *source scope* to be available or visible to their *destination scope*.

- For an availability operation, the source scope is a set of (agent,reference,memory location) tuples, and the destination scope is a set of memory domains.
- For a memory domain operation, the source scope is a memory domain and the destination scope is a memory domain.
- For a visibility operation, the source scope is a set of memory domains and the destination scope is a set of (agent,reference,memory location) tuples.

How the scopes are determined depends on the specific operation. Availability and memory domain operations expand the set of memory domains to which the write is available. Visibility operations expand the set of (agent,reference,memory location) tuples to which the write is visible.

Recall that availability and visibility states are per-memory location, and let W be a write operation to one or more locations performed by agent A via reference R. Let L be one of the locations written. (W,L) (the write W to L), is initially not available to any memory domain and only visible to (A,R,L). An availability operation AV that happens-after W and that includes (A,R,L) in its source scope makes (W,L) *available* to the memory domains in its destination scope.

A memory domain operation DOM that happens-after AV and for which (W,L) is available in the source scope makes (W,L) available in the destination memory domain.

A visibility operation VIS that happens-after AV (or DOM) and for which (W,L) is available in any

domain in the source scope makes (W,L) *visible* to all (agent,reference,L) tuples included in its destination scope.

If write W_2 happens-after W , and their sets of memory locations overlap, then W will not be available/visible to all agents/references for those memory locations that overlap (and future AV/DOM/VIS ops cannot revive W 's write to those locations).

Availability, memory domain, and visibility operations are treated like other non-atomic memory accesses for the purpose of [memory semantics](#), meaning they can be ordered by release-acquire sequences or memory barriers.

An *availability chain* is a sequence of availability operations to increasingly broad memory domains, where element $N+1$ of the chain is performed in the dual scope instance of the destination memory domain of element N and element N happens-before element $N+1$. An example is an availability operation with destination scope of the workgroup instance domain that happens-before an availability operation to the shader domain performed by an invocation in the same workgroup. An availability chain AVC that happens-after W and that includes (A,R,L) in the source scope makes (W,L) *available* to the memory domains in its final destination scope. An availability chain with a single element is just the availability operation.

Similarly, a *visibility chain* is a sequence of visibility operations from increasingly narrow memory domains, where element N of the chain is performed in the dual scope instance of the source memory domain of element $N+1$ and element N happens-before element $N+1$. An example is a visibility operation with source scope of the shader domain that happens-before a visibility operation with source scope of the workgroup instance domain performed by an invocation in the same workgroup. A visibility chain VISC that happens-after AVC (or DOM) and for which (W,L) is available in any domain in the source scope makes (W,L) *visible* to all (agent,reference,L) tuples included in its final destination scope. A visibility chain with a single element is just the visibility operation.

Availability, Visibility, and Domain Operations

The following operations generate availability, visibility, and domain operations. When multiple availability/visibility/domain operations are described, they are system-synchronized-with each other in the order listed.

An operation that performs a [memory dependency](#) generates:

- If the source access mask includes `VK_ACCESS_HOST_WRITE_BIT`, then the dependency includes a memory domain operation from host domain to device domain.
- An availability operation with source scope of all writes in the first [access scope](#) of the dependency and a destination scope of the device domain.
- A visibility operation with source scope of the device domain and destination scope of the second access scope of the dependency.
- If the destination access mask includes `VK_ACCESS_HOST_READ_BIT` or `VK_ACCESS_HOST_WRITE_BIT`, then the dependency includes a memory domain operation from device domain to host domain.

[vkFlushMappedMemoryRanges](#) performs an availability operation, with a source scope of

(agents,references) = (all host threads, all mapped memory ranges passed to the command), and destination scope of the host domain.

`vkInvalidateMappedMemoryRanges` performs a visibility operation, with a source scope of the host domain and a destination scope of (agents,references) = (all host threads, all mapped memory ranges passed to the command).

`vkQueueSubmit` performs a memory domain operation from host to device, and a visibility operation with source scope of the device domain and destination scope of all agents and references on the device.

Availability and Visibility Semantics

A memory barrier or atomic operation via agent A that includes `MakeAvailable` in its semantics performs an availability operation whose source scope includes agent A and all references in the storage classes in that instruction's storage class semantics, and all memory locations, and whose destination scope is a set of memory domains selected as specified below. The implicit availability operation is program-ordered between the barrier or atomic and all other operations program-ordered before the barrier or atomic.

A memory barrier or atomic operation via agent A that includes `MakeVisible` in its semantics performs a visibility operation whose source scope is a set of memory domains selected as specified below, and whose destination scope includes agent A and all references in the storage classes in that instruction's storage class semantics, and all memory locations. The implicit visibility operation is program-ordered between the barrier or atomic and all other operations program-ordered after the barrier or atomic.

The memory domains are selected based on the memory scope of the instruction as follows:

- `Device` scope uses the shader domain
- `QueueFamily` scope uses the queue family instance domain
- `FragmentInterlock` scope uses the fragment interlock instance domain
- `Workgroup` scope uses the workgroup instance domain
- `Subgroup` uses the subgroup instance domain
- `Invocation` perform no availability/visibility operations.

When an availability operation performed by an agent A includes a memory domain D in its destination scope, where D corresponds to scope instance S, it also includes the memory domains that correspond to each smaller scope instance S' that is a subset of S and that includes A. Similarly for visibility operations.

Per-Instruction Availability and Visibility Semantics

A memory write instruction that includes `MakePointerAvailable`, or an image write instruction that includes `MakeTexelAvailable`, performs an availability operation whose source scope includes the agent and reference used to perform the write and the memory locations written by the

instruction, and whose destination scope is a set of memory domains selected by the Scope operand specified in [Availability and Visibility Semantics](#). The implicit availability operation is program-ordered between the write and all other operations program-ordered after the write.

A memory read instruction that includes `MakePointerVisible`, or an image read instruction that includes `MakeTexelVisible`, performs a visibility operation whose source scope is a set of memory domains selected by the Scope operand as specified in [Availability and Visibility Semantics](#), and whose destination scope includes the agent and reference used to perform the read and the memory locations read by the instruction. The implicit visibility operation is program-ordered between read and all other operations program-ordered before the read.

NOTE

Although reads with per-instruction visibility only perform visibility ops from the shader or fragment interlock instance or workgroup instance or subgroup instance domain, they will also see writes that were made visible via the device domain, i.e. those writes previously performed by non-shader agents and made visible via API commands.

NOTE

It is expected that all invocations in a subgroup execute on the same processor with the same path to memory, and thus availability and visibility operations with subgroup scope can be expected to be “free”.

Location-Ordered

Let X and Y be memory accesses to overlapping sets of memory locations M , where $X \neq Y$. Let (A_x, R_x) be the agent and reference used for X , and (A_y, R_y) be the agent and reference used for Y . For now, let “ $\rightarrow$ ” denote happens-before and “ $\rightarrow^{rcpo}$ ” denote the reflexive closure of program-ordered before.

If D_1 and D_2 are different memory domains, then let $DOM(D_1, D_2)$ be a memory domain operation from D_1 to D_2 . Otherwise, let $DOM(D, D)$ be a placeholder such that $X \rightarrow DOM(D, D) \rightarrow Y$ if and only if $X \rightarrow Y$.

X is *location-ordered* before Y for a location L in M if and only if any of the following is true:

- $A_x == A_y$ and $R_x == R_y$ and $X \rightarrow Y$
 - NOTE: this case means no availability/visibility ops are required when it is the same (agent,reference).
- X is a read, both X and Y are non-private, and $X \rightarrow Y$
- X is a read, and X (transitively) system-synchronizes with Y
- If $R_x == R_y$ and A_x and A_y access a common memory domain D (e.g. are in the same workgroup instance if D is the workgroup instance domain), and both X and Y are non-private:
 - X is a write, Y is a write, $AVC(A_x, R_x, D, L)$ is an availability chain making (X, L) available to domain D , and $X \rightarrow^{rcpo} AVC(A_x, R_x, D, L) \rightarrow Y$
 - X is a write, Y is a read, $AVC(A_x, R_x, D, L)$ is an availability chain making (X, L) available to domain D , $VISC(A_y, R_y, D, L)$ is a visibility chain making writes to L available in domain D visible to Y , and $X \rightarrow^{rcpo} AVC(A_x, R_x, D, L) \rightarrow VISC(A_y, R_y, D, L) \rightarrow^{rcpo} Y$

- If `VkPhysicalDeviceVulkanMemoryModelFeatures::vulkanMemoryModelAvailabilityVisibilityChains` is `VK_FALSE`, then AVC and VISC **must** each only have a single element in the chain, in each sub-bullet above.
- Let D_x and D_y each be either the device domain or the host domain, depending on whether A_x and A_y execute on the device or host:
 - X is a write and Y is a write, and $X \rightarrow AV(A_x, R_x, D_x, L) \rightarrow DOM(D_x, D_y) \rightarrow Y$
 - X is a write and Y is a read, and $X \rightarrow AV(A_x, R_x, D_x, L) \rightarrow DOM(D_x, D_y) \rightarrow VIS(A_y, R_y, D_y, L) \rightarrow Y$

NOTE

The final bullet (synchronization through device/host domain) requires API-level synchronization operations, since the device/host domains are not accessible via shader instructions. And “device domain” is not to be confused with “device scope”, which synchronizes through the “shader domain”.

Data Race

Let X and Y be operations that access overlapping sets of memory locations M, where $X \neq Y$, and at least one of X and Y is a write, and X and Y are not mutually-ordered atomic operations. If there does not exist a location-ordered relation between X and Y for each location in M, then there is a *data race*.

Applications **must** ensure that no data races occur during the execution of their application.

NOTE

Data races can only occur due to instructions that are actually executed. For example, an instruction skipped due to control flow must not contribute to a data race.

Visible-To

Let X be a write and Y be a read whose sets of memory locations overlap, and let M be the set of memory locations that overlap. Let M_2 be a non-empty subset of M. Then X is *visible-to* Y for memory locations M_2 if and only if all of the following are true:

- X is location-ordered before Y for each location L in M_2 .
- There does not exist another write Z to any location L in M_2 such that X is location-ordered before Z for location L and Z is location-ordered before Y for location L.

If X is visible-to Y, then Y reads the value written by X for locations M_2 .

NOTE

It is possible for there to be a write between X and Y that overwrites a subset of the memory locations, but the remaining memory locations (M_2) will still be visible-to Y.

Acyclicity

Reads-from is a relation between operations, where the first operation is a write, the second operation is a read, and the second operation reads the value written by the first operation. *From-*

reads is a relation between operations, where the first operation is a read, the second operation is a write, and the first operation reads a value written earlier than the second operation in the second operation's scoped modification order or location order (or the first operation reads from the initial value, and the second operation is any write to the same locations).

Then the implementation **must** guarantee that no cycles exist in the union of the following relations:

- location-ordered
- scoped modification order (over all atomic writes)
- reads-from
- from-reads

NOTE

This is a “consistency” axiom, which informally guarantees that sequences of operations cannot violate causality.

Scoped Modification Order Coherence

Let A and B be mutually-ordered atomic operations, where A is location-ordered before B. Then the following rules are a consequence of acyclicity:

- If A and B are both reads and A does not read the initial value, then the write that A takes its value from **must** be earlier in its own scoped modification order than (or the same as) the write that B takes its value from (no cycles between location-order, reads-from, and from-reads).
- If A is a read and B is a write and A does not read the initial value, then A **must** take its value from a write earlier than B in B's scoped modification order (no cycles between location-order, scope modification order, and reads-from).
- If A is a write and B is a read, then B **must** take its value from A or a write later than A in A's scoped modification order (no cycles between location-order, scoped modification order, and from-reads).
- If A and B are both writes, then A **must** be earlier than B in A's scoped modification order (no cycles between location-order and scoped modification order).
- If A is a write and B is a read-modify-write and B reads the value written by A, then B comes immediately after A in A's scoped modification order (no cycles between scoped modification order and from-reads).

Shader I/O

If a shader invocation A in a shader stage other than **Vertex** performs a memory read operation X from an object in storage class **Input**, then X is system-synchronized-after all writes to the corresponding **Output** storage variable(s) in the shader invocation(s) that contribute to generating invocation A, and those writes are all visible-to X.

NOTE

It is not necessary for the upstream shader invocations to have completed execution, they only need to have generated the output that is being read.

Deallocation

The deallocation of SPIR-V variables is managed by the system and happens-after all operations on those variables.

Descriptions (Informative)

This subsection offers more easily understandable consequences of the memory model for app/compiler developers.

Let SC be the storage class(es) specified by a release or acquire operation or barrier.

- An atomic write with release semantics must not be reordered against any read or write to SC that is program-ordered before it (regardless of the storage class the atomic is in).
- An atomic read with acquire semantics must not be reordered against any read or write to SC that is program-ordered after it (regardless of the storage class the atomic is in).
- Any write to SC program-ordered after a release barrier must not be reordered against any read or write to SC program-ordered before that barrier.
- Any read from SC program-ordered before an acquire barrier must not be reordered against any read or write to SC program-ordered after the barrier.

A control barrier (even if it has no memory semantics) must not be reordered against any memory barriers.

This memory model allows memory accesses with and without availability and visibility operations, as well as atomic operations, all to be performed on the same memory location. This is critical to allow it to reason about memory that is reused in multiple ways, e.g. across the lifetime of different shader invocations or draw calls. While GLSL (and legacy SPIR-V) applies the “coherent” decoration to variables (for historical reasons), this model treats each memory access instruction as having optional implicit availability/visibility operations. GLSL to SPIR-V compilers should map all (non-atomic) operations on a coherent variable to `Make{Pointer, Texel}{Available}{Visible}` flags in this model.

Atomic operations implicitly have availability/visibility operations, and the scope of those operations is taken from the atomic operation’s scope.

Tessellation Output Ordering

For SPIR-V that uses the Vulkan Memory Model, the `OutputMemory` storage class is used to synchronize accesses to tessellation control output variables. For legacy SPIR-V that does not enable the Vulkan Memory Model via `OpMemoryModel`, tessellation outputs can be ordered using a control barrier with no particular memory scope or semantics, as defined below.

Let X and Y be memory operations performed by shader invocations A_x and A_y . Operation X is *tessellation-output-ordered* before operation Y if and only if all of the following are true:

- There is a dynamic instance of an `OpControlBarrier` instruction C such that X is program-ordered

before C in A_x and C is program-ordered before Y in A_y .

- A_x and A_y are in the same instance of C's execution scope.

If shader invocations A_x and A_y in the **TessellationControl** execution model execute memory operations X and Y, respectively, on the **Output** storage class, and X is tessellation-output-ordered before Y with a scope of **Workgroup**, then X is location-ordered before Y, and if X is a write and Y is a read then X is visible-to Y.

Appendix C: Compressed Image Formats

The compressed texture formats used by Vulkan are described in the specifically identified sections of the [Khronos Data Format Specification](#), version 1.3.

Unless otherwise described, the quantities encoded in these compressed formats are treated as normalized, unsigned values.

Those formats listed as sRGB-encoded have in-memory representations of R, G and B components which are nonlinearly-encoded as R', G', and B'; any alpha component is unchanged. As part of filtering, the nonlinear R', G', and B' values are converted to linear R, G, and B components; any alpha component is unchanged. The conversion between linear and nonlinear encoding is performed as described in the “KHR_DF_TRANSFER_SRGB” section of the Khronos Data Format Specification.

Block-Compressed Image Formats

BC1, BC2 and BC3 formats are described in “S3TC Compressed Texture Image Formats” chapter of the [Khronos Data Format Specification](#). BC4 and BC5 are described in the “RGTC Compressed Texture Image Formats” chapter. BC6H and BC7 are described in the “BPTC Compressed Texture Image Formats” chapter.

Table 85. Mapping of Vulkan BC Formats to Descriptions

VkFormat	Khronos Data Format Specification description
Formats described in the “S3TC Compressed Texture Image Formats” chapter	
VK_FORMAT_BC1_RGB_UNORM_BLOCK	BC1 with no alpha
VK_FORMAT_BC1_RGB_SRGB_BLOCK	BC1 with no alpha, sRGB-encoded
VK_FORMAT_BC1_RGBA_UNORM_BLOCK	BC1 with alpha
VK_FORMAT_BC1_RGBA_SRGB_BLOCK	BC1 with alpha, sRGB-encoded
VK_FORMAT_BC2_UNORM_BLOCK	BC2
VK_FORMAT_BC2_SRGB_BLOCK	BC2, sRGB-encoded
VK_FORMAT_BC3_UNORM_BLOCK	BC3
VK_FORMAT_BC3_SRGB_BLOCK	BC3, sRGB-encoded
Formats described in the “RGTC Compressed Texture Image Formats” chapter	
VK_FORMAT_BC4_UNORM_BLOCK	BC4 unsigned
VK_FORMAT_BC4_SNORM_BLOCK	BC4 signed
VK_FORMAT_BC5_UNORM_BLOCK	BC5 unsigned
VK_FORMAT_BC5_SNORM_BLOCK	BC5 signed
Formats described in the “BPTC Compressed Texture Image Formats” chapter	
VK_FORMAT_BC6H_UFLOAT_BLOCK	BC6H (unsigned version)
VK_FORMAT_BC6H_SFLOAT_BLOCK	BC6H (signed version)
VK_FORMAT_BC7_UNORM_BLOCK	BC7
VK_FORMAT_BC7_SRGB_BLOCK	BC7, sRGB-encoded

ETC Compressed Image Formats

The following formats are described in the “ETC2 Compressed Texture Image Formats” chapter of the [Khronos Data Format Specification](#).

Table 86. Mapping of Vulkan ETC Formats to Descriptions

VkFormat	Khronos Data Format Specification description
VK_FORMAT_ETC2_R8G8B8_UNORM_BLOCK	RGB ETC2

VK_FORMAT_EAC_R11G11_UNORM_BLOCK	Unsigned RG11 EAC
VK_FORMAT_EAC_R11G11_SNORM_BLOCK	Signed RG11 EAC

ASTC Compressed Image Formats

ASTC formats are described in the “ASTC Compressed Texture Image Formats” chapter of the [Khronos Data Format Specification](#).

Table 87. Mapping of Vulkan ASTC Formats to Descriptions

VkFormat	Compressed texel block dimensions	Requested mode
VK_FORMAT_ASTC_4x4_UNORM_BLOCK	4 × 4	Linear LDR
VK_FORMAT_ASTC_4x4_SRGB_BLOCK	4 × 4	sRGB
VK_FORMAT_ASTC_5x4_UNORM_BLOCK	5 × 4	Linear LDR
VK_FORMAT_ASTC_5x4_SRGB_BLOCK	5 × 4	sRGB
VK_FORMAT_ASTC_5x5_UNORM_BLOCK	5 × 5	Linear LDR
VK_FORMAT_ASTC_5x5_SRGB_BLOCK	5 × 5	sRGB
VK_FORMAT_ASTC_6x5_UNORM_BLOCK	6 × 5	Linear LDR
VK_FORMAT_ASTC_6x5_SRGB_BLOCK	6 × 5	sRGB
VK_FORMAT_ASTC_6x6_UNORM_BLOCK	6 × 6	Linear LDR
VK_FORMAT_ASTC_6x6_SRGB_BLOCK	6 × 6	sRGB
VK_FORMAT_ASTC_8x5_UNORM_BLOCK	8 × 5	Linear LDR
VK_FORMAT_ASTC_8x5_SRGB_BLOCK	8 × 5	sRGB
VK_FORMAT_ASTC_8x6_UNORM_BLOCK	8 × 6	Linear LDR
VK_FORMAT_ASTC_8x6_SRGB_BLOCK	8 × 6	sRGB
VK_FORMAT_ASTC_8x8_UNORM_BLOCK	8 × 8	Linear LDR
VK_FORMAT_ASTC_8x8_SRGB_BLOCK	8 × 8	sRGB
VK_FORMAT_ASTC_10x5_UNORM_BLOCK	10 × 5	Linear LDR
VK_FORMAT_ASTC_10x5_SRGB_BLOCK	10 × 5	sRGB
VK_FORMAT_ASTC_10x6_UNORM_BLOCK	10 × 6	Linear LDR
VK_FORMAT_ASTC_10x6_SRGB_BLOCK	10 × 6	sRGB
VK_FORMAT_ASTC_10x8_UNORM_BLOCK	10 × 8	Linear LDR
VK_FORMAT_ASTC_10x8_SRGB_BLOCK	10 × 8	sRGB
VK_FORMAT_ASTC_10x10_UNORM_BLOCK	10 × 10	Linear LDR
VK_FORMAT_ASTC_10x10_SRGB_BLOCK	10 × 10	sRGB
VK_FORMAT_ASTC_12x10_UNORM_BLOCK	12 × 10	Linear LDR
VK_FORMAT_ASTC_12x10_SRGB_BLOCK	12 × 10	sRGB
VK_FORMAT_ASTC_12x12_UNORM_BLOCK	12 × 12	Linear LDR

VkFormat	Compressed texel block dimensions	Requested mode
VK_FORMAT_ASTC_12x12_SRGB_BLOCK	12 × 12	sRGB
VK_FORMAT_ASTC_4x4_SFLOAT_BLOCK	4 × 4	HDR
VK_FORMAT_ASTC_5x4_SFLOAT_BLOCK	5 × 4	HDR
VK_FORMAT_ASTC_5x5_SFLOAT_BLOCK	5 × 5	HDR
VK_FORMAT_ASTC_6x5_SFLOAT_BLOCK	6 × 5	HDR
VK_FORMAT_ASTC_6x6_SFLOAT_BLOCK	6 × 6	HDR
VK_FORMAT_ASTC_8x5_SFLOAT_BLOCK	8 × 5	HDR
VK_FORMAT_ASTC_8x6_SFLOAT_BLOCK	8 × 6	HDR
VK_FORMAT_ASTC_8x8_SFLOAT_BLOCK	8 × 8	HDR
VK_FORMAT_ASTC_10x5_SFLOAT_BLOCK	10 × 5	HDR
VK_FORMAT_ASTC_10x6_SFLOAT_BLOCK	10 × 6	HDR
VK_FORMAT_ASTC_10x8_SFLOAT_BLOCK	10 × 8	HDR
VK_FORMAT_ASTC_10x10_SFLOAT_BLOCK	10 × 10	HDR
VK_FORMAT_ASTC_12x10_SFLOAT_BLOCK	12 × 10	HDR
VK_FORMAT_ASTC_12x12_SFLOAT_BLOCK	12 × 12	HDR

ASTC textures containing HDR block encodings **should** be passed to the API using an ASTC SFLOAT texture format.

NOTE

An HDR block in a texture passed using a LDR UNORM format will return the appropriate ASTC error color if the implementation supports only the ASTC LDR profile, but may result in either the error color or a decompressed HDR color if the implementation supports HDR decoding.

ASTC Decode Mode

If the `VK_EXT_astc_decode_mode` extension is enabled, the decode mode is determined as follows:

Table 88. Mapping of Vulkan ASTC Decoding Format to ASTC Decoding Modes

VkFormat	Decoding mode
VK_FORMAT_R16G16B16A16_SFLOAT	decode_float16
VK_FORMAT_R8G8B8A8_UNORM	decode_unorm8
VK_FORMAT_E5B9G9R9_UFLOAT_PACK32	decode_rgb9e5

Otherwise, the ASTC decode mode is `decode_float16`.

Note that an implementation **may** use HDR mode when linear LDR mode is requested unless the decode mode is `decode_unorm8`.

Appendix D: Core Revisions (Informative)

New minor versions of the Vulkan API are defined periodically by the Khronos Vulkan Working Group. These consist of some amount of additional functionality added to the core API, potentially including both new functionality and functionality [promoted](#) from extensions.

It is possible to build the specification for earlier versions, but to aid readability of the latest versions, this appendix gives an overview of the changes as compared to earlier versions.

Vulkan Version 1.2

Vulkan Version 1.2 [promoted](#) a number of key extensions into the core API:

- `VK_KHR_8bit_storage`
- `VK_KHR_buffer_device_address`
- `VK_KHR_create_renderpass2`
- `VK_KHR_depth_stencil_resolve`
- `VK_KHR_draw_indirect_count`
- `VK_KHR_driver_properties`
- `VK_KHR_image_format_list`
- `VK_KHR_imageless_framebuffer`
- `VK_KHR_sampler_mirror_clamp_to_edge`
- `VK_KHR_separate_depth_stencil_layouts`
- `VK_KHR_shader_atomic_int64`
- `VK_KHR_shader_float16_int8`
- `VK_KHR_shader_float_controls`
- `VK_KHR_shader_subgroup_extended_types`
- `VK_KHR_spirv_1_4`
- `VK_KHR_timeline_semaphore`
- `VK_KHR_uniform_buffer_standard_layout`
- `VK_KHR_vulkan_memory_model`
- `VK_EXT_descriptor_indexing`
- `VK_EXT_host_query_reset`
- `VK_EXT_sampler_filter_minmax`
- `VK_EXT_scalar_block_layout`
- `VK_EXT_separate_stencil_usage`
- `VK_EXT_shader_viewport_index_layer`

All differences in behavior between these extensions and the corresponding Vulkan 1.2

functionality are summarized below.

Differences Relative to `VK_KHR_8bit_storage`

If the `VK_KHR_8bit_storage` extension is not supported, support for the SPIR-V `storageBuffer8BitAccess` capability in shader modules is optional. Support for this feature is defined by `VkPhysicalDeviceVulkan12Features::storageBuffer8BitAccess` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences Relative to `VK_KHR_draw_indirect_count`

If the `VK_KHR_draw_indirect_count` extension is not supported, support for the commands `vkCmdDrawIndirectCount` and `vkCmdDrawIndexedIndirectCount` is optional. Support for this feature is defined by `VkPhysicalDeviceVulkan12Features::drawIndirectCount` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences Relative to `VK_KHR_sampler_mirror_clamp_to_edge`

If the `VK_KHR_sampler_mirror_clamp_to_edge` extension is not supported, support for the `VkSamplerAddressMode` `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE` is optional. Support for this feature is defined by `VkPhysicalDeviceVulkan12Features::samplerMirrorClampToEdge` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences Relative to `VK_EXT_descriptor_indexing`

If the `VK_EXT_descriptor_indexing` extension is not supported, support for the `descriptorIndexing` feature is optional. Support for this feature is defined by `VkPhysicalDeviceVulkan12Features::descriptorIndexing` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences Relative to `VK_EXT_scalar_block_layout`

If the `VK_EXT_scalar_block_layout` extension is not supported, support for the `scalarBlockLayout` feature is optional. Support for this feature is defined by `VkPhysicalDeviceVulkan12Features::scalarBlockLayout` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences Relative to `VK_EXT_shader_viewport_index_layer`

The `ShaderViewportIndexLayerEXT` SPIR-V capability was replaced with the `ShaderViewportIndex` and `ShaderLayer` capabilities. Declaring both is equivalent to declaring `ShaderViewportIndexLayerEXT`. If the `VK_EXT_shader_viewport_index_layer` extension is not supported, support for the `ShaderViewportIndexLayerEXT` SPIR-V capability is optional. Support for this feature is defined by `VkPhysicalDeviceVulkan12Features::shaderOutputViewportIndex` and `VkPhysicalDeviceVulkan12Features::shaderOutputLayer` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences Relative to `VK_KHR_buffer_device_address`

If the `VK_KHR_buffer_device_address` extension is not supported, support for the `bufferDeviceAddress` feature is optional. Support for this feature is defined by `VkPhysicalDeviceVulkan12Features::bufferDeviceAddress` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences Relative to `VK_KHR_shader_atomic_int64`

If the `VK_KHR_shader_atomic_int64` extension is not supported, support for the `shaderBufferInt64Atomics` feature is optional. Support for this feature is defined by

`VkPhysicalDeviceVulkan12Features::shaderBufferInt64Atomics` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences Relative to `VK_KHR_shader_float16_int8`

If the `VK_KHR_shader_float16_int8` extension is not supported, support for the `shaderFloat16` and `shaderInt8` features is optional. Support for these features are defined by `VkPhysicalDeviceVulkan12Features::shaderFloat16` and `VkPhysicalDeviceVulkan12Features::shaderInt8` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences Relative to `VK_KHR_vulkan_memory_model`

If the `VK_KHR_vulkan_memory_model` extension is not supported, support for the `vulkanMemoryModel` feature is optional. Support for this feature is defined by `VkPhysicalDeviceVulkan12Features::vulkanMemoryModel` when queried via `vkGetPhysicalDeviceFeatures2`.

Additional Vulkan 1.2 Feature Support

In addition to the promoted extensions described above, Vulkan 1.2 added support for:

- SPIR-V version 1.4.
- SPIR-V version 1.5.
- The `samplerMirrorClampToEdge` feature which indicates whether the implementation supports the `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE` sampler address mode.
- The `ShaderNonUniform` capability in SPIR-V version 1.5.
- The `shaderOutputViewportIndex` feature which indicates that the `ShaderViewportIndex` capability can be used.
- The `shaderOutputLayer` feature which indicates that the `ShaderLayer` capability can be used.
- The `subgroupBroadcastDynamicId` feature which allows the “Id” operand of `OpGroupNonUniformBroadcast` to be dynamically uniform within a subgroup, and the “Index” operand of `OpGroupNonUniformQuadBroadcast` to be dynamically uniform within a derivative group, in shader modules of version 1.5 or higher.
- The `drawIndirectCount` feature which indicates whether the `vkCmdDrawIndirectCount` and `vkCmdDrawIndexedIndirectCount` functions can be used.
- The `descriptorIndexing` feature which indicates the implementation supports the minimum number of descriptor indexing features as defined in the [Feature Requirements](#) section.
- The `samplerFilterMinmax` feature which indicates whether the implementation supports the minimum number of image formats that support the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT` feature bit as defined by the `filterMinmaxSingleComponentFormats` property minimum requirements.
- The `framebufferIntegerColorSampleCounts` limit which indicates the color sample counts that are supported for all framebuffer color attachments with integer formats.

Vulkan Version 1.1

Vulkan Version 1.1 [promoted](#) a number of key extensions into the core API:

- `VK_KHR_16bit_storage`
- `VK_KHR_bind_memory2`
- `VK_KHR_dedicated_allocation`
- `VK_KHR_descriptor_update_template`
- `VK_KHR_device_group`
- `VK_KHR_device_group_creation`
- `VK_KHR_external_fence`
- `VK_KHR_external_fence_capabilities`
- `VK_KHR_external_memory`
- `VK_KHR_external_memory_capabilities`
- `VK_KHR_external_semaphore`
- `VK_KHR_external_semaphore_capabilities`
- `VK_KHR_get_memory_requirements2`
- `VK_KHR_get_physical_device_properties2`
- `VK_KHR_maintenance1`
- `VK_KHR_maintenance2`
- `VK_KHR_maintenance3`
- `VK_KHR_multiview`
- `VK_KHR_relaxed_block_layout`
- `VK_KHR_sampler_ycbcr_conversion`
- `VK_KHR_shader_draw_parameters`
- `VK_KHR_storage_buffer_storage_class`
- `VK_KHR_variable_pointers`

All differences in behavior between these extensions and the corresponding Vulkan 1.1 functionality are summarized below.

Differences Relative to `VK_KHR_16bit_storage`

If the `VK_KHR_16bit_storage` extension is not supported, support for the `storageBuffer16BitAccess` feature is optional. Support for this feature is defined by `VkPhysicalDevice16BitStorageFeatures::storageBuffer16BitAccess` or `VkPhysicalDeviceVulkan11Features::storageBuffer16BitAccess` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences Relative to `VK_KHR_sampler_ycbcr_conversion`

If the `VK_KHR_sampler_ycbcr_conversion` extension is not supported, support for the `samplerYcbcrConversion` feature is optional. Support for this feature is defined by `VkPhysicalDeviceSamplerYcbcrConversionFeatures::samplerYcbcrConversion` or `VkPhysicalDeviceVulkan11Features::samplerYcbcrConversion` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences Relative to `VK_KHR_shader_draw_parameters`

If the `VK_KHR_shader_draw_parameters` extension is not supported, support for the `SPV_KHR_shader_draw_parameters` SPIR-V extension is optional. Support for this feature is defined by `VkPhysicalDeviceShaderDrawParametersFeatures::shaderDrawParameters` or `VkPhysicalDeviceVulkan11Features::shaderDrawParameters` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences Relative to `VK_KHR_variable_pointers`

If the `VK_KHR_variable_pointers` extension is not supported, support for the `variablePointersStorageBuffer` feature is optional. Support for this feature is defined by `VkPhysicalDeviceVariablePointersFeatures::variablePointersStorageBuffer` or `VkPhysicalDeviceVulkan11Features::variablePointersStorageBuffer` when queried via `vkGetPhysicalDeviceFeatures2`.

Additional Vulkan 1.1 Feature Support

In addition to the promoted extensions described above, Vulkan 1.1 added support for:

- SPIR-V version 1.1
- SPIR-V version 1.2
- SPIR-V version 1.3
- The `group operations` and `subgroup scope`.
- The `protected memory` feature.
- A new command to enumerate the instance version: `vkEnumerateInstanceVersion`.
- The `VkPhysicalDeviceShaderDrawParametersFeatures` feature query structure (where the `VK_KHR_shader_draw_parameters` extension did not have one).

Appendix E: Layers & Extensions

(Informative)

Extensions to the Vulkan API **can** be defined by authors, groups of authors, and the Khronos Vulkan Safety Critical Working Group. The online Registry of extensions is available at URL

<https://registry.khronos.org/vulkansc/>

Authors creating extensions and layers **must** follow the mandatory procedures described in the [Vulkan Documentation and Extensions](#) document when creating extensions and layers.

The version of the Vulkan specification published in the Registry includes all registered and published extensions. It is also possible to build the specification with an arbitrary set of extensions included, and the specification you are viewing may not include all extensions.

In the remainder of this appendix, extensions are grouped as Khronos **KHR**, multivendor **EXT**, and then alphabetically by author ID. Within each group, extensions are listed in alphabetical order by their name.

Extension Dependencies

Extensions which have dependencies on specific core versions or on other extensions will list such dependencies.

For core versions, the specified version **must** be supported at runtime. All extensions implicitly require support for Vulkan 1.0.

For a device extension, use of any device-level functionality defined by that extension requires that any extensions that extension depends on be enabled.

For any extension, use of any instance-level functionality defined by that extension requires only that any extensions that extension depends on be supported at runtime.

Extension Interactions

Some extensions define APIs which are only supported when other extensions or core versions are supported at runtime. Such interactions are noted as “API Interactions”.

Description

This extension provides extensible versions of the Vulkan buffer and image copy commands. The new commands are functionally identical to the core commands, except that their copy parameters are specified using extensible structures that can be used to pass extension-specific information.

The following extensible copy commands are introduced with this extension: [vkCmdCopyBuffer2KHR](#), [vkCmdCopyImage2KHR](#), [vkCmdCopyBufferToImage2KHR](#), [vkCmdCopyImageToBuffer2KHR](#), [vkCmdBlitImage2KHR](#), and [vkCmdResolveImage2KHR](#). Each command contains an **Info2KHR* structure parameter that includes *sType/pNext* members. Lower level structures describing each region to be copied are also extended with *sType/pNext* members.

New Commands

- [vkCmdBlitImage2KHR](#)
- [vkCmdCopyBuffer2KHR](#)
- [vkCmdCopyBufferToImage2KHR](#)
- [vkCmdCopyImage2KHR](#)
- [vkCmdCopyImageToBuffer2KHR](#)
- [vkCmdResolveImage2KHR](#)

New Structures

- [VkBlitImageInfo2KHR](#)
- [VkBufferCopy2KHR](#)
- [VkBufferImageCopy2KHR](#)
- [VkCopyBufferInfo2KHR](#)
- [VkCopyBufferToImageInfo2KHR](#)

- [VkCopyImageInfo2KHR](#)
- [VkCopyImageToBufferInfo2KHR](#)
- [VkImageBlit2KHR](#)
- [VkImageCopy2KHR](#)
- [VkImageResolve2KHR](#)
- [VkResolveImageInfo2KHR](#)

New Enum Constants

- `VK_KHR_COPY_COMMANDS_2_EXTENSION_NAME`
- `VK_KHR_COPY_COMMANDS_2_SPEC_VERSION`
- Extending [VkStructureType](#):
 - `VK_STRUCTURE_TYPE_BLIT_IMAGE_INFO_2_KHR`
 - `VK_STRUCTURE_TYPE_BUFFER_COPY_2_KHR`
 - `VK_STRUCTURE_TYPE_BUFFER_IMAGE_COPY_2_KHR`
 - `VK_STRUCTURE_TYPE_COPY_BUFFER_INFO_2_KHR`
 - `VK_STRUCTURE_TYPE_COPY_BUFFER_TO_IMAGE_INFO_2_KHR`
 - `VK_STRUCTURE_TYPE_COPY_IMAGE_INFO_2_KHR`
 - `VK_STRUCTURE_TYPE_COPY_IMAGE_TO_BUFFER_INFO_2_KHR`
 - `VK_STRUCTURE_TYPE_IMAGE_BLIT_2_KHR`
 - `VK_STRUCTURE_TYPE_IMAGE_COPY_2_KHR`
 - `VK_STRUCTURE_TYPE_IMAGE_RESOLVE_2_KHR`
 - `VK_STRUCTURE_TYPE_RESOLVE_IMAGE_INFO_2_KHR`

Promotion to Vulkan 1.3

Vulkan APIs in this extension are included in core Vulkan 1.3, with the KHR suffix omitted. External interactions defined by this extension, such as SPIR-V token names, retain their original names. The original Vulkan API names are still available as aliases of the core functionality.

Issues

1) Which properties of a mode should be fixed in the mode information vs. settable in some other function when setting the mode? E.g., do we need to double the size of the mode pool to include

both stereo and non-stereo modes? YUV and RGB scanout even if they both take RGB input images? BGR vs. RGB input? etc.

RESOLVED: Many modern displays support at most a handful of resolutions and timings natively. Other “modes” are expected to be supported using scaling hardware on the display engine or GPU. Other properties, such as rotation and mirroring should not require duplicating hardware modes just to express all combinations. Further, these properties may be implemented on a per-display or per-overlay granularity.

To avoid the exponential growth of modes as mutable properties are added, as was the case with `EGLConfig`/WGL pixel formats/`GLXFBConfig`, this specification should separate out hardware properties and configurable state into separate objects. Modes and overlay planes will express capabilities of the hardware, while a separate structure will allow applications to configure scaling, rotation, mirroring, color keys, LUT values, alpha masks, etc. for a given swapchain independent of the mode in use. Constraints on these settings will be established by properties of the immutable objects.

Note the resolution of this issue may affect issue 5 as well.

2) What properties of a display itself are useful?

RESOLVED: This issue is too broad. It was meant to prompt general discussion, but resolving this issue amounts to completing this specification. All interesting properties should be included. The issue will remain as a placeholder since removing it would make it hard to parse existing discussion notes that refer to issues by number.

3) How are multiple overlay planes within a display or mode enumerated?

RESOLVED: They are referred to by an index. Each display will report the number of overlay planes it contains.

4) Should swapchains be created relative to a mode or a display?

RESOLVED: When using this extension, swapchains are created relative to a mode and a plane. The mode implies the display object the swapchain will present to. If the specified mode is not the display’s current mode, the new mode will be applied when the first image is presented to the swapchain, and the default operating system mode, if any, will be restored when the swapchain is destroyed.

5) Should users query generic ranges from displays and construct their own modes explicitly using those constraints rather than querying a fixed set of modes (Most monitors only have one real “mode” these days, even though many support relatively arbitrary scaling, either on the monitor side or in the GPU display engine, making “modes” something of a relic/compatibility construct).

RESOLVED: Expose both. Display information structures will expose a set of predefined modes, as well as any attributes necessary to construct a customized mode.

6) Is it fine if we return the display and display mode handles in the structure used to query their properties?

RESOLVED: Yes.

7) Is there a possibility that not all displays of a device work with all of the present queues of a device? If yes, how do we determine which displays work with which present queues?

RESOLVED: No known hardware has such limitations, but determining such limitations is supported automatically using the existing `VK_KHR_surface` and `VK_KHR_swapchain` query mechanisms.

8) Should all presentation need to be done relative to an overlay plane, or can a display mode + display be used alone to target an output?

RESOLVED: Require specifying a plane explicitly.

9) Should displays have an associated window system display, such as an `HDC` or `Display*`?

RESOLVED: No. Displays are independent of any windowing system in use on the system. Further, neither `HDC` nor `Display*` refer to a physical display object.

10) Are displays queried from a physical GPU or from a device instance?

RESOLVED: Developers prefer to query modes directly from the physical GPU so they can use display information as an input to their device selection algorithms prior to device creation. This avoids the need to create placeholder device instances to enumerate displays.

This preference must be weighed against the extra initialization that must be done by driver vendors prior to device instance creation to support this usage.

11) Should displays and/or modes be dispatchable objects? If functions are to take displays, overlays, or modes as their first parameter, they must be dispatchable objects as defined in Khronos bug 13529. If they are not added to the list of dispatchable objects, functions operating on them must take some higher-level object as their first parameter. There is no performance case against making them dispatchable objects, but they would be the first extension objects to be dispatchable.

RESOLVED: Do not make displays or modes dispatchable. They will dispatch based on their associated physical device.

12) Should hardware cursor capabilities be exposed?

RESOLVED: Defer. This could be a separate extension on top of the base WSI specs.

13) How many display objects should be enumerated for "tiled" display devices? There are ongoing design discussions among lower-level display API authors regarding how to expose displays if they are one physical display device to an end user, but may internally be implemented as two side-by-side displays using the same display engine (and sometimes cabling) resources as two physically separate display devices.

RESOLVED: Tiled displays will appear as a single display object in this API.

14) Should the raw EDID data be included in the display information?

RESOLVED: No. A future extension could be added which reports the EDID if necessary. This may be complicated by the outcome of issue 13.

15) Should min and max scaling factor capabilities of overlays be exposed?

RESOLVED: Yes. This is exposed indirectly by allowing applications to query the min/max position and extent of the source and destination regions from which image contents are fetched by the display engine when using a particular mode and overlay pair.

16) Should devices be able to expose planes that can be moved between displays? If so, how?

RESOLVED: Yes. Applications can determine which displays a given plane supports using [vkGetDisplayPlaneSupportedDisplaysKHR](#).

17) Should there be a way to destroy display modes? If so, does it support destroying “built in” modes?

RESOLVED: Not in this extension. A future extension could add this functionality.

18) What should the lifetime of display and built-in display mode objects be?

RESOLVED: The lifetime of the instance. These objects cannot be destroyed. A future extension may be added to expose a way to destroy these objects and/or support display hotplug.

19) Should persistent mode for smart panels be enabled/disabled at swapchain creation time, or on a per-present basis.

RESOLVED: On a per-present basis.

Version History

- Revision 1, 2015-02-24 (James Jones)
 - Initial draft
- Revision 2, 2015-03-12 (Norbert Nopper)
 - Added overlay enumeration for a display.
- Revision 3, 2015-03-17 (Norbert Nopper)
 - Fixed typos and namings as discussed in Bugzilla.
 - Reordered and grouped functions.
 - Added functions to query count of display, mode and overlay.
 - Added native display handle, which may be needed on some platforms to create a native Window.
- Revision 4, 2015-03-18 (Norbert Nopper)
 - Removed primary and virtualPosition members (see comment of James Jones in Bugzilla).
 - Added native overlay handle to information structure.
 - Replaced , with ; in struct.
- Revision 6, 2015-03-18 (Daniel Rakos)
 - Added WSI extension suffix to all items.

- Made the whole API more “Vulkanish”.
- Replaced all functions with a single `vkGetDisplayInfoKHR` function to better match the rest of the API.
- Made the display, display mode, and overlay objects be first class objects, not subclasses of `VkBaseObject` as they do not support the common functions anyways.
- Renamed `*Info` structures to `*Properties`.
- Removed `overlayIndex` field from `VkOverlayProperties` as there is an implicit index already as a result of moving to a “Vulkanish” API.
- Displays are not get through device, but through physical GPU to match the rest of the Vulkan API. Also this is something ISVs explicitly requested.
- Added issue (6) and (7).
- Revision 7, 2015-03-25 (James Jones)
 - Added an issues section
 - Added rotation and mirroring flags
- Revision 8, 2015-03-25 (James Jones)
 - Combined the duplicate issues sections introduced in last change.
 - Added proposed resolutions to several issues.
- Revision 9, 2015-04-01 (Daniel Rakos)
 - Rebased extension against Vulkan 0.82.0
- Revision 10, 2015-04-01 (James Jones)
 - Added issues (10) and (11).
 - Added more straw-man issue resolutions, and cleaned up the proposed resolution for issue (4).
 - Updated the rotation and mirroring enums to have proper bitmask semantics.
- Revision 11, 2015-04-15 (James Jones)
 - Added proposed resolution for issues (1) and (2).
 - Added issues (12), (13), (14), and (15)
 - Removed `pNativeHandle` field from overlay structure.
 - Fixed small compilation errors in example code.
- Revision 12, 2015-07-29 (James Jones)
 - Rewrote the guts of the extension against the latest WSI swapchain specifications and the latest Vulkan API.
 - Address overlay planes by their index rather than an object handle and refer to them as “planes” rather than “overlays” to make it slightly clearer that even a display with no “overlays” still has at least one base “plane” that images can be displayed on.
 - Updated most of the issues.
 - Added an “extension type” section to the specification header.

- Reused the `VK_EXT_KHR_surface` surface transform enumerations rather than redefining them here.
- Updated the example code to use the new semantics.
- Revision 13, 2015-08-21 (Ian Elliott)
 - Renamed this extension and all of its enumerations, types, functions, etc. This makes it compliant with the proposed standard for Vulkan extensions.
 - Switched from “revision” to “version”, including use of the `VK_MAKE_VERSION` macro in the header file.
- Revision 14, 2015-09-01 (James Jones)
 - Restore single-field revision number.
- Revision 15, 2015-09-08 (James Jones)
 - Added alpha flags enum.
 - Added premultiplied alpha support.
- Revision 16, 2015-09-08 (James Jones)
 - Added description section to the spec.
 - Added issues 16 - 18.
- Revision 17, 2015-10-02 (James Jones)
 - Planes are now a property of the entire device rather than individual displays. This allows planes to be moved between multiple displays on devices that support it.
 - Added a function to create a `VkSurfaceKHR` object describing a display plane and mode to align with the new per-platform surface creation conventions.
 - Removed detailed mode timing data. It was agreed that the mode extents and refresh rate are sufficient for current use cases. Other information could be added back in as an extension if it is needed in the future.
 - Added support for smart/persistent/buffered display devices.
- Revision 18, 2015-10-26 (Ian Elliott)
 - Renamed from `VK_EXT_KHR_display` to `VK_KHR_display`.
- Revision 19, 2015-11-02 (James Jones)
 - Updated example code to match revision 17 changes.
- Revision 20, 2015-11-03 (Daniel Rakos)
 - Added allocation callbacks to creation functions.
- Revision 21, 2015-11-10 (Jesse Hall)
 - Added `VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR`, and use `VkDisplayPlaneAlphaFlagBitsKHR` for `VkDisplayPlanePropertiesKHR::alphaMode` instead of `VkDisplayPlaneAlphaFlagsKHR`, since it only represents one mode.
 - Added reserved flags bitmask to `VkDisplayPlanePropertiesKHR`.
 - Use `VkSurfaceTransformFlagBitsKHR` instead of obsolete `VkSurfaceTransformKHR`.

- Renamed `vkGetDisplayPlaneSupportedDisplaysKHR` parameters for clarity.
- Revision 22, 2015-12-18 (James Jones)
 - Added missing “planeIndex” parameter to `vkGetDisplayPlaneSupportedDisplaysKHR()`
- Revision 23, 2017-03-13 (James Jones)
 - Closed all remaining issues. The specification and implementations have been shipping with the proposed resolutions for some time now.
 - Removed the sample code and noted it has been integrated into the official Vulkan SDK cube demo.

Description

This extension provides an API to create a swapchain directly on a device's display without any underlying window system.

New Commands

- [vkCreateSharedSwapchainsKHR](#)

New Structures

- Extending [VkPresentInfoKHR](#):
 - [VkDisplayPresentInfoKHR](#)

New Enum Constants

- [VK_KHR_DISPLAY_SWAPCHAIN_EXTENSION_NAME](#)
- [VK_KHR_DISPLAY_SWAPCHAIN_SPEC_VERSION](#)
- Extending [VkResult](#):
 - [VK_ERROR_INCOMPATIBLE_DISPLAY_KHR](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_DISPLAY_PRESENT_INFO_KHR](#)

Issues

1) Should swapchains sharing images each hold a reference to the images, or should it be up to the application to destroy the swapchains and images in an order that avoids the need for reference counting?

RESOLVED: Take a reference. The lifetime of presentable images is already complex enough.

2) Should the [srcRect](#) and [dstRect](#) parameters be specified as part of the presentation command, or at swapchain creation time?

RESOLVED: As part of the presentation command. This allows moving and scaling the image on the screen without the need to respecify the mode or create a new swapchain and presentable images.

3) Should [srcRect](#) and [dstRect](#) be specified as rects, or separate offset/extent values?

RESOLVED: As rects. Specifying them separately might make it easier for hardware to expose support for one but not the other, but in such cases applications must just take care to obey the reported capabilities and not use non-zero offsets or extents that require scaling, as appropriate.

4) How can applications create multiple swapchains that use the same images?

RESOLVED: By calling [vkCreateSharedSwapchainsKHR](#).

An earlier resolution used `vkCreateSwapchainKHR`, chaining multiple `VkSwapchainCreateInfoKHR` structures through `pNext`. In order to allow each swapchain to also allow other extension structs, a level of indirection was used: `VkSwapchainCreateInfoKHR::pNext` pointed to a different structure, which had both `sType` and `pNext` members for additional extensions, and also had a pointer to the next `VkSwapchainCreateInfoKHR` structure. The number of swapchains to be created could only be found by walking this linked list of alternating structures, and the `pSwapchains` out parameter was reinterpreted to be an array of `VkSwapchainKHR` handles.

Another option considered was a method to specify a “shared” swapchain when creating a new swapchain, such that groups of swapchains using the same images could be built up one at a time. This was deemed unusable because drivers need to know all of the displays an image will be used on when determining which internal formats and layouts to use for that image.

Version History

- Revision 1, 2015-07-29 (James Jones)
 - Initial draft
- Revision 2, 2015-08-21 (Ian Elliott)
 - Renamed this extension and all of its enumerations, types, functions, etc. This makes it compliant with the proposed standard for Vulkan extensions.
 - Switched from “revision” to “version”, including use of the `VK_MAKE_VERSION` macro in the header file.
- Revision 3, 2015-09-01 (James Jones)
 - Restore single-field revision number.
- Revision 4, 2015-09-08 (James Jones)
 - Allow creating multiple swapchains that share the same images using a single call to `vkCreateSwapchainKHR`.
- Revision 5, 2015-09-10 (Alon Or-bach)
 - Removed underscores from `SWAP_CHAIN` in two enums.
- Revision 6, 2015-10-02 (James Jones)
 - Added support for smart panels/buffered displays.
- Revision 7, 2015-10-26 (Ian Elliott)
 - Renamed from `VK_EXT_KHR_display_swapchain` to `VK_KHR_display_swapchain`.
- Revision 8, 2015-11-03 (Daniel Rakos)
 - Updated sample code based on the changes to `VK_KHR_swapchain`.
- Revision 9, 2015-11-10 (Jesse Hall)
 - Replaced `VkDisplaySwapchainCreateInfoKHR` with `vkCreateSharedSwapchainsKHR`, changing resolution of issue #4.
- Revision 10, 2017-03-13 (James Jones)
 - Closed all remaining issues. The specification and implementations have been shipping with the proposed resolutions for some time now.

- Removed the sample code and noted it has been integrated into the official Vulkan SDK cube demo.

Description

An application may wish to reference device memory in multiple Vulkan logical devices or instances, in multiple processes, and/or in multiple APIs. This extension enables an application to export POSIX file descriptor handles from Vulkan memory objects and to import Vulkan memory objects from POSIX file descriptor handles exported from other Vulkan memory objects or from similar resources in other APIs.

New Commands

- [vkGetMemoryFdKHR](#)
- [vkGetMemoryFdPropertiesKHR](#)

New Structures

- [VkMemoryFdPropertiesKHR](#)
- [VkMemoryGetFdInfoKHR](#)
- Extending [VkMemoryAllocateInfo](#):
 - [VkImportMemoryFdInfoKHR](#)

New Enum Constants

- [VK_KHR_EXTERNAL_MEMORY_FD_EXTENSION_NAME](#)
- [VK_KHR_EXTERNAL_MEMORY_FD_SPEC_VERSION](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_IMPORT_MEMORY_FD_INFO_KHR](#)

- `VK_STRUCTURE_TYPE_MEMORY_FD_PROPERTIES_KHR`
- `VK_STRUCTURE_TYPE_MEMORY_GET_FD_INFO_KHR`

Issues

1) Does the application need to close the file descriptor returned by [vkGetMemoryFdKHR](#)?

RESOLVED: Yes, unless it is passed back in to a driver instance to import the memory. A successful get call transfers ownership of the file descriptor to the application, and a successful import transfers it back to the driver. Destroying the original memory object will not close the file descriptor or remove its reference to the underlying memory resource associated with it.

2) Do drivers ever need to expose multiple file descriptors per memory object?

RESOLVED: No. This would indicate there are actually multiple memory objects, rather than a single memory object.

3) How should the valid size and memory type for POSIX file descriptor memory handles created outside of Vulkan be specified?

RESOLVED: The valid memory types are queried directly from the external handle. The size will be specified by future extensions that introduce such external memory handle types.

Description

An application using external memory may wish to synchronize access to that memory using semaphores. This extension enables an application to export semaphore payload to and import semaphore payload from POSIX file descriptors.

New Commands

- [vkGetSemaphoreFdKHR](#)
- [vkImportSemaphoreFdKHR](#)

New Structures

- [VkImportSemaphoreFdInfoKHR](#)
- [VkSemaphoreGetFdInfoKHR](#)

New Enum Constants

- `VK_KHR_EXTERNAL_SEMAPHORE_FD_EXTENSION_NAME`
- `VK_KHR_EXTERNAL_SEMAPHORE_FD_SPEC_VERSION`
- Extending [VkStructureType](#):
 - `VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_FD_INFO_KHR`
 - `VK_STRUCTURE_TYPE_SEMAPHORE_GET_FD_INFO_KHR`

Issues

1) Does the application need to close the file descriptor returned by [vkGetSemaphoreFdKHR](#)?

RESOLVED: Yes, unless it is passed back in to a driver instance to import the semaphore. A

successful get call transfers ownership of the file descriptor to the application, and a successful import transfers it back to the driver. Destroying the original semaphore object will not close the file descriptor or remove its reference to the underlying semaphore resource associated with it.

- Contributors to the VK_EXT_fragment_density_map specification

Description

This extension adds the ability to change the rate at which fragments are shaded. Rather than the usual single fragment invocation for each pixel covered by a primitive, multiple pixels can be shaded by a single fragment shader invocation.

Up to three methods are available to the application to change the fragment shading rate:

- [Pipeline Fragment Shading Rate](#), which allows the specification of a rate per-draw.
- [Primitive Fragment Shading Rate](#), which allows the specification of a rate per primitive, specified during shading.
- [Attachment Fragment Shading Rate](#), which allows the specification of a rate per-region of the framebuffer, specified in a specialized image attachment.

Additionally, these rates can all be specified and combined in order to adjust the overall detail in the image at each point.

This functionality can be used to focus shading efforts where higher levels of detail are needed in some parts of a scene compared to others. This can be particularly useful in high resolution rendering, or for XR contexts.

This extension also adds support for the [SPV_KHR_fragment_shading_rate](#) extension which enables setting the [primitive fragment shading rate](#), and allows querying the final shading rate from a fragment shader.

Description

This extension provides new queries for device display properties and capabilities that can be easily extended by other extensions, without introducing any further queries. This extension can be considered the [VK_KHR_display](#) equivalent of the [VK_KHR_get_physical_device_properties2](#) extension.

New Commands

- [vkGetDisplayModeProperties2KHR](#)
- [vkGetDisplayPlaneCapabilities2KHR](#)
- [vkGetPhysicalDeviceDisplayPlaneProperties2KHR](#)
- [vkGetPhysicalDeviceDisplayProperties2KHR](#)

New Structures

- [VkDisplayModeProperties2KHR](#)
- [VkDisplayPlaneCapabilities2KHR](#)
- [VkDisplayPlaneInfo2KHR](#)
- [VkDisplayPlaneProperties2KHR](#)
- [VkDisplayProperties2KHR](#)

New Enum Constants

- [VK_KHR_GET_DISPLAY_PROPERTIES_2_EXTENSION_NAME](#)
- [VK_KHR_GET_DISPLAY_PROPERTIES_2_SPEC_VERSION](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_DISPLAY_MODE_PROPERTIES_2_KHR](#)
 - [VK_STRUCTURE_TYPE_DISPLAY_PLANE_CAPABILITIES_2_KHR](#)
 - [VK_STRUCTURE_TYPE_DISPLAY_PLANE_INFO_2_KHR](#)
 - [VK_STRUCTURE_TYPE_DISPLAY_PLANE_PROPERTIES_2_KHR](#)
 - [VK_STRUCTURE_TYPE_DISPLAY_PROPERTIES_2_KHR](#)

Issues

1) What should this extension be named?

RESOLVED: `VK_KHR_get_display_properties2`. Other alternatives:

- `VK_KHR_display2`
- One extension, combined with `VK_KHR_surface_capabilities2`.

2) Should extensible input structs be added for these new functions:

RESOLVED:

- `vkGetPhysicalDeviceDisplayProperties2KHR`: No. The only current input is a `VkPhysicalDevice`. Other inputs would not make sense.
- `vkGetPhysicalDeviceDisplayPlaneProperties2KHR`: No. The only current input is a `VkPhysicalDevice`. Other inputs would not make sense.
- `vkGetDisplayModeProperties2KHR`: No. The only current inputs are a `VkPhysicalDevice` and a `VkDisplayModeKHR`. Other inputs would not make sense.

3) Should additional display query functions be extended?

RESOLVED:

- `vkGetDisplayPlaneSupportedDisplaysKHR`: No. Extensions should instead extend `vkGetDisplayPlaneCapabilitiesKHR()`.

Version History

- Revision 1, 2017-02-21 (James Jones)
 - Initial draft.

Description

This extension provides new queries for device surface capabilities that can be easily extended by other extensions, without introducing any further queries. This extension can be considered the [VK_KHR_surface](#) equivalent of the [VK_KHR_get_physical_device_properties2](#) extension.

New Commands

- [vkGetPhysicalDeviceSurfaceCapabilities2KHR](#)
- [vkGetPhysicalDeviceSurfaceFormats2KHR](#)

New Structures

- [VkPhysicalDeviceSurfaceInfo2KHR](#)
- [VkSurfaceCapabilities2KHR](#)
- [VkSurfaceFormat2KHR](#)

New Enum Constants

- [VK_KHR_GET_SURFACE_CAPABILITIES_2_EXTENSION_NAME](#)
- [VK_KHR_GET_SURFACE_CAPABILITIES_2_SPEC_VERSION](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SURFACE_INFO_2_KHR](#)
 - [VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_KHR](#)
 - [VK_STRUCTURE_TYPE_SURFACE_FORMAT_2_KHR](#)

Issues

1) What should this extension be named?

RESOLVED: `VK_KHR_get_surface_capabilities2`. Other alternatives:

- `VK_KHR_surface2`
- One extension, combining a separate display-specific query extension.

2) Should additional WSI query functions be extended?

RESOLVED:

- `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`: Yes. The need for this motivated the extension.
- `vkGetPhysicalDeviceSurfaceSupportKHR`: No. Currently only has boolean output. Extensions should instead extend `vkGetPhysicalDeviceSurfaceCapabilities2KHR`.
- `vkGetPhysicalDeviceSurfaceFormatsKHR`: Yes.
- `vkGetPhysicalDeviceSurfacePresentModesKHR`: No. Recent discussion concluded this introduced too much variability for applications to deal with. Extensions should instead extend `vkGetPhysicalDeviceSurfaceCapabilities2KHR`.
- `vkGetPhysicalDeviceXlibPresentationSupportKHR`: Not in this extension.
- `vkGetPhysicalDeviceXcbPresentationSupportKHR`: Not in this extension.
- `vkGetPhysicalDeviceWaylandPresentationSupportKHR`: Not in this extension.
- `vkGetPhysicalDeviceWin32PresentationSupportKHR`: Not in this extension.

- Contributors to `VK_EXT_global_priority_query`

Description

In Vulkan, users can specify device-scope queue priorities. In some cases it may be useful to extend this concept to a system-wide scope. This device extension allows applications to query the global queue priorities supported by a queue family, and then set a priority when creating queues. The default queue priority is `VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT`.

Implementations can report which global priority levels are treated differently by the implementation. It is intended primarily for use in system integration along with certain platform-specific priority enforcement rules.

The driver implementation will attempt to skew hardware resource allocation in favor of the higher-priority task. Therefore, higher-priority work may retain similar latency and throughput characteristics even if the system is congested with lower priority work.

The global priority level of a queue shall take precedence over the per-process queue priority (`VkDeviceQueueCreateInfo::pQueuePriorities`).

Abuse of this feature may result in starving the rest of the system from hardware resources. Therefore, the driver implementation may deny requests to acquire a priority above the default priority (`VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT`) if the caller does not have sufficient privileges. In this scenario `VK_ERROR_NOT_PERMITTED_EXT` is returned.

The driver implementation may fail the queue allocation request if resources required to complete the operation have been exhausted (either by the same process or a different process). In this scenario `VK_ERROR_INITIALIZATION_FAILED` is returned.

New Structures

- Extending [VkDeviceQueueCreateInfo](#):
 - [VkDeviceQueueGlobalPriorityCreateInfoKHR](#)
- Extending [VkPhysicalDeviceFeatures2](#), [VkDeviceCreateInfo](#):
 - [VkPhysicalDeviceGlobalPriorityQueryFeaturesKHR](#)
- Extending [VkQueueFamilyProperties2](#):
 - [VkQueueFamilyGlobalPriorityPropertiesKHR](#)

New Enums

 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GLOBAL_PRIORITY_QUERY_FEATURES_KHR](#)
 - [VK_STRUCTURE_TYPE_QUEUE_FAMILY_GLOBAL_PRIORITY_PROPERTIES_KHR](#)

Promotion to Vulkan 1.4

Functionality in this extension is included in core Vulkan 1.4 with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

Issues

1) Can we additionally query whether a caller is permitted to acquire a specific global queue priority in this extension?

RESOLVED: No. Whether a caller has enough privilege goes with the OS, and the Vulkan driver cannot really guarantee that the privilege will not change in between this query and the actual queue creation call.

2) If more than 1 queue using global priority is requested, is there a good way to know which queue is failing the device creation?

RESOLVED: No. There is not a good way at this moment, and it is also not quite actionable for the applications to know that because the information may not be accurate. Queue creation can fail because of runtime constraints like insufficient privilege or lack of resource, and the failure is not necessarily tied to that particular queue configuration requested.

Description

This device extension extends [vkQueuePresentKHR](#), from the [VK_KHR_swapchain](#) extension, allowing an application to specify a list of rectangular, modified regions of each image to present. This should be used in situations where an application is only changing a small portion of the presentable images within a swapchain, since it enables the presentation engine to avoid wasting time presenting parts of the surface that have not changed.

This extension is leveraged from the [EGL_KHR_swap_buffers_with_damage](#) extension.

New Structures

- [VkPresentRegionKHR](#)
- [VkRectLayerKHR](#)
- Extending [VkPresentInfoKHR](#):
 - [VkPresentRegionsKHR](#)

New Enum Constants

- [VK_KHR_INCREMENTAL_PRESENT_EXTENSION_NAME](#)
- [VK_KHR_INCREMENTAL_PRESENT_SPEC_VERSION](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_PRESENT_REGIONS_KHR](#)

Issues

1) How should we handle stereoscopic-3D swapchains? We need to add a layer for each rectangle. One approach is to create another structure containing the [VkRect2D](#) plus layer, and have [VkPresentRegionsKHR](#) point to an array of that struct. Another approach is to have two parallel arrays, [pRectangles](#) and [pLayers](#), where [pRectangles\[i\]](#) and [pLayers\[i\]](#) must be used together. Which approach should we use, and if the array of a new structure, what should that be called?

RESOLVED: Create a new structure, which is a [VkRect2D](#) plus a layer, and will be called [VkRectLayerKHR](#).

2) Where is the origin of the [VkRectLayerKHR](#)?

RESOLVED: The upper left corner of the presentable image(s) of the swapchain, per the definition of framebuffer coordinates.

3) Does the rectangular region, [VkRectLayerKHR](#), specify pixels of the swapchain's image(s), or of the surface?

RESOLVED: Of the image(s). Some presentation engines may scale the pixels of a swapchain's image(s) to the size of the surface. The size of the swapchain's image(s) will be consistent, where the size of the surface may vary over time.

4) What if all of the rectangles for a given swapchain contain a width and/or height of zero?

RESOLVED: The application is indicating that no pixels changed since the last present. The presentation engine may use such a hint and not update any pixels for the swapchain. However, all other semantics of [vkQueuePresentKHR](#) must still be honored, including waiting for semaphores to signal.

5) When the swapchain is created with [VkSwapchainCreateInfoKHR::preTransform](#) set to a value other than [VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR](#), should the rectangular region, [VkRectLayerKHR](#), be transformed to align with the [preTransform](#)?

RESOLVED: No. The rectangular region in [VkRectLayerKHR](#) should not be transformed. As such, it may not align with the extents of the swapchain's image(s). It is the responsibility of the presentation engine to transform the rectangular region. This matches the behavior of the Android presentation engine, which set the precedent.

Version History

 - [VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR](#)
 - [VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR](#)
 - [VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINE_RASTERIZATION_FEATURES_KHR](#)
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINE_RASTERIZATION_PROPERTIES_KHR](#)
 - [VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_LINE_STATE_CREATE_INFO_KHR](#)

Promotion to Vulkan 1.4

Functionality in this extension is included in core Vulkan 1.4 with the KHR suffix omitted. The

original type, enum and command names are still available as aliases of the core functionality.

When [Version 1.4](#) is supported, the [bresenhamLines](#) feature must be supported.

Issues

1) Do we need to support Bresenham-style and smooth lines with more than one rasterization sample? i.e. the equivalent of `glDisable(GL_MULTISAMPLE)` in OpenGL when the framebuffer has more than one sample?

RESOLVED: Yes. For simplicity, Bresenham line rasterization carries forward a few restrictions from OpenGL, such as not supporting per-sample shading, alpha to coverage, or alpha to one.

Description

Many safety critical environments are required to contend with single event upsets (SEUs). These occur when a bit in a physical device's memory or register is inadvertently flipped. It is typical for host memory to include automatic error detection (EDC) or correction (ECC) on platforms where this a concern. However, device-accessible memory may not have these protections. In that case, the data must be periodically refreshed.

Unextended Vulkan provides a variety of methods to mitigate SEUs. Image and buffer objects can be bound to SEU-safe memory, and many object types can be refreshed explicitly by the application by reloading or regenerating the object's data. However, implementations may store internal object-specific data in non-SEU-safe memory, and unextended Vulkan provides no clear method to determine which object types this applies to or how to refresh that data.

This extension adds a mechanism to query which object types store implementation-internal data in device regions susceptible to SEUs, and to explicitly refresh that implementation-internal data.

New Commands

- [vkCmdRefreshObjectsKHR](#)
- [vkGetPhysicalDeviceRefreshableObjectTypesKHR](#)

New Structures

- [VkRefreshObjectKHR](#)
- [VkRefreshObjectListKHR](#)

New Enums

- [VkRefreshObjectFlagBitsKHR](#)

New Bitmasks

- [VkRefreshObjectFlagsKHR](#)

New Enum Constants

- [VK_KHR_OBJECT_REFRESH_EXTENSION_NAME](#)
- [VK_KHR_OBJECT_REFRESH_SPEC_VERSION](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_REFRESH_OBJECT_LIST_KHR](#)

Issues

1) Should this extension refresh object data, or validate whether or not the data has been corrupted?

RESOLVED This extension should refresh data, not validate it. This reduces application error-handling complexity, and invalid data would have to be refreshed anyway.

2) Should object refreshes be done using the host or with command buffers?

RESOLVED Object refreshes should be done with command buffers. This reduces the synchronization complexity.

3) Refresh operations will need a pipeline barrier so that subsequent commands will see the results of the refresh. What access flags and pipeline stage should apply to refresh operations? Should they use new flags and stages, or reuse an existing one?

RESOLVED Object refreshes are considered to be a transfer operation for the purposes of pipeline barriers.

4) Should this extension add a feature bit?

RESOLVED A feature bit is not necessary. In the case of this extension being promoted to core, implementations that do not support or require refreshing of any object types will return 0 for the `count` parameter of `vkGetPhysicalDeviceRefreshableObjectTypesKHR`.

Examples

None.

- Igor Ostrowski, Intel

Description

The [VK_KHR_performance_query](#) extension adds a mechanism to allow querying of performance counters for use in applications and by profiling tools.

Each queue family **may** expose counters that **can** be enabled on a queue of that family. We extend

[VkQueryType](#) to add a new query type for performance queries, and chain a structure on [VkQueryPoolCreateInfo](#) to specify the performance queries to enable.

New Commands

- [vkAcquireProfilingLockKHR](#)
- [vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR](#)
- [vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR](#)
- [vkReleaseProfilingLockKHR](#)

New Structures

- [VkAcquireProfilingLockInfoKHR](#)
- [VkPerformanceCounterDescriptionKHR](#)
- [VkPerformanceCounterKHR](#)
- Extending [VkPhysicalDeviceFeatures2](#), [VkDeviceCreateInfo](#):
 - [VkPhysicalDevicePerformanceQueryFeaturesKHR](#)
- Extending [VkPhysicalDeviceProperties2](#):
 - [VkPhysicalDevicePerformanceQueryPropertiesKHR](#)
- Extending [VkQueryPoolCreateInfo](#):
 - [VkQueryPoolPerformanceCreateInfoKHR](#)
- Extending [VkSubmitInfo](#), [VkSubmitInfo2](#):
 - [VkPerformanceQuerySubmitInfoKHR](#)

If Vulkan SC 1.0 is supported:

- Extending [VkDeviceCreateInfo](#):
 - [VkPerformanceQueryReservationInfoKHR](#)

New Unions

- [VkPerformanceCounterResultKHR](#)

New Enums

- [VkAcquireProfilingLockFlagBitsKHR](#)
- [VkPerformanceCounterDescriptionFlagBitsKHR](#)
- [VkPerformanceCounterScopeKHR](#)
- [VkPerformanceCounterStorageKHR](#)
- [VkPerformanceCounterUnitKHR](#)

New Bitmasks

- [VkAcquireProfilingLockFlagsKHR](#)
- [VkPerformanceCounterDescriptionFlagsKHR](#)

New Enum Constants

- [VK_KHR_PERFORMANCE_QUERY_EXTENSION_NAME](#)
- [VK_KHR_PERFORMANCE_QUERY_SPEC_VERSION](#)
- Extending [VkQueryType](#):
 - [VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_ACQUIRE_PROFILING_LOCK_INFO_KHR](#)
 - [VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_DESCRIPTION_KHR](#)
 - [VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_KHR](#)
 - [VK_STRUCTURE_TYPE_PERFORMANCE_QUERY_SUBMIT_INFO_KHR](#)
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PERFORMANCE_QUERY_FEATURES_KHR](#)
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PERFORMANCE_QUERY_PROPERTIES_KHR](#)
 - [VK_STRUCTURE_TYPE_QUERY_POOL_PERFORMANCE_CREATE_INFO_KHR](#)

If Vulkan SC 1.0 is supported:

- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_PERFORMANCE_QUERY_RESERVATION_INFO_KHR](#)

Issues

1) Should this extension include a mechanism to begin a query in command buffer *A* and end the query in command buffer *B*?

RESOLVED No - queries are tied to command buffer creation and thus have to be encapsulated within a single command buffer.

2) Should this extension include a mechanism to begin and end queries globally on the queue, not using the existing command buffer commands?

RESOLVED No - for the same reasoning as the resolution of 1).

3) Should this extension expose counters that require multiple passes?

RESOLVED Yes - users should re-submit a command buffer with the same commands in it multiple times, specifying the pass to count as the query parameter in [VkPerformanceQuerySubmitInfoKHR](#).

4) How to handle counters across parallel workloads?

RESOLVED In the spirit of Vulkan, a counter description flag

`VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR` denotes that the accuracy of a counter result is affected by parallel workloads.

5) How to handle secondary command buffers?

RESOLVED Secondary command buffers inherit any counter pass index specified in the parent primary command buffer. Note: this is no longer an issue after change from issue 10 resolution

6) What commands does the profiling lock have to be held for?

RESOLVED For any command buffer that is being queried with a performance query pool, the profiling lock **must** be held while that command buffer is in the *recording*, *executable*, or *pending state*.

7) Should we support `vkCmdCopyQueryPoolResults`?

RESOLVED Yes.

8) Should we allow performance queries to interact with multiview?

RESOLVED Yes, but the performance queries must be performed once for each pass per view.

9) Should a `queryCount > 1` be usable for performance queries?

RESOLVED Yes. Some vendors will have costly performance counter query pool creation, and would rather if a certain set of counters were to be used multiple times that a `queryCount > 1` can be used to amortize the instantiation cost.

10) Should we introduce an indirect mechanism to set the counter pass index?

RESOLVED Specify the counter pass index at submit time instead, to avoid requiring re-recording of command buffers when multiple counter passes are needed.

Examples

The following example shows how to find what performance counters a queue family supports, setup a query pool to record these performance counters, how to add the query pool to the command buffer to record information, and how to get the results from the query pool.

```
// A previously created physical device
VkPhysicalDevice physicalDevice;

// One of the queue families our device supports
uint32_t queueFamilyIndex;

uint32_t counterCount;

// Get the count of counters supported
vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR(
    physicalDevice,
    queueFamilyIndex,
```

```

&counterCount,
NULL,
NULL);

VkPerformanceCounterKHR* counters =
    malloc(sizeof(VkPerformanceCounterKHR) * counterCount);
VkPerformanceCounterDescriptionKHR* counterDescriptions =
    malloc(sizeof(VkPerformanceCounterDescriptionKHR) * counterCount);

// Get the counters supported
vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR(
    physicalDevice,
    queueFamilyIndex,
    &counterCount,
    counters,
    counterDescriptions);

// Try to enable the first 8 counters
uint32_t enabledCounters[8];

const uint32_t enabledCounterCount = min(counterCount, 8));

for (uint32_t i = 0; i < enabledCounterCount; i++) {
    enabledCounters[i] = i;
}

// A previously created device that had the performanceCounterQueryPools feature
// set to VK_TRUE
VkDevice device;

VkQueryPoolPerformanceCreateInfoKHR performanceQueryCreateInfo = {
    .sType = VK_STRUCTURE_TYPE_QUERY_POOL_PERFORMANCE_CREATE_INFO_KHR,
    .pNext = NULL,

    // Specify the queue family that this performance query is performed on
    .queueFamilyIndex = queueFamilyIndex,

    // The number of counters to enable
    .counterIndexCount = enabledCounterCount,

    // The array of indices of counters to enable
    .pCounterIndices = enabledCounters
};

// Get the number of passes our counters will require.
uint32_t numPasses;

vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR(
    physicalDevice,
    &performanceQueryCreateInfo,

```

```

&numPasses);

VkQueryPoolCreateInfo queryPoolCreateInfo = {
    .sType = VK_STRUCTURE_TYPE_QUERY_POOL_CREATE_INFO,
    .pNext = &performanceQueryCreateInfo,
    .flags = 0,
    // Using our new query type here
    .queryType = VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR,
    .queryCount = 1,
    .pipelineStatistics = 0
};

VkQueryPool queryPool;

VkResult result = vkCreateQueryPool(
    device,
    &queryPoolCreateInfo,
    NULL,
    &queryPool);

assert(VK_SUCCESS == result);

// A queue from queueFamilyIndex
VkQueue queue;

// A command buffer we want to record counters on
VkCommandBuffer commandBuffer;

VkCommandBufferBeginInfo commandBufferBeginInfo = {
    .sType = VK_STRUCTURE_TYPE_COMMAND_BUFFER_BEGIN_INFO,
    .pNext = NULL,
    .flags = 0,
    .pInheritanceInfo = NULL
};

VkAcquireProfilingLockInfoKHR lockInfo = {
    .sType = VK_STRUCTURE_TYPE_ACQUIRE_PROFILING_LOCK_INFO_KHR,
    .pNext = NULL,
    .flags = 0,
    .timeout = UINT64_MAX // Wait forever for the lock
};

// Acquire the profiling lock before we record command buffers
// that will use performance queries

result = vkAcquireProfilingLockKHR(device, &lockInfo);

assert(VK_SUCCESS == result);

result = vkBeginCommandBuffer(commandBuffer, &commandBufferBeginInfo);

```

```

assert(VK_SUCCESS == result);

vkCmdResetQueryPool(
    commandBuffer,
    queryPool,
    0,
    1);

vkCmdBeginQuery(
    commandBuffer,
    queryPool,
    0,
    0);

// Perform the commands you want to get performance information on
// ...

// Perform a barrier to ensure all previous commands were complete before
// ending the query
vkCmdPipelineBarrier(commandBuffer,
    VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT,
    VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT,
    0,
    0,
    NULL,
    0,
    NULL,
    0,
    NULL);

vkCmdEndQuery(
    commandBuffer,
    queryPool,
    0);

result = vkEndCommandBuffer(commandBuffer);

assert(VK_SUCCESS == result);

for (uint32_t counterPass = 0; counterPass < numPasses; counterPass++) {

    VkPerformanceQuerySubmitInfoKHR performanceQuerySubmitInfo = {
        VK_STRUCTURE_TYPE_PERFORMANCE_QUERY_SUBMIT_INFO_KHR,
        NULL,
        counterPass
    };

    // Submit the command buffer and wait for its completion
    // ...
}

```

```

// Release the profiling lock after the command buffer is no longer in the
// pending state.
vkReleaseProfilingLockKHR(device);

result = vkResetCommandBuffer(commandBuffer, 0);

assert(VK_SUCCESS == result);

// Create an array to hold the results of all counters
VkPerformanceCounterResultKHR* recordedCounters = malloc(
    sizeof(VkPerformanceCounterResultKHR) * enabledCounterCount);

result = vkGetQueryPoolResults(
    device,
    queryPool,
    0,
    1,
    sizeof(VkPerformanceCounterResultKHR) * enabledCounterCount,
    recordedCounters,
    sizeof(VkPerformanceCounterResultKHR) * enabledCounterCount,
    NULL);

// recordedCounters is filled with our counters, we will look at one for posterity
switch (counters[0].storage) {
    case VK_PERFORMANCE_COUNTER_STORAGE_INT32:
        // use recordCounters[0].int32 to get at the counter result!
        break;
    case VK_PERFORMANCE_COUNTER_STORAGE_INT64:
        // use recordCounters[0].int64 to get at the counter result!
        break;
    case VK_PERFORMANCE_COUNTER_STORAGE_UINT32:
        // use recordCounters[0].uint32 to get at the counter result!
        break;
    case VK_PERFORMANCE_COUNTER_STORAGE_UINT64:
        // use recordCounters[0].uint64 to get at the counter result!
        break;
    case VK_PERFORMANCE_COUNTER_STORAGE_FLOAT32:
        // use recordCounters[0].float32 to get at the counter result!
        break;
    case VK_PERFORMANCE_COUNTER_STORAGE_FLOAT64:
        // use recordCounters[0].float64 to get at the counter result!
        break;
}

```

Interactions and External Dependencies

- This extension provides API support for [GL_ARB_shader_clock](#) and [GL_EXT_shader_realtime_clock](#)

Contributors

- Aaron Hagan, AMD
- Daniel Koch, NVIDIA

Description

This extension advertises the SPIR-V [ShaderClockKHR](#) capability for Vulkan, which allows a shader to query a real-time or monotonically incrementing counter at the subgroup level or across the device level. The two valid SPIR-V scopes for [OpReadClockKHR](#) are [Subgroup](#) and [Device](#).

When using GLSL source-based shading languages, the `clockRealtime*EXT()` timing functions map to the `OpReadClockKHR` instruction with a scope of `Device`, and the `clock*ARB()` timing functions map to the `OpReadClockKHR` instruction with a scope of `Subgroup`.

New Structures

Description

This extension adds Vulkan support for the [SPV_KHR_terminate_invocation](#) SPIR-V extension. That SPIR-V extension provides a new instruction, [OpTerminateInvocation](#), which causes a shader invocation to immediately terminate and sets the coverage of shaded samples to [0](#); only previously executed instructions will have observable effects. The [OpTerminateInvocation](#) instruction, along with the [OpDemoteToHelperInvocation](#) instruction from the [VK_EXT_shader_demote_to_helper_invocation](#) extension, together replace the [OpKill](#) instruction, which could behave like either of these instructions. [OpTerminateInvocation](#) provides the behavior required by the GLSL [discard](#) statement, and should be used when available by GLSL compilers and applications that need the GLSL [discard](#) behavior.

New Structures

- Extending [VkPhysicalDeviceFeatures2](#), [VkDeviceCreateInfo](#):
 - [VkPhysicalDeviceShaderTerminateInvocationFeaturesKHR](#)

New Enum Constants

- [VK_KHR_SHADER_TERMINATE_INVOCATION_EXTENSION_NAME](#)

Description

This extension extends [VK_KHR_swapchain](#) to enable creation of a shared presentable image. This allows the application to use the image while the presentation engine is accessing it, in order to reduce the latency between rendering and presentation.

New Commands

- [vkGetSwapchainStatusKHR](#)

New Structures

- Extending [VkSurfaceCapabilities2KHR](#):
 - [VkSharedPresentSurfaceCapabilitiesKHR](#)

New Enum Constants

- [VK_KHR_SHARED_PRESENTABLE_IMAGE_EXTENSION_NAME](#)
- [VK_KHR_SHARED_PRESENTABLE_IMAGE_SPEC_VERSION](#)
- Extending [VkImageLayout](#):
 - [VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR](#)
- Extending [VkPresentModeKHR](#):
 - [VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR](#)
 - [VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_SHARED_PRESENT_SURFACE_CAPABILITIES_KHR](#)

Issues

1) Should we allow a Vulkan WSI swapchain to toggle between normal usage and shared presentation usage?

RESOLVED: No. WSI swapchains are typically recreated with new properties instead of having their properties changed. This can also save resources, assuming that fewer images are needed for shared presentation, and assuming that most VR applications do not need to switch between normal and shared usage.

2) Should we have a query for determining how the presentation engine refresh is triggered?

RESOLVED: Yes. This is done via which presentation modes a surface supports.

3) Should the object representing a shared presentable image be an extension of a [VkSwapchainKHR](#) or a separate object?

RESOLVED: Extension of a swapchain due to overlap in creation properties and to allow common functionality between shared and normal presentable images and swapchains.

4) What should we call the extension and the new structures it creates?

RESOLVED: Shared presentable image / shared present.

5) Should the `minImageCount` and `presentMode` values of the [VkSwapchainCreateInfoKHR](#) be ignored, or required to be compatible values?

RESOLVED: `minImageCount` must be 1, and `presentMode` should be set to either `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`.

6) What should the layout of the shared presentable image be?

RESOLVED: After acquiring the shared presentable image, the application must transition it to the `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` layout prior to it being used. After this initial transition, any image usage that was requested during swapchain creation **can** be performed on the image without layout transitions being performed.

7) Do we need a new API for the trigger to refresh new content?

RESOLVED: [vkQueuePresentKHR](#) to act as API to trigger a refresh, as will allow combination with other compatible extensions to [vkQueuePresentKHR](#).

8) How should an application detect a `VK_ERROR_OUT_OF_DATE_KHR` error on a swapchain using the `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR` present mode?

RESOLVED: Introduce [vkGetSwapchainStatusKHR](#) to allow applications to query the status of a swapchain using a shared presentation mode.

9) What should subsequent calls to [vkQueuePresentKHR](#) for `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR` swapchains be defined to do?

RESOLVED: State that implementations may use it as a hint for updated content.

10) Can the ownership of a shared presentable image be transferred to a different queue?

RESOLVED: No. It is not possible to transfer ownership of a shared presentable image obtained from a swapchain created using `VK_SHARING_MODE_EXCLUSIVE` after it has been presented.

11) How should `vkQueueSubmit` behave if a command buffer uses an image from a `VK_ERROR_OUT_OF_DATE_KHR` swapchain?

RESOLVED: `vkQueueSubmit` is expected to return the `VK_ERROR_DEVICE_LOST` error.

12) Can Vulkan provide any guarantee on the order of rendering, to enable beam chasing?

RESOLVED: This could be achieved via use of render passes to ensure strip rendering.

Description

The `VK_KHR_surface` extension is an instance extension. It introduces `VkSurfaceKHR` objects, which abstract native platform surface or window objects for use with Vulkan. It also provides a way to determine whether a queue family in a physical device supports presenting to particular surface.

Separate extensions for each platform provide the mechanisms for creating `VkSurfaceKHR` objects, but once created they may be used in this and other platform-independent extensions, in particular the `VK_KHR_swapchain` extension.

New Object Types

- `VkSurfaceKHR`

New Commands

- `vkDestroySurfaceKHR`
- `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`
- `vkGetPhysicalDeviceSurfaceFormatsKHR`
- `vkGetPhysicalDeviceSurfacePresentModesKHR`
- `vkGetPhysicalDeviceSurfaceSupportKHR`

New Structures

- `VkSurfaceCapabilitiesKHR`
- `VkSurfaceFormatKHR`

New Enums

- [VkColorSpaceKHR](#)
- [VkCompositeAlphaFlagBitsKHR](#)
- [VkPresentModeKHR](#)
- [VkSurfaceTransformFlagBitsKHR](#)

New Bitmasks

- [VkCompositeAlphaFlagsKHR](#)

New Enum Constants

- [VK_KHR_SURFACE_EXTENSION_NAME](#)
- [VK_KHR_SURFACE_SPEC_VERSION](#)
- Extending [VkObjectType](#):
 - [VK_OBJECT_TYPE_SURFACE_KHR](#)
- Extending [VkResult](#):
 - [VK_ERROR_NATIVE_WINDOW_IN_USE_KHR](#)
 - [VK_ERROR_SURFACE_LOST_KHR](#)

Issues

1) Should this extension include a method to query whether a physical device supports presenting to a specific window or native surface on a given platform?

RESOLVED: Yes. Without this, applications would need to create a device instance to determine whether a particular window can be presented to. Knowing that a device supports presentation to a platform in general is not sufficient, as a single machine might support multiple seats, or instances of the platform that each use different underlying physical devices. Additionally, on some platforms, such as the X Window System, different drivers and devices might be used for different windows depending on which section of the desktop they exist on.

2) Should the [vkGetPhysicalDeviceSurfaceCapabilitiesKHR](#), [vkGetPhysicalDeviceSurfaceFormatsKHR](#), and [vkGetPhysicalDeviceSurfacePresentModesKHR](#) functions be in this extension and operate on physical devices, rather than being in [VK_KHR_swapchain](#) (i.e. device extension) and being dependent on [VkDevice](#)?

RESOLVED: Yes. While it might be useful to depend on [VkDevice](#) (and therefore on enabled extensions and features) for the queries, Vulkan was released only with the [VkPhysicalDevice](#) versions. Many cases can be resolved by a Valid Usage statement, and/or by a separate [pNext](#) chain version of the query structure specific to a given extension or parameters, via extensible versions of the queries: [vkGetPhysicalDeviceSurfaceCapabilities2KHR](#), and [vkGetPhysicalDeviceSurfaceFormats2KHR](#).

3) Should Vulkan support Xlib or XCB as the API for accessing the X Window System platform?

RESOLVED: Both. XCB is a more modern and efficient API, but Xlib usage is deeply ingrained in many applications and likely will remain in use for the foreseeable future. Not all drivers necessarily need to support both, but including both as options in the core specification will probably encourage support, which should in turn ease adoption of the Vulkan API in older codebases. Additionally, the performance improvements possible with XCB likely will not have a measurable impact on the performance of Vulkan presentation and other minimal window system interactions defined here.

4) Should the GBM platform be included in the list of platform enums?

RESOLVED: Deferred, and will be addressed with a platform-specific extension to be written in the future.

Version History

- Revision 1, 2015-05-20 (James Jones)
 - Initial draft, based on LunarG KHR spec, other KHR specs, patches attached to bugs.
- Revision 2, 2015-05-22 (Ian Elliott)
 - Created initial Description section.
 - Removed query for whether a platform requires the use of a queue for presentation, since it was decided that presentation will always be modeled as being part of the queue.
 - Fixed typos and other minor mistakes.
- Revision 3, 2015-05-26 (Ian Elliott)
 - Improved the Description section.
- Revision 4, 2015-05-27 (James Jones)
 - Fixed compilation errors in example code.
- Revision 5, 2015-06-01 (James Jones)
 - Added issues 1 and 2 and made related spec updates.
- Revision 6, 2015-06-01 (James Jones)
 - Merged the platform type mappings table previously removed from VK_KHR_swapchain with the platform description table in this spec.
 - Added issues 3 and 4 documenting choices made when building the initial list of native platforms supported.
- Revision 7, 2015-06-11 (Ian Elliott)
 - Updated table 1 per input from the KHR TSG.
 - Updated issue 4 (GBM) per discussion with Daniel Stone. He will create a platform-specific extension sometime in the future.
- Revision 8, 2015-06-17 (James Jones)
 - Updated enum-extending values using new convention.
 - Fixed the value of VK_SURFACE_PLATFORM_INFO_TYPE_SUPPORTED_KHR.

- Revision 9, 2015-06-17 (James Jones)
 - Rebased on Vulkan API version 126.
- Revision 10, 2015-06-18 (James Jones)
 - Marked issues 2 and 3 resolved.
- Revision 11, 2015-06-23 (Ian Elliott)
 - Examples now show use of function pointers for extension functions.
 - Eliminated extraneous whitespace.
- Revision 12, 2015-07-07 (Daniel Rakos)
 - Added error section describing when each error is expected to be reported.
 - Replaced the term “queue node index” with “queue family index” in the spec as that is the agreed term to be used in the latest version of the core header and spec.
 - Replaced `bool32_t` with `VkBool32`.
- Revision 13, 2015-08-06 (Daniel Rakos)
 - Updated spec against latest core API header version.
- Revision 14, 2015-08-20 (Ian Elliott)
 - Renamed this extension and all of its enumerations, types, functions, etc. This makes it compliant with the proposed standard for Vulkan extensions.
 - Switched from “revision” to “version”, including use of the `VK_MAKE_VERSION` macro in the header file.
 - Did miscellaneous cleanup, etc.
- Revision 15, 2015-08-20 (Ian Elliott—porting a 2015-07-29 change from James Jones)
 - Moved the surface transform enums here from `VK_WSI_swapchain` so they could be reused by `VK_WSI_display`.
- Revision 16, 2015-09-01 (James Jones)
 - Restore single-field revision number.
- Revision 17, 2015-09-01 (James Jones)
 - Fix example code compilation errors.
- Revision 18, 2015-09-26 (Jesse Hall)
 - Replaced `VkSurfaceDescriptionKHR` with the `VkSurfaceKHR` object, which is created via layered extensions. Added `VkDestroySurfaceKHR`.
- Revision 19, 2015-09-28 (Jesse Hall)
 - Renamed from `VK_EXT_KHR_swapchain` to `VK_EXT_KHR_surface`.
- Revision 20, 2015-09-30 (Jeff Vigil)
 - Add error result `VK_ERROR_SURFACE_LOST_KHR`.
- Revision 21, 2015-10-15 (Daniel Rakos)
 - Updated the resolution of issue #2 and include the surface capability queries in this

extension.

- Renamed SurfaceProperties to SurfaceCapabilities as it better reflects that the values returned are the capabilities of the surface on a particular device.
- Other minor cleanup and consistency changes.
- Revision 22, 2015-10-26 (Ian Elliott)
 - Renamed from VK_EXT_KHR_surface to VK_KHR_surface.
- Revision 23, 2015-11-03 (Daniel Rakos)
 - Added allocation callbacks to vkDestroySurfaceKHR.
- Revision 24, 2015-11-10 (Jesse Hall)
 - Removed VkSurfaceTransformKHR. Use VkSurfaceTransformFlagBitsKHR instead.
 - Rename VkSurfaceCapabilitiesKHR member maxImageArraySize to maxImageArrayLayers.
- Revision 25, 2016-01-14 (James Jones)
 - Moved VK_ERROR_NATIVE_WINDOW_IN_USE_KHR from the VK_KHR_android_surface to the VK_KHR_surface extension.
- 2016-08-23 (Ian Elliott)
 - Update the example code, to not have so many characters per line, and to split out a new example to show how to obtain function pointers.
- 2016-08-25 (Ian Elliott)
 - A note was added at the beginning of the example code, stating that it will be removed from future versions of the appendix.

Description

The [VK_KHR_swapchain](#) extension is the device-level companion to the [VK_KHR_surface](#) extension. It introduces [VkSwapchainKHR](#) objects, which provide the ability to present rendering results to a surface.

New Object Types

- [VkSwapchainKHR](#)

New Commands

- [vkAcquireNextImageKHR](#)
- [vkCreateSwapchainKHR](#)
- [vkDestroySwapchainKHR](#)
- [vkGetSwapchainImagesKHR](#)
- [vkQueuePresentKHR](#)

If [Vulkan Version 1.1](#) is supported:

- [vkAcquireNextImage2KHR](#)
- [vkGetDeviceGroupPresentCapabilitiesKHR](#)
- [vkGetDeviceGroupSurfacePresentModesKHR](#)
- [vkGetPhysicalDevicePresentRectanglesKHR](#)

New Structures

- [VkPresentInfoKHR](#)
- [VkSwapchainCreateInfoKHR](#)

If [Vulkan Version 1.1](#) is supported:

- [VkAcquireNextImageInfoKHR](#)
- [VkDeviceGroupPresentCapabilitiesKHR](#)
- Extending [VkBindImageMemoryInfo](#):
 - [VkBindImageMemorySwapchainInfoKHR](#)
- Extending [VkImageCreateInfo](#):
 - [VkImageSwapchainCreateInfoKHR](#)
- Extending [VkPresentInfoKHR](#):
 - [VkDeviceGroupPresentInfoKHR](#)
- Extending [VkSwapchainCreateInfoKHR](#):
 - [VkDeviceGroupSwapchainCreateInfoKHR](#)

New Enums

- [VkSwapchainCreateFlagBitsKHR](#)

If [Vulkan Version 1.1](#) is supported:

- [VkDeviceGroupPresentModeFlagBitsKHR](#)

New Bitmasks

- [VkSwapchainCreateFlagsKHR](#)

If [Vulkan Version 1.1](#) is supported:

- [VkDeviceGroupPresentModeFlagsKHR](#)

New Enum Constants

- [VK_KHR_SWAPCHAIN_EXTENSION_NAME](#)
- [VK_KHR_SWAPCHAIN_SPEC_VERSION](#)
- Extending [VkImageLayout](#):
 - [VK_IMAGE_LAYOUT_PRESENT_SRC_KHR](#)
- Extending [VkObjectType](#):
 - [VK_OBJECT_TYPE_SWAPCHAIN_KHR](#)
- Extending [VkResult](#):
 - [VK_ERROR_OUT_OF_DATE_KHR](#)
 - [VK_SUBOPTIMAL_KHR](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_PRESENT_INFO_KHR](#)
 - [VK_STRUCTURE_TYPE_SWAPCHAIN_CREATE_INFO_KHR](#)

If [Vulkan Version 1.1](#) is supported:

- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_ACQUIRE_NEXT_IMAGE_INFO_KHR](#)
 - [VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_SWAPCHAIN_INFO_KHR](#)
 - [VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_CAPABILITIES_KHR](#)
 - [VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_INFO_KHR](#)
 - [VK_STRUCTURE_TYPE_DEVICE_GROUP_SWAPCHAIN_CREATE_INFO_KHR](#)
 - [VK_STRUCTURE_TYPE_IMAGE_SWAPCHAIN_CREATE_INFO_KHR](#)
- Extending [VkSwapchainCreateFlagBitsKHR](#):
 - [VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR](#)
 - [VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR](#)

Issues

1) Does this extension allow the application to specify the memory backing of the presentable images?

RESOLVED: No. Unlike standard images, the implementation will allocate the memory backing of

the presentable image.

2) What operations are allowed on presentable images?

RESOLVED: This is determined by the image usage flags specified when creating the presentable image's swapchain.

3) Does this extension support MSAA presentable images?

RESOLVED: No. Presentable images are always single-sampled. Multi-sampled rendering must use regular images. To present the rendering results the application must manually resolve the multi-sampled image to a single-sampled presentable image prior to presentation.

4) Does this extension support stereo/multi-view presentable images?

RESOLVED: Yes. The number of views associated with a presentable image is determined by the `imageArrayLayers` specified when creating a swapchain. All presentable images in a given swapchain use the same array size.

5) Are the layers of stereo presentable images half-sized?

RESOLVED: No. The image extents always match those requested by the application.

6) Do the “present” and “acquire next image” commands operate on a queue? If not, do they need to include explicit semaphore objects to interlock them with queue operations?

RESOLVED: The present command operates on a queue. The image ownership operation it represents happens in order with other operations on the queue, so no explicit semaphore object is required to synchronize its actions.

Applications may want to acquire the next image in separate threads from those in which they manage their queue, or in multiple threads. To make such usage easier, the acquire next image command takes a semaphore to signal as a method of explicit synchronization. The application must later queue a wait for this semaphore before queuing execution of any commands using the image.

7) Does `vkAcquireNextImageKHR` block if no images are available?

RESOLVED: The command takes a timeout parameter. Special values for the timeout are 0, which makes the call a non-blocking operation, and `UINT64_MAX`, which blocks indefinitely. Values in between will block for up to the specified time. The call will return when an image becomes available or an error occurs. It may, but is not required to, return before the specified timeout expires if the swapchain becomes out of date.

8) Can multiple presents be queued using one `vkQueuePresentKHR` call?

RESOLVED: Yes. `VkPresentInfoKHR` contains a list of swapchains and corresponding image indices that will be presented. When supported, all presentations queued with a single `vkQueuePresentKHR` call will be applied atomically as one operation. The same swapchain must not appear in the list more than once. Later extensions may provide applications stronger guarantees of atomicity for such present operations, and/or allow them to query whether atomic

presentation of a particular group of swapchains is possible.

9) How do the presentation and acquire next image functions notify the application the targeted surface has changed?

RESOLVED: Two new result codes are introduced for this purpose:

- **VK_SUBOPTIMAL_KHR** - Presentation will still succeed, subject to the window resize behavior, but the swapchain is no longer configured optimally for the surface it targets. Applications should query updated surface information and recreate their swapchain at the next convenient opportunity.
- **VK_ERROR_OUT_OF_DATE_KHR** - Failure. The swapchain is no longer compatible with the surface it targets. The application must query updated surface information and recreate the swapchain before presentation will succeed.

These can be returned by both [vkAcquireNextImageKHR](#) and [vkQueuePresentKHR](#).

10) Does the [vkAcquireNextImageKHR](#) command return a semaphore to the application via an output parameter, or accept a semaphore to signal from the application as an object handle parameter?

RESOLVED: Accept a semaphore to signal as an object handle. This avoids the need to specify whether the application must destroy the semaphore or whether it is owned by the swapchain, and if the latter, what its lifetime is and whether it can be reused for other operations once it is received from [vkAcquireNextImageKHR](#).

11) What types of swapchain queuing behavior should be exposed? Options include swap interval specification, mailbox/most recent vs. FIFO queue management, targeting specific vertical blank intervals or absolute times for a given present operation, and probably others. For some of these, whether they are specified at swapchain creation time or as per-present parameters needs to be decided as well.

RESOLVED: The base swapchain extension will expose 3 possible behaviors (of which, FIFO will always be supported):

- Immediate present: Does not wait for vertical blanking period to update the current image, likely resulting in visible tearing. No internal queue is used. Present requests are applied immediately.
- Mailbox queue: Waits for the next vertical blanking period to update the current image. No tearing should be observed. An internal single-entry queue is used to hold pending presentation requests. If the queue is full when a new presentation request is received, the new request replaces the existing entry, and any images associated with the prior entry become available for reuse by the application.
- FIFO queue: Waits for the next vertical blanking period to update the current image. No tearing should be observed. An internal queue containing **numSwapchainImages** - 1 entries is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during each vertical blanking period in which the queue is non-empty

Not all surfaces will support all of these modes, so the modes supported will be returned using a surface information query. All surfaces must support the FIFO queue mode. Applications must choose one of these modes up front when creating a swapchain. Switching modes can be accomplished by recreating the swapchain.

12) Can `VK_PRESENT_MODE_MAILBOX_KHR` provide non-blocking guarantees for `vkAcquireNextImageKHR`? If so, what is the proper criteria?

RESOLVED: Yes. The difficulty is not immediately obvious here. Naively, if at least 3 images are requested, mailbox mode should always have an image available for the application if the application does not own any images when the call to `vkAcquireNextImageKHR` was made. However, some presentation engines may have more than one “current” image, and would still need to block in some cases. The right requirement appears to be that if the application allocates the surface’s minimum number of images + 1 then it is guaranteed non-blocking behavior when it does not currently own any images.

13) Is there a way to create and initialize a new swapchain for a surface that has generated a `VK_SUBOPTIMAL_KHR` return code while still using the old swapchain?

RESOLVED: Not as part of this specification. This could be useful to allow the application to create an “optimal” replacement swapchain and rebuild all its command buffers using it in a background thread at a low priority while continuing to use the “suboptimal” swapchain in the main thread. It could probably use the same “atomic replace” semantics proposed for recreating direct-to-device swapchains without incurring a mode switch. However, after discussion, it was determined some platforms probably could not support concurrent swapchains for the same surface though, so this will be left out of the base KHR extensions. A future extension could add this for platforms where it is supported.

14) Should there be a special value for `VkSurfaceCapabilitiesKHR::maxImageCount` to indicate there are no practical limits on the number of images in a swapchain?

RESOLVED: Yes. There will often be cases where there is no practical limit to the number of images in a swapchain other than the amount of available resources (i.e., memory) in the system. Trying to derive a hard limit from things like memory size is prone to failure. It is better in such cases to leave it to applications to figure such soft limits out via trial/failure iterations.

15) Should there be a special value for `VkSurfaceCapabilitiesKHR::currentExtent` to indicate the size of the platform surface is undefined?

RESOLVED: Yes. On some platforms (Wayland, for example), the surface size is defined by the images presented to it rather than the other way around.

16) Should there be a special value for `VkSurfaceCapabilitiesKHR::maxImageExtent` to indicate there is no practical limit on the surface size?

RESOLVED: No. It seems unlikely such a system would exist. 0 could be used to indicate the platform places no limits on the extents beyond those imposed by Vulkan for normal images, but this query could just as easily return those same limits, so a special “unlimited” value does not seem useful for this field.

17) How should surface rotation and mirroring be exposed to applications? How do they specify rotation and mirroring transforms applied prior to presentation?

RESOLVED: Applications can query both the supported and current transforms of a surface. Both are specified relative to the device's "natural" display rotation and direction. The supported transforms indicate which orientations the presentation engine accepts images in. For example, a presentation engine that does not support transforming surfaces as part of presentation, and which is presenting to a surface that is displayed with a 90-degree rotation, would return only one supported transform bit: `VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR`. Applications must transform their rendering by the transform they specify when creating the swapchain in `preTransform` field.

18) Can surfaces ever not support `VK_MIRROR_NONE`? Can they support vertical and horizontal mirroring simultaneously? Relatedly, should `VK_MIRROR_NONE_BIT` be zero, or bit one, and should applications be allowed to specify multiple pre and current mirror transform bits, or exactly one?

RESOLVED: Since some platforms may not support presenting with a transform other than the native window's current transform, and prerotation/mirroring are specified relative to the device's natural rotation and direction, rather than relative to the surface's current rotation and direction, it is necessary to express lack of support for no mirroring. To allow this, the `MIRROR_NONE` enum must occupy a bit in the flags. Since `MIRROR_NONE` must be a bit in the bitmask rather than a bitmask with no values set, allowing more than one bit to be set in the bitmask would make it possible to describe undefined transforms such as `VK_MIRROR_NONE_BIT | VK_MIRROR_HORIZONTAL_BIT`, or a transform that includes both "no mirroring" and "horizontal mirroring" simultaneously. Therefore, it is desirable to allow specifying all supported mirroring transforms using only one bit. The question then becomes, should there be a `VK_MIRROR_HORIZONTAL_AND_VERTICAL_BIT` to represent a simultaneous horizontal and vertical mirror transform? However, such a transform is equivalent to a 180 degree rotation, so presentation engines and applications that wish to support or use such a transform can express it through rotation instead. Therefore, 3 exclusive bits are sufficient to express all needed mirroring transforms.

19) Should support for sRGB be required?

RESOLVED: In the advent of UHD and HDR display devices, proper color space information is vital to the display pipeline represented by the swapchain. The application can discover the supported format/color-space pairs and select a pair most suited to its rendering needs. Currently only the sRGB color space is supported, future extensions may provide support for more color spaces. See issues 23 and 24.

20) Is there a mechanism to modify or replace an existing swapchain with one targeting the same surface?

RESOLVED: Yes. This is described above in the text.

21) Should there be a way to set prerotation and mirroring using native APIs when presenting using a Vulkan swapchain?

RESOLVED: Yes. The transforms that can be expressed in this extension are a subset of those possible on native platforms. If a platform exposes a method to specify the transform of presented images for a given surface using native methods and exposes more transforms or other properties for surfaces than Vulkan supports, it might be impossible, difficult, or inconvenient to set some of

those properties using Vulkan KHR extensions and some using the native interfaces. To avoid overwriting properties set using native commands when presenting using a Vulkan swapchain, the application can set the pretransform to “inherit”, in which case the current native properties will be used, or if none are available, a platform-specific default will be used. Platforms that do not specify a reasonable default or do not provide native mechanisms to specify such transforms should not include the inherit bits in the `supportedTransforms` bitmask they return in `VkSurfaceCapabilitiesKHR`.

22) Should the content of presentable images be clipped by objects obscuring their target surface?

RESOLVED: Applications can choose which behavior they prefer. Allowing the content to be clipped could enable more efficient presentation methods on some platforms, but some applications might rely on the content of presentable images to perform techniques such as partial updates or motion blurs.

23) What is the purpose of specifying a `VkColorSpaceKHR` along with `VkFormat` when creating a swapchain?

RESOLVED: While Vulkan itself is color space agnostic (e.g. even the meaning of R, G, B and A can be freely defined by the rendering application), the swapchain eventually will have to present the images on a display device with specific color reproduction characteristics. If any color space transformations are necessary before an image can be displayed, the color space of the presented image must be known to the swapchain. A swapchain will only support a restricted set of color format and -space pairs. This set can be discovered via `vkGetPhysicalDeviceSurfaceFormatsKHR`. As it can be expected that most display devices support the sRGB color space, at least one format/color-space pair has to be exposed, where the color space is `VK_COLOR_SPACE_SRGB_NONLINEAR_KHR`.

24) How are sRGB formats and the sRGB color space related?

RESOLVED: While Vulkan exposes a number of SRGB texture formats, using such formats does not guarantee working in a specific color space. It merely means that the hardware can directly support applying the non-linear transfer functions defined by the sRGB standard color space when reading from or writing to images of those formats. Still, it is unlikely that a swapchain will expose a `*_SRGB` format along with any color space other than `VK_COLOR_SPACE_SRGB_NONLINEAR_KHR`.

On the other hand, non-`*_SRGB` formats will be very likely exposed in pair with a SRGB color space. This means, the hardware will not apply any transfer function when reading from or writing to such images, yet they will still be presented on a device with sRGB display characteristics. In this case the application is responsible for applying the transfer function, for instance by using shader math.

25) How are the lifetimes of surfaces and swapchains targeting them related?

RESOLVED: A surface must outlive any swapchains targeting it. A `VkSurfaceKHR` owns the binding of the native window to the Vulkan driver.

26) How can the application control the way the alpha component of swapchain images is treated by the presentation engine during compositing?

RESOLVED: We should add new enum values to allow the application to negotiate with the

presentation engine on how to treat image alpha values during the compositing process. Since not all platforms can practically control this through the Vulkan driver, a value of `VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR` is provided like for surface transforms.

27) Is `vkCreateSwapchainKHR` the right function to return `VK_ERROR_NATIVE_WINDOW_IN_USE_KHR`, or should the various platform-specific `VkSurfaceKHR` factory functions catch this error earlier?

RESOLVED: For most platforms, the `VkSurfaceKHR` structure is a simple container holding the data that identifies a native window or other object representing a surface on a particular platform. For the surface factory functions to return this error, they would likely need to register a reference on the native objects with the native display server somehow, and ensure no other such references exist. Surfaces were not intended to be that heavyweight.

Swapchains are intended to be the objects that directly manipulate native windows and communicate with the native presentation mechanisms. Swapchains will already need to communicate with the native display server to negotiate allocation and/or presentation of presentable images for a native surface. Therefore, it makes more sense for swapchain creation to be the point at which native object exclusivity is enforced. Platforms may choose to enforce further restrictions on the number of `VkSurfaceKHR` objects that may be created for the same native window if such a requirement makes sense on a particular platform, but a global requirement is only sensible at the swapchain level.

Version History

- Revision 1, 2015-05-20 (James Jones)
 - Initial draft, based on LunarG KHR spec, other KHR specs, patches attached to bugs.
- Revision 2, 2015-05-22 (Ian Elliott)
 - Made many agreed-upon changes from 2015-05-21 KHR TSG meeting. This includes using only a queue for presentation, and having an explicit function to acquire the next image.
 - Fixed typos and other minor mistakes.
- Revision 3, 2015-05-26 (Ian Elliott)
 - Improved the Description section.
 - Added or resolved issues that were found in improving the Description. For example, `pSurfaceDescription` is used consistently, instead of sometimes using `pSurface`.
- Revision 4, 2015-05-27 (James Jones)
 - Fixed some grammatical errors and typos
 - Filled in the description of `imageUseFlags` when creating a swapchain.
 - Added a description of `swapInterval`.
 - Replaced the paragraph describing the order of operations on a queue for image ownership and presentation.
- Revision 5, 2015-05-27 (James Jones)
 - Imported relevant issues from the (abandoned) `vk_wsi_persistent_swapchain_images` extension.

- Added issues 6 and 7, regarding behavior of the acquire next image and present commands with respect to queues.
- Updated spec language and examples to align with proposed resolutions to issues 6 and 7.
- Revision 6, 2015-05-27 (James Jones)
 - Added issue 8, regarding atomic presentation of multiple swapchains
 - Updated spec language and examples to align with proposed resolution to issue 8.
- Revision 7, 2015-05-27 (James Jones)
 - Fixed compilation errors in example code, and made related spec fixes.
- Revision 8, 2015-05-27 (James Jones)
 - Added issue 9, and the related VK_SUBOPTIMAL_KHR result code.
 - Renamed VK_OUT_OF_DATE_KHR to VK_ERROR_OUT_OF_DATE_KHR.
- Revision 9, 2015-05-27 (James Jones)
 - Added inline proposed resolutions (marked with [JRJ]) to some XXX questions/issues. These should be moved to the issues section in a subsequent update if the proposals are adopted.
- Revision 10, 2015-05-28 (James Jones)
 - Converted vkAcquireNextImageKHR back to a non-queue operation that uses a VkSemaphore object for explicit synchronization.
 - Added issue 10 to determine whether vkAcquireNextImageKHR generates or returns semaphores, or whether it operates on a semaphore provided by the application.
- Revision 11, 2015-05-28 (James Jones)
 - Marked issues 6, 7, and 8 resolved.
 - Renamed VkSurfaceCapabilityPropertiesKHR to VkSurfacePropertiesKHR to better convey the mutable nature of the information it contains.
- Revision 12, 2015-05-28 (James Jones)
 - Added issue 11 with a proposed resolution, and the related issue 12.
 - Updated various sections of the spec to match the proposed resolution to issue 11.
- Revision 13, 2015-06-01 (James Jones)
 - Moved some structures to VK_EXT_KHR_swap_chain to resolve the specification's issues 1 and 2.
- Revision 14, 2015-06-01 (James Jones)
 - Added code for example 4 demonstrating how an application might make use of the two different present and acquire next image KHR result codes.
 - Added issue 13.
- Revision 15, 2015-06-01 (James Jones)
 - Added issues 14 - 16 and related spec language.
 - Fixed some spelling errors.
 - Added language describing the meaningful return values for vkAcquireNextImageKHR and

vkQueuePresentKHR.

- Revision 16, 2015-06-02 (James Jones)
 - Added issues 17 and 18, as well as related spec language.
 - Removed some erroneous text added by mistake in the last update.
- Revision 17, 2015-06-15 (Ian Elliott)
 - Changed special value from “-1” to “0” so that the data types can be unsigned.
- Revision 18, 2015-06-15 (Ian Elliott)
 - Clarified the values of `VkSurfacePropertiesKHR::minImageCount` and the timeout parameter of the `vkAcquireNextImageKHR` function.
- Revision 19, 2015-06-17 (James Jones)
 - Misc. cleanup. Removed resolved inline issues and fixed typos.
 - Fixed clarification of `VkSurfacePropertiesKHR::minImageCount` made in version 18.
 - Added a brief “Image Ownership” definition to the list of terms used in the spec.
- Revision 20, 2015-06-17 (James Jones)
 - Updated enum-extending values using new convention.
- Revision 21, 2015-06-17 (James Jones)
 - Added language describing how to use `VK_IMAGE_LAYOUT_PRESENT_SOURCE_KHR`.
 - Cleaned up an XXX comment regarding the description of which queues `vkQueuePresentKHR` can be used on.
- Revision 22, 2015-06-17 (James Jones)
 - Rebased on Vulkan API version 126.
- Revision 23, 2015-06-18 (James Jones)
 - Updated language for issue 12 to read as a proposed resolution.
 - Marked issues 11, 12, 13, 16, and 17 resolved.
 - Temporarily added links to the relevant bugs under the remaining unresolved issues.
 - Added issues 19 and 20 as well as proposed resolutions.
- Revision 24, 2015-06-19 (Ian Elliott)
 - Changed special value for `VkSurfacePropertiesKHR::currentExtent` back to “-1” from “0”. This value will never need to be unsigned, and “0” is actually a legal value.
- Revision 25, 2015-06-23 (Ian Elliott)
 - Examples now show use of function pointers for extension functions.
 - Eliminated extraneous whitespace.
- Revision 26, 2015-06-25 (Ian Elliott)
 - Resolved Issues 9 & 10 per KHR TSG meeting.
- Revision 27, 2015-06-25 (James Jones)

- Added oldSwapchain member to VkSwapchainCreateInfoKHR.
- Revision 28, 2015-06-25 (James Jones)
 - Added the “inherit” bits to the rotation and mirroring flags and the associated issue 21.
- Revision 29, 2015-06-25 (James Jones)
 - Added the “clipped” flag to VkSwapchainCreateInfoKHR, and the associated issue 22.
 - Specified that presenting an image does not modify it.
- Revision 30, 2015-06-25 (James Jones)
 - Added language to the spec that clarifies the behavior of vkCreateSwapchainKHR() when the oldSwapchain field of VkSwapchainCreateInfoKHR is not NULL.
- Revision 31, 2015-06-26 (Ian Elliott)
 - Example of new VkSwapchainCreateInfoKHR members, “oldSwapchain” and “clipped”.
 - Example of using VkSurfacePropertiesKHR::{min|max}ImageCount to set VkSwapchainCreateInfoKHR::minImageCount.
 - Rename vkGetSurfaceInfoKHR()'s 4th parameter to “pDataSize”, for consistency with other functions.
 - Add macro with C-string name of extension (just to header file).
- Revision 32, 2015-06-26 (James Jones)
 - Minor adjustments to the language describing the behavior of “oldSwapchain”
 - Fixed the version date on my previous two updates.
- Revision 33, 2015-06-26 (Jesse Hall)
 - Add usage flags to VkSwapchainCreateInfoKHR
- Revision 34, 2015-06-26 (Ian Elliott)
 - Rename vkQueuePresentKHR()'s 2nd parameter to “pPresentInfo”, for consistency with other functions.
- Revision 35, 2015-06-26 (Faith Ekstrand)
 - Merged the VkRotationFlagBitsKHR and VkMirrorFlagBitsKHR enums into a single VkSurfaceTransformFlagBitsKHR enum.
- Revision 36, 2015-06-26 (Faith Ekstrand)
 - Added a VkSurfaceTransformKHR enum that is not a bitmask. Each value in VkSurfaceTransformKHR corresponds directly to one of the bits in VkSurfaceTransformFlagBitsKHR so transforming from one to the other is easy. Having a separate enum means that currentTransform and preTransform are now unambiguous by definition.
- Revision 37, 2015-06-29 (Ian Elliott)
 - Corrected one of the signatures of vkAcquireNextImageKHR, which had the last two parameters switched from what it is elsewhere in the specification and header files.
- Revision 38, 2015-06-30 (Ian Elliott)

- Corrected a typo in description of the `vkGetSwapchainInfoKHR()` function.
- Corrected a typo in header file comment for `VkPresentInfoKHR::sType`.
- Revision 39, 2015-07-07 (Daniel Rakos)
 - Added error section describing when each error is expected to be reported.
 - Replaced `bool32_t` with `VkBool32`.
- Revision 40, 2015-07-10 (Ian Elliott)
 - Updated to work with version 138 of the `vulkan.h` header. This includes declaring the `VkSwapchainKHR` type using the new `VK_DEFINE_NONDISP_HANDLE` macro, and no longer extending `VkObjectType` (which was eliminated).
- Revision 41 2015-07-09 (Mathias Heyer)
 - Added color space language.
- Revision 42, 2015-07-10 (Daniel Rakos)
 - Updated query mechanism to reflect the convention changes done in the core spec.
 - Removed “queue” from the name of `VK_STRUCTURE_TYPE_QUEUE_PRESENT_INFO_KHR` to be consistent with the established naming convention.
 - Removed reference to the no longer existing `VkObjectType` enum.
- Revision 43, 2015-07-17 (Daniel Rakos)
 - Added support for concurrent sharing of swapchain images across queue families.
 - Updated sample code based on recent changes
- Revision 44, 2015-07-27 (Ian Elliott)
 - Noted that support for `VK_PRESENT_MODE_FIFO_KHR` is required. That is ICDs may optionally support `IMMEDIATE` and `MAILBOX`, but must support `FIFO`.
- Revision 45, 2015-08-07 (Ian Elliott)
 - Corrected a typo in spec file (type and variable name had wrong case for the `imageColorSpace` member of the `VkSwapchainCreateInfoKHR` struct).
 - Corrected a typo in header file (last parameter in `PFN_vkGetSurfacePropertiesKHR` was missing “KHR” at the end of type: `VkSurfacePropertiesKHR`).
- Revision 46, 2015-08-20 (Ian Elliott)
 - Renamed this extension and all of its enumerations, types, functions, etc. This makes it compliant with the proposed standard for Vulkan extensions.
 - Switched from “revision” to “version”, including use of the `VK_MAKE_VERSION` macro in the header file.
 - Made improvements to several descriptions.
 - Changed the status of several issues from `PROPOSED` to `RESOLVED`, leaving no unresolved issues.
 - Resolved several TODOs, did miscellaneous cleanup, etc.
- Revision 47, 2015-08-20 (Ian Elliott—porting a 2015-07-29 change from James Jones)

- Moved the surface transform enums to `VK_WSI_swapchain` so they could be reused by `VK_WSI_display`.
- Revision 48, 2015-09-01 (James Jones)
 - Various minor cleanups.
- Revision 49, 2015-09-01 (James Jones)
 - Restore single-field revision number.
- Revision 50, 2015-09-01 (James Jones)
 - Update Example #4 to include code that illustrates how to use the `oldSwapchain` field.
- Revision 51, 2015-09-01 (James Jones)
 - Fix example code compilation errors.
- Revision 52, 2015-09-08 (Matthaeus G. Chajdas)
 - Corrected a typo.
- Revision 53, 2015-09-10 (Alon Or-bach)
 - Removed underscore from `SWAP_CHAIN` left in `VK_STRUCTURE_TYPE_SWAPCHAIN_CREATE_INFO_KHR`.
- Revision 54, 2015-09-11 (Jesse Hall)
 - Described the execution and memory coherence requirements for image transitions to and from `VK_IMAGE_LAYOUT_PRESENT_SOURCE_KHR`.
- Revision 55, 2015-09-11 (Ray Smith)
 - Added errors for destroying and binding memory to presentable images
- Revision 56, 2015-09-18 (James Jones)
 - Added fence argument to `vkAcquireNextImageKHR`
 - Added example of how to meter a host thread based on presentation rate.
- Revision 57, 2015-09-26 (Jesse Hall)
 - Replace `VkSurfaceDescriptionKHR` with `VkSurfaceKHR`.
 - Added issue 25 with agreed resolution.
- Revision 58, 2015-09-28 (Jesse Hall)
 - Renamed from `VK_EXT_KHR_device_swapchain` to `VK_EXT_KHR_swapchain`.
- Revision 59, 2015-09-29 (Ian Elliott)
 - Changed `vkDestroySwapchainKHR()` to return void.
- Revision 60, 2015-10-01 (Jeff Vigil)
 - Added error result `VK_ERROR_SURFACE_LOST_KHR`.
- Revision 61, 2015-10-05 (Faith Ekstrand)
 - Added the `VkCompositeAlpha` enum and corresponding structure fields.
- Revision 62, 2015-10-12 (Daniel Rakos)

- Added VK_PRESENT_MODE_FIFO_RELAXED_KHR.
- Revision 63, 2015-10-15 (Daniel Rakos)
 - Moved surface capability queries to VK_EXT_KHR_surface.
- Revision 64, 2015-10-26 (Ian Elliott)
 - Renamed from VK_EXT_KHR_swapchain to VK_KHR_swapchain.
- Revision 65, 2015-10-28 (Ian Elliott)
 - Added optional pResult member to VkPresentInfoKHR, so that per-swapchain results can be obtained from vkQueuePresentKHR().
- Revision 66, 2015-11-03 (Daniel Rakos)
 - Added allocation callbacks to create and destroy functions.
 - Updated resource transition language.
 - Updated sample code.
- Revision 67, 2015-11-10 (Jesse Hall)
 - Add reserved flags bitmask to VkSwapchainCreateInfoKHR.
 - Modify naming and member ordering to match API style conventions, and so the VkSwapchainCreateInfoKHR image property members mirror corresponding VkImageCreateInfo members but with an 'image' prefix.
 - Make VkPresentInfoKHR::pResults non-const; it is an output array parameter.
 - Make pPresentInfo parameter to vkQueuePresentKHR const.
- Revision 68, 2016-04-05 (Ian Elliott)
 - Moved the “validity” include for vkAcquireNextImage to be in its proper place, after the prototype and list of parameters.
 - Clarified language about presentable images, including how they are acquired, when applications can and cannot use them, etc. As part of this, removed language about “ownership” of presentable images, and replaced it with more-consistent language about presentable images being “acquired” by the application.
- 2016-08-23 (Ian Elliott)
 - Update the example code, to use the final API command names, to not have so many characters per line, and to split out a new example to show how to obtain function pointers. This code is more similar to the LunarG “cube” demo program.
- 2016-08-25 (Ian Elliott)
 - A note was added at the beginning of the example code, stating that it will be removed from future versions of the appendix.
- Revision 69, 2017-09-07 (Tobias Hector)
 - Added interactions with Vulkan 1.1
- Revision 70, 2017-10-06 (Ian Elliott)
 - Corrected interactions with Vulkan 1.1

Description

This extension allows processing of swapchain images as different formats to that used by the window system, which is particularly useful for switching between sRGB and linear RGB formats.

It adds a new swapchain creation flag that enables creating image views from presentable images with a different format than the one used to create the swapchain.

New Enum Constants

- `VK_KHR_SWAPCHAIN_MUTABLE_FORMAT_EXTENSION_NAME`
- `VK_KHR_SWAPCHAIN_MUTABLE_FORMAT_SPEC_VERSION`
- Extending `VkSwapchainCreateFlagBitsKHR`:
 - `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR`

Issues

1) Are there any new capabilities needed?

RESOLVED: No. It is expected that all implementations exposing this extension support swapchain image format mutability.

2) Do we need a separate `VK_SWAPCHAIN_CREATE_EXTENDED_USAGE_BIT_KHR`?

RESOLVED: No. This extension requires `VK_KHR_maintenance2` and presentable images of swapchains created with `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR` are created internally in a way equivalent to specifying both `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` and `VK_IMAGE_CREATE_EXTENDED_USAGE_BIT_KHR`.

3) Do we need a separate structure to allow specifying an image format list for swapchains?

RESOLVED: No. We simply use the same `VkImageFormatListCreateInfoKHR` structure introduced by `VK_KHR_image_format_list`. The structure is required to be included in the `pNext` chain of `VkSwapchainCreateInfoKHR` for swapchains created with `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR`.

Description

This extension modifies the original core synchronization APIs to simplify the interface and improve usability of these APIs. It also adds new pipeline stage and access flag types that extend into the 64-bit range, as we have run out within the 32-bit range. The new flags are identical to the old values within the 32-bit range, with new stages and bits beyond that.

Pipeline stages and access flags are now specified together in memory barrier structures, making the connection between the two more obvious. Additionally, scoping the pipeline stages into the barrier structs allows the use of the `MEMORY_READ` and `MEMORY_WRITE` flags without sacrificing precision. The per-stage access flags should be used to disambiguate specific accesses in a given stage or set of stages - for instance, between uniform reads and sampling operations.

Layout transitions have been simplified as well; rather than requiring a different set of layouts for depth/stencil/color attachments, there are generic `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` and `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR` layouts which are contextually applied based on the image format. For example, for a depth format image, `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR` is equivalent to `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR`. `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR` also functionally replaces `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`.

Events are now more efficient, because they include memory dependency information when you set them on the device. Previously, this information was only known when waiting on an event, so the dependencies could not be satisfied until the wait occurred. That sometimes meant stalling the pipeline when the wait occurred. The new API provides enough information for implementations to satisfy these dependencies in parallel with other tasks.

Queue submission has been changed to wrap command buffers and semaphores in extensible structures, which incorporate changes from Vulkan 1.1, `VK_KHR_device_group`, and `VK_KHR_timeline_semaphore`. This also adds a pipeline stage to the semaphore signal operation, mirroring the existing pipeline stage specification for wait operations.

Other miscellaneous changes include:

- Events can now be specified as interacting only with the device, allowing more efficient access to the underlying object.
- Image memory barriers that do not perform an image layout transition can be specified by setting `oldLayout` equal to `newLayout`.
 - E.g. the old and new layout can both be set to `VK_IMAGE_LAYOUT_UNDEFINED`, without discarding data in the image.
- Queue family ownership transfer parameters are simplified in some cases.
- Extensions with commands or functions with a `VkPipelineStageFlags` or `VkPipelineStageFlagBits` parameter have had those APIs replaced with equivalents using `VkPipelineStageFlags2KHR`.
- The new event and barrier interfaces are now more extensible for future changes.
- Relevant pipeline stage masks can now be specified as empty with the new

[VK_PIPELINE_STAGE_NONE_KHR](#) and [VK_PIPELINE_STAGE_2_NONE_KHR](#) values.

- [VkMemoryBarrier2KHR](#) can be chained to [VkSubpassDependency2](#), overriding the original 32-bit stage and access masks.

If VK_EXT_conditional_rendering is supported:

- Extending VkAccessFlagBits2:
 - VK_ACCESS_2_CONDITIONAL_RENDERING_READ_BIT_EXT
- Extending VkPipelineStageFlagBits2:
 - VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT

If VK_EXT_device_generated_commands is supported:

- Extending VkAccessFlagBits2:
 - VK_ACCESS_2_COMMAND_PREPROCESS_READ_BIT_EXT
 - VK_ACCESS_2_COMMAND_PREPROCESS_WRITE_BIT_EXT
- Extending VkPipelineStageFlagBits2:
 - VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_EXT

If VK_EXT_fragment_density_map is supported:

- Extending VkAccessFlagBits2:
 - VK_ACCESS_2_FRAGMENT_DENSITY_MAP_READ_BIT_EXT
- Extending VkPipelineStageFlagBits2:
 - VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT

If VK_EXT_mesh_shader is supported:

- Extending VkPipelineStageFlagBits2:
 - VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT
 - VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT

If VK_EXT_transform_feedback is supported:

- Extending VkAccessFlagBits2:
 - VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT
 - VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT
 - VK_ACCESS_2_TRANSFORM_FEEDBACK_WRITE_BIT_EXT

- Extending [VkPipelineStageFlagBits2](#):
 - `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`

If `VK_KHR_acceleration_structure` is supported:

- Extending [VkAccessFlagBits2](#):
 - `VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR`
 - `VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`
- Extending [VkPipelineStageFlagBits2](#):
 - `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`

If `VK_KHR_fragment_shading_rate` is supported:

- Extending [VkAccessFlagBits2](#):
 - `VK_ACCESS_2_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR`
- Extending [VkPipelineStageFlagBits2](#):
 - `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

If `VK_KHR_ray_tracing_pipeline` is supported:

- Extending [VkPipelineStageFlagBits2](#):
 - `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

If `VK_NV_device_generated_commands` is supported:

- Extending [VkAccessFlagBits2](#):
 - `VK_ACCESS_2_COMMAND_PREPROCESS_READ_BIT_NV`
 - `VK_ACCESS_2_COMMAND_PREPROCESS_WRITE_BIT_NV`
- Extending [VkPipelineStageFlagBits2](#):
 - `VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV`

If `VK_NV_mesh_shader` is supported:

- Extending [VkPipelineStageFlagBits2](#):
 - `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_NV`
 - `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_NV`

If `VK_NV_ray_tracing` is supported:

- Extending [VkAccessFlagBits2](#):
 - `VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_NV`
 - `VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_NV`
- Extending [VkPipelineStageFlagBits2](#):

- `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_NV`
- `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_NV`

If `VK_NV_shading_rate_image` is supported:

- Extending `VkAccessFlagBits2`:
 - `VK_ACCESS_2_SHADING_RATE_IMAGE_READ_BIT_NV`
- Extending `VkPipelineStageFlagBits2`:
 - `VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV`

Promotion to Vulkan 1.3

Vulkan APIs in this extension are included in core Vulkan 1.3, with the KHR suffix omitted. External interactions defined by this extension, such as SPIR-V token names, retain their original names. The original Vulkan API names are still available as aliases of the core functionality.

Description

This extension defines the `VK_FORMAT_A4R4G4B4_UNORM_PACK16_EXT` and `VK_FORMAT_A4B4G4R4_UNORM_PACK16_EXT` formats which are defined in other current graphics APIs.

This extension may be useful for building translation layers for those APIs or for porting applications that use these formats without having to resort to swizzles.

When `VK_EXT_custom_border_color` is used, these formats are not subject to the same restrictions for border color without format as with `VK_FORMAT_B4G4R4A4_UNORM_PACK16`.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
 - `VkPhysicalDevice4444FormatsFeaturesEXT`

New Enum Constants

- `VK_EXT_4444_FORMATS_EXTENSION_NAME`
- `VK_EXT_4444_FORMATS_SPEC_VERSION`
- Extending `VkFormat`:
 - `VK_FORMAT_A4B4G4R4_UNORM_PACK16_EXT`
 - `VK_FORMAT_A4R4G4B4_UNORM_PACK16_EXT`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_4444_FORMATS_FEATURES_EXT`

Promotion to Vulkan 1.3

The format enumerants introduced by the extension are included in core Vulkan 1.3, with the EXT suffix omitted. However, runtime support for these formats is optional in core Vulkan 1.3, while if this extension is supported, runtime support is mandatory. The feature structure is not promoted. The original enum names are still available as aliases of the core functionality.

Description

This instance extension enables an application to pass application parameters to the implementation at instance or device creation time.

The application parameters consist of a set of vendor-specific keys and values. Each key is a 32-bit enum, and each value is a 64-bit integer. The valid keys, range of values, and default values are documented external to this specification in implementation-specific documentation.

This extension is an instance extension rather than a device extension so that the implementation can modify reported `VkPhysicalDevice` properties or features as needed.

New Structures

- Extending [VkApplicationInfo](#), [VkDeviceCreateInfo](#):
 - [VkApplicationParametersEXT](#)

New Enum Constants

- `VK_EXT_APPLICATION_PARAMETERS_EXTENSION_NAME`

- `VK_EXT_APPLICATION_PARAMETERS_SPEC_VERSION`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_APPLICATION_PARAMETERS_EXT`

Issues

1. How should the `key` enumerants be assigned?

RESOLVED: The `key` enumerants are completely implementation-specific and do not need to be centrally reserved. They should be documented in the implementation-specific documentation. The vendor ID and optionally the device ID are provided to disambiguate between multiple ICDs or devices.

2. How does an application know what application parameters are valid on a particular implementation?

DISCUSSION: There is no ability to enumerate device or system properties before an instance is created, however `key` and `values` **must** be recognized by an implementation in order for instance or device creation to succeed. The vendor and optionally the device ID are provided to identify which ICD or device the application parameters are targeted at.

3. Is it OK if the "valid value" for specified keys is not from static documented values, but must be consistent-with/interdependent-on other `VkApplicationParametersEXT`?

DISCUSSION: Yes this is fine. Examples for how this could be used include:

- a checksum `key` where the `value` is computed based on other `VkApplicationParametersEXT` structures in the `pNext` chain.
- an "application key" which either implies or explicitly lists a set of prevalidated key/value pairs.

Description

The existing specification requires that low dynamic range (LDR) ASTC textures are decompressed to FP16 values per component. In many cases, decompressing LDR textures to a lower precision intermediate result gives acceptable image quality. Source material for LDR textures is typically authored as 8-bit UNORM values, so decoding to FP16 values adds little value. On the other hand, reducing precision of the decoded result reduces the size of the decompressed data, potentially improving texture cache performance and saving power.

The goal of this extension is to enable this efficiency gain on existing ASTC texture data. This is achieved by giving the application the ability to select the intermediate decoding precision.

Three decoding options are provided:

- Decode to [VK_FORMAT_R16G16B16A16_SFLOAT](#) precision: This is the default, and matches the required behavior in the core API.
- Decode to [VK_FORMAT_R8G8B8A8_UNORM](#) precision: This is provided as an option in LDR mode.
- Decode to [VK_FORMAT_E5B9G9R9_UFLOAT_PACK32](#) precision: This is provided as an option in both LDR and HDR mode. In this mode, negative values cannot be represented and are clamped to zero. The alpha component is ignored, and the results are as if alpha was 1.0. This decode mode is optional and support can be queried via the physical device properties.

New Structures

- [VK_EXT_ASTC_DECODE_MODE_SPEC_VERSION](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_IMAGE_VIEW_ASTC_DECODE_MODE_EXT](#)
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ASTC_DECODE_FEATURES_EXT](#)

Issues

1) Are implementations allowed to decode at a higher precision than what is requested?

RESOLUTION: No.

If we allow this, then this extension could be exposed on all implementations that support ASTC.

But developers would have no way of knowing what precision was actually used, and thus whether the image quality is sufficient at reduced precision.

2) Should the decode mode be image view state and/or sampler state?

RESOLUTION: Image view state only.

Some implementations treat the different decode modes as different texture formats.

Example

Create an image view that decodes to [VK_FORMAT_R8G8B8A8_UNORM](#) precision:

```
VkImageViewASTCDecodeModeEXT decodeMode =
{
    .sType = VK_STRUCTURE_TYPE_IMAGE_VIEW_ASTC_DECODE_MODE_EXT,
    .pNext = NULL,
    .decodeMode = VK_FORMAT_R8G8B8A8_UNORM
};

VkImageViewCreateInfo createInfo =
{
    .sType = VK_STRUCTURE_TYPE_IMAGE_VIEW_CREATE_INFO,
    .pNext = &decodeMode,
    // flags, image, viewType set to application-desired values
    .format = VK_FORMAT_ASTC_8x8_UNORM_BLOCK,
    // components, subresourceRange set to application-desired values
}
```

```
};

VkImageView imageView;
VkResult result = vkCreateImageView(
    device,
    &createInfo,
    NULL,
    &imageView);
```

Description

This extension adds a number of “advanced” blending operations that **can** be used to perform new color blending operations, many of which are more complex than the standard blend modes provided by unextended Vulkan. This extension requires different styles of usage, depending on the level of hardware support and the enabled features:

- If `VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT::advancedBlendCoherentOperations` is `VK_FALSE`, the new blending operations are supported, but a memory dependency **must** separate each advanced blend operation on a given sample. `VK_ACCESS_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT` is used to synchronize reads using advanced blend operations.
- If `VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT::advancedBlendCoherentOperations` is `VK_TRUE`, advanced blend operations obey primitive order just like basic blend operations.

In unextended Vulkan, the set of blending operations is limited, and **can** be expressed very simply. The `VK_BLEND_OP_MIN` and `VK_BLEND_OP_MAX` blend operations simply compute component-wise minimums or maximums of source and destination color components. The `VK_BLEND_OP_ADD`, `VK_BLEND_OP_SUBTRACT`, and `VK_BLEND_OP_REVERSE_SUBTRACT` modes multiply the source and destination colors by source and destination factors and either add the two products together or subtract one from the other. This limited set of operations supports many common blending operations but precludes the use of more sophisticated transparency and blending operations commonly available in many dedicated imaging APIs.

This extension provides a number of new “advanced” blending operations. Unlike traditional blending operations using `VK_BLEND_OP_ADD`, these blending equations do not use source and destination factors specified by `VkBlendFactor`. Instead, each blend operation specifies a complete equation based on the source and destination colors. These new blend operations are used for both RGB and alpha components; they **must** not be used to perform separate RGB and alpha blending (via different values of color and alpha `VkBlendOp`).

These blending operations are performed using premultiplied colors, where RGB colors **can** be considered premultiplied or non-premultiplied by alpha, according to the `srcPremultiplied` and `dstPremultiplied` members of `VkPipelineColorBlendAdvancedStateCreateInfoEXT`. If a color is considered non-premultiplied, the (R,G,B) color components are multiplied by the alpha component prior to blending. For non-premultiplied color components in the range [0,1], the corresponding premultiplied color component would have values in the range $[0 \times A, 1 \times A]$.

Many of these advanced blending equations are formulated where the result of blending source and destination colors with partial coverage have three separate contributions: from the portions covered by both the source and the destination, from the portion covered only by the source, and from the portion covered only by the destination. The blend parameter `VkPipelineColorBlendAdvancedStateCreateInfoEXT::blendOverlap` **can** be used to specify a correlation between source and destination pixel coverage. If set to `VK_BLEND_OVERLAP_CONJOINT_EXT`, the source and destination are considered to have maximal overlap, as would be the case if drawing two objects on top of each other. If set to `VK_BLEND_OVERLAP_DISJOINT_EXT`, the source and destination are considered to have minimal overlap, as would be the case when rendering a complex polygon tessellated into individual non-intersecting triangles. If set to `VK_BLEND_OVERLAP_UNCORRELATED_EXT`, the source and destination coverage are assumed to have no

spatial correlation within the pixel.

In addition to the coherency issues on implementations not supporting [advancedBlendCoherentOperations](#), this extension has several limitations worth noting. First, the new blend operations have a limit on the number of color attachments they **can** be used with, as indicated by [VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendMaxColorAttachments](#). Additionally, blending precision **may** be limited to 16-bit floating-point, which **may** result in a loss of precision and dynamic range for framebuffer formats with 32-bit floating-point components, and in a loss of precision for formats with 12- and 16-bit signed or unsigned normalized integer components.

Description

This extension allows for selectively enabling and disabling writes to output color attachments via a pipeline dynamic state.

The intended use cases for this new state are mostly identical to those of `colorWriteMask`, such as selectively disabling writes to avoid feedback loops between subpasses or bandwidth savings for unused outputs. By making the state dynamic, one additional benefit is the ability to reduce pipeline counts and pipeline switching via shaders that write a superset of the desired data of which subsets are selected dynamically. The reason for a new state, `colorWriteEnable`, rather than making `colorWriteMask` dynamic is that, on many implementations, the more flexible per-component semantics of the `colorWriteMask` state cannot be made dynamic in a performant manner.

Description

This extension adds a new rasterization mode called conservative rasterization. There are two modes of conservative rasterization; overestimation and underestimation.

When overestimation is enabled, if any part of the primitive, including its edges, covers any part of the rectangular pixel area, including its sides, then a fragment is generated with all coverage samples turned on. This extension allows for some variation in implementations by accounting for differences in overestimation, where the generating primitive size is increased at each of its edges by some sub-pixel amount to further increase conservative pixel coverage. Implementations can allow the application to specify an extra overestimation beyond the base overestimation the implementation already does. It also allows implementations to either cull degenerate primitives or rasterize them.

When underestimation is enabled, fragments are only generated if the rectangular pixel area is fully covered by the generating primitive. If supported by the implementation, when a pixel rectangle is fully covered the fragment shader input variable builtin called FullyCoveredEXT is set to true. The shader variable works in either overestimation or underestimation mode.

Implementations can process degenerate triangles and lines by either discarding them or generating conservative fragments for them. Degenerate triangles are those that end up with zero area after the rasterizer quantizes them to the fixed-point pixel grid. Degenerate lines are those with zero length after quantization.

Description

This extension provides cross-vendor functionality to specify a custom border color for use when the sampler address mode `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER` is used.

To create a sampler which uses a custom border color set `VkSamplerCreateInfo::borderColor` to one of:

- `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT`
- `VK_BORDER_COLOR_INT_CUSTOM_EXT`

When `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT` or `VK_BORDER_COLOR_INT_CUSTOM_EXT` is used, applications

must provide a `VkSamplerCustomBorderColorCreateInfoEXT` in the `pNext` chain for `VkSamplerCreateInfo`.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
 - `VkPhysicalDeviceCustomBorderColorFeaturesEXT`
- Extending `VkPhysicalDeviceProperties2`:
 - `VkPhysicalDeviceCustomBorderColorPropertiesEXT`
- Extending `VkSamplerCreateInfo`:
 - `VkSamplerCustomBorderColorCreateInfoEXT`

New Enum Constants

- `VK_EXT_CUSTOM_BORDER_COLOR_EXTENSION_NAME`
- `VK_EXT_CUSTOM_BORDER_COLOR_SPEC_VERSION`
- Extending `VkBorderColor`:
 - `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT`
 - `VK_BORDER_COLOR_INT_CUSTOM_EXT`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CUSTOM_BORDER_COLOR_FEATURES_EXT`
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CUSTOM_BORDER_COLOR_PROPERTIES_EXT`
 - `VK_STRUCTURE_TYPE_SAMPLER_CUSTOM_BORDER_COLOR_CREATE_INFO_EXT`

Issues

1) Should `VkClearColorValue` be used for the border color value, or should we have our own struct/union? Do we need to specify the type of the input values for the components? This is more of a concern if `VkClearColorValue` is used here because it provides a union of float,int,uint types.

RESOLVED: Will reuse existing `VkClearColorValue` structure in order to easily take advantage of float,int,uint border color types.

2) For hardware which supports a limited number of border colors what happens if that number is exceeded? Should this be handled by the driver unbeknownst to the application? In Revision 1 we had solved this issue using a new Object type, however that may have lead to additional system resource consumption which would otherwise not be required.

RESOLVED: Added `VkPhysicalDeviceCustomBorderColorPropertiesEXT::maxCustomBorderColorSamplers` for tracking implementation-specific limit, and Valid Usage statement handling overflow.

3) Should this be supported for immutable samplers at all, or by a feature bit? Some implementations may not be able to support custom border colors on immutable samplers — is it worthwhile enabling this to work on them for implementations that can support it, or forbidding it entirely.

RESOLVED: Samplers created with a custom border color are forbidden from being immutable. This resolves concerns for implementations where the custom border color is an index to a LUT instead of being directly embedded into sampler state.

4) Should UINT and SINT (unsigned integer and signed integer) border color types be separated or should they be combined into one generic INT (integer) type?

RESOLVED: Separating these does not make much sense as the existing fixed border color types do not have this distinction, and there is no reason in hardware to do so. This separation would also create unnecessary work and considerations for the application.

Version History

- Revision 1, 2019-10-10 (Joshua Ashton)
 - Internal revisions.
- Revision 2, 2019-10-11 (Liam Middlebrook)
 - Remove `VkCustomBorderColor` object and associated functions
 - Add issues concerning HW limitations for custom border color count
- Revision 3, 2019-10-12 (Joshua Ashton)
 - Re-expose the limits for the maximum number of unique border colors
 - Add extra details about border color tracking
 - Fix typos
- Revision 4, 2019-10-12 (Joshua Ashton)
 - Changed `maxUniqueCustomBorderColors` to a `uint32_t` from a `VkDeviceSize`
- Revision 5, 2019-10-14 (Liam Middlebrook)
 - Added features bit
- Revision 6, 2019-10-15 (Joshua Ashton)
 - Type-ize `VK_BORDER_COLOR_CUSTOM`
 - Fix const-ness on `pNext` of `VkSamplerCustomBorderColorCreateInfoEXT`
- Revision 7, 2019-11-26 (Liam Middlebrook)
 - Renamed `maxUniqueCustomBorderColors` to `maxCustomBorderColors`
- Revision 8, 2019-11-29 (Joshua Ashton)
 - Renamed `borderColor` member of `VkSamplerCustomBorderColorCreateInfoEXT` to `customBorderColor`
- Revision 9, 2020-02-19 (Joshua Ashton)
 - Renamed `maxCustomBorderColors` to `maxCustomBorderColorSamplers`
- Revision 10, 2020-02-21 (Joshua Ashton)
 - Added format to `VkSamplerCustomBorderColorCreateInfoEXT` and feature bit
- Revision 11, 2020-04-07 (Joshua Ashton)

- Dropped UINT/SINT border color differences, consolidated types
- Revision 12, 2020-04-16 (Joshua Ashton)
 - Renamed `VK_BORDER_COLOR_CUSTOM_FLOAT_EXT` to `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT` for consistency

Description

Due to the nature of the Vulkan interface, there is very little error information available to the developer and application. By using the `VK_EXT_debug_utils` extension, developers **can** obtain more information. When combined with validation layers, even more detailed feedback on the application's use of Vulkan will be provided.

This extension provides the following capabilities:

- The ability to create a debug messenger which will pass along debug messages to an application supplied callback.
- The ability to identify specific Vulkan objects using a name or tag to improve tracking.
- The ability to identify specific sections within a `VkQueue` or `VkCommandBuffer` using labels to aid organization and offline analysis in external tools.

The main difference between this extension and `VK_EXT_debug_report` and `VK_EXT_debug_marker` is that those extensions use `VkDebugReportObjectTypeEXT` to identify objects. This extension uses the core `VkObjectType` in place of `VkDebugReportObjectTypeEXT`. The primary reason for this move is that no future object type handle enumeration values will be added to `VkDebugReportObjectTypeEXT` since the creation of `VkObjectType`.

In addition, this extension combines the functionality of both `VK_EXT_debug_report` and `VK_EXT_debug_marker` by allowing object name and debug markers (now called labels) to be returned to the application's callback function. This should assist in clarifying the details of a debug message including: what objects are involved and potentially which location within a `VkQueue` or `VkCommandBuffer` the message occurred.

Examples

Example 1

`VK_EXT_debug_utils` allows an application to register multiple callbacks with any Vulkan component wishing to report debug information. Some callbacks may log the information to a file, others may cause a debug break point or other application-defined behavior. An application **can** register callbacks even when no validation layers are enabled, but they will only be called for loader and, if implemented, driver events.

To capture events that occur while creating or destroying an instance an application **can** link a `VkDebugUtilsMessengerCreateInfoEXT` structure to the `pNext` chain of the `VkInstanceCreateInfo` structure passed to `vkCreateInstance`.

Example uses: Create three callback objects. One will log errors and warnings to the debug console using Windows `OutputDebugString`. The second will cause the debugger to break at that callback when an error happens and the third will log warnings to stdout.

```
extern VkInstance instance;
VkResult res;
VkDebugUtilsMessengerEXT cb1, cb2, cb3;

// Must call extension functions through a function pointer:
PFN_vkCreateDebugUtilsMessengerEXT pfnCreateDebugUtilsMessengerEXT =
(PFN_vkCreateDebugUtilsMessengerEXT)vkGetInstanceProcAddr(instance,
"vkCreateDebugUtilsMessengerEXT");
PFN_vkDestroyDebugUtilsMessengerEXT pfnDestroyDebugUtilsMessengerEXT =
(PFN_vkDestroyDebugUtilsMessengerEXT)vkGetInstanceProcAddr(instance,
"vkDestroyDebugUtilsMessengerEXT");

VkDebugUtilsMessengerCreateInfoEXT callback1 = {
    .sType = VK_STRUCTURE_TYPE_DEBUG_UTILS_MESSENGER_CREATE_INFO_EXT,
    .pNext = NULL,
```

```

        .flags = 0,
        .messageSeverity = VK_DEBUG_UTILS_MESSAGE_SEVERITY_ERROR_BIT_EXT |
                           VK_DEBUG_UTILS_MESSAGE_SEVERITY_WARNING_BIT_EXT,
        .messageType = VK_DEBUG_UTILS_MESSAGE_TYPE_GENERAL_BIT_EXT |
                       VK_DEBUG_UTILS_MESSAGE_TYPE_VALIDATION_BIT_EXT,
        .pfnUserCallback = myOutputDebugString,
        .pUserData = NULL
    };
    res = pfncreateDebugUtilsMessengerEXT(instance, &callback1, NULL, &cb1);
    if (res != VK_SUCCESS) {
        // Do error handling for VK_ERROR_OUT_OF_MEMORY
    }

    callback1.messageSeverity = VK_DEBUG_UTILS_MESSAGE_SEVERITY_ERROR_BIT_EXT;
    callback1.pfnUserCallback = myDebugBreak;
    callback1.pUserData = NULL;
    res = pfncreateDebugUtilsMessengerEXT(instance, &callback1, NULL, &cb2);
    if (res != VK_SUCCESS) {
        // Do error handling for VK_ERROR_OUT_OF_MEMORY
    }

    VkDebugUtilsMessengerCreateInfoEXT callback3 = {
        .sType = VK_STRUCTURE_TYPE_DEBUG_UTILS_MESSENGER_CREATE_INFO_EXT,
        .pNext = NULL,
        .flags = 0,
        .messageSeverity = VK_DEBUG_UTILS_MESSAGE_SEVERITY_WARNING_BIT_EXT,
        .messageType = VK_DEBUG_UTILS_MESSAGE_TYPE_GENERAL_BIT_EXT |
                      VK_DEBUG_UTILS_MESSAGE_TYPE_VALIDATION_BIT_EXT,
        .pfnUserCallback = myStdOutLogger,
        .pUserData = NULL
    };
    res = pfncreateDebugUtilsMessengerEXT(instance, &callback3, NULL, &cb3);
    if (res != VK_SUCCESS) {
        // Do error handling for VK_ERROR_OUT_OF_MEMORY
    }

    ...

    // Remove callbacks when cleaning up
    pfndestroyDebugUtilsMessengerEXT(instance, cb1, NULL);
    pfndestroyDebugUtilsMessengerEXT(instance, cb2, NULL);
    pfndestroyDebugUtilsMessengerEXT(instance, cb3, NULL);

```

Example 2

Associate a name with an image, for easier debugging in external tools or with validation layers that can print a friendly name when referring to objects in error messages.

```

extern VkInstance instance;
extern VkDevice device;

```

```

extern VkImage image;

// Must call extension functions through a function pointer:
PFN_vkSetDebugUtilsObjectNameEXT pfnSetDebugUtilsObjectNameEXT =
(PFN_vkSetDebugUtilsObjectNameEXT)vkGetInstanceProcAddr(instance,
"vkSetDebugUtilsObjectNameEXT");

// Set a name on the image
const VkDebugUtilsObjectNameInfoEXT imageNameInfo =
{
    .sType = VK_STRUCTURE_TYPE_DEBUG_UTILS_OBJECT_NAME_INFO_EXT,
    .pNext = NULL,
    .objectType = VK_OBJECT_TYPE_IMAGE,
    .objectHandle = (uint64_t)image,
    .pObjectName = "Brick Diffuse Texture",
};

pfnSetDebugUtilsObjectNameEXT(device, &imageNameInfo);

// A subsequent error might print:
// Image 'Brick Diffuse Texture' (0xc0dec0dedeadbeef) is used in a
// command buffer with no memory bound to it.

```

Example 3

Annotating regions of a workload with naming information so that offline analysis tools can display a more usable visualization of the commands submitted.

```

extern VkInstance instance;
extern VkCommandBuffer commandBuffer;

// Must call extension functions through a function pointer:
PFN_vkQueueBeginDebugUtilsLabelEXT pfnQueueBeginDebugUtilsLabelEXT =
(PFN_vkQueueBeginDebugUtilsLabelEXT)vkGetInstanceProcAddr(instance,
"vkQueueBeginDebugUtilsLabelEXT");
PFN_vkQueueEndDebugUtilsLabelEXT pfnQueueEndDebugUtilsLabelEXT =
(PFN_vkQueueEndDebugUtilsLabelEXT)vkGetInstanceProcAddr(instance,
"vkQueueEndDebugUtilsLabelEXT");
PFN_vkCmdBeginDebugUtilsLabelEXT pfnCmdBeginDebugUtilsLabelEXT =
(PFN_vkCmdBeginDebugUtilsLabelEXT)vkGetInstanceProcAddr(instance,
"vkCmdBeginDebugUtilsLabelEXT");
PFN_vkCmdEndDebugUtilsLabelEXT pfnCmdEndDebugUtilsLabelEXT =
(PFN_vkCmdEndDebugUtilsLabelEXT)vkGetInstanceProcAddr(instance,
"vkCmdEndDebugUtilsLabelEXT");
PFN_vkCmdInsertDebugUtilsLabelEXT pfnCmdInsertDebugUtilsLabelEXT =
(PFN_vkCmdInsertDebugUtilsLabelEXT)vkGetInstanceProcAddr(instance,
"vkCmdInsertDebugUtilsLabelEXT");

// Describe the area being rendered
const VkDebugUtilsLabelEXT houseLabel =

```

```

{
    .sType = VK_STRUCTURE_TYPE_DEBUG_UTILS_LABEL_EXT,
    .pNext = NULL,
    .pLabelName = "Brick House",
    .color = { 1.0f, 0.0f, 0.0f, 1.0f },
};

// Start an annotated group of calls under the 'Brick House' name
pfnCmdBeginDebugUtilsLabelEXT(commandBuffer, &houseLabel);
{
    // A mutable structure for each part being rendered
    VkDebugUtilsLabelEXT housePartLabel =
    {
        .sType = VK_STRUCTURE_TYPE_DEBUG_UTILS_LABEL_EXT,
        .pNext = NULL,
        .pLabelName = NULL,
        .color = { 0.0f, 0.0f, 0.0f, 0.0f },
    };

    // Set the name and insert the marker
    housePartLabel.pLabelName = "Walls";
    pfnCmdInsertDebugUtilsLabelEXT(commandBuffer, &housePartLabel);

    // Insert the drawcall for the walls
    vkCmdDrawIndexed(commandBuffer, 1000, 1, 0, 0, 0);

    // Insert a recursive region for two sets of windows
    housePartLabel.pLabelName = "Windows";
    pfnCmdBeginDebugUtilsLabelEXT(commandBuffer, &housePartLabel);
    {
        vkCmdDrawIndexed(commandBuffer, 75, 6, 1000, 0, 0);
        vkCmdDrawIndexed(commandBuffer, 100, 2, 1450, 0, 0);
    }
    pfnCmdEndDebugUtilsLabelEXT(commandBuffer);

    housePartLabel.pLabelName = "Front Door";
    pfnCmdInsertDebugUtilsLabelEXT(commandBuffer, &housePartLabel);

    vkCmdDrawIndexed(commandBuffer, 350, 1, 1650, 0, 0);

    housePartLabel.pLabelName = "Roof";
    pfnCmdInsertDebugUtilsLabelEXT(commandBuffer, &housePartLabel);

    vkCmdDrawIndexed(commandBuffer, 500, 1, 2000, 0, 0);
}
// End the house annotation started above
pfnCmdEndDebugUtilsLabelEXT(commandBuffer);

// Do other work

vkEndCommandBuffer(commandBuffer);

```

```

// Describe the queue being used
const VkDebugUtilsLabelEXT queueLabel =
{
    .sType = VK_STRUCTURE_TYPE_DEBUG_UTILS_LABEL_EXT,
    .pNext = NULL,
    .pLabelName = "Main Render Work",
    .color = { 0.0f, 1.0f, 0.0f, 1.0f },
};

// Identify the queue label region
pfnQueueBeginDebugUtilsLabelEXT(queue, &queueLabel);

// Submit the work for the main render thread
const VkCommandBuffer cmd_bufs[] = {commandBuffer};
VkSubmitInfo submit_info =
{
    .sType = VK_STRUCTURE_TYPE_SUBMIT_INFO,
    .pNext = NULL,
    .waitSemaphoreCount = 0,
    .pWaitSemaphores = NULL,
    .pWaitDstStageMask = NULL,
    .commandBufferCount = 1,
    .pCommandBuffers = cmd_bufs,
    .signalSemaphoreCount = 0,
    .pSignalSemaphores = NULL
};
vkQueueSubmit(queue, 1, &submit_info, fence);

// End the queue label region
pfnQueueEndDebugUtilsLabelEXT(queue);

```

Issues

1) Should we just name this extension `VK_EXT_debug_report2`

RESOLVED: No. There is enough additional changes to the structures to break backwards compatibility. So, a new name was decided that would not indicate any interaction with the previous extension.

2) Will validation layers immediately support all the new features.

RESOLVED: Not immediately. As one can imagine, there is a lot of work involved with converting the validation layer logging over to the new functionality. Basic logging, as seen in the origin `VK_EXT_debug_report` extension will be made available immediately. However, adding the labels and object names will take time. Since the priority for Khronos at this time is to continue focusing on Valid Usage statements, it may take a while before the new functionality is fully exposed.

3) If the validation layers will not expose the new functionality immediately, then what is the point of this extension?

RESOLVED: We needed a replacement for `VK_EXT_debug_report` because the `VkDebugReportObjectTypeEXT` enumeration will no longer be updated and any new objects will need to be debugged using the new functionality provided by this extension.

4) Should this extension be split into two separate parts (1 extension that is an instance extension providing the callback functionality, and another device extension providing the general debug marker and annotation functionality)?

RESOLVED: No, the functionality for this extension is too closely related. If we did split up the extension, where would the structures and enums live, and how would you define that the device behavior in the instance extension is really only valid if the device extension is enabled, and the functionality is passed in. It is cleaner to just define this all as an instance extension, plus it allows the application to enable all debug functionality provided with one enable string during [vkCreateInstance](#).

Version History

- Revision 1, 2017-09-14 (Mark Young and all listed Contributors)
 - Initial draft, based on `VK_EXT_debug_report` and `VK_EXT_debug_marker` in addition to previous feedback supplied from various companies including Valve, Epic, and Oxide games.
- Revision 2, 2020-04-03 (Mark Young and Piers Daniell)
 - Updated to allow either `NULL` or an empty string to be passed in for `pObjectName` in `VkDebugUtilsObjectNameInfoEXT`, because the loader and various drivers support `NULL` already.

Description

This extension allows the depth clipping operation, that is normally implicitly controlled by [VkPipelineRasterizationStateCreateInfo::depthClampEnable](#), to instead be controlled explicitly by [VkPipelineRasterizationDepthClipStateCreateInfoEXT::depthClipEnable](#).

This is useful for translating DX content which assumes depth clamping is always enabled, but depth clip can be controlled by the DepthClipEnable rasterization state (D3D12_RASTERIZER_DESC).

New Structures

- Extending [VkPhysicalDeviceFeatures2](#), [VkDeviceCreateInfo](#):
 - [VkPhysicalDeviceDepthClipEnableFeaturesEXT](#)
- Extending [VkPipelineRasterizationStateCreateInfo](#):
 - [VkPipelineRasterizationDepthClipStateCreateInfoEXT](#)

New Bitmasks

- [VkPipelineRasterizationDepthClipStateCreateFlagsEXT](#)

New Enum Constants

Last Modified Date

2017-06-22

Contributors

- Daniel Koch, NVIDIA
- Jeff Bolz, NVIDIA

Description

This extension removes the [VkViewport](#) `minDepth` and `maxDepth` restrictions that the values must be between `0.0` and `1.0`, inclusive. It also removes the same restriction on [VkPipelineDepthStencilStateCreateInfo](#) `minDepthBounds` and `maxDepthBounds`. Finally it removes the restriction on the `depth` value in [VkClearDepthStencilValue](#).

New Enum Constants

- VK_EXT_DEPTH_RANGE_UNRESTRICTED_EXTENSION_NAME
- VK_EXT_DEPTH_RANGE_UNRESTRICTED_SPEC_VERSION

Issues

1) How do [VkViewport minDepth](#) and [maxDepth](#) values outside of the [0.0](#) to [1.0](#) range interact with [Primitive Clipping](#)?

RESOLVED: The behavior described in [Primitive Clipping](#) still applies. If depth clamping is disabled the depth values are still clipped to $0 \leq z_c \leq w_c$ before the viewport transform. If depth clamping is enabled the above equation is ignored and the depth values are instead clamped to the [VkViewport minDepth](#) and [maxDepth](#) values, which in the case of this extension can be outside of the [0.0](#) to [1.0](#) range.

2) What happens if a resulting depth fragment is outside of the [0.0](#) to [1.0](#) range and the depth buffer is fixed-point rather than floating-point?

RESOLVED: This situation can also arise without this extension (when fragment shaders replace depth values, for example), and this extension does not change the behavior, which is defined in the [Depth Test](#) section of the Fragment Operations chapter.

Description

This is extension, along with related platform extensions, allows applications to take exclusive control of displays associated with a native windowing system. This is especially useful for virtual reality applications that wish to hide HMDs (head mounted displays) from the native platform's display management system, desktop, and/or other applications.

New Commands

- [vkReleaseDisplayEXT](#)

New Enum Constants

- [VK_EXT_DIRECT_MODE_DISPLAY_EXTENSION_NAME](#)
- [VK_EXT_DIRECT_MODE_DISPLAY_SPEC_VERSION](#)

Issues

1) Should this extension and its related platform-specific extensions leverage [VK_KHR_display](#), or provide separate equivalent interfaces.

RESOLVED: Use [VK_KHR_display](#) concepts and objects. [VK_KHR_display](#) can be used to enumerate all displays on the system, including those attached to/in use by a window system or native platform, but [VK_KHR_display_swapchain](#) will fail to create a swapchain on in-use displays. This extension and its platform-specific children will allow applications to grab in-use displays away from window systems and/or native platforms, allowing them to be used with [VK_KHR_display_swapchain](#).

2) Are separate calls needed to acquire displays and enable direct mode?

RESOLVED: No, these operations happen in one combined command. Acquiring a display puts it into direct mode.

Interactions and External Dependencies

- Interacts with [VK_KHR_device_group](#)
- Interacts with Vulkan 1.1

Contributors

- Daniel Koch, NVIDIA
- Jeff Bolz, NVIDIA

Description

This extension provides additional orthogonally aligned “discard rectangles” specified in framebuffer-space coordinates that restrict rasterization of all points, lines and triangles.

From zero to an implementation-dependent limit (specified by [maxDiscardRectangles](#)) number of discard rectangles can be operational at once. When one or more discard rectangles are active, rasterized fragments can either survive if the fragment is within any of the operational discard

rectangles (`VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT` mode) or be rejected if the fragment is within any of the operational discard rectangles (`VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT` mode).

These discard rectangles operate orthogonally to the existing scissor test functionality. The discard rectangles can be different for each physical device in a device group by specifying the device mask and setting discard rectangle dynamic state.

Version 2 of this extension introduces new dynamic states `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` and `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT`, and the corresponding functions `vkCmdSetDiscardRectangleEnableEXT` and `vkCmdSetDiscardRectangleModeEXT`. Applications that use these dynamic states must ensure the implementation advertises at least `specVersion 2` of this extension.

New Commands

- `vkCmdSetDiscardRectangleEXT`
- `vkCmdSetDiscardRectangleEnableEXT`
- `vkCmdSetDiscardRectangleModeEXT`

New Structures

- Extending `VkGraphicsPipelineCreateInfo`:
 - `VkPipelineDiscardRectangleStateCreateInfoEXT`

 - [VK_STRUCTURE_TYPE_DISPLAY_EVENT_INFO_EXT](#)
 - [VK_STRUCTURE_TYPE_DISPLAY_POWER_INFO_EXT](#)
 - [VK_STRUCTURE_TYPE_SWAPCHAIN_COUNTER_CREATE_INFO_EXT](#)

Issues

1) Should this extension add an explicit “WaitForVsync” API or a fence signaled at vsync that the application can wait on?

RESOLVED: A fence. A separate API could later be provided that allows exporting the fence to a native object that could be inserted into standard run loops on POSIX and Windows systems.

2) Should callbacks be added for a vsync event, or in general to monitor events in Vulkan?

RESOLVED: No, fences should be used. Some events are generated by interrupts which are managed in the kernel. In order to use a callback provided by the application, drivers would need to have the userspace driver spawn threads that would wait on the kernel event, and hence the callbacks could be difficult for the application to synchronize with its other work given they would arrive on a foreign thread.

3) Should vblank or scanline events be exposed?

RESOLVED: Vblank events. Scanline events could be added by a separate extension, but the latency of processing an interrupt and waking up a userspace event is high enough that the accuracy of a scanline event would be rather low. Further, per-scanline interrupts are not supported by all hardware.

 - [VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE_EXT](#)

- `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT`
- `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTENDED_DYNAMIC_STATE_FEATURES_EXT`

Promotion to Vulkan 1.3

All dynamic state enumerants and commands in this extension are included in core Vulkan 1.3, with the EXT suffix omitted. The feature structure is not promoted. Extension interfaces that were promoted remain available as aliases of the core functionality.

Issues

1) Why are the values of `pStrides` in `vkCmdBindVertexBuffers2EXT` limited to be between 0 and the maximum extent of the binding, when this restriction is not present for the same static state?

Implementing these edge cases adds overhead to some implementations that would require significant cost when calling this function, and the intention is that this state should be more or less free to change.

`VK_EXT_vertex_input_dynamic_state` allows the stride to be changed freely when supported via `vkCmdSetVertexInputEXT`.

Description

A `dma_buf` is a type of file descriptor, defined by the Linux kernel, that allows sharing memory across kernel device drivers and across processes. This extension enables applications to import a `dma_buf` as `VkDeviceMemory`, to export `VkDeviceMemory` as a `dma_buf`, and to create `VkBuffer` objects that **can** be bound to that memory.

New Enum Constants

- `VK_EXT_EXTERNAL_MEMORY_DMA_BUF_EXTENSION_NAME`
- `VK_EXT_EXTERNAL_MEMORY_DMA_BUF_SPEC_VERSION`
- Extending `VkExternalMemoryHandleTypeFlagBits`:
 - `VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT`

Issues

1) How does the application, when creating a `VkImage` that it intends to bind to `dma_buf` `VkDeviceMemory` containing an externally produced image, specify the memory layout (such as row pitch and DRM format modifier) of the `VkImage`? In other words, how does the application achieve behavior comparable to that provided by `EGL_EXT_image_dma_buf_import` and `EGL_EXT_image_dma_buf_import_modifiers`?

RESOLVED: Features comparable to those in `EGL_EXT_image_dma_buf_import` and `EGL_EXT_image_dma_buf_import_modifiers` will be provided by an extension layered atop this one.

2) Without the ability to specify the memory layout of external `dma_buf` images, how is this extension useful?

RESOLVED: This extension provides exactly one new feature: the ability to import/export between `dma_buf` and `VkDeviceMemory`. This feature, together with features provided by `VK_KHR_external_memory_fd`, is sufficient to bind a `VkBuffer` to `dma_buf`.

Description

This extension enables an application to import host allocations and host mapped foreign device

memory to Vulkan memory objects.

New Commands

- [vkGetMemoryHostPointerPropertiesEXT](#)

New Structures

- [VkMemoryHostPointerPropertiesEXT](#)
- Extending [VkMemoryAllocateInfo](#):
 - [VkImportMemoryHostPointerInfoEXT](#)
- Extending [VkPhysicalDeviceProperties2](#):
 - [VkPhysicalDeviceExternalMemoryHostPropertiesEXT](#)

New Enum Constants

- [VK_EXT_EXTERNAL_MEMORY_HOST_EXTENSION_NAME](#)
- [VK_EXT_EXTERNAL_MEMORY_HOST_SPEC_VERSION](#)
- Extending [VkExternalMemoryHandleTypeFlagBits](#):
 - [VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT](#)
 - [VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_IMPORT_MEMORY_HOST_POINTER_INFO_EXT](#)
 - [VK_STRUCTURE_TYPE_MEMORY_HOST_POINTER_PROPERTIES_EXT](#)
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_MEMORY_HOST_PROPERTIES_EXT](#)

Issues

1) What memory type has to be used to import host pointers?

RESOLVED: Depends on the implementation. Applications have to use the new [vkGetMemoryHostPointerPropertiesEXT](#) command to query the supported memory types for a particular host pointer. The reported memory types may include memory types that come from a memory heap that is otherwise not usable for regular memory object allocation and thus such a heap's size may be zero.

2) Can the application still access the contents of the host allocation after importing?

RESOLVED: Yes. However, usual synchronization requirements apply.

3) Can the application free the host allocation?

RESOLVED: No, it violates valid usage conditions. Using the memory object imported from a host allocation that is already freed thus results in undefined behavior.

4) Is [vkMapMemory](#) expected to return the same host address which was specified when importing

it to the memory object?

RESOLVED: No. Implementations are allowed to return the same address but it is not required. Some implementations might return a different virtual mapping of the allocation, although the same physical pages will be used.

5) Is there any limitation on the alignment of the host pointer and/or size?

RESOLVED: Yes. Both the address and the size have to be an integer multiple of `minImportedHostPointerAlignment`. In addition, some platforms and foreign devices may have additional restrictions.

6) Can the same host allocation be imported multiple times into a given physical device?

RESOLVED: No, at least not guaranteed by this extension. Some platforms do not allow locking the same physical pages for device access multiple times, so attempting to do it may result in undefined behavior.

7) Does this extension support exporting the new handle type?

RESOLVED: No.

8) Should we include the possibility to import host mapped foreign device memory using this API?

RESOLVED: Yes, through a separate handle type. Implementations are still allowed to support only one of the handle types introduced by this extension by not returning import support for a particular handle type as returned in `VkExternalMemoryPropertiesKHR`.

Description

`VK_EXT_filter_cubic` extends `VK_IMG_filter_cubic`.

It documents cubic filtering of other image view types. It adds new structures that **can** be added to the `pNext` chain of `VkPhysicalDeviceImageFormatInfo2` and `VkImageFormatProperties2` that **can** be used to determine which image types and which image view types support cubic filtering.

New Structures

- Extending `VkImageFormatProperties2`:
 - `VkFilterCubicImageViewImageFormatPropertiesEXT`
- Extending `VkPhysicalDeviceImageFormatInfo2`:
 - `VkPhysicalDeviceImageViewImageFormatInfoEXT`

New Enum Constants

- `VK_EXT_FILTER_CUBIC_EXTENSION_NAME`
- `VK_EXT_FILTER_CUBIC_SPEC_VERSION`
- Extending `VkFilter`:

- `VK_FILTER_CUBIC_EXT`
- Extending `VkFormatFeatureFlagBits`:
 - `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_FILTER_CUBIC_IMAGE_VIEW_IMAGE_FORMAT_PROPERTIES_EXT`
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_VIEW_IMAGE_FORMAT_INFO_EXT`

Version History

- Revision 3, 2019-12-13 (wwlk)
 - Delete requirement to cubic filter the formats `USCALED_PACKED32`, `SSCALED_PACKED32`, `UINT_PACK32`, and `SINT_PACK32` (cut/paste error)
- Revision 2, 2019-06-05 (wwlk)
 - Clarify 1D optional
- Revision 1, 2019-01-24 (wwlk)
 - Initial version

Description

This extension adds support for the `FragmentShaderPixelInterlockEXT`, `FragmentShaderSampleInterlockEXT`, and `FragmentShaderShadingRateInterlockEXT` capabilities from the `SPV_EXT_fragment_shader_interlock` extension to Vulkan.

Enabling these capabilities provides a critical section for fragment shaders to avoid overlapping pixels being processed at the same time, and certain guarantees about the ordering of fragment shader invocations of fragments of overlapping pixels.

This extension can be useful for algorithms that need to access per-pixel data structures via shader loads and stores. Algorithms using this extension can access per-pixel data structures in critical sections without other invocations accessing the same per-pixel data. Additionally, the ordering guarantees are useful for cases where the API ordering of fragments is meaningful. For example, applications may be able to execute programmable blending operations in the fragment shader, where the destination buffer is read via image loads and the final value is written via image stores.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
 - `VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT`

New Enum Constants

Description

This extension defines two new structures and a function to assign SMPTE (the Society of Motion Picture and Television Engineers) 2086 metadata and CTA (Consumer Technology Association) 861.3 metadata to a swapchain.

SMPTE 2086 metadata defines the color volume of the display on which the content was optimized for viewing and includes the color primaries, white point, and luminance range. When such content is reproduced on another display, this metadata can be used by the presentation engine to improve processing of images. For instance, values in the image can first be clamped to the color volume described in the metadata, and then what remains can be remapped to the color volume of the presentation engine.

CTA 861.3 metadata additionally includes the maximum intended luminance for the content and the maximum average light level across frames.

This extension does not define exactly how this metadata is used, however, it simply provides a mechanism to provide it to the presentation engine. Presentation engines may process the image based on the metadata before displaying it, resulting in the image being modified outside of Vulkan. For example, the clamping of colors in the image to the color volume may change those values in the image itself.

The metadata does not override or otherwise influence the color space and color encoding.

New Commands

- [vkSetHdrMetadataEXT](#)

New Structures

- [VkHdrMetadataEXT](#)
- [VkXYColorEXT](#)

New Enum Constants

- [VK_EXT_HDR_METADATA_EXTENSION_NAME](#)
- [VK_EXT_HDR_METADATA_SPEC_VERSION](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_HDR_METADATA_EXT](#)

Issues

1) Do we need a query function for the currently specified metadata?

No, Vulkan does not provide queries for state that the application can track on its own.

2) Should we specify default metadata if not specified by the application?

No, the metadata is optional and the absence of the metadata is well-defined.

Description

The [VK_EXT_headless_surface](#) extension is an instance extension. It provides a mechanism to create [VkSurfaceKHR](#) objects independently of any window system or display device. The presentation

operation for a swapchain created from a headless surface is by default a no-op, resulting in no externally-visible result.

Because there is no real presentation target, future extensions can layer on top of the headless surface to introduce arbitrary or customizable sets of restrictions or features. These could include features like saving to a file or restrictions to emulate a particular presentation target.

This functionality is expected to be useful for application and driver development because it allows any platform to expose an arbitrary or customizable set of restrictions and features of a presentation engine. This makes it a useful portable test target for applications targeting a wide range of presentation engines where the actual target presentation engines might be scarce, unavailable or otherwise undesirable or inconvenient to use for general Vulkan application development.

Description

This extension provides the ability to use *DRM format modifiers* with images, enabling Vulkan to better integrate with the Linux ecosystem of graphics, video, and display APIs.

Its functionality closely overlaps with `EGL_EXT_image_dma_buf_import_modifiers`² and `EGL_MESA_image_dma_buf_export`³. Unlike the EGL extensions, this extension does not require the use of a specific handle type (such as a `dma_buf`) for external memory and provides more explicit control of image creation.

Introduction to DRM Format Modifiers

A *DRM format modifier* is a 64-bit, vendor-prefixed, semi-opaque unsigned integer. Most *modifiers* represent a concrete, vendor-specific tiling format for images. Some exceptions are `DRM_FORMAT_MOD_LINEAR` (which is not vendor-specific); `DRM_FORMAT_MOD_NONE` (which is an alias of `DRM_FORMAT_MOD_LINEAR` due to historical accident); and `DRM_FORMAT_MOD_INVALID` (which does not represent a tiling format). The *modifier*'s vendor prefix consists of the 8 most significant bits. The canonical list of *modifiers* and vendor prefixes is found in `drm_fourcc.h` in the Linux kernel source. The other dominant source of *modifiers* are vendor kernel trees.

One goal of *modifiers* in the Linux ecosystem is to enumerate for each vendor a reasonably sized set of tiling formats that are appropriate for images shared across processes, APIs, and/or devices, where each participating component may possibly be from different vendors. A non-goal is to enumerate all tiling formats supported by all vendors. Some tiling formats used internally by vendors are inappropriate for sharing; no *modifiers* should be assigned to such tiling formats.

Modifier values typically do not *describe* memory layouts. More precisely, a *modifier*'s lower 56 bits usually have no structure. Instead, *modifiers name* memory layouts; they name a small set of vendor-preferred layouts for image sharing. As a consequence, in each vendor namespace the modifier values are often sequentially allocated starting at 1.

Each *modifier* is usually supported by a single vendor and its name matches the pattern `{VENDOR}_FORMAT_MOD_*` or `DRM_FORMAT_MOD_{VENDOR}_*`. Examples are `I915_FORMAT_MOD_X_TILED` and `DRM_FORMAT_MOD_BROADCOM_VC4_T_TILED`. An exception is `DRM_FORMAT_MOD_LINEAR`, which is supported by most vendors.

Many APIs in Linux use *modifiers* to negotiate and specify the memory layout of shared images. For example, a Wayland compositor and Wayland client may, by relaying *modifiers* over the Wayland protocol `zwp_linux_dmabuf_v1`, negotiate a vendor-specific tiling format for a shared `wl_buffer`. The client may allocate the underlying memory for the `wl_buffer` with GBM, providing the chosen *modifier* to `gbm_bo_create_with_modifiers`. The client may then import the `wl_buffer` into Vulkan for producing image content, providing the resource's `dma_buf` to `VkImportMemoryFdInfoKHR` and its *modifier* to `VkImageDrmFormatModifierExplicitCreateInfoEXT`. The compositor may then import the `wl_buffer` into OpenGL for sampling, providing the resource's `dma_buf` and *modifier* to `eglCreateImage`. The compositor may also bypass OpenGL and submit the `wl_buffer` directly to the kernel's display API, providing the `dma_buf` and *modifier* through `drm_mode_fb_cmd2`.

Format Translation

Modifier-capable APIs often pair *modifiers* with DRM formats, which are defined in `drm_fourcc.h`.

However, `VK_EXT_image_drm_format_modifier` uses `VkFormat` instead of DRM formats. The application must convert between `VkFormat` and DRM format when it sends or receives a DRM format to or from an external API.

The mapping from `VkFormat` to DRM format is lossy. Therefore, when receiving a DRM format from an external API, often the application must use information from the external API to accurately map the DRM format to a `VkFormat`. For example, DRM formats do not distinguish between RGB and sRGB (as of 2018-03-28); external information is required to identify the image's color space.

The mapping between `VkFormat` and DRM format is also incomplete. For some DRM formats there exist no corresponding Vulkan format, and for some Vulkan formats there exist no corresponding DRM format.

Usage Patterns

Three primary usage patterns are intended for this extension:

- **Negotiation.** The application negotiates with *modifier*-aware, external components to determine sets of image creation parameters supported among all components.

In the Linux ecosystem, the negotiation usually assumes the image is a 2D, single-sampled, non-mipmapped, non-array image; this extension permits that assumption but does not require it. The result of the negotiation usually resembles a set of tuples such as *(drmFormat, drmFormatModifier)*, where each participating component supports all tuples in the set.

Many details of this negotiation - such as the protocol used during negotiation, the set of image creation parameters expressible in the protocol, and how the protocol chooses which process and which API will create the image - are outside the scope of this specification.

In this extension, `vkGetPhysicalDeviceFormatProperties2` with `VkDrmFormatModifierPropertiesListEXT` serves a primary role during the negotiation, and `vkGetPhysicalDeviceImageFormatProperties2` with `VkPhysicalDeviceImageDrmFormatModifierInfoEXT` serves a secondary role.

- **Import.** The application imports an image with a *modifier*.

In this pattern, the application receives from an external source the image's memory and its creation parameters, which are often the result of the negotiation described above. Some image creation parameters are implicitly defined by the external source; for example, `VK_IMAGE_TYPE_2D` is often assumed. Some image creation parameters are usually explicit, such as the image's *format*, *drmFormatModifier*, and *extent*; and each plane's *offset* and *rowPitch*.

Before creating the image, the application first verifies that the physical device supports the received creation parameters by querying `vkGetPhysicalDeviceFormatProperties2` with `VkDrmFormatModifierPropertiesListEXT` and `vkGetPhysicalDeviceImageFormatProperties2` with `VkPhysicalDeviceImageDrmFormatModifierInfoEXT`. Then the application creates the image by chaining `VkImageDrmFormatModifierExplicitCreateInfoEXT` and `VkExternalMemoryImageCreateInfo` onto `VkImageCreateInfo`.

- **Export.** The application creates an image and allocates its memory. Then the application

exports to *modifier*-aware consumers the image's memory handles; its creation parameters; its *modifier*; and the *offset*, *size*, and *rowPitch* of each *memory plane*.

In this pattern, the Vulkan device is the authority for the image; it is the allocator of the image's memory and the decider of the image's creation parameters. When choosing the image's creation parameters, the application usually chooses a tuple (*format*, *drmFormatModifier*) from the result of the negotiation described above. The negotiation's result often contains multiple tuples that share the same format but differ in their *modifier*. In this case, the application should defer the choice of the image's *modifier* to the Vulkan implementation by providing all such *modifiers* to `VkImageDrmFormatModifierListCreateInfoEXT::pDrmFormatModifiers`; and the implementation should choose from `pDrmFormatModifiers` the optimal *modifier* in consideration with the other image parameters.

The application creates the image by chaining `VkImageDrmFormatModifierListCreateInfoEXT` and `VkExternalMemoryImageCreateInfo` onto `VkImageCreateInfo`. The protocol and APIs by which the application will share the image with external consumers will likely determine the value of `VkExternalMemoryImageCreateInfo::handleTypes`. The implementation chooses for the image an optimal *modifier* from `VkImageDrmFormatModifierListCreateInfoEXT::pDrmFormatModifiers`. The application then queries the implementation-chosen *modifier* with `vkGetImageDrmFormatModifierPropertiesEXT`, and queries the memory layout of each plane with `vkGetImageSubresourceLayout`.

The application then allocates the image's memory with `VkMemoryAllocateInfo`, adding chained extending structures for external memory; binds it to the image; and exports the memory, for example, with `vkGetMemoryFdKHR`.

Finally, the application sends the image's creation parameters, its *modifier*, its per-plane memory layout, and the exported memory handle to the external consumers. The details of how the application transmits this information to external consumers is outside the scope of this specification.

Prior Art

Extension `EGL_EXT_image_dma_buf_import`¹ introduced the ability to create an `EGLImage` by importing for each plane a `dma_buf`, `offset`, and `row pitch`.

Later, extension `EGL_EXT_image_dma_buf_import_modifiers`² introduced the ability to query which combination of formats and *modifiers* the implementation supports and to specify *modifiers* during creation of the `EGLImage`.

Extension `EGL_MESA_image_dma_buf_export`³ is the inverse of `EGL_EXT_image_dma_buf_import_modifiers`.

The Linux kernel modesetting API (KMS), when configuring the display's framebuffer with `struct drm_mode_fb_cmd2`⁴, allows one to specify the framebuffer's *modifier* as well as a per-plane memory handle, `offset`, and `row pitch`.

GBM, a graphics buffer manager for Linux, allows creation of a `gbm_bo` (that is, a graphics *buffer object*) by importing data similar to that in `EGL_EXT_image_dma_buf_import_modifiers`¹; and symmetrically allows exporting the same data from the `gbm_bo`. See the references to *modifier* and *plane* in `gbm.h`⁵.

If `VK_KHR_format_feature_flags2` or Vulkan Version 1.3 is supported:

- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_DRM_FORMAT_MODIFIER_PROPERTIES_LIST_2_EXT`

Issues

1) Should this extension define a single DRM format modifier per `VkImage`? Or define one per plane?

+

RESOLVED: There exists a single DRM format modifier per `VkImage`.

DISCUSSION: Prior art, such as `EGL_EXT_image_dma_buf_import_modifiers`², `struct drm_mode_fb_cmd2`⁴, and `struct gbm_import_fd_modifier_data`⁵, allows defining one *modifier* per plane. However, developers of the GBM and kernel APIs concede it was a mistake. Beginning in Linux 4.10, the kernel requires that the application provide the same DRM format *modifier* for each plane. (See Linux commit [bae781b259269590109e8a4a8227331362b88212](#)). And GBM provides an entry point, `gbm_bo_get_modifier`, for querying the *modifier* of the image but does not provide one to query the modifier of individual planes.

2) When creating an image with `VkImageDrmFormatModifierExplicitCreateInfoEXT`, which is typically used when *importing* an image, should the application explicitly provide the size of each plane?

+

RESOLVED: No. The application **must** not provide the size. To enforce this, the API requires that `VkImageDrmFormatModifierExplicitCreateInfoEXT::pPlaneLayouts->size` **must** be 0.

DISCUSSION: Prior art, such as `EGL_EXT_image_dma_buf_import_modifiers`², `struct drm_mode_fb_cmd2`⁴, and `struct gbm_import_fd_modifier_data`⁵, omits from the API the size of each plane. Instead, the APIs infer each plane's size from the import parameters, which include the image's pixel format and a `dma_buf`, offset, and row pitch for each plane.

However, Vulkan differs from EGL and GBM with regards to image creation in the following ways:

Differences in Image Creation

- **Undedicated allocation by default.** When importing or exporting a set of `dma_bufs` as an `EGLImage` or `gbm_bo`, common practice mandates that each `dma_buf`'s memory be dedicated (in the sense of `VK_KHR_dedicated_allocation`) to the image (though not necessarily dedicated to a single plane). In particular, neither the GBM documentation nor the EGL extension specifications explicitly state this requirement, but in light of common practice this is likely due to under-specification rather than intentional omission. In contrast, `VK_EXT_image_drm_format_modifier` permits, but does not require, the implementation to require dedicated allocations for images created with `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`.
- **Separation of image creation and memory allocation.** When importing a set of `dma_bufs` as an `EGLImage` or `gbm_bo`, EGL and GBM create the image resource and bind it to memory (the

dma_bufs) simultaneously. This allows EGL and GBM to query each dma_buf's size during image creation. In Vulkan, image creation and memory allocation are independent unless a dedicated allocation is used (as in [VK_KHR_dedicated_allocation](#)). Therefore, without requiring dedicated allocation, Vulkan cannot query the size of each dma_buf (or other external handle) when calculating the image's memory layout. Even if dedication allocation were required, Vulkan cannot calculate the image's memory layout until after the image is bound to its dma_bufs.

The above differences complicate the potential inference of plane size in Vulkan. Consider the following problematic cases:

Problematic Plane Size Calculations

- **Padding.** Some plane of the image may require implementation-dependent padding.
- **Metadata.** For some *modifiers*, the image may have a metadata plane which requires a non-trivial calculation to determine its size.
- **Mipmapped, array, and 3D images.** The implementation may support [VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT](#) for images whose *mipLevels*, *arrayLayers*, or *depth* is greater than 1. For such images with certain *modifiers*, the calculation of each plane's size may be non-trivial.

However, an application-provided plane size solves none of the above problems.

For simplicity, consider an external image with a single memory plane. The implementation is obviously capable calculating the image's size when its tiling is [VK_IMAGE_TILING_OPTIMAL](#). Likewise, any reasonable implementation is capable of calculating the image's size when its tiling uses a supported *modifier*.

Suppose that the external image's size is smaller than the implementation-calculated size. If the application provided the external image's size to [vkCreateImage](#), the implementation would observe the mismatched size and recognize its inability to comprehend the external image's layout (unless the implementation used the application-provided size to select a refinement of the tiling layout indicated by the *modifier*, which is strongly discouraged). The implementation would observe the conflict, and reject image creation with [VK_ERROR_INVALID_DRM_FORMAT_MODIFIER_PLANE_LAYOUT_EXT](#). On the other hand, if the application did not provide the external image's size to [vkCreateImage](#), then the application would observe after calling [vkGetImageMemoryRequirements](#) that the external image's size is less than the size required by the implementation. The application would observe the conflict and refuse to bind the [VkImage](#) to the external memory. In both cases, the result is explicit failure.

Suppose that the external image's size is larger than the implementation-calculated size. If the application provided the external image's size to [vkCreateImage](#), for reasons similar to above the implementation would observe the mismatched size and recognize its inability to comprehend the image data residing in the extra size. The implementation, however, must assume that image data resides in the entire size provided by the application. The implementation would observe the conflict and reject image creation with [VK_ERROR_INVALID_DRM_FORMAT_MODIFIER_PLANE_LAYOUT_EXT](#). On the other hand, if the application did not provide the external image's size to [vkCreateImage](#), then the application would observe after calling [vkGetImageMemoryRequirements](#) that the external image's size is larger than the implementation-usable size. The application would observe the

conflict and refuse to bind the `VkImage` to the external memory. In both cases, the result is explicit failure.

Therefore, an application-provided size provides no benefit, and this extension should not require it. This decision renders `VkSubresourceLayout::size` an unused field during image creation, and thus introduces a risk that implementations may require applications to submit sideband creation parameters in the unused field. To prevent implementations from relying on sideband data, this extension *requires* the application to set `size` to 0.

Description

This extension adds stricter requirements for how out of bounds reads from images are handled. Rather than returning undefined values, most out of bounds reads return R, G, and B values of zero and alpha values of either zero or one. Components not present in the image format may be set to zero or to values based on the format as described in [Component Substitution](#).

New Structures

- [VK_EXT_IMAGE_ROBUSTNESS_SPEC_VERSION](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_ROBUSTNESS_FEATURES_EXT](#)

Promotion to Vulkan 1.3

Vulkan APIs in this extension are included in core Vulkan 1.3, with the EXT suffix omitted. External interactions defined by this extension, such as SPIR-V token names, retain their original names. The original Vulkan API names are still available as aliases of the core functionality.

Issues

1. How does this extension differ from VK_EXT_robustness2?

The guarantees provided by this extension are a subset of those provided by the robustImageAccess2 feature of VK_EXT_robustness2. Where this extension allows return values of (0, 0, 0, 0) or (0, 0, 0, 1), robustImageAccess2 requires that a particular value dependent on the image format be returned. This extension provides no guarantees about the values returned for an access to an invalid Lod.

Examples

Description

This extension provides a mechanism for configuring programmatically through the Vulkan API the behavior of layers.

This extension provides the [VkLayerSettingsCreateInfoEXT](#) structure that can be included in the [pNext](#) chain of the [VkInstanceCreateInfo](#) structure passed as the [pCreateInfo](#) parameter of [vkCreateInstance](#).

The structure contains an array of [VkLayerSettingEXT](#) structure values that configure specific features of layers.

NOTE

The [VK_EXT_layer_settings](#) extension subsumes all the functionality provided in the [VK_EXT_validation_flags](#) extension and the [VK_EXT_validation_features](#) extension.

New Structures

- [VkLayerSettingEXT](#)
- Extending [VkInstanceCreateInfo](#):
 - [VkLayerSettingsCreateInfoEXT](#)

New Enums

- [VkLayerSettingTypeEXT](#)

New Enum Constants

- [VK_EXT_LAYER_SETTINGS_EXTENSION_NAME](#)

- `VK_EXT_LAYER_SETTINGS_SPEC_VERSION`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_LAYER_SETTINGS_CREATE_INFO_EXT`

Example

One example usage of `VK_EXT_layer_settings` is as implemented by the Vulkan Profiles layer.

It allows the profiles layer tests used by the profiles layer C.I. to programmatically configure the layer for each test without affecting the C.I. environment, allowing to run multiple tests concurrently.

```
const char* profile_file_data = JSON_TEST_FILES_PATH "VP_KHR_roadmap_2022.json";
const char* profile_name_data = "VP_KHR_roadmap_2022";
VkBool32 emulate_portability_data = VK_TRUE;
const char* simulate_capabilities[] = {
    "SIMULATE_API_VERSION_BIT",
    "SIMULATE_FEATURES_BIT",
    "SIMULATE_PROPERTIES_BIT",
    "SIMULATE_EXTENSIONS_BIT",
    "SIMULATE_FORMATS_BIT",
    "SIMULATE_QUEUE_FAMILY_PROPERTIES_BIT"
};
const char* debug_reports[] = {
    "DEBUG_REPORT_ERROR_BIT",
    "DEBUG_REPORT_WARNING_BIT",
    "DEBUG_REPORT_NOTIFICATION_BIT",
    "DEBUG_REPORT_DEBUG_BIT"
};

const VkLayerSettingEXT settings[] = {
    {kLayerName, kLayerSettingsProfileFile, VK_LAYER_SETTING_TYPE_STRING_EXT, 1,
    &profile_file_data},
    {kLayerName, kLayerSettingsProfileName, VK_LAYER_SETTING_TYPE_STRING_EXT, 1,
    &profile_name_data},
    {kLayerName, kLayerSettingsEmulatePortability, VK_LAYER_SETTING_TYPE_BOOL32_EXT,
    1, &emulate_portability_data},
    {kLayerName, kLayerSettingsSimulateCapabilities,
    VK_LAYER_SETTING_TYPE_STRING_EXT,
    static_cast<uint32_t>(std::size(simulate_capabilities)),
    simulate_capabilities},
    {kLayerName, kLayerSettingsDebugReports, VK_LAYER_SETTING_TYPE_STRING_EXT,
    static_cast<uint32_t>(std::size(debug_reports)), debug_reports}
};

const VkLayerSettingsCreateInfoEXT layer_settings_create_info{
    VK_STRUCTURE_TYPE_LAYER_SETTINGS_CREATE_INFO_EXT, nullptr,
    static_cast<uint32_t>(std::size(settings)), settings};
```

```
VkInstanceCreateInfo inst_create_info = {};  
...  
inst_create_info.pNext = &layer_settings_create_info;  
vkCreateInstance(&inst_create_info, nullptr, &instances);
```

Issues

- How should application developers figure out the list of available settings?

This extension does not provide a reflection API for layer settings. Layer settings are described in each layer JSON manifest and the documentation of each layer which implements this extension.

Description

While running a Vulkan application, other processes on the machine might also be attempting to use the same device memory, which can pose problems. This extension adds support for querying the amount of memory used and the total memory budget for a memory heap. The values returned by this query are implementation-dependent and can depend on a variety of factors including operating system and system load.

The [VkPhysicalDeviceMemoryBudgetPropertiesEXT::heapBudget](#) values can be used as a guideline for how much total memory from each heap the **current process** can use at any given time, before allocations may start failing or causing performance degradation. The values may change based on other activity in the system that is outside the scope and control of the Vulkan implementation.

The [VkPhysicalDeviceMemoryBudgetPropertiesEXT::heapUsage](#) will display the **current process** estimated heap usage.

With this information, the idea is for an application at some interval (once per frame, per few seconds, etc) to query [heapBudget](#) and [heapUsage](#). From here the application can notice if it is over budget and decide how it wants to handle the memory situation (free it, move to host memory, changing mipmap levels, etc). This extension is designed to be used in concert with [VK_EXT_memory_priority](#) to help with this part of memory management.

Description

This extension adds a new query to obtain PCI bus information about a physical device.

Not all physical devices have PCI bus information, either due to the device not being connected to the system through a PCI interface or due to platform specific restrictions and policies. Thus this extension is only expected to be supported by physical devices which can provide the information.

As a consequence, applications should always check for the presence of the extension string for each individual physical device for which they intend to issue the new query for and should not have any assumptions about the availability of the extension on any given platform.

Interactions and External Dependencies

- This extension provides API support for `GL_ARB_post_depth_coverage` and `GL_EXT_post_depth_coverage`

Contributors

- Jeff Bolz, NVIDIA

Description

This extension adds support for the following SPIR-V extension in Vulkan:

- `SPV_KHR_post_depth_coverage`

which allows the fragment shader to control whether values in the `SampleMask` built-in input variable reflect the coverage after early `depth` and `stencil` tests are applied.

This extension adds a new `PostDepthCoverage` execution mode under the `SampleMaskPostDepthCoverage` capability. When this mode is specified along with `EarlyFragmentTests`, the value of an input variable decorated with the `SampleMask` built-in reflects the coverage after the early fragment tests are applied. Otherwise, it reflects the coverage before the depth and stencil tests.

When using GLSL source-based shading languages, the `post_depth_coverage` layout qualifier from `GL_ARB_post_depth_coverage` or `GL_EXT_post_depth_coverage` maps to the `PostDepthCoverage` execution mode.

Description

This extension defines a special queue family, [VK_QUEUE_FAMILY_FOREIGN_EXT](#), which can be used to transfer ownership of resources backed by external memory to foreign, external queues. This is similar to [VK_QUEUE_FAMILY_EXTERNAL_KHR](#), defined in [VK_KHR_external_memory](#). The key differences between the two are:

- The queues represented by [VK_QUEUE_FAMILY_EXTERNAL_KHR](#) must share the same physical device and the same driver version as the current [VkInstance](#). [VK_QUEUE_FAMILY_FOREIGN_EXT](#) has no such restrictions. It can represent devices and drivers from other vendors, and can even represent non-Vulkan-capable devices.

- All resources backed by external memory support `VK_QUEUE_FAMILY_EXTERNAL_KHR`. Support for `VK_QUEUE_FAMILY_FOREIGN_EXT` is more restrictive.
- Applications should expect transitions to/from `VK_QUEUE_FAMILY_FOREIGN_EXT` to be more expensive than transitions to/from `VK_QUEUE_FAMILY_EXTERNAL_KHR`.

- Jeff Bolz, NVIDIA

Description

This extension adds stricter requirements for how out of bounds reads and writes are handled. Most accesses **must** be tightly bounds-checked, out of bounds writes **must** be discarded, out of bound reads **must** return zero. Rather than allowing multiple possible (0,0,0,x) vectors, the out of bounds values are treated as zero, and then missing components are inserted based on the format as described in [Component Substitution](#) and [vertex input attribute extraction](#).

These additional requirements **may** be expensive on some implementations, and should only be enabled when truly necessary.

This extension also adds support for “null descriptors”, where [VK_NULL_HANDLE](#) **can** be used instead of a valid handle. Accesses to null descriptors have well-defined behavior, and do not rely on robustness.

Promotion to [VK_KHR_robustness2](#)

All functionality in this extension is included in [VK_KHR_robustness2](#), with the suffix changed to KHR. The original type, enum, and command names are still available as aliases of the core functionality.

New Structures

- Extending [VkPhysicalDeviceFeatures2](#), [VkDeviceCreateInfo](#):
 - [VkPhysicalDeviceRobustness2FeaturesEXT](#)
- Extending [VkPhysicalDeviceProperties2](#):
 - [VkPhysicalDeviceRobustness2PropertiesEXT](#)

New Enum Constants

- [VK_EXT_ROBUSTNESS_2_EXTENSION_NAME](#)
- [VK_EXT_ROBUSTNESS_2_SPEC_VERSION](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ROBUSTNESS_2_FEATURES_EXT](#)
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ROBUSTNESS_2_PROPERTIES_EXT](#)

Issues

1. Why do [VkPhysicalDeviceRobustness2PropertiesEXT::robustUniformBufferAccessSizeAlignment](#) and [VkPhysicalDeviceRobustness2PropertiesEXT::robustStorageBufferAccessSizeAlignment](#) exist?

RESOLVED: Some implementations cannot efficiently tightly bounds-check all buffer accesses. Rather, the size of the bound range is padded to some power of two multiple, up to 256 bytes for uniform buffers and up to 4 bytes for storage buffers, and that padded size is bounds-checked. This is sufficient to implement D3D-like behavior, because D3D only allows binding whole uniform buffers or ranges that are a multiple of 256 bytes, and D3D raw and structured buffers only support 32-bit accesses.

Examples

None.

Description

This extension allows an application to modify the locations of samples within a pixel used in rasterization. Additionally, it allows applications to specify different sample locations for each pixel in a group of adjacent pixels, which **can** increase antialiasing quality (particularly if a custom resolve shader is used that takes advantage of these different locations).

It is common for implementations to optimize the storage of depth values by storing values that **can** be used to reconstruct depth at each sample location, rather than storing separate depth values for each sample. For example, the depth values from a single triangle **may** be represented using plane equations. When the depth value for a sample is needed, it is automatically evaluated at the sample location. Modifying the sample locations causes the reconstruction to no longer evaluate the same depth values as when the samples were originally generated, thus the depth aspect of a depth/stencil attachment **must** be cleared before rendering to it using different sample locations.

Some implementations **may** need to evaluate depth image values while performing image layout transitions. To accommodate this, instances of the [VkSampleLocationsInfoEXT](#) structure **can** be specified for each situation where an explicit or automatic layout transition has to take place. [VkSampleLocationsInfoEXT](#) **can** be chained from [VkImageMemoryBarrier](#) structures to provide sample locations for layout transitions performed by [vkCmdWaitEvents](#) and [vkCmdPipelineBarrier](#) calls, and [VkRenderPassSampleLocationsBeginInfoEXT](#) **can** be chained from [VkRenderPassBeginInfo](#) to provide sample locations for layout transitions performed implicitly by a render pass instance.

Interactions and External Dependencies

- This extension provides API support for `GL_EXT_demote_to_helper_invocation`

Contributors

- Jeff Bolz, NVIDIA

Description

This extension adds Vulkan support for the `SPV_EXT_demote_to_helper_invocation` SPIR-V extension. That SPIR-V extension provides a new instruction `OpDemoteToHelperInvocationEXT` allowing shaders to “demote” a fragment shader invocation to behave like a helper invocation for its duration. The demoted invocation will have no further side effects and will not output to the framebuffer, but remains active and can participate in computing derivatives and in [group operations](#). This is a better match for the “discard” instruction in HLSL.

Description

This extension extends existing 64-bit integer atomic support to enable these operations on images as well.

When working with large 2- or 3-dimensional data sets (e.g. rasterization or screen-space effects), image accesses are generally more efficient than equivalent buffer accesses. This extension allows applications relying on 64-bit integer atomics in this manner to quickly improve performance with only relatively minor code changes.

64-bit integer atomic support is guaranteed for optimally tiled images with the `VK_FORMAT_R64_UINT` and `VK_FORMAT_R64_SINT` formats.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
 - `VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT`

New Enum Constants

- `VK_EXT_SHADER_IMAGE_ATOMIC_INT64_EXTENSION_NAME`
- `VK_EXT_SHADER_IMAGE_ATOMIC_INT64_SPEC_VERSION`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_IMAGE_ATOMIC_INT64_FEATURES_EXT`

Description

This extension enables an implementation to control the subgroup size by allowing a varying subgroup size and also specifying a required subgroup size.

It extends the subgroup support in Vulkan 1.1 to allow an implementation to expose a varying subgroup size. Previously Vulkan exposed a single subgroup size per physical device, with the expectation that implementations will behave as if all subgroups have the same size. Some implementations **may** dispatch shaders with a varying subgroup size for different subgroups. As a result they could implicitly split a large subgroup into smaller subgroups or represent a small subgroup as a larger subgroup, some of whose invocations were inactive on launch.

To aid developers in understanding the performance characteristics of their programs, this extension exposes a minimum and maximum subgroup size that a physical device supports and a pipeline create flag to enable that pipeline to vary its subgroup size. If enabled, any **SubgroupSize** decorated variables in the SPIR-V shader modules provided to pipeline creation **may** vary between the **minimum** and **maximum** subgroup sizes.

An implementation is also optionally allowed to support specifying a required subgroup size for a given pipeline stage. Implementations advertise which **stages support a required subgroup size**, and any pipeline of a supported stage can be passed a **VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT** structure to set the subgroup size for that shader stage of the pipeline. For compute shaders, this requires the developer to query the **maxComputeWorkgroupSubgroups** and ensure that:

$$s = \text{WorkGroupSize.x} \times \text{WorkGroupSize.y} \times \text{WorkGroupSize.z} \leq \text{SubgroupSize} \times \text{maxComputeWorkgroupSubgroups}$$

Developers can also specify a new pipeline shader stage create flag that requires the implementation to have fully populated subgroups within local workgroups. This requires the workgroup size in the X dimension to be a multiple of the subgroup size.

New Structures

- Extending **VkPhysicalDeviceFeatures2**, **VkDeviceCreateInfo**:
 - **VkPhysicalDeviceSubgroupSizeControlFeaturesEXT**
- Extending **VkPhysicalDeviceProperties2**:
 - **VkPhysicalDeviceSubgroupSizeControlPropertiesEXT**
- Extending **VkPipelineShaderStageCreateInfo**, **VkShaderCreateInfoEXT**:
 - **VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT**

New Enum Constants

- **VK_EXT_SUBGROUP_SIZE_CONTROL_EXTENSION_NAME**
- **VK_EXT_SUBGROUP_SIZE_CONTROL_SPEC_VERSION**
- Extending **VkPipelineShaderStageCreateFlagBits**:
 - **VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT**
 - **VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT**

- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBGROUP_SIZE_CONTROL_FEATURES_EXT](#)
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBGROUP_SIZE_CONTROL_PROPERTIES_EXT](#)
 - [VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_REQUIRED_SUBGROUP_SIZE_CREATE_INFO_EXT](#)

Promotion to Vulkan 1.3

Vulkan APIs in this extension are included in core Vulkan 1.3, with the EXT suffix omitted. External interactions defined by this extension, such as SPIR-V token names, retain their original names. The original Vulkan API names are still available as aliases of the core functionality.

Version History

- Revision 1, 2019-03-05 (Neil Henning)
 - Initial draft
- Revision 2, 2019-07-26 (Faith Ekstrand)
 - Add the missing [VkPhysicalDeviceSubgroupSizeControlFeaturesEXT](#) for querying subgroup size control features.

IP Status

No known IP claims.

Contributors

- Courtney Goeltzenleuchter, Google

Description

This extension expands [VkColorSpaceKHR](#) to add support for most standard color spaces beyond [VK_COLOR_SPACE_SRGB_NONLINEAR_KHR](#). This extension also adds support for [VK_COLOR_SPACE_PASS_THROUGH_EXT](#) which allows applications to use color spaces not explicitly enumerated in [VkColorSpaceKHR](#).

New Enum Constants

- [VK_EXT_SWAPCHAIN_COLOR_SPACE_EXTENSION_NAME](#)
- [VK_EXT_SWAPCHAIN_COLOR_SPACE_SPEC_VERSION](#)
- Extending [VkColorSpaceKHR](#):
 - [VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT](#)
 - [VK_COLOR_SPACE_ADOBERGB_NONLINEAR_EXT](#)
 - [VK_COLOR_SPACE_BT2020_LINEAR_EXT](#)
 - [VK_COLOR_SPACE_BT709_LINEAR_EXT](#)
 - [VK_COLOR_SPACE_BT709_NONLINEAR_EXT](#)
 - [VK_COLOR_SPACE_DCI_P3_NONLINEAR_EXT](#)
 - [VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT](#)
 - [VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT](#)
 - [VK_COLOR_SPACE_DOLBYVISION_EXT](#)
 - [VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT](#)
 - [VK_COLOR_SPACE_EXTENDED_SRGB_NONLINEAR_EXT](#)
 - [VK_COLOR_SPACE_HDR10_HLG_EXT](#)
 - [VK_COLOR_SPACE_HDR10_ST2084_EXT](#)
 - [VK_COLOR_SPACE_PASS_THROUGH_EXT](#)

Issues

1) Does the spec need to specify which kinds of image formats support the color spaces?

RESOLVED: Pixel format is independent of color space (though some color spaces really want / need floating-point color components to be useful). Therefore, do not plan on documenting what formats support which color spaces. An application **can** call [vkGetPhysicalDeviceSurfaceFormatsKHR](#) to query what a particular implementation supports.

2) How does application determine if HW supports appropriate transfer function for a color space?

RESOLVED: Extension indicates that implementation **must** not do the OETF encoding if it is not sRGB. That responsibility falls to the application shaders. Any other native OETF / EOTF functions supported by an implementation can be described by separate extension.

Version History

- Revision 1, 2016-12-27 (Courtney Goeltzenleuchter)
 - Initial version
- Revision 2, 2017-01-19 (Courtney Goeltzenleuchter)
 - Add pass through and multiple options for BT2020.
 - Clean up some issues with equations not displaying properly.
- Revision 3, 2017-06-23 (Courtney Goeltzenleuchter)
 - Add extended sRGB non-linear enum.
- Revision 4, 2019-04-26 (Graeme Leese)
 - Clarify color space transfer function usage.
 - Refer to normative definitions in the Data Format Specification.
 - Clarify DCI-P3 and Display P3 usage.
- Revision 5, 2024-03-16 (Zehui Lin)
 - Fix interchanged concepts of EOTF and OETF.
 - Clarify that the presentation engine can accept the color spaces.

 - [VK_FORMAT_ASTC_8x6_SFLOAT_BLOCK_EXT](#)
 - [VK_FORMAT_ASTC_8x8_SFLOAT_BLOCK_EXT](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TEXTURE_COMPRESSION_ASTC_HDR_FEATURES_EXT](#)

Promotion to Vulkan 1.3

Vulkan APIs in this extension are included in core Vulkan 1.3, with the EXT suffix omitted. However, the feature is made optional in Vulkan 1.3. External interactions defined by this extension, such as SPIR-V token names, retain their original names. The original Vulkan API names are still available as aliases of the core functionality.

Issues

1) Should we add a feature or limit for this functionality?

Yes. It is consistent with the ASTC LDR support to add a feature like `textureCompressionASTC_HDR`.

The feature is strictly speaking redundant as long as this is just an extension; it would be sufficient to just enable the extension. But adding the feature is more forward-looking if wanted to make this an optional core feature in the future.

2) Should we introduce new format enums for HDR?

Yes. Vulkan 1.0 describes the ASTC format enums as UNORM, e.g. `VK_FORMAT_ASTC_4x4_UNORM_BLOCK`, so it is confusing to make these contain HDR data. Note that the OpenGL (ES) extensions did not make this distinction because a single ASTC HDR texture may contain both unorm and float blocks. Implementations **may** not be able to distinguish between LDR and HDR ASTC textures internally and just treat them as the same format, i.e. if this extension is supported then sampling from a `VK_FORMAT_ASTC_4x4_UNORM_BLOCK` image format **may** return HDR results. Applications **can** get predictable results by using the appropriate image format.

Description

One of the states that contributes to the combinatorial explosion of pipeline state objects that need to be created, is the vertex input binding and attribute descriptions. By allowing them to be dynamic applications may reduce the number of pipeline objects they need to create.

This extension adds dynamic state support for what is normally static state in [VkPipelineVertexInputStateCreateInfo](#).

New Commands

Description

This extension allows an application to take exclusive control of a display on Windows 10 provided that the display is not already controlled by a compositor. Examples of compositors include the Windows desktop compositor, other applications using this Vulkan extension, and applications that “[Acquire](#)” a “[DisplayTarget](#)” using a “[WinRT](#)” command such as “[winrt::Windows::Devices::Display::Core::DisplayManager.TryAcquireTarget\(\)](#)”.

When control is acquired the application has exclusive access to the display until control is released or the application terminates. An application’s attempt to acquire is denied if a different application has already acquired the display.

New Commands

- [vkAcquireWinrtDisplayNV](#)
- [vkGetWinrtDisplayNV](#)

New Enum Constants

- [VK_NV_ACQUIRE_WINRT_DISPLAY_EXTENSION_NAME](#)
- [VK_NV_ACQUIRE_WINRT_DISPLAY_SPEC_VERSION](#)

Issues

1) What should the platform substring be for this extension:

RESOLVED: The platform substring is “Winrt”.

The substring “Winrt” matches the fact that the OS API exposing the acquire and release functionality is called “WinRT”.

The substring “Win32” is wrong because the related “WinRT” API is explicitly **not** a “Win32” API. “WinRT” is a competing API family to the “Win32” API family.

The substring “Windows” is suboptimal because there could be more than one relevant API on the Windows platform. There is preference to use the more-specific substring “Winrt”.

2) Should [vkAcquireWinrtDisplayNV](#) take a winRT DisplayTarget, or a Vulkan display handle as input?

RESOLVED: A Vulkan display handle. This matches the design of [vkAcquireXlibDisplayEXT](#).

3) Should the acquire command be platform-independent named “vkAcquireDisplayNV”, or platform-specific named “vkAcquireWinrtDisplayNV”?

RESOLVED: Add a platform-specific command.

The inputs to the Acquire command are all Vulkan types. None are WinRT types. This opens the possibility of the winrt extension defining a platform-independent acquire command.

The X11 acquire command does need to accept a platform-specific parameter. This could be handled by adding to a platform-independent acquire command a params structure to which platform-dependent types can be chained by [pNext](#) pointer.

The prevailing opinion is that it would be odd to create a second platform-independent function that is used on the Windows 10 platform, but that is not used for the X11 platform. Since a Windows 10 platform-specific command is needed anyway for converting between vkDisplayKHR and platform-native handles, opinion was to create a platform-specific acquire function.

4) Should the [vkGetWinrtDisplayNV](#) parameter identifying a display be named “deviceRelativeId” or “adapterRelativeId”?

RESOLVED: The WinRT name is “AdapterRelativeId”. The name “adapter” is the Windows analog to a Vulkan “physical device”. Vulkan already has precedent to use the name [deviceLUID](#) for the concept that Windows APIs call “AdapterLuid”. Keeping form with this precedent, the name “deviceRelativeId” is chosen.

5) Does [vkAcquireWinrtDisplayNV](#) cause the Windows desktop compositor to release a display?

RESOLVED: No. [vkAcquireWinrtDisplayNV](#) does not itself cause the Windows desktop compositor to release a display. This action must be performed outside of Vulkan.

Beginning with Windows 10 version 2004 it is possible to cause the Windows desktop compositor to release a display by using the “Advanced display settings” sub-page of the “Display settings” control

panel. See <https://docs.microsoft.com/en-us/windows-hardware/drivers/display/specialized-monitors>

6) Where can one find additional information about custom compositors for Windows 10?

RESOLVED: Relevant references are as follows.

According to Microsoft's documentation on "[building a custom compositor](#)", the ability to write a custom compositor is not a replacement for a fullscreen desktop window. The feature is for writing compositor apps that drive specialized hardware.

Only certain editions of Windows 10 support custom compositors, "[documented here](#)". The product type can be queried from Windows 10. See <https://docs.microsoft.com/en-us/windows/win32/api/sysinfoapi/nf-sysinfoapi-getproductinfo>

Description

This extension enables an application to access external memory via [NvSciBufObj](#). To import a [NvSciBufObj](#) to [VkDeviceMemory](#), applications need to:

- Create an unreconciled [NvSciBufAttrList](#) via [NvSciBufAttrListCreate\(\)](#)
- Fill in the private attribute list via [vkGetPhysicalDeviceSciBufAttributesNV\(\)](#)
- Fill in the public attribute list via [NvSciBufAttrListSetAttrs\(\)](#)
- Reconcile the [NvSciBufAttrList](#) via [NvSciBufAttrListReconcile\(\)](#)
- Create a [NvSciBufObj](#) via [NvSciBufObjAlloc\(\)](#)
- Import the [NvSciBufObj](#) to a [VkDeviceMemory](#) by chaining [VkImportMemorySciBufInfoNV](#) structure to the command [vkAllocateMemory](#).

For details of the [NvSciBuf](#) APIs and data structures, see the [NvStreams Documentation](#).

New Commands

- [vkGetMemorySciBufNV](#)
- [vkGetPhysicalDeviceExternalMemorySciBufPropertiesNV](#)
- [vkGetPhysicalDeviceSciBufAttributesNV](#)

New Structures

- [VkMemoryGetSciBufInfoNV](#)
- [VkMemorySciBufPropertiesNV](#)
- Extending [VkMemoryAllocateInfo](#):
 - [VkExportMemorySciBufInfoNV](#)
 - [VkImportMemorySciBufInfoNV](#)
- Extending [VkPhysicalDeviceFeatures2](#), [VkDeviceCreateInfo](#):
 - [VkPhysicalDeviceExternalMemorySciBufFeaturesNV](#)
 - [VkPhysicalDeviceExternalSciBufFeaturesNV](#)

New Enum Constants

- [VK_NV_EXTERNAL_MEMORY_SCI_BUF_EXTENSION_NAME](#)
- [VK_NV_EXTERNAL_MEMORY_SCI_BUF_SPEC_VERSION](#)

- Extending [VkExternalMemoryHandleTypeFlagBits](#):
 - `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCI_BUF_BIT_NV`
- Extending [VkStructureType](#):
 - `VK_STRUCTURE_TYPE_EXPORT_MEMORY_SCI_BUF_INFO_NV`
 - `VK_STRUCTURE_TYPE_IMPORT_MEMORY_SCI_BUF_INFO_NV`
 - `VK_STRUCTURE_TYPE_MEMORY_GET_SCI_BUF_INFO_NV`
 - `VK_STRUCTURE_TYPE_MEMORY_SCI_BUF_PROPERTIES_NV`
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_MEMORY_SCI_BUF_FEATURES_NV`
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_SCI_BUF_FEATURES_NV`

Issues

1) What should we call this extension?

RESOLVED. The external API is `NvSciBuf`, but the Vulkan convention is to append the vendor suffix at the end of an identifier. Using `NvSciBufNV` seems awkward, so we have chosen to use just the `SciBuf` portion of the name in Vulkan commands and tokens. Since this is for interacting with memory objects allocated from outside Vulkan, we use "external_memory" in the name, similar to [VK_KHR_external_memory_fd](#). To avoid an explosion of extensions, we include the capability to import and export memory in one extension but include separate features in case implementations only implement (or safety certify) a subset.

2) What changed in revision 2?

RESOLVED. The [VkPhysicalDeviceExternalSciBufFeaturesNV](#) structure was renamed to [VkPhysicalDeviceExternalMemorySciBufFeaturesNV](#) to follow naming conventions (previous names retained as aliases), and drop const on `pNext` pointer.

Description

An application using external memory may wish to synchronize access to that memory using semaphores and fences. This extension enables an application to import semaphore and import/export fence payloads to and from `NvSciSync` objects. To import a `NvSciSyncObj` to a `VkSemaphore` or `VkFence`, applications need to:

- Create an unreconciled `NvSciSyncAttrList` via `NvSciSyncAttrListCreate()`
- Fill the private attribute list via `vkGetPhysicalDeviceSciSyncAttributesNV()`
- Fill the public attribute list via `NvSciSyncAttrListSetAttrs()`
- Reconcile the `NvSciSyncAttrList` via `NvSciSyncAttrListReconcile()`
- Create a `NvSciSyncObj` via `NvSciSyncObjAlloc()`
- To import a `NvSciSyncObj` to a `VkSemaphore`, create a `VkSemaphoreSciSyncPoolNV` for the `NvSciSyncObj` and then select the semaphore from `VkSemaphoreSciSyncPoolNV` by passing the `VkSemaphoreSciSyncCreateInfoNV` structure to `vkCreateSemaphore`
- To import a `NvSciSyncObj` to a `VkFence`, pass the `VkImportFenceSciSyncInfoNV` structure to the `vkImportFenceSciSyncObjNV` command.

To import/export a `NvSciSyncFence` to a `VkFence` object, that `VkFence` object **must** already have a `NvSciSyncObj` previously imported.

This extension does not support exporting semaphores from **NvSciSync** objects.

For details of the **NvSciSync** APIs and data structures, see the **NvStreams Documentation**.

New Object Types

- [VkSemaphoreSciSyncPoolNV](#)

New Commands

- [vkCreateSemaphoreSciSyncPoolNV](#)
- [vkDestroySemaphoreSciSyncPoolNV](#)
- [vkGetFenceSciSyncFenceNV](#)
- [vkGetFenceSciSyncObjNV](#)
- [vkGetPhysicalDeviceSciSyncAttributesNV](#)
- [vkImportFenceSciSyncFenceNV](#)
- [vkImportFenceSciSyncObjNV](#)

New Structures

- [VkFenceGetSciSyncInfoNV](#)
- [VkImportFenceSciSyncInfoNV](#)
- [VkSciSyncAttributesInfoNV](#)
- [VkSemaphoreSciSyncPoolCreateInfoNV](#)
- Extending [VkFenceCreateInfo](#):
 - [VkExportFenceSciSyncInfoNV](#)
- Extending [VkPhysicalDeviceFeatures2](#), [VkDeviceCreateInfo](#):
 - [VkPhysicalDeviceExternalSciSync2FeaturesNV](#)
- Extending [VkSemaphoreCreateInfo](#):
 - [VkSemaphoreSciSyncCreateInfoNV](#)

If Vulkan SC 1.0 is supported:

- Extending [VkDeviceCreateInfo](#):
 - [VkDeviceSemaphoreSciSyncPoolReservationCreateInfoNV](#)

New Enums

- [VkSciSyncClientTypeNV](#)
- [VkSciSyncPrimitiveTypeNV](#)

New Enum Constants

- `VK_NV_EXTERNAL_SCI_SYNC_2_EXTENSION_NAME`
- `VK_NV_EXTERNAL_SCI_SYNC_2_SPEC_VERSION`
- Extending `VkExternalFenceHandleTypeFlagBits`:
 - `VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_FENCE_BIT_NV`
 - `VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_OBJ_BIT_NV`
- Extending `VkObjectType`:
 - `VK_OBJECT_TYPE_SEMAPHORE_SCI_SYNC_POOL_NV`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_EXPORT_FENCE_SCI_SYNC_INFO_NV`
 - `VK_STRUCTURE_TYPE_FENCE_GET_SCI_SYNC_INFO_NV`
 - `VK_STRUCTURE_TYPE_IMPORT_FENCE_SCI_SYNC_INFO_NV`
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_SCI_SYNC_2_FEATURES_NV`
 - `VK_STRUCTURE_TYPE_SCI_SYNC_ATTRIBUTES_INFO_NV`
 - `VK_STRUCTURE_TYPE_SEMAPHORE_SCI_SYNC_CREATE_INFO_NV`
 - `VK_STRUCTURE_TYPE_SEMAPHORE_SCI_SYNC_POOL_CREATE_INFO_NV`

If Vulkan SC 1.0 is supported:

- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_DEVICE_SEMAPHORE_SCI_SYNC_POOL_RESERVATION_CREATE_INFO_NV`

Issues

1) Does this extension extend or replace `VK_NV_external_sci_sync`?

RESOLVED. Replaces - expect to deprecate it and eventually remove it.

2) What part of `VK_NV_external_sci_sync` is deprecated/removed in this extension?

RESOLVED. The commands to import and export semaphores from `VK_NV_external_sci_sync` are removed and have been replaced with an alternate mechanism to import semaphores. Fence import and export functionality is unchanged.

In particular:

- Removed Commands:
 - `vkImportSemaphoreSciSyncObjNV`
 - `vkGetSemaphoreSciSyncObjNV`
- Removed Structures:
 - `VkImportSemaphoreSciSyncInfoNV`

- [VkExportSemaphoreSciSyncInfoNV](#)
- [VkSemaphoreGetSciSyncInfoNV](#)

3) Application migration guide from [VK_NV_external_sci_sync](#) to [VK_NV_external_sci_sync2](#)

- In [VK_NV_external_sci_sync](#), to import a [NvSciSyncObj](#) to [VkSemaphore](#), applications need to:
 - Create a [VkSemaphore](#) by command [vkCreateSemaphore](#).
 - Call [vkImportSemaphoreSciSyncObjNV](#) command to import the [NvSciSyncObj](#) to [VkSemaphore](#) created.
 - Call [vkDestroySemaphore](#) to destroy the [VkSemaphore](#) after all submitted batches that refer to it have completed execution.
- In order to migrate to [VK_NV_external_sci_sync2](#), applications need to:
 - Chain [VkDeviceSemaphoreSciSyncPoolReservationCreateInfoNV](#) to [VkDeviceObjectReservationCreateInfo](#) and specify the [semaphoreSciSyncPoolRequestCount](#) maximum number of semaphore SciSync pools that will be used simultaneously.
 - Import the a [NvSciSyncObj](#) to a [VkSemaphoreSciSyncPoolNV](#) by command [vkCreateSemaphoreSciSyncPoolNV](#).
 - Select the [VkSemaphore](#) from [VkSemaphoreSciSyncPoolNV](#) by passing the [VkSemaphoreSciSyncCreateInfoNV](#) structure to [vkCreateSemaphore](#).
 - Can call [vkDestroySemaphore](#) to destroy the [VkSemaphore](#) immediately after all the batches that refer to it are submitted.

Description

This extension enables an application to import QNX Screen `_screen_buffer` objects created outside of the Vulkan device into Vulkan memory objects, where they can be bound to images and buffers.

Some `_screen_buffer` images have implementation-defined *external formats* that **may** not correspond to Vulkan formats. Sampler Y'C_BC_R conversion **can** be used to sample from these images and convert them to a known color space.

`_screen_buffer` is strongly typed, so naming the handle type is redundant. The internal layout and therefore size of a `_screen_buffer` image may depend on native usage flags that do not have corresponding Vulkan counterparts.

Description

This extension adds some line rasterization features that are commonly used in CAD applications and supported in other APIs like OpenGL. Bresenham-style line rasterization is supported, smooth rectangular lines (coverage to alpha) are supported, and stippled lines are supported for all three line rasterization modes.

Promotion to **VK_KHR_line_rasterization**

All functionality in this extension is included in [VK_KHR_line_rasterization](#), with the suffix changed to KHR. The original enum names are still available as aliases of the KHR functionality.

New Commands

- [vkCmdSetLineStippleEXT](#)

New Structures

- Extending [VkPhysicalDeviceFeatures2](#), [VkDeviceCreateInfo](#):
 - [VkPhysicalDeviceLineRasterizationFeaturesEXT](#)
- Extending [VkPhysicalDeviceProperties2](#):
 - [VkPhysicalDeviceLineRasterizationPropertiesEXT](#)

 - [VkPipelineRasterizationLineStateCreateInfoEXT](#)

New Enums

- [VkLineRasterizationModeEXT](#)

New Enum Constants

- `VK_EXT_LINE_RASTERIZATION_EXTENSION_NAME`
- `VK_EXT_LINE_RASTERIZATION_SPEC_VERSION`
- Extending `VkDynamicState`:
 - `VK_DYNAMIC_STATE_LINE_STIPPLE_EXT`
- Extending `VkLineRasterizationMode`:
 - `VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT`
 - `VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT`
 - `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT`
 - `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINE_RASTERIZATION_FEATURES_EXT`
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINE_RASTERIZATION_PROPERTIES_EXT`
 - `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_LINE_STATE_CREATE_INFO_EXT`

Issues

1) Do we need to support Bresenham-style and smooth lines with more than one rasterization sample? i.e. the equivalent of `glDisable(GL_MULTISAMPLE)` in OpenGL when the framebuffer has more than one sample?

RESOLVED: Yes. For simplicity, Bresenham line rasterization carries forward a few restrictions from OpenGL, such as not supporting per-sample shading, alpha to coverage, or alpha to one.

Description

An application using external memory may wish to synchronize access to that memory using semaphores and fences. This extension enables an application to import and export semaphore and fence payloads to and from [NvSciSync](#) objects. To import a [NvSciSyncObj](#) to a [VkSemaphore](#) or [VkFence](#), applications need to:

- Create an unreconciled [NvSciSyncAttrList](#) via [NvSciSyncAttrListCreate\(\)](#)
- Fill the private attribute list via [vkGetPhysicalDeviceSciSyncAttributesNV\(\)](#)
- Fill the public attribute list via [NvSciSyncAttrListSetAttrs\(\)](#)
- Reconcile the [NvSciSyncAttrList](#) via [NvSciSyncAttrListReconcile\(\)](#)
- Create a [NvSciSyncObj](#) via [NvSciSyncObjAlloc\(\)](#)
- Import the [NvSciSyncObj](#) to a [VkSemaphore](#) by passing the [VkImportSemaphoreSciSyncInfoNV](#) structure to the [vkImportSemaphoreSciSyncObjNV](#) command, or to a [VkFence](#) by passing the [VkImportFenceSciSyncInfoNV](#) structure to the [vkImportFenceSciSyncObjNV](#) command.

To import/export a [NvSciSyncFence](#) to a [VkFence](#) object, that [VkFence](#) object **must** already have a [NvSciSyncObj](#) previously imported.

For details of the [NvSciSync](#) APIs and data structures, see the [NvStreams Documentation](#).

New Commands

- [vkGetFenceSciSyncFenceNV](#)
- [vkGetFenceSciSyncObjNV](#)
- [vkGetPhysicalDeviceSciSyncAttributesNV](#)
- [vkGetSemaphoreSciSyncObjNV](#)
- [vkImportFenceSciSyncFenceNV](#)
- [vkImportFenceSciSyncObjNV](#)
- [vkImportSemaphoreSciSyncObjNV](#)

- `VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_SCI_SYNC_INFO_NV`
- `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_SCI_SYNC_FEATURES_NV`
- `VK_STRUCTURE_TYPE_SCI_SYNC_ATTRIBUTES_INFO_NV`
- `VK_STRUCTURE_TYPE_SEMAPHORE_GET_SCI_SYNC_INFO_NV`

Issues

1) What should we call this extension?

RESOLVED. The external API is `NvSciSync`, but the Vulkan convention is to append the vendor suffix at the end of an identifier. Using `NvSciSyncNV` seems awkward, so we have chosen to use just the `SciSync` portion of the name in Vulkan commands and tokens. Since this is for interacting with objects from outside Vulkan, we use "external" in the name, similar to `VK_KHR_external_fence_fd`. To avoid an explosion of extensions, we include the capability to import and export both semaphores and fences in one extension but include separate features in case implementations only implement (or safety certify) a subset.

2) How do we resolve the NvStreams terminology of `NvSciSyncFence` which conflicts with the Vulkan SC terminology of `VkFence`.

RESOLVED: "fence" refers to `VkFence`. "`NvSciSyncFence`" refers to the NvStreams type and "`VkFence`" refers to the Vulkan SC type.

Version History

- Revision 2, 2022-03-29 (Daniel Koch)
 - use separate commands for `NvSciSyncFence` and `NvSciSyncObj` handles
- Revision 1, 2020-11-25 (Kai Zhang, Daniel Koch)
 - Initial revision

Appendix F: Legacy and Superseded Functionality

Functionality in the specification such as commands and structures **may** be marked as *legacy*. This label indicates that either functionality that supersedes it is available in a newer core version, or the functionality has simply fallen out of favor for other reasons. Forward-looking applications **should** avoid using functionality marked as legacy where possible.

A link to an explanatory section is provided to explain why the functionality was marked as legacy, what functionality supersedes it (if any), and what applications **should** do instead.

Newer extensions **may** also provide functionality that supersedes existing functionality, but the original functionality will not be tagged as legacy in the specification unless a superseding solution has been fully promoted to the core API. Explanatory text will still be included below for these cases as reference.

NOTE

Legacy and superseded functionality is tagged in the xml registry via a deprecation tag, for both core versions and extensions. It is expected that tooling such as the validation layers will be able to warn users when they are making use of any functionality that is either legacy or superseded by the version and extensions the application has enabled.

Legacy functionality remains available for use in the specification, but it **may** be less capable than newer functionality. Interactions with legacy functionality will often be omitted when new extensions or features are developed, so legacy functionality **may** not work with the latest features.

NOTE

Another mechanism exists to indicate that an entire extension is considered legacy, using different terminology. See [the Deprecation section of the Extensions chapter](#) for more information.

List of Legacy Functionality

When functionality is marked as legacy or if an extension supersedes it, an explanation will be added to the following sections.

NOTE

This list is a work in progress - we intend to add other items to this section over time. Examples include shader modules (superseded by [VK_KHR_maintenance5](#)) and anything superseded by a new version of the same functionality (e.g. [VK_KHR_synchronization2](#)).

Physical Device Queries: Superseded via version 2

[VK_KHR_get_physical_device_properties2](#) was incorporated into Vulkan 1.1, which introduced new versions of several physical device query functions. These provide the same functionality as the Vulkan 1.0 functionality but with greater extensibility.

When querying device features, `vkGetPhysicalDeviceFeatures2` **should** be used instead of `vkGetPhysicalDeviceFeatures`. When enabling device features, `VkPhysicalDeviceFeatures2` **should** be provided in the `pNext` chain of `VkDeviceCreateInfo` instead of using `VkDeviceCreateInfo::pEnabledFeatures`.

Device Layers: Superseded via instance layers

Previous versions of this specification distinguished between instance and device layers. Instance layers were only able to intercept commands that operate on `VkInstance` and `VkPhysicalDevice`, except they were not able to intercept `vkCreateDevice`. Device layers were enabled for individual devices when they were created, and could only intercept commands operating on that device or its child objects.

Device-only layers are now marked as legacy, and this specification no longer distinguishes between instance and device layers. Layers are enabled during instance creation, and are able to intercept all commands operating on that instance or any of its child objects. At the time this was marked as legacy, there were no known device-only layers and no compelling reason to create one.

Render Pass Functions: Superseded via version 2

Vulkan 1.2 introduced new versions of several render pass functions. These provide the same functionality as the Vulkan 1.0 functionality but with greater extensibility.

Appendix G: API Boilerplate

This appendix defines Vulkan API features that are infrastructure required for a complete functional description of Vulkan, but do not logically belong elsewhere in the Specification.

Vulkan Header Files

Vulkan is defined as an API in the C99 language. Khronos provides a corresponding set of header files for applications using the API, which may be used in either C or C++ code. The interface descriptions in the specification are the same as the interfaces defined in these header files, and both are derived from the `vk.xml` XML API Registry, which is the canonical machine-readable description of the Vulkan API. The Registry, scripts used for processing it into various forms, and documentation of the registry schema are available as described at <https://registry.khronos.org/vulkansc/#apiregistry>.

Language bindings for other languages can be defined using the information in the Specification and the Registry. Khronos does not provide any such bindings, but third-party developers have created some additional bindings.

Vulkan Combined API Header `vulkan_sc.h` (Informative)

Applications normally will include the header `vulkan_sc.h`. In turn, `vulkan_sc.h` always includes the following headers:

- `vk_platform.h`, defining platform-specific macros and headers.
- `vulkan_sc_core.h`, defining APIs for the Vulkan core and all registered extensions *other* than `window system-specific` and `provisional` extensions, which are included in separate header files.

In addition, specific preprocessor macros defined at the time `vulkan_sc.h` is included cause header files for the corresponding window system-specific and provisional interfaces to be included, as described below.

Vulkan Platform-Specific Header `vk_platform.h` (Informative)

Platform-specific macros and interfaces are defined in `vk_platform.h`. These macros are used to control platform-dependent behavior, and their exact definitions are under the control of specific platforms and Vulkan implementations.

Platform-Specific Calling Conventions

On many platforms the following macros are empty strings, causing platform- and compiler-specific default calling conventions to be used.

`VKAPI_ATTR` is a macro placed before the return type in Vulkan API function declarations. This macro controls calling conventions for C++11 and GCC/Clang-style compilers.

`VKAPI_CALL` is a macro placed after the return type in Vulkan API function declarations. This macro controls calling conventions for MSVC-style compilers.

VKAPI_PTR is a macro placed between the '(' and '*' in Vulkan API function pointer declarations. This macro also controls calling conventions, and typically has the same definition as **VKAPI_ATTR** or **VKAPI_CALL**, depending on the compiler.

With these macros, a Vulkan function declaration takes the form of:

```
VKAPI_ATTR <return_type> VKAPI_CALL <command_name>(<command_parameters>);
```

Additionally, a Vulkan function pointer type declaration takes the form of:

```
typedef <return_type> (VKAPI_PTR *PFN_<command_name>)(<command_parameters>);
```

Platform-Specific Header Control

If the **VK_NO_STDINT_H** macro is defined by the application at compile time, extended integer types used by the Vulkan API, such as **uint8_t**, **must** also be defined by the application. Otherwise, the Vulkan headers will not compile. If **VK_NO_STDINT_H** is not defined, the system **<stdint.h>** is used to define these types. There is a fallback path when Microsoft Visual Studio version 2008 and earlier versions are detected at compile time.

If the **VK_NO_STDDEF_H** macro is defined by the application at compile time, **size_t**, **must** also be defined by the application. Otherwise, the Vulkan headers will not compile. If **VK_NO_STDDEF_H** is not defined, the system **<stddef.h>** is used to define this type.

Vulkan Core API Header **vulkan_sc_core.h**

Applications that do not make use of window system-specific extensions may simply include **vulkan_sc_core.h** instead of **vulkan_sc.h**, although there is usually no reason to do so. In addition to the Vulkan API, **vulkan_sc_core.h** also defines and / or uses a small number of C preprocessor macros that are described below.

vulkan_sc_core.hpp provides the same functionality as **vulkan_sc_core.h**, but does so in a manner that is aligned for compliance with MISRA C++. In contrast, **vulkan_sc_core.h** is aligned for compliance with MISRA C:2012.

Vulkan Header File Compile Time Controls

If the **VK_NO_PROTOTYPES** macro is defined by an application at compile time, prototypes for Vulkan APIs will not be included. Only typedefs for API function pointers will be defined.

This is intended for applications using their own function loader and dispatch mechanism.

If the macro is not defined by the application, prototypes for Vulkan APIs will be included.

If the **VK_ONLY_EXPORTED_PROTOTYPES** macro is defined by an application at compile time, only prototypes for Vulkan APIs tagged as `"exported"` in the API XML will be included. For non-tagged APIs, only typedefs for API function pointers will be defined.

This is intended to match APIs which are statically exported by the Vulkan loader. At present, the exported APIs are only those defined by Vulkan core versions.

If the macro is not defined by the application, prototypes for all Vulkan APIs will be included.

Vulkan Header File Version Number

`VK_HEADER_VERSION` is the version number of the `vulkan_sc_core.h` header. This value is kept synchronized with the patch version of the released Specification.

```
// Provided by VK_VERSION_1_0
// Version of this file
#define VK_HEADER_VERSION 20
```

`VK_HEADER_VERSION_COMPLETE` is the complete version number of the `vulkan_sc_core.h` header, comprising the major, minor, and patch versions. The major/minor values are kept synchronized with the complete version of the released Specification. This value is intended for use by automated tools to identify exactly which version of the header was used during their generation.

Applications should not use this value as their `VkApplicationInfo::apiVersion`. Instead applications should explicitly select a specific fixed major/minor API version using, for example, one of the `VK_API_VERSION_*` values.

```
// Provided by VK_VERSION_1_0
// Complete version of this file
#define VK_HEADER_VERSION_COMPLETE VK_MAKE_API_VERSION(VKSC_API_VARIANT, 1, 0,
VK_HEADER_VERSION)
```

Vulkan Handle Macros

`VK_DEFINE_HANDLE` defines a [dispatchable handle](#) type.

```
// Provided by VK_VERSION_1_0
#define VK_DEFINE_HANDLE(object) typedef struct object##_T* (object);
```

- `object` is the name of the resulting C type.

The only dispatchable handle types are those related to device and instance management, such as `VkDevice`.

`VK_DEFINE_NON_DISPATCHABLE_HANDLE` defines a [non-dispatchable handle](#) type.

```
// Provided by VK_VERSION_1_0
#ifndef VK_DEFINE_NON_DISPATCHABLE_HANDLE
    #if (VK_USE_64_BIT_PTR_DEFINES==1)
        #define VK_DEFINE_NON_DISPATCHABLE_HANDLE(object) typedef struct object##_T
    *(object);
    #else
        #define VK_DEFINE_NON_DISPATCHABLE_HANDLE(object) typedef uint64_t (object);
    #endif
#endif
```

- **object** is the name of the resulting C type.

Most Vulkan handle types, such as [VkBuffer](#), are non-dispatchable.

NOTE

The `vulkan_sc_core.h` header allows the `VK_DEFINE_NON_DISPATCHABLE_HANDLE` and `VK_NULL_HANDLE` definitions to be overridden by the application. If `VK_DEFINE_NON_DISPATCHABLE_HANDLE` is already defined when `vulkan_sc_core.h` is compiled, the default definitions for `VK_DEFINE_NON_DISPATCHABLE_HANDLE` and `VK_NULL_HANDLE` are skipped. This allows the application to define a binary-compatible custom handle which **may** provide more type-safety or other features needed by the application. Applications **must** not define handles in a way that is not binary compatible - where binary compatibility is platform dependent.

`VK_NULL_HANDLE` is a reserved value representing a non-valid object handle. It may be passed to and returned from Vulkan commands only when [specifically allowed](#).

```
// Provided by VK_VERSION_1_0
#ifndef VK_DEFINE_NON_DISPATCHABLE_HANDLE
    #if (VK_USE_64_BIT_PTR_DEFINES==1)
        #if (defined(__cplusplus) && (__cplusplus >= 201103L)) || (defined(_MSVC_LANG)
&& (_MSVC_LANG >= 201103L))
            #define VK_NULL_HANDLE nullptr
        #else
            #define VK_NULL_HANDLE ((void*)0)
        #endif
    #else
        #define VK_NULL_HANDLE 0ULL
    #endif
#endif
#ifndef VK_NULL_HANDLE
    #define VK_NULL_HANDLE 0
#endif
```

`VK_USE_64_BIT_PTR_DEFINES` defines whether the default non-dispatchable handles are declared using either a 64-bit pointer type or a 64-bit unsigned integer type.

`VK_USE_64_BIT_PTR_DEFINES` is set to '1' to use a 64-bit pointer type or any other value to use a 64-bit

unsigned integer type.

```
// Provided by VK_VERSION_1_0
#ifndef VK_USE_64_BIT_PTR_DEFINES
    #if defined(__LP64__) || defined(_WIN64) || (defined(__x86_64__) &&
!defined(__ILP32__) ) || defined(_M_X64) || defined(__ia64) || defined (_M_IA64) ||
defined(__aarch64__) || defined(__powerpc64__) || (defined(__riscv) && __riscv_xlen ==
64)
        #define VK_USE_64_BIT_PTR_DEFINES 1
    #else
        #define VK_USE_64_BIT_PTR_DEFINES 0
    #endif
#endif
```

NOTE

The `vulkan_sc_core.h` header allows the `VK_USE_64_BIT_PTR_DEFINES` definition to be overridden by the application. This allows the application to select either a 64-bit pointer type or a 64-bit unsigned integer type for non-dispatchable handles in the case where the predefined preprocessor check does not identify the desired configuration.

Window System-Specific Header Control (Informative)

To use a Vulkan extension supporting a platform-specific window system, header files for that window system **must** be included at compile time, or platform-specific types **must** be forward-declared. The Vulkan header files are unable to determine whether or not an external header is available at compile time, so platform-specific extensions are provided in separate headers from the core API and platform-independent extensions, allowing applications to decide which ones they need to be defined and how the external headers are included.

Extensions dependent on particular sets of platform headers, or that forward-declare platform-specific types, are declared in a header named for that platform. Before including these platform-specific Vulkan headers, applications **must** include both `vulkan_sc_core.h` and any external native headers the platform extensions depend on.

As a convenience for applications that do not need the flexibility of separate platform-specific Vulkan headers, `vulkan_sc.h` includes `vulkan_sc_core.h`, and then conditionally includes platform-specific Vulkan headers and the external headers they depend on. Applications control which platform-specific headers are included by #defining macros before including `vulkan_sc.h`.

The correspondence between platform-specific extensions, external headers they require, the platform-specific header which declares them, and the preprocessor macros which enable inclusion by `vulkan_sc.h` are shown in the [following table](#).

Table 89. Window System Extensions and Headers

Extension Name	Window System Name	Platform-specific Header	Required External Headers	Controlling <code>vulkan_sc.h</code> Macro
VK_KHR_android_surface	Android	<code>vulkan_android.h</code>	None	VK_USE_PLATFORM_ANDROID_KHR
VK_KHR_wayland_surface	Wayland	<code>vulkan_wayland.h</code>	<code><wayland-client.h></code>	VK_USE_PLATFORM_WAYLAND_KHR
VK_KHR_win32_surface, VK_KHR_external_memory_win32, VK_KHR_win32_keyed_mutex, VK_KHR_external_semaphore_win32, VK_KHR_external_fence_win32, VK_NV_external_memory_win32, VK_NV_win32_keyed_mutex	Microsoft Windows	<code>vulkan_win32.h</code>	<code><windows.h></code>	VK_USE_PLATFORM_WIN32_KHR
VK_KHR_xcb_surface	X11 Xcb	<code>vulkan_xcb.h</code>	<code><xcb/xcb.h></code>	VK_USE_PLATFORM_XCB_KHR
VK_KHR_xlib_surface	X11 Xlib	<code>vulkan_xlib.h</code>	<code><X11/Xlib.h></code>	VK_USE_PLATFORM_XLIB_KHR
VK_EXT_directfb_surface	DirectFB	<code>vulkan_directfb.h</code>	<code><directfb/directfb.h></code>	VK_USE_PLATFORM_DIRECTFB_EXT
VK_EXT_acquire_xlib_display	X11 XRandR	<code>vulkan_xlib_xrandr.h</code>	<code><X11/Xlib.h></code> , <code><X11/extensions/Xrandr.h></code>	VK_USE_PLATFORM_XLIB_XRANDR_EXT
VK_GGP_stream_descriptor_surface, VK_GGP_frame_token	Google Games Platform	<code>vulkan_ggp.h</code>	<code><ggp_c/vulkan_types.h></code>	VK_USE_PLATFORM_GGP
VK_MVK_ios_surface	iOS	<code>vulkan_ios.h</code>	None	VK_USE_PLATFORM_IOS_MVK
VK_MVK_macos_surface	macOS	<code>vulkan_macos.h</code>	None	VK_USE_PLATFORM_MACOS_MVK
VK_OHOS_surface	OHOS	<code>vulkan_ohos.h</code>	None	VK_USE_PLATFORM_OHOS
VK_NN_vi_surface	VI	<code>vulkan_vi.h</code>	None	VK_USE_PLATFORM_VI_NN
VK_FUCHSIA_imagepipe_surface	Fuchsia	<code>vulkan_fuchsia.h</code>	<code><zircon/types.h></code>	VK_USE_PLATFORM_FUCHSIA
VK_EXT_metal_surface	Metal on CoreAnimation	<code>vulkan_metal.h</code>	None	VK_USE_PLATFORM_METAL_EXT
VK_QNX_screen_surface	QNX Screen	<code>vulkan_screen.h</code>	<code><screen/screen.h></code>	VK_USE_PLATFORM_SCREEN_QNX

Extension Name	Window System Name	Platform-specific Header	Required External Headers	Controlling <code>vulkan_sc.h</code> Macro
<code>VK_NV_external_sc_i_sync</code> , <code>VK_NV_external_sc_i_sync2</code> , <code>VK_NV_external_memory_sc_i_buf</code>	NVIDIA Sci	<code>vulkan_sc_i.h</code>	<code><nvscisync.h></code> , <code><nvscibuf.h></code>	<code>VK_USE_PLATFORM_SC_I</code>

NOTE

This section describes the purpose of the headers independently of the specific underlying functionality of the window system extensions themselves. Each extension name will only link to a description of that extension when viewing a specification built with that extension included.

Provisional Extension Header Control (Informative)

Provisional extensions **should** not be used in production applications. The functionality defined by such extensions **may** change in ways that break backwards compatibility between revisions, and before final release of a non-provisional version of that extension.

Provisional extensions are defined in a separate *provisional header*, `vulkan_beta.h`, allowing applications to decide whether or not to include them. The mechanism is similar to [window system-specific headers](#): before including `vulkan_beta.h`, applications **must** include `vulkan_sc_core.h`.

NOTE

Sometimes a provisional extension will include a subset of its interfaces in `vulkan_sc_core.h`. This may occur if the provisional extension is promoted from an existing vendor or EXT extension and some of the existing interfaces are defined as aliases of the provisional extension interfaces. All other interfaces of that provisional extension which are not aliased will be included in `vulkan_beta.h`.

As a convenience for applications, `vulkan_sc.h` conditionally includes `vulkan_beta.h`. Applications **can** control inclusion of `vulkan_beta.h` by #defining the macro `VK_ENABLE_BETA_EXTENSIONS` before including `vulkan_sc.h`.

NOTE

Starting in version 1.2.171 of the Specification, all provisional enumerants are protected by the macro `VK_ENABLE_BETA_EXTENSIONS`. Applications needing to use provisional extensions must always define this macro, even if they are explicitly including `vulkan_beta.h`. This is a minor change to behavior, affecting only provisional extensions.

NOTE

This section describes the purpose of the provisional header independently of the specific provisional extensions which are contained in that header at any given time. The extension appendices for provisional extensions note their provisional status, and link back to this section for more information. Provisional extensions are intended to provide early access for bleeding-edge developers, with the understanding that extension interfaces may change in response to developer feedback. Provisional extensions are very likely to eventually be updated and

released as non-provisional extensions, but there is no guarantee this will happen, or how long it will take if it does happen.

Appendix H: Invariance

The Vulkan specification is not pixel exact. It therefore does not guarantee an exact match between images produced by different Vulkan implementations. However, the specification does specify exact matches, in some cases, for images produced by the same implementation. The purpose of this appendix is to identify and provide justification for those cases that require exact matches.

Repeatability

The obvious and most fundamental case is repeated issuance of a series of Vulkan commands. For any given Vulkan and framebuffer state vector, and for any Vulkan command, the resulting Vulkan and framebuffer state **must** be identical whenever the command is executed on that initial Vulkan and framebuffer state. This repeatability requirement does not apply when using shaders containing side effects (image and buffer variable stores and atomic operations), because these memory operations are not guaranteed to be processed in a defined order.

One purpose of repeatability is avoidance of visual artifacts when a double-buffered scene is redrawn. If rendering is not repeatable, swapping between two buffers rendered with the same command sequence **may** result in visible changes in the image. Such false motion is distracting to the viewer. Another reason for repeatability is testability.

Repeatability, while important, is a weak requirement. Given only repeatability as a requirement, two scenes rendered with one (small) polygon changed in position might differ at every pixel. Such a difference, while within the law of repeatability, is certainly not within its spirit. Additional invariance rules are desirable to ensure useful operation.

Multi-Pass Algorithms

Invariance is necessary for a whole set of useful multi-pass algorithms. Such algorithms render multiple times, each time with a different Vulkan mode vector, to eventually produce a result in the framebuffer. Examples of these algorithms include:

- “Erasing” a primitive from the framebuffer by redrawing it, either in a different color or using the XOR logical operation.
- Using stencil operations to compute capping planes.

Invariance Rules

For a given Vulkan device:

Rule 1 *For any given Vulkan and framebuffer state vector, and for any given Vulkan command, the resulting Vulkan and framebuffer state **must** be identical each time the command is executed on that initial Vulkan and framebuffer state.*

Rule 2 *Changes to the following state values have no side effects (the use of any other state value is not affected by the change):*

Required:

- *Color and depth/stencil attachment contents*
- *Scissor parameters (other than enable)*
- *Write masks (color, depth, stencil)*
- *Clear values (color, depth, stencil)*

Strongly suggested:

- *Stencil parameters (other than enable)*
- *Depth test parameters (other than enable)*
- *Blend parameters (other than enable)*
- *Logical operation parameters (other than enable)*

Corollary 1 *Fragment generation is invariant with respect to the state values listed in Rule 2.*

Rule 3 *The arithmetic of each per-fragment operation is invariant except with respect to parameters that directly control it.*

Corollary 2 *Images rendered into different color attachments of the same framebuffer, either simultaneously or separately using the same command sequence, are pixel identical.*

Rule 4 *Identical pipelines will produce the same result when run multiple times with the same input. The wording “Identical pipelines” means [VkPipeline](#) objects that have been created with identical SPIR-V binaries and identical state, which are then used by commands executed using the same Vulkan state vector. Invariance is relaxed for shaders with side effects, such as performing stores or atomics.*

Rule 5 *All fragment shaders that either conditionally or unconditionally assign [FragCoord.z](#) to [FragDepth](#) are depth-invariant with respect to each other, for those fragments where the assignment to [FragDepth](#) actually is done.*

If a sequence of Vulkan commands specifies primitives to be rendered with shaders containing side effects (image and buffer variable stores and atomic operations), invariance rules are relaxed. In particular, rule 1, corollary 2, and rule 4 do not apply in the presence of shader side effects.

The following weaker versions of rules 1 and 4 apply to Vulkan commands involving shader side effects:

Rule 6 *For any given Vulkan and framebuffer state vector, and for any given Vulkan command, the contents of any framebuffer state not directly or indirectly affected by results of shader image or buffer variable stores or atomic operations **must** be identical each time the command is executed on that initial Vulkan and framebuffer state.*

Rule 7 *Identical pipelines will produce the same result when run multiple times with the same input as long as:*

- *shader invocations do not use image atomic operations;*

- *no framebuffer memory is written to more than once by image stores, unless all such stores write the same value; and*
- *no shader invocation, or other operation performed to process the sequence of commands, reads memory written to by an image store.*

NOTE

The OpenGL specification has the following invariance rule: Consider a primitive p' obtained by translating a primitive p through an offset (x, y) in window coordinates, where x and y are integers. As long as neither p' nor p is clipped, it **must** be the case that each fragment f' produced from p' is identical to a corresponding fragment f from p except that the center of f' is offset by (x, y) from the center of f .

This rule does not apply to Vulkan and is an intentional difference from OpenGL.

When any sequence of Vulkan commands triggers shader invocations that perform image stores or atomic operations, and subsequent Vulkan commands read the memory written by those shader invocations, these operations **must** be explicitly synchronized.

Tessellation Invariance

When using a pipeline containing tessellation evaluation shaders, the fixed-function tessellation primitive generator consumes the input patch specified by an application and emits a new set of primitives. The following invariance rules are intended to provide repeatability guarantees. Additionally, they are intended to allow an application with a carefully crafted tessellation evaluation shader to ensure that the sets of triangles generated for two adjacent patches have identical vertices along shared patch edges, avoiding “cracks” caused by minor differences in the positions of vertices along shared edges.

Rule 1 *When processing two patches with identical outer and inner tessellation levels, the tessellation primitive generator will emit an identical set of point, line, or triangle primitives as long as the pipeline used to process the patch primitives has tessellation evaluation shaders specifying the same tessellation mode, spacing, vertex order, and point mode decorations. Two sets of primitives are considered identical if and only if they contain the same number and type of primitives and the generated tessellation coordinates for the vertex numbered m of the primitive numbered n are identical for all values of m and n .*

Rule 2 *The set of vertices generated along the outer edge of the subdivided primitive in triangle and quad tessellation, and the tessellation coordinates of each, depend only on the corresponding outer tessellation level and the spacing decorations in the tessellation shaders of the pipeline.*

Rule 3 *The set of vertices generated when subdividing any outer primitive edge is always symmetric. For triangle tessellation, if the subdivision generates a vertex with tessellation coordinates of the form $(0, x, 1-x)$, $(x, 0, 1-x)$, or $(x, 1-x, 0)$, it will also generate a vertex with coordinates of exactly $(0, 1-x, x)$, $(1-x, 0, x)$, or $(1-x, x, 0)$, respectively. For quad tessellation, if the subdivision generates a vertex with coordinates of $(x, 0)$ or $(0, x)$, it will also generate a vertex with coordinates of exactly $(1-x, 0)$ or $(0, 1-x)$, respectively. For isoline tessellation, if it generates vertices at $(0, x)$ and $(1, x)$ where x is not zero, it will also generate vertices at exactly $(0, 1-x)$ and $(1, 1-x)$, respectively.*

Rule 4 *The set of vertices generated when subdividing outer edges in triangular and quad tessellation*

must be independent of the specific edge subdivided, given identical outer tessellation levels and spacing. For example, if vertices at $(x, 1 - x, 0)$ and $(1 - x, x, 0)$ are generated when subdividing the $w = 0$ edge in triangular tessellation, vertices **must** be generated at $(x, 0, 1 - x)$ and $(1 - x, 0, x)$ when subdividing an otherwise identical $v = 0$ edge. For quad tessellation, if vertices at $(x, 0)$ and $(1 - x, 0)$ are generated when subdividing the $v = 0$ edge, vertices **must** be generated at $(0, x)$ and $(0, 1 - x)$ when subdividing an otherwise identical $u = 0$ edge.

Rule 5 When processing two patches that are identical in all respects enumerated in rule 1 except for vertex order, the set of triangles generated for triangle and quad tessellation **must** be identical except for vertex and triangle order. For each triangle $n1$ produced by processing the first patch, there **must** be a triangle $n2$ produced when processing the second patch each of whose vertices has the same tessellation coordinates as one of the vertices in $n1$.

Rule 6 When processing two patches that are identical in all respects enumerated in rule 1 other than matching outer tessellation levels and/or vertex order, the set of interior triangles generated for triangle and quad tessellation **must** be identical in all respects except for vertex and triangle order. For each interior triangle $n1$ produced by processing the first patch, there **must** be a triangle $n2$ produced when processing the second patch each of whose vertices has the same tessellation coordinates as one of the vertices in $n1$. A triangle produced by the tessellator is considered an interior triangle if none of its vertices lie on an outer edge of the subdivided primitive.

Rule 7 For quad and triangle tessellation, the set of triangles connecting an inner and outer edge depends only on the inner and outer tessellation levels corresponding to that edge and the spacing decorations.

Rule 8 The value of all defined components of **TessCoord** will be in the range $[0, 1]$. Additionally, for any defined component x of **TessCoord**, the results of computing $1.0 - x$ in a tessellation evaluation shader will be exact. If any floating-point values in the range $[0, 1]$ fail to satisfy this property, such values **must** not be used as tessellation coordinate components.

Appendix I: Vulkan SC Deviations From Base Vulkan

Additions

The following extensions have been added to Vulkan SC:

Extension	Level
VK_KHR_object_refresh	Optional

The following items have been added to Vulkan SC:

Chapter	Additions
Fundamentals	- extending VkResult VK_ERROR_VALIDATION_FAILED [SCID-1] VK_ERROR_INVALID_PIPELINE_CACHE_DATA [SCID-1] VK_ERROR_NO_PIPELINE_MATCH [SCID-1]
Devices and Queues	VkPhysicalDeviceVulkanSC10Properties [SCID-1] VkDeviceObjectReservationCreateInfo [SCID-4] VkPerformanceQueryReservationInfoKHR [SCID-4] VkPipelinePoolSize [SCID-4]
Command Buffers	VkCommandPoolMemoryReservationCreateInfo [SCID-4] vkGetCommandPoolMemoryConsumption [SCID-1] VkCommandPoolMemoryConsumption [SCID-1]
Pipelines	- extending VkPipelineCacheCreateFlagBits VK_PIPELINE_CACHE_CREATE_READ_ONLY_BIT [SCID-1], [SCID-8] VK_PIPELINE_CACHE_CREATE_USE_APPLICATION_STORAGE_BIT [SCID-2] - extending VkPipelineCacheHeaderVersion VK_PIPELINE_CACHE_HEADER_VERSION_SAFETY_CRITICAL_ONE [SCID-1], [SCID-8] VkPipelineCacheHeaderVersionSafetyCriticalOne [SCID-1], [SCID-8] VkPipelineCacheValidationVersion [SCID-1], [SCID-8] VkPipelineCacheSafetyCriticalIndexEntry [SCID-1], [SCID-8] VkPipelineCacheStageValidationIndexEntry [SCID-1], [SCID-8] VkPipelineOfflineCreateInfo [SCID-1], [SCID-8] VkPipelineMatchControl [SCID-1]

Chapter	Additions
Memory Allocation	- extending VkMemoryHeapFlagBits VK_MEMORY_HEAP_SEU_SAFE_BIT [SCID-1]
Features	VkPhysicalDeviceVulkanSC10Features [SCID-1]
Debugging	VkFaultData [SCID-6] VkFaultCallbackInfo [SCID-6] VkFaultLevel [SCID-6] VkFaultType [SCID-6] VkFaultQueryBehavior [SCID-6] PFN_vkFaultCallbackFunction [SCID-6] vkGetFaultData [SCID-6]

Modifications

The following aspects of Base Vulkan have been modified for Vulkan SC:

Chapter	Modifications
Fundamentals	If VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations is VK_TRUE, VK_ERROR_OUT_OF_HOST_MEMORY must not be returned by physical or logical device commands which explicitly disallow it [SCID-4].
Devices and Queues	- The VkDeviceCreateInfo::pNext chain must include a VkDeviceObjectReservationCreateInfo structure [SCID-4]. - The VkDeviceCreateInfo::pNext chain must include a VkPhysicalDeviceVulkanSC10Features structure [SCID-1]. vkCreateDevice returns VK_ERROR_INVALID_PIPELINE_CACHE_DATA if the pInitialData member of any element of VkDeviceObjectReservationCreateInfo::pPipelineCacheCreateInfos is a pointer to incompatible pipeline cache data [SCID-1]. vkCreateDevice returns VK_ERROR_INVALID_PIPELINE_CACHE_DATA if the pInitialData member of any element of VkDeviceObjectReservationCreateInfo::pPipelineCacheCreateInfos is not aligned according to the platform and/or implementation specific pipeline cache data alignment requirements [SCID-8].

Chapter	Modifications
Command Buffers	• The <code>VkCommandPoolCreateInfo::pNext</code> chain must include a valid <code>VkCommandPoolMemoryReservationCreateInfo</code> structure [SCID-4]. • If <code>commandPoolResetCommandBuffer</code> is not supported [SCID-8], <code>vkResetCommandBuffer</code> must not be called. • <code>vkFreeCommandBuffers</code> does not return the memory used by command recording back to its parent command pool [SCID-4]. This memory is reclaimed when <code>vkResetCommandPool</code> is next called. • If <code>VkPhysicalDeviceVulkanSC10Properties::commandPoolMultipleCommandBuffersRecording</code> is <code>VK_FALSE</code>, then only one command buffer from a command pool can be in the <code>recording state</code> at a time [SCID-8]. • If <code>VkPhysicalDeviceVulkanSC10Properties::commandBufferSimultaneousUse</code> is <code>VK_FALSE</code>, then <code>VkCommandBufferBeginInfo::flags</code> must not include <code>VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT</code> [SCID-8]. • If <code>commandPoolResetCommandBuffer</code> is not supported, <code>commandBuffer</code> must be in the <code>initial state</code> when <code>vkBeginCommandBuffer</code> is called [SCID-8]. • If <code>VkPhysicalDeviceVulkanSC10Properties::secondaryCommandBufferNullOrImagelessFramebuffer</code> is <code>VK_FALSE</code>, then <code>VkCommandBufferInheritanceInfo::framebuffer</code> must not be <code>VK_NULL_HANDLE</code> and must not have been created with a <code>VkFramebufferCreateInfo::flags</code> value that includes <code>VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT</code> if the command buffer will be executed within a render pass instance [SCID-8].

Chapter	Modifications
Pipelines	• <code>vkCreateComputePipelines</code> returns <code>VK_ERROR_NO_PIPELINE_MATCH</code> if the <code>VkComputePipelineCreateInfo::pNext</code> chain does not include a valid <code>VkPipelineOfflineCreateInfo</code> structure [SCID-1]. • <code>vkCreateComputePipelines::pipelineCache</code> must not be <code>VK_NULL_HANDLE</code> [SCID-1], [SCID-8]. • <code>VkComputePipelineCreateInfo::basePipelineHandle</code> must be <code>VK_NULL_HANDLE</code> [SCID-8]. • <code>VkComputePipelineCreateInfo::basePipelineIndex</code> must be zero [SCID-8]. • <code>vkCreateGraphicsPipelines</code> returns <code>VK_ERROR_NO_PIPELINE_MATCH</code> if the <code>VkGraphicsPipelineCreateInfo::pNext</code> chain does not include a valid <code>VkPipelineOfflineCreateInfo</code> structure [SCID-1]. • <code>vkCreateGraphicsPipelines::pipelineCache</code> must not be <code>VK_NULL_HANDLE</code> [SCID-1], [SCID-8]. • <code>VkGraphicsPipelineCreateInfo::basePipelineHandle</code> must be <code>VK_NULL_HANDLE</code> [SCID-8]. • <code>VkGraphicsPipelineCreateInfo::basePipelineIndex</code> must be zero [SCID-8]. • <code>VkPipelineCacheCreateInfo::pInitialData</code> must point to a valid pipeline cache that has been generated offline [SCID-1], [SCID-8]. • <code>VkPipelineCacheCreateInfo::initialDataSize</code> must not be 0 [SCID-1], [SCID-8]. • <code>VkPipelineCacheCreateInfo::pInitialData</code> must not be <code>NULL</code> [SCID-1], [SCID-8]. • <code>VkPipelineCacheCreateInfo::flags</code> must include <code>VK_PIPELINE_CACHE_CREATE_READ_ONLY_BIT</code> [SCID-1], [SCID-8]. • <code>VkPipelineCacheCreateInfo::flags</code> must include <code>VK_PIPELINE_CACHE_CREATE_USE_APPLICATION_STORAGE_BIT</code> [SCID-2]. • The contents of <code>VkPipelineCacheCreateInfo</code>, including the data pointed to by <code>VkPipelineCacheCreateInfo::pInitialData</code>, passed to <code>vkCreatePipelineCache</code> must be the same as specified in one of the <code>VkDeviceObjectReservationCreateInfo::pPipelineCacheCreateInfos</code> structures when the device was created [SCID-1]. • <code>VkPipelineCacheHeaderVersionOne::headerSize</code> must be 56 [SCID-1]. • <code>VkPipelineCacheHeaderVersionOne::headerVersion</code> must be <code>VK_PIPELINE_CACHE_HEADER_VERSION_SAFETY_CRITICAL_ONE</code> [SCID-1].

Chapter	Modifications
Memory Allocation	• <code>vkCreate*::pAllocator</code> must be <code>NULL</code> [SCID-2], [SCID-8]. • <code>vkDestroy*::pAllocator</code> must be <code>NULL</code> [SCID-2], [SCID-8]. • <code>vk*Memory::pAllocator</code> must be <code>NULL</code> [SCID-2], [SCID-8]. • <code>vkRegisterDeviceEventEXT::pAllocator</code> must be <code>NULL</code> [SCID-8].
Resource Creation	• <code>VkBufferCreateInfo::flags</code> must not contain any of the <code>VK_BUFFER_CREATE_SPARSE_BINDING_BIT</code>, <code>VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT</code>, or <code>VK_BUFFER_CREATE_SPARSE_ALIASED_BIT</code> flags [SCID-8]. • <code>VkImageCreateInfo::flags</code> must not contain any of the <code>VK_IMAGE_CREATE_SPARSE_BINDING_BIT</code>, <code>VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT</code>, <code>VK_IMAGE_CREATE_SPARSE_ALIASED_BIT</code>, or <code>VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT</code> flags [SCID-8]. • <code>VkBindImageMemoryDeviceGroupInfo::splitInstanceBindRegionCount</code> must be zero [SCID-8].
Resource Descriptors	• If <code>recycleDescriptorSetMemory</code> is <code>VK_FALSE</code>, then freeing a descriptor set does not make the pool memory it used available to be reallocated until the descriptor pool is reset [SCID-4].
Sparse Resources	• <code>VkPhysicalDeviceSparseProperties::residencyStandard2DBlockShape</code> must be reported as <code>VK_FALSE</code> [SCID-8]. • <code>VkPhysicalDeviceSparseProperties::residencyStandard2DMultisampleBlockShape</code> must be reported as <code>VK_FALSE</code> [SCID-8]. • <code>VkPhysicalDeviceSparseProperties::residencyStandard3DBlockShape</code> must be reported as <code>VK_FALSE</code> [SCID-8]. • <code>VkPhysicalDeviceSparseProperties::residencyAlignedMipSize</code> must be reported as <code>VK_FALSE</code> [SCID-8]. • <code>VkPhysicalDeviceSparseProperties::residencyNonResidentStrict</code> must be reported as <code>VK_FALSE</code> [SCID-8].
WSI Swapchain	• <code>VkSwapchainCreateInfoKHR::flags</code> must not contain <code>VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR</code> [SCID-8]. • <code>VkSwapchainCreateInfoKHR::oldSwapchain</code> must be <code>VK_NULL_HANDLE</code> [SCID-4].

Chapter	Modifications
Features	• <code>VkPhysicalDeviceFeatures::shaderResourceResidency</code> must be reported as <code>VK_FALSE</code> [SCID-8]. • <code>VkPhysicalDeviceFeatures::sparseBinding</code> must be reported as <code>VK_FALSE</code> [SCID-8]. • <code>VkPhysicalDeviceFeatures::sparseResidencyBuffer</code> must be reported as <code>VK_FALSE</code> [SCID-8]. • <code>VkPhysicalDeviceFeatures::sparseResidencyImage2D</code> must be reported as <code>VK_FALSE</code> [SCID-8]. • <code>VkPhysicalDeviceFeatures::sparseResidencyImage3D</code> must be reported as <code>VK_FALSE</code> [SCID-8]. • <code>VkPhysicalDeviceFeatures::sparseResidency2Samples</code> must be reported as <code>VK_FALSE</code> [SCID-8]. • <code>VkPhysicalDeviceFeatures::sparseResidency4Samples</code> must be reported as <code>VK_FALSE</code> [SCID-8]. • <code>VkPhysicalDeviceFeatures::sparseResidency8Samples</code> must be reported as <code>VK_FALSE</code> [SCID-8]. • <code>VkPhysicalDeviceFeatures::sparseResidency16Samples</code> must be reported as <code>VK_FALSE</code> [SCID-8]. • <code>VkPhysicalDeviceFeatures::sparseResidencyAliased</code> must be reported as <code>VK_FALSE</code> [SCID-8]. • <code>VkPhysicalDeviceVulkanSC10Features::shaderAtomicInstructions</code> are made optional [SCID-1]. • <code>VkPhysicalDeviceVulkan11Features::multiview</code> is made optional [SCID-8]. • <code>VkPhysicalDeviceVulkan12Features::timelineSemaphore</code> is made optional [SCID-8]. • <code>VkPhysicalDeviceVulkan12Features::vulkanMemoryModel</code> must be reported as <code>VK_TRUE</code> [SCID-1].
Limits	• <code>VkPhysicalDeviceLimits::maxFramebufferLayers</code> may be 1 if neither <code>geometryShader</code> or <code>shaderOutputLayer</code> are supported [SCID-8]. • <code>VkPhysicalDeviceVulkan12Properties::supportedDepthResolveModes</code> may be only <code>VK_RESOLVE_MODE_NONE</code> [SCID-8]. • <code>VkPhysicalDeviceVulkan12Properties::supportedStencilResolveModes</code> may be only <code>VK_RESOLVE_MODE_NONE</code> [SCID-8].

Removals

The following functionality has been removed from Base Vulkan in Vulkan SC:

Chapter	Removals
Fundamentals	• VkStructureType (legacy aliases) ◦ VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VARIABLE_POINTER_FEATURES [SCID-8] ◦ VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_DRAW_PARAMETER_FEATURES [SCID-8] ◦ VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES2_EXT [SCID-8]
Devices and Queues	• VkQueueFlagBits ◦ VK_QUEUE_SPARSE_BINDING_BIT [SCID-8]
Command Buffers	• vkDestroyCommandPool [SCID-4] • vkTrimCommandPool, vkTrimCommandPoolKHR [SCID-8] • VkCommandPoolTrimFlags, VkCommandPoolTrimFlagsKHR [SCID-8] • VkCommandPoolResetFlagBits ◦ VK_COMMAND_POOL_RESET_RELEASE_RESOURCES_BIT [SCID-4]
Synchronization and Cache Control	• vkDestroySemaphoreSciSyncPoolNV [SCID-4]
Shaders	• VkStructureType ◦ VK_STRUCTURE_TYPE_SHADER_MODULE_CREATE_INFO [SCID-8] • VkObjectType ◦ VK_OBJECT_TYPE_SHADER_MODULE [SCID-8] • vkCreateShaderModule, vkDestroyShaderModule [SCID-8] • VkShaderModule, VkShaderModuleCreateInfo [SCID-8] • VkShaderModuleCreateFlags [SCID-8] • VkShaderModuleCreateFlagBits [SCID-8]
Pipelines	• VkPipelineCreateFlagBits ◦ VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT [SCID-8] ◦ VK_PIPELINE_CREATE_DERIVATIVE_BIT [SCID-8] • vkMergePipelineCaches, vkGetPipelineCacheData [SCID-1], [SCID-8]
Memory Allocation	• VkSystemAllocationScope, VkInternalAllocationType [SCID-8] • vkFreeMemory [SCID-4]

Chapter	Removals
Resource Descriptors	• vkDestroyDescriptorPool [SCID-4] • VkStructureType ◦ VK_STRUCTURE_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_CREATE_INFO_KHR [SCID-8] • VkObjectType ◦ VK_OBJECT_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_KHR [SCID-8] • vkCreateDescriptorUpdateTemplateKHR, vkDestroyDescriptorUpdateTemplateKHR, vkUpdateDescriptorSetWithTemplateKHR, vkCmdPushDescriptorSetWithTemplateKHR [SCID-8] • VkDescriptorUpdateTemplateKHR, VkDescriptorUpdateTemplateEntryKHR, VkDescriptorUpdateTemplateCreateInfoKHR [SCID-8] • VkDescriptorUpdateTemplateTypeKHR [SCID-8] • VkDescriptorUpdateTemplateCreateFlagsKHR [SCID-8] • VkDescriptorUpdateTemplateType ◦ VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET_KHR [SCID-8] ◦ VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS [SCID-8]
Queries	• vkDestroyQueryPool [SCID-4]
Fragment Operations	• VkStencilFaceFlagBits (legacy alias) ◦ VK_STENCIL_FRONT_AND_BACK [SCID-8]

Chapter	Removals
Sparse Resources	• VkStructureType ◦ VK_STRUCTURE_TYPE_BIND_SPARSE_INFO [SCID-8] ◦ VK_STRUCTURE_TYPE_DEVICE_GROUP_BIND_SPARSE_INFO [SCID-8] ◦ VK_STRUCTURE_TYPE_IMAGE_SPARSE_MEMORY_REQUIREMENTS_INFO_2 [SCID-8] ◦ VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SPARSE_IMAGE_FORMAT_INFO_2 [SCID-8] ◦ VK_STRUCTURE_TYPE_SPARSE_IMAGE_FORMAT_PROPERTIES_2 [SCID-8] ◦ VK_STRUCTURE_TYPE_SPARSE_IMAGE_MEMORY_REQUIREMENTS_2 [SCID-8] • VkSparseImageFormatProperties [SCID-8] • VkSparseImageFormatFlagBits [SCID-8] • VkSparseImageFormatFlags [SCID-8] • vkGetPhysicalDeviceSparseImageFormatProperties [SCID-8] • vkGetPhysicalDeviceSparseImageFormatProperties2 [SCID-8] • VkPhysicalDeviceSparseImageFormatInfo2 [SCID-8] • VkSparseImageFormatProperties2 [SCID-8] • VkSparseImageMemoryRequirements [SCID-8] • vkGetImageSparseMemoryRequirements [SCID-8] • vkGetImageSparseMemoryRequirements2 [SCID-8] • VkImageSparseMemoryRequirementsInfo2 [SCID-8] • VkSparseImageMemoryRequirements2 [SCID-8] • VkSparseMemoryBind [SCID-8] • VkSparseMemoryBindFlagBits [SCID-8] • VkSparseMemoryBindFlags [SCID-8] • VkSparseBufferMemoryBindInfo [SCID-8] • VkSparseImageOpaqueMemoryBindInfo [SCID-8] • VkSparseImageMemoryBindInfo [SCID-8] • VkSparseImageMemoryBind [SCID-8] • vkQueueBindSparse [SCID-8] • VkBindSparseInfo [SCID-8] • VkDeviceGroupBindSparseInfo [SCID-8]

Chapter	Removals
Window System Integration	• VkColorSpaceKHR (legacy aliases) ◦ VK_COLORSPACE_SRGB_NONLINEAR_KHR [SCID-8] ◦ VK_COLOR_SPACE_DCI_P3_LINEAR_EXT [SCID-8] • VkColorSpaceKHR (not well-defined) ◦ VK_COLOR_SPACE_DOLBYVISION_EXT [SCID-8]
WSI Swapchain	• vkDestroySwapchainKHR [SCID-4]

Extension Support

Vulkan SC supports a subset of the extensions supported in Base Vulkan. This subset was decided by:

- Excluding any extensions that would pose significant difficulty to certify their implementations.
- Excluding any extension that would not be used in deployed devices. This was primarily extensions focused on application development and debug.
- Excluding any extensions that are specific to an Operating System or Windowing system that is highly unlikely to be used in the Safety Critical space.
- Non-KHR or EXT extension are supported on request.

NOTE

During development it is likely that application developers will need additional functionality in a Vulkan SC implementation beyond what is provided by the supported extensions. This can be achieved by implementing a development focused version of the implementation that exposes additional Vulkan extensions and tools support but is non-conformant to the Vulkan SC specification.

A Vulkan SC conformant implementation with this additional functionality removed will be used on the end device.

Fault and Error Handling

Vulkan SC maintains the use of [VkResult Return Codes](#) on a small number of commands. These allow the command to confirm it completed successfully or return an error code for situations where a failure could be detected at runtime during the execution of the command.

In addition to [VkResult Return Codes](#) Vulkan SC adds [Fault Handling](#) support. This provides the implementation the ability to communicate information on errors or faults to the application that have been detected but are not covered by [VkResult Return Codes](#) in the Vulkan SC API. These could be runtime failures of the system or application faults that are detected asynchronously to the Vulkan API commands.

Undefined Behavior in the API

If an application uses the API incorrectly the behavior of the API is undefined. The Vulkan SC runtime will perform minimal error and state checking and it is assumed that applications are using the API correctly, see [Valid Usage](#).

With incorrect input to the API, the implementation could continue to function correctly, generate unexpected output, become unstable, or be terminated. The exact behavior will vary and be dependent on the specifics of the invalid usage and the implementation.

It is primarily the application's responsibility to ensure it always uses the API correctly. Potential methods to detect incorrect API usage include performing manual code inspection, use of validation layers during development, use of validation layers at runtime, or adding runtime checking to the application. Outside of this, Vulkan SC implementations **can** add implementation-specific targeted checks to detect invalid API usage that could significantly impact the correct operation of the application or implementation. The [Fault Handling](#) extension allows implementations to communicate information on such occurrences.

MISRA C:2012 Deviations

`vulkan_sc_core.h` is intended to be compatible with safety coding standards like MISRA C:2012.

The following provides information on items a MISRA C code analysis tool **may** report for a project using Vulkan SC.

MISRA headline guidelines are copyright © The MISRA Consortium Limited and are reproduced with permission. For further explanation of the directives and rules please see the *MISRA C:2012* specification (<https://www.misra.org.uk/misra-c/>). See *MISRA Compliance:2020* (<https://www.misra.org.uk/app/uploads/2021/06/MISRA-Compliance-2020.pdf>) for a framework for handling deviations.

Directives

Directive	4.6: "typedefs that indicate size and signedness should be used in place of the basic numerical types"
Category	Advisory
Note	This is reported for every <code>char</code> and <code>float</code> variable used in the API.
Rationale	Vulkan SC maintains the Base Vulkan type conventions for compatibility between APIs.

Rules

Rule	2.3: "A project should not contain unused type declarations"
Category	Advisory
Note	This is reported for any unused type definitions.

Rule	2.3: "A project should not contain unused type declarations"
Rationale	The <code>vulkan_sc_core.h</code> provides a complete API definition and it is expected that an application may not use all the provided type declarations.

Rule	2.4: "A project should not contain unused tag declarations"
Category	Advisory
Note	This is reported for each instance of <code>typedef struct VkStruct { ... } VkStruct;</code> and <code>typedef enum VkEnum { ... } VkEnum;</code> where the tag declaration is unused.
Rationale	The <code>vulkan_sc_core.h</code> provides a complete API definition and it is expected that an application may not use all the provided tag declarations. Vulkan SC maintains the Base Vulkan type conventions for compatibility between APIs. Tag declarations are required in case an application wishes to make forward declarations to API-defined types.

Rule	2.5: "A project should not contain unused macro declarations"
Category	Advisory
Note	This is reported for every unused macro defined in the header.
Rationale	The <code>vulkan_sc_core.h</code> provides a complete API definition and it is expected that an application may not use all the provided macro declarations.

Rule	5.1: "External identifiers shall be distinct"
Category	Required
Note	This is reported for identifiers with names that do not differ in the first 31 characters, such as <code>vkGetPhysicalDeviceFormatProperties</code> and <code>vkGetPhysicalDeviceFormatProperties2</code> .
Rationale	Vulkan SC maintains the Base Vulkan naming conventions for compatibility between APIs. Vulkan SC applications must be built using a compiler that treats enough characters as significant.

Rule	5.2: "Identifiers declared in the same <i>scope</i> and name space shall be distinct"
Category	Required
Note	This is reported for many <code>typedef</code> statements with long identifiers.
Rationale	Vulkan SC maintains the Base Vulkan type and naming conventions for compatibility between APIs. Vulkan SC applications must be built using a compiler that treats enough characters as significant.

Rule	5.4: "Macro identifiers shall be distinct"
Category	Required
Note	This is reported for macros with names that do not differ in the first 31 characters, such as <code>VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT</code> and <code>VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT</code> .

Rule	5.4: "Macro identifiers shall be distinct"
Rationale	Vulkan SC maintains the Base Vulkan naming conventions for compatibility between APIs. Vulkan SC applications must be built using a compiler that treats enough characters as significant.

Rule	8.6: "An identifier with external linkage shall have exactly one external definition"
Category	Required
Note	This is reported for every API command declaration, and the external definitions are provided by the implementation.
Rationale	It is expected that a Vulkan SC application will link against an implementation that provides these definitions.

Rule	19.2: "The <i>union</i> keyword should not be used"
Category	Advisory
Note	This is reported on the VkClearColorValue , VkClearValue , and VkPerformanceCounterResultKHR unions.
Rationale	These are required to remain compatible with the Base Vulkan API.

Rule	20.1: "#include directives should only be preceded by preprocessor directives or comments"
Category	Advisory
Note	This is reported because the entire Vulkan SC API definition is wrapped in an extern "C" block.
Rationale	This is expected because the Vulkan SC API is a C ABI and the header may be included from C++ code.

Rule	20.10: "The # and ## preprocessor operators should not be used"
Category	Advisory
Note	This is reported for the two lines: <pre>#define VK_DEFINE_HANDLE(object) typedef struct object##_T* (object); #define VK_DEFINE_NON_DISPATCHABLE_HANDLE(object) typedef struct object##_T *(object);</pre>
Rationale	This is expected usage of the macro expansion operation and there are not multiple operators used in the statement.

Appendix J: Lexicon

This appendix defines terms, abbreviations, and API prefixes used in the Specification.

Glossary

The terms defined in this section are used consistently throughout the Specification and may be used with or without capitalization.

Accessible (Descriptor Binding)

A descriptor binding is accessible to a shader stage if that stage is included in the `stageFlags` of the descriptor binding. Descriptors using that binding **can** only be used by stages in which they are accessible.

Acquire Operation (Resource)

An operation that acquires ownership of an image subresource or buffer range.

Adjacent Vertex

A vertex in an adjacency primitive topology that is not part of a given primitive, but is accessible in geometry shaders.

Advanced Blend Operation

Blending performed using one of the blend operation enums introduced by the `VK_EXT_blend_operation_advanced` extension. See [Advanced Blending Operations](#).

Alias (API type/command)

An identical definition of another API type/command with the same behavior but a different name.

Aliased Range (Memory)

A range of a device memory allocation that is bound to multiple resources simultaneously.

Allocation Scope

An association of a host memory allocation to a parent object or command, where the allocation's lifetime ends before or at the same time as the parent object is freed or destroyed, or during the parent command.

API command

Any command defined in the Vulkan specification. These entry points all have a `vk` prefix.

Aspect (Image)

Some image types contain multiple kinds (called “aspects”) of data for each pixel, where each aspect is used in a particular way by the pipeline and **may** be stored differently or separately from other aspects. For example, the color components of an image format make up the color aspect of the image, and **can** be used as a framebuffer color attachment. Some operations, like depth testing, operate only on specific aspects of an image.

Attachment (Render Pass)

A zero-based integer index name used in render pass creation to refer to a framebuffer attachment that is accessed by one or more subpasses. The index also refers to an attachment description which includes information about the properties of the image view that will later be attached.

Availability Operation

An operation that causes the values generated by specified memory write accesses to become available for future access.

Available

A state of values written to memory that allows them to be made visible.

Back-Facing

See Facingness.

Batch

A single structure submitted to a queue as part of a [queue submission command](#), describing a set of queue operations to execute.

Backwards Compatibility

A given version of the API is backwards compatible with an earlier version if an application, relying only on valid behavior and functionality defined by the earlier specification, is able to correctly run against each version without any modification. This assumes no active attempt by that application to not run when it detects a different version.

Binary Semaphore

A semaphore with a boolean payload indicating whether the semaphore is signaled or unsignaled. Represented by a [VkSemaphore](#) object created with a semaphore type of `VK_SEMAPHORE_TYPE_BINARY`.

Binding (Memory)

An association established between a range of a resource object and a range of a memory object. These associations determine the memory locations affected by operations performed on elements of a resource object. Memory bindings are established using the [vkBindBufferMemory](#) command for non-sparse buffer objects, and using the [vkBindImageMemory](#) command for non-sparse image objects.

Blend Constant

Four floating-point (RGBA) values used as an input to blending.

Blending

Arithmetic operations between a fragment color value and a value in a color attachment that produce a final color value to be written to the attachment.

Buffer

A resource that represents a linear array of data in device memory. Represented by a [VkBuffer](#) object.

Buffer Device Address

A 64-bit value used in a shader to access buffer memory through the `PhysicalStorageBuffer` storage class.

Buffer View

An object that represents a range of a specific buffer, and state controlling how the contents are interpreted. Represented by a `VkBufferView` object.

Built-In Variable

A variable decorated in a shader, where the decoration makes the variable take values provided by the execution environment or values that are generated by fixed-function pipeline stages.

Built-In Interface Block

A block defined in a shader containing only variables decorated with built-in decorations, and is used to match against other shader stages.

Clip Coordinates

The homogeneous coordinate space in which vertex positions (`Position` decoration) are written by `pre-rasterization shader stages`.

Clip Distance

A built-in output from `pre-rasterization shader stages` defining a clip half-space against which the primitive is clipped.

Clip Volume

The intersection of the view volume with all clip half-spaces.

Color Attachment

A subpass attachment point, or image view, that is the target of fragment color outputs and blending.

Color Renderable Format

A `VkFormat` where `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` is set in one of the following, depending on the image's tiling:

- `VkFormatProperties::linearTilingFeatures`
- `VkFormatProperties::optimalTilingFeatures`
- `VkDrmFormatModifierPropertiesEXT::drmFormatModifierTilingFeatures`

Combined Image Sampler

A descriptor type that includes both a sampled image and a sampler.

Command Buffer

An object that records commands to be submitted to a queue. Represented by a `VkCommandBuffer` object.

Command Pool

An object that command buffer memory is allocated from, and that owns that memory.

Command pools aid multithreaded performance by enabling different threads to use different allocators, without internal synchronization on each use. Represented by a [VkCommandPool](#) object.

Compatible Allocator

When allocators are compatible, allocations from each allocator **can** be freed by the other allocator.

Compatible Image Formats

When formats are compatible, images created with one of the formats **can** have image views created from it using any of the compatible formats. Also see *Size-Compatible Image Formats*.

Compatible Queues

Queues within a queue family. Compatible queues have identical properties.

Complete Mipmap Chain

The entire set of mip levels that can be provided for an image, from the largest application-specified mip level size down to the *minimum mip level size*. See [Image Mip Level Sizing](#).

Component (Format)

A distinct part of a format. Color components are represented with **R**, **G**, **B**, and **A**. Depth and stencil components are represented with **D** and **S**. Formats **can** have multiple instances of the same component. Some formats have other notations such as **E** or **X** which are not considered a component of the format.

Compressed Texel Block

An element of an image having a block-compressed format, comprising a rectangular block of texel values that are encoded as a single value in memory. Compressed texel blocks of a particular block-compressed format have a corresponding width, height, and depth defining the dimensions of these elements in units of texels, and a size in bytes of the encoding in memory.

Constant Integral Expressions

A SPIR-V constant instruction whose type is **OpTypeInt**. See *Constant Instruction* in section 2.2.1 “Instructions” of the [Khronos SPIR-V Specification](#).

Coverage Index

The index of a sample in the coverage mask.

Coverage Mask

A bitfield associated with a fragment representing the samples that were determined to be covered based on the result of rasterization, and then subsequently modified by fragment operations or the fragment shader.

Cull Distance

A built-in output from [pre-rasterization shader stages](#) defining a cull half-space where the primitive is rejected if all vertices have a negative value for the same cull distance.

Cull Volume

The intersection of the view volume with all cull half-spaces.

Decoration (SPIR-V)

Auxiliary information such as built-in variables, stream numbers, invariance, interpolation type, relaxed precision, etc., added to variables or structure-type members through decorations.

Depth/Stencil Attachment

A subpass attachment point, or image view, that is the target of depth and/or stencil test operations and writes.

Depth/Stencil Format

A [VkFormat](#) that includes depth and/or stencil components.

Depth/Stencil Image (or ImageView)

A [VkImage](#) (or [VkImageView](#)) with a depth/stencil format.

Depth/Stencil Resolve Attachment

A subpass attachment point, or image view, that is the target of a multisample resolve operation from the corresponding depth/stencil attachment at the end of the subpass.

Derivative Group

A set of fragment shader invocations that cooperate to compute derivatives, including implicit derivatives for sampled image operations.

Descriptor

Information about a resource or resource view written into a descriptor set that is used to access the resource or view from a shader.

Descriptor Binding

An entry in a descriptor set layout corresponding to zero or more descriptors of a single descriptor type in a set. Defined by a [VkDescriptorSetLayoutBinding](#) structure.

Descriptor Pool

An object that descriptor sets are allocated from, and that owns the storage of those descriptor sets. Descriptor pools aid multithreaded performance by enabling different threads to use different allocators, without internal synchronization on each use. Represented by a [VkDescriptorPool](#) object.

Descriptor Set

An object that resource descriptors are written into via the API, and that **can** be bound to a command buffer such that the descriptors contained within it **can** be accessed from shaders. Represented by a [VkDescriptorSet](#) object.

Descriptor Set Layout

An object defining the set of resources (types and counts) and their relative arrangement (in the binding namespace) within a descriptor set. Used when allocating descriptor sets and when creating pipeline layouts. Represented by a [VkDescriptorSetLayout](#) object.

Device

The processor(s) and execution environment that perform tasks requested by the application via the Vulkan API.

Device Group

A set of physical devices that support accessing each other's memory and recording a single command buffer that **can** be executed on all the physical devices.

Device Index

A zero-based integer that identifies one physical device from a logical device. A device index is valid if it is less than the number of physical devices in the logical device.

Device Mask

A bitmask where each bit represents one device index. A device mask value is valid if every bit that is set in the mask is at a bit position that is less than the number of physical devices in the logical device.

Device Memory

Memory accessible to the device. Represented by a [VkDeviceMemory](#) object.

Device-Level Command

Any command that is dispatched from a logical device, or from a child object of a logical device.

Device-Level Functionality

All device-level commands and objects, and their structures, enumerated types, and enumerants. Additionally, physical-device-level functionality defined by a [device extension](#) is also considered device-level functionality.

Device-Level Object

Logical device objects and their child objects. For example, [VkDevice](#), [VkQueue](#), and [VkCommandBuffer](#) objects are device-level objects.

Device-Local Memory

Memory that is connected to the device, and **may** be more performant for device access than host-local memory.

Direct Drawing Commands

Drawing commands that take all their parameters as direct arguments to the command (and not sourced via structures in buffer memory as the *indirect drawing commands*). Includes [vkCmdDraw](#), and [vkCmdDrawIndexed](#).

Disjoint

Disjoint planes are *image planes* to which memory is bound independently.

A *disjoint image* consists of multiple *disjoint planes*, and is created with the [VK_IMAGE_CREATE_DISJOINT_BIT](#) bit set.

Dispatchable Command

A non-global command. The first argument to each dispatchable command is a dispatchable

handle type.

Dispatchable Handle

A handle of a pointer handle type which **may** be used by layers as part of intercepting API commands.

Dispatching Commands

Commands that provoke work using a compute pipeline, such as [vkCmdDispatch](#). See [Dispatching Commands](#).

Drawing Commands

Commands that provoke work using a graphics pipeline. Includes [vkCmdDraw](#), [vkCmdDrawIndexed](#), [vkCmdDrawIndirectCount](#), [vkCmdDrawIndexedIndirectCount](#), [vkCmdDrawIndirect](#), and [vkCmdDrawIndexedIndirect](#).

Duration (Command)

The *duration* of a Vulkan command refers to the interval between calling the command and its return to the caller.

Dynamic Storage Buffer

A storage buffer whose offset is specified each time the storage buffer is bound to a command buffer via a descriptor set.

Dynamic Uniform Buffer

A uniform buffer whose offset is specified each time the uniform buffer is bound to a command buffer via a descriptor set.

Dynamically Uniform

See *Dynamically Uniform* in section 2.2 “Terms” of the [Khronos SPIR-V Specification](#).

Element

Arrays are composed of multiple elements, where each element exists at a unique index within that array. Used primarily to describe data passed to or returned from the Vulkan API.

Explicitly-Enabled Layer

A layer enabled by the application by adding it to the enabled layer list in [vkCreateInstance](#) or [vkCreateDevice](#).

Event

A synchronization primitive that is signaled when execution of previous commands completes through a specified set of pipeline stages. Events can be waited on by the device and polled by the host. Represented by a [VkEvent](#) object.

Executable State (Command Buffer)

A command buffer that has ended recording commands and **can** be executed. See also Initial State and Recording State.

Execution Dependency

A dependency that guarantees that certain pipeline stages' work for a first set of commands has completed execution before certain pipeline stages' work for a second set of commands begins execution. This is accomplished via pipeline barriers, subpass dependencies, events, or implicit ordering operations.

Execution Dependency Chain

A sequence of execution dependencies that transitively act as a single execution dependency.

Explicit chroma reconstruction

An implementation of sampler $Y'C_B C_R$ conversion which reconstructs reduced-resolution chroma samples to luma resolution and then separately performs texture sample interpolation. This is distinct from an implicit implementation, which incorporates chroma sample reconstruction into texture sample interpolation.

Extension Scope

The set of objects and commands that **can** be affected by an extension. Extensions are either device scope or instance scope.

Extending Structure

A structure type which may appear in the *pNext chain* of another structure, extending the functionality of the other structure. Extending structures may be defined by either core API versions or extensions.

External Handle

A resource handle which has meaning outside of a specific Vulkan device or its parent instance. External handles **may** be used to share resources between multiple Vulkan devices in different instances, or between Vulkan and other APIs. Some external handle types correspond to platform-defined handles, in which case the resource **may** outlive any particular Vulkan device or instance and **may** be transferred between processes, or otherwise manipulated via functionality defined by the platform for that handle type.

External synchronization

A type of synchronization **required** of the application, where parameters defined to be externally synchronized **must** not be used simultaneously in multiple threads.

Facingness (Polygon)

A classification of a polygon as either front-facing or back-facing, depending on the orientation (winding order) of its vertices.

Facingness (Fragment)

A fragment is either front-facing or back-facing, depending on the primitive it was generated from. If the primitive was a polygon (regardless of polygon mode), the fragment inherits the facingness of the polygon. All other fragments are front-facing.

Fence

A synchronization primitive that is signaled when a set of batches or sparse binding operations complete execution on a queue. Fences **can** be waited on by the host. Represented by a [VkFence](#)

object.

Flat Shading

A property of a vertex attribute that causes the value from a single vertex (the provoking vertex) to be used for all vertices in a primitive, and for interpolation of that attribute to return that single value unaltered.

Format Features

A set of features from [VkFormatFeatureFlagBits](#) that a [VkFormat](#) is capable of using for various commands. The list is determined by factors such as [VkImageTiling](#).

Fragment

A rectangular framebuffer region with associated data produced by [rasterization](#) and processed by [fragment operations](#) including the fragment shader.

Fragment Area

The width and height, in pixels, of a fragment.

Fragment Input Attachment Interface

Variables with [UniformConstant](#) storage class and a decoration of [InputAttachmentIndex](#) that are statically used by a fragment shader's entry point, which receive values from input attachments.

Fragment Output Interface

A fragment shader entry point's variables with [Output](#) storage class, which output to color and/or depth/stencil attachments.

Framebuffer

A collection of image views and a set of dimensions that, in conjunction with a render pass, define the inputs and outputs used by drawing commands. Represented by a [VkFramebuffer](#) object.

Framebuffer Attachment

One of the image views used in a framebuffer.

Framebuffer Coordinates

A coordinate system in which adjacent pixels' coordinates differ by 1 in x and/or y, with (0,0) in the upper left corner and pixel centers at half-integers.

Framebuffer-Space

Operating with respect to framebuffer coordinates.

Framebuffer-Local

A framebuffer-local dependency guarantees that only for a single framebuffer region, the first set of operations happens-before the second set of operations.

Framebuffer-Global

A framebuffer-global dependency guarantees that for all framebuffer regions, the first set of operations happens-before the second set of operations.

Framebuffer Region

A framebuffer region is a set of sample (x, y, layer, sample) coordinates that is a subset of the entire framebuffer.

Front-Facing

See Facingness.

Full Compatibility

A given version of the API is fully compatible with another version if an application, relying only on valid behavior and functionality defined by either of those specifications, is able to correctly run against each version without any modification. This assumes no active attempt by that application to not run when it detects a different version.

Global Command

A Vulkan command for which the first argument is not a dispatchable handle type.

Global Workgroup

A collection of local workgroups dispatched by a single dispatching command.

Handle

An opaque integer or pointer value used to refer to a Vulkan object. Each object type has a unique handle type.

Happen-after, happens-after

A transitive, irreflexive and antisymmetric ordering relation between operations. An execution dependency with a source of **A** and a destination of **B** enforces that **B** happens-after **A**. The inverse relation of happens-before.

Happen-before, happens-before

A transitive, irreflexive and antisymmetric ordering relation between operations. An execution dependency with a source of **A** and a destination of **B** enforces that **A** happens-before **B**. The inverse relation of happens-after.

Helper Invocation

A fragment shader invocation that is created solely for the purposes of evaluating derivatives for use in non-helper fragment shader invocations, and which does not have side effects.

Host

The processor(s) and execution environment that the application runs on, and that the Vulkan API is exposed on.

Host Mapped Device Memory

Device memory that is mapped for host access using [vkMapMemory](#).

Host Mapped Foreign Memory

Memory owned by a foreign device that is mapped for host access.

Host Memory

Memory not accessible to the device, used to store implementation data structures.

Host-Accessible Subresource

A buffer, or a linear image subresource in either the `VK_IMAGE_LAYOUT_PREINITIALIZED` or `VK_IMAGE_LAYOUT_GENERAL` layout. Host-accessible subresources have a well-defined addressing scheme which can be used by the host.

Host-Local Memory

Memory that is not local to the device, and **may** be less performant for device access than device-local memory.

Host-Visible Memory

Device memory that **can** be mapped on the host and **can** be read and written by the host.

ICD

Installable Client Driver. An ICD is represented as a `VkPhysicalDevice`.

Identically Defined Objects

Objects of the same type where all arguments to their creation or allocation functions, with the exception of `pAllocator`, are

1. Vulkan handles which refer to the same object or
2. identical scalar or enumeration values or
3. Host pointers which point to an array of values or structures which also satisfy these three constraints.

Image

A resource that represents a multi-dimensional formatted interpretation of device memory. Represented by a `VkImage` object.

Image Subresource

A specific mipmap level, layer, and set of aspects of an image.

Image Subresource Range

A set of image subresources that are contiguous mipmap levels and layers.

Image View

An object that represents an image subresource range of a specific image, and state controlling how the contents are interpreted. Represented by a `VkImageView` object.

Immutable Sampler

A sampler descriptor provided at descriptor set layout creation time for a specific binding. This sampler is then used for that binding in all descriptor sets allocated with the layout, and it **cannot** be changed.

Implicit chroma reconstruction

An implementation of sampler $Y'C_B C_R$ conversion which reconstructs the reduced-resolution

chroma samples directly at the sample point, as part of the normal texture sampling operation. This is distinct from an *explicit chroma reconstruction* implementation, which reconstructs the reduced-resolution chroma samples to the resolution of the luma samples, then filters the result as part of texture sample interpolation.

Implicitly-Enabled Layer

A layer enabled by a loader-defined mechanism outside the Vulkan API, rather than explicitly by the application during instance or device creation.

Index Buffer

A buffer bound via [vkCmdBindIndexBuffer](#) which is the source of index values used to fetch vertex attributes for a [vkCmdDrawIndexed](#) or [vkCmdDrawIndexedIndirect](#) command.

Indexed Drawing Commands

Drawing commands which use an *index buffer* as the source of index values used to fetch vertex attributes for a drawing command. Includes [vkCmdDrawIndexed](#), [vkCmdDrawIndexedIndirectCount](#), and [vkCmdDrawIndexedIndirect](#).

Indirect Commands

Drawing or dispatching commands that source some of their parameters from structures in buffer memory. Includes [vkCmdDrawIndirect](#), [vkCmdDrawIndexedIndirect](#), [vkCmdDrawIndirectCount](#), [vkCmdDrawIndexedIndirectCount](#), and [vkCmdDispatchIndirect](#).

Indirect Drawing Commands

Drawing commands that source some of their parameters from structures in buffer memory. Includes [vkCmdDrawIndirect](#), [vkCmdDrawIndirectCount](#), [vkCmdDrawIndexedIndirectCount](#), and [vkCmdDrawIndexedIndirect](#).

Initial State (Command Buffer)

A command buffer that has not begun recording commands. See also Recording State and Executable State.

Input Attachment

A descriptor type that represents an image view, and supports unfiltered read-only access in a shader, only at the fragment's location in the view.

Instance

The top-level Vulkan object, which represents the application's connection to the implementation. Represented by a [VkInstance](#) object.

Instance-Level Command

Any command that is dispatched from an instance, or from a child object of an instance, except for physical devices and their children.

Instance-Level Functionality

All instance-level commands and objects, and their structures, enumerated types, and enumerants.

Instance-Level Object

High-level Vulkan objects, which are not physical devices, nor children of physical devices. For example, [VkInstance](#) is an instance-level object.

Instance (Memory)

In a logical device representing more than one physical device, some device memory allocations have the requested amount of memory allocated multiple times, once for each physical device in a device mask. Each such replicated allocation is an instance of the device memory.

Instance (Resource)

In a logical device representing more than one physical device, buffer and image resources exist on all physical devices but **can** be bound to memory differently on each. Each such replicated resource is an instance of the resource.

Internal Synchronization

A type of synchronization **required** of the implementation, where parameters not defined to be externally synchronized **may** require internal mutexing to avoid multithreaded race conditions.

Invocation (Shader)

A single execution of an entry point in a SPIR-V module. For example, a single vertex's execution of a vertex shader or a single fragment's execution of a fragment shader.

Invocation Group

A set of shader invocations that are executed in parallel and that **must** execute the same control flow path in order for control flow to be considered dynamically uniform.

Legacy (feature)

A feature which is no longer recommended as the correct or best way to achieve its intended purpose. Legacy features are typically superseded by new features which are the currently recommended way to achieve that purpose.

Linear Resource

A resource is *linear* if it is one of the following:

- a [VkBuffer](#)
- a [VkImage](#) created with `VK_IMAGE_TILING_LINEAR`
- a [VkImage](#) created with `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` and whose [Linux DRM format modifier](#) is `DRM_FORMAT_MOD_LINEAR`

A resource is *non-linear* if it is one of the following:

- a [VkImage](#) created with `VK_IMAGE_TILING_OPTIMAL`
- a [VkImage](#) created with `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` and whose [Linux DRM format modifier](#) is not `DRM_FORMAT_MOD_LINEAR`

Linux DRM Format Modifier

A 64-bit, vendor-prefixed, semi-opaque unsigned integer describing vendor-specific details of an

image's memory layout. In Linux graphics APIs, *modifiers* are commonly used to specify the memory layout of externally shared images. An image has a *modifier* if and only if it is created with *tiling* equal to `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`. For more details, refer to the appendix for extension `VK_EXT_image_drm_format_modifier`.

Local Workgroup

A collection of compute shader invocations invoked by a single dispatching command, which share data via `WorkgroupLocal` variables and can synchronize with each other.

Logical Device

An object that represents the application's interface to the physical device. The logical device is the parent of most Vulkan objects. Represented by a `VkDevice` object.

Logical Operation

Bitwise operations between a fragment color value and a value in a color attachment, that produce a final color value to be written to the attachment.

Lost Device

A state that a logical device **may** be in as a result of unrecoverable implementation errors, or other exceptional conditions.

Mappable

See Host-Visible Memory.

Memory Dependency

A memory dependency is an execution dependency which includes availability and visibility operations such that:

- The first set of operations happens-before the availability operation
- The availability operation happens-before the visibility operation
- The visibility operation happens-before the second set of operations

Memory Domain

A memory domain is an abstract place to which memory writes are made available by availability operations and memory domain operations. The memory domains correspond to the set of agents that the write **can** then be made visible to. The memory domains are *host*, *device*, *shader*, *workgroup instance* (for workgroup instance there is a unique domain for each compute workgroup) and *subgroup instance* (for subgroup instance there is a unique domain for each subgroup).

Memory Domain Operation

An operation that makes the writes that are available to one memory domain available to another memory domain.

Memory Heap

A region of memory from which device memory allocations **can** be made.

Memory Type

An index used to select a set of memory properties (e.g. mappable, cached) for a device memory allocation.

Minimum Mip Level Size

The smallest size that is permitted for a mip level. For conventional images this is 1x1x1. See [Image Mip Level Sizing](#).

Mip Tail Region

The set of mipmap levels of a sparse residency texture that are too small to fill a sparse block, and that **must** all be bound to memory collectively and opaquely.

Multi-planar

A *multi-planar format* (or “planar format”) is an image format consisting of more than one *plane*, identifiable with a `_2PLANE` or `_3PLANE` component to the format name and listed in [Formats Requiring Sampler Y'C_BC_R Conversion for VK_IMAGE_ASPECT_COLOR_BIT Image Views](#). A *multi-planar image* (or “planar image”) is an image of a multi-planar format.

Non-Dispatchable Handle

A handle of an integer handle type. Handle values **may** not be unique, even for two objects of the same type.

Non-Indexed Drawing Commands

Drawing commands for which the vertex attributes are sourced in linear order from the vertex input attributes for a drawing command (i.e. they do not use an *index buffer*). Includes [vkCmdDraw](#), [vkCmdDrawIndirectCount](#), and [vkCmdDrawIndirect](#).

Normalized

A value that is interpreted as being in the range [0,1] as a result of being implicitly divided by some other value.

Normalized Device Coordinates

A coordinate space after perspective division is applied to clip coordinates, and before the viewport transformation converts them to framebuffer coordinates.

Obsoleted (feature)

A feature is obsolete if it can no longer be used.

Opaque Capture Address

A 64-bit value representing the device address of a buffer or memory object that is expected to be used by trace capture/replay tools in combination with the `bufferDeviceAddress` feature.

Overlapped Range (Aliased Range)

The aliased range of a device memory allocation that intersects a given image subresource of an image or range of a buffer.

Ownership (Resource)

If an entity (e.g. a queue family) has ownership of a resource, access to that resource is well-

defined for access by that entity.

Packed Format

A format whose components are stored as a single texel block in memory, with their relative locations defined within that element.

Payload

Importable or exportable reference to the internal data of an object in Vulkan.

Peer Memory

An instance of memory corresponding to a different physical device than the physical device performing the memory access, in a logical device that represents multiple physical devices.

Physical Device

An object that represents a single device in the system. Represented by a [VkPhysicalDevice](#) object.

Physical-Device-Level Command

Any command that is dispatched from a physical device.

Physical-Device-Level Functionality

All physical-device-level commands and objects, and their structures, enumerated types, and enumerants.

Physical-Device-Level Object

Physical device objects. For example, [VkPhysicalDevice](#) is a physical-device-level object.

Pipeline

An object controlling how graphics or compute work is executed on the device. A pipeline includes one or more shaders, as well as state controlling any non-programmable stages of the pipeline. Represented by a [VkPipeline](#) object.

Pipeline Barrier

An execution and/or memory dependency recorded as an explicit command in a command buffer, that forms a dependency between the previous and subsequent commands.

Pipeline Cache

An object that **can** be used to collect and retrieve information from pipelines as they are created, and **can** be populated with previously retrieved information in order to accelerate pipeline creation. Represented by a [VkPipelineCache](#) object.

Pipeline JSON Schema

A JSON-based representation for encapsulating all pipeline state which is necessary for the offline pipeline cache compiler. This includes the SPIR-V shader module, pipeline layout, render pass information and pipeline state creation information.

Pipeline Layout

An object defining the set of resources (via a collection of descriptor set layouts) and push

constants used by pipelines that are created using the layout. Used when creating a pipeline and when binding descriptor sets and setting push constant values. Represented by a [VkPipelineLayout](#) object.

Pipeline Stage

A logically independent execution unit that performs some of the operations defined by an action command.

Pipeline Identifier

An identifier that can be used to identify a specific pipeline independently from the pipeline description.

pNext Chain

A set of structures [chained together](#) through their [pNext](#) members.

Planar

See *multi-planar*.

Plane

An *image plane* is part of the representation of an image, containing a subset of the color components necessary to represent the texels in the image and with a contiguous mapping of coordinates to bound memory. Most images consist only of a single plane, but some formats spread the components across multiple image planes. The host-accessible properties of each image plane are accessible for a linear layout using [vkGetImageSubresourceLayout](#). If a multi-planar image is created with the [VK_IMAGE_CREATE_DISJOINT_BIT](#) bit set, the image is described as *disjoint*, and its planes are therefore bound to memory independently.

Point Sampling (Rasterization)

A rule that determines whether a fragment sample location is covered by a polygon primitive by testing whether the sample location is in the interior of the polygon in framebuffer-space, or on the boundary of the polygon according to the tie-breaking rules.

Potential Format Features

The union of all [VkFormatFeatureFlagBits](#) that the implementation supports for a specified [VkFormat](#), over all supported image tilings. For [QNX Screen external formats](#) the [VkFormatFeatureFlagBits](#) is provided by the implementation.

Pre-rasterization

Operations that execute before [rasterization](#), and any state associated with those operations.

Presentable image

A [VkImage](#) object obtained from a [VkSwapchainKHR](#) used to present to a [VkSurfaceKHR](#) object.

Preserve Attachment

One of a list of attachments in a subpass description that is not read or written by the subpass, but that is read or written on earlier and later subpasses and whose contents **must** be preserved through this subpass.

Primary Command Buffer

A command buffer that **can** execute secondary command buffers, and **can** be submitted directly to a queue.

Primitive Topology

State controlling how vertices are assembled into primitives, e.g. as lists of triangles, strips of lines, etc.

Promoted (feature)

A feature from an older extension is considered promoted if it is made available as part of a new core version or newer extension with wider support.

Protected Buffer

A buffer to which protected device memory **can** be bound.

Protected-capable Device Queue

A device queue to which protected command buffers **can** be submitted.

Protected Command Buffer

A command buffer which **can** be submitted to a protected-capable device queue.

Protected Device Memory

Device memory which **can** be visible to the device but **must** not be visible to the host.

Protected Image

An image to which protected device memory **can** be bound.

Provisional

A feature is released provisionally in order to get wider feedback on the functionality before it is finalized. Provisional features may change in ways that break backwards compatibility, and thus are not recommended for use in production applications.

Provoking Vertex

The vertex in a primitive from which flat shaded attribute values are taken. This is generally the “first” vertex in the primitive, and depends on the primitive topology.

Push Constants

A small bank of values writable via the API and accessible in shaders. Push constants allow the application to set values used in shaders without creating buffers or modifying and binding descriptor sets for each update.

Push Constant Interface

The set of variables with **PushConstant** storage class that are statically used by a shader entry point, and which receive values from push constant commands.

Descriptor Update Template

An object specifying a mapping from descriptor update information in host memory to elements in a descriptor set, which helps enable more efficient descriptor set updates.

Query Pool

An object containing a number of query entries and their associated state and results. Represented by a [VkQueryPool](#) object.

Queue

An object that executes command buffers and sparse binding operations on a device. Represented by a [VkQueue](#) object.

Queue Family

A set of queues that have common properties and support the same functionality, as advertised in [VkQueueFamilyProperties](#).

Queue Operation

A unit of work to be executed by a specific queue on a device, submitted via a [queue submission command](#). Each queue submission command details the specific queue operations that occur as a result of calling that command. Queue operations typically include work that is specific to each command, and synchronization tasks.

Queue Submission

Zero or more batches and an optional fence to be signaled, passed to a command for execution on a queue. See the [Devices and Queues chapter](#) for more information.

Recording State (Command Buffer)

A command buffer that is ready to record commands. See also Initial State and Executable State.

Release Operation (Resource)

An operation that releases ownership of an image subresource or buffer range.

Render Pass

An object that represents a set of framebuffer attachments and phases of rendering using those attachments. Represented by a [VkRenderPass](#) object.

Render Pass Instance

A use of a render pass in a command buffer.

Required Extensions

Extensions that **must** be enabled alongside extensions dependent on them (see [Extension Dependencies](#)).

Reset (Command Buffer)

Resetting a command buffer discards any previously recorded commands and puts a command buffer in the initial state.

Residency Code

An integer value returned by sparse image instructions, indicating whether any sparse unbound texels were accessed.

Resolve Attachment

A subpass attachment point, or image view, that is the target of a multisample resolve operation from the corresponding color attachment at the end of the subpass.

Retired Swapchain

A swapchain that has been used as the `oldSwapchain` parameter to `vkCreateSwapchainKHR`. Images cannot be acquired from a retired swapchain, however images that were acquired (but not presented) before the swapchain was retired **can** be presented.

Sample Index

The index of a sample within a [single set of samples](#).

Sample Shading

Invoking the fragment shader multiple times per fragment, with the covered samples partitioned among the invocations.

Sampled Image

A descriptor type that represents an image view, and supports filtered (sampled) and unfiltered read-only access in a shader.

Sampler

An object containing state controlling how sampled image data is sampled (or filtered) when accessed in a shader. Also a descriptor type describing the object. Represented by a [VkSampler](#) object.

Secondary Command Buffer

A command buffer that **can** be executed by a primary command buffer, and **must** not be submitted directly to a queue.

Self-Dependency

A subpass dependency from a subpass to itself, i.e. with `srcSubpass` equal to `dstSubpass`. A self-dependency is not automatically performed during a render pass instance, rather a subset of it **can** be performed via [vkCmdPipelineBarrier](#) during the subpass.

Semaphore

A synchronization primitive that supports signal and wait operations, and **can** be used to synchronize operations within a queue or across queues. Represented by a [VkSemaphore](#) object.

Shader

Instructions selected (via an entry point) from a shader module, which are executed in a shader stage.

Shader Code

A stream of instructions used to describe the operation of a shader.

Shader Module

A collection of shader code, potentially including several functions and entry points, that is used to create shaders in pipelines. Represented by a [VkShaderModule](#) object.

Shader Stage

A stage of the graphics or compute pipeline that executes shader code.

Shading Rate

The ratio of the number of fragment shader invocations generated in a fully covered framebuffer region to the size (in pixels) of that region.

Shared presentable image

A presentable image created from a swapchain with `VkPresentModeKHR` set to either `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`.

Side Effect

A store to memory or atomic operation on memory from a shader invocation.

Single Event Upset

A change of physical device state, such as a register or memory bitflip, e.g. caused by ionizing radiation.

Single-plane format

A format that is not *multi-planar*.

Size-Compatible Image Formats

When a compressed image format and an uncompressed image format are size-compatible, it means that the texel block size of the uncompressed format **must** equal the texel block size of the compressed format.

Sparse Block

An element of a sparse resource that can be independently bound to memory. Sparse blocks of a particular sparse resource have a corresponding size in bytes that they use in the bound memory.

Sparse Image Block

A sparse block in a sparse partially-resident image. In addition to the sparse block size in bytes, sparse image blocks have a corresponding width, height, and depth defining the dimensions of these elements in units of texels or compressed texel blocks, the latter being used in case of sparse images having a block-compressed format.

Sparse Unbound Texel

A texel read from a region of a sparse texture that does not have memory bound to it.

Static Use

An object in a shader is statically used by a shader entry point if any function in the entry point's call tree contains an instruction using the object. A reference in the entry point's interface list does not constitute a static use. Static use is used to constrain the set of descriptors used by a shader entry point.

Storage Buffer

A descriptor type that represents a buffer, and supports reads, writes, and atomics in a shader.

Storage Image

A descriptor type that represents an image view, and supports unfiltered loads, stores, and atomics in a shader.

Storage Texel Buffer

A descriptor type that represents a buffer view, and supports unfiltered, formatted reads, writes, and atomics in a shader.

Subgroup

A set of shader invocations that **can** synchronize and share data with each other efficiently. In compute shaders, the *local workgroup* is a superset of the subgroup.

Subgroup Mask

A bitmask for all invocations in the current subgroup with one bit per invocation, starting with the least significant bit in the first vector component, continuing to the last bit (less than `SubgroupSize`) in the last required vector component.

Subpass

A phase of rendering within a render pass, that reads and writes a subset of the attachments.

Subpass Dependency

An execution and/or memory dependency between two subpasses described as part of render pass creation, and automatically performed between subpasses in a render pass instance. A subpass dependency limits the overlap of execution of the pair of subpasses, and **can** provide guarantees of memory coherence between accesses in the subpasses.

Subpass Description

Lists of attachment indices for input attachments, color attachments, depth/stencil attachment, resolve attachments, depth/stencil resolve, and preserve attachments used by the subpass in a render pass.

Subset (Self-Dependency)

A subset of a self-dependency is a pipeline barrier performed during the subpass of the self-dependency, and whose stage masks and access masks each contain a subset of the bits set in the identically named mask in the self-dependency.

Superseded (feature)

A legacy feature can be superseded by newer functionality that achieves the same goals through a newer style of API, being more efficient, or otherwise following current recommendations for use of Vulkan.

Texel Block

A single addressable element of an image with an uncompressed [VkFormat](#), or a single compressed block of an image with a compressed [VkFormat](#).

Texel Block Size

The size (in bytes) used to store a texel block of a compressed or uncompressed image.

Texel Coordinate System

One of three coordinate systems (normalized, unnormalized, integer) defining how texel coordinates are interpreted in an image or a specific mipmap level of an image.

Timeline Semaphore

A semaphore with a strictly increasing 64-bit unsigned integer payload indicating whether the semaphore is signaled with respect to a particular reference value. Represented by a [VkSemaphore](#) object created with a semaphore type of `VK_SEMAPHORE_TYPE_TIMELINE`.

Uniform Texel Buffer

A descriptor type that represents a buffer view, and supports unfiltered, formatted, read-only access in a shader.

Uniform Buffer

A descriptor type that represents a buffer, and supports read-only access in a shader.

Units in the Last Place (ULP)

A measure of floating-point error loosely defined as the smallest representable step in a floating-point format near a given value. For the precise definition see [Precision and Operation of SPIR-V instructions](#) or Jean-Michel Muller, “On the definition of ulp(x)”, RR-5504, INRIA. Other sources may also use the term “unit of least precision”.

Unnormalized

A value that is interpreted according to its conventional interpretation, and is not normalized.

Unprotected Buffer

A buffer to which unprotected device memory **can** be bound.

Unprotected Command Buffer

A command buffer which **can** be submitted to an unprotected device queue or a protected-capable device queue.

Unprotected Device Memory

Device memory which **can** be visible to the device and **can** be visible to the host.

Unprotected Image

An image to which unprotected device memory **can** be bound.

User-Defined Variable Interface

A shader entry point’s variables with `Input` or `Output` storage class that are not built-in variables.

Vertex Input Attribute

A graphics pipeline resource that produces input values for the vertex shader by reading data from a vertex input binding and converting it to the attribute’s format.

Variable-Sized Descriptor Binding

A descriptor binding whose size will be specified when a descriptor set is allocated using this layout.

Vertex Input Binding

A graphics pipeline resource that is bound to a buffer and includes state that affects addressing calculations within that buffer.

Vertex Input Interface

A vertex shader entry point's variables with **Input** storage class, which receive values from vertex input attributes.

View Mask

When multiview is enabled, a view mask is a property of a subpass controlling which views the rendering commands are broadcast to.

View Volume

A subspace in homogeneous coordinates, corresponding to post-projection x and y values between -1 and +1, and z values between 0 and +1.

Viewport Transformation

A transformation from normalized device coordinates to framebuffer coordinates, based on a viewport rectangle and depth range.

Visibility Operation

An operation that causes available values to become visible to specified memory accesses.

Visible

A state of values written to memory that allows them to be accessed by a set of operations.

Common Abbreviations

The abbreviations and acronyms defined in this section are sometimes used in the Specification and the API where they are considered clear and commonplace.

Prefixes

Prefixes are used in the API to denote specific semantic meaning of Vulkan names, or as a label to avoid name clashes, and are explained here:

VK/Vk/vk

Vulkan namespace

All types, commands, enumerants and defines in this specification are prefixed with these two characters.

PFN/pfn

Function Pointer

Denotes that a type is a function pointer, or that a variable is of a pointer type.

p

Pointer

Variable is a pointer.

vkCmd

Commands that record commands in command buffers

These API commands do not result in immediate processing on the device. Instead, they record the requested action in a command buffer for execution when the command buffer is submitted to a queue.

s

Structure

Used to denote the `VK_STRUCTURE_TYPE*` member of each structure in `sType`

Appendix K: Credits (Informative)

Vulkan SC 1.0 is the result of contributions from many people and companies participating in the Khronos Vulkan SC Working Group, building upon the Base Vulkan specification produced by the Khronos Vulkan Working Group, as well as input from the Vulkan Advisory Panel.

Members of the Working Group, including the company that they represented at the time of their most recent contribution, are listed in the following sections. Some specific contributions made by individuals are listed together with their name.

Working Group Contributors to Vulkan SC 1.0

- Aarusha Thakral, CoreAVI
- Aidan Fabius, CoreAVI
- Alastair Donaldson, Google
- Alastair Murray, Codeplay Software Ltd.
- Alex Crabb, Khronos
- Alexander Galazin, Arm
- Alis Ors, NXP Semiconductors
- Alon Or-bach, Samsung Electronics
- Andrew Garrard, Imagination Technologies
- Anna Buczkowska, Mobica
- Balajee Gurumoorah, Huawei Technologies Co., Ltd.
- Bogdan Naodovic, NVIDIA
- Boris Zanin, Mobica
- Brad Cain, NVIDIA
- Cary Ashby, Collins Aerospace
- Chris Forbes, Google
- Craig Davies, Huawei Technologies Co., Ltd.
- Daniel Bernal, Arm
- Daniel Koch, NVIDIA
- Dave Higham, Imagination Technologies
- Dave McCloskey, Juice Labs
- David Hayward, Imagination Technologies
- Donald Scorgie, Imagination Technologies
- Doug Singkofer, Collins Aerospace
- Emily Stearns, Khronos

- Erik Tomusk, Codeplay Software Ltd.
- Ewa Galamon, Mobica
- Greg Szober, CoreAVI
- Illya Rudkin, Codeplay Software Ltd.
- Jacek Wisniewski, Mobica
- James Helferty, NVIDIA
- Jan Hemes, Continental Corporation
- Jan-Harald Fredriksen, Arm
- Janos Lakatos, Imagination Technologies
- Jeff Bolz, NVIDIA
- Jim Carroll, Mobica
- John Zulauf, LunarG
- Jon Leech, Independent (XML toolchain, normative language, release wrangler)
- Jun Wang, Huawei Technologies Co., Ltd.
- Karen Ghavam, LunarG
- Karolina Palka, Mobica
- Ken Wenger, CoreAVI
- Lenny Komow, LunarG
- Lilja Tamminen, Basemark Oy
- Luca Di Mauro, Arm
- Lukasz Janyst, Daedalean
- Mark Bellamy, Arm
- Matthew Netsch, Qualcomm Technologies, Inc.
- Michael Wong, Codeplay Software Ltd.
- Mukund Keshava, NVIDIA
- Neil Stroud, CoreAVI
- Neil Trevett, NVIDIA
- Nick Blurton-Jones, CoreAVI
- Pawel Ksiezopolski, Mobica
- Piotr Byszewski, Mobica
- Rob Simpson, Qualcomm Technologies, Inc.
- Stephne Strahn, Kalray
- Steve Viggers, CoreAVI (working group chair)
- Tim Lewis, Khronos
- Todd Brown, Collins Aerospace

- Tom Malnar, CoreAVI
- Tom Olson, Arm
- Tony Zlatinski, NVIDIA
- Vladyslav Zakkarchenko, Huawei Technologies Co., Ltd.
