

Vulkan[®] SC 1.0.20 - A Specification
(with all registered Vulkan SC
extensions)

Based on Vulkan 1.2.330

The Khronos[®] Vulkan SC Working Group

Version 1.0.20, 2025-11-19 21:18:25Z: from git branch: github-sc_main commit:
df93b82d4036924cdf735fa83077c7d10d65d7d9

Table of Contents

1. Preamble	1
2. Introduction	3
2.1. Safety Critical Philosophy	3
2.2. Document Conventions	4
3. Fundamentals	8
3.1. Host and Device Environment	8
3.2. Execution Model	8
3.3. Object Model	10
3.4. Application Binary Interface	12
3.5. Command Syntax and Duration	13
3.6. Threading Behavior	17
3.7. Valid Usage	26
3.8. VkResult Return Codes	33
3.9. Numeric Representation and Computation	36
3.10. Fixed-Point Data Conversions	38
3.11. String Representation	40
3.12. Common Object Types	40
3.13. API Name Aliases	57
4. Initialization	58
4.1. Command Function Pointers	58
4.2. Instances	61
5. Devices and Queues	75
5.1. Physical Devices	75
5.2. Devices	108
5.3. Queues	129
6. Command Buffers	138
6.1. Command Buffer Lifecycle	138
6.2. Command Pools	140
6.3. Command Buffer Allocation and Management	148
6.4. Command Buffer Recording	153
6.5. Command Buffer Submission	160
6.6. Queue Forward Progress	179
6.7. Secondary Command Buffer Execution	179
6.8. Command Buffer Device Mask	183
7. Synchronization and Cache Control	187
7.1. Execution and Memory Dependencies	187
7.2. Implicit Synchronization Guarantees	213
7.3. Fences	215

7.4. Semaphores	245
7.5. Events	277
7.6. Pipeline Barriers	301
7.7. Memory Barriers	310
7.8. Wait Idle Operations	345
7.9. Host Write Ordering Guarantees	347
7.10. Synchronization and Multiple Physical Devices	347
7.11. Calibrated Timestamps	347
8. Render Pass	352
8.1. Render Pass Creation	353
8.2. Render Pass Compatibility	407
8.3. Framebuffers	408
8.4. Render Pass Load Operations	419
8.5. Render Pass Store Operations	420
8.6. Render Pass Multisample Resolve Operations	421
8.7. Render Pass Commands	423
8.8. Common Render Pass Data Races (Informative)	446
9. Shaders	448
9.1. Shader Modules	448
9.2. Binding Shaders	450
9.3. Shader Execution	450
9.4. Shader Out-of-Bounds Memory Access	451
9.5. Shader Memory Access Ordering	455
9.6. Shader Inputs and Outputs	455
9.7. Vertex Shaders	456
9.8. Tessellation Control Shaders	456
9.9. Tessellation Evaluation Shaders	458
9.10. Geometry Shaders	458
9.11. Fragment Shaders	459
9.12. Compute Shaders	459
9.13. Interpolation Decorations	459
9.14. Static Use	460
9.15. Scope	460
9.16. Group Operations	464
9.17. Quad Group Operations	466
9.18. Derivative Operations	466
9.19. Helper Invocations	468
10. Pipelines	469
10.1. Multiple Pipeline Creation	470
10.2. Pipeline Creation Flags	471
10.3. Compute Pipelines	472

10.4. Graphics Pipelines	482
10.5. Pipeline Destruction	505
10.6. Pipeline Derivatives	506
10.7. Pipeline Cache	506
10.8. Offline Pipeline Compilation	516
10.9. Pipeline Memory Reservation	517
10.10. Pipeline Identifier	517
10.11. Specialization Constants	519
10.12. Pipeline Binding	523
10.13. Dynamic State	525
11. Memory Allocation	527
11.1. Host Memory	527
11.2. Device Memory	527
12. Resource Creation	582
12.1. Buffers	582
12.2. Buffer Views	590
12.3. Buffer Device Addresses	595
12.4. Images	597
12.5. Image Layouts	628
12.6. Image Views	633
12.7. Resource Memory Association	651
12.8. Resource Sharing Mode	679
12.9. Memory Aliasing	682
13. Images	685
13.1. Image Coordinate Validation	686
13.2. Image Reads	686
13.3. Image Writes	687
14. Samplers	688
14.1. Sampler $Y'C_B C_R$ Conversion	699
15. Resource Descriptors	709
15.1. Descriptor Types	709
15.2. Descriptor Sets	713
15.3. Physical Storage Buffer Access	770
16. Shader Interfaces	771
16.1. Shader Input and Output Interfaces	771
16.2. Vertex Input Interface	774
16.3. Fragment Output Interface	774
16.4. Fragment Input Attachment Interface	775
16.5. Shader Resource Interface	776
16.6. Built-In Variables	784
17. Image Operations	811

17.1. Image Operations Overview	811
17.2. Sampling Operations	814
17.3. Normalized Texel Coordinate Operations	830
17.4. Unnormalized Texel Coordinate Operations	836
17.5. Integer Texel Coordinate Operations	838
17.6. Image Sample Operations	838
17.7. Image Operation Steps	843
17.8. Image Query Instructions	843
18. Queries	845
18.1. Query Pools	845
18.2. Query Operation	851
18.3. Occlusion Queries	868
18.4. Pipeline Statistics Queries	869
18.5. Timestamp Queries	871
18.6. Performance Queries	877

Chapter 1. Preamble

Copyright 2014-2025 The Khronos Group Inc.

This Specification is protected by copyright laws and contains material proprietary to Khronos. Except as described by these terms, it or any components may not be reproduced, republished, distributed, transmitted, displayed, broadcast or otherwise exploited in any manner without the express prior written permission of Khronos.

Khronos grants a conditional copyright license to use and reproduce the unmodified Specification for any purpose, without fee or royalty, EXCEPT no licenses to any patent, trademark or other intellectual property rights are granted under these terms.

Khronos makes no, and expressly disclaims any, representations or warranties, express or implied, regarding this Specification, including, without limitation: merchantability, fitness for a particular purpose, non-infringement of any intellectual property, correctness, accuracy, completeness, timeliness, and reliability. Under no circumstances will Khronos, or any of its Promoters, Contributors or Members, or their respective partners, officers, directors, employees, agents or representatives be liable for any damages, whether direct, indirect, special or consequential damages for lost revenues, lost profits, or otherwise, arising from or in connection with these materials.

This document contains extensions which are not ratified by Khronos, and as such is not a ratified Specification, though it contains text from (and is a superset of) the ratified Specification.

The ratified version of the Vulkan SC Specification can be found at <https://registry.khronos.org/vulkansc/specs/latest-ratified/pdf/vkspec.pdf> (core with all ratified extensions).

This Specification contains substantially unmodified functionality from, and is a successor to, Khronos specifications including Vulkan, OpenGL SC OpenGL, OpenGL ES and OpenCL.

The Khronos Intellectual Property Rights Policy defines the terms 'Scope', 'Compliant Portion', and 'Necessary Patent Claims'.

Some parts of this Specification are purely informative and so are EXCLUDED the Scope of this Specification. The [Document Conventions](#) section of the [Introduction](#) defines how these parts of the Specification are identified.

Where this Specification uses [technical terminology](#), defined in the [Glossary](#) or otherwise, that refer to enabling technologies that are not expressly set forth in this Specification, those enabling technologies are EXCLUDED from the Scope of this Specification. For clarity, enabling technologies not disclosed with particularity in this Specification (e.g. semiconductor manufacturing technology, hardware architecture, processor architecture or microarchitecture, memory architecture, compiler technology, object oriented technology, basic operating system technology, compression technology, algorithms, and so on) are NOT to be considered expressly set forth; only those application program interfaces and data structures disclosed with particularity are included in the Scope of this Specification.

For purposes of the Khronos Intellectual Property Rights Policy as it relates to the definition of

Necessary Patent Claims, all recommended or optional features, behaviors and functionality set forth in this Specification, if implemented, are considered to be included as Compliant Portions.

Where this Specification identifies specific sections of external references, only those specifically identified sections define [normative](#) functionality. The Khronos Intellectual Property Rights Policy excludes external references to materials and associated enabling technology not created by Khronos from the Scope of this Specification, and any licenses that may be required to implement such referenced materials and associated technologies must be obtained separately and may involve royalty payments.

Khronos and Vulkan are registered trademarks, and SPIR-V is a trademark of The Khronos Group Inc. OpenCL is a trademark of Apple Inc., used under license by Khronos. OpenGL is a registered trademark and the OpenGL ES logo is a trademark of Hewlett Packard Enterprise, used under license by Khronos. ASTC is a trademark of ARM Holdings PLC. All other product names, trademarks, and/or company names are used solely for identification and belong to their respective owners.

Chapter 2. Introduction

This document, referred to as the “Vulkan SC Specification”, “Vulkan Specification” or just the “Specification” hereafter, describes the Vulkan SC Application Programming Interface (API). “Base Vulkan Specification” refers to the Vulkan Specification (<https://registry.khronos.org/vulkan/>) that Vulkan SC is based on. “Vulkan” and “Vulkan SC” refer to the Vulkan SC API and “Base Vulkan” refers to the Vulkan API that Vulkan SC is based on. Vulkan is a C99 API designed for explicit control of low-level graphics and compute functionality.

The canonical version of the Specification is available in the official [Vulkan SC Registry](https://registry.khronos.org/vulkansc/) (<https://registry.khronos.org/vulkansc/>). The source files used to generate the Vulkan SC specification are stored in the [Vulkan SC Documentation Repository](https://github.com/KhronosGroup/VulkanSC-Docs) (<https://github.com/KhronosGroup/VulkanSC-Docs>). The source repository additionally has a public issue tracker and allows the submission of pull requests that improve the specification.

2.1. Safety Critical Philosophy

Vulkan SC 1.0.20 is based on Vulkan 1.2 and, except where explicitly noted, supports all of the same features, properties, and limits as Vulkan 1.2.

Throughout the Vulkan SC specification, changes have been made to the Base Vulkan Specification in order to align it with safety critical use cases and certification. In general changes were made to meet the following categories:

- Deterministic Execution (predictable execution times and results)
- Robustness (error handling, removing ambiguity, clarifying undefined behavior)
- Simplification (changes made to reduce certification effort and challenges)

To simplify capturing the reasoning behind deviations made from the Base Vulkan Specification, the Vulkan SC specification utilizes change identifications to give the reader insight into why the change was made in a concise manner. The change identifications are captured in [Change Justification Table](#). In addition, the Vulkan SC specification contains [Vulkan SC Deviations From Base Vulkan](#) which is a complete list of changes between Base Vulkan and Vulkan SC. This is targeted at readers who are familiar with Base Vulkan and would like to understand the differences between Vulkan SC and the Base Vulkan specification. Vulkan SC was designed to maintain as much compatibility as possible with base Vulkan. Some functionality has been removed, some new functionality has been added, but where the APIs overlap the only changes are to Valid Usage rules. All functions and structures that exist in both APIs have the same signatures, and enums and defined constants that exist in both APIs have the same values.

Vulkan SC follows the Base Vulkan philosophy of requiring valid usage from the application. It is left to each implementation to determine how to ensure safe operation with respect to invalid usage. This **may** involve determining that certain invalid usage does not pose a safety risk, adding valid usage checks in the driver, requiring valid usage checks in the application, or some combination of these. Additionally, validation layers are supported during development.

2.1.1. Change Justification Table

The following is a list of the safety critical change identifications used to concisely capture the justification for deviations from the Base Vulkan Specification.

Table 1. Change Justifications

Change ID	Description
SCID-1	Deterministic behavior - no randomness or unpredictability, always produce the same output from a given starting condition or initial state
SCID-2	Asynchronous calls - calls initiated by the application but may not execute or use their parameter data until a later time shall be clearly defined when any parameter data is used, especially data which is passed by reference or pointer
SCID-3	Notification of change of state - avoid the use of asynchronous events causing code to execute (i.e. callbacks) as this can cause the worst case execution time of a system to be indeterminate
SCID-4	Garbage collection methods - avoid the use of garbage collection as this can cause the worst case execution time of a system to be indeterminate. Avoid memory fragmentation by deleting entire buffers instead of individual items within a buffer
SCID-5	Fully testable - all behavior of the API must be testable in a repeatable manner, consistent from test run to test run (in some cases this may mean testable by inspection)
SCID-6	Undefined behavior - the API must behave as expected under valid input conditions, clearly document conditions that would result in 'fatal error' leaving the system in an unrecoverable state, and document conditions that would result in undefined behavior based on invalid input
SCID-7	Unique ID - provide a facility to return a runtime implementation unique identifier specific to that runtime so that it may be interrogated at any time. For example, such information could be the version number, name, date, release build number or a combination of these that is unique and comprehensible
SCID-8	Code complexity - reducing code complexity to help facilitate certification (for example if there are multiple ways to do the same thing, potentially eliminating one or more of the alternative methods)

2.2. Document Conventions

The Vulkan specification is intended for use by both implementors of the API and application developers seeking to make use of the API, forming a contract between these parties. Specification text may address either party; typically the intended audience can be inferred from context, though some sections are defined to address only one of these parties. (For example, [Valid Usage](#) sections only address application developers). Any requirements, prohibitions, recommendations or options defined in specification text are imposed only on the audience of that text.

2.2.1. Normative Requirements

The Vulkan Specification uses a combination of [normative terminology](#) and [normative descriptions](#) to express the requirements that it imposes on applications and implementations. An application which complies with all normative requirements imposed on applications is said to make **valid use** of the API; failing to comply with such requirements results in undefined behavior, as discussed in the [Valid Usage](#) section below. In the context of this document, an implementation which complies with all normative requirements imposed on implementations is said to be **conformant**.

NOTE

The Khronos Group imposes additional requirements on implementors who wish to make public statements describing their Vulkan implementations as conformant. These include signing the Vulkan Adopter's Agreement, paying the associated fee, and making a successful conformance test submission to the Khronos Conformance Process. For details see the [Khronos Trademark Guidelines](https://www.khronos.org/legal/khronos-trademark-guidelines) (<https://www.khronos.org/legal/khronos-trademark-guidelines>).

Normative Terminology

Within this specification, the key words **must**, **required**, **should**, **may**, and **optional** are to be interpreted as described in [RFC 2119 - Key words for use in RFCs to Indicate Requirement Levels](https://www.ietf.org/rfc/rfc2119.txt) (<https://www.ietf.org/rfc/rfc2119.txt>). The additional key word **optionally** is an alternate form of **optional**, for use where grammatically appropriate. These key words are highlighted in the specification to indicate that they are being used in a specific technical sense.

The additional key words **can** and **cannot** are to be interpreted as describing the capabilities of an application, as follows:

can

This word means that the application is able to perform the action described.

cannot

This word means that the API and/or the execution environment provide no mechanism through which the application can express or accomplish the action described.

These key words are never used in text addressing implementors.

NOTE

There is an important distinction between **cannot** and **must not**, as used in this Specification. **Cannot** refers to something the API provides no way for the application to express or accomplish. **Must not** describes something that the application is able to express, but that is not valid use of the API, and will have undefined and potentially unrecoverable consequences.

Normative Descriptions

In the Vulkan Specification, the normative term **must** is primarily used to describe **application** behavior, and in particular to constrain what inputs or commands issued by the application to the implementation are considered valid.

To constrain **implementation** behavior, the specification sometimes uses **must**, but more often

simply describes the behavior of the implementation in response to specified commands and inputs. Unless explicitly stated otherwise, such references to implementation behavior describe the behavior of **conformant** implementations, and express normative requirements which an implementation must satisfy in order to conform to the specification. For example, if the specification says “Under **specified condition**, the error code `VK_ERROR_FEATURE_NOT_PRESENT` is returned”, that behavior is a requirement of the specification, and an implementation which does not return that error code under that condition is not conformant.

When the normative terms **may**, **should**, or **optional** are used to describe implementation behavior, they define alternative or optional behaviors which a conformant implementation may or may not exhibit. Such statements are also normative. For example, if the specification says “Under **specified condition**, the implementation **should** return A but **may** instead return B”, then an implementation that returns either A or B under that condition is conformant (assuming it does not violate other normative requirements), while an implementation that returns anything else is not.

2.2.2. Normative References

References to external documents are considered normative references if the Specification uses [normative terminology](#) or [normative descriptions](#) to refer to them or their requirements, either as a whole or in part.

The following documents are referenced by normative sections of the specification:

IEEE. August, 2008. *IEEE Standard for Floating-Point Arithmetic*. IEEE Std 754-2008. <https://dx.doi.org/10.1109/IEEESTD.2008.4610935>.

2.2.3. Informative Language

Some language in the specification is purely informative, intended to provide background information or make suggestions to implementors or developers. Such language does not impose normative requirements on implementations or applications.

All NOTES are implicitly informative.

If an entire chapter, section, or appendix contains only informative language, its title will be suffixed with “(Informative)”. Unless so noted in the title, all chapters, sections, and appendices in this document are normative.

2.2.4. Technical Terminology

The Vulkan Specification makes use of common engineering and graphics terms such as **Pipeline**, **Shader**, and **Host** to identify and describe Vulkan API constructs and their attributes, states, and behaviors. The [Glossary](#) defines the basic meanings of these terms in the context of the Specification. The Specification text provides fuller definitions of the terms and may elaborate, extend, or clarify the [Glossary](#) definitions. When a term defined in the [Glossary](#) is used in normative language within the Specification, the definitions within the Specification govern and supersede any meanings the terms may have in other technical contexts (i.e. outside the Specification).

2.2.5. Ratification

Ratification of a Vulkan core version or extension is a status conferred by vote of the Khronos Board of Promoters, bringing that core version or extension under the umbrella of the Khronos IP Rights Policy.

All Vulkan core versions and **KHR** extensions (including provisional specifications) are ratified, as are some multi-vendor **EXT** extensions. Ratification status of extensions is described in the [Layers & Extensions \(Informative\)](#) appendix.

NOTE

Ratification status is primarily of interest to IHVs developing GPU hardware and Vulkan implementations. For developers, ratification does not necessarily mean that an extension is “better”, has a more stable API, or is more widely supported than alternative ways of achieving that functionality.

Interactions between ratified and non-ratified extensions are not themselves ratified.

Chapter 3. Fundamentals

This chapter introduces fundamental concepts including the Vulkan architecture and execution model, API syntax, queues, pipeline configurations, numeric representation, state and state queries, and the different types of objects and shaders. It provides a framework for interpreting more specific descriptions of commands and behavior in the remainder of the Specification.

3.1. Host and Device Environment

The Vulkan Specification assumes and requires: the following properties of the host environment with respect to Vulkan implementations:

- The host **must** have runtime support for 8, 16, 32 and 64-bit signed and unsigned twos-complement integers, all addressable at the granularity of their size in bytes.
- The host **must** have runtime support for 32- and 64-bit floating-point types satisfying the range and precision constraints in the [Floating-Point Computation](#) section.
- The representation and endianness of these types on the host **must** match the representation and endianness of the same types on every physical device supported.

NOTE

Since a variety of data types and structures in Vulkan **may** be accessible by both host and physical device operations, the implementation **should** be able to access such data efficiently in both paths in order to facilitate writing portable and performant applications.

3.2. Execution Model

This section outlines the execution model of a Vulkan system.

Vulkan exposes one or more *devices*, each of which exposes one or more *queues* which **may** process work asynchronously to one another. The set of queues supported by a device is partitioned into *families*. Each family supports one or more types of functionality and **may** contain multiple queues with similar characteristics. Queues within a single family are considered *compatible* with one another, and work produced for a family of queues **can** be executed on any queue within that family. This specification defines the following types of functionality that queues **may** support: graphics, compute, protected memory management, and transfer.

NOTE

A single device **may** report multiple similar queue families rather than, or as well as, reporting multiple members of one or more of those families. This indicates that while members of those families have similar capabilities, they are *not* directly compatible with one another.

Device memory is explicitly managed by the application. Each device **may** advertise one or more heaps, representing different areas of memory. Memory heaps are either device-local or host-local, but are always visible to the device. Further detail about memory heaps is exposed via memory types available on that heap. Examples of memory areas that **may** be available on an implementation include:

- *device-local* is memory that is physically connected to the device.
- *device-local, host visible* is device-local memory that is visible to the host.
- *host-local, host visible* is memory that is local to the host and visible to the device and host.

On other architectures, there **may** only be a single heap that **can** be used for any purpose.

3.2.1. Queue Operation

Vulkan queues provide an interface to the execution engines of a device. Commands for these execution engines are recorded into command buffers ahead of execution time, and then submitted to a queue for execution. Once submitted to a queue, command buffers will begin and complete execution without further application intervention, though the order of this execution is dependent on a number of [implicit and explicit ordering constraints](#).

Work is submitted to queues using *queue submission commands* that typically take the form `vkQueue*` (e.g. `vkQueueSubmit`), and **can** take a list of semaphores upon which to wait before work begins and a list of semaphores to signal once work has completed. The work itself, as well as signaling and waiting on the semaphores are all *queue operations*. Queue submission commands return control to the application once queue operations have been submitted - they do not wait for completion.

There are no implicit ordering constraints between queue operations on different queues, or between queues and the host, so these **may** operate in any order with respect to each other. Explicit ordering constraints between different queues or with the host **can** be expressed with [semaphores](#) and [fences](#).

Command buffer submissions to a single queue respect [submission order](#) and other [implicit ordering guarantees](#), but otherwise **may** overlap or execute out of order. Other types of batches and queue submissions against a single queue have no implicit ordering constraints with any other queue submission or batch. Additional explicit ordering constraints between queue submissions and individual batches can be expressed with [semaphores](#) and [fences](#).

Before a fence or semaphore is signaled, it is guaranteed that any previously submitted queue operations have completed execution, and that memory writes from those queue operations are [available](#) to future queue operations. Waiting on a signaled semaphore or fence guarantees that previous writes that are available are also [visible](#) to subsequent commands.

Command buffer boundaries, both between primary command buffers of the same or different batches or submissions as well as between primary and secondary command buffers, do not introduce any additional ordering constraints. In other words, submitting the set of command buffers (which **can** include executing secondary command buffers) between any semaphore or fence operations execute the recorded commands as if they had all been recorded into a single primary command buffer, except that the current state is [reset](#) on each boundary. Explicit ordering constraints **can** be expressed with [explicit synchronization primitives](#).

There are a few [implicit ordering guarantees](#) between commands within a command buffer, but only covering a subset of execution. Additional explicit ordering constraints can be expressed with the various [explicit synchronization primitives](#).

NOTE

Implementations have significant freedom to overlap execution of work submitted to a queue, and this is common due to deep pipelining and parallelism in Vulkan devices.

Commands recorded in command buffers can perform actions, set state that persists across commands, synchronize other commands, or indirectly launch other commands, with some commands fulfilling several of these roles. The “Command Properties” section for each such command lists which of these roles the command takes:

Action

Action commands perform operations that can update values in memory. E.g. [draw commands](#), [dispatch commands](#).

State

State setting commands update the current state of a command buffer, affecting the operation of future action commands.

Synchronization

Synchronization commands impose ordering constraints on action commands, by introducing explicit [execution and memory dependencies](#).

Indirection

Indirection commands execute other commands which were not directly recorded in the same command buffer.

NOTE

In the absence of explicit synchronization or [implicit ordering guarantees](#), action commands may overlap execution or execute out of order, potentially leading to data races. However, such reordering does not affect the current state observed by any action command. Each action command uses the state in effect at the point where the command occurs in the command buffer, regardless of when it is executed.

3.3. Object Model

The devices, queues, and other entities in Vulkan are represented by Vulkan objects. At the API level, all objects are referred to by handles. There are two classes of handles, dispatchable and non-dispatchable. *Dispatchable* handle types are a pointer to an opaque type. This pointer **may** be used by layers as part of intercepting API commands, and thus each API command takes a dispatchable type as its first parameter. Each object of a dispatchable type **must** have a unique handle value during its lifetime.

Non-dispatchable handle types are a 64-bit integer type whose meaning is implementation-dependent. Non-dispatchable handles **may** encode object information directly in the handle rather than acting as a reference to an underlying object, and thus **may** not have unique handle values. If handle values are not unique, then destroying one such handle **must** not cause identical handles of other types to become invalid, and **must** not cause identical handles of the same type to become invalid if that handle value has been created more times than it has been destroyed.

All objects created or allocated from a **VkDevice** (i.e. with a **VkDevice** as the first parameter) are private to that device, and **must** not be used on other devices.

3.3.1. Object Lifetime

Objects are created or allocated by **vkCreate*** and **vkAllocate*** commands, respectively. Once an object is created or allocated, its “structure” is considered to be immutable, though the content of certain object types is still free to change. When an object is passed to another command, it **may** be accessed by the implementation, which **may** include both read and write access unless explicitly stated otherwise. Objects are destroyed or freed by **vkDestroy*** and **vkFree*** commands, respectively.

Objects that are allocated (rather than created) take resources from an existing pool object or memory heap, and when freed return resources to that pool or heap. While object creation and destruction are generally expected to be low-frequency occurrences during runtime, allocating and freeing objects **can** occur at high frequency. Pool objects help accommodate improved performance of the allocations and frees.

In Vulkan SC, data structures for objects are reserved by the implementation at device creation time in order to enable implementations to rely solely on static memory management at runtime. The **VkDeviceObjectReservationCreateInfo** structure provides upper bounds on the simultaneous number of objects of each type that **can** be allocated during the lifetime of the **VkDevice**. Most objects can be created and destroyed as needed, provided that no more than the requested number are in existence at any point in time.

Applications are responsible for managing the lifetimes of Vulkan objects and memory passed into the Vulkan API. The access semantics of different functions in the API follow a typical pattern as laid out below, with any exceptions listed with the commands or objects that have them.

Application-owned memory and Vulkan objects **may** be accessed at any time during the execution of a command they are passed to. Vulkan objects that device addresses are retrieved from **may** be accessed by the implementation any time that memory backing the device address is accessed. Device addresses and Vulkan objects passed in during the creation or allocation of another object **may** be accessed by the implementation any time that the created/allocated object is accessed unless explicitly stated otherwise. Device addresses and Vulkan objects passed to a recording command (**vkCmd***) **may** be accessed at any time during the execution of the command, when the command buffer is subsequently recorded into another command buffer, during any subsequent command that is recorded to either the command buffer or one it is recorded into, or while the command buffer is in the **pending state**, unless explicitly stated otherwise. Some additional operations hold references to other objects or application-owned memory beyond the duration of the command; in which case the access semantics and lifetime of those references are described by that command.

When destroying or freeing an object, implementations **must** not access any memory or other objects that **may** otherwise be accessed when the object is accessed. Applications **can** free or destroy objects in any order, except that parent objects **must** be freed only after all child objects are freed. An object is the parent of another child object if the parent was used as the first object parameter in the creation of the child. Once an object is freed or destroyed it **must** not be accessed again, either directly or via access through another object. Applications **must** not free or destroy any object while it is being accessed.

3.3.2. External Object Handles

As defined above, the scope of object handles created or allocated from a `VkDevice` is limited to that logical device. Objects which are not in scope are said to be external. To bring an external object into scope, an external handle **must** be exported from the object in the source scope and imported into the destination scope.

NOTE

The scope of external handles and their associated resources **may** vary according to their type, but they **can** generally be shared across process and API boundaries.

3.4. Application Binary Interface

The mechanism by which Vulkan is made available to applications is platform- or implementation-defined. On many platforms the C interface described in this Specification is provided by a shared library. Since shared libraries can be changed independently of the applications that use them, they present particular compatibility challenges, and this Specification places some requirements on them.

Shared library implementations **must** use the default Application Binary Interface (ABI) of the standard C compiler for the platform, or provide customized API headers that cause application code to use the implementation's non-default ABI. An ABI in this context means the size, alignment, and layout of C data types; the procedure calling convention; and the naming convention for shared library symbols corresponding to C functions. Customizing the calling convention for a platform is usually accomplished by defining [calling convention macros](#) appropriately in `vk_platform.h`.

On platforms where Vulkan is provided as a shared library, library symbols beginning with “vk” and followed by a digit or uppercase letter are reserved for use by the implementation. Applications which use Vulkan **must** not provide definitions of these symbols. This allows the Vulkan shared library to be updated with additional symbols for new API versions or extensions without causing symbol conflicts with existing applications.

Shared library implementations **should** provide library symbols for commands in the highest version of this Specification they support, and for [Window System Integration](#) extensions relevant to the platform. They **may** also provide library symbols for commands defined by additional extensions.

NOTE

These requirements and recommendations are intended to allow implementors to take advantage of platform-specific conventions for SDKs, ABIs, library versioning mechanisms, etc. while still minimizing the code changes necessary to port applications or libraries between platforms. Platform vendors, or providers of the *de facto* standard Vulkan shared library for a platform, are encouraged to document what symbols the shared library provides and how it will be versioned when new symbols are added.

Applications **should** only rely on shared library symbols for commands in the minimum core version required by the application. [vkGetInstanceProcAddr](#) and [vkGetDeviceProcAddr](#) **should** be used to obtain function pointers for commands in core versions beyond the application's minimum required version.

3.5. Command Syntax and Duration

The Specification describes Vulkan commands as functions or procedures using C99 syntax. Language bindings for other languages such as C++ and JavaScript **may** allow for stricter parameter passing, or object-oriented interfaces.

Vulkan uses the standard C types for the base type of scalar parameters (e.g. types from `<stdint.h>`), with exceptions described below, or elsewhere in the text when appropriate:

`VkBool32` represents boolean `True` and `False` values, since C does not have a sufficiently portable built-in boolean type:

```
// Provided by VK_VERSION_1_0
typedef uint32_t VkBool32;
```

`VK_TRUE` represents a boolean **True** (unsigned integer 1) value, and `VK_FALSE` a boolean **False** (unsigned integer 0) value.

All values returned from a Vulkan implementation in a `VkBool32` will be either `VK_TRUE` or `VK_FALSE`.

Applications **must** not pass any other values than `VK_TRUE` or `VK_FALSE` into a Vulkan implementation where a `VkBool32` is expected.

`VK_TRUE` is a constant representing a `VkBool32` **True** value.

```
#define VK_TRUE 1U
```

`VK_FALSE` is a constant representing a `VkBool32` **False** value.

```
#define VK_FALSE 0U
```

`VkDeviceSize` represents device memory size and offset values:

```
// Provided by VK_VERSION_1_0
typedef uint64_t VkDeviceSize;
```

`VkDeviceAddress` represents device buffer address values:

```
// Provided by VK_VERSION_1_0
typedef uint64_t VkDeviceAddress;
```

Valid Usage

- VUID-VkDeviceAddress-size-11364

A valid `VkDeviceAddress` **must** be equal to the sum of an address retrieved from a `VkBuffer` via `vkGetBufferDeviceAddress`, and any offset in the range `[0, size)`, where `size` is the value of `VkBufferCreateInfo::size` used to create that `VkBuffer`

- VUID-VkDeviceAddress-None-10894

If a `VkDeviceAddress` was retrieved from a non-sparse buffer, that buffer **must** be bound completely and contiguously to a single `VkDeviceMemory` object

Commands that create Vulkan objects are of the form `vkCreate*` and take `Vk*CreateInfo` structures with the parameters needed to create the object. These Vulkan objects are destroyed with commands of the form `vkDestroy*`.

The last in-parameter to each command that creates or destroys a Vulkan object is `pAllocator`. The `pAllocator` parameter **must** be `NULL`. Refer to the [Memory Allocation](#) chapter for further details.

Commands that allocate Vulkan objects owned by pool objects are of the form `vkAllocate*`, and take `Vk*AllocateInfo` structures. These Vulkan objects are freed with commands of the form `vkFree*`. These objects do not take allocators; if host memory is needed, they will use the allocator that was specified when their parent pool was created.

Commands are recorded into a command buffer by calling API commands of the form `vkCmd*`. Each such command **may** have different restrictions on where it **can** be used: in a primary and/or secondary command buffer, inside and/or outside a render pass, and in one or more of the supported queue types. These restrictions are documented together with the definition of each such command.

The *duration* of a Vulkan command refers to the interval between calling the command and its return to the caller.

3.5.1. Lifetime of Retrieved Results

Information is retrieved from the implementation with commands of the form `vkGet*` and `vkEnumerate*`.

Unless otherwise specified for an individual command, the results are *invariant*; that is, they will remain unchanged when retrieved again by calling the same command with the same parameters, so long as those parameters themselves all remain valid.

3.5.2. Array Results

Some query commands of the form `vkGet*` and `vkEnumerate*` enable retrieving multiple results in the form of a return array. Such commands typically have two pointer arguments as follows:

- An element count pointer pointing to an integer variable, conventionally named as `p*Count` where `*` is the capitalized singular form of the name of the retrieved values.
- A pointer to an array where the result array is retrieved, conventionally named as `p*` where `*` is the capitalized plural form of the name of the retrieved values.

If such commands are called with the array pointer set to `NULL`, then the number of retrievable

elements is returned in the variable pointed to by the element count pointer. Otherwise, the element count pointer **must** point to a variable set by the application to the number of elements in the return array, and on return the variable is overwritten with the number of elements actually written to the return array. If the input element count is less than the number of retrievable array elements, the query will write only as many elements to the return array as specified by the element count variable set by the application, and the command will return `VK_INCOMPLETE` instead of `VK_SUCCESS`, to indicate that not all retrievable array elements were returned.

NOTE

In practice, this means that applications will typically call such query commands twice:

- First, with the array pointer set to `NULL`, to retrieve the number of retrievable elements.
- Second, with the array pointer pointing to an application allocated storage for at least as many elements as indicated by the variable pointed to by the element count pointer, to retrieve at most as many of the retrievable elements.

Query commands that return one or more structures, regardless of whether they return a single or an array of structures with or without a `pNext` chain, **may** also contain arrays within those structures. Such return arrays are typically defined in the form of two members as follows:

- An integer value specifying the element count, conventionally named as `*Count` where `*` is the singular form of the name of the retrieved values.
- A pointer to an array where the result array is retrieved, conventionally named as `p*` where `*` is the capitalized plural form of the name of the retrieved values.

Analogously to query commands that return multiple results, if the command is called with the array pointer member of the output structure in question set to `NULL`, then the number of retrievable elements is returned in the element count member of that output structure. Otherwise, the element count **must** specify the number of elements in the return array, and on return the element count member is overwritten with the number of elements actually written to the return array. If the input element count is less than the number of retrievable array elements, the query will write only as many elements to the return array as specified by the input element count, and the command will return `VK_INCOMPLETE` instead of `VK_SUCCESS`, if the query command has a `VkResult` return type, to indicate that not all retrievable array elements were returned.

NOTE

Applications need to separately track the value they provided as the input element count member for such arrays and compare those with the returned element counts in order to determine whether the actually returned element count is smaller than the size of the return array. Another side effect of this is that it is impossible for the application to determine if the number of retrievable elements has increased beyond the provided input element count so using return arrays in output structures **should** be limited to *invariant* array results. In practice, this means that applications will typically call such query commands multiple times:

- First, with the array pointer member(s) set to `NULL`, to retrieve the number(s) of retrievable elements.

- Second, with the array pointer(s) pointing to an application allocated storage for at least as many elements as indicated by the element count member(s), to retrieve at most as many of the retrievable elements.
- Then the process **may** need to be repeated for all other newly introduced return arrays in any nested output structures indirectly specified through the previously retrieved result arrays.

Regardless of the type of query command, any array pointer member of an output structure **must** either be **NULL**, or point to an application-allocated array. Query commands **must** not return a pointer to implementation allocated storage in any output structure.

3.5.3. Opaque Binary Data Results

Some query commands of the form **vkGet*** retrieve opaque binary data in the form of a byte array and have a possible result code of **VK_ERROR_NOT_ENOUGH_SPACE_KHR**. Such commands always have two pointer arguments as follows:

- A binary data size pointer pointing to a **size_t** variable, conventionally named as **p*Size** where ***** is the capitalized form of the name of the retrieved binary data.
- A pointer to a byte array where the binary data is retrieved, conventionally named as **p*** where ***** is the capitalized form of the name of the retrieved binary data.

If such commands are called with the binary pointer not set to **NULL**, the binary size pointer **must** point to a variable set by the application to the allocated size of the binary pointer. These arguments **may** also be placed in an extensible structure, in which case the binary data size argument is not a pointer.

If the input binary size is less than the total retrievable binary size, the query will not write any data to the location pointed to the binary pointer, and the command will return **VK_ERROR_NOT_ENOUGH_SPACE_KHR** instead of **VK_SUCCESS**.

If the return code is **VK_SUCCESS** or **VK_ERROR_NOT_ENOUGH_SPACE_KHR**, the total size of the binary data that **can** be retrieved is returned in the variable pointed to by the binary size pointer.

If multiple binaries are being retrieved, **VK_ERROR_NOT_ENOUGH_SPACE_KHR** will be returned if any input binary sizes are less than their respective total retrievable binary sizes. Unless otherwise specified, this command will determine writing data to each binary individually based on if their input binary sizes are sufficiently sized, following the behavior for single binary retrieval.

For all other error codes, the contents of the return structures are undefined.

NOTE

If **VK_ERROR_NOT_ENOUGH_SPACE_KHR** is returned with a command that returns multiple binaries, the application **can** determine which binaries are undersized by comparing the total binary size that is returned for each binary against the allocated size that was provided to the command.

NOTE

Some binary queries do not behave consistently with this pattern for historical reasons, primarily that the **VK_ERROR_NOT_ENOUGH_SPACE_KHR** error code was not

defined until after those queries were written.

A NOTE is added to each such query, describing such inconsistent behavior.

3.6. Threading Behavior

Vulkan is intended to provide scalable performance when used on multiple host threads. All commands support being called concurrently from multiple threads, but certain parameters, or components of parameters are defined to be *externally synchronized*. This means that the caller **must** guarantee that no more than one thread is using such a parameter at a given time.

More precisely, Vulkan commands use simple stores to update the state of Vulkan objects. The implementation **may** not synchronize accesses to memory parameters or object parameters declared as externally synchronized with other accesses. If two commands access the same object or memory and at least one of the commands declares the object to be externally synchronized, then the caller **must** guarantee not only that the commands do not execute simultaneously, but also that the two commands are separated by an appropriate memory barrier (if needed). Similarly, if a Vulkan command accesses a non-const memory parameter and the application also accesses that memory, or if the application writes to that memory and the command accesses it as a const memory parameter, the application **must** ensure the accesses are properly synchronized with a memory barrier if needed.

NOTE

Memory barriers are particularly relevant for hosts based on the ARM CPU architecture, which is more weakly ordered than many developers are accustomed to from x86/x64 programming. Fortunately, most higher-level synchronization primitives (like the pthread library) perform memory barriers as a part of mutual exclusion, so mutexing Vulkan objects via these primitives will have the desired effect.

Any object parameters that are not labeled as externally synchronized are either not mutated by the command or are internally synchronized. Additionally, certain objects related to a command's parameters (e.g. command pools and descriptor pools) **may** be affected by a command, and **must** also be externally synchronized. These implicit parameters are documented as described below.

Parameters of commands that are externally synchronized are listed below.

Externally Synchronized Parameters and Members

- The **instance** parameter in [vkDestroyInstance](#)
- The **device** parameter in [vkDestroyDevice](#)
- The **queue** parameter in [vkQueueSubmit](#)
- The **fence** parameter in [vkQueueSubmit](#)
- The **queue** parameter in [vkQueueWaitIdle](#)
- The **memory** parameter in [vkMapMemory](#)
- The **memory** parameter in [vkUnmapMemory](#)

- The `buffer` parameter in `vkBindBufferMemory`
- The `image` parameter in `vkBindImageMemory`
- The `fence` parameter in `vkDestroyFence`
- The `semaphore` parameter in `vkDestroySemaphore`
- The `buffer` parameter in `vkDestroyBuffer`
- The `image` parameter in `vkDestroyImage`
- The `imageView` parameter in `vkDestroyImageView`
- The `commandPool` parameter in `vkResetCommandPool`
- The `commandPool` parameter in `vkFreeCommandBuffers`
- The `commandBuffer` parameter in `vkBeginCommandBuffer`
- The `commandBuffer` parameter in `vkEndCommandBuffer`
- The `commandBuffer` parameter in `vkResetCommandBuffer`
- The `commandBuffer` parameter in `vkCmdCopyBuffer`
- The `commandBuffer` parameter in `vkCmdCopyImage`
- The `commandBuffer` parameter in `vkCmdCopyBufferToImage`
- The `commandBuffer` parameter in `vkCmdCopyImageToBuffer`
- The `commandBuffer` parameter in `vkCmdUpdateBuffer`
- The `commandBuffer` parameter in `vkCmdFillBuffer`
- The `commandBuffer` parameter in `vkCmdPipelineBarrier`
- The `commandBuffer` parameter in `vkCmdBeginQuery`
- The `commandBuffer` parameter in `vkCmdEndQuery`
- The `commandBuffer` parameter in `vkCmdResetQueryPool`
- The `commandBuffer` parameter in `vkCmdWriteTimestamp`
- The `commandBuffer` parameter in `vkCmdCopyQueryPoolResults`
- The `commandBuffer` parameter in `vkCmdExecuteCommands`
- The `event` parameter in `vkDestroyEvent`
- The `event` parameter in `vkSetEvent`
- The `event` parameter in `vkResetEvent`
- The `bufferView` parameter in `vkDestroyBufferView`
- The `pipelineCache` parameter in `vkDestroyPipelineCache`
- The `pipelineCache` parameter in `vkCreateComputePipelines`, conditionally¹
- The `pipeline` parameter in `vkDestroyPipeline`
- The `pipelineLayout` parameter in `vkDestroyPipelineLayout`
- The `sampler` parameter in `vkDestroySampler`
- The `descriptorSetLayout` parameter in `vkDestroyDescriptorSetLayout`

- The `descriptorPool` parameter in `vkResetDescriptorPool`
- The `descriptorPool` parameter in `vkFreeDescriptorSets`
- The `commandBuffer` parameter in `vkCmdBindPipeline`
- The `commandBuffer` parameter in `vkCmdBindDescriptorSets`
- The `commandBuffer` parameter in `vkCmdClearColorImage`
- The `commandBuffer` parameter in `vkCmdDispatch`
- The `commandBuffer` parameter in `vkCmdDispatchIndirect`
- The `commandBuffer` parameter in `vkCmdSetEvent`
- The `commandBuffer` parameter in `vkCmdResetEvent`
- The `commandBuffer` parameter in `vkCmdWaitEvents`
- The `commandBuffer` parameter in `vkCmdPushConstants`
- The `pipelineCache` parameter in `vkCreateGraphicsPipelines`, conditionally¹
- The `framebuffer` parameter in `vkDestroyFramebuffer`
- The `renderPass` parameter in `vkDestroyRenderPass`
- The `commandBuffer` parameter in `vkCmdSetViewport`
- The `commandBuffer` parameter in `vkCmdSetScissor`
- The `commandBuffer` parameter in `vkCmdSetLineWidth`
- The `commandBuffer` parameter in `vkCmdSetDepthBias`
- The `commandBuffer` parameter in `vkCmdSetBlendConstants`
- The `commandBuffer` parameter in `vkCmdSetDepthBounds`
- The `commandBuffer` parameter in `vkCmdSetStencilCompareMask`
- The `commandBuffer` parameter in `vkCmdSetStencilWriteMask`
- The `commandBuffer` parameter in `vkCmdSetStencilReference`
- The `commandBuffer` parameter in `vkCmdBindIndexBuffer`
- The `commandBuffer` parameter in `vkCmdBindVertexBuffers`
- The `commandBuffer` parameter in `vkCmdDraw`
- The `commandBuffer` parameter in `vkCmdDrawIndexed`
- The `commandBuffer` parameter in `vkCmdDrawIndirect`
- The `commandBuffer` parameter in `vkCmdDrawIndexedIndirect`
- The `commandBuffer` parameter in `vkCmdBlitImage`
- The `commandBuffer` parameter in `vkCmdClearDepthStencilImage`
- The `commandBuffer` parameter in `vkCmdClearAttachments`
- The `commandBuffer` parameter in `vkCmdResolveImage`
- The `commandBuffer` parameter in `vkCmdBeginRenderPass`
- The `commandBuffer` parameter in `vkCmdNextSubpass`

- The `commandBuffer` parameter in `vkCmdEndRenderPass`
- The `commandBuffer` parameter in `vkCmdSetDeviceMask`
- The `commandBuffer` parameter in `vkCmdDispatchBase`
- The `ycbcrConversion` parameter in `vkDestroySamplerYcbcrConversion`
- The `commandBuffer` parameter in `vkCmdDrawIndirectCount`
- The `commandBuffer` parameter in `vkCmdDrawIndexedIndirectCount`
- The `commandBuffer` parameter in `vkCmdBeginRenderPass2`
- The `commandBuffer` parameter in `vkCmdNextSubpass2`
- The `commandBuffer` parameter in `vkCmdEndRenderPass2`
- The `commandPool` parameter in `vkGetCommandPoolMemoryConsumption`
- The `commandBuffer` parameter in `vkGetCommandPoolMemoryConsumption`
- The `surface` parameter in `vkDestroySurfaceKHR`
- The `swapchain` parameter in `vkAcquireNextImageKHR`
- The `semaphore` parameter in `vkAcquireNextImageKHR`
- The `fence` parameter in `vkAcquireNextImageKHR`
- The `queue` parameter in `vkQueuePresentKHR`
- The `surface` parameter in `vkGetDeviceGroupSurfacePresentModesKHR`
- The `surface` parameter in `vkGetPhysicalDevicePresentRectanglesKHR`
- The `display` parameter in `vkCreateDisplayModeKHR`
- The `mode` parameter in `vkGetDisplayPlaneCapabilitiesKHR`
- The `swapchain` parameter in `vkGetSwapchainStatusKHR`
- The `commandBuffer` parameter in `vkCmdSetFragmentShadingRateKHR`
- The `commandBuffer` parameter in `vkCmdRefreshObjectsKHR`
- The `commandBuffer` parameter in `vkCmdSetEvent2KHR`
- The `commandBuffer` parameter in `vkCmdResetEvent2KHR`
- The `commandBuffer` parameter in `vkCmdWaitEvents2KHR`
- The `commandBuffer` parameter in `vkCmdPipelineBarrier2KHR`
- The `commandBuffer` parameter in `vkCmdWriteTimestamp2KHR`
- The `queue` parameter in `vkQueueSubmit2KHR`
- The `fence` parameter in `vkQueueSubmit2KHR`
- The `commandBuffer` parameter in `vkCmdCopyBuffer2KHR`
- The `commandBuffer` parameter in `vkCmdCopyImage2KHR`
- The `commandBuffer` parameter in `vkCmdCopyBufferToImage2KHR`
- The `commandBuffer` parameter in `vkCmdCopyImageToBuffer2KHR`
- The `commandBuffer` parameter in `vkCmdBlitImage2KHR`

- The `commandBuffer` parameter in `vkCmdResolveImage2KHR`
- The `commandBuffer` parameter in `vkCmdSetLineStippleKHR`
- The `commandBuffer` parameter in `vkCmdSetDiscardRectangleEXT`
- The `commandBuffer` parameter in `vkCmdSetDiscardRectangleEnableEXT`
- The `commandBuffer` parameter in `vkCmdSetDiscardRectangleModeEXT`
- The `objectHandle` member of the `pNameInfo` parameter in `vkSetDebugUtilsObjectNameEXT`
- The `queue` parameter in `vkQueueBeginDebugUtilsLabelEXT`
- The `queue` parameter in `vkQueueEndDebugUtilsLabelEXT`
- The `queue` parameter in `vkQueueInsertDebugUtilsLabelEXT`
- The `commandBuffer` parameter in `vkCmdBeginDebugUtilsLabelEXT`
- The `commandBuffer` parameter in `vkCmdEndDebugUtilsLabelEXT`
- The `commandBuffer` parameter in `vkCmdInsertDebugUtilsLabelEXT`
- The `messenger` parameter in `vkDestroyDebugUtilsMessengerEXT`
- The `commandBuffer` parameter in `vkCmdSetSampleLocationsEXT`
- The `commandBuffer` parameter in `vkCmdSetLineStippleEXT`
- The `commandBuffer` parameter in `vkCmdSetCullModeEXT`
- The `commandBuffer` parameter in `vkCmdSetFrontFaceEXT`
- The `commandBuffer` parameter in `vkCmdSetPrimitiveTopologyEXT`
- The `commandBuffer` parameter in `vkCmdSetViewportWithCountEXT`
- The `commandBuffer` parameter in `vkCmdSetScissorWithCountEXT`
- The `commandBuffer` parameter in `vkCmdBindVertexBuffers2EXT`
- The `commandBuffer` parameter in `vkCmdSetDepthTestEnableEXT`
- The `commandBuffer` parameter in `vkCmdSetDepthWriteEnableEXT`
- The `commandBuffer` parameter in `vkCmdSetDepthCompareOpEXT`
- The `commandBuffer` parameter in `vkCmdSetDepthBoundsTestEnableEXT`
- The `commandBuffer` parameter in `vkCmdSetStencilTestEnableEXT`
- The `commandBuffer` parameter in `vkCmdSetStencilOpEXT`
- The `commandBuffer` parameter in `vkCmdSetVertexInputEXT`
- The `commandBuffer` parameter in `vkCmdSetPatchControlPointsEXT`
- The `commandBuffer` parameter in `vkCmdSetRasterizerDiscardEnableEXT`
- The `commandBuffer` parameter in `vkCmdSetDepthBiasEnableEXT`
- The `commandBuffer` parameter in `vkCmdSetLogicOpEXT`
- The `commandBuffer` parameter in `vkCmdSetPrimitiveRestartEnableEXT`
- The `commandBuffer` parameter in `vkCmdSetColorWriteEnableEXT`
- The `commandPool` member of `VkCommandBufferAllocateInfo`

- The `dstSet` member of `VkCopyDescriptorSet`, conditionally¹
- The `descriptorPool` member of `VkDescriptorSetAllocateInfo`
- The `buffer` member of `VkBindBufferMemoryInfo`
- The `image` member of `VkBindImageMemoryInfo`
- The `surface` member of `VkSwapchainCreateInfoKHR`
- The `swapchain` member of `VkBindImageMemorySwapchainInfoKHR`
- The `swapchain` member of `VkAcquireNextImageInfoKHR`
- The `semaphore` member of `VkAcquireNextImageInfoKHR`
- The `fence` member of `VkAcquireNextImageInfoKHR`
- The `semaphore` member of `VkImportSemaphoreFdInfoKHR`
- The `fence` member of `VkImportFenceFdInfoKHR`
- The `mode` member of `VkDisplayPlaneInfo2KHR`
- The `objectHandle` member of `VkRefreshObjectKHR`
- The `objectHandle` member of `VkDebugUtilsObjectTagInfoEXT`
- The `fence` member of `VkImportFenceSciSyncInfoNV`
- The `semaphore` member of `VkImportSemaphoreSciSyncInfoNV`

¹ See Valid Usage language for this token for details.

There are also a few instances where a command **can** take in an application-allocated list whose contents are externally synchronized parameters. In these cases, the caller **must** guarantee that at most one thread is using a given element within the list at a given time. These parameters are listed below.

Externally Synchronized Parameter and Member Lists

- Each element of the `pFences` parameter in `vkResetFences`
- Each element of the `pCommandBuffers` parameter in `vkFreeCommandBuffers`
- Each element of the `pDescriptorSets` parameter in `vkFreeDescriptorSets`
- The `dstSet` member of each element of the `pDescriptorWrites` parameter in `vkUpdateDescriptorSets`, conditionally¹
- Each element of the `pWaitSemaphores` member of `VkPresentInfoKHR`
- Each element of the `pSwapchains` member of `VkPresentInfoKHR`

¹ See Valid Usage language for this token for details.

In addition, there are some implicit parameters that need to be externally synchronized. For example, when a `commandBuffer` parameter needs to be externally synchronized, it implies that the `commandPool` from which that command buffer was allocated also needs to be externally

synchronized. The implicit parameters and their associated object are listed below.

Implicit Externally Synchronized Parameters

- All `VkPhysicalDevice` objects enumerated from `instance` in `vkDestroyInstance`
- All `VkQueue` objects created from `device` in `vkDestroyDevice`
- All `VkQueue` objects created from `device` in `vkDeviceWaitIdle`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkBeginCommandBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkEndCommandBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkResetCommandBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyImage`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyBufferToImage`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyImageToBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdUpdateBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdFillBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdPipelineBarrier`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBeginQuery`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdEndQuery`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdResetQueryPool`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdWriteTimestamp`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyQueryPoolResults`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdExecuteCommands`
- Any `VkDescriptorSet` objects allocated from `descriptorPool` in `vkResetDescriptorPool`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindPipeline`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindDescriptorSets`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdClearColorImage`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDispatch`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDispatchIndirect`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetEvent`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdResetEvent`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdWaitEvents`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdPushConstants`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetViewport`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetScissor`

- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetLineWidth`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDepthBias`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetBlendConstants`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDepthBounds`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetStencilCompareMask`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetStencilWriteMask`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetStencilReference`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindIndexBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindVertexBuffers`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDraw`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndexed`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndirect`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndexedIndirect`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBlitImage`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdClearDepthStencilImage`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdClearAttachments`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdResolveImage`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBeginRenderPass`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdNextSubpass`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdEndRenderPass`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDeviceMask`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDispatchBase`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndirectCount`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndexedIndirectCount`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBeginRenderPass2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdNextSubpass2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdEndRenderPass2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetFragmentShadingRateKHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdRefreshObjectsKHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetEvent2KHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdResetEvent2KHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdWaitEvents2KHR`

- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdPipelineBarrier2KHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdWriteTimestamp2KHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyBuffer2KHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyImage2KHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyBufferToImage2KHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyImageToBuffer2KHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBlitImage2KHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdResolveImage2KHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetLineStippleKHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDiscardRectangleEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDiscardRectangleEnableEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDiscardRectangleModeEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBeginDebugUtilsLabelEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdEndDebugUtilsLabelEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdInsertDebugUtilsLabelEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetSampleLocationsEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetLineStippleEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetCullModeEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetFrontFaceEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetPrimitiveTopologyEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetViewportWithCountEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetScissorWithCountEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindVertexBuffers2EXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDepthTestEnableEXT`

- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDepthWriteEnableEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDepthCompareOpEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDepthBoundsTestEnableEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetStencilTestEnableEXT`

- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetVertexInputEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetPatchControlPointsEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetRasterizerDiscardEnableEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDepthBiasEnableEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetLogicOpEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetPrimitiveRestartEnableEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetColorWriteEnableEXT`

3.7. Valid Usage

Valid usage defines a set of conditions which **must** be met in order to achieve well-defined runtime behavior in an application. These conditions depend only on Vulkan state, and the parameters or objects whose usage is constrained by the condition.

The core layer assumes applications are using the API correctly. Except as documented elsewhere in the Specification, the behavior of the core layer to an application using the API incorrectly is undefined, and **may** include program termination. However, implementations **must** ensure that incorrect usage by an application does not affect the integrity of the operating system, the Vulkan implementation, or other applications in the system using Vulkan. In particular, any guarantees made by an operating system about whether memory from one process **can** be visible to another process or not **must** not be violated by a Vulkan implementation for **any memory allocation**. Vulkan implementations are not **required** to make additional security or integrity guarantees beyond those provided by the OS unless explicitly directed by the application's use of a particular feature or extension.

NOTE

For instance, if an operating system guarantees that data in all its memory allocations are set to zero when newly allocated, the Vulkan implementation **must** make the same guarantees for any allocations it controls (e.g. `VkDeviceMemory`).

Similarly, if an operating system guarantees that use-after-free of host allocations will not result in values written by another process becoming visible, the same guarantees **must** be made by the Vulkan implementation for device memory.

If the `protectedMemory` feature is supported, the implementation provides additional guarantees when invalid usage occurs to prevent values in protected memory from being accessed or inferred outside of protected operations, as described in [Protected Memory Access Rules](#).

Some valid usage conditions have dependencies on runtime limits or feature availability. It is possible to validate these conditions against Vulkan's minimum supported values for these limits and features, or some subset of other known values.

Valid usage conditions do not cover conditions where well-defined behavior (including returning an error code) exists.

Valid usage conditions **should** apply to the command or structure where complete information about the condition would be known during execution of an application. This is such that a validation layer or linter **can** be written directly against these statements at the point they are specified.

NOTE

This does lead to some non-obvious places for valid usage statements. For instance, the valid values for a structure might depend on a separate value in the calling command. In this case, the structure itself will not reference this valid usage as it is impossible to determine validity from the structure that it is invalid - instead this valid usage would be attached to the calling command.

Another example is draw state - the state setters are independent, and can cause a legitimately invalid state configuration between draw calls; so the valid usage statements are attached to the place where all state needs to be valid - at the drawing command.

Valid usage conditions are described in a block labeled "Valid Usage" following each command or structure they apply to.

3.7.1. Usage Validation

Vulkan is a layered API. The lowest layer is the core Vulkan layer, as defined by this Specification. The application **can** use additional layers above the core for debugging, validation, and other purposes.

One of the core principles of Vulkan is that building and submitting command buffers **should** be highly efficient. Thus error checking and validation of state in the core layer is minimal, although more rigorous validation **can** be enabled through the use of layers.

Validation of correct API usage is left to validation layers. Applications **should** be developed with validation layers enabled, to help catch and eliminate errors.

3.7.2. Implicit Valid Usage

Some valid usage conditions apply to all commands and structures in the API, unless explicitly denoted otherwise for a specific command or structure. These conditions are considered *implicit*, and are described in a block labeled “Valid Usage (Implicit)” following each command or structure they apply to. Implicit valid usage conditions are described in detail below.

Valid Usage for Object Handles

Any input parameter to a command that is an object handle **must** be a valid object handle, unless otherwise specified. An object handle is valid if:

- It has been created or allocated by a previous, successful call to the API. Such calls are noted in the Specification.
- It has not been deleted or freed by a previous call to the API. Such calls are noted in the Specification.
- Any objects used by that object, either as part of creation or execution, **must** also be valid.

The reserved values `VK_NULL_HANDLE` and `NULL` **can** be used in place of valid non-dispatchable handles and dispatchable handles, respectively, when *explicitly called out in the Specification*. Any command that creates an object successfully **must** not return these values. It is valid to pass these values to `vkDestroy*` or `vkFree*` commands, which will silently ignore these values.

Valid Usage for Pointers

Any parameter that is a pointer **must** be a *valid pointer* only if it is explicitly called out by a Valid Usage statement.

A pointer is “valid” if it points at memory containing values of the number and type(s) expected by the command, and all fundamental types accessed through the pointer (e.g. as elements of an array or as members of a structure) satisfy the alignment requirements of the host processor.

Valid Usage for Strings

Any parameter that is a pointer to `char` **must** be a finite sequence of values terminated by a null character, or if *explicitly called out in the Specification*, **can** be `NULL`.

Strings specified as UTF-8 encoded **must** not contain invalid UTF-8 sequences. See [String Representation](#) for additional information about strings.

Valid Usage for Enumerated Types

Any parameter of an enumerated type **must** be a valid enumerator for that type. Use of an enumerator is valid if the following conditions are true:

- The enumerator is defined as part of the enumerated type.
- The enumerator is not a value suffixed with `_MAX_ENUM`.
 - This value exists only to ensure that C `enum` types are 32 bits in size and **must** not be used by applications.

- If the enumerant is used in a function that has a [VkInstance](#) as its first parameter and either:
 - it was added by a core version that is supported (as reported by [vkEnumerateInstanceVersion](#)) and the value of [VkApplicationInfo::apiVersion](#) is greater than or equal to the version that added it; or
 - it was added by an [instance extension](#) that was enabled for the instance.
- If the enumerant is used in a function that has a [VkPhysicalDevice](#) object as its first parameter and either:
 - it was added by a core version that is supported by that device (as reported by [VkPhysicalDeviceProperties::apiVersion](#));
 - it was added by an [instance extension](#) that was enabled for the instance; or
 - it was added by a [device extension](#) that is supported by that device.
- If the enumerant is used in a function that has any other dispatchable object as its first parameter and either:
 - it was added by a core version that is supported for the device (as reported by [VkPhysicalDeviceProperties::apiVersion](#)); or
 - it was added by a [device extension](#) that was enabled for the device.

Any enumerated type returned from a query command or otherwise output from Vulkan to the application **must** not have a reserved value. Reserved values are values not defined by any extension for that enumerated type.

NOTE

In some special cases, an enumerant is only meaningful if a feature defined by an extension is also enabled, as well as the extension itself. The global “valid enumerant” rule described here does not address such cases.

NOTE

This language is intended to accommodate cases such as “hidden” extensions known only to driver internals, or layers enabling extensions without knowledge of the application, without allowing return of values not defined by any extension.

NOTE

Application developers are encouraged to be careful when using [switch](#) statements with Vulkan API enums. This is because new extensions can add new values to existing enums. Using a [default:](#) statement within a [switch](#) may avoid future compilation issues.

This is particularly true for enums such as [VkDriverId](#), which may have values added that do not belong to a corresponding new extension.

Valid Usage for Flags

A collection of flags is represented by a bitmask using the type [VkFlags](#):

```
// Provided by VK_VERSION_1_0
typedef uint32_t VkFlags;
```

Bitmasks are passed to many commands and structures to compactly represent options, but `VkFlags` is not used directly in the API. Instead, a `Vk*Flags` type which is an alias of `VkFlags`, and whose name matches the corresponding `Vk*FlagBits` that are valid for that type, is used.

Any `Vk*Flags` member or parameter used in the API as an input **must** be a valid combination of bit flags. A valid combination is either zero or the bitwise OR of valid bit flags.

An individual bit flag is valid for a `Vk*Flags` type if it would be a [valid enumerant](#) when used with the equivalent `Vk*FlagBits` type, where the bits type is obtained by taking the flag type and replacing the trailing `Flags` with `FlagBits`. For example, a flag value of type `VkColorComponentFlags` **must** contain only bit flags defined by `VkColorComponentFlagBits`.

Any `Vk*Flags` member or parameter returned from a query command or otherwise output from Vulkan to the application **may** contain bit flags undefined in its corresponding `Vk*FlagBits` type. An application **cannot** rely on the state of these unspecified bits.

Only the low-order 31 bits (bit positions zero through 30) are available for use as flag bits.

NOTE

This restriction is due to poorly defined behavior by C compilers given a C enumerant value of `0x80000000`. In some cases adding this enumerant value may increase the size of the underlying `Vk*FlagBits` type, breaking the ABI.

A collection of 64-bit flags is represented by a bitmask using the type `VkFlags64`:

```
// Provided by VK_KHR_synchronization2
typedef uint64_t VkFlags64;
```

When the 31 bits available in `VkFlags` are insufficient, the `VkFlags64` type can be passed to commands and structures to represent up to 64 options. `VkFlags64` is not used directly in the API. Instead, a `Vk*Flags2` type which is an alias of `VkFlags64`, and whose name matches the corresponding `Vk*FlagBits2` that are valid for that type, is used.

Any `Vk*Flags2` member or parameter used in the API as an input **must** be a valid combination of bit flags. A valid combination is either zero or the bitwise OR of valid bit flags.

An individual bit flag is valid for a `Vk*Flags2` type if it would be a [valid enumerant](#) when used with the equivalent `Vk*FlagBits2` type, where the bits type is obtained by taking the flag type and replacing the trailing `Flags2` with `FlagBits2`. For example, a flag value of type `VkAccessFlags2KHR` **must** contain only bit flags defined by `VkAccessFlagBits2KHR`.

Any `Vk*Flags2` member or parameter returned from a query command or otherwise output from Vulkan to the application **may** contain bit flags undefined in its corresponding `Vk*FlagBits2` type. An application **cannot** rely on the state of these unspecified bits.

NOTE

Both the `Vk*FlagBits2` type, and the individual bits defined for that type, are defined as `uint64_t` integers in the C API. This is in contrast to the 32-bit types, where the `Vk*FlagBits` type is defined as a C `enum` and the individual bits as enumerants belonging to that `enum`. As a result, there is less compile time type checking possible

for the 64-bit types. This is unavoidable since there is no sufficiently portable way to define a 64-bit `enum` type in C99.

Valid Usage for Structure Types

Any parameter that is a structure containing a `sType` member **must** have a value of `sType` which is a valid `VkStructureType` value matching the type of the structure.

Valid Usage for Structure Pointer Chains

Any parameter that is a structure containing a `void* pNext` member **must** have a value of `pNext` that is either `NULL`, or is a pointer to a valid *extending structure*, containing `sType` and `pNext` members as described in the [Vulkan Documentation and Extensions](#) document in the section “Extending Structures”. The set of structures connected by `pNext` pointers is referred to as a *pNext chain*.

Each structure included in the `pNext` chain **must** be defined at runtime by either:

- a core version which is supported
- an extension which is enabled
- a supported device extension in the case of physical-device-level functionality added by the device extension

Each type of extending structure **must** not appear more than once in a `pNext` chain, including any [aliases](#). This general rule may be explicitly overridden for specific structures.

Any component of the implementation (the loader, any enabled layers, and drivers) **must** skip over, without processing (other than reading the `sType` and `pNext` members) any extending structures in the chain not defined by core versions or extensions supported by that component.

As a convenience to implementations and layers needing to iterate through a structure pointer chain, the Vulkan API provides two *base structures*. These structures allow for some type safety, and can be used by Vulkan API functions that operate on generic inputs and outputs.

The `VkBaseInStructure` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkBaseInStructure {
    VkStructureType      sType;
    const struct VkBaseInStructure* pNext;
} VkBaseInStructure;
```

- `sType` is the structure type of the structure being iterated through.
- `pNext` is `NULL` or a pointer to the next structure in a structure chain.

`VkBaseInStructure` can be used to facilitate iterating through a read-only structure pointer chain.

The `VkBaseOutStructure` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkBaseOutStructure {
    VkStructureType      sType;
    struct VkBaseOutStructure* pNext;
} VkBaseOutStructure;
```

- **sType** is the structure type of the structure being iterated through.
- **pNext** is **NULL** or a pointer to the next structure in a structure chain.

VkBaseOutStructure can be used to facilitate iterating through a structure pointer chain that returns data back to the application.

Valid Usage for Nested Structures

The above conditions also apply recursively to members of structures provided as input to a command, either as a direct argument to the command, or themselves a member of another structure.

Specifics on valid usage of each command are covered in their individual sections.

Valid Usage for Extensions

Instance-level functionality or behavior added by an [instance extension](#) to the API **must** not be used unless that extension is supported by the instance as determined by [vkEnumerateInstanceExtensionProperties](#), and that extension is enabled in [VkInstanceCreateInfo](#).

Physical-device-level functionality or behavior added by an [instance extension](#) to the API **must** not be used unless that extension is supported by the instance as determined by [vkEnumerateInstanceExtensionProperties](#), and that extension is enabled in [VkInstanceCreateInfo](#).

Physical-device-level functionality or behavior added by a [device extension](#) to the API **must** not be used unless the conditions described in [Extending Physical Device From Device Extensions](#) are met.

Device-level functionality added by a [device extension](#) that is dispatched from a [VkDevice](#), or from a child object of a [VkDevice](#) **must** not be used unless that extension is supported by the device as determined by [vkEnumerateDeviceExtensionProperties](#), and that extension is enabled in [VkDeviceCreateInfo](#).

Valid Usage for Newer Core Versions

Instance-level functionality or behavior added by a [new core version](#) of the API **must** not be used unless it is supported by the instance as determined by [vkEnumerateInstanceVersion](#) and the specified version of [VkApplicationInfo::apiVersion](#).

Physical-device-level functionality or behavior added by a [new core version](#) of the API **must** not be used unless it is supported by the physical device as determined by [VkPhysicalDeviceProperties::apiVersion](#) and the specified version of [VkApplicationInfo::apiVersion](#).

Device-level functionality or behavior added by a [new core version](#) of the API **must** not be used

unless it is supported by the device as determined by `VkPhysicalDeviceProperties::apiVersion` and the specified version of `VkApplicationInfo::apiVersion`.

3.8. `VkResult` Return Codes

While the core Vulkan API is not designed to capture incorrect usage, some circumstances still require return codes. Commands in Vulkan return their status via return codes that are in one of two categories:

- Successful completion codes are returned when a command needs to communicate success or status information. All successful completion codes are non-negative values.
- Runtime error codes are returned when a command needs to communicate a failure that could only be detected at runtime. All runtime error codes are negative values.

All return codes in Vulkan are reported via `VkResult` return values. The possible codes are:

```
// Provided by VK_VERSION_1_0
typedef enum VkResult {
    VK_SUCCESS = 0,
    VK_NOT_READY = 1,
    VK_TIMEOUT = 2,
    VK_EVENT_SET = 3,
    VK_EVENT_RESET = 4,
    VK_INCOMPLETE = 5,
    VK_ERROR_OUT_OF_HOST_MEMORY = -1,
    VK_ERROR_OUT_OF_DEVICE_MEMORY = -2,
    VK_ERROR_INITIALIZATION_FAILED = -3,
    VK_ERROR_DEVICE_LOST = -4,
    VK_ERROR_MEMORY_MAP_FAILED = -5,
    VK_ERROR_LAYER_NOT_PRESENT = -6,
    VK_ERROR_EXTENSION_NOT_PRESENT = -7,
    VK_ERROR_FEATURE_NOT_PRESENT = -8,
    VK_ERROR_INCOMPATIBLE_DRIVER = -9,
    VK_ERROR_TOO_MANY_OBJECTS = -10,
    VK_ERROR_FORMAT_NOT_SUPPORTED = -11,
    VK_ERROR_FRAGMENTED_POOL = -12,
    VK_ERROR_UNKNOWN = -13,
// Provided by VK_VERSION_1_0
    VK_ERROR_VALIDATION_FAILED = -1000011001,
// Provided by VK_VERSION_1_1
    VK_ERROR_OUT_OF_POOL_MEMORY = -1000069000,
// Provided by VK_VERSION_1_1
    VK_ERROR_INVALID_EXTERNAL_HANDLE = -1000072003,
// Provided by VK_VERSION_1_2
    VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS = -1000257000,
// Provided by VK_VERSION_1_2
    VK_ERROR_FRAGMENTATION = -1000161000,
    VK_ERROR_NOT_PERMITTED = -1000174001,
// Provided by VKSC_VERSION_1_0
```

```

    VK_ERROR_INVALID_PIPELINE_CACHE_DATA = -1000298000,
// Provided by VKSC_VERSION_1_0
    VK_ERROR_NO_PIPELINE_MATCH = -1000298001,
// Provided by VK_KHR_surface
    VK_ERROR_SURFACE_LOST_KHR = -1000000000,
// Provided by VK_KHR_surface
    VK_ERROR_NATIVE_WINDOW_IN_USE_KHR = -1000000001,
// Provided by VK_KHR_swapchain
    VK_SUBOPTIMAL_KHR = 1000001003,
// Provided by VK_KHR_swapchain
    VK_ERROR_OUT_OF_DATE_KHR = -1000001004,
// Provided by VK_KHR_display_swapchain
    VK_ERROR_INCOMPATIBLE_DISPLAY_KHR = -1000003001,
// Provided by VK_EXT_image_drm_format_modifier
    VK_ERROR_INVALID_DRM_FORMAT_MODIFIER_PLANE_LAYOUT_EXT = -1000158000,
// Provided by VK_KHR_global_priority
    VK_ERROR_NOT_PERMITTED_KHR = VK_ERROR_NOT_PERMITTED,
} VkResult;

```

Success Codes

- **VK_SUCCESS** Command successfully completed
- **VK_NOT_READY** A fence or query has not yet completed
- **VK_TIMEOUT** A wait operation has not completed in the specified time
- **VK_EVENT_SET** An event is signaled
- **VK_EVENT_RESET** An event is unsignaled
- **VK_INCOMPLETE** A return array was too small for the result
- **VK_SUBOPTIMAL_KHR** A swapchain no longer matches the surface properties exactly, but **can** still be used to present to the surface successfully.

Error Codes

- **VK_ERROR_OUT_OF_HOST_MEMORY** A host memory allocation has failed.
- **VK_ERROR_OUT_OF_DEVICE_MEMORY** A device memory allocation has failed.
- **VK_ERROR_INITIALIZATION_FAILED** Initialization of an object could not be completed for implementation-specific reasons.
- **VK_ERROR_DEVICE_LOST** The logical or physical device has been lost. See [Lost Device](#)
- **VK_ERROR_MEMORY_MAP_FAILED** Mapping of a memory object has failed.
- **VK_ERROR_LAYER_NOT_PRESENT** A requested layer is not present or could not be loaded.
- **VK_ERROR_EXTENSION_NOT_PRESENT** A requested extension is not supported.
- **VK_ERROR_FEATURE_NOT_PRESENT** A requested feature is not supported.
- **VK_ERROR_INCOMPATIBLE_DRIVER** The requested version of Vulkan is not supported by the driver or is otherwise incompatible for implementation-specific reasons.
- **VK_ERROR_TOO_MANY_OBJECTS** Too many objects of the type have already been created.

- **VK_ERROR_FORMAT_NOT_SUPPORTED** A requested format is not supported on this device.
- **VK_ERROR_FRAGMENTED_POOL** A pool allocation has failed due to fragmentation of the pool's memory. This **must** only be returned if no attempt to allocate host or device memory was made to accommodate the new allocation. This **should** be returned in preference to **VK_ERROR_OUT_OF_POOL_MEMORY**, but only if the implementation is certain that the pool allocation failure was due to fragmentation.
- **VK_ERROR_SURFACE_LOST_KHR** A surface is no longer available.
- **VK_ERROR_NATIVE_WINDOW_IN_USE_KHR** The requested window is already in use by Vulkan or another API in a manner which prevents it from being used again.
- **VK_ERROR_OUT_OF_DATE_KHR** A surface has changed in such a way that it is no longer compatible with the swapchain, and further presentation requests using the swapchain will fail. Applications **must** query the new surface properties and recreate their swapchain if they wish to continue presenting to the surface.
- **VK_ERROR_INCOMPATIBLE_DISPLAY_KHR** The display used by a swapchain does not use the same presentable image layout, or is incompatible in a way that prevents sharing an image.
- **VK_ERROR_OUT_OF_POOL_MEMORY** A pool memory allocation has failed. This **must** only be returned if no attempt to allocate host or device memory was made to accommodate the new allocation. If the failure was definitely due to fragmentation of the pool, **VK_ERROR_FRAGMENTED_POOL** **should** be returned instead.
- **VK_ERROR_INVALID_EXTERNAL_HANDLE** An external handle is not a valid handle of the specified type.
- **VK_ERROR_FRAGMENTATION** A descriptor pool creation has failed due to fragmentation.
- **VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS** A buffer creation or memory allocation failed because the requested address is not available.
- **VK_ERROR_VALIDATION_FAILED** A command failed because invalid usage was detected by the implementation or a validation layer. This **may** result in the command not being dispatched to the ICD.
- **VK_ERROR_INVALID_PIPELINE_CACHE_DATA** The supplied pipeline cache data was not valid for the current implementation.
- **VK_ERROR_NO_PIPELINE_MATCH** The implementation did not find a match in the pipeline cache for the specified pipeline, or **VkPipelineOfflineCreateInfo** was not provided to the **vkCreate*Pipelines** function.
- **VK_ERROR_NOT_PERMITTED** The driver implementation has denied a request to acquire a priority above the default priority (**VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT**) because the application does not have sufficient privileges.
- **VK_ERROR_UNKNOWN** An unknown error has occurred; either the application has provided invalid input, or an implementation failure has occurred.

If a command returns a runtime error, unless otherwise specified any output parameters will have undefined contents, except that if the output parameter is a structure with **sType** and **pNext** fields, those fields will be unmodified. Any structures chained from **pNext** will also have undefined contents, except that **sType** and **pNext** will be unmodified.

VK_ERROR_OUT_OF_*_MEMORY errors do not modify any currently existing Vulkan objects. Objects that

have already been successfully created **can** still be used by the application. If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `VK_ERROR_OUT_OF_HOST_MEMORY` **must** not be returned from any physical or logical device command which explicitly disallows it.

NOTE

As a general rule, `Free`, `Release`, and `Reset` commands do not return `VK_ERROR_OUT_OF_HOST_MEMORY`, while any other command with a return code **may** return it. Any exceptions from this rule are described for those commands.

`VK_ERROR_UNKNOWN` will be returned by an implementation when an unexpected error occurs that cannot be attributed to valid behavior of the application and implementation. Under these conditions, it **may** be returned from any command returning a `VkResult`.

NOTE

`VK_ERROR_UNKNOWN` is not expected to ever be returned if the application behavior is valid, and if the implementation is bug-free. If `VK_ERROR_UNKNOWN` is returned, the application should be checked against the latest validation layers to verify correct behavior as much as possible. If no issues are identified it could be an implementation issue, and the implementor should be contacted for support.

Any command returning a `VkResult` **may** return `VK_ERROR_VALIDATION_FAILED` if a violation of valid usage is detected.

Performance-critical commands generally do not have return codes. If a runtime error occurs in such commands, the implementation will defer reporting the error until a specified point. For commands that record into command buffers (`vkCmd*`) runtime errors are reported by `vkEndCommandBuffer`.

NOTE

Implementations can also use [Fault Handling](#) to report runtime errors where suitable return values are not available or to provide more prompt notification of an error.

3.9. Numeric Representation and Computation

Implementations normally perform computations in floating-point, and **must** meet the range and precision requirements defined under “Floating-Point Computation” below.

These requirements only apply to computations performed in Vulkan operations outside of shader execution, such as texture image specification and sampling, and per-fragment operations. Range and precision requirements during shader execution differ and are specified by the [Precision and Operation of SPIR-V Instructions](#) section.

In some cases, the representation and/or precision of operations is implicitly limited by the specified format of vertex or texel data consumed by Vulkan. Specific floating-point formats are described later in this section.

3.9.1. Floating-Point Computation

Most floating-point computation is performed in SPIR-V shader modules. The properties of

computation within shaders are constrained as defined by the [Precision and Operation of SPIR-V Instructions](#) section.

Some floating-point computation is performed outside of shaders, such as viewport and depth range calculations. For these computations, we do not specify how floating-point numbers are to be represented, or the details of how operations on them are performed, but only place minimal requirements on representation and precision as described in the remainder of this section.

We require simply that numbers' floating-point parts contain enough bits and that their exponent fields are large enough so that individual results of floating-point operations are accurate to about 1 part in 10^5 . The maximum representable magnitude for all floating-point values **must** be at least 2^{32} .

$x \times 0 = 0 \times x = 0$ for any non-infinite and non-NaN x .

$1 \times x = x \times 1 = x$.

$x + 0 = 0 + x = x$.

$0^0 = 1$.

Occasionally, further requirements will be specified. Most single-precision floating-point formats meet these requirements.

The special values Inf and -Inf encode values with magnitudes too large to be represented; the special value NaN encodes “Not A Number” values resulting from undefined arithmetic operations such as $0 / 0$. Implementations **may** support Inf and NaN in their floating-point computations. Any computation which does not support either Inf or NaN, for which that value is an input or output will yield an undefined value.

3.9.2. Floating-Point Format Conversions

When a value is converted to a defined floating-point representation, finite values falling between two representable finite values are rounded to one or the other. The rounding mode is not defined. Finite values whose magnitude is larger than that of any representable finite value may be rounded either to the closest representable finite value or to the appropriately signed infinity. For unsigned destination formats any negative values are converted to zero. Positive infinity is converted to positive infinity; negative infinity is converted to negative infinity in signed formats and to zero in unsigned formats; and any NaN is converted to a NaN.

3.9.3. 16-Bit Floating-Point Numbers

16-bit floating-point numbers are defined in the “16-bit floating-point numbers” section of the [Khronos Data Format Specification](#).

3.9.4. Unsigned 11-Bit Floating-Point Numbers

Unsigned 11-bit floating-point numbers are defined in the “Unsigned 11-bit floating-point numbers” section of the [Khronos Data Format Specification](#).

3.9.5. Unsigned 10-Bit Floating-Point Numbers

Unsigned 10-bit floating-point numbers are defined in the “Unsigned 10-bit floating-point numbers” section of the [Khronos Data Format Specification](#).

3.9.6. 8-bit booleans

An 8-bit boolean uses the following representation for `true` and `false`:

- Zero to represent `false`
- Any non-zero value to represent `true`

3.9.7. General Requirements

Any representable floating-point value in the appropriate format is legal as input to a Vulkan command that requires floating-point data. The result of providing a value that is not a floating-point number to such a command is unspecified, but **must** not lead to Vulkan interruption or termination. For example, providing a negative zero (where applicable) or a denormalized number to a Vulkan command **must** yield deterministic results, while providing a NaN or Inf yields unspecified results.

Some calculations require division. In such cases (including implied divisions performed by vector normalization), division by zero produces an unspecified result but **must** not lead to Vulkan interruption or termination.

3.10. Fixed-Point Data Conversions

When generic vertex attributes and pixel color or depth *components* are represented as integers, they are often (but not always) considered to be *normalized*. Normalized integer values are treated specially when being converted to and from floating-point values, and are usually referred to as *normalized fixed-point*.

In the remainder of this section, *b* denotes the bit width of the fixed-point integer representation. When the integer is one of the types defined by the API, *b* is the bit width of that type. When the integer comes from an [image](#) containing color or depth component texels, *b* is the number of bits allocated to that component in its [specified image format](#).

The signed and unsigned fixed-point representations are assumed to be *b*-bit binary two's-complement integers and binary unsigned integers, respectively.

3.10.1. Conversion From Normalized Fixed-Point to Floating-Point

Unsigned normalized fixed-point integers represent numbers in the range [0,1]. The conversion from an unsigned normalized fixed-point value *c* to the corresponding floating-point value *f* is

defined as

$$f = \frac{c}{2^b - 1}$$

Signed normalized fixed-point integers represent numbers in the range [-1,1]. The conversion from a signed normalized fixed-point value c to the corresponding floating-point value f is performed using

$$f = \max\left(\frac{c}{2^{b-1} - 1}, -1.0\right)$$

Only the range $[-2^{b-1} + 1, 2^{b-1} - 1]$ is used to represent signed fixed-point values in the range [-1,1]. For example, if $b = 8$, then the integer value -127 corresponds to -1.0 and the value 127 corresponds to 1.0. This equation is used everywhere that signed normalized fixed-point values are converted to floating-point.

Note that while zero is exactly expressible in this representation, one value (-128 in the example) is outside the representable range, and implementations **must** clamp it to -1.0. Where the value is subject to further processing by the implementation, e.g. during texture filtering, values less than -1.0 **may** be used but the result **must** be clamped before the value is returned to shaders.

3.10.2. Conversion From Floating-Point to Normalized Fixed-Point

The conversion from a floating-point value f to the corresponding unsigned normalized fixed-point value c is defined by first clamping f to the range [0,1], then computing

$$c = \text{convertFloatToUint}(f \times (2^b - 1), b)$$

where $\text{convertFloatToUint}(r, b)$ returns one of the two unsigned binary integer values with exactly b bits which are closest to the floating-point value r . Implementations **should** round to nearest. If r is equal to an integer, then that integer value **must** be returned. In particular, if f is equal to 0.0 or 1.0, then c **must** be assigned 0 or $2^b - 1$, respectively.

The conversion from a floating-point value f to the corresponding signed normalized fixed-point value c is performed by clamping f to the range [-1,1], then computing

$$c = \text{convertFloatToInt}(f \times (2^{b-1} - 1), b)$$

where $\text{convertFloatToInt}(r, b)$ returns one of the two signed two's-complement binary integer values with exactly b bits which are closest to the floating-point value r . Implementations **should** round to nearest. If r is equal to an integer, then that integer value **must** be returned. In particular, if f is equal to -1.0, 0.0, or 1.0, then c **must** be assigned $-(2^{b-1} - 1)$, 0, or $2^{b-1} - 1$, respectively.

This equation is used everywhere that floating-point values are converted to signed normalized fixed-point.

3.11. String Representation

Strings passed into and returned from Vulkan API commands are usually defined to be null-terminated and UTF-8 encoded.

NOTE

Exceptions to this rule exist only when strings are defined or used by operating system APIs where that OS has a different convention. For example, `VkExportMemoryWin32HandleInfoKHR::name` is a null-terminated UTF-16 encoded string used in conjunction with Windows handles.

When a UTF-8 string is **returned from** a Vulkan API query, it is returned in a fixed-length buffer of C `char`. For example, a string returned in `VkPhysicalDeviceProperties::deviceName` has maximum length `VK_MAX_PHYSICAL_DEVICE_NAME_SIZE`, and a string returned in `VkExtensionProperties::extensionName` has maximum length `VK_MAX_EXTENSION_NAME_SIZE`. The string, **including** its null terminator, will always fit completely within this buffer. If the string is shorter than the buffer size, the contents of `char` in the buffer following the null terminator are undefined.

When a UTF-8 string is **passed into** a Vulkan API, such as `VkDeviceCreateInfo::ppEnabledExtensionNames`, there is no explicit limit on the length of that string. However, the string **must** contain a valid UTF-8 encoded string and **must** be null-terminated.

3.12. Common Object Types

Some types of Vulkan objects are used in many different structures and command parameters, and are described here. These types include *offsets*, *extents*, and *rectangles*.

3.12.1. Offsets

Offsets are used to describe a pixel location within an image or framebuffer, as an (x,y) location for two-dimensional images, or an (x,y,z) location for three-dimensional images.

A two-dimensional offset is defined by the structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkOffset2D {
    int32_t    x;
    int32_t    y;
} VkOffset2D;
```

- `x` is the x offset.
- `y` is the y offset.

A three-dimensional offset is defined by the structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkOffset3D {
    int32_t    x;
    int32_t    y;
    int32_t    z;
} VkOffset3D;
```

- **x** is the x offset.
- **y** is the y offset.
- **z** is the z offset.

3.12.2. Extents

Extents are used to describe the size of a rectangular region of pixels within an image or framebuffer, as (width,height) for two-dimensional images, or as (width,height,depth) for three-dimensional images.

A two-dimensional extent is defined by the structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkExtent2D {
    uint32_t    width;
    uint32_t    height;
} VkExtent2D;
```

- **width** is the width of the extent.
- **height** is the height of the extent.

A three-dimensional extent is defined by the structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkExtent3D {
    uint32_t    width;
    uint32_t    height;
    uint32_t    depth;
} VkExtent3D;
```

- **width** is the width of the extent.
- **height** is the height of the extent.
- **depth** is the depth of the extent.

3.12.3. Rectangles

Rectangles are used to describe a specified rectangular region of pixels within an image or framebuffer. Rectangles include both an offset and an extent of the same dimensionality, as

described above. Two-dimensional rectangles are defined by the structure

```
// Provided by VK_VERSION_1_0
typedef struct VkRect2D {
    VkOffset2D    offset;
    VkExtent2D    extent;
} VkRect2D;
```

- `offset` is a `VkOffset2D` specifying the rectangle offset.
- `extent` is a `VkExtent2D` specifying the rectangle extent.

3.12.4. Structure Types

Each value corresponds to a particular structure with a `sType` member with a matching name. As a general rule, the name of each `VkStructureType` value is obtained by taking the name of the structure, stripping the leading `Vk`, prefixing each capital letter with `_`, converting the entire resulting string to upper case, and prefixing it with `VK_STRUCTURE_TYPE_`. For example, structures of type `VkImageCreateInfo` correspond to a `VkStructureType` value of `VK_STRUCTURE_TYPE_IMAGE_CREATE_INFO`, and thus a structure of this type **must** have its `sType` member set to this value before it is passed to the API.

The values `VK_STRUCTURE_TYPE_LOADER_INSTANCE_CREATE_INFO` and `VK_STRUCTURE_TYPE_LOADER_DEVICE_CREATE_INFO` are reserved for internal use by the loader, and do not have corresponding Vulkan structures in this Specification.

Structure types supported by the Vulkan API include:

```
// Provided by VK_VERSION_1_0
typedef enum VkStructureType {
    VK_STRUCTURE_TYPE_APPLICATION_INFO = 0,
    VK_STRUCTURE_TYPE_INSTANCE_CREATE_INFO = 1,
    VK_STRUCTURE_TYPE_DEVICE_QUEUE_CREATE_INFO = 2,
    VK_STRUCTURE_TYPE_DEVICE_CREATE_INFO = 3,
    VK_STRUCTURE_TYPE_SUBMIT_INFO = 4,
    VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_INFO = 5,
    VK_STRUCTURE_TYPE_MAPPED_MEMORY_RANGE = 6,
    VK_STRUCTURE_TYPE_FENCE_CREATE_INFO = 8,
    VK_STRUCTURE_TYPE_SEMAPHORE_CREATE_INFO = 9,
    VK_STRUCTURE_TYPE_EVENT_CREATE_INFO = 10,
    VK_STRUCTURE_TYPE_QUERY_POOL_CREATE_INFO = 11,
    VK_STRUCTURE_TYPE_BUFFER_CREATE_INFO = 12,
    VK_STRUCTURE_TYPE_BUFFER_VIEW_CREATE_INFO = 13,
    VK_STRUCTURE_TYPE_IMAGE_CREATE_INFO = 14,
    VK_STRUCTURE_TYPE_IMAGE_VIEW_CREATE_INFO = 15,
    VK_STRUCTURE_TYPE_PIPELINE_CACHE_CREATE_INFO = 17,
    VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_CREATE_INFO = 18,
    VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_STATE_CREATE_INFO = 19,
    VK_STRUCTURE_TYPE_PIPELINE_INPUT_ASSEMBLY_STATE_CREATE_INFO = 20,
```

```

VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_STATE_CREATE_INFO = 21,
VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_STATE_CREATE_INFO = 22,
VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_CREATE_INFO = 23,
VK_STRUCTURE_TYPE_PIPELINE_MULTISAMPLE_STATE_CREATE_INFO = 24,
VK_STRUCTURE_TYPE_PIPELINE_DEPTH_STENCIL_STATE_CREATE_INFO = 25,
VK_STRUCTURE_TYPE_PIPELINE_COLOR_BLEND_STATE_CREATE_INFO = 26,
VK_STRUCTURE_TYPE_PIPELINE_DYNAMIC_STATE_CREATE_INFO = 27,
VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_CREATE_INFO = 28,
VK_STRUCTURE_TYPE_COMPUTE_PIPELINE_CREATE_INFO = 29,
VK_STRUCTURE_TYPE_PIPELINE_LAYOUT_CREATE_INFO = 30,
VK_STRUCTURE_TYPE_SAMPLER_CREATE_INFO = 31,
VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO = 32,
VK_STRUCTURE_TYPE_DESCRIPTOR_POOL_CREATE_INFO = 33,
VK_STRUCTURE_TYPE_DESCRIPTOR_SET_ALLOCATE_INFO = 34,
VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET = 35,
VK_STRUCTURE_TYPE_COPY_DESCRIPTOR_SET = 36,
VK_STRUCTURE_TYPE_FRAMEBUFFER_CREATE_INFO = 37,
VK_STRUCTURE_TYPE_RENDER_PASS_CREATE_INFO = 38,
VK_STRUCTURE_TYPE_COMMAND_POOL_CREATE_INFO = 39,
VK_STRUCTURE_TYPE_COMMAND_BUFFER_ALLOCATE_INFO = 40,
VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_INFO = 41,
VK_STRUCTURE_TYPE_COMMAND_BUFFER_BEGIN_INFO = 42,
VK_STRUCTURE_TYPE_RENDER_PASS_BEGIN_INFO = 43,
VK_STRUCTURE_TYPE_BUFFER_MEMORY_BARRIER = 44,
VK_STRUCTURE_TYPE_IMAGE_MEMORY_BARRIER = 45,
VK_STRUCTURE_TYPE_MEMORY_BARRIER = 46,
VK_STRUCTURE_TYPE_LOADER_INSTANCE_CREATE_INFO = 47,
VK_STRUCTURE_TYPE_LOADER_DEVICE_CREATE_INFO = 48,
// Provided by VK_VERSION_1_1
VK_STRUCTURE_TYPE_BIND_BUFFER_MEMORY_INFO = 1000157000,
// Provided by VK_VERSION_1_1

3.13. API Name Aliases

A small number of APIs did not follow the [naming conventions](#) when initially defined. For consistency, when we discover an API name that violates the naming conventions, we rename it in the Specification, XML, and header files. For backwards compatibility, the original (incorrect) name is retained as a “typo alias”. The alias is legacy and should not be used, but will be retained indefinitely.

NOTE

`VK_STENCIL_FRONT_AND_BACK` is an example of a *typo alias*. It was initially defined as part of `VkStencilFaceFlagBits`. Once the naming inconsistency was noticed, it was renamed to `VK_STENCIL_FACE_FRONT_AND_BACK`, and the old name was aliased to the correct name.

Chapter 4. Initialization

Before using Vulkan, an application **must** initialize it by loading the Vulkan commands, and creating a `VkInstance` object.

4.1. Command Function Pointers

Vulkan commands are not necessarily exposed by static linking on a platform. Commands to query function pointers for Vulkan commands are described below.

NOTE

When extensions are [promoted](#) or otherwise incorporated into another extension or Vulkan core version, command [aliases](#) may be included. Whilst the behavior of each command alias is identical, the behavior of retrieving each alias's function pointer is not. A function pointer for a given alias can only be retrieved if the extension or version that introduced that alias is supported and enabled, irrespective of whether any other alias is available.

Function pointers for all Vulkan commands **can** be obtained by calling:

```
// Provided by VK_VERSION_1_0
PFN_vkVoidFunction vkGetInstanceProcAddr(
    VkInstance          instance,
    const char*         pName);
```

- `instance` is the instance that the function pointer will be compatible with, or `NULL` for commands not dependent on any instance.
- `pName` is the name of the command to obtain.

`vkGetInstanceProcAddr` itself is obtained in a platform- and loader- specific manner. Typically, the loader library will export this command as a function symbol, so applications **can** link against the loader library, or load it dynamically and look up the symbol using platform-specific APIs.

The table below defines the various use cases for `vkGetInstanceProcAddr` and expected return value (“fp” is “function pointer”) for each case. A valid returned function pointer (“fp”) **must** not be `NULL`.

The returned function pointer is of type `PFN_vkVoidFunction`, and **must** be cast to the type of the command being queried before use.

Table 2. `vkGetInstanceProcAddr` behavior

<code>instance</code>	<code>pName</code>	return value
* ¹	<code>NULL</code>	undefined
invalid non- <code>NULL</code> instance	* ¹	undefined
<code>NULL</code>	<i>global command</i> ²	fp
<code>NULL</code>	<code>vkGetInstanceProcAddr</code>	fp ⁵

instance	pName	return value
instance	vkGetInstanceProcAddr	fp
instance	core <i>dispatchable command</i>	fp ³
instance	enabled instance extension dispatchable command for instance	fp ³
instance	available device extension ⁴ dispatchable command for instance	fp ³
any other case, not covered above		NULL

1

"*" means any representable value for the parameter (including valid values, invalid values, and **NULL**).

2

The global commands are: [vkEnumerateInstanceVersion](#), [vkEnumerateInstanceExtensionProperties](#), [vkEnumerateInstanceLayerProperties](#), and [vkCreateInstance](#). Dispatchable commands are all other commands which are not global.

3

The returned function pointer **must** only be called with a dispatchable object (the first parameter) that is **instance** or a child of **instance**, e.g. [VkInstance](#), [VkPhysicalDevice](#), [VkDevice](#), [VkQueue](#), or [VkCommandBuffer](#).

4

An “available device extension” is a device extension supported by any physical device enumerated by **instance**.

5

[vkGetInstanceProcAddr](#) can resolve itself with a **NULL** instance pointer.

Valid Usage (Implicit)

- VUID-vkGetInstanceProcAddr-instance-parameter
If **instance** is not **NULL**, **instance** **must** be a valid [VkInstance](#) handle
- VUID-vkGetInstanceProcAddr-pName-parameter
pName **must** be a null-terminated UTF-8 string

In order to support systems with multiple Vulkan implementations, the function pointers returned by [vkGetInstanceProcAddr](#) **may** point to dispatch code that calls a different real implementation for different [VkDevice](#) objects or their child objects. The overhead of the internal dispatch for [VkDevice](#) objects can be avoided by obtaining device-specific function pointers for any commands that use a

device or device-child object as their dispatchable object. Such function pointers **can** be obtained by calling:

```
// Provided by VK_VERSION_1_0
PFN_vkVoidFunction vkGetDeviceProcAddr(
    VkDevice          device,
    const char*       pName);
```

The table below defines the various use cases for `vkGetDeviceProcAddr` and expected return value (“fp” is “function pointer”) for each case. A valid returned function pointer (“fp”) **must** not be `NULL`.

The returned function pointer is of type `PFN_vkVoidFunction`, and **must** be cast to the type of the command being queried before use. The function pointer **must** only be called with a dispatchable object (the first parameter) that is `device` or a child of `device`.

Table 3. `vkGetDeviceProcAddr` behavior

device	pName	return value
<code>NULL</code>	* ¹	undefined
invalid device	* ¹	undefined
device	<code>NULL</code>	undefined
device	requested core version ² device-level dispatchable command ³	fp ⁴
device	enabled extension device-level dispatchable command ³	fp ⁴
any other case, not covered above		<code>NULL</code>

1
“*” means any representable value for the parameter (including valid values, invalid values, and `NULL`).

2
Device-level commands which are part of the core version specified by `VkApplicationInfo::apiVersion` when creating the instance will always return a valid function pointer. Core commands beyond that version which are supported by the implementation **may** either return `NULL` or a function pointer. If a function pointer is returned, it **must** not be called.

3
In this function, device-level excludes all physical-device-level commands.

4
The returned function pointer **must** only be called with a dispatchable object (the first parameter) that is `device` or a child of `device` e.g. `VkDevice`, `VkQueue`, or `VkCommandBuffer`.

Valid Usage (Implicit)

- VUID-vkGetDeviceProcAddr-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkGetDeviceProcAddr-pName-parameter
pName **must** be a null-terminated UTF-8 string

The definition of [PFN_vkVoidFunction](#) is:

```
// Provided by VK_VERSION_1_0
typedef void (VKAPI_PTR *PFN_vkVoidFunction)(void);
```

This type is returned from command function pointer queries, and **must** be cast to an actual command function pointer before use.

4.1.1. Extending Physical Device Core Functionality

New core physical-device-level functionality **can** be used when both [VkPhysicalDeviceProperties::apiVersion](#) and [VkApplicationInfo::apiVersion](#) are greater than or equal to the version of Vulkan that added the new functionality. The Vulkan version supported by a physical device **can** be obtained by calling [vkGetPhysicalDeviceProperties](#).

4.1.2. Extending Physical Device From Device Extensions

In Vulkan SC 1.0, physical-device-level functionality of a device extension **can** be used with a physical device if the corresponding extension is enumerated by [vkEnumerateDeviceExtensionProperties](#) for that physical device, even before a logical device has been created.

To obtain a function pointer for a physical-device-level command from a device extension, an application **can** use [vkGetInstanceProcAddr](#). This function pointer **may** point to dispatch code, which calls a different real implementation for different [VkPhysicalDevice](#) objects. Applications **must** not use a [VkPhysicalDevice](#) in any command added by an extension or core version that is not supported by that physical device.

Device extensions **may** define structures that **can** be added to the **pNext** chain of physical-device-level commands.

4.2. Instances

There is no global state in Vulkan and all per-application state is stored in a [VkInstance](#) object. Creating a [VkInstance](#) object initializes the Vulkan library and allows the application to pass information about itself to the implementation.

Instances are represented by [VkInstance](#) handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkInstance)
```

To query the version of instance-level functionality supported by the implementation, call:

```
// Provided by VK_VERSION_1_1
VkResult vkEnumerateInstanceVersion(
    uint32_t*                               pApiVersion);
```

- `pApiVersion` is a pointer to a `uint32_t`, which is the version of Vulkan supported by instance-level functionality, encoded as described in [Version Numbers](#).

NOTE

The intended behavior of `vkEnumerateInstanceVersion` is that an implementation **should** not need to perform memory allocations and **should** unconditionally return `VK_SUCCESS`. The loader, and any enabled layers, **may** return `VK_ERROR_OUT_OF_HOST_MEMORY` in the case of a failed memory allocation.

Valid Usage (Implicit)

- VUID-vkEnumerateInstanceVersion-pApiVersion-parameter `pApiVersion` **must** be a valid pointer to a `uint32_t` value

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

To create an instance object, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateInstance(
    const VkInstanceCreateInfo*   pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkInstance*                   pInstance);
```

- `pCreateInfo` is a pointer to a `VkInstanceCreateInfo` structure controlling creation of the instance.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

- `pInstance` points a `VkInstance` handle in which the resulting instance is returned.

`vkCreateInstance` verifies that the requested layers exist. If not, `vkCreateInstance` will return `VK_ERROR_LAYER_NOT_PRESENT`. Next `vkCreateInstance` verifies that the requested extensions are supported (e.g. in the implementation or in any enabled instance layer) and if any requested extension is not supported, `vkCreateInstance` **must** return `VK_ERROR_EXTENSION_NOT_PRESENT`. After verifying and enabling the instance layers and extensions the `VkInstance` object is created and returned to the application. If a requested extension is only supported by a layer, both the layer and the extension need to be specified at `vkCreateInstance` time for the creation to succeed.

Valid Usage

- VUID-vkCreateInstance-ppEnabledExtensionNames-01388

All **required extensions** for each extension in the `VkInstanceCreateInfo::ppEnabledExtensionNames` list **must** also be present in that list

Valid Usage (Implicit)

- VUID-vkCreateInstance-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkInstanceCreateInfo` structure
- VUID-vkCreateInstance-pAllocator-null
`pAllocator` **must** be `NULL`
- VUID-vkCreateInstance-pInstance-parameter
`pInstance` **must** be a valid pointer to a `VkInstance` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_EXTENSION_NOT_PRESENT`
- `VK_ERROR_INCOMPATIBLE_DRIVER`
- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_LAYER_NOT_PRESENT`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkInstanceCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkInstanceCreateInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkInstanceCreateFlags flags;
    const VkApplicationInfo* pApplicationInfo;
    uint32_t             enabledLayerCount;
    const char* const*   ppEnabledLayerNames;
    uint32_t             enabledExtensionCount;
    const char* const*   ppEnabledExtensionNames;
} VkInstanceCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkInstanceCreateFlagBits` indicating the behavior of the instance.
- `pApplicationInfo` is `NULL` or a pointer to a `VkApplicationInfo` structure. If not `NULL`, this information helps implementations recognize behavior inherent to classes of applications. `VkApplicationInfo` is defined in detail below.
- `enabledLayerCount` is the number of global layers to enable.
- `ppEnabledLayerNames` is a pointer to an array of `enabledLayerCount` null-terminated UTF-8 strings containing the names of layers to enable for the created instance. The layers are loaded in the order they are listed in this array, with the first array element being the closest to the application, and the last array element being the closest to the driver. See the [Layers](#) section for further details.
- `enabledExtensionCount` is the number of global extensions to enable.
- `ppEnabledExtensionNames` is a pointer to an array of `enabledExtensionCount` null-terminated UTF-8 strings containing the names of extensions to enable.

To capture events that occur while creating or destroying an instance, an application **can** link a `VkDebugUtilsMessengerCreateInfoEXT` structure to the `pNext` chain of the `VkInstanceCreateInfo` structure passed to `vkCreateInstance`. This callback is only valid for the duration of the `vkCreateInstance` and the `vkDestroyInstance` call. Use `vkCreateDebugUtilsMessengerEXT` to create persistent callback objects.

Valid Usage

- VUID-VkInstanceCreateInfo-pNext-04926
If the `pNext` chain of `VkInstanceCreateInfo` includes a `VkDebugUtilsMessengerCreateInfoEXT` structure, the list of enabled extensions in `ppEnabledExtensionNames` **must** contain `VK_EXT_debug_utils`
- VUID-VkInstanceCreateInfo-pNext-10242
If the `pNext` chain of `VkInstanceCreateInfo` includes a `VkLayerSettingsCreateInfoEXT` structure, the list of enabled extensions in `ppEnabledExtensionNames` **must** contain `VK_EXT_layer_settings`

- VUID-VkInstanceCreateInfo-pNext-10243

If the `pNext` chain of `VkInstanceCreateInfo` includes a `VkValidationFeaturesEXT` structure, the list of enabled extensions in `ppEnabledExtensionNames` **must** contain `VK_EXT_validation_features`

Valid Usage (Implicit)

- VUID-VkInstanceCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_INSTANCE_CREATE_INFO`
- VUID-VkInstanceCreateInfo-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkDebugUtilsMessengerCreateInfoEXT`, `VkLayerSettingsCreateInfoEXT`, or `VkValidationFeaturesEXT`
- VUID-VkInstanceCreateInfo-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique, with the exception of structures of type `VkDebugUtilsMessengerCreateInfoEXT` or `VkLayerSettingsCreateInfoEXT`
- VUID-VkInstanceCreateInfo-flags-zero-bitmask
`flags` **must** be 0
- VUID-VkInstanceCreateInfo-pApplicationInfo-parameter
If `pApplicationInfo` is not `NULL`, `pApplicationInfo` **must** be a valid pointer to a valid `VkApplicationInfo` structure
- VUID-VkInstanceCreateInfo-ppEnabledLayerNames-parameter
If `enabledLayerCount` is not 0, `ppEnabledLayerNames` **must** be a valid pointer to an array of `enabledLayerCount` null-terminated UTF-8 strings
- VUID-VkInstanceCreateInfo-ppEnabledExtensionNames-parameter
If `enabledExtensionCount` is not 0, `ppEnabledExtensionNames` **must** be a valid pointer to an array of `enabledExtensionCount` null-terminated UTF-8 strings

```
// Provided by VK_VERSION_1_0
typedef enum VkInstanceCreateFlagBits {
} VkInstanceCreateFlagBits;
```

NOTE

All bits for this type are defined by extensions, and none of those extensions are enabled in this build of the specification.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkInstanceCreateFlags;
```

`VkInstanceCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

When creating a Vulkan instance for which you wish to enable or disable specific validation

features, add a [VkValidationFeaturesEXT](#) structure to the `pNext` chain of the [VkInstanceCreateInfo](#) structure, specifying the features to be enabled or disabled.

```
// Provided by VK_EXT_validation_features
typedef struct VkValidationFeaturesEXT {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           enabledValidationFeatureCount;
    const VkValidationFeatureEnableEXT* pEnabledValidationFeatures;
    uint32_t           disabledValidationFeatureCount;
    const VkValidationFeatureDisableEXT* pDisabledValidationFeatures;
} VkValidationFeaturesEXT;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `enabledValidationFeatureCount` is the number of features to enable.
- `pEnabledValidationFeatures` is a pointer to an array of [VkValidationFeatureEnableEXT](#) values specifying the validation features to be enabled.
- `disabledValidationFeatureCount` is the number of features to disable.
- `pDisabledValidationFeatures` is a pointer to an array of [VkValidationFeatureDisableEXT](#) values specifying the validation features to be disabled.

Valid Usage

- VUID-VkValidationFeaturesEXT-pEnabledValidationFeatures-02967

If the `pEnabledValidationFeatures` array contains `VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_RESERVE_BINDING_SLOT_EXT`, then it **must** also contain `VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT` or `VK_VALIDATION_FEATURE_ENABLE_DEBUG_PRINTF_EXT`

Valid Usage (Implicit)

- VUID-VkValidationFeaturesEXT-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_VALIDATION_FEATURES_EXT`

- VUID-VkValidationFeaturesEXT-pEnabledValidationFeatures-parameter

If `enabledValidationFeatureCount` is not 0, `pEnabledValidationFeatures` **must** be a valid pointer to an array of `enabledValidationFeatureCount` valid [VkValidationFeatureEnableEXT](#) values

- VUID-VkValidationFeaturesEXT-pDisabledValidationFeatures-parameter

If `disabledValidationFeatureCount` is not 0, `pDisabledValidationFeatures` **must** be a valid pointer to an array of `disabledValidationFeatureCount` valid [VkValidationFeatureDisableEXT](#) values

Possible values of elements of the `VkValidationFeaturesEXT::pEnabledValidationFeatures` array, specifying validation features to be enabled, are:

```
// Provided by VK_EXT_validation_features
typedef enum VkValidationFeatureEnableEXT {
    VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT = 0,
    VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_RESERVE_BINDING_SLOT_EXT = 1,
    VK_VALIDATION_FEATURE_ENABLE_BEST_PRACTICES_EXT = 2,
    VK_VALIDATION_FEATURE_ENABLE_DEBUG_PRINTF_EXT = 3,
    VK_VALIDATION_FEATURE_ENABLE_SYNCHRONIZATION_VALIDATION_EXT = 4,
} VkValidationFeatureEnableEXT;
```

- `VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT` specifies that GPU-assisted validation is enabled. Activating this feature instruments shader programs to generate additional diagnostic data. This feature is disabled by default.
- `VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_RESERVE_BINDING_SLOT_EXT` specifies that the validation layers reserve a descriptor set binding slot for their own use. The layer reports a value for `VkPhysicalDeviceLimits::maxBoundDescriptorSets` that is one less than the value reported by the device. If the device supports the binding of only one descriptor set, the validation layer does not perform GPU-assisted validation. This feature is disabled by default.
- `VK_VALIDATION_FEATURE_ENABLE_BEST_PRACTICES_EXT` specifies that Vulkan best-practices validation is enabled. Activating this feature enables the output of warnings related to common misuse of the API, but which are not explicitly prohibited by the specification. This feature is disabled by default.
- `VK_VALIDATION_FEATURE_ENABLE_DEBUG_PRINTF_EXT` specifies that the layers will process `debugPrintfEXT` operations in shaders and send the resulting output to the debug callback. This feature is disabled by default.
- `VK_VALIDATION_FEATURE_ENABLE_SYNCHRONIZATION_VALIDATION_EXT` specifies that Vulkan synchronization validation is enabled. This feature reports resource access conflicts due to missing or incorrect synchronization operations between actions (Draw, Copy, Dispatch, Blit) reading or writing the same regions of memory. This feature is disabled by default.

Possible values of elements of the `VkValidationFeaturesEXT::pDisabledValidationFeatures` array, specifying validation features to be disabled, are:

```
// Provided by VK_EXT_validation_features
typedef enum VkValidationFeatureDisableEXT {
    VK_VALIDATION_FEATURE_DISABLE_ALL_EXT = 0,
    VK_VALIDATION_FEATURE_DISABLE_SHADERS_EXT = 1,
    VK_VALIDATION_FEATURE_DISABLE_THREAD_SAFETY_EXT = 2,
    VK_VALIDATION_FEATURE_DISABLE_API_PARAMETERS_EXT = 3,
    VK_VALIDATION_FEATURE_DISABLE_OBJECT_LIFETIMES_EXT = 4,
    VK_VALIDATION_FEATURE_DISABLE_CORE_CHECKS_EXT = 5,
    VK_VALIDATION_FEATURE_DISABLE_UNIQUE_HANDLES_EXT = 6,
    VK_VALIDATION_FEATURE_DISABLE_SHADER_VALIDATION_CACHE_EXT = 7,
} VkValidationFeatureDisableEXT;
```

- **VK_VALIDATION_FEATURE_DISABLE_ALL_EXT** specifies that all validation checks are disabled.
- **VK_VALIDATION_FEATURE_DISABLE_SHADERS_EXT** specifies that shader validation, both runtime and standalone, is disabled. This validation occurs inside **VkShaderModuleCreateInfo**. This feature is enabled by default.
- **VK_VALIDATION_FEATURE_DISABLE_THREAD_SAFETY_EXT** specifies that thread safety validation is disabled. This feature is enabled by default.
- **VK_VALIDATION_FEATURE_DISABLE_API_PARAMETERS_EXT** specifies that stateless parameter validation is disabled. This feature is enabled by default.
- **VK_VALIDATION_FEATURE_DISABLE_OBJECT_LIFETIMES_EXT** specifies that object lifetime validation is disabled. This feature is enabled by default.
- **VK_VALIDATION_FEATURE_DISABLE_CORE_CHECKS_EXT** specifies that core validation checks are disabled. This feature is enabled by default. If this feature is disabled, **VK_VALIDATION_FEATURE_DISABLE_SHADERS_EXT** is implied.
- **VK_VALIDATION_FEATURE_DISABLE_UNIQUE_HANDLES_EXT** specifies that protection against duplicate non-dispatchable object handles is disabled. This feature is enabled by default.
- **VK_VALIDATION_FEATURE_DISABLE_SHADER_VALIDATION_CACHE_EXT** specifies that there will be no caching of shader validation results and every shader will be validated on every application execution. Shader validation caching is enabled by default.

NOTE

Disabling checks such as parameter validation and object lifetime validation prevents the reporting of error conditions that can cause other validation checks to behave incorrectly or crash. Some validation checks assume that their inputs are already valid and do not always revalidate them.

To create a Vulkan instance with a specific configuration of layer settings, add **VkLayerSettingsCreateInfoEXT** structures to the **pNext** chain of the **VkInstanceCreateInfo** structure, specifying the settings to be configured.

```
// Provided by VK_EXT_layer_settings
typedef struct VkLayerSettingsCreateInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    uint32_t             settingCount;
    const VkLayerSettingEXT* pSettings;
} VkLayerSettingsCreateInfoEXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **settingCount** is the number of settings to configure.
- **pSettings** is a pointer to an array of **settingCount** [VkLayerSettingEXT](#) values specifying the settings to be configured.

Valid Usage (Implicit)

- VUID-VkLayerSettingsCreateInfoEXT-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_LAYER_SETTINGS_CREATE_INFO_EXT**
- VUID-VkLayerSettingsCreateInfoEXT-pSettings-parameter
If **settingCount** is not 0, **pSettings** **must** be a valid pointer to an array of **settingCount** valid [VkLayerSettingEXT](#) structures

The values of elements of the [VkLayerSettingsCreateInfoEXT::pSettings](#) array, specifying layer settings to be configured, are:

```
// Provided by VK_EXT_layer_settings
typedef struct VkLayerSettingEXT {
    const char*      pLayerName;
    const char*      pSettingName;
    VkLayerSettingTypeEXT type;
    uint32_t         valueCount;
    const void*      pValues;
} VkLayerSettingEXT;
```

- **pLayerName** is a pointer to a null-terminated UTF-8 string naming the layer to configure the setting from.
- **pSettingName** is a pointer to a null-terminated UTF-8 string naming the setting to configure. Values of **pSettingName** that are unknown to the layer are ignored.
- **type** is a [VkLayerSettingTypeEXT](#) value specifying the type of the **pValues** values.
- **valueCount** is the number of values used to configure the layer setting.
- **pValues** is a pointer to an array of **valueCount** values of the type indicated by **type** to configure the layer setting.

When multiple `VkLayerSettingsCreateInfoEXT` structures are chained and the same `pSettingName` is referenced for the same `pLayerName`, the value of the first reference of the layer setting is used.

Valid Usage

- VUID-VkLayerSettingEXT-valueCount-10070

If `valueCount` is not 0, `pValues` **must** be a valid pointer to an array of `valueCount` values of the type indicated by `type`

Valid Usage (Implicit)

- VUID-VkLayerSettingEXT-pLayerName-parameter
`pLayerName` **must** be a null-terminated UTF-8 string
- VUID-VkLayerSettingEXT-pSettingName-parameter
`pSettingName` **must** be a null-terminated UTF-8 string
- VUID-VkLayerSettingEXT-type-parameter
`type` **must** be a valid `VkLayerSettingTypeEXT` value

Possible values of `VkLayerSettingEXT::type`, specifying the type of the data returned in `VkLayerSettingEXT::pValues`, are:

```
// Provided by VK_EXT_layer_settings
typedef enum VkLayerSettingTypeEXT {
    VK_LAYER_SETTING_TYPE_BOOL32_EXT = 0,
    VK_LAYER_SETTING_TYPE_INT32_EXT = 1,
    VK_LAYER_SETTING_TYPE_INT64_EXT = 2,
    VK_LAYER_SETTING_TYPE_UINT32_EXT = 3,
    VK_LAYER_SETTING_TYPE_UINT64_EXT = 4,
    VK_LAYER_SETTING_TYPE_FLOAT32_EXT = 5,
    VK_LAYER_SETTING_TYPE_FLOAT64_EXT = 6,
    VK_LAYER_SETTING_TYPE_STRING_EXT = 7,
} VkLayerSettingTypeEXT;
```

- `VK_LAYER_SETTING_TYPE_BOOL32_EXT` specifies that the layer setting's type is `VkBool32`.
- `VK_LAYER_SETTING_TYPE_INT32_EXT` specifies that the layer setting's type is signed 32-bit integer.
- `VK_LAYER_SETTING_TYPE_INT64_EXT` specifies that the layer setting's type is signed 64-bit integer.
- `VK_LAYER_SETTING_TYPE_UINT32_EXT` specifies that the layer setting's type is unsigned 32-bit integer.
- `VK_LAYER_SETTING_TYPE_UINT64_EXT` specifies that the layer setting's type is unsigned 64-bit integer.
- `VK_LAYER_SETTING_TYPE_FLOAT32_EXT` specifies that the layer setting's type is 32-bit floating-point.
- `VK_LAYER_SETTING_TYPE_FLOAT64_EXT` specifies that the layer setting's type is 64-bit floating-point.

- `VK_LAYER_SETTING_TYPE_STRING_EXT` specifies that the layer setting's type is a pointer to a null-terminated UTF-8 string.

The `VkApplicationInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkApplicationInfo {
    VkStructureType    sType;
    const void*        pNext;
    const char*        pApplicationName;
    uint32_t           applicationVersion;
    const char*        pEngineName;
    uint32_t           engineVersion;
    uint32_t           apiVersion;
} VkApplicationInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pApplicationName` is `NULL` or is a pointer to a null-terminated UTF-8 string containing the name of the application.
- `applicationVersion` is an unsigned integer variable containing the developer-supplied version number of the application.
- `pEngineName` is `NULL` or is a pointer to a null-terminated UTF-8 string containing the name of the engine (if any) used to create the application.
- `engineVersion` is an unsigned integer variable containing the developer-supplied version number of the engine used to create the application.
- `apiVersion` **must** be the highest version of Vulkan that the application is designed to use, encoded as described in [Version Numbers](#). The patch version number specified in `apiVersion` is ignored when creating an instance object. The variant version of the instance **must** match that requested in `apiVersion`.

Vulkan 1.0 implementations were required to return `VK_ERROR_INCOMPATIBLE_DRIVER` if `apiVersion` was larger than 1.0. Implementations that support Vulkan 1.1 or later **must** not return `VK_ERROR_INCOMPATIBLE_DRIVER` for any value of `apiVersion`, unless an incompatible variant is requested.

NOTE	Vulkan SC 1.0 is based on Vulkan 1.2 and thus instance creation may only fail with <code>VK_ERROR_INCOMPATIBLE_DRIVER</code> if an incompatible variant is requested - that is if the Vulkan SC API is requested from a Vulkan implementation or if the Vulkan API is requested from a Vulkan SC implementation.
NOTE	Providing a <code>NULL</code> <code>VkInstanceCreateInfo::pApplicationInfo</code> or providing an <code>apiVersion</code> of 0 is equivalent to providing an <code>apiVersion</code> of <code>VK_MAKE_API_VERSION(1,1,0,0)</code> .

To provide *application parameters* at instance creation time, an application **can** link one or more

`VkApplicationParametersEXT` structures to the `pNext` chain of the `VkApplicationInfo` structure.

If `VkApplicationParametersEXT::vendorID` does not correspond to an ICD that is currently available, or if `VkApplicationParametersEXT::deviceID` is not `0` and does not correspond to a physical device that is available on the system, `vkCreateInstance` will fail and return `VK_ERROR_INCOMPATIBLE_DRIVER`. If `VkApplicationParametersEXT::deviceID` is `0`, the application parameter applies to all physical devices supported by the ICD identified by `VkApplicationParametersEXT::vendorID`.

If `VkApplicationParametersEXT::key` is not a valid implementation-defined application parameter key for the instance being created with `vendorID`, or if `value` is not a valid value for the specified `key`, `vkCreateInstance` will fail and return `VK_ERROR_INITIALIZATION_FAILED`.

For any implementation-defined application parameter `key` that exists but is not set by the application, the implementation-specific default value is used.

Valid Usage

- VUID-VkApplicationInfo-apiVersion-05021
If `apiVersion` is not `0` and its variant is `VKSC_API_VARIANT`, then it **must** be greater than or equal to `VKSC_API_VERSION_1_0`
- VUID-VkApplicationInfo-key-05093
The `key` value of each `VkApplicationParametersEXT` structure in the `VkApplicationInfo::pNext` chain **must** be unique for each `vendorID` and `deviceID` pairing

Valid Usage (Implicit)

- VUID-VkApplicationInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_APPLICATION_INFO`
- VUID-VkApplicationInfo-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkApplicationParametersEXT`
- VUID-VkApplicationInfo-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique, with the exception of structures of type `VkApplicationParametersEXT`
- VUID-VkApplicationInfo-pApplicationName-parameter
If `pApplicationName` is not `NULL`, `pApplicationName` **must** be a null-terminated UTF-8 string
- VUID-VkApplicationInfo-pEngineName-parameter
If `pEngineName` is not `NULL`, `pEngineName` **must** be a null-terminated UTF-8 string

The `VkApplicationParametersEXT` structure is defined as:

```
// Provided by VK_EXT_application_parameters
typedef struct VkApplicationParametersEXT {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           vendorID;
    uint32_t           deviceID;
    uint32_t           key;
    uint64_t           value;
} VkApplicationParametersEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `vendorID` is the `VkPhysicalDeviceProperties::vendorID` of the ICD that the application parameter is applied to.
- `deviceID` is `0` or the `VkPhysicalDeviceProperties::deviceID` of the physical device that the application parameter is applied to.
- `key` is a 32-bit vendor-specific enumerant identifying the application parameter that is being set.
- `value` is the 64-bit value that is being set for the application parameter specified by `key`.

Valid Usage (Implicit)

- VUID-VkApplicationParametersEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_APPLICATION_PARAMETERS_EXT`

To destroy an instance, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyInstance(
    VkInstance          instance,
    const VkAllocationCallbacks* pAllocator);
```

- `instance` is the handle of the instance to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

Prior to destroying an instance, an application is responsible for destroying/freeing any Vulkan objects with explicit `vkDestroy*` or `vkFree*` commands that were created using that instance, or any `VkPhysicalDevice` object retrieved from it, as the first parameter of the corresponding `vkCreate*` or `vkAllocate*` command.

Valid Usage

- VUID-vkDestroyInstance-instance-00629
All child objects that were created with `instance` or with a `VkPhysicalDevice` retrieved

from it, and that **can** be destroyed or freed, **must** have been destroyed or freed prior to destroying **instance**

Valid Usage (Implicit)

- VUID-vkDestroyInstance-instance-parameter
If **instance** is not **NULL**, **instance** **must** be a valid **VkInstance** handle
- VUID-vkDestroyInstance-pAllocator-null
pAllocator **must** be **NULL**

Host Synchronization

- Host access to **instance** **must** be externally synchronized
- Host access to all **VkPhysicalDevice** objects enumerated from **instance** **must** be externally synchronized

Chapter 5. Devices and Queues

Once Vulkan is initialized, devices and queues are the primary objects used to interact with a Vulkan implementation.

Vulkan separates the concept of *physical* and *logical* devices. A physical device usually represents a single complete implementation of Vulkan (excluding instance-level functionality) available to the host, of which there are a finite number. A logical device represents an instance of that implementation with its own state and resources independent of other logical devices.

Physical devices **cannot** be independently destroyed, and are instead destroyed with the [VkInstance](#) that they were retrieved from.

Physical devices are represented by [VkPhysicalDevice](#) handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkPhysicalDevice)
```

5.1. Physical Devices

To retrieve a list of physical device objects representing the physical devices installed in the system, call:

```
// Provided by VK_VERSION_1_0
VkResult vkEnumeratePhysicalDevices(
    VkInstance          instance,
    uint32_t*           pPhysicalDeviceCount,
    VkPhysicalDevice*   pPhysicalDevices);
```

- [instance](#) is a handle to a Vulkan instance previously created with [vkCreateInstance](#).
- [pPhysicalDeviceCount](#) is a pointer to an integer related to the number of physical devices available or queried, as described below.
- [pPhysicalDevices](#) is either [NULL](#) or a pointer to an array of [VkPhysicalDevice](#) handles.

If [pPhysicalDevices](#) is [NULL](#), then the number of physical devices available is returned in [pPhysicalDeviceCount](#). Otherwise, [pPhysicalDeviceCount](#) **must** point to a variable set by the application to the number of elements in the [pPhysicalDevices](#) array, and on return the variable is overwritten with the number of handles actually written to [pPhysicalDevices](#). If [pPhysicalDeviceCount](#) is less than the number of physical devices available, at most [pPhysicalDeviceCount](#) structures will be written, and [VK_INCOMPLETE](#) will be returned instead of [VK_SUCCESS](#), to indicate that not all the available physical devices were returned.

Valid Usage (Implicit)

- VUID-vkEnumeratePhysicalDevices-instance-parameter

`instance` **must** be a valid [VkInstance](#) handle

- VUID-vkEnumeratePhysicalDevices-pPhysicalDeviceCount-parameter

`pPhysicalDeviceCount` **must** be a valid pointer to a `uint32_t` value

- VUID-vkEnumeratePhysicalDevices-pPhysicalDevices-parameter

If the value referenced by `pPhysicalDeviceCount` is not `0`, and `pPhysicalDevices` is not `NULL`, `pPhysicalDevices` **must** be a valid pointer to an array of `pPhysicalDeviceCount` [VkPhysicalDevice](#) handles

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

To query general properties of physical devices once enumerated, call:

WARNING

This functionality is superseded by [Vulkan Version 1.1](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceProperties(
    VkPhysicalDevice          physicalDevice,
    VkPhysicalDeviceProperties* pProperties);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pProperties` is a pointer to a [VkPhysicalDeviceProperties](#) structure in which properties are returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceProperties-physicalDevice-parameter

`physicalDevice` **must** be a valid [VkPhysicalDevice](#) handle

- VUID-vkGetPhysicalDeviceProperties-pProperties-parameter

`pProperties` **must** be a valid pointer to a [VkPhysicalDeviceProperties](#) structure

The `VkPhysicalDeviceProperties` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceProperties {
    uint32_t          apiVersion;
    uint32_t          driverVersion;
    uint32_t          vendorID;
    uint32_t          deviceID;
    VkPhysicalDeviceType deviceType;
    char              deviceName[VK_MAX_PHYSICAL_DEVICE_NAME_SIZE];
    uint8_t           pipelineCacheUUID[VK_UUID_SIZE];
    VkPhysicalDeviceLimits limits;
    VkPhysicalDeviceSparseProperties sparseProperties;
} VkPhysicalDeviceProperties;
```

- `apiVersion` is the version of Vulkan supported by the device, encoded as described in [Version Numbers](#).
- `driverVersion` is the vendor-specified version of the driver.
- `vendorID` is a unique identifier for the *vendor* (see below) of the physical device.
- `deviceID` is a unique identifier for the physical device among devices available from the vendor.
- `deviceType` is a [VkPhysicalDeviceType](#) specifying the type of device.
- `deviceName` is an array of `VK_MAX_PHYSICAL_DEVICE_NAME_SIZE` `char` containing a null-terminated UTF-8 string which is the name of the device.
- `pipelineCacheUUID` is an array of `VK_UUID_SIZE` `uint8_t` values representing a universally unique identifier for the device.
- `limits` is the [VkPhysicalDeviceLimits](#) structure specifying device-specific limits of the physical device. See [Limits](#) for details.
- `sparseProperties` is the [VkPhysicalDeviceSparseProperties](#) structure specifying various sparse related properties of the physical device. See [Sparse Properties](#) for details.

NOTE The value of `apiVersion` **may** be different than the version returned by [vkEnumerateInstanceVersion](#); either higher or lower. In such cases, the application **must** not use functionality that exceeds the version of Vulkan associated with a given object. The `pApiVersion` parameter returned by [vkEnumerateInstanceVersion](#) is the version associated with a [VkInstance](#) and its children, except for a [VkPhysicalDevice](#) and its children. `VkPhysicalDeviceProperties::apiVersion` is the version associated with a [VkPhysicalDevice](#) and its children.

NOTE The encoding of `driverVersion` is implementation-defined. It **may** not use the same encoding as `apiVersion`. Applications should follow information from the *vendor* on how to extract the version information from `driverVersion`.

The `vendorID` and `deviceID` fields are provided to allow applications to adapt to device characteristics that are not adequately exposed by other Vulkan queries.

NOTE These **may** include performance profiles, hardware errata, or other characteristics.

The *vendor* identified by **vendorID** is the entity responsible for the most salient characteristics of the underlying implementation of the **VkPhysicalDevice** being queried.

NOTE For example, in the case of a discrete GPU implementation, this **should** be the GPU chipset vendor. In the case of a hardware accelerator integrated into a system-on-chip (SoC), this **should** be the supplier of the silicon IP used to create the accelerator.

If the vendor has a **PCI vendor ID**, the low 16 bits of **vendorID** **must** contain that PCI vendor ID, and the remaining bits **must** be zero. Otherwise, the value returned **must** be a valid Khronos vendor ID, obtained as described in the [Vulkan Documentation and Extensions: Procedures and Conventions](#) document in the section “Registering a Vendor ID with Khronos”. Khronos vendor IDs are allocated starting at 0x10000, to distinguish them from the PCI vendor ID namespace. Khronos vendor IDs are symbolically defined in the **VkVendorId** type.

The vendor is also responsible for the value returned in **deviceID**. If the implementation is driven primarily by a **PCI device** with a **PCI device ID**, the low 16 bits of **deviceID** **must** contain that PCI device ID, and the remaining bits **must** be zero. Otherwise, the choice of what values to return **may** be dictated by operating system or platform policies - but **should** uniquely identify both the device version and any major configuration options (for example, core count in the case of multicore devices).

NOTE The same device ID **should** be used for all physical implementations of that device version and configuration. For example, all uses of a specific silicon IP GPU version and configuration **should** use the same device ID, even if those uses occur in different SoCs.

Khronos vendor IDs which **may** be returned in **VkPhysicalDeviceProperties::vendorID** are:

```
// Provided by VK_VERSION_1_0
typedef enum VkVendorId {
    VK_VENDOR_ID_KHRONOS = 0x10000,
    VK_VENDOR_ID_VIV = 0x10001,
    VK_VENDOR_ID_VSI = 0x10002,
    VK_VENDOR_ID_KAZAN = 0x10003,
    VK_VENDOR_ID_CODEPLAY = 0x10004,
    VK_VENDOR_ID_MESA = 0x10005,
    VK_VENDOR_ID_POCL = 0x10006,
    VK_VENDOR_ID_MOBILEYE = 0x10007,
} VkVendorId;
```

NOTE Khronos vendor IDs may be allocated by vendors at any time. Only the latest canonical versions of this Specification, of the corresponding **vk.xml** API Registry, and of the corresponding **vulkan_sc_core.h** header file **must** contain all reserved Khronos vendor IDs.

Only Khronos vendor IDs are given symbolic names at present. PCI vendor IDs returned by the implementation can be looked up in the PCI-SIG database.

`VK_MAX_PHYSICAL_DEVICE_NAME_SIZE` is the length in `char` values of an array containing a physical device name string, as returned in `VkPhysicalDeviceProperties::deviceName`.

```
#define VK_MAX_PHYSICAL_DEVICE_NAME_SIZE 256U
```

The physical device types which **may** be returned in `VkPhysicalDeviceProperties::deviceType` are:

```
// Provided by VK_VERSION_1_0
typedef enum VkPhysicalDeviceType {
    VK_PHYSICAL_DEVICE_TYPE_OTHER = 0,
    VK_PHYSICAL_DEVICE_TYPE_INTEGRATED_GPU = 1,
    VK_PHYSICAL_DEVICE_TYPE_DISCRETE_GPU = 2,
    VK_PHYSICAL_DEVICE_TYPE_VIRTUAL_GPU = 3,
    VK_PHYSICAL_DEVICE_TYPE_CPU = 4,
} VkPhysicalDeviceType;
```

- `VK_PHYSICAL_DEVICE_TYPE_OTHER` - the device does not match any other available types.
- `VK_PHYSICAL_DEVICE_TYPE_INTEGRATED_GPU` - the device is typically one embedded in or tightly coupled with the host.
- `VK_PHYSICAL_DEVICE_TYPE_DISCRETE_GPU` - the device is typically a separate processor connected to the host via an interlink.
- `VK_PHYSICAL_DEVICE_TYPE_VIRTUAL_GPU` - the device is typically a virtual node in a virtualization environment.
- `VK_PHYSICAL_DEVICE_TYPE_CPU` - the device is typically running on the same processors as the host.

The physical device type is advertised for informational purposes only, and does not directly affect the operation of the system. However, the device type **may** correlate with other advertised properties or capabilities of the system, such as how many memory heaps there are.

To query general properties of physical devices once enumerated, call:

```
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceProperties2(
    VkPhysicalDevice          physicalDevice,
    VkPhysicalDeviceProperties2* pProperties);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pProperties` is a pointer to a `VkPhysicalDeviceProperties2` structure in which properties are returned.

Each structure in `pProperties` and its `pNext` chain contains members corresponding to

implementation-dependent properties, behaviors, or limits. `vkGetPhysicalDeviceProperties2` fills in each member to specify the corresponding value for the implementation.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceProperties2-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceProperties2-pProperties-parameter `pProperties` **must** be a valid pointer to a `VkPhysicalDeviceProperties2` structure

The `VkPhysicalDeviceProperties2` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceProperties2 {
    VkStructureType    sType;
    void*              pNext;
    VkPhysicalDeviceProperties  properties;
} VkPhysicalDeviceProperties2;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `properties` is a `VkPhysicalDeviceProperties` structure describing properties of the physical device. This structure is written with the same values as if it were written by `vkGetPhysicalDeviceProperties`.

The `pNext` chain of this structure is used to extend the structure with properties defined by extensions.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceProperties2-sType-sType `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROPERTIES_2`
- VUID-VkPhysicalDeviceProperties2-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT`, `VkPhysicalDeviceConservativeRasterizationPropertiesEXT`, `VkPhysicalDeviceCustomBorderColorPropertiesEXT`, `VkPhysicalDeviceDepthStencilResolveProperties`, `VkPhysicalDeviceDescriptorIndexingProperties`, `VkPhysicalDeviceDiscardRectanglePropertiesEXT`, `VkPhysicalDeviceDriverProperties`, `VkPhysicalDeviceExternalMemoryHostPropertiesEXT`, `VkPhysicalDeviceFloatControlsProperties`, `VkPhysicalDeviceFragmentShadingRatePropertiesKHR`, `VkPhysicalDeviceIDProperties`, `VkPhysicalDeviceLineRasterizationProperties`, `VkPhysicalDeviceMaintenance3Properties`,

[VkPhysicalDeviceMultiviewProperties](#), [VkPhysicalDevicePCIBusInfoPropertiesEXT](#),
[VkPhysicalDevicePerformanceQueryPropertiesKHR](#),
[VkPhysicalDevicePointClippingProperties](#), [VkPhysicalDeviceProtectedMemoryProperties](#),
[VkPhysicalDeviceRobustness2PropertiesKHR](#),
[VkPhysicalDeviceSampleLocationsPropertiesEXT](#),
[VkPhysicalDeviceSamplerFilterMinmaxProperties](#), [VkPhysicalDeviceSubgroupProperties](#),
[VkPhysicalDeviceSubgroupSizeControlProperties](#),
[VkPhysicalDeviceTexelBufferAlignmentProperties](#),
[VkPhysicalDeviceTimelineSemaphoreProperties](#),
[VkPhysicalDeviceVertexAttributeDivisorProperties](#), [VkPhysicalDeviceVulkan11Properties](#),
[VkPhysicalDeviceVulkan12Properties](#), or [VkPhysicalDeviceVulkanSC10Properties](#)

- `VUID-VkPhysicalDeviceProperties2-sType-unique`
The `sType` value of each structure in the `pNext` chain **must** be unique

The `VkPhysicalDeviceVulkan11Properties` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceVulkan11Properties {
    VkStructureType    sType;
    void*              pNext;
    uint8_t             deviceUUID[VK_UUID_SIZE];
    uint8_t             driverUUID[VK_UUID_SIZE];
    uint8_t             deviceLUID[VK_LUID_SIZE];
    uint32_t            deviceNodeMask;
    VkBool32            deviceLUIDValid;
    uint32_t            subgroupSize;
    VkShaderStageFlags  subgroupSupportedStages;
    VkSubgroupFeatureFlags subgroupSupportedOperations;
    VkBool32            subgroupQuadOperationsInAllStages;
    VkPointClippingBehavior pointClippingBehavior;
    uint32_t            maxMultiviewViewCount;
    uint32_t            maxMultiviewInstanceIndex;
    VkBool32            protectedNoFault;
    uint32_t            maxPerSetDescriptors;
    VkDeviceSize         maxMemoryAllocationSize;
} VkPhysicalDeviceVulkan11Properties;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceUUID` is an array of `VK_UUID_SIZE` `uint8_t` values representing a universally unique identifier for the device.
- `driverUUID` is an array of `VK_UUID_SIZE` `uint8_t` values representing a universally unique identifier for the driver build in use by the device.
- `deviceLUID` is an array of `VK_LUID_SIZE` `uint8_t` values representing a locally unique identifier for the device.

- `deviceNodeMask` is a `uint32_t` bitfield identifying the node within a linked device adapter corresponding to the device.
- `deviceLUIDValid` is a boolean value that will be `VK_TRUE` if `deviceLUID` contains a valid LUID and `deviceNodeMask` contains a valid node mask, and `VK_FALSE` if they do not.
- `subgroupSize` is the default number of invocations in each subgroup. `subgroupSize` is at least 1 if any of the physical device's queues support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`. `subgroupSize` is a power-of-two.
- `subgroupSupportedStages` is a bitfield of `VkShaderStageFlagBits` describing the shader stages that `group operations` with `subgroup scope` are supported in. `subgroupSupportedStages` will have the `VK_SHADER_STAGE_COMPUTE_BIT` bit set if any of the physical device's queues support `VK_QUEUE_COMPUTE_BIT`.
- `subgroupSupportedOperations` is a bitmask of `VkSubgroupFeatureFlagBits` specifying the sets of `group operations` with `subgroup scope` supported on this device. `subgroupSupportedOperations` will have the `VK_SUBGROUP_FEATURE_BASIC_BIT` bit set if any of the physical device's queues support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`.
- `subgroupQuadOperationsInAllStages` is a boolean specifying whether `quad group operations` are available in all stages, or are restricted to fragment and compute stages.
- `pointClippingBehavior` is a `VkPointClippingBehavior` value specifying the point clipping behavior supported by the implementation.
- `maxMultiviewViewCount` is one greater than the maximum view index that **can** be used in a subpass.
- `maxMultiviewInstanceIndex` is the maximum valid value of instance index allowed to be generated by a drawing command recorded within a subpass of a multiview render pass instance.
- `protectedNoFault` specifies how an implementation behaves when an application attempts to write to unprotected memory in a protected queue operation, read from protected memory in an unprotected queue operation, or perform a query in a protected queue operation. If this limit is `VK_TRUE`, such writes will be discarded or have undefined values written, reads and queries will return undefined values. If this limit is `VK_FALSE`, applications **must** not perform these operations. See [Protected Memory Access Rules](#) for more information.
- `maxPerSetDescriptors` is a maximum number of descriptors (summed over all descriptor types) in a single descriptor set that is guaranteed to satisfy any implementation-dependent constraints on the size of a descriptor set itself. Applications **can** query whether a descriptor set that goes beyond this limit is supported using `vkGetDescriptorSetLayoutSupport`.
- `maxMemoryAllocationSize` is the maximum size of a memory allocation that **can** be created, even if there is more space available in the heap. If `VkMemoryAllocateInfo::allocationSize` is larger the error `VK_ERROR_OUT_OF_DEVICE_MEMORY` **may** be returned.

If the `VkPhysicalDeviceVulkan11Properties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These properties correspond to Vulkan 1.1 functionality.

The members of `VkPhysicalDeviceVulkan11Properties` have the same values as the corresponding members of `VkPhysicalDeviceIDProperties`, `VkPhysicalDeviceSubgroupProperties`, `VkPhysicalDevicePointClippingProperties`, `VkPhysicalDeviceMultiviewProperties`, `VkPhysicalDeviceProtectedMemoryProperties`, and `VkPhysicalDeviceMaintenance3Properties`.

NOTE

The `subgroupSupportedStages`, `subgroupSupportedOperations`, and `subgroupQuadOperationsInAllStages` members of this structure correspond respectively to the `VkPhysicalDeviceSubgroupProperties::supportedStages`, `VkPhysicalDeviceSubgroupProperties::supportedOperations`, and `VkPhysicalDeviceSubgroupProperties::quadOperationsInAllStages` members, but add the `subgroup` prefix to the member name.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVulkan11Properties-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_1_PROPERTIES`

The `VkPhysicalDeviceVulkan12Properties` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceVulkan12Properties {
    VkStructureType    sType;
    void*              pNext;

```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **driverID** is a unique identifier for the driver of the physical device.
- **driverName** is an array of `VK_MAX_DRIVER_NAME_SIZE` `char` containing a null-terminated UTF-8 string

which is the name of the driver.

- `driverInfo` is an array of `VK_MAX_DRIVER_INFO_SIZE` `char` containing a null-terminated UTF-8 string with additional information about the driver.
- `conformanceVersion` is the latest version of the Vulkan conformance test that the implementor has successfully tested this driver against prior to release (see [VkConformanceVersion](#)).
- `denormBehaviorIndependence` is a [VkShaderFloatControlsIndependence](#) value indicating whether, and how, denorm behavior can be set independently for different bit widths.
- `roundingModeIndependence` is a [VkShaderFloatControlsIndependence](#) value indicating whether, and how, rounding modes can be set independently for different bit widths.
- `shaderSignedZeroInfNanPreserveFloat16` is a boolean value indicating whether sign of a zero, Nans and $\pm\infty$ **can** be preserved in 16-bit floating-point computations. It also indicates whether the `SignedZeroInfNanPreserve` execution mode **can** be used for 16-bit floating-point types.
- `shaderSignedZeroInfNanPreserveFloat32` is a boolean value indicating whether sign of a zero, Nans and $\pm\infty$ **can** be preserved in 32-bit floating-point computations. It also indicates whether the `SignedZeroInfNanPreserve` execution mode **can** be used for 32-bit floating-point types.
- `shaderSignedZeroInfNanPreserveFloat64` is a boolean value indicating whether sign of a zero, Nans and $\pm\infty$ **can** be preserved in 64-bit floating-point computations. It also indicates whether the `SignedZeroInfNanPreserve` execution mode **can** be used for 64-bit floating-point types.
- `shaderDenormPreserveFloat16` is a boolean value indicating whether denormals **can** be preserved in 16-bit floating-point computations. It also indicates whether the `DenormPreserve` execution mode **can** be used for 16-bit floating-point types.
- `shaderDenormPreserveFloat32` is a boolean value indicating whether denormals **can** be preserved in 32-bit floating-point computations. It also indicates whether the `DenormPreserve` execution mode **can** be used for 32-bit floating-point types.
- `shaderDenormPreserveFloat64` is a boolean value indicating whether denormals **can** be preserved in 64-bit floating-point computations. It also indicates whether the `DenormPreserve` execution mode **can** be used for 64-bit floating-point types.
- `shaderDenormFlushToZeroFloat16` is a boolean value indicating whether denormals **can** be flushed to zero in 16-bit floating-point computations. It also indicates whether the `DenormFlushToZero` execution mode **can** be used for 16-bit floating-point types.
- `shaderDenormFlushToZeroFloat32` is a boolean value indicating whether denormals **can** be flushed to zero in 32-bit floating-point computations. It also indicates whether the `DenormFlushToZero` execution mode **can** be used for 32-bit floating-point types.
- `shaderDenormFlushToZeroFloat64` is a boolean value indicating whether denormals **can** be flushed to zero in 64-bit floating-point computations. It also indicates whether the `DenormFlushToZero` execution mode **can** be used for 64-bit floating-point types.
- `shaderRoundingModeRTEFloat16` is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 16-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTE` execution mode **can** be used for 16-bit floating-point types.
- `shaderRoundingModeRTEFloat32` is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 32-bit floating-point arithmetic and

conversion instructions. It also indicates whether the `RoundingModeRTE` execution mode **can** be used for 32-bit floating-point types.

- `shaderRoundingModeRTEFloat64` is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 64-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTE` execution mode **can** be used for 64-bit floating-point types.
- `shaderRoundingModeRTZFloat16` is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 16-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTZ` execution mode **can** be used for 16-bit floating-point types.
- `shaderRoundingModeRTZFloat32` is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 32-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTZ` execution mode **can** be used for 32-bit floating-point types.
- `shaderRoundingModeRTZFloat64` is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 64-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTZ` execution mode **can** be used for 64-bit floating-point types.
- `maxUpdateAfterBindDescriptorsInAllPools` is the maximum number of descriptors (summed over all descriptor types) that **can** be created across all pools that are created with the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` bit set. Pool creation **may** fail when this limit is exceeded, or when the space this limit represents is unable to satisfy a pool creation due to fragmentation.
- `shaderUniformBufferArrayNonUniformIndexingNative` is a boolean value indicating whether uniform buffer descriptors natively support non-uniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that non-uniformly indexes an array of uniform buffers **may** execute multiple times in order to access all the descriptors.
- `shaderSampledImageArrayNonUniformIndexingNative` is a boolean value indicating whether sampler and image descriptors natively support non-uniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that non-uniformly indexes an array of samplers or images **may** execute multiple times in order to access all the descriptors.
- `shaderStorageBufferArrayNonUniformIndexingNative` is a boolean value indicating whether storage buffer descriptors natively support non-uniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that non-uniformly indexes an array of storage buffers **may** execute multiple times in order to access all the descriptors.
- `shaderStorageImageArrayNonUniformIndexingNative` is a boolean value indicating whether storage image descriptors natively support non-uniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that non-uniformly indexes an array of storage images **may** execute multiple times in order to access all the descriptors.
- `shaderInputAttachmentArrayNonUniformIndexingNative` is a boolean value indicating whether input attachment descriptors natively support non-uniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that non-uniformly indexes an array of input attachments **may** execute multiple times in order to access all the descriptors.

- `robustBufferAccessUpdateAfterBind` is a boolean value indicating whether `robustBufferAccess` **can** be enabled on a device simultaneously with `descriptorBindingUniformBufferUpdateAfterBind`, `descriptorBindingStorageBufferUpdateAfterBind`, `descriptorBindingUniformTexelBufferUpdateAfterBind`, and/or `descriptorBindingStorageTexelBufferUpdateAfterBind`. If this is `VK_FALSE`, then either `robustBufferAccess` **must** be disabled or all of these update-after-bind features **must** be disabled.
- `quadDivergentImplicitLod` is a boolean value indicating whether implicit LOD calculations for image operations have well-defined results when the image and/or sampler objects used for the instruction are not uniform within a quad. See [Derivative Image Operations](#).
- `maxPerStageDescriptorUpdateAfterBindSamplers` is similar to `maxPerStageDescriptorSamplers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxPerStageDescriptorUpdateAfterBindUniformBuffers` is similar to `maxPerStageDescriptorUniformBuffers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxPerStageDescriptorUpdateAfterBindStorageBuffers` is similar to `maxPerStageDescriptorStorageBuffers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxPerStageDescriptorUpdateAfterBindSampledImages` is similar to `maxPerStageDescriptorSampledImages` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxPerStageDescriptorUpdateAfterBindStorageImages` is similar to `maxPerStageDescriptorStorageImages` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxPerStageDescriptorUpdateAfterBindInputAttachments` is similar to `maxPerStageDescriptorInputAttachments` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxPerStageUpdateAfterBindResources` is similar to `maxPerStageResources` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetUpdateAfterBindSamplers` is similar to `maxDescriptorSetSamplers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetUpdateAfterBindUniformBuffers` is similar to `maxDescriptorSetUniformBuffers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetUpdateAfterBindUniformBuffersDynamic` is similar to `maxDescriptorSetUniformBuffersDynamic` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set. While an application **can** allocate dynamic uniform buffer descriptors from a pool created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT`, bindings for these descriptors **must** not be present in any descriptor set layout that includes bindings created with `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`.

- `maxDescriptorSetUpdateAfterBindStorageBuffers` is similar to `maxDescriptorSetStorageBuffers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetUpdateAfterBindStorageBuffersDynamic` is similar to `maxDescriptorSetStorageBuffersDynamic` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set. While an application **can** allocate dynamic storage buffer descriptors from a pool created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT`, bindings for these descriptors **must** not be present in any descriptor set layout that includes bindings created with `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`.
- `maxDescriptorSetUpdateAfterBindSampledImages` is similar to `maxDescriptorSetSampledImages` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetUpdateAfterBindStorageImages` is similar to `maxDescriptorSetStorageImages` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetUpdateAfterBindInputAttachments` is similar to `maxDescriptorSetInputAttachments` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `supportedDepthResolveModes` is a bitmask of `VkResolveModeFlagBits` indicating the set of supported depth resolve modes. A value of `VK_RESOLVE_MODE_NONE` indicates that depth resolve operations are disallowed [SCID-8]. If any bits are set then `VK_RESOLVE_MODE_SAMPLE_ZERO_BIT` **must** be included in the set but implementations **may** support additional modes.
- `supportedStencilResolveModes` is a bitmask of `VkResolveModeFlagBits` indicating the set of supported stencil resolve modes. A value of `VK_RESOLVE_MODE_NONE` indicates that stencil resolve operations are disallowed [SCID-8]. If any bits are set then `VK_RESOLVE_MODE_SAMPLE_ZERO_BIT` **must** be included in the set but implementations **may** support additional modes. `VK_RESOLVE_MODE_AVERAGE_BIT` **must** not be included in the set.
- `independentResolveNone` is `VK_TRUE` if the implementation supports setting the depth and stencil resolve modes to different values when one of those modes is `VK_RESOLVE_MODE_NONE`. Otherwise the implementation only supports setting both modes to the same value.
- `independentResolve` is `VK_TRUE` if the implementation supports all combinations of the supported depth and stencil resolve modes, including setting either depth or stencil resolve mode to `VK_RESOLVE_MODE_NONE`. An implementation that supports `independentResolve` **must** also support `independentResolveNone`.
- `filterMinmaxSingleComponentFormats` is a boolean value indicating whether a minimum set of required formats support min/max filtering.
- `filterMinmaxImageComponentMapping` is a boolean value indicating whether the implementation supports non-identity component mapping of the image when doing min/max filtering.
- `maxTimelineSemaphoreValueDifference` indicates the maximum difference allowed by the implementation between the current value of a timeline semaphore and any pending signal or wait operations.
- `framebufferIntegerColorSampleCounts` is a bitmask of `VkSampleCountFlagBits` indicating the color

sample counts that are supported for all framebuffer color attachments with integer formats.

If the `VkPhysicalDeviceVulkan12Properties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These properties correspond to Vulkan 1.2 functionality.

The members of `VkPhysicalDeviceVulkan12Properties` **must** have the same values as the corresponding members of `VkPhysicalDeviceDriverProperties`, `VkPhysicalDeviceFloatControlsProperties`, `VkPhysicalDeviceDescriptorIndexingProperties`, `VkPhysicalDeviceDepthStencilResolveProperties`, `VkPhysicalDeviceSamplerFilterMinmaxProperties`, and `VkPhysicalDeviceTimelineSemaphoreProperties`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVulkan12Properties-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_2_PROPERTIES`

The `VkPhysicalDeviceVulkanSC10Properties` structure is defined as:

```
// Provided by VKSC_VERSION_1_0
typedef struct VkPhysicalDeviceVulkanSC10Properties {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           deviceNoDynamicHostAllocations;
    VkBool32           deviceDestroyFreesMemory;
    VkBool32           commandPoolMultipleCommandBuffersRecording;
    VkBool32           commandPoolResetCommandBuffer;
    VkBool32           commandBufferSimultaneousUse;
    VkBool32           secondaryCommandBufferNullOrImagelessFramebuffer;
    VkBool32           recycleDescriptorSetMemory;
    VkBool32           recyclePipelineMemory;
    uint32_t           maxRenderPassSubpasses;
    uint32_t           maxRenderPassDependencies;
    uint32_t           maxSubpassInputAttachments;
    uint32_t           maxSubpassPreserveAttachments;
    uint32_t           maxFramebufferAttachments;
    uint32_t           maxDescriptorSetLayoutBindings;
    uint32_t           maxQueryFaultCount;
    uint32_t           maxCallbackFaultCount;
    uint32_t           maxCommandPoolCommandBuffers;
    VkDeviceSize       maxCommandBufferSize;
} VkPhysicalDeviceVulkanSC10Properties;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `deviceNoDynamicHostAllocations` indicates whether the implementation will perform dynamic host memory allocations for physical or logical device commands. If `deviceNoDynamicHostAllocations` is `VK_TRUE` the implementation will allocate host memory for objects based on the provided `VkDeviceObjectReservationCreateInfo` limits during `vkCreateDevice`. Under valid API usage, `VK_ERROR_OUT_OF_HOST_MEMORY` **may** only be returned by commands which do not explicitly disallow it.
- `deviceDestroyFreesMemory` indicates whether destroying the device frees all memory resources back to the system.
- `commandPoolMultipleCommandBuffersRecording` indicates whether multiple command buffers from the same command pool **can** be in the `recording state` at the same time.
- `commandPoolResetCommandBuffer` indicates whether command buffers support `vkResetCommandBuffer`, and `vkBeginCommandBuffer` when not in the `initial state`.
- `commandBufferSimultaneousUse` indicates whether command buffers support `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`.
- `secondaryCommandBufferNullOrImagelessFramebuffer` indicates whether the `framebuffer` member of `VkCommandBufferInheritanceInfo` **may** be equal to `VK_NULL_HANDLE` or be created with a `VkFramebufferCreateInfo::flags` value that includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT` if the command buffer will be executed within a render pass instance.
- `recycleDescriptorSetMemory` indicates whether descriptor pools are able to immediately reuse pool memory from descriptor sets that have been freed. If this is `VK_FALSE`, then memory **may** only be reallocated after `vkResetDescriptorPool` is called.
- `recyclePipelineMemory` indicates whether the memory for a pipeline is available for reuse by new pipelines after the pipeline is destroyed.
- `maxRenderPassSubpasses` is the maximum number of subpasses in a render pass.
- `maxRenderPassDependencies` is the maximum number of dependencies in a render pass.
- `maxSubpassInputAttachments` is the maximum number of input attachments in a subpass.
- `maxSubpassPreserveAttachments` is the maximum number of preserve attachments in a subpass.
- `maxFramebufferAttachments` is the maximum number of attachments in a framebuffer, as well as the maximum number of attachments in a render pass.
- `maxDescriptorSetLayoutBindings` is the maximum number of bindings in a descriptor set layout.
- `maxQueryFaultCount` is the maximum number of faults that the implementation **can** record, to be reported via `vkGetFaultData`.
- `maxCallbackFaultCount` is the maximum number of faults that the implementation **can** report via a single call to `PFN_vkFaultCallbackFunction`.
- `maxCommandPoolCommandBuffers` is the maximum number of command buffers that **can** be allocated from a single command pool.
- `maxCommandBufferSize` is the maximum supported size of a single command buffer in bytes. Applications **can** use `vkGetCommandPoolMemoryConsumption` to compare a command buffer's current memory usage to this limit.

NOTE | Implementations that do not have a fixed upper bound on the number of command

buffers that **may** be allocated from a command pool **can** report 0xFFFFFFFFU for `maxCommandPoolCommandBuffers`.

Implementations that do not have a fixed upper bound on the command buffer size **can** report `UINT64_MAX` for `maxCommandBufferSize`.

If the `VkPhysicalDeviceVulkanSC10Properties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These properties correspond to Vulkan SC 1.0 functionality.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceVulkanSC10Properties-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_SC_1_0_PROPERTIES`

The `VkPhysicalDeviceIDProperties` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceIDProperties {
    VkStructureType    sType;
    void*              pNext;
    uint8_t            deviceUUID[VK_UUID_SIZE];
    uint8_t            driverUUID[VK_UUID_SIZE];
    uint8_t            deviceLUID[VK_LUID_SIZE];
    uint32_t           deviceNodeMask;
    VkBool32           deviceLUIDValid;
} VkPhysicalDeviceIDProperties;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceUUID` is an array of `VK_UUID_SIZE` `uint8_t` values representing a universally unique identifier for the device.
- `driverUUID` is an array of `VK_UUID_SIZE` `uint8_t` values representing a universally unique identifier for the driver build in use by the device.
- `deviceLUID` is an array of `VK_LUID_SIZE` `uint8_t` values representing a locally unique identifier for the device.
- `deviceNodeMask` is a `uint32_t` bitfield identifying the node within a linked device adapter corresponding to the device.
- `deviceLUIDValid` is a boolean value that will be `VK_TRUE` if `deviceLUID` contains a valid LUID and `deviceNodeMask` contains a valid node mask, and `VK_FALSE` if they do not.

If the `VkPhysicalDeviceIDProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with

each corresponding implementation-dependent property.

deviceUUID **must** be immutable for a given device across instances, processes, driver APIs, driver versions, and system reboots.

Applications **can** compare the **driverUUID** value across instance and process boundaries, and **can** make similar queries in external APIs to determine whether they are capable of sharing memory objects and resources using them with the device.

deviceUUID and/or **driverUUID** **must** be used to determine whether a particular external object can be shared between driver components, where such a restriction exists as defined in the compatibility table for the particular object type:

- [External memory handle types compatibility](#)
- [External semaphore handle types compatibility](#)
- [External fence handle types compatibility](#)

If **deviceLUIDValid** is **VK_FALSE**, the values of **deviceLUID** and **deviceNodeMask** are undefined. If **deviceLUIDValid** is **VK_TRUE** and Vulkan is running on the Windows operating system, the contents of **deviceLUID** **can** be cast to an **LUID** object and **must** be equal to the locally unique identifier of a **IDXGIAdapter1** object that corresponds to **physicalDevice**. If **deviceLUIDValid** is **VK_TRUE**, **deviceNodeMask** **must** contain exactly one bit. If Vulkan is running on an operating system that supports the Direct3D 12 API and **physicalDevice** corresponds to an individual device in a linked device adapter, **deviceNodeMask** identifies the Direct3D 12 node corresponding to **physicalDevice**. Otherwise, **deviceNodeMask** **must** be 1.

NOTE

Although they have identical descriptions, [VkPhysicalDeviceIDProperties::deviceUUID](#) may differ from [VkPhysicalDeviceProperties2::properties.pipelineCacheUUID](#). The former is intended to identify and correlate devices across API and driver boundaries, while the latter is used to identify a compatible device and driver combination to use when serializing and deserializing pipeline state.

Implementations **should** return **deviceUUID** values which are likely to be unique even in the presence of multiple Vulkan implementations (such as a GPU driver and a software renderer; two drivers for different GPUs; or the same Vulkan driver running on two logically different devices).

Khronos' conformance testing is unable to guarantee that **deviceUUID** values are actually unique, so implementors **should** make their own best efforts to ensure this. In particular, hard-coded **deviceUUID** values, especially all-0 bits, **should** never be used.

A combination of values unique to the vendor, the driver, and the hardware environment can be used to provide a **deviceUUID** which is unique to a high degree of certainty. Some possible inputs to such a computation are:

- Information reported by [vkGetPhysicalDeviceProperties](#)
- PCI device ID (if defined)

- PCI bus ID, or similar system configuration information.
- Driver binary checksums.

NOTE

While `VkPhysicalDeviceIDProperties::deviceUUID` is specified to remain consistent across driver versions and system reboots, it is not intended to be usable as a serializable persistent identifier for a device. It may change when a device is physically added to, removed from, or moved to a different connector in a system while that system is powered down. Further, there is no reasonable way to verify with conformance testing that a given device retains the same UUID in a given system across all driver versions supported in that system. While implementations should make every effort to report consistent device UUIDs across driver versions, applications should avoid relying on the persistence of this value for uses other than identifying compatible devices for external object sharing purposes.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceIDProperties-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ID_PROPERTIES`

`VK_UUID_SIZE` is the length in `uint8_t` values of an array containing a universally unique device or driver build identifier, as returned in `VkPhysicalDeviceIDProperties::deviceUUID` and `VkPhysicalDeviceIDProperties::driverUUID`.

```
#define VK_UUID_SIZE          16U
```

`VK_LUID_SIZE` is the length in `uint8_t` values of an array containing a locally unique device identifier, as returned in `VkPhysicalDeviceIDProperties::deviceLUID`.

```
#define VK_LUID_SIZE          8U
```

The `VkPhysicalDeviceDriverProperties` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceDriverProperties {
    VkStructureType    sType;
    void*              pNext;
    VkDriverId          driverID;
    char                driverName[VK_MAX_DRIVER_NAME_SIZE];
    char                driverInfo[VK_MAX_DRIVER_INFO_SIZE];
    VkConformanceVersion conformanceVersion;
} VkPhysicalDeviceDriverProperties;
```

- `sType` is a `VkStructureType` value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `driverID` is a unique identifier for the driver of the physical device.
- `driverName` is an array of `VK_MAX_DRIVER_NAME_SIZE` `char` containing a null-terminated UTF-8 string which is the name of the driver.
- `driverInfo` is an array of `VK_MAX_DRIVER_INFO_SIZE` `char` containing a null-terminated UTF-8 string with additional information about the driver.
- `conformanceVersion` is the latest version of the Vulkan conformance test that the implementor has successfully tested this driver against prior to release (see [VkConformanceVersion](#)).

If the `VkPhysicalDeviceDriverProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the driver corresponding to a physical device.

`driverID` **must** be immutable for a given driver across instances, processes, driver versions, and system reboots.

Valid Usage (Implicit)

- `VOID-VkPhysicalDeviceDriverProperties-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DRIVER_PROPERTIES`

Khronos driver IDs which **may** be returned in `VkPhysicalDeviceDriverProperties::driverID` are:

```
// Provided by VK_VERSION_1_2
typedef enum VkDriverId {
    VK_DRIVER_ID_AMD_PROPRIETARY = 1,
    VK_DRIVER_ID_AMD_OPEN_SOURCE = 2,
    VK_DRIVER_ID_MESA_RADV = 3,
    VK_DRIVER_ID_NVIDIA_PROPRIETARY = 4,
    VK_DRIVER_ID_INTEL_PROPRIETARY_WINDOWS = 5,
    VK_DRIVER_ID_INTEL_OPEN_SOURCE_MESA = 6,
    VK_DRIVER_ID_IMAGINATION_PROPRIETARY = 7,
    VK_DRIVER_ID_QUALCOMM_PROPRIETARY = 8,
    VK_DRIVER_ID_ARM_PROPRIETARY = 9,
    VK_DRIVER_ID_GOOGLE_SWIFTSHADER = 10,
    VK_DRIVER_ID_GGP_PROPRIETARY = 11,
    VK_DRIVER_ID_BROADCOM_PROPRIETARY = 12,
    VK_DRIVER_ID_MESA_LLVMPIPE = 13,
    VK_DRIVER_ID_MOLTENVK = 14,
    VK_DRIVER_ID_COREAVI_PROPRIETARY = 15,
    VK_DRIVER_ID_JUICE_PROPRIETARY = 16,
    VK_DRIVER_ID_VERISILICON_PROPRIETARY = 17,
    VK_DRIVER_ID_MESA_TURNIP = 18,
    VK_DRIVER_ID_MESA_V3DV = 19,
    VK_DRIVER_ID_MESA_PANVK = 20,
    VK_DRIVER_ID_SAMSUNG_PROPRIETARY = 21,
    VK_DRIVER_ID_MESA_VENUS = 22,
    VK_DRIVER_ID_MESA_DOZEN = 23,
    VK_DRIVER_ID_MESA_NVK = 24,
    VK_DRIVER_ID_IMAGINATION_OPEN_SOURCE_MESA = 25,
    VK_DRIVER_ID_MESA_HONEYKRISP = 26,
    VK_DRIVER_ID_VULKAN_SC_EMULATION_ON_VULKAN = 27,
    VK_DRIVER_ID_MESA_KOSMICKRISP = 28,
} VkDriverId;
```

NOTE

Khronos driver IDs may be allocated by vendors at any time. There may be multiple driver IDs for the same vendor, representing different drivers (for e.g. different platforms, proprietary or open source, etc.). Only the latest canonical versions of this Specification, of the corresponding [vk.xml](#) API Registry, and of the corresponding [vulkan_sc_core.h](#) header file **must** contain all reserved Khronos driver IDs.

Only driver IDs registered with Khronos are given symbolic names. There **may** be unregistered driver IDs returned.

[VK_MAX_DRIVER_NAME_SIZE](#) is the length in [char](#) values of an array containing a driver name string, as returned in [VkPhysicalDeviceDriverProperties::driverName](#).

```
#define VK_MAX_DRIVER_NAME_SIZE 256U
```

[VK_MAX_DRIVER_INFO_SIZE](#) is the length in [char](#) values of an array containing a driver information

string, as returned in [VkPhysicalDeviceDriverProperties::driverInfo](#).

```
#define VK_MAX_DRIVER_INFO_SIZE 256U
```

The conformance test suite version an implementation is compliant with is described with the [VkConformanceVersion](#) structure:

```
// Provided by VK_VERSION_1_2
typedef struct VkConformanceVersion {
    uint8_t    major;
    uint8_t    minor;
    uint8_t    subminor;
    uint8_t    patch;
} VkConformanceVersion;
```

- [major](#) is the major version number of the conformance test suite.
- [minor](#) is the minor version number of the conformance test suite.
- [subminor](#) is the subminor version number of the conformance test suite.
- [patch](#) is the patch version number of the conformance test suite.

The [VkPhysicalDevicePCIBusInfoPropertiesEXT](#) structure is defined as:

```
// Provided by VK_EXT_pci_bus_info
typedef struct VkPhysicalDevicePCIBusInfoPropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    uint32_t            pciDomain;
    uint32_t            pciBus;
    uint32_t            pciDevice;
    uint32_t            pciFunction;
} VkPhysicalDevicePCIBusInfoPropertiesEXT;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [pciDomain](#) is the PCI bus domain.
- [pciBus](#) is the PCI bus identifier.
- [pciDevice](#) is the PCI device identifier.
- [pciFunction](#) is the PCI device function identifier.

If the [VkPhysicalDevicePCIBusInfoPropertiesEXT](#) structure is included in the [pNext](#) chain of the [VkPhysicalDeviceProperties2](#) structure passed to [vkGetPhysicalDeviceProperties2](#), it is filled in with each corresponding implementation-dependent property.

These are properties of the PCI bus information of a physical device.

Valid Usage (Implicit)

- VUID-VkPhysicalDevicePCIBusInfoPropertiesEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PCI_BUS_INFO_PROPERTIES_EXT`

To query properties of queues available on a physical device, call:

WARNING

This functionality is superseded by [Vulkan Version 1.1](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceQueueFamilyProperties(
    VkPhysicalDevice          physicalDevice,
    uint32_t*                 pQueueFamilyPropertyCount,
    VkQueueFamilyProperties*   pQueueFamilyProperties);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pQueueFamilyPropertyCount` is a pointer to an integer related to the number of queue families available or queried, as described below.
- `pQueueFamilyProperties` is either `NULL` or a pointer to an array of [VkQueueFamilyProperties](#) structures.

If `pQueueFamilyProperties` is `NULL`, then the number of queue families available is returned in `pQueueFamilyPropertyCount`. Implementations **must** support at least one queue family. Otherwise, `pQueueFamilyPropertyCount` **must** point to a variable set by the application to the number of elements in the `pQueueFamilyProperties` array, and on return the variable is overwritten with the number of structures actually written to `pQueueFamilyProperties`. If `pQueueFamilyPropertyCount` is less than the number of queue families available, at most `pQueueFamilyPropertyCount` structures will be written.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceQueueFamilyProperties-physicalDevice-parameter
`physicalDevice` **must** be a valid [VkPhysicalDevice](#) handle
- VUID-vkGetPhysicalDeviceQueueFamilyProperties-pQueueFamilyPropertyCount-parameter
`pQueueFamilyPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceQueueFamilyProperties-pQueueFamilyProperties-parameter
If the value referenced by `pQueueFamilyPropertyCount` is not `0`, and `pQueueFamilyProperties` is not `NULL`, `pQueueFamilyProperties` **must** be a valid pointer to an array of `pQueueFamilyPropertyCount` [VkQueueFamilyProperties](#) structures

The [VkQueueFamilyProperties](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkQueueFamilyProperties {
    VkQueueFlags    queueFlags;
    uint32_t        queueCount;
    uint32_t        timestampValidBits;
    VkExtent3D      minImageTransferGranularity;
} VkQueueFamilyProperties;
```

- **queueFlags** is a bitmask of [VkQueueFlagBits](#) indicating capabilities of the queues in this queue family.
- **queueCount** is the unsigned integer count of queues in this queue family. Each queue family **must** support at least one queue.
- **timestampValidBits** is the unsigned integer count of meaningful bits in the timestamps written via [vkCmdWriteTimestamp2KHR](#) or [vkCmdWriteTimestamp](#). The valid range for the count is 36 to 64 bits, or a value of 0, indicating no support for timestamps. Bits outside the valid range are guaranteed to be zeros.
- **minImageTransferGranularity** is the minimum granularity supported for image transfer operations on the queues in this queue family.

The value returned in **minImageTransferGranularity** has a unit of compressed texel blocks for images having a block-compressed format, and a unit of texels otherwise.

Possible values of **minImageTransferGranularity** are:

- (0,0,0) specifies that only whole mip levels **must** be transferred using the image transfer operations on the corresponding queues. In this case, the following restrictions apply to all offset and extent parameters of image transfer operations:
 - The **x**, **y**, and **z** members of a [VkOffset3D](#) parameter **must** always be zero.
 - The **width**, **height**, and **depth** members of a [VkExtent3D](#) parameter **must** always match the width, height, and depth of the image subresource corresponding to the parameter, respectively.
- (A_x , A_y , A_z) where A_x , A_y , and A_z are all integer powers of two. In this case the following restrictions apply to all image transfer operations:
 - **x**, **y**, and **z** of a [VkOffset3D](#) parameter **must** be integer multiples of A_x , A_y , and A_z , respectively.
 - **width** of a [VkExtent3D](#) parameter **must** be an integer multiple of A_x , or else **x** + **width** **must** equal the width of the image subresource corresponding to the parameter.
 - **height** of a [VkExtent3D](#) parameter **must** be an integer multiple of A_y , or else **y** + **height** **must** equal the height of the image subresource corresponding to the parameter.
 - **depth** of a [VkExtent3D](#) parameter **must** be an integer multiple of A_z , or else **z** + **depth** **must** equal the depth of the image subresource corresponding to the parameter.
 - If the format of the image corresponding to the parameters is one of the block-compressed formats then for the purposes of the above calculations the granularity **must** be scaled up

by the compressed texel block dimensions.

Queues supporting graphics and/or compute operations **must** report (1,1,1) in `minImageTransferGranularity`, meaning that there are no additional restrictions on the granularity of image transfer operations for these queues. Other queues supporting image transfer operations are only **required** to support whole mip level transfers, thus `minImageTransferGranularity` for queues belonging to such queue families **may** be (0,0,0).

The [Device Memory](#) section describes memory properties queried from the physical device.

For physical device feature queries see the [Features](#) chapter.

Bits which **may** be set in `VkQueueFamilyProperties::queueFlags`, indicating capabilities of queues in a queue family are:

```
// Provided by VK_VERSION_1_0
typedef enum VkQueueFlagBits {
    VK_QUEUE_GRAPHICS_BIT = 0x00000001,
    VK_QUEUE_COMPUTE_BIT = 0x00000002,
    VK_QUEUE_TRANSFER_BIT = 0x00000004,
    // Provided by VK_VERSION_1_1
    VK_QUEUE_PROTECTED_BIT = 0x00000010,
} VkQueueFlagBits;
```

- `VK_QUEUE_GRAPHICS_BIT` specifies that queues in this queue family support graphics operations.
- `VK_QUEUE_COMPUTE_BIT` specifies that queues in this queue family support compute operations.
- `VK_QUEUE_TRANSFER_BIT` specifies that queues in this queue family support transfer operations.
- `VK_QUEUE_SPARSE_BINDING_BIT` specifies that queues in this queue family support sparse memory management operations (see [Sparse Resources](#)). If any of the sparse resource features are enabled, then at least one queue family **must** support this bit. This flag is not supported in Vulkan SC [\[SCID-8\]](#).
- `VK_QUEUE_PROTECTED_BIT` specifies that queues in this queue family support the `VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT` bit. (see [Protected Memory](#)). If the physical device supports the `protectedMemory` feature, at least one of its queue families **must** support this bit.

If an implementation exposes any queue family that supports graphics operations, at least one queue family of at least one physical device exposed by the implementation **must** support both graphics and compute operations.

Furthermore, if the `protectedMemory` physical device feature is supported, then at least one queue family of at least one physical device exposed by the implementation **must** support graphics operations, compute operations, and protected memory operations.

NOTE

All commands that are allowed on a queue that supports transfer operations are also allowed on a queue that supports either graphics or compute operations. Thus, if the capabilities of a queue family include `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`, then reporting the `VK_QUEUE_TRANSFER_BIT` capability

separately for that queue family is **optional**.

For further details see [Queues](#).

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueueFlags;
```

VkQueueFlags is a bitmask type for setting a mask of zero or more [VkQueueFlagBits](#).

To query properties of queues available on a physical device, call:

```
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceQueueFamilyProperties2(
    VkPhysicalDevice          physicalDevice,
    uint32_t*                 pQueueFamilyPropertyCount,
    VkQueueFamilyProperties2*  pQueueFamilyProperties);
```

- **physicalDevice** is the handle to the physical device whose properties will be queried.
- **pQueueFamilyPropertyCount** is a pointer to an integer related to the number of queue families available or queried, as described in [vkGetPhysicalDeviceQueueFamilyProperties](#).
- **pQueueFamilyProperties** is either **NULL** or a pointer to an array of [VkQueueFamilyProperties2](#) structures.

vkGetPhysicalDeviceQueueFamilyProperties2 behaves similarly to [vkGetPhysicalDeviceQueueFamilyProperties](#), with the ability to return extended information in a **pNext** chain of output structures.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceQueueFamilyProperties2-physicalDevice-parameter **physicalDevice** **must** be a valid [VkPhysicalDevice](#) handle
- VUID-vkGetPhysicalDeviceQueueFamilyProperties2-pQueueFamilyPropertyCount-parameter **pQueueFamilyPropertyCount** **must** be a valid pointer to a **uint32_t** value
- VUID-vkGetPhysicalDeviceQueueFamilyProperties2-pQueueFamilyProperties-parameter
If the value referenced by **pQueueFamilyPropertyCount** is not 0, and **pQueueFamilyProperties** is not **NULL**, **pQueueFamilyProperties** **must** be a valid pointer to an array of **pQueueFamilyPropertyCount** [VkQueueFamilyProperties2](#) structures

The **VkQueueFamilyProperties2** structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkQueueFamilyProperties2 {
    VkStructureType    sType;
    void*              pNext;
    VkQueueFamilyProperties queueFamilyProperties;
} VkQueueFamilyProperties2;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `queueFamilyProperties` is a `VkQueueFamilyProperties` structure which is populated with the same values as in `vkGetPhysicalDeviceQueueFamilyProperties`.

Valid Usage (Implicit)

- VUID-VkQueueFamilyProperties2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_QUEUE_FAMILY_PROPERTIES_2`
- VUID-VkQueueFamilyProperties2-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkQueueFamilyGlobalPriorityProperties`
- VUID-VkQueueFamilyProperties2-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique

The `VkQueueFamilyGlobalPriorityProperties` structure is defined as:

```
typedef struct VkQueueFamilyGlobalPriorityProperties {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           priorityCount;
    VkQueueGlobalPriority priorities[VK_MAX_GLOBAL_PRIORITY_SIZE];
} VkQueueFamilyGlobalPriorityProperties;
```

```
// Provided by VK_KHR_global_priority
typedef VkQueueFamilyGlobalPriorityProperties
VkQueueFamilyGlobalPriorityPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `priorityCount` is the number of supported global queue priorities in this queue family, and it **must** be greater than 0.
- `priorities` is an array of `VK_MAX_GLOBAL_PRIORITY_SIZE` `VkQueueGlobalPriority` enums representing all supported global queue priorities in this queue family. The first `priorityCount` elements of the array will be valid.

If the `VkQueueFamilyGlobalPriorityProperties` structure is included in the `pNext` chain of the `VkQueueFamilyProperties2` structure passed to `vkGetPhysicalDeviceQueueFamilyProperties2`, it is filled in with the list of supported global queue priorities for the indicated family.

The valid elements of `priorities` **must** not contain any duplicate values.

The valid elements of `priorities` **must** be a continuous sequence of `VkQueueGlobalPriority` enums in the ascending order.

NOTE

For example, returning `priorityCount` as 3 with supported `priorities` as `VK_QUEUE_GLOBAL_PRIORITY_LOW`, `VK_QUEUE_GLOBAL_PRIORITY_MEDIUM` and `VK_QUEUE_GLOBAL_PRIORITY_REALTIME` is not allowed.

Valid Usage (Implicit)

- `VOID-VkQueueFamilyGlobalPriorityProperties-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_QUEUE_FAMILY_GLOBAL_PRIORITY_PROPERTIES`

`VK_MAX_GLOBAL_PRIORITY_SIZE` is the length of an array of `VkQueueGlobalPriority` enumerants representing supported queue priorities, as returned in `VkQueueFamilyGlobalPriorityProperties::priorities`.

```
#define VK_MAX_GLOBAL_PRIORITY_SIZE 16U
```

```
#define VK_MAX_GLOBAL_PRIORITY_SIZE_KHR VK_MAX_GLOBAL_PRIORITY_SIZE
```

To enumerate the performance query counters available on a queue family of a physical device, call:

```
// Provided by VK_KHR_performance_query
VkResult vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR(
    VkPhysicalDevice          physicalDevice,
    uint32_t                  queueFamilyIndex,
    uint32_t*                  pCounterCount,
    VkPerformanceCounterKHR*   pCounters,
    VkPerformanceCounterDescriptionKHR* pCounterDescriptions);
```

- `physicalDevice` is the handle to the physical device whose queue family performance query counter properties will be queried.
- `queueFamilyIndex` is the index into the queue family of the physical device we want to get properties for.
- `pCounterCount` is a pointer to an integer related to the number of counters available or queried, as described below.

- `pCounters` is either `NULL` or a pointer to an array of `VkPerformanceCounterKHR` structures.
- `pCounterDescriptions` is either `NULL` or a pointer to an array of `VkPerformanceCounterDescriptionKHR` structures.

If `pCounters` is `NULL` and `pCounterDescriptions` is `NULL`, then the number of counters available is returned in `pCounterCount`. Otherwise, `pCounterCount` **must** point to a variable set by the application to the number of elements in the `pCounters`, `pCounterDescriptions`, or both arrays and on return the variable is overwritten with the number of structures actually written out. If `pCounterCount` is less than the number of counters available, at most `pCounterCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available counters were returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-pCounterCount-parameter
`pCounterCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-pCounters-parameter
If the value referenced by `pCounterCount` is not `0`, and `pCounters` is not `NULL`, `pCounters` **must** be a valid pointer to an array of `pCounterCount` `VkPerformanceCounterKHR` structures
- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-pCounterDescriptions-parameter
If the value referenced by `pCounterCount` is not `0`, and `pCounterDescriptions` is not `NULL`, `pCounterDescriptions` **must** be a valid pointer to an array of `pCounterCount` `VkPerformanceCounterDescriptionKHR` structures

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkPerformanceCounterKHR` structure is defined as:

```
// Provided by VK_KHR_performance_query
typedef struct VkPerformanceCounterKHR {
    VkStructureType      sType;
    void*                pNext;
    VkPerformanceCounterUnitKHR    unit;
    VkPerformanceCounterScopeKHR   scope;
    VkPerformanceCounterStorageKHR storage;
    uint8_t              uuid[VK_UUID_SIZE];
} VkPerformanceCounterKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `unit` is a `VkPerformanceCounterUnitKHR` specifying the unit that the counter data will record.
- `scope` is a `VkPerformanceCounterScopeKHR` specifying the scope that the counter belongs to.
- `storage` is a `VkPerformanceCounterStorageKHR` specifying the storage type that the counter's data uses.
- `uuid` is an array of size `VK_UUID_SIZE`, containing 8-bit values that represent a universally unique identifier for the counter of the physical device.

Valid Usage (Implicit)

- VUID-VkPerformanceCounterKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_KHR`
- VUID-VkPerformanceCounterKHR-pNext-pNext
`pNext` **must** be `NULL`

Performance counters have an associated unit. This unit describes how to interpret the performance counter result.

The performance counter unit types which **may** be returned in `VkPerformanceCounterKHR::unit` are:

```
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterUnitKHR {
    VK_PERFORMANCE_COUNTER_UNIT_GENERIC_KHR = 0,
    VK_PERFORMANCE_COUNTER_UNIT_PERCENTAGE_KHR = 1,
    VK_PERFORMANCE_COUNTER_UNIT_NANOSECONDS_KHR = 2,
    VK_PERFORMANCE_COUNTER_UNIT_BYTES_KHR = 3,
    VK_PERFORMANCE_COUNTER_UNIT_BYTES_PER_SECOND_KHR = 4,
    VK_PERFORMANCE_COUNTER_UNIT_KELVIN_KHR = 5,
    VK_PERFORMANCE_COUNTER_UNIT_WATTS_KHR = 6,
    VK_PERFORMANCE_COUNTER_UNIT_VOLTS_KHR = 7,
    VK_PERFORMANCE_COUNTER_UNIT_AMPS_KHR = 8,
    VK_PERFORMANCE_COUNTER_UNIT_HERTZ_KHR = 9,
    VK_PERFORMANCE_COUNTER_UNIT_CYCLES_KHR = 10,
} VkPerformanceCounterUnitKHR;
```

- `VK_PERFORMANCE_COUNTER_UNIT_GENERIC_KHR` - the performance counter unit is a generic data point.
- `VK_PERFORMANCE_COUNTER_UNIT_PERCENTAGE_KHR` - the performance counter unit is a percentage (%).
- `VK_PERFORMANCE_COUNTER_UNIT_NANOSECONDS_KHR` - the performance counter unit is a value of nanoseconds (ns).
- `VK_PERFORMANCE_COUNTER_UNIT_BYTES_KHR` - the performance counter unit is a value of bytes.
- `VK_PERFORMANCE_COUNTER_UNIT_BYTES_PER_SECOND_KHR` - the performance counter unit is a value of bytes/s.
- `VK_PERFORMANCE_COUNTER_UNIT_KELVIN_KHR` - the performance counter unit is a temperature reported in Kelvin.
- `VK_PERFORMANCE_COUNTER_UNIT_WATTS_KHR` - the performance counter unit is a value of watts (W).
- `VK_PERFORMANCE_COUNTER_UNIT_VOLTS_KHR` - the performance counter unit is a value of volts (V).
- `VK_PERFORMANCE_COUNTER_UNIT_AMPS_KHR` - the performance counter unit is a value of amps (A).
- `VK_PERFORMANCE_COUNTER_UNIT_HERTZ_KHR` - the performance counter unit is a value of hertz (Hz).
- `VK_PERFORMANCE_COUNTER_UNIT_CYCLES_KHR` - the performance counter unit is a value of cycles.

Performance counters have an associated scope. This scope describes the granularity of a performance counter.

The performance counter scope types which **may** be returned in `VkPerformanceCounterKHR::scope` are:

```
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterScopeKHR {
    VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR = 0,
    VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR = 1,
    VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR = 2,
    // VK_QUERY_SCOPE_COMMAND_BUFFER_KHR is a legacy alias
    VK_QUERY_SCOPE_COMMAND_BUFFER_KHR =
VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR,
    // VK_QUERY_SCOPE_RENDER_PASS_KHR is a legacy alias
    VK_QUERY_SCOPE_RENDER_PASS_KHR = VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR,
    // VK_QUERY_SCOPE_COMMAND_KHR is a legacy alias
    VK_QUERY_SCOPE_COMMAND_KHR = VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR,
} VkPerformanceCounterScopeKHR;
```

- **VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR** - the performance counter scope is a single complete command buffer.
- **VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR** - the performance counter scope is zero or more complete render passes. The performance query containing the performance counter **must** begin and end outside a render pass instance.
- **VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR** - the performance counter scope is zero or more commands.

Performance counters have an associated storage. This storage describes the payload of a counter result.

The performance counter storage types which **may** be returned in [VkPerformanceCounterKHR::storage](#) are:

```
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterStorageKHR {
    VK_PERFORMANCE_COUNTER_STORAGE_INT32_KHR = 0,
    VK_PERFORMANCE_COUNTER_STORAGE_INT64_KHR = 1,
    VK_PERFORMANCE_COUNTER_STORAGE_UINT32_KHR = 2,
    VK_PERFORMANCE_COUNTER_STORAGE_UINT64_KHR = 3,
    VK_PERFORMANCE_COUNTER_STORAGE_FLOAT32_KHR = 4,
    VK_PERFORMANCE_COUNTER_STORAGE_FLOAT64_KHR = 5,
} VkPerformanceCounterStorageKHR;
```

- **VK_PERFORMANCE_COUNTER_STORAGE_INT32_KHR** - the performance counter storage is a 32-bit signed integer.
- **VK_PERFORMANCE_COUNTER_STORAGE_INT64_KHR** - the performance counter storage is a 64-bit signed integer.
- **VK_PERFORMANCE_COUNTER_STORAGE_UINT32_KHR** - the performance counter storage is a 32-bit unsigned integer.
- **VK_PERFORMANCE_COUNTER_STORAGE_UINT64_KHR** - the performance counter storage is a 64-bit unsigned integer.

- `VK_PERFORMANCE_COUNTER_STORAGE_FLOAT32_KHR` - the performance counter storage is a 32-bit floating-point.
- `VK_PERFORMANCE_COUNTER_STORAGE_FLOAT64_KHR` - the performance counter storage is a 64-bit floating-point.

The `VkPerformanceCounterDescriptionKHR` structure is defined as:

```
// Provided by VK_KHR_performance_query
typedef struct VkPerformanceCounterDescriptionKHR {
    VkStructureType           sType;
    void*                     pNext;
    VkPerformanceCounterDescriptionFlagsKHR flags;
    char                      name[VK_MAX_DESCRIPTION_SIZE];
    char                      category[VK_MAX_DESCRIPTION_SIZE];
    char                      description[VK_MAX_DESCRIPTION_SIZE];
} VkPerformanceCounterDescriptionKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPerformanceCounterDescriptionFlagBitsKHR` indicating the usage behavior for the counter.
- `name` is an array of size `VK_MAX_DESCRIPTION_SIZE`, containing a null-terminated UTF-8 string specifying the name of the counter.
- `category` is an array of size `VK_MAX_DESCRIPTION_SIZE`, containing a null-terminated UTF-8 string specifying the category of the counter.
- `description` is an array of size `VK_MAX_DESCRIPTION_SIZE`, containing a null-terminated UTF-8 string specifying the description of the counter.

Valid Usage (Implicit)

- VUID-VkPerformanceCounterDescriptionKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_DESCRIPTION_KHR`
- VUID-VkPerformanceCounterDescriptionKHR-pNext-pNext
`pNext` **must** be `NULL`

Bits which **can** be set in `VkPerformanceCounterDescriptionKHR::flags`, specifying usage behavior of a performance counter, are:

```
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterDescriptionFlagBitsKHR {
    VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_BIT_KHR = 0x00000001,
    VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR = 0x00000002,
    // VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_KHR is a legacy alias
    VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_KHR =
VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_BIT_KHR,
    // VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_KHR is a legacy alias
    VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_KHR =
VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR,
} VkPerformanceCounterDescriptionFlagBitsKHR;
```

- `VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_BIT_KHR` specifies that recording the counter **may** have a noticeable performance impact.
- `VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR` specifies that concurrently recording the counter while other submitted command buffers are running **may** impact the accuracy of the recording.

```
// Provided by VK_KHR_performance_query
typedef VkFlags VkPerformanceCounterDescriptionFlagsKHR;
```

`VkPerformanceCounterDescriptionFlagsKHR` is a bitmask type for setting a mask of zero or more `VkPerformanceCounterDescriptionFlagBitsKHR`.

5.2. Devices

Device objects represent logical connections to physical devices. Each device exposes a number of *queue families* each having one or more *queues*. All queues in a queue family support the same operations.

As described in [Physical Devices](#), a Vulkan application will first query for all physical devices in a system. Each physical device **can** then be queried for its capabilities, including its queue and queue family properties. Once an acceptable physical device is identified, an application will create a corresponding logical device. The created logical device is then the primary interface to the physical device.

How to enumerate the physical devices in a system and query those physical devices for their queue family properties is described in the [Physical Device Enumeration](#) section above.

A single logical device **can** be created from multiple physical devices, if those physical devices belong to the same device group. A *device group* is a set of physical devices that support accessing each other's memory and recording a single command buffer that **can** be executed on all the physical devices. Device groups are enumerated by calling `vkEnumeratePhysicalDeviceGroups`, and a logical device is created from a subset of the physical devices in a device group by passing the physical devices through `VkDeviceGroupDeviceCreateInfo`. For two physical devices to be in the same device group, they **must** support identical extensions, features, and properties.

NOTE

Physical devices in the same device group **must** be so similar because there are no rules for how different features/properties would interact. They **must** return the same values for nearly every invariant `vkGetPhysicalDevice*` feature, property, capability, etc., but could potentially differ for certain queries based on things like having a different display connected, or a different compositor. The specification does not attempt to enumerate which state is in each category, because such a list would quickly become out of date.

To retrieve a list of the device groups present in the system, call:

```
// Provided by VK_VERSION_1_1
VkResult vkEnumeratePhysicalDeviceGroups(
    VkInstance          instance,
    uint32_t*           pPhysicalDeviceGroupCount,
    VkPhysicalDeviceGroupProperties* pPhysicalDeviceGroupProperties);
```

- `instance` is a handle to a Vulkan instance previously created with `vkCreateInstance`.
- `pPhysicalDeviceGroupCount` is a pointer to an integer related to the number of device groups available or queried, as described below.
- `pPhysicalDeviceGroupProperties` is either `NULL` or a pointer to an array of `VkPhysicalDeviceGroupProperties` structures.

If `pPhysicalDeviceGroupProperties` is `NULL`, then the number of device groups available is returned in `pPhysicalDeviceGroupCount`. Otherwise, `pPhysicalDeviceGroupCount` **must** point to a variable set by the application to the number of elements in the `pPhysicalDeviceGroupProperties` array, and on return the variable is overwritten with the number of structures actually written to `pPhysicalDeviceGroupProperties`. If `pPhysicalDeviceGroupCount` is less than the number of device groups available, at most `pPhysicalDeviceGroupCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available device groups were returned.

Every physical device **must** be in exactly one device group.

Valid Usage (Implicit)

- VUID-vkEnumeratePhysicalDeviceGroups-instance-parameter
`instance` **must** be a valid `VkInstance` handle
- VUID-vkEnumeratePhysicalDeviceGroups-pPhysicalDeviceGroupCount-parameter
`pPhysicalDeviceGroupCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkEnumeratePhysicalDeviceGroups-pPhysicalDeviceGroupProperties-parameter
If the value referenced by `pPhysicalDeviceGroupCount` is not `0`, and `pPhysicalDeviceGroupProperties` is not `NULL`, `pPhysicalDeviceGroupProperties` **must** be a valid pointer to an array of `pPhysicalDeviceGroupCount` `VkPhysicalDeviceGroupProperties` structures

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkPhysicalDeviceGroupProperties` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceGroupProperties {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           physicalDeviceCount;
    VkPhysicalDevice    physicalDevices[VK_MAX_DEVICE_GROUP_SIZE];
    VkBool32           subsetAllocation;
} VkPhysicalDeviceGroupProperties;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `physicalDeviceCount` is the number of physical devices in the group.
- `physicalDevices` is an array of `VK_MAX_DEVICE_GROUP_SIZE` `VkPhysicalDevice` handles representing all physical devices in the group. The first `physicalDeviceCount` elements of the array will be valid.
- `subsetAllocation` specifies whether logical devices created from the group support allocating device memory on a subset of devices, via the `deviceMask` member of the `VkMemoryAllocateFlagsInfo`. If this is `VK_FALSE`, then all device memory allocations are made across all physical devices in the group. If `physicalDeviceCount` is 1, then `subsetAllocation` **must** be `VK_FALSE`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceGroupProperties-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GROUP_PROPERTIES`
- VUID-VkPhysicalDeviceGroupProperties-pNext-pNext
`pNext` **must** be `NULL`

`VK_MAX_DEVICE_GROUP_SIZE` is the length of an array containing `VkPhysicalDevice` handle values representing all physical devices in a group, as returned in `VkPhysicalDeviceGroupProperties::physicalDevices`.

```
#define VK_MAX_DEVICE_GROUP_SIZE 32U
```

5.2.1. Device Creation

Logical devices are represented by `VkDevice` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkDevice)
```

A logical device is created as a *connection* to a physical device. To create a logical device, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateDevice(
    VkPhysicalDevice          physicalDevice,
    const VkDeviceCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDevice*                 pDevice);
```

- `physicalDevice` **must** be one of the device handles returned from a call to `vkEnumeratePhysicalDevices` (see [Physical Device Enumeration](#)).
- `pCreateInfo` is a pointer to a `VkDeviceCreateInfo` structure containing information about how to create the device.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pDevice` is a pointer to a handle in which the created `VkDevice` is returned.

`vkCreateDevice` verifies that extensions and features requested in the `ppEnabledExtensionNames` and `pEnabledFeatures` members of `pCreateInfo`, respectively, are supported by the implementation. If any requested extension is not supported, `vkCreateDevice` **must** return `VK_ERROR_EXTENSION_NOT_PRESENT`. If any requested feature is not supported, `vkCreateDevice` **must** return `VK_ERROR_FEATURE_NOT_PRESENT`. Support for extensions **can** be checked before creating a device by querying `vkEnumerateDeviceExtensionProperties`. Support for features **can** similarly be checked by querying `vkGetPhysicalDeviceFeatures`.

`vkCreateDevice` also verifies that mandatory structures and features for Vulkan SC are present and enabled:

- The `pNext` chain **must** include a `VkDeviceObjectReservationCreateInfo` structure.
- The `pNext` chain **must** include a `VkPhysicalDeviceVulkanSC10Features` structure.

If any of these conditions are not met, `vkCreateDevice` **must** return `VK_ERROR_INITIALIZATION_FAILED`.

After verifying and enabling the extensions the `VkDevice` object is created and returned to the application.

An implementation **may** allow multiple logical devices to be created from the same physical device. Logical device creation **may** fail due to lack of device-specific resources, including too many other logical devices, in addition to other errors. If that occurs, `vkCreateDevice` will return `VK_ERROR_TOO_MANY_OBJECTS`.

If the pipeline cache data pointed to by the `pInitialData` member of any element of `VkDeviceObjectReservationCreateInfo::pPipelineCacheCreateInfos` is not compatible with the device, then `vkCreateDevice` will return `VK_ERROR_INVALID_PIPELINE_CACHE_DATA`.

Some implementations **may** only accept pipeline cache data pointers that conform to platform and/or implementation specific alignment requirements. These alignment requirements cannot exceed 8 bytes. If any of the pipeline cache data pointers specified in the `pInitialData` member of the elements of `VkDeviceObjectReservationCreateInfo::pPipelineCacheCreateInfos` are not aligned according to these requirements, then `vkCreateDevice` will return `VK_ERROR_INVALID_PIPELINE_CACHE_DATA`.

To provide *application parameters* at device creation time, an application **can** link one or more `VkApplicationParametersEXT` structures to the `pNext` chain of the `VkDeviceCreateInfo` structure.

If the `VkApplicationParametersEXT::vendorID` and `VkApplicationParametersEXT::deviceID` values do not match the `VkPhysicalDeviceProperties::vendorID` and `VkPhysicalDeviceProperties::deviceID` of `physicalDevice`, `vkCreateDevice` **must** return `VK_ERROR_INITIALIZATION_FAILED`.

If `VkApplicationParametersEXT::key` is not a valid implementation-defined application parameter key for the device being created, or if `value` is not a valid value for the specified `key`, `vkCreateDevice` will fail and return `VK_ERROR_INITIALIZATION_FAILED`.

For any implementation-defined application parameter `key` that exists but is not set by the application, the implementation-specific default value is used.

Valid Usage

- VUID-vkCreateDevice-ppEnabledExtensionNames-01387
All **required device extensions** for each extension in the `VkDeviceCreateInfo::ppEnabledExtensionNames` list **must** also be present in that list.
- VUID-vkCreateDevice-key-05092
The `key` value of each `VkApplicationParametersEXT` structure in the `VkDeviceCreateInfo::pNext` chain **must** be unique
- VUID-vkCreateDevice-deviceMemoryRequestCount-05095
The sum of `deviceMemoryRequestCount` over all `VkDeviceObjectReservationCreateInfo` structures included in the `VkDeviceCreateInfo::pNext` chain **must** be less than or equal to `VkPhysicalDeviceLimits::maxMemoryAllocationCount`
- VUID-vkCreateDevice-samplerRequestCount-05096
The sum of `samplerRequestCount` over all `VkDeviceObjectReservationCreateInfo` structures included in the `VkDeviceCreateInfo::pNext` chain **must** be less than or equal to

Valid Usage (Implicit)

- VUID-vkCreateDevice-physicalDevice-parameter
physicalDevice must be a valid [VkPhysicalDevice](#) handle
- VUID-vkCreateDevice-pCreateInfo-parameter
pCreateInfo must be a valid pointer to a valid [VkDeviceCreateInfo](#) structure
- VUID-vkCreateDevice-pAllocator-null
pAllocator must be **NULL**
- VUID-vkCreateDevice-pDevice-parameter
pDevice must be a valid pointer to a [VkDevice](#) handle

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_DEVICE_LOST**
- **VK_ERROR_EXTENSION_NOT_PRESENT**
- **VK_ERROR_FEATURE_NOT_PRESENT**
- **VK_ERROR_INITIALIZATION_FAILED**
- **VK_ERROR_INVALID_PIPELINE_CACHE_DATA**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_TOO_MANY_OBJECTS**
- **VK_ERROR_UNKNOWN**
- **VK_ERROR_VALIDATION_FAILED**

The [VkDeviceCreateInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkDeviceCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkDeviceCreateFlags       flags;
    uint32_t                  queueCreateInfoCount;
    const VkDeviceQueueCreateInfo* pQueueCreateInfos;
    // enabledLayerCount is legacy and should not be used
    uint32_t                  enabledLayerCount;
    // ppEnabledLayerNames is legacy and should not be used
    const char* const*        ppEnabledLayerNames;
    uint32_t                  enabledExtensionCount;
    const char* const*        ppEnabledExtensionNames;
    const VkPhysicalDeviceFeatures* pEnabledFeatures;
} VkDeviceCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `queueCreateInfoCount` is the unsigned integer size of the `pQueueCreateInfos` array. Refer to the [Queue Creation](#) section below for further details.
- `pQueueCreateInfos` is a pointer to an array of `VkDeviceQueueCreateInfo` structures describing the queues that are requested to be created along with the logical device. Refer to the [Queue Creation](#) section below for further details.
- `enabledLayerCount` is legacy and ignored. See [Device Layers: Superseded via instance layers](#).
- `ppEnabledLayerNames` is legacy and ignored. See [Device Layers: Superseded via instance layers](#).
- `enabledExtensionCount` is the number of device extensions to enable.
- `ppEnabledExtensionNames` is a pointer to an array of `enabledExtensionCount` null-terminated UTF-8 strings containing the names of extensions to enable for the created device. See the [Extensions](#) section for further details.
- `pEnabledFeatures` is `NULL` or a pointer to a `VkPhysicalDeviceFeatures` structure containing boolean indicators of all the features to be enabled. Refer to the [Features](#) section for further details. This field is legacy. See [Physical Device Queries: Superseded via version 2](#).

Valid Usage

- VUID-VkDeviceCreateInfo-queueFamilyIndex-02802
The `queueFamilyIndex` member of each element of `pQueueCreateInfos` **must** be unique within `pQueueCreateInfos`, except that two members can share the same `queueFamilyIndex` if one describes protected-capable queues and one describes queues that are not protected-capable
- VUID-VkDeviceCreateInfo-pQueueCreateInfos-06755
If multiple elements of `pQueueCreateInfos` share the same `queueFamilyIndex`, the sum of

their `queueCount` members **must** be less than or equal to the `queueCount` member of the `VkQueueFamilyProperties` structure, as returned by `vkGetPhysicalDeviceQueueFamilyProperties` in the `pQueueFamilyProperties[queueFamilyIndex]`

- VUID-VkDeviceCreateInfo-pQueueCreateInfos-06654

If multiple elements of `pQueueCreateInfos` share the same `queueFamilyIndex`, then all of such elements **must** have the same global priority level, which **can** be specified explicitly by the including a `VkDeviceQueueGlobalPriorityCreateInfo` structure in the `pNext` chain, or by the implicit default value

- VUID-VkDeviceCreateInfo-pNext-00373

If the `pNext` chain includes a `VkPhysicalDeviceFeatures2` structure, then `pEnabledFeatures` **must** be `NULL`

- VUID-VkDeviceCreateInfo-pNext-02829

If the `pNext` chain includes a `VkPhysicalDeviceVulkan11Features` structure, then it **must** not include a `VkPhysicalDevice16BitStorageFeatures`, `VkPhysicalDeviceMultiviewFeatures`, `VkPhysicalDeviceVariablePointersFeatures`, `VkPhysicalDeviceProtectedMemoryFeatures`, `VkPhysicalDeviceSamplerYcbcrConversionFeatures`, or `VkPhysicalDeviceShaderDrawParametersFeatures` structure

- VUID-VkDeviceCreateInfo-pNext-02830

If the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then it **must** not include a `VkPhysicalDevice8BitStorageFeatures`, `VkPhysicalDeviceShaderAtomicInt64Features`, `VkPhysicalDeviceShaderFloat16Int8Features`, `VkPhysicalDeviceDescriptorIndexingFeatures`, `VkPhysicalDeviceScalarBlockLayoutFeatures`, `VkPhysicalDeviceImagelessFramebufferFeatures`, `VkPhysicalDeviceUniformBufferStandardLayoutFeatures`, `VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures`, `VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures`, `VkPhysicalDeviceHostQueryResetFeatures`, `VkPhysicalDeviceTimelineSemaphoreFeatures`, `VkPhysicalDeviceBufferDeviceAddressFeatures`, or `VkPhysicalDeviceVulkanMemoryModelFeatures` structure

- VUID-VkDeviceCreateInfo-None-04896

If the `sparseImageInt64Atomics` feature is enabled, `shaderImageInt64Atomics` **must** be enabled

- VUID-VkDeviceCreateInfo-None-04897

If the `sparseImageFloat32Atomics` feature is enabled, `shaderImageFloat32Atomics` **must** be enabled

- VUID-VkDeviceCreateInfo-None-04898

If the `sparseImageFloat32AtomicAdd` feature is enabled, `shaderImageFloat32AtomicAdd` **must** be enabled

- VUID-VkDeviceCreateInfo-robustBufferAccess-10247

If the `robustBufferAccess` feature is enabled, and `robustBufferAccessUpdateAfterBind` is

`VK_FALSE`, then `descriptorBindingUniformBufferUpdateAfterBind`, `descriptorBindingStorageBufferUpdateAfterBind`, `descriptorBindingUniformTexelBufferUpdateAfterBind`, and `descriptorBindingStorageTexelBufferUpdateAfterBind` **must** not be enabled

- `VUID-VkDeviceCreateInfo-None-10778`
`queueCreateInfoCount` **must** be greater than 0

Valid Usage (Implicit)

- `VUID-VkDeviceCreateInfo-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_CREATE_INFO`
- `VUID-VkDeviceCreateInfo-pNext-pNext`
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkApplicationParametersEXT`, `VkDeviceGroupDeviceCreateInfo`, `VkDeviceObjectReservationCreateInfo`, `VkDeviceSemaphoreSciSyncPoolReservationCreateInfoNV`, `VkFaultCallbackInfo`, `VkPerformanceQueryReservationInfoKHR`, `VkPhysicalDevice16BitStorageFeatures`, `VkPhysicalDevice4444FormatsFeaturesEXT`, `VkPhysicalDevice8BitStorageFeatures`, `VkPhysicalDeviceASTCDecodeFeaturesEXT`, `VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT`, `VkPhysicalDeviceBufferDeviceAddressFeatures`, `VkPhysicalDeviceColorWriteEnableFeaturesEXT`, `VkPhysicalDeviceCustomBorderColorFeaturesEXT`, `VkPhysicalDeviceDepthClipEnableFeaturesEXT`, `VkPhysicalDeviceDescriptorIndexingFeatures`, `VkPhysicalDeviceExtendedDynamicState2FeaturesEXT`, `VkPhysicalDeviceExtendedDynamicStateFeaturesEXT`, `VkPhysicalDeviceExternalMemorySciBufFeaturesNV`, `VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX`, `VkPhysicalDeviceExternalSciSync2FeaturesNV`, `VkPhysicalDeviceExternalSciSyncFeaturesNV`, `VkPhysicalDeviceFeatures2`, `VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT`, `VkPhysicalDeviceFragmentShadingRateFeaturesKHR`, `VkPhysicalDeviceGlobalPriorityQueryFeatures`, `VkPhysicalDeviceHostQueryResetFeatures`, `VkPhysicalDeviceImageRobustnessFeatures`, `VkPhysicalDeviceImagelessFramebufferFeatures`, `VkPhysicalDeviceIndexTypeUint8Features`, `VkPhysicalDeviceLineRasterizationFeatures`, `VkPhysicalDeviceMultiviewFeatures`, `VkPhysicalDevicePerformanceQueryFeaturesKHR`, `VkPhysicalDeviceProtectedMemoryFeatures`, `VkPhysicalDeviceRobustness2FeaturesKHR`, `VkPhysicalDeviceSamplerYcbcrConversionFeatures`, `VkPhysicalDeviceScalarBlockLayoutFeatures`, `VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures`, `VkPhysicalDeviceShaderAtomicFloatFeaturesEXT`, `VkPhysicalDeviceShaderAtomicInt64Features`, `VkPhysicalDeviceShaderClockFeaturesKHR`, `VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures`,

VkPhysicalDeviceShaderDrawParametersFeatures,
 VkPhysicalDeviceShaderFloat16Int8Features,
 VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT,
 VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures,
 VkPhysicalDeviceShaderTerminateInvocationFeatures,
 VkPhysicalDeviceSubgroupSizeControlFeatures,
 VkPhysicalDeviceSynchronization2Features,
 VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT,
 VkPhysicalDeviceTextureCompressionASTCHDRFeatures,
 VkPhysicalDeviceTimelineSemaphoreFeatures,
 VkPhysicalDeviceUniformBufferStandardLayoutFeatures,
 VkPhysicalDeviceVariablePointersFeatures,
 VkPhysicalDeviceVertexAttributeDivisorFeatures,
 VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT,
 VkPhysicalDeviceVulkan11Features, VkPhysicalDeviceVulkan12Features,
 VkPhysicalDeviceVulkanMemoryModelFeatures, VkPhysicalDeviceVulkanSC10Features,
 VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT, or
 VkPhysicalDeviceYcbcrImageArraysFeaturesEXT

- VUID-VkDeviceCreateInfo-sType-unique
The **sType** value of each structure in the **pNext** chain **must** be unique, with the exception of structures of type [VkApplicationParametersEXT](#), [VkDeviceObjectReservationCreateInfo](#), [VkDeviceSemaphoreSciSyncPoolReservationCreateInfoNV](#), or [VkPerformanceQueryReservationInfoKHR](#)
- VUID-VkDeviceCreateInfo-flags-zero-bitmask
flags **must** be 0
- VUID-VkDeviceCreateInfo-pQueueCreateInfos-parameter
If **queueCreateInfoCount** is not 0, **pQueueCreateInfos** **must** be a valid pointer to an array of **queueCreateInfoCount** valid [VkDeviceQueueCreateInfo](#) structures
- VUID-VkDeviceCreateInfo-ppEnabledLayerNames-parameter
If **enabledLayerCount** is not 0, **ppEnabledLayerNames** **must** be a valid pointer to an array of **enabledLayerCount** null-terminated UTF-8 strings
- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-parameter
If **enabledExtensionCount** is not 0, **ppEnabledExtensionNames** **must** be a valid pointer to an array of **enabledExtensionCount** null-terminated UTF-8 strings
- VUID-VkDeviceCreateInfo-pEnabledFeatures-parameter
If **pEnabledFeatures** is not **NULL**, **pEnabledFeatures** **must** be a valid pointer to a valid [VkPhysicalDeviceFeatures](#) structure

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkDeviceCreateFlags;
```

VkDeviceCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

A logical device **can** be created that connects to one or more physical devices by adding a

`VkDeviceGroupDeviceCreateInfo` structure to the `pNext` chain of `VkDeviceCreateInfo`. The `VkDeviceGroupDeviceCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupDeviceCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           physicalDeviceCount;
    const VkPhysicalDevice* pPhysicalDevices;
} VkDeviceGroupDeviceCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `physicalDeviceCount` is the number of elements in the `pPhysicalDevices` array.
- `pPhysicalDevices` is a pointer to an array of physical device handles belonging to the same device group.

The elements of the `pPhysicalDevices` array are an ordered list of the physical devices that the logical device represents. These **must** be a subset of a single device group, and need not be in the same order as they were enumerated. The order of the physical devices in the `pPhysicalDevices` array determines the *device index* of each physical device, with element `i` being assigned a device index of `i`. Certain commands and structures refer to one or more physical devices by using device indices or *device masks* formed using device indices.

A logical device created without using `VkDeviceGroupDeviceCreateInfo`, or with `physicalDeviceCount` equal to zero, is equivalent to a `physicalDeviceCount` of one and `pPhysicalDevices` pointing to the `physicalDevice` parameter to `vkCreateDevice`. In particular, the device index of that physical device is zero.

Valid Usage

- VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-00375
Each element of `pPhysicalDevices` **must** be unique
- VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-00376
All elements of `pPhysicalDevices` **must** be in the same device group as enumerated by `vkEnumeratePhysicalDeviceGroups`
- VUID-VkDeviceGroupDeviceCreateInfo-physicalDeviceCount-00377
If `physicalDeviceCount` is not 0, the `physicalDevice` parameter of `vkCreateDevice` **must** be an element of `pPhysicalDevices`

Valid Usage (Implicit)

- VUID-VkDeviceGroupDeviceCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_DEVICE_CREATE_INFO`

- VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-parameter

If `physicalDeviceCount` is not 0, `pPhysicalDevices` **must** be a valid pointer to an array of `physicalDeviceCount` valid `VkPhysicalDevice` handles

Data structures for objects are reserved by the implementation at device creation time. The application **must** provide upper bounds on numbers of objects and other limits at device creation time. To reserve data structures for use by objects created from this device, add a `VkDeviceObjectReservationCreateInfo` structure to the `pNext` chain of the `VkDeviceCreateInfo` structure.

```

// Provided by VKSC_VERSION_1_0
typedef struct VkDeviceObjectReservationCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    uint32_t                  pipelineCacheCreateInfoCount;
    const VkPipelineCacheCreateInfo* pPipelineCacheCreateInfos;
    uint32_t                  pipelinePoolSizeCount;
    const VkPipelinePoolSize* pPipelinePoolSizes;
    uint32_t                  semaphoreRequestCount;
    uint32_t                  commandBufferRequestCount;
    uint32_t                  fenceRequestCount;
    uint32_t                  deviceMemoryRequestCount;
    uint32_t                  bufferRequestCount;
    uint32_t                  imageRequestCount;
    uint32_t                  eventRequestCount;
    uint32_t                  queryPoolRequestCount;
    uint32_t                  bufferViewRequestCount;
    uint32_t                  imageViewRequestCount;
    uint32_t                  layeredImageViewRequestCount;
    uint32_t                  pipelineCacheRequestCount;
    uint32_t                  pipelineLayoutRequestCount;
    uint32_t                  renderPassRequestCount;
    uint32_t                  graphicsPipelineRequestCount;
    uint32_t                  computePipelineRequestCount;
    uint32_t                  descriptorSetLayoutRequestCount;
    uint32_t                  samplerRequestCount;
    uint32_t                  descriptorPoolRequestCount;
    uint32_t                  descriptorSetRequestCount;
    uint32_t                  framebufferRequestCount;
    uint32_t                  commandPoolRequestCount;
    uint32_t                  samplerYcbcrConversionRequestCount;
    uint32_t                  surfaceRequestCount;
    uint32_t                  swapchainRequestCount;
    uint32_t                  displayModeRequestCount;
    uint32_t                  subpassDescriptionRequestCount;
    uint32_t                  attachmentDescriptionRequestCount;
    uint32_t                  descriptorSetLayoutBindingRequestCount;
    uint32_t                  descriptorSetLayoutBindingLimit;
    uint32_t                  maxImageViewMipLevels;
    uint32_t                  maxImageViewArrayLayers;
    uint32_t                  maxLayeredImageViewMipLevels;
    uint32_t                  maxOcclusionQueriesPerPool;
    uint32_t                  maxPipelineStatisticsQueriesPerPool;
    uint32_t                  maxTimestampQueriesPerPool;
    uint32_t                  maxImmutableSamplersPerDescriptorSetLayout;
} VkDeviceObjectReservationCreateInfo;

```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.

- `pipelineCacheCreateInfoCount` is the length of the `pPipelineCacheCreateInfos` array.
- `pPipelineCacheCreateInfos` is a pointer to an array of `VkPipelineCacheCreateInfo` structures that contain the creation information of the pipeline caches that **can** be created on this device.
- `pipelinePoolSizeCount` is the length of the `pPipelinePoolSizes` array.
- `pPipelinePoolSizes` is a pointer to an array of `VkPipelinePoolSize` structures requesting memory be reserved for pipelines of the specified sizes.
- `semaphoreRequestCount` is the requested maximum number of `VkSemaphore` objects that **can** exist at the same time.
- `commandBufferRequestCount` is the requested maximum number of `VkCommandBuffer` objects that **can** be reserved by all `VkCommandPool` objects.
- `fenceRequestCount` is the requested maximum number of `VkFence` objects that **can** exist at the same time.
- `deviceMemoryRequestCount` is the requested maximum number of `VkDeviceMemory` objects that **can** exist at the same time.
- `bufferRequestCount` is the requested maximum number of `VkBuffer` objects that **can** exist at the same time.
- `imageRequestCount` is the requested maximum number of `VkImage` objects that **can** exist at the same time.
- `eventRequestCount` is the requested maximum number of `VkEvent` objects that **can** exist at the same time.
- `queryPoolRequestCount` is the requested maximum number of `VkQueryPool` objects that **can** exist at the same time.
- `bufferViewRequestCount` is the requested maximum number of `VkBufferView` objects that **can** exist at the same time.
- `imageViewRequestCount` is the requested maximum number of `VkImageView` objects that **can** exist at the same time.
- `layeredImageViewRequestCount` is the requested maximum number `VkImageView` objects created with `VkImageViewCreateInfo::subresourceRange.layerCount` greater than 1 that **can** exist at the same time.
- `pipelineCacheRequestCount` is the requested maximum number of `VkPipelineCache` objects that **can** exist at the same time.
- `pipelineLayoutRequestCount` is the requested maximum number of `VkPipelineLayout` objects that **can** exist at the same time.
- `renderPassRequestCount` is the requested maximum number of `VkRenderPass` objects that **can** exist at the same time.
- `graphicsPipelineRequestCount` is the requested maximum number of graphics `VkPipeline` objects that **can** exist at the same time.
- `computePipelineRequestCount` is the requested maximum number of compute `VkPipeline` objects that **can** exist at the same time.
- `descriptorSetLayoutRequestCount` is the requested maximum number of `VkDescriptorSetLayout`

objects that **can** exist at the same time.

- `samplerRequestCount` is the requested maximum number of `VkSampler` objects that **can** exist at the same time.
- `descriptorPoolRequestCount` is the requested maximum number of `VkDescriptorPool` objects that **can** exist at the same time.
- `descriptorSetRequestCount` is the requested maximum number of `VkDescriptorSet` objects that **can** exist at the same time.
- `framebufferRequestCount` is the requested maximum number of `VkFramebuffer` objects that **can** exist at the same time.
- `commandPoolRequestCount` is the requested maximum number of `VkCommandPool` objects that **can** exist at the same time.
- `samplerYcbcrConversionRequestCount` is the requested maximum number of `VkSamplerYcbcrConversion` objects that **can** exist at the same time.
- `surfaceRequestCount` is legacy and implementations **must** ignore it.
- `swapchainRequestCount` is the requested maximum number of `VkSwapchainKHR` objects that **can** exist at the same time.
- `displayModeRequestCount` is legacy and implementations **must** ignore it.
- `subpassDescriptionRequestCount` is the requested maximum sum of all `VkRenderPassCreateInfo2::subpassCount` values across all `VkRenderPass` objects that **can** exist at the same time.
- `attachmentDescriptionRequestCount` is the requested maximum sum of all `VkRenderPassCreateInfo2::attachmentCount` values across all `VkRenderPass` objects that **can** exist at the same time.
- `descriptorSetLayoutBindingRequestCount` is the requested maximum sum of all `VkDescriptorSetLayoutCreateInfo::bindingCount` values across all `VkDescriptorSetLayout` objects that **can** exist at the same time.
- `descriptorSetLayoutBindingLimit` is one greater than the maximum value of `VkDescriptorSetLayoutBinding::binding` that **can** be used.
- `maxImageViewMipLevels` is the maximum value of `VkImageViewCreateInfo::subresourceRange.levelCount` that **can** be used.
- `maxImageViewArrayLayers` is the maximum value of `VkImageViewCreateInfo::subresourceRange.layerCount` that **can** be used.
- `maxLayeredImageViewMipLevels` is the maximum value of `VkImageViewCreateInfo::subresourceRange.levelCount` that **can** be used when `VkImageViewCreateInfo::subresourceRange.layerCount` is greater than 1.
- `maxOcclusionQueriesPerPool` is the requested maximum number of `VK_QUERY_TYPE_OCCLUSION` queries that **can** exist at the same time in a single query pool.
- `maxPipelineStatisticsQueriesPerPool` is the requested maximum number of `VK_QUERY_TYPE_PIPELINE_STATISTICS` queries that **can** exist at the same time in a single query pool.

- `maxTimestampQueriesPerPool` is the requested maximum number of `VK_QUERY_TYPE_TIMESTAMP` queries that **can** exist at the same time in a single query pool.
- `maxImmutableSamplersPerDescriptorSetLayout` is the requested maximum number of immutable samplers that can be used across all bindings in a descriptor set layout.

Multiple `VkDeviceObjectReservationCreateInfo` structures **can** be chained together. The maximum value from all instances of `maxImageViewMipLevels`, `maxImageViewArrayLayers`, `maxLayeredImageViewMipLevels`, `descriptorSetLayoutBindingLimit`, `maxOcclusionQueriesPerPool`, `maxPipelineStatisticsQueriesPerPool`, `maxTimestampQueriesPerPool`, and `maxImmutableSamplersPerDescriptorSetLayout` will be reserved. For the remaining members, the sum of the requested resources from all instances of `VkDeviceObjectReservationCreateInfo` will be reserved.

If `VkPhysicalDeviceVulkanSC10Properties::deviceDestroyFreesMemory` is `VK_TRUE`, the reserved memory is returned to the system when the device is destroyed, otherwise it **may** not be returned to the system until the process is terminated.

Valid Usage

- VUID-VkDeviceObjectReservationCreateInfo-maxImageViewArrayLayers-05014 `maxImageViewArrayLayers` **must** be less than or equal to `VkPhysicalDeviceLimits::maxImageArrayLayers`
- VUID-VkDeviceObjectReservationCreateInfo-maxImageViewMipLevels-05015 `maxImageViewMipLevels` **must** be less than or equal to the number of levels in the complete mipmap chain based on the maximum of `VkPhysicalDeviceLimits::maxImageDimension1D`, `maxImageDimension2D`, `maxImageDimension3D`, and `maxImageDimensionCube`
- VUID-VkDeviceObjectReservationCreateInfo-maxLayeredImageViewMipLevels-05016 `maxLayeredImageViewMipLevels` **must** be less than or equal to the number of levels in the complete mipmap chain based on `VkPhysicalDeviceLimits::maxImageDimension1D`, `maxImageDimension2D`, `maxImageDimension3D`, and `maxImageDimensionCube`
- VUID-VkDeviceObjectReservationCreateInfo-subpassDescriptionRequestCount-05017 `subpassDescriptionRequestCount` **must** be less than or equal to `renderPassRequestCount` multiplied by `VkPhysicalDeviceVulkanSC10Properties::maxRenderPassSubpasses`
- VUID-VkDeviceObjectReservationCreateInfo-attachmentDescriptionRequestCount-05018 `attachmentDescriptionRequestCount` **must** be less than or equal to `renderPassRequestCount` multiplied by `VkPhysicalDeviceVulkanSC10Properties::maxFramebufferAttachments`

Valid Usage (Implicit)

- VUID-VkDeviceObjectReservationCreateInfo-sType-sType `sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_OBJECT_RESERVATION_CREATE_INFO`
- VUID-VkDeviceObjectReservationCreateInfo-pPipelineCacheCreateInfos-parameter If `pipelineCacheCreateInfoCount` is not 0, `pPipelineCacheCreateInfos` **must** be a valid pointer to an array of `pipelineCacheCreateInfoCount` valid `VkPipelineCacheCreateInfo`

structures

- VUID-VkDeviceObjectReservationCreateInfo-pPipelinePoolSizes-parameter

If `pipelinePoolSizeCount` is not 0, `pPipelinePoolSizes` **must** be a valid pointer to an array of `pipelinePoolSizeCount` valid `VkPipelinePoolSize` structures

If the `pNext` chain of `VkDeviceObjectReservationCreateInfo` includes a `VkPerformanceQueryReservationInfoKHR` structure, then the structure indicates upper bounds on the number of performance queries that **can** exist at the same time in a query pool.

The `VkPerformanceQueryReservationInfoKHR` structure is defined as:

```
// Provided by VKSC_VERSION_1_0 with VK_KHR_performance_query
typedef struct VkPerformanceQueryReservationInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           maxPerformanceQueriesPerPool;
} VkPerformanceQueryReservationInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxPerformanceQueriesPerPool` is the requested maximum number of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` queries that **can** exist at the same time in a single query pool.

If the `VkDeviceObjectReservationCreateInfo::pNext` chain does not include this structure, then `maxPerformanceQueriesPerPool` defaults to 0.

Multiple `VkPerformanceQueryReservationInfoKHR` structures can be chained together. The maximum value from all instances of `maxPerformanceQueriesPerPool` will be reserved.

Valid Usage (Implicit)

- VUID-VkPerformanceQueryReservationInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PERFORMANCE_QUERY_RESERVATION_INFO_KHR`

If the `pNext` chain of `VkDeviceObjectReservationCreateInfo` includes a `VkDeviceSemaphoreSciSyncPoolReservationCreateInfoNV` structure, then the structure indicates the maximum number of `VkSemaphoreSciSyncPoolNV` objects that **can** exist at the same time.

The `VkDeviceSemaphoreSciSyncPoolReservationCreateInfoNV` structure is defined as:

```
// Provided by VKSC_VERSION_1_0 with VK_NV_external_sci_sync2
typedef struct VkDeviceSemaphoreSciSyncPoolReservationCreateInfoNV {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           semaphoreSciSyncPoolRequestCount;
} VkDeviceSemaphoreSciSyncPoolReservationCreateInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphoreSciSyncPoolRequestCount` is the requested maximum number of `VkSemaphoreSciSyncPoolNV` objects that **can** exist at the same time.

If the `VkDeviceObjectReservationCreateInfo::pNext` chain does not include this structure, then `semaphoreSciSyncPoolRequestCount` defaults to 0.

Multiple `VkDeviceSemaphoreSciSyncPoolReservationCreateInfoNV` structures **can** be chained together. The sum of the `semaphoreSciSyncPoolRequestCount` values from all instances of `VkDeviceSemaphoreSciSyncPoolReservationCreateInfoNV` will be reserved.

Valid Usage (Implicit)

- VUID-VkDeviceSemaphoreSciSyncPoolReservationCreateInfoNV-sType-sType **must** be `VK_STRUCTURE_TYPE_DEVICE_SEMAPHORE_SCI_SYNC_POOL_RESERVATION_CREATE_INFO_NV`

Memory for pipelines is reserved by the implementation at device creation time. The application specifies sizes to be reserved and a count for each size, and when a pipeline is created the application specifies which size to use.

```
// Provided by VKSC_VERSION_1_0
typedef struct VkPipelinePoolSize {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceSize        poolEntrySize;
    uint32_t           poolEntryCount;
} VkPipelinePoolSize;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `poolEntrySize` is the size to reserve for each entry.
- `poolEntryCount` is the number of entries to reserve.

Valid Usage (Implicit)

- VUID-VkPipelinePoolSize-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_POOL_SIZE`
- VUID-VkPipelinePoolSize-pNext-pNext
`pNext` **must** be `NULL`

5.2.2. Device Use

The following is a high-level list of `VkDevice` uses along with references on where to find more information:

- Creation of queues. See the [Queues](#) section below for further details.
- Creation and tracking of various synchronization constructs. See [Synchronization and Cache Control](#) for further details.
- Allocating, freeing, and managing memory. See [Memory Allocation](#) and [Resource Creation](#) for further details.
- Creation and destruction of command buffers and command buffer pools. See [Command Buffers](#) for further details.
- Creation, destruction, and management of graphics state. See [Pipelines](#) and [Resource Descriptors](#), among others, for further details.

5.2.3. Lost Device

A logical device **may** become *lost* for a number of implementation-specific reasons, indicating that pending and future command execution **may** fail and cause resources and backing memory to become undefined.

NOTE

[Fault Handling](#) can be used by the implementation to provide more information on the cause of a device becoming *lost*. Allowing applications to take appropriate corrective behavior for the cause of the device lost.

NOTE

Typical reasons for device loss will include things like execution timing out (to prevent denial of service), power management events, platform resource management, implementation errors.

Applications not adhering to [valid usage](#) may also result in device loss being reported, however this is not guaranteed. Even if device loss is reported, the system may be in an unrecoverable state, and further usage of the API is still considered invalid.

When this happens, certain commands will return `VK_ERROR_DEVICE_LOST`. After any such event, the logical device is considered *lost*. It is not possible to reset the logical device to a non-lost state, however the lost state is specific to a logical device (`VkDevice`), and the corresponding physical device (`VkPhysicalDevice`) **may** be otherwise unaffected.

In some cases, the physical device **may** also be lost, and attempting to create a new logical device will fail, returning `VK_ERROR_DEVICE_LOST`. This is usually indicative of a problem with the underlying implementation, or its connection to the host. If the physical device has not been lost, and a new logical device is successfully created from that physical device, it **must** be in the non-lost state.

NOTE

Whilst logical device loss **may** be recoverable, in the case of physical device loss, it is unlikely that an application will be able to recover unless additional, unaffected physical devices exist on the system. The error is largely informational and intended only to inform the application that a platform issue has occurred, and **should** be investigated further. For example, underlying hardware **may** have developed a fault or become physically disconnected from the rest of the system. In many cases, physical device loss **may** cause other more serious issues such as the operating system crashing; in which case it **may** not be reported via the Vulkan API.

When a device is lost, its child objects are not implicitly destroyed and their handles are still valid. Those objects **must** still be destroyed before their parents or the device **can** be destroyed (see the [Object Lifetime](#) section). The host address space corresponding to device memory mapped using `vkMapMemory` is still valid, and host memory accesses to these mapped regions are still valid, but the contents are undefined. It is still legal to call any API command on the device and child objects.

Once a device is lost, command execution **may** fail, and certain commands that return a `VkResult` **may** return `VK_ERROR_DEVICE_LOST`. These commands can be identified by the inclusion of `VK_ERROR_DEVICE_LOST` in the Return Codes section for each command. Commands that do not allow runtime errors **must** still operate correctly for valid usage and, if applicable, return valid data.

Commands that wait indefinitely for device execution (namely `vkDeviceWaitIdle`, `vkQueueWaitIdle`, `vkWaitForFences` or `vkAcquireNextImageKHR` with a maximum `timeout`, and `vkGetQueryPoolResults` with the `VK_QUERY_RESULT_WAIT_BIT` bit set in `flags`) **must** return in finite time even in the case of a lost device, and return either `VK_SUCCESS` or `VK_ERROR_DEVICE_LOST`. For any command that **may** return `VK_ERROR_DEVICE_LOST`, for the purpose of determining whether a command buffer is in the [pending state](#), or whether resources are considered in-use by the device, a return value of `VK_ERROR_DEVICE_LOST` is equivalent to `VK_SUCCESS`.

The content of any external memory objects that have been exported from or imported to a lost device become undefined. Objects on other logical devices or in other APIs which are associated with the same underlying memory resource as the external memory objects on the lost device are unaffected other than their content becoming undefined. The layout of subresources of images on other logical devices that are bound to `VkDeviceMemory` objects associated with the same underlying memory resources as external memory objects on the lost device becomes `VK_IMAGE_LAYOUT_UNDEFINED`.

The state of `VkSemaphore` objects on other logical devices created by [importing a semaphore payload](#) with temporary permanence which was exported from the lost device is undefined. The state of `VkSemaphore` objects on other logical devices that permanently share a semaphore payload with a `VkSemaphore` object on the lost device is undefined, and remains undefined following any subsequent signal operations. Implementations **must** ensure pending and subsequently submitted wait operations on such semaphores behave as defined in [Semaphore State Requirements For Wait Operations](#) for external semaphores not in a valid state for a wait operation.

5.2.4. Device Destruction

To destroy a device, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyDevice(
    VkDevice          device,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device to destroy.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

To ensure that no work is active on the device, **vkDeviceWaitIdle** can be used to gate the destruction of the device. Prior to destroying a device, an application is responsible for destroying/freeing any Vulkan objects with explicit **vkDestroy*** or **vkFree*** commands that were created using that device as the first parameter of the corresponding **vkCreate*** or **vkAllocate*** command.

NOTE

The lifetime of each of these objects is bound by the lifetime of the **VkDevice** object. Therefore, to avoid resource leaks, it is critical that an application explicitly free all of these resources prior to calling **vkDestroyDevice**.

Valid Usage

- VUID-vkDestroyDevice-device-05137
All child objects created on **device** that can be destroyed or freed **must** have been destroyed or freed prior to destroying **device**

Valid Usage (Implicit)

- VUID-vkDestroyDevice-device-parameter
If **device** is not **NULL**, **device** **must** be a valid **VkDevice** handle
- VUID-vkDestroyDevice-pAllocator-null
pAllocator **must** be **NULL**

Host Synchronization

- Host access to **device** **must** be externally synchronized
- Host access to all **VkQueue** objects created from **device** **must** be externally synchronized

5.3. Queues

5.3.1. Queue Family Properties

As discussed in the [Physical Device Enumeration](#) section above, the `vkGetPhysicalDeviceQueueFamilyProperties` command is used to retrieve details about the queue families and queues supported by a device.

Each index in the `pQueueFamilyProperties` array returned by `vkGetPhysicalDeviceQueueFamilyProperties` describes a unique queue family on that physical device. These indices are used when creating queues, and they correspond directly with the `queueFamilyIndex` that is passed to the `vkCreateDevice` command via the `VkDeviceQueueCreateInfo` structure as described in the [Queue Creation](#) section below.

Grouping of queue families within a physical device is implementation-dependent.

NOTE

The general expectation is that a physical device groups all queues of matching capabilities into a single family. However, while implementations **should** do this, it is possible that a physical device **may** return two separate queue families with the same capabilities.

Once an application has identified a physical device with the queue(s) that it desires to use, it will create those queues in conjunction with a logical device. This is described in the following section.

5.3.2. Queue Creation

Creating a logical device also creates the queues associated with that device. The queues to create are described by a set of `VkDeviceQueueCreateInfo` structures that are passed to `vkCreateDevice` in `pQueueCreateInfos`. Queues **cannot** be independently destroyed, and are instead destroyed with the `VkDevice` that they were created from.

Queues are represented by `VkQueue` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkQueue)
```

The `VkDeviceQueueCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkDeviceQueueCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceQueueCreateFlags flags;
    uint32_t           queueFamilyIndex;
    uint32_t           queueCount;
    const float*        pQueuePriorities;
} VkDeviceQueueCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask indicating behavior of the queues.
- `queueFamilyIndex` is an unsigned integer indicating the index of the queue family in which to create the queues on this device. This index corresponds to the index of an element of the `pQueueFamilyProperties` array that was returned by `vkGetPhysicalDeviceQueueFamilyProperties`.
- `queueCount` is an unsigned integer specifying the number of queues to create in the queue family indicated by `queueFamilyIndex`, and with the behavior specified by `flags`.
- `pQueuePriorities` is a pointer to an array of `queueCount` normalized floating-point values, specifying priorities of work that will be submitted to each created queue. See [Queue Priority](#) for more information.

Valid Usage

- VUID-VkDeviceQueueCreateInfo-queueFamilyIndex-00381
`queueFamilyIndex` **must** be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties`
- VUID-VkDeviceQueueCreateInfo-queueCount-00382
`queueCount` **must** be less than or equal to the `queueCount` member of the `VkQueueFamilyProperties` structure, as returned by `vkGetPhysicalDeviceQueueFamilyProperties` in the `pQueueFamilyProperties[queueFamilyIndex]`
- VUID-VkDeviceQueueCreateInfo-pQueuePriorities-00383
Each element of `pQueuePriorities` **must** be between `0.0` and `1.0` inclusive
- VUID-VkDeviceQueueCreateInfo-flags-02861
If the `protectedMemory` feature is not enabled, the `VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT` bit of `flags` **must** not be set
- VUID-VkDeviceQueueCreateInfo-flags-06449
If `flags` includes `VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT`, `queueFamilyIndex` **must** be the index of a queue family that includes the `VK_QUEUE_PROTECTED_BIT` capability

Valid Usage (Implicit)

- VUID-VkDeviceQueueCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_QUEUE_CREATE_INFO`
- VUID-VkDeviceQueueCreateInfo-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkDeviceQueueGlobalPriorityCreateInfo`
- VUID-VkDeviceQueueCreateInfo-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkDeviceQueueCreateInfo-flags-parameter
`flags` **must** be a valid combination of `VkDeviceQueueCreateFlagBits` values

- VUID-VkDeviceQueueCreateInfo-pQueuePriorities-parameter
`pQueuePriorities` **must** be a valid pointer to an array of `queueCount` `float` values
- VUID-VkDeviceQueueCreateInfo-queueCount-arraylength
`queueCount` **must** be greater than 0

Bits which **can** be set in `VkDeviceQueueCreateInfo::flags`, specifying usage behavior of a queue, are:

```
// Provided by VK_VERSION_1_1
typedef enum VkDeviceQueueCreateFlagBits {
    // Provided by VK_VERSION_1_1
    VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT = 0x00000001,
} VkDeviceQueueCreateFlagBits;
```

- `VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT` specifies that the device queue is a protected-capable queue.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkDeviceQueueCreateFlags;
```

`VkDeviceQueueCreateFlags` is a bitmask type for setting a mask of zero or more `VkDeviceQueueCreateFlagBits`.

Queues **can** be created with a system-wide priority by adding a `VkDeviceQueueGlobalPriorityCreateInfo` structure to the `pNext` chain of `VkDeviceQueueCreateInfo`.

The `VkDeviceQueueGlobalPriorityCreateInfo` structure is defined as:

```
typedef struct VkDeviceQueueGlobalPriorityCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkQueueGlobalPriority globalPriority;
} VkDeviceQueueGlobalPriorityCreateInfo;
```

```
// Provided by VK_KHR_global_priority
typedef VkDeviceQueueGlobalPriorityCreateInfo
VkDeviceQueueGlobalPriorityCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `globalPriority` is the system-wide priority associated to these queues as specified by `VkQueueGlobalPriority`

Queues created without specifying `VkDeviceQueueGlobalPriorityCreateInfo` will default to

VK_QUEUE_GLOBAL_PRIORITY_MEDIUM.

Valid Usage (Implicit)

- VUID-VkDeviceQueueGlobalPriorityCreateInfo-sType-sType
sType **must** be VK_STRUCTURE_TYPE_DEVICE_QUEUE_GLOBAL_PRIORITY_CREATE_INFO
- VUID-VkDeviceQueueGlobalPriorityCreateInfo-globalPriority-parameter
globalPriority **must** be a valid VkQueueGlobalPriority value

Possible values of `VkDeviceQueueGlobalPriorityCreateInfo::globalPriority`, specifying a system-wide priority level are:

```
typedef enum VkQueueGlobalPriority {  
    VK_QUEUE_GLOBAL_PRIORITY_LOW = 128,  
    VK_QUEUE_GLOBAL_PRIORITY_MEDIUM = 256,  
    VK_QUEUE_GLOBAL_PRIORITY_HIGH = 512,  
    VK_QUEUE_GLOBAL_PRIORITY_REALTIME = 1024,  
    // Provided by VK_KHR_global_priority  
    VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR = VK_QUEUE_GLOBAL_PRIORITY_LOW,  
    // Provided by VK_KHR_global_priority  
    VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR = VK_QUEUE_GLOBAL_PRIORITY_MEDIUM,  
    // Provided by VK_KHR_global_priority  
    VK_QUEUE_GLOBAL_PRIORITY_HIGH_KHR = VK_QUEUE_GLOBAL_PRIORITY_HIGH,  
    // Provided by VK_KHR_global_priority  
    VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR = VK_QUEUE_GLOBAL_PRIORITY_REALTIME,  
} VkQueueGlobalPriority;
```

```
// Provided by VK_KHR_global_priority  
typedef VkQueueGlobalPriority VkQueueGlobalPriorityKHR;
```

Priority values are sorted in ascending order. A comparison operation on the enum values can be used to determine the priority order.

- VK_QUEUE_GLOBAL_PRIORITY_LOW is below the system default. Useful for non-interactive tasks.
- VK_QUEUE_GLOBAL_PRIORITY_MEDIUM is the system default priority.
- VK_QUEUE_GLOBAL_PRIORITY_HIGH is above the system default.
- VK_QUEUE_GLOBAL_PRIORITY_REALTIME is the highest priority. Useful for critical tasks.

Queues with higher system priority **may** be allotted more processing time than queues with lower priority. An implementation **may** allow a higher-priority queue to starve a lower-priority queue until the higher-priority queue has no further commands to execute.

Priorities imply no ordering or scheduling constraints.

No specific guarantees are made about higher priority queues receiving more processing time or

better quality of service than lower priority queues.

The global priority level of a queue takes precedence over the per-process queue priority ([VkDeviceQueueCreateInfo::pQueuePriorities](#)).

Abuse of this feature **may** result in starving the rest of the system of implementation resources. Therefore, the driver implementation **may** deny requests to acquire a priority above the default priority ([VK_QUEUE_GLOBAL_PRIORITY_MEDIUM](#)) if the caller does not have sufficient privileges. In this scenario [VK_ERROR_NOT_PERMITTED](#) is returned.

The driver implementation **may** fail the queue allocation request if resources required to complete the operation have been exhausted (either by the same process or a different process). In this scenario [VK_ERROR_INITIALIZATION_FAILED](#) is returned.

If the [globalPriorityQuery](#) feature is enabled and the requested global priority is not reported via [VkQueueFamilyGlobalPriorityProperties](#), the driver implementation **must** fail the queue creation. In this scenario, [VK_ERROR_INITIALIZATION_FAILED](#) is returned.

To retrieve a handle to a [VkQueue](#) object, call:

```
// Provided by VK_VERSION_1_0
void vkGetDeviceQueue(
    VkDevice          device,
    uint32_t          queueFamilyIndex,
    uint32_t          queueIndex,
    VkQueue*          pQueue);
```

- [device](#) is the logical device that owns the queue.
- [queueFamilyIndex](#) is the index of the queue family to which the queue belongs.
- [queueIndex](#) is the index within this queue family of the queue to retrieve.
- [pQueue](#) is a pointer to a [VkQueue](#) object that will be filled with the handle for the requested queue.

[vkGetDeviceQueue](#) **must** only be used to get queues that were created with the [flags](#) parameter of [VkDeviceQueueCreateInfo](#) set to zero. To get queues that were created with a non-zero [flags](#) parameter use [vkGetDeviceQueue2](#).

Valid Usage

- VUID-vkGetDeviceQueue-queueFamilyIndex-00384
[queueFamilyIndex](#) **must** be one of the queue family indices specified when [device](#) was created, via the [VkDeviceQueueCreateInfo](#) structure
- VUID-vkGetDeviceQueue-queueIndex-00385
[queueIndex](#) **must** be less than the value of [VkDeviceQueueCreateInfo::queueCount](#) for the queue family indicated by [queueFamilyIndex](#) when [device](#) was created
- VUID-vkGetDeviceQueue-flags-01841

`VkDeviceQueueCreateInfo::flags` **must** have been zero when `device` was created

Valid Usage (Implicit)

- VUID-vkGetDeviceQueue-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetDeviceQueue-pQueue-parameter
`pQueue` **must** be a valid pointer to a `VkQueue` handle

To retrieve a handle to a `VkQueue` object with specific `VkDeviceQueueCreateFlags` creation flags, call:

```
// Provided by VK_VERSION_1_1
void vkGetDeviceQueue2(
    VkDevice                device,
    const VkDeviceQueueInfo2* pQueueInfo,
    VkQueue*                pQueue);
```

- `device` is the logical device that owns the queue.
- `pQueueInfo` is a pointer to a `VkDeviceQueueInfo2` structure, describing parameters of the device queue to be retrieved.
- `pQueue` is a pointer to a `VkQueue` object that will be filled with the handle for the requested queue.

Valid Usage (Implicit)

- VUID-vkGetDeviceQueue2-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetDeviceQueue2-pQueueInfo-parameter
`pQueueInfo` **must** be a valid pointer to a valid `VkDeviceQueueInfo2` structure
- VUID-vkGetDeviceQueue2-pQueue-parameter
`pQueue` **must** be a valid pointer to a `VkQueue` handle

The `VkDeviceQueueInfo2` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkDeviceQueueInfo2 {
    VkStructureType      sType;
    const void*          pNext;
    VkDeviceQueueCreateFlags flags;
    uint32_t             queueFamilyIndex;
    uint32_t             queueIndex;
} VkDeviceQueueInfo2;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure. The **pNext** chain of [VkDeviceQueueInfo2](#) **can** be used to provide additional device queue parameters to [vkGetDeviceQueue2](#).
- **flags** is a [VkDeviceQueueCreateFlags](#) value indicating the flags used to create the device queue.
- **queueFamilyIndex** is the index of the queue family to which the queue belongs.
- **queueIndex** is the index of the queue to retrieve from within the set of queues that share both the queue family and flags specified.

The queue returned by [vkGetDeviceQueue2](#) **must** have the same **flags** value from this structure as that used at device creation time in a [VkDeviceQueueCreateInfo](#) structure.

NOTE

Normally, if you create both protected-capable and non-protected-capable queues with the same family, they are treated as separate lists of queues and **queueIndex** is relative to the start of the list of queues specified by both **queueFamilyIndex** and **flags**. However, for historical reasons, some implementations may exhibit different behavior. These divergent implementations instead concatenate the lists of queues and treat **queueIndex** as relative to the start of the first list of queues with the given **queueFamilyIndex**. This only matters in cases where an application has created both protected-capable and non-protected-capable queues from the same queue family.

For such divergent implementations, the maximum value of **queueIndex** is equal to the sum of [VkDeviceQueueCreateInfo::queueCount](#) minus one, for all [VkDeviceQueueCreateInfo](#) structures that share a common **queueFamilyIndex**.

Such implementations will return `NULL` for either the protected or unprotected queues when calling [vkGetDeviceQueue2](#) with **queueIndex** in the range zero to [VkDeviceQueueCreateInfo::queueCount](#) minus one. In cases where these implementations returned `NULL`, the corresponding queues are instead located in the extended range described in the preceding two paragraphs.

This behavior will not be observed on any driver that has passed Vulkan conformance test suite version 1.3.3.0, or any subsequent version. This information can be found by querying [VkPhysicalDeviceDriverProperties::conformanceVersion](#).

Valid Usage

- VUID-VkDeviceQueueInfo2-queueFamilyIndex-01842
`queueFamilyIndex` **must** be one of the queue family indices specified when `device` was created, via the `VkDeviceQueueCreateInfo` structure
- VUID-VkDeviceQueueInfo2-flags-06225
`flags` **must** be equal to `VkDeviceQueueCreateInfo::flags` for a `VkDeviceQueueCreateInfo` structure for the queue family indicated by `queueFamilyIndex` when `device` was created
- VUID-VkDeviceQueueInfo2-queueIndex-01843
`queueIndex` **must** be less than `VkDeviceQueueCreateInfo::queueCount` for the corresponding queue family and flags indicated by `queueFamilyIndex` and `flags` when `device` was created

Valid Usage (Implicit)

- VUID-VkDeviceQueueInfo2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_QUEUE_INFO_2`
- VUID-VkDeviceQueueInfo2-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkDeviceQueueInfo2-flags-parameter
`flags` **must** be a valid combination of `VkDeviceQueueCreateFlagBits` values

5.3.3. Queue Family Index

The queue family index is used in multiple places in Vulkan in order to tie operations to a specific family of queues.

When retrieving a handle to the queue via `vkGetDeviceQueue`, the queue family index is used to select which queue family to retrieve the `VkQueue` handle from as described in the previous section.

When creating a `VkCommandPool` object (see [Command Pools](#)), a queue family index is specified in the `VkCommandPoolCreateInfo` structure. Command buffers from this pool **can** only be submitted on queues corresponding to this queue family.

When creating `VkImage` (see [Images](#)) and `VkBuffer` (see [Buffers](#)) resources, a set of queue families is included in the `VkImageCreateInfo` and `VkBufferCreateInfo` structures to specify the queue families that **can** access the resource.

When inserting a `VkBufferMemoryBarrier` or `VkImageMemoryBarrier` (see [Pipeline Barriers](#)), a source and destination queue family index is specified to allow the ownership of a buffer or image to be transferred from one queue family to another. See the [Resource Sharing](#) section for details.

5.3.4. Queue Priority

Each queue is assigned a priority, as set in the `VkDeviceQueueCreateInfo` structures when creating the device. The priority of each queue is a normalized floating-point value between 0.0 and 1.0,

which is then translated to a discrete priority level by the implementation. Higher values indicate a higher priority, with 0.0 being the lowest priority and 1.0 being the highest.

Within the same device, queues with higher priority **may** be allotted more processing time than queues with lower priority. The implementation makes no guarantees with regards to ordering or scheduling among queues with the same priority, other than the constraints defined by any [explicit synchronization primitives](#). The implementation makes no guarantees with regards to queues across different devices.

An implementation **may** allow a higher-priority queue to starve a lower-priority queue on the same **VkDevice** until the higher-priority queue has no further commands to execute. The relationship of queue priorities **must** not cause queues on one **VkDevice** to starve queues on another **VkDevice**.

No specific guarantees are made about higher priority queues receiving more processing time or better quality of service than lower priority queues.

5.3.5. Queue Submission

Work is submitted to a queue via *queue submission* commands such as [vkQueueSubmit2KHR](#) or [vkQueuePresentKHR](#) or [vkQueueSubmit](#). Queue submission commands define a set of *queue operations* to be executed by the underlying physical device, including synchronization with semaphores and fences.

Submission commands take as parameters a target queue, zero or more *batches* of work, and an **optional** fence to signal upon completion. Each batch consists of three distinct parts:

1. Zero or more semaphores to wait on before execution of the rest of the batch.
 - If present, these describe a [semaphore wait operation](#).
2. Zero or more work items to execute.
 - If present, these describe a *queue operation* matching the work described.
3. Zero or more semaphores to signal upon completion of the work items.
 - If present, these describe a [semaphore signal operation](#).

If a fence is present in a queue submission, it describes a [fence signal operation](#).

All work described by a queue submission command **must** be submitted to the queue before the command returns.

5.3.6. Queue Destruction

Queues are created along with a logical device during **vkCreateDevice**. All queues associated with a logical device are destroyed when **vkDestroyDevice** is called on that device.

Chapter 6. Command Buffers

Command buffers are objects used to record commands which **can** be subsequently submitted to a device queue for execution. There are two levels of command buffers - *primary command buffers*, which **can** execute secondary command buffers, and which are submitted to queues, and *secondary command buffers*, which **can** be executed by primary command buffers, and which are not directly submitted to queues.

Command buffers are represented by `VkCommandBuffer` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkCommandBuffer)
```

Recorded commands include commands to bind pipelines and descriptor sets to the command buffer, commands to modify dynamic state, commands to draw (for graphics rendering), commands to dispatch (for compute), commands to execute secondary command buffers (for primary command buffers only), commands to copy buffers and images, and other commands.

Each command buffer manages state independently of other command buffers. There is no inheritance of state across primary and secondary command buffers, or between secondary command buffers. When a command buffer begins recording, all state in that command buffer is undefined. When secondary command buffer(s) are recorded to execute on a primary command buffer, the secondary command buffer inherits no state from the primary command buffer, and all state of the primary command buffer is undefined after an execute secondary command buffer command is recorded. There is one exception to this rule - if the primary command buffer is inside a render pass instance, then the render pass and subpass state is not disturbed by executing secondary command buffers. For state dependent commands (such as draws and dispatches), any state consumed by those commands **must** not be undefined.

Unless otherwise specified, and without explicit synchronization, the various commands submitted to a queue via command buffers **may** execute in arbitrary order relative to each other, and/or concurrently. Also, the memory side effects of those commands **may** not be directly visible to other commands without explicit memory dependencies. This is true within a command buffer, and across command buffers submitted to a given queue. See [the synchronization chapter](#) for information on [implicit](#) and explicit synchronization between commands.

6.1. Command Buffer Lifecycle

Each command buffer is always in one of the following states:

Initial

When a command buffer is [allocated](#), it is in the *initial state*. Some commands are able to *reset* a command buffer (or a set of command buffers) back to this state from any of the executable, recording or invalid state. Command buffers in the initial state **can** only be moved to the recording state, or freed.

Recording

[vkBeginCommandBuffer](#) changes the state of a command buffer from the initial state to the *recording state*. Once a command buffer is in the recording state, [vkCmd*](#) commands **can** be used to record to the command buffer.

Executable

[vkEndCommandBuffer](#) ends the recording of a command buffer, and moves it from the recording state to the *executable state*. Executable command buffers **can** be [submitted](#), reset, or [recorded to another command buffer](#).

Pending

[Queue submission](#) of a command buffer changes the state of a command buffer from the executable state to the *pending state*. Whilst in the pending state, applications **must** not attempt to modify the command buffer in any way - as the device **may** be processing the commands recorded to it. Once execution of a command buffer completes, the command buffer either reverts back to the *executable state*, or if it was recorded with [VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT](#), it moves to the *invalid state*. A [synchronization command](#) **should** be used to detect when this occurs.

Invalid

Other than [VkQueryPool](#), [VkDescriptorPool](#), [VkDeviceMemory](#), or [VkCommandPool](#) objects, destroying or freeing any object or memory that **may** be accessed when the command buffer is accessed (e.g. an object bound to the command buffer) will transition the state of that command buffer to the *invalid state*. The command buffer **must** not be in the *pending state* when this happens. Command buffers in the invalid state **can** only be reset or freed.

Figure 1. Lifecycle of a command buffer

Any given command that operates on a command buffer has its own requirements on what state a command buffer **must** be in, which are detailed in the valid usage constraints for that command.

Resetting a command buffer is an operation that discards any previously recorded commands and puts a command buffer in the *initial state*. Resetting occurs as a result of [vkResetCommandBuffer](#) or [vkResetCommandPool](#), or as part of [vkBeginCommandBuffer](#) (which additionally puts the command buffer in the *recording state*).

Secondary command buffers can be recorded to a primary command buffer via `vkCmdExecuteCommands`. This partially ties the lifecycle of the two command buffers together - if the primary is submitted to a queue, both the primary and any secondaries recorded to it move to the *pending state*. Once execution of the primary completes, so it does for any secondary recorded within it. After all executions of each command buffer complete, they each move to their appropriate completion state (either to the *executable state* or the *invalid state*, as specified above).

If a secondary moves to the *invalid state* or the *initial state*, then all primary buffers it is recorded in move to the *invalid state*. A primary moving to any other state does not affect the state of a secondary recorded in it.

NOTE

Resetting or freeing a primary command buffer removes the lifecycle linkage to all secondary command buffers that were recorded into it.

6.2. Command Pools

Command pools are opaque objects that command buffer memory is allocated from, and which allow the implementation to amortize the cost of resource creation across multiple command buffers. Command pools are externally synchronized, meaning that a command pool **must** not be used concurrently in multiple threads. That includes use via recording commands on any command buffers allocated from the pool, as well as operations that allocate, free, and reset command buffers or the pool itself.

Command pools **cannot** be destroyed or trimmed [SCID-4].

If `VkPhysicalDeviceVulkanSC10Properties::deviceDestroyFreesMemory` is `VK_TRUE`, then the memory used by command pools is returned to the system when the device is destroyed. Otherwise, it **may** not be returned to the system until the process is terminated.

Command pools are represented by `VkCommandPool` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkCommandPool)
```

To create a command pool, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateCommandPool(
    VkDevice                                device,
    const VkCommandPoolCreateInfo*          pCreateInfo,
    const VkAllocationCallbacks*           pAllocator,
    VkCommandPool*                          pCommandPool);
```

- `device` is the logical device that creates the command pool.
- `pCreateInfo` is a pointer to a `VkCommandPoolCreateInfo` structure specifying the state of the command pool object.

- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pCommandPool` is a pointer to a `VkCommandPool` handle in which the created pool is returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkCreateCommandPool` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkCreateCommandPool-queueFamilyIndex-01937
`pCreateInfo->queueFamilyIndex` **must** be the index of a queue family available in the logical device `device`
- VUID-vkCreateCommandPool-device-05068
The number of command pools currently allocated from `device` plus 1 **must** be less than or equal to the total number of command pools requested via `VkDeviceObjectReservationCreateInfo::commandPoolRequestCount` specified when `device` was created

Valid Usage (Implicit)

- VUID-vkCreateCommandPool-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCreateCommandPool-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkCommandPoolCreateInfo` structure
- VUID-vkCreateCommandPool-pAllocator-null
`pAllocator` **must** be `NULL`
- VUID-vkCreateCommandPool-pCommandPool-parameter
`pCommandPool` **must** be a valid pointer to a `VkCommandPool` handle
- VUID-vkCreateCommandPool-device-queuecount
The device **must** have been created with at least 1 queue

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkCommandPoolCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkCommandPoolCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkCommandPoolCreateFlags flags;
    uint32_t           queueFamilyIndex;
} VkCommandPoolCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkCommandPoolCreateFlagBits` indicating usage behavior for the pool and command buffers allocated from it.
- `queueFamilyIndex` designates a queue family as described in section [Queue Family Properties](#). All command buffers allocated from this command pool **must** be submitted on queues from the same queue family.

Valid Usage

- VUID-VkCommandPoolCreateInfo-flags-02860
If the `protectedMemory` feature is not enabled, the `VK_COMMAND_POOL_CREATE_PROTECTED_BIT` bit of `flags` **must** not be set
- VUID-VkCommandPoolCreateInfo-pNext-05002
The `pNext` chain **must** include a `VkCommandPoolMemoryReservationCreateInfo` structure

Valid Usage (Implicit)

- VUID-VkCommandPoolCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_COMMAND_POOL_CREATE_INFO`
- VUID-VkCommandPoolCreateInfo-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkCommandPoolMemoryReservationCreateInfo`
- VUID-VkCommandPoolCreateInfo-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkCommandPoolCreateInfo-flags-parameter
`flags` **must** be a valid combination of `VkCommandPoolCreateFlagBits` values

Bits which **can** be set in `VkCommandPoolCreateInfo::flags`, specifying usage behavior for a command pool, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkCommandPoolCreateFlagBits {
    VK_COMMAND_POOL_CREATE_TRANSIENT_BIT = 0x00000001,
    VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT = 0x00000002,
    // Provided by VK_VERSION_1_1
    VK_COMMAND_POOL_CREATE_PROTECTED_BIT = 0x00000004,
} VkCommandPoolCreateFlagBits;
```

- **VK_COMMAND_POOL_CREATE_TRANSIENT_BIT** specifies that command buffers allocated from the pool will be short-lived, meaning that they will be reset or freed in a relatively short timeframe. This flag **may** be used by the implementation to control memory allocation behavior within the pool.
- **VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT** allows any command buffer allocated from a pool to be individually reset to the **initial state**; either by calling **vkResetCommandBuffer**, or via the implicit reset when calling **vkBeginCommandBuffer**. If this flag is not set on a pool, then **vkResetCommandBuffer** **must** not be called for any command buffer allocated from that pool.
- **VK_COMMAND_POOL_CREATE_PROTECTED_BIT** specifies that command buffers allocated from the pool are protected command buffers.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandPoolCreateFlags;
```

VkCommandPoolCreateFlags is a bitmask type for setting a mask of zero or more **VkCommandPoolCreateFlagBits**.

The **pNext** chain of **VkCommandPoolCreateInfo** **must** include a **VkCommandPoolMemoryReservationCreateInfo** structure. This structure controls how much memory is allocated at command pool creation time to be used for all command buffers recorded from this pool.

The **VkCommandPoolMemoryReservationCreateInfo** structure is defined as:

```
// Provided by VKSC_VERSION_1_0
typedef struct VkCommandPoolMemoryReservationCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceSize        commandPoolReservedSize;
    uint32_t            commandPoolMaxCommandBuffers;
} VkCommandPoolMemoryReservationCreateInfo;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **commandPoolReservedSize** is the number of bytes to be allocated for all command buffer data recorded into this pool.
- **commandPoolMaxCommandBuffers** is the maximum number of command buffers that can be

allocated from this command pool.

The number of command buffers reserved using `commandPoolMaxCommandBuffers` is permanently counted against the total number of command buffers requested via `VkDeviceObjectReservationCreateInfo::commandBufferRequestCount` even if the command buffers are freed at a later time.

Each command recorded into a command buffer has an implementation-dependent size that counts against `commandPoolReservedSize`. There is no minimum command pool size, but some sizes may be too small for any commands to be recorded in them on a given implementation. Applications are expected to estimate their worst-case command buffer memory usage at development time using `vkGetCommandPoolMemoryConsumption` and reserve large enough command buffers. This command **can** also be used at runtime to verify expected memory usage.

While the memory consumption of a particular command is implementation-dependent, it is a deterministic function of the parameters to the command and of the objects used by the command (including the command buffer itself). Two command buffers will consume the same amount of pool memory if:

- all numerical parameters to each command match exactly,
- all objects used by each command are **identically defined**, and
- the order of the commands is the same.

NOTE

The rules for **identically defined** objects apply recursively, implying for example that if the command buffers are created in different devices that those devices must have been created with the same features enabled.

Each command buffer **may** require some base alignment in the pool, so the total pool memory will match if each command buffer's consumption matches and the command buffers are recorded one at a time and in the same order.

If all these criteria are satisfied, then a command pool memory consumption returned by `vkGetCommandPoolMemoryConsumption` will be sufficient to record the same command buffers again.

Valid Usage

- VUID-VkCommandPoolMemoryReservationCreateInfo-commandPoolReservedSize-05003 `commandPoolReservedSize` **must** be greater than 0
- VUID-VkCommandPoolMemoryReservationCreateInfo-commandPoolMaxCommandBuffers-05004 `commandPoolMaxCommandBuffers` **must** be greater than 0
- VUID-VkCommandPoolMemoryReservationCreateInfo-commandPoolMaxCommandBuffers-05090 `commandPoolMaxCommandBuffers` **must** be less than or equal to `VkPhysicalDeviceVulkanSC10Properties::maxCommandPoolCommandBuffers`
- VUID-VkCommandPoolMemoryReservationCreateInfo-

commandPoolMaxCommandBuffers-05074

The number of command buffers reserved by all command pools plus **commandPoolMaxCommandBuffers** **must** be less than or equal to the total number of command buffers requested via **VkDeviceObjectReservationCreateInfo::commandBufferRequestCount**

Valid Usage (Implicit)

- VUID-VkCommandPoolMemoryReservationCreateInfo-sType-sType **sType** **must** be **VK_STRUCTURE_TYPE_COMMAND_POOL_MEMORY_RESERVATION_CREATE_INFO**

To get memory usage information for a command pool object, call:

```
// Provided by VKSC_VERSION_1_0
void vkGetCommandPoolMemoryConsumption(
    VkDevice                device,
    VkCommandPool           commandPool,
    VkCommandBuffer         commandBuffer,
    VkCommandPoolMemoryConsumption* pConsumption);
```

- **device** is the logical device that owns the command pool.
- **commandPool** is the command pool from which to query the memory usage.
- **commandBuffer** is an optional command buffer from which to query the memory usage.
- **pConsumption** is a pointer to a **VkCommandPoolMemoryConsumption** structure where the memory usage is written.

Valid Usage (Implicit)

- VUID-vkGetCommandPoolMemoryConsumption-device-parameter **device** **must** be a valid **VkDevice** handle
- VUID-vkGetCommandPoolMemoryConsumption-commandPool-parameter **commandPool** **must** be a valid **VkCommandPool** handle
- VUID-vkGetCommandPoolMemoryConsumption-commandBuffer-parameter
If **commandBuffer** is not **NULL**, **commandBuffer** **must** be a valid **VkCommandBuffer** handle
- VUID-vkGetCommandPoolMemoryConsumption-pConsumption-parameter
pConsumption **must** be a valid pointer to a **VkCommandPoolMemoryConsumption** structure
- VUID-vkGetCommandPoolMemoryConsumption-commandPool-parent
commandPool **must** have been created, allocated, or retrieved from **device**
- VUID-vkGetCommandPoolMemoryConsumption-commandBuffer-parent
If **commandBuffer** is a valid handle, it **must** have been created, allocated, or retrieved from **commandPool**

Host Synchronization

- Host access to **commandPool** **must** be externally synchronized
- Host access to **commandBuffer** **must** be externally synchronized

The **VkCommandPoolMemoryConsumption** structure is defined as:

```
// Provided by VKSC_VERSION_1_0
typedef struct VkCommandPoolMemoryConsumption {
    VkStructureType    sType;
    void*              pNext;
    VkDeviceSize        commandPoolAllocated;
    VkDeviceSize        commandPoolReservedSize;
    VkDeviceSize        commandBufferAllocated;
} VkCommandPoolMemoryConsumption;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **commandPoolAllocated** is the number of bytes currently allocated from this pool for command buffer data.
- **commandPoolReservedSize** is the total number of bytes available for all command buffer data recorded into this pool. This is equal to the value requested in **VkCommandPoolMemoryReservationCreateInfo::commandPoolReservedSize**.
- **commandBufferAllocated** is the number of bytes currently allocated from this pool for the specified command buffer's data. This number will be less than or equal to **VkPhysicalDeviceVulkanSC10Properties::maxCommandBufferSize**. If no command buffer is specified, then **commandBufferAllocated** will be zero.

Valid Usage (Implicit)

- VUID-VkCommandPoolMemoryConsumption-sType-sType
sType must be **VK_STRUCTURE_TYPE_COMMAND_POOL_MEMORY_CONSUMPTION**
- VUID-VkCommandPoolMemoryConsumption-pNext-pNext
pNext must be **NULL**

To reset a command pool, call:

```
// Provided by VK_VERSION_1_0
VkResult vkResetCommandPool(
    VkDevice                device,
    VkCommandPool            commandPool,
    VkCommandPoolResetFlags flags);
```

- **device** is the logical device that owns the command pool.
- **commandPool** is the command pool to reset.
- **flags** is a bitmask of **VkCommandPoolResetFlagBits** controlling the reset operation.

Resetting a command pool recycles all of the resources from all of the command buffers allocated from the command pool back to the command pool. All command buffers that have been allocated from the command pool are put in the **initial state**.

Any primary command buffer allocated from another **VkCommandPool** that is in the **recording or executable state** and has a secondary command buffer allocated from **commandPool** recorded into it, becomes **invalid**.

Valid Usage

- VUID-vkResetCommandPool-commandPool-00040
All **VkCommandBuffer** objects allocated from **commandPool** **must** not be in the **pending state**

Valid Usage (Implicit)

- VUID-vkResetCommandPool-device-parameter
device **must** be a valid **VkDevice** handle
- VUID-vkResetCommandPool-commandPool-parameter
commandPool **must** be a valid **VkCommandPool** handle
- VUID-vkResetCommandPool-flags-zero-bitmask
flags **must** be 0
- VUID-vkResetCommandPool-commandPool-parent
commandPool **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **commandPool** **must** be externally synchronized

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_UNKNOWN**
- **VK_ERROR_VALIDATION_FAILED**

Bits which **can** be set in `vkResetCommandPool::flags`, controlling the reset operation, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkCommandPoolResetFlagBits {
} VkCommandPoolResetFlagBits;
```

- `VK_COMMAND_POOL_RESET_RELEASE_RESOURCES_BIT` is not supported in Vulkan SC [SCID-4].

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandPoolResetFlags;
```

`VkCommandPoolResetFlags` is a bitmask type for setting a mask of zero or more `VkCommandPoolResetFlagBits`.

6.3. Command Buffer Allocation and Management

To allocate command buffers, call:

```
// Provided by VK_VERSION_1_0
VkResult vkAllocateCommandBuffers(
    VkDevice device,
    const VkCommandBufferAllocateInfo* pAllocateInfo,
    VkCommandBuffer* pCommandBuffers);
```

- `device` is the logical device that owns the command pool.
- `pAllocateInfo` is a pointer to a `VkCommandBufferAllocateInfo` structure describing parameters of the allocation. `commandPool` **may** be accessed any time one of the resulting command buffers is accessed.
- `pCommandBuffers` is a pointer to an array of `VkCommandBuffer` handles in which the resulting command buffer objects are returned. The array **must** be at least the length specified by the `commandBufferCount` member of `pAllocateInfo`. Each allocated command buffer begins in the initial state.

`vkAllocateCommandBuffers` **can** be used to allocate multiple command buffers. If the allocation of any of those command buffers fails, the implementation **must** free all successfully allocated command buffer objects from this command, set all entries of the `pCommandBuffers` array to `NULL` and return the error.

NOTE

Filling `pCommandBuffers` with `NULL` values on failure is an exception to the default error behavior that output parameters will have undefined contents.

When command buffers are first allocated, they are in the `initial state`.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkAllocateCommandBuffers` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkAllocateCommandBuffers-device-parameter **device** **must** be a valid [VkDevice](#) handle
- VUID-vkAllocateCommandBuffers-pAllocateInfo-parameter **pAllocateInfo** **must** be a valid pointer to a valid [VkCommandBufferAllocateInfo](#) structure
- VUID-vkAllocateCommandBuffers-pCommandBuffers-parameter **pCommandBuffers** **must** be a valid pointer to an array of **pAllocateInfo->commandBufferCount** [VkCommandBuffer](#) handles
- VUID-vkAllocateCommandBuffers-device-queuecount
The device **must** have been created with at least **1** queue
- VUID-vkAllocateCommandBuffers-pAllocateInfo::commandBufferCount-arraylength
pAllocateInfo->commandBufferCount **must** be greater than **0**

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_UNKNOWN**
- **VK_ERROR_VALIDATION_FAILED**

The [VkCommandBufferAllocateInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkCommandBufferAllocateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkCommandPool       commandPool;
    VkCommandBufferLevel level;
    uint32_t            commandBufferCount;
} VkCommandBufferAllocateInfo;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **commandPool** is the command pool from which the command buffers are allocated.
- **level** is a [VkCommandBufferLevel](#) value specifying the command buffer level.
- **commandBufferCount** is the number of command buffers to allocate from the pool.

The number of command buffers allocated using `commandBufferCount` counts against the maximum number of command buffers reserved via `VkCommandPoolMemoryReservationCreateInfo::commandPoolMaxCommandBuffers` specified when `commandPool` was created. Once command buffers are freed with `vkFreeCommandBuffers`, they can be allocated from `commandPool` again.

Valid Usage

- VUID-VkCommandBufferAllocateInfo-level-09660
If `level` is not `VK_COMMAND_BUFFER_LEVEL_PRIMARY`, `commandPool` **must** have been allocated with a `queueFamilyIndex` identifying a queue family that supports one of the `VK_QUEUE_TRANSFER_BIT`, `VK_QUEUE_COMPUTE_BIT`, or `VK_QUEUE_GRAPHICS_BIT` capabilities
- VUID-VkCommandBufferAllocateInfo-commandPool-05006
The number of command buffers currently allocated from `commandPool` plus `commandBufferCount` **must** be less than or equal to the value of `VkCommandPoolMemoryReservationCreateInfo::commandPoolMaxCommandBuffers` specified when `commandPool` was created

Valid Usage (Implicit)

- VUID-VkCommandBufferAllocateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_ALLOCATE_INFO`
- VUID-VkCommandBufferAllocateInfo-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkCommandBufferAllocateInfo-commandPool-parameter
`commandPool` **must** be a valid `VkCommandPool` handle
- VUID-VkCommandBufferAllocateInfo-level-parameter
`level` **must** be a valid `VkCommandBufferLevel` value

Host Synchronization

- Host access to `commandPool` **must** be externally synchronized

Possible values of `VkCommandBufferAllocateInfo::level`, specifying the command buffer level, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkCommandBufferLevel {
    VK_COMMAND_BUFFER_LEVEL_PRIMARY = 0,
    VK_COMMAND_BUFFER_LEVEL_SECONDARY = 1,
} VkCommandBufferLevel;
```

- `VK_COMMAND_BUFFER_LEVEL_PRIMARY` specifies a primary command buffer.
- `VK_COMMAND_BUFFER_LEVEL_SECONDARY` specifies a secondary command buffer.

To reset a command buffer, call:

```
// Provided by VK_VERSION_1_0
VkResult vkResetCommandBuffer(
    VkCommandBuffer          commandBuffer,
    VkCommandBufferResetFlags flags);
```

- **commandBuffer** is the command buffer to reset. The command buffer **can** be in any state other than **pending**, and is moved into the **initial state**.
- **flags** is a bitmask of **VkCommandBufferResetFlagBits** controlling the reset operation.

Any primary command buffer that is in the **recording or executable state** and has **commandBuffer** recorded into it, becomes **invalid**.

After a command buffer is reset, any objects or memory specified by commands recorded into the command buffer **must** no longer be accessed when the command buffer is accessed by the implementation.

Valid Usage

- VUID-vkResetCommandBuffer-commandBuffer-00045
commandBuffer **must** not be in the **pending state**
- VUID-vkResetCommandBuffer-commandBuffer-00046
commandBuffer **must** have been allocated from a pool that was created with the **VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT**
- VUID-vkResetCommandBuffer-commandPoolResetCommandBuffer-05135
commandPoolResetCommandBuffer **must** be supported

Valid Usage (Implicit)

- VUID-vkResetCommandBuffer-commandBuffer-parameter
commandBuffer **must** be a valid **VkCommandBuffer** handle
- VUID-vkResetCommandBuffer-flags-parameter
flags **must** be a valid combination of **VkCommandBufferResetFlagBits** values

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

Bits which **can** be set in `vkResetCommandBuffer::flags`, controlling the reset operation, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkCommandBufferResetFlagBits {
    VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT = 0x00000001,
} VkCommandBufferResetFlagBits;
```

- `VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT` specifies that most or all memory resources currently owned by the command buffer **should** be returned to the parent command pool. If this flag is not set, then the command buffer **may** hold onto memory resources and reuse them when recording commands. `commandBuffer` is moved to the [initial state](#).

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandBufferResetFlags;
```

`VkCommandBufferResetFlags` is a bitmask type for setting a mask of zero or more `VkCommandBufferResetFlagBits`.

To free command buffers, call:

```
// Provided by VK_VERSION_1_0
void vkFreeCommandBuffers(
    VkDevice          device,
    VkCommandPool     commandPool,
    uint32_t          commandBufferCount,
    const VkCommandBuffer* pCommandBuffers);
```

- `device` is the logical device that owns the command pool.
- `commandPool` is the command pool from which the command buffers were allocated.
- `commandBufferCount` is the length of the `pCommandBuffers` array.
- `pCommandBuffers` is a pointer to an array of handles of command buffers to free.

Any primary command buffer that is in the [recording or executable state](#) and has any element of

`pCommandBuffers` recorded into it, becomes `invalid`.

Freeing a command buffer does not return the memory used by command recording back to its parent command pool. This memory will be reclaimed the next time `vkResetCommandPool` is called.

Valid Usage

- VUID-vkFreeCommandBuffers-pCommandBuffers-00047
All elements of `pCommandBuffers` **must** not be in the `pending state`
- VUID-vkFreeCommandBuffers-pCommandBuffers-00048
`pCommandBuffers` **must** be a valid pointer to an array of `commandBufferCount` `VkCommandBuffer` handles, each element of which **must** either be a valid handle or `NULL`

Valid Usage (Implicit)

- VUID-vkFreeCommandBuffers-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkFreeCommandBuffers-commandPool-parameter
`commandPool` **must** be a valid `VkCommandPool` handle
- VUID-vkFreeCommandBuffers-commandBufferCount-arraylength
`commandBufferCount` **must** be greater than 0
- VUID-vkFreeCommandBuffers-commandPool-parent
`commandPool` **must** have been created, allocated, or retrieved from `device`
- VUID-vkFreeCommandBuffers-pCommandBuffers-parent
Each element of `pCommandBuffers` that is a valid handle **must** have been created, allocated, or retrieved from `commandPool`

Host Synchronization

- Host access to `commandPool` **must** be externally synchronized
- Host access to each member of `pCommandBuffers` **must** be externally synchronized

6.4. Command Buffer Recording

To begin recording a command buffer, call:

```
// Provided by VK_VERSION_1_0
VkResult vkBeginCommandBuffer(
    VkCommandBuffer                                commandBuffer,
    const VkCommandBufferBeginInfo*                pBeginInfo);
```

- `commandBuffer` is the handle of the command buffer which is to be put in the recording state.
- `pBeginInfo` is a pointer to a `VkCommandBufferBeginInfo` structure defining additional information about how the command buffer begins recording.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkBeginCommandBuffer` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkBeginCommandBuffer-commandBuffer-00049
`commandBuffer` **must** not be in the `recording or pending state`
- VUID-vkBeginCommandBuffer-commandBuffer-00050
If `commandBuffer` was allocated from a `VkCommandPool` which did not have the `VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT` flag set, `commandBuffer` **must** be in the `initial state`
- VUID-vkBeginCommandBuffer-commandPoolResetCommandBuffer-05136
If `commandPoolResetCommandBuffer` is not supported, `commandBuffer` **must** be in the `initial state`
- VUID-vkBeginCommandBuffer-commandBuffer-00051
If `commandBuffer` is a secondary command buffer, the `pInheritanceInfo` member of `pBeginInfo` **must** be a valid `VkCommandBufferInheritanceInfo` structure
- VUID-vkBeginCommandBuffer-commandBuffer-00052
If `commandBuffer` is a secondary command buffer and either the `occlusionQueryEnable` member of the `pInheritanceInfo` member of `pBeginInfo` is `VK_FALSE`, or the `occlusionQueryPrecise` feature is not enabled, then `pBeginInfo->pInheritanceInfo->queryFlags` **must** not contain `VK_QUERY_CONTROL_PRECISE_BIT`
- VUID-vkBeginCommandBuffer-commandBuffer-02840
If `commandBuffer` is a primary command buffer, then `pBeginInfo->flags` **must** not set both the `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` and the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flags
- VUID-vkBeginCommandBuffer-commandPoolMultipleCommandBuffersRecording-05007
If `commandPoolMultipleCommandBuffersRecording` is `VK_FALSE`, then the command pool that `commandBuffer` was created from **must** have no other command buffers in the `recording state`
- VUID-vkBeginCommandBuffer-commandBufferSimultaneousUse-05008
If `commandBufferSimultaneousUse` is `VK_FALSE`, then `pBeginInfo->flags` **must** not include `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`

Valid Usage (Implicit)

- VUID-vkBeginCommandBuffer-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkBeginCommandBuffer-pBeginInfo-parameter

`pBeginInfo` **must** be a valid pointer to a valid `VkCommandBufferBeginInfo` structure

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkCommandBufferBeginInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkCommandBufferBeginInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkCommandBufferUsageFlags flags;
    const VkCommandBufferInheritanceInfo* pInheritanceInfo;
} VkCommandBufferBeginInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkCommandBufferUsageFlagBits` specifying usage behavior for the command buffer.
- `pInheritanceInfo` is a pointer to a `VkCommandBufferInheritanceInfo` structure, used if `commandBuffer` is a secondary command buffer. If this is a primary command buffer, then this value is ignored.

Valid Usage

- VUID-VkCommandBufferBeginInfo-flags-09123
If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`, the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-VkCommandBufferBeginInfo-flags-05009
If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` and `secondaryCommandBufferNullOrImagelessFramebuffer` is `VK_TRUE`, the `framebuffer` member of `pInheritanceInfo` **must** be either `VK_NULL_HANDLE`, or a valid `VkFramebuffer` that is compatible with the `renderPass` member of `pInheritanceInfo`
- VUID-VkCommandBufferBeginInfo-flags-05010
If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` and `secondaryCommandBufferNullOrImagelessFramebuffer` is `VK_FALSE`, the `framebuffer` member of `pInheritanceInfo` **must** be a valid `VkFramebuffer` that is compatible with the `renderPass` member of `pInheritanceInfo` and **must** not have been created with a `VkFramebufferCreateInfo::flags` value that includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`
- VUID-VkCommandBufferBeginInfo-flags-06000
If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` the `renderPass` member of `pInheritanceInfo` **must** be a valid `VkRenderPass`
- VUID-VkCommandBufferBeginInfo-flags-06001
If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` the `subpass` member of `pInheritanceInfo` **must** be a valid subpass index within the `renderPass` member of `pInheritanceInfo`

Valid Usage (Implicit)

- VUID-VkCommandBufferBeginInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_BEGIN_INFO`
- VUID-VkCommandBufferBeginInfo-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkDeviceGroupCommandBufferBeginInfo`
- VUID-VkCommandBufferBeginInfo-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkCommandBufferBeginInfo-flags-parameter
`flags` **must** be a valid combination of `VkCommandBufferUsageFlagBits` values

Bits which **can** be set in `VkCommandBufferBeginInfo::flags`, specifying usage behavior for a command buffer, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkCommandBufferUsageFlagBits {
    VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT = 0x00000001,
    VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT = 0x00000002,
    VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT = 0x00000004,
} VkCommandBufferUsageFlagBits;
```

- `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` specifies that each recording of the command buffer will only be submitted once, and the command buffer will be reset and recorded again

between each submission.

- `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` specifies that a secondary command buffer is considered to be entirely inside a render pass. If this is a primary command buffer, then this bit is ignored.
- `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` specifies that a command buffer **can** be resubmitted to any queue of the same queue family while it is in the *pending state*, and recorded into multiple primary command buffers.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandBufferUsageFlags;
```

`VkCommandBufferUsageFlags` is a bitmask type for setting a mask of zero or more `VkCommandBufferUsageFlagBits`.

If the command buffer is a secondary command buffer, then the `VkCommandBufferInheritanceInfo` structure defines any state that will be inherited from the primary command buffer:

```
// Provided by VK_VERSION_1_0
typedef struct VkCommandBufferInheritanceInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkRenderPass        renderPass;
    uint32_t            subpass;
    VkFramebuffer       framebuffer;
    VkBool32            occlusionQueryEnable;
    VkQueryControlFlags queryFlags;
    VkQueryPipelineStatisticFlags pipelineStatistics;
} VkCommandBufferInheritanceInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `renderPass` is a `VkRenderPass` object defining which render passes the `VkCommandBuffer` will be **compatible** with and **can** be executed within.
- `subpass` is the index of the subpass within the render pass instance that the `VkCommandBuffer` will be executed within.
- `framebuffer` **can** refer to the `VkFramebuffer` object that the `VkCommandBuffer` will be rendering to if it is executed within a render pass instance. It **can** be `VK_NULL_HANDLE` if the framebuffer is not known.

NOTE

Specifying the exact framebuffer that the secondary command buffer will be executed with **may** result in better performance at command buffer execution time.

- `occlusionQueryEnable` specifies whether the command buffer **can** be executed while an occlusion query is active in the primary command buffer. If this is `VK_TRUE`, then this command

buffer **can** be executed whether the primary command buffer has an occlusion query active or not. If this is `VK_FALSE`, then the primary command buffer **must** not have an occlusion query active.

- `queryFlags` specifies the query flags that **can** be used by an active occlusion query in the primary command buffer when this secondary command buffer is executed. If this value includes the `VK_QUERY_CONTROL_PRECISE_BIT` bit, then the active query **can** return boolean results or actual sample counts. If this bit is not set, then the active query **must** not use the `VK_QUERY_CONTROL_PRECISE_BIT` bit.
- `pipelineStatistics` is a bitmask of `VkQueryPipelineStatisticFlagBits` specifying the set of pipeline statistics that **can** be counted by an active query in the primary command buffer when this secondary command buffer is executed. If this value includes a given bit, then this command buffer **can** be executed whether the primary command buffer has a pipeline statistics query active that includes this bit or not. If this value excludes a given bit, then the active pipeline statistics query **must** not be from a query pool that counts that statistic.

If the `VkCommandBuffer` will not be executed within a render pass instance, `renderPass`, `subpass`, and `framebuffer` are ignored.

Valid Usage

- VUID-VkCommandBufferInheritanceInfo-occlusionQueryEnable-00056
If the `inheritedQueries` feature is not enabled, `occlusionQueryEnable` **must** be `VK_FALSE`
- VUID-VkCommandBufferInheritanceInfo-queryFlags-00057
If the `inheritedQueries` feature is enabled, `queryFlags` **must** be a valid combination of `VkQueryControlFlagBits` values
- VUID-VkCommandBufferInheritanceInfo-queryFlags-02788
If the `inheritedQueries` feature is not enabled, `queryFlags` **must** be `0`
- VUID-VkCommandBufferInheritanceInfo-pipelineStatistics-02789
If the `pipelineStatisticsQuery` feature is enabled, `pipelineStatistics` **must** be a valid combination of `VkQueryPipelineStatisticFlagBits` values
- VUID-VkCommandBufferInheritanceInfo-pipelineStatistics-00058
If the `pipelineStatisticsQuery` feature is not enabled, `pipelineStatistics` **must** be `0`

Valid Usage (Implicit)

- VUID-VkCommandBufferInheritanceInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_INFO`
- VUID-VkCommandBufferInheritanceInfo-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkCommandBufferInheritanceInfo-commonparent
Both of `framebuffer`, and `renderPass` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

NOTE

On some implementations, not using the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` bit enables command buffers to be patched in-place if needed, rather than creating a copy of the command buffer.

If a command buffer is in the [invalid, or executable state](#), and the command buffer was allocated from a command pool with the `VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT` flag set, then `vkBeginCommandBuffer` implicitly resets the command buffer, behaving as if `vkResetCommandBuffer` had been called with `VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT` not set. After the implicit reset, `commandBuffer` is moved to the [recording state](#).

Once recording starts, an application records a sequence of commands (`vkCmd*`) to set state in the command buffer, draw, dispatch, and other commands.

To complete recording of a command buffer, call:

```
// Provided by VK_VERSION_1_0
VkResult vkEndCommandBuffer(
    VkCommandBuffer                commandBuffer);
```

- `commandBuffer` is the command buffer to complete recording.

The command buffer **must** have been in the [recording state](#), and, if successful, is moved to the [executable state](#).

If there was an error during recording, the application will be notified by an unsuccessful return code returned by `vkEndCommandBuffer`, and the command buffer will be moved to the [invalid state](#).

If recording a command would exceed the amount of command pool memory reserved by `VkCommandPoolMemoryReservationCreateInfo::commandPoolReservedSize` or the maximum supported command buffer size reported in `VkPhysicalDeviceVulkanSC10Properties::maxCommandBufferSize`, the implementation **may** report a `VK_FAULT_TYPE_COMMAND_BUFFER_FULL` fault. The command buffer remains in the [recording state](#) until `vkEndCommandBuffer` is called. When `vkEndCommandBuffer` is called on a command buffer for which the command pool memory reservation was exceeded during recording, it **must** return `VK_ERROR_OUT_OF_DEVICE_MEMORY`.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkEndCommandBuffer` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkEndCommandBuffer-commandBuffer-00059
`commandBuffer` **must** be in the [recording state](#)
- VUID-vkEndCommandBuffer-commandBuffer-00060
If `commandBuffer` is a primary command buffer, there **must** not be an active render pass instance
- VUID-vkEndCommandBuffer-commandBuffer-00061
All queries made [active](#) during the recording of `commandBuffer` **must** have been made

inactive

- VUID-vkEndCommandBuffer-commandBuffer-01815

If `commandBuffer` is a secondary command buffer, there **must** not be an outstanding `vkCmdBeginDebugUtilsLabelEXT` command recorded to `commandBuffer` that has not previously been ended by a call to `vkCmdEndDebugUtilsLabelEXT`

Valid Usage (Implicit)

- VUID-vkEndCommandBuffer-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

When a command buffer is in the executable state, it **can** be submitted to a queue for execution.

6.5. Command Buffer Submission

NOTE

Submission can be a high overhead operation, and applications **should** attempt to batch work together into as few calls to `vkQueueSubmit` or `vkQueueSubmit2KHR` as possible.

To submit command buffers to a queue, call:

```
// Provided by VK_KHR_synchronization2
VkResult vkQueueSubmit2KHR(
    VkQueue          queue,
    uint32_t         submitCount,
    const VkSubmitInfo2* pSubmits,
    VkFence          fence);
```

- `queue` is the queue that the command buffers will be submitted to.
- `submitCount` is the number of elements in the `pSubmits` array.
- `pSubmits` is a pointer to an array of `VkSubmitInfo2` structures, each specifying a command buffer submission batch. Command buffers and semaphores specified in this array **may** be accessed at any point until the [queue operations](#) they define complete execution on the device.
- `fence` is an **optional** handle to a fence to be signaled once all submitted command buffers have completed execution. If `fence` is not `VK_NULL_HANDLE`, it defines a [fence signal operation](#). If it is not `VK_NULL_HANDLE`, `fence` **may** be accessed at any point until this command completes on the device.

`vkQueueSubmit2KHR` is a [queue submission command](#), with each batch defined by an element of `pSubmits`.

Semaphore operations submitted with `vkQueueSubmit2KHR` have additional ordering constraints compared to other submission commands, with dependencies involving previous and subsequent queue operations. Information about these additional constraints can be found in the [semaphore](#) section of [the synchronization chapter](#).

If any command buffer submitted to this queue is in the [executable state](#), it is moved to the [pending state](#). Once execution of all submissions of a command buffer complete, it moves from the [pending state](#), back to the [executable state](#). If a command buffer was recorded with the `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` flag, it instead moves back to the [invalid state](#).

If `vkQueueSubmit2KHR` fails, it **may** return `VK_ERROR_OUT_OF_HOST_MEMORY` or `VK_ERROR_OUT_OF_DEVICE_MEMORY`. If it does, the implementation **must** ensure that the state and contents of any resources or synchronization primitives referenced by the submitted command buffers and any semaphores referenced by `pSubmits` is unaffected by the call or its failure. If `vkQueueSubmit2KHR` fails in such a way that the implementation is unable to make that guarantee, the implementation **must** return `VK_ERROR_DEVICE_LOST`. See [Lost Device](#).

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkQueueSubmit2KHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkQueueSubmit2-fence-04894
If `fence` is not `VK_NULL_HANDLE`, `fence` **must** be unsignaled
- VUID-vkQueueSubmit2-fence-04895
If `fence` is not `VK_NULL_HANDLE`, `fence` **must** not be associated with any other queue

command that has not yet completed execution on that queue

- VUID-vkQueueSubmit2-synchronization2-03866
The **synchronization2** feature **must** be enabled
- VUID-vkQueueSubmit2-commandBuffer-03867
If a command recorded into the **commandBuffer** member of any element of the **pCommandBufferInfos** member of any element of **pSubmits** referenced a **VkEvent**, that event **must** not be referenced by a command that has been submitted to another queue and is still in the *pending state*
- VUID-vkQueueSubmit2-semaphore-03868
The **semaphore** member of any binary semaphore element of the **pSignalSemaphoreInfos** member of any element of **pSubmits** **must** be unsignaled when the semaphore signal operation it defines is executed on the device
- VUID-vkQueueSubmit2-stageMask-03869
The **stageMask** member of any element of the **pSignalSemaphoreInfos** member of any element of **pSubmits** **must** only include pipeline stages that are supported by the queue family which **queue** belongs to
- VUID-vkQueueSubmit2-stageMask-03870
The **stageMask** member of any element of the **pWaitSemaphoreInfos** member of any element of **pSubmits** **must** only include pipeline stages that are supported by the queue family which **queue** belongs to
- VUID-vkQueueSubmit2-semaphore-03871
When a semaphore wait operation for a binary semaphore is executed, as defined by the **semaphore** member of any element of the **pWaitSemaphoreInfos** member of any element of **pSubmits**, there **must** be no other queues waiting on the same semaphore
- VUID-vkQueueSubmit2-semaphore-03873
The **semaphore** member of any element of the **pWaitSemaphoreInfos** member of any element of **pSubmits** that was created with a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_BINARY** **must** reference a semaphore signal operation that has been submitted for execution and any **semaphore signal operations** on which it depends **must** have also been submitted for execution
- VUID-vkQueueSubmit2-commandBuffer-03874
The **commandBuffer** member of any element of the **pCommandBufferInfos** member of any element of **pSubmits** **must** be in the **pending or executable state**
- VUID-vkQueueSubmit2-commandBuffer-03875
If a command recorded into the **commandBuffer** member of any element of the **pCommandBufferInfos** member of any element of **pSubmits** was not recorded with the **VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT**, it **must** not be in the **pending state**
- VUID-vkQueueSubmit2-commandBuffer-03876
Any **secondary command buffers recorded** into the **commandBuffer** member of any element of the **pCommandBufferInfos** member of any element of **pSubmits** **must** be in the **pending or executable state**
- VUID-vkQueueSubmit2-commandBuffer-03877
If any **secondary command buffers recorded** into the **commandBuffer** member of any

element of the `pCommandBufferInfos` member of any element of `pSubmits` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`, it **must** not be in the `pending` state

- VUID-vkQueueSubmit2-commandBuffer-03878

The `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` **must** have been allocated from a `VkCommandPool` that was created for the same queue family `queue` belongs to

- VUID-vkQueueSubmit2-commandBuffer-03879

If a command recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` includes a `Queue Family Ownership Transfer Acquire Operation`, there **must** exist a previously submitted `Queue Family Ownership Transfer Release Operation` on a queue in the queue family identified by the acquire operation, with parameters matching the acquire operation as defined in the definition of such `acquire operations`, and which happens before the acquire operation

- VUID-vkQueueSubmit2-commandBuffer-10910

If a command recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` includes a `Queue Family Ownership Transfer Acquire Operation`, the affected resource **must** not be modified in any way between the last matching release operation and the acquire operation

- VUID-vkQueueSubmit2-commandBuffer-03880

If a command recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` was a `vkCmdBeginQuery` whose `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the `profiling lock` **must** have been held continuously on the `VkDevice` that `queue` was retrieved from, throughout recording of those command buffers

- VUID-vkQueueSubmit2-queue-06447

If `queue` was not created with `VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT`, the `flags` member of any element of `pSubmits` **must** not include `VK_SUBMIT_PROTECTED_BIT_KHR`

Valid Usage (Implicit)

- VUID-vkQueueSubmit2-queue-parameter

`queue` **must** be a valid `VkQueue` handle

- VUID-vkQueueSubmit2-pSubmits-parameter

If `submitCount` is not 0, `pSubmits` **must** be a valid pointer to an array of `submitCount` valid `VkSubmitInfo2` structures

- VUID-vkQueueSubmit2-fence-parameter

If `fence` is not `VK_NULL_HANDLE`, `fence` **must** be a valid `VkFence` handle

- VUID-vkQueueSubmit2-commonparent

Both of `fence`, and `queue` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to **queue** **must** be externally synchronized
- Host access to **fence** **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
-	-	Any	-

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_DEVICE_LOST**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_UNKNOWN**
- **VK_ERROR_VALIDATION_FAILED**

The **VkSubmitInfo2** structure is defined as:

```
typedef struct VkSubmitInfo2 {  
    VkStructureType      sType;  
    const void*          pNext;  
    VkSubmitFlags        flags;  
    uint32_t             waitSemaphoreInfoCount;  
    const VkSemaphoreSubmitInfo* pWaitSemaphoreInfos;  
    uint32_t             commandBufferInfoCount;  
    const VkCommandBufferSubmitInfo* pCommandBufferInfos;  
    uint32_t             signalSemaphoreInfoCount;  
    const VkSemaphoreSubmitInfo* pSignalSemaphoreInfos;  
} VkSubmitInfo2;
```

```
// Provided by VK_KHR_synchronization2  
typedef VkSubmitInfo2 VkSubmitInfo2KHR;
```

- **sType** is a **VkStructureType** value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkSubmitFlagBits`.
- `waitSemaphoreInfoCount` is the number of elements in `pWaitSemaphoreInfos`.
- `pWaitSemaphoreInfos` is a pointer to an array of `VkSemaphoreSubmitInfo` structures defining semaphore wait operations.
- `commandBufferInfoCount` is the number of elements in `pCommandBufferInfos` and the number of command buffers to execute in the batch.
- `pCommandBufferInfos` is a pointer to an array of `VkCommandBufferSubmitInfo` structures describing command buffers to execute in the batch.
- `signalSemaphoreInfoCount` is the number of elements in `pSignalSemaphoreInfos`.
- `pSignalSemaphoreInfos` is a pointer to an array of `VkSemaphoreSubmitInfo` describing semaphore signal operations.

Valid Usage

- VUID-VkSubmitInfo2-flags-03886
If `flags` includes `VK_SUBMIT_PROTECTED_BIT`, all elements of `pCommandBuffers` **must** be protected command buffers
- VUID-VkSubmitInfo2-flags-03887
If `flags` does not include `VK_SUBMIT_PROTECTED_BIT`, each element of `pCommandBuffers` **must** not be a protected command buffer

Valid Usage (Implicit)

- VUID-VkSubmitInfo2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SUBMIT_INFO_2`
- VUID-VkSubmitInfo2-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkPerformanceQuerySubmitInfoKHR`
- VUID-VkSubmitInfo2-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkSubmitInfo2-flags-parameter
`flags` **must** be a valid combination of `VkSubmitFlagBits` values
- VUID-VkSubmitInfo2-pWaitSemaphoreInfos-parameter
If `waitSemaphoreInfoCount` is not 0, `pWaitSemaphoreInfos` **must** be a valid pointer to an array of `waitSemaphoreInfoCount` valid `VkSemaphoreSubmitInfo` structures
- VUID-VkSubmitInfo2-pCommandBufferInfos-parameter
If `commandBufferInfoCount` is not 0, `pCommandBufferInfos` **must** be a valid pointer to an array of `commandBufferInfoCount` valid `VkCommandBufferSubmitInfo` structures
- VUID-VkSubmitInfo2-pSignalSemaphoreInfos-parameter
If `signalSemaphoreInfoCount` is not 0, `pSignalSemaphoreInfos` **must** be a valid pointer to an

array of `signalSemaphoreInfoCount` valid `VkSemaphoreSubmitInfo` structures

Bits which **can** be set in `VkSubmitInfo2::flags`, specifying submission behavior, are:

```
typedef enum VkSubmitFlagBits {  
    VK_SUBMIT_PROTECTED_BIT = 0x00000001,  
    // Provided by VK_KHR_synchronization2  
    VK_SUBMIT_PROTECTED_BIT_KHR = VK_SUBMIT_PROTECTED_BIT,  
} VkSubmitFlagBits;
```

```
// Provided by VK_KHR_synchronization2  
typedef VkSubmitFlagBits VkSubmitFlagBitsKHR;
```

- `VK_SUBMIT_PROTECTED_BIT` specifies that this batch is a protected submission.

```
typedef VkFlags VkSubmitFlags;
```

```
// Provided by VK_KHR_synchronization2  
typedef VkSubmitFlags VkSubmitFlagsKHR;
```

`VkSubmitFlags` is a bitmask type for setting a mask of zero or more `VkSubmitFlagBits`.

The `VkSemaphoreSubmitInfo` structure is defined as:

```
typedef struct VkSemaphoreSubmitInfo {  
    VkStructureType      sType;  
    const void*          pNext;  
    VkSemaphore          semaphore;  
    uint64_t             value;  
    VkPipelineStageFlags2 stageMask;  
    uint32_t             deviceIndex;  
} VkSemaphoreSubmitInfo;
```

```
// Provided by VK_KHR_synchronization2  
typedef VkSemaphoreSubmitInfo VkSemaphoreSubmitInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is a `VkSemaphore` affected by this operation.
- `value` is ignored.
- `stageMask` is a `VkPipelineStageFlags2` mask of pipeline stages which limit the first

synchronization scope of a semaphore signal operation, or second synchronization scope of a semaphore wait operation as described in the [semaphore wait operation](#) and [semaphore signal operation](#) sections of [the synchronization chapter](#).

- **deviceIndex** is the index of the device within a device group that executes the semaphore wait or signal operation.

Whether this structure defines a semaphore wait or signal operation is defined by how it is used.

Valid Usage

- VUID-VkSemaphoreSubmitInfo-stageMask-03929
If the **geometryShader** feature is not enabled, **stageMask** **must** not contain **VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT**
- VUID-VkSemaphoreSubmitInfo-stageMask-03930
If the **tessellationShader** feature is not enabled, **stageMask** **must** not contain **VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT** or **VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT**
- VUID-VkSemaphoreSubmitInfo-stageMask-07317
If the **attachmentFragmentShadingRate** feature is not enabled, **stageMask** **must** not contain **VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR**
- VUID-VkSemaphoreSubmitInfo-device-03888
If the **device** that **semaphore** was created on is not a device group, **deviceIndex** **must** be 0
- VUID-VkSemaphoreSubmitInfo-device-03889
If the **device** that **semaphore** was created on is a device group, **deviceIndex** **must** be a valid device index
- VUID-VkSemaphoreSubmitInfoKHR-semaphore-05094
If **semaphore** has a payload of **NvSciSyncObj**, **value** **must** be calculated by application via [NvSciSync APIs](#)

Valid Usage (Implicit)

- VUID-VkSemaphoreSubmitInfo-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_SEMAPHORE_SUBMIT_INFO**
- VUID-VkSemaphoreSubmitInfo-pNext-pNext
pNext **must** be **NULL**
- VUID-VkSemaphoreSubmitInfo-semaphore-parameter
semaphore **must** be a valid [VkSemaphore](#) handle
- VUID-VkSemaphoreSubmitInfo-stageMask-parameter
stageMask **must** be a valid combination of [VkPipelineStageFlagBits2](#) values

The **VkCommandBufferSubmitInfo** structure is defined as:

```
typedef struct VkCommandBufferSubmitInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkCommandBuffer    commandBuffer;
    uint32_t           deviceMask;
} VkCommandBufferSubmitInfo;
```

```
// Provided by VK_KHR_synchronization2
typedef VkCommandBufferSubmitInfo VkCommandBufferSubmitInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **commandBuffer** is a [VkCommandBuffer](#) to be submitted for execution.
- **deviceMask** is a bitmask indicating which devices in a device group execute the command buffer. A **deviceMask** of **0** is equivalent to setting all bits corresponding to valid devices in the group to **1**.

Valid Usage

- VUID-VkCommandBufferSubmitInfo-commandBuffer-03890
commandBuffer **must** not have been allocated with **VK_COMMAND_BUFFER_LEVEL_SECONDARY**
- VUID-VkCommandBufferSubmitInfo-deviceMask-03891
If **deviceMask** is not **0**, it **must** be a valid device mask

Valid Usage (Implicit)

- VUID-VkCommandBufferSubmitInfo-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_COMMAND_BUFFER_SUBMIT_INFO**
- VUID-VkCommandBufferSubmitInfo-pNext-pNext
pNext **must** be **NULL**
- VUID-VkCommandBufferSubmitInfo-commandBuffer-parameter
commandBuffer **must** be a valid [VkCommandBuffer](#) handle

To submit command buffers to a queue, call:

```
// Provided by VK_VERSION_1_0
VkResult vkQueueSubmit(
    VkQueue          queue,
    uint32_t         submitCount,
    const VkSubmitInfo* pSubmits,
    VkFence          fence);
```

- `queue` is the queue that the command buffers will be submitted to.
- `submitCount` is the number of elements in the `pSubmits` array.
- `pSubmits` is a pointer to an array of `VkSubmitInfo` structures, each specifying a command buffer submission batch. Command buffers and semaphores specified in this array **may** be accessed at any point until the `queue operations` they define complete execution on the device.
- `fence` is an **optional** handle to a fence to be signaled once all submitted command buffers have completed execution. If `fence` is not `VK_NULL_HANDLE`, it defines a `fence signal operation`. If it is not `VK_NULL_HANDLE`, `fence` **may** be accessed at any point until this command completes on the device.

`vkQueueSubmit` is a `queue submission command`, with each batch defined by an element of `pSubmits`. Batches begin execution in the order they appear in `pSubmits`, but **may** complete out of order.

Fence and semaphore operations submitted with `vkQueueSubmit` have additional ordering constraints compared to other submission commands, with dependencies involving previous and subsequent queue operations. Information about these additional constraints can be found in the `semaphore` and `fence` sections of [the synchronization chapter](#).

Details on the interaction of `pWaitDstStageMask` with synchronization are described in the `semaphore wait operation` section of [the synchronization chapter](#).

The order that batches appear in `pSubmits` is used to determine `submission order`, and thus all the `implicit ordering guarantees` that respect it. Other than these implicit ordering guarantees and any `explicit synchronization primitives`, these batches **may** overlap or otherwise execute out of order.

If any command buffer submitted to this queue is in the `executable state`, it is moved to the `pending state`. Once execution of all submissions of a command buffer complete, it moves from the `pending state`, back to the `executable state`. If a command buffer was recorded with the `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` flag, it instead moves to the `invalid state`.

If `vkQueueSubmit` fails, it **may** return `VK_ERROR_OUT_OF_HOST_MEMORY` or `VK_ERROR_OUT_OF_DEVICE_MEMORY`. If it does, the implementation **must** ensure that the state and contents of any resources or synchronization primitives referenced by the submitted command buffers and any semaphores referenced by `pSubmits` is unaffected by the call or its failure. If `vkQueueSubmit` fails in such a way that the implementation is unable to make that guarantee, the implementation **must** return `VK_ERROR_DEVICE_LOST`. See [Lost Device](#).

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkQueueSubmit` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkQueueSubmit-fence-00063
If `fence` is not `VK_NULL_HANDLE`, `fence` **must** be unsignaled
- VUID-vkQueueSubmit-fence-00064
If `fence` is not `VK_NULL_HANDLE`, `fence` **must** not be associated with any other queue command that has not yet completed execution on that queue

- VUID-vkQueueSubmit-pCommandBuffers-00065
Any calls to [vkCmdSetEvent](#), [vkCmdResetEvent](#) or [vkCmdWaitEvents](#) that have been recorded into any of the command buffer elements of the [pCommandBuffers](#) member of any element of [pSubmits](#), **must** not reference any [VkEvent](#) that is referenced by any of those commands in a command buffer that has been submitted to another queue and is still in the *pending state*
- VUID-vkQueueSubmit-pWaitDstStageMask-00066
Any stage flag included in any element of the [pWaitDstStageMask](#) member of any element of [pSubmits](#) **must** be a pipeline stage supported by one of the capabilities of [queue](#), as specified in the [table of supported pipeline stages](#)
- VUID-vkQueueSubmit-pSignalSemaphores-00067
Each binary semaphore element of the [pSignalSemaphores](#) member of any element of [pSubmits](#) **must** be unsignaled when the semaphore signal operation it defines is executed on the device
- VUID-vkQueueSubmit-pWaitSemaphores-00068
When a semaphore wait operation referring to a binary semaphore defined by any element of the [pWaitSemaphores](#) member of any element of [pSubmits](#) executes on [queue](#), there **must** be no other queues waiting on the same semaphore
- VUID-vkQueueSubmit-pWaitSemaphores-03238
All elements of the [pWaitSemaphores](#) member of all elements of [pSubmits](#) created with a [VkSemaphoreType](#) of [VK_SEMAPHORE_TYPE_BINARY](#) **must** reference a semaphore signal operation that has been submitted for execution and any [semaphore signal operations](#) on which it depends **must** have also been submitted for execution
- VUID-vkQueueSubmit-pCommandBuffers-00070
Each element of the [pCommandBuffers](#) member of each element of [pSubmits](#) **must** be in the *pending or executable state*
- VUID-vkQueueSubmit-pCommandBuffers-00071
If any element of the [pCommandBuffers](#) member of any element of [pSubmits](#) was not recorded with the [VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT](#), it **must** not be in the *pending state*
- VUID-vkQueueSubmit-pCommandBuffers-00072
Any [secondary command buffers recorded](#) into any element of the [pCommandBuffers](#) member of any element of [pSubmits](#) **must** be in the *pending or executable state*
- VUID-vkQueueSubmit-pCommandBuffers-00073
If any [secondary command buffers recorded](#) into any element of the [pCommandBuffers](#) member of any element of [pSubmits](#) was not recorded with the [VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT](#), it **must** not be in the *pending state*
- VUID-vkQueueSubmit-pCommandBuffers-00074
Each element of the [pCommandBuffers](#) member of each element of [pSubmits](#) **must** have been allocated from a [VkCommandPool](#) that was created for the same queue family [queue](#) belongs to
- VUID-vkQueueSubmit-pSubmits-02207
If any element of [pSubmits](#)->[pCommandBuffers](#) includes a [Queue Family Ownership Transfer Acquire Operation](#), there **must** exist a previously submitted [Queue Family Ownership](#)

[Transfer Release Operation](#) on a queue in the queue family identified by the acquire operation, with parameters matching the acquire operation as defined in the definition of such [acquire operations](#), and which happens-before the acquire operation

- VUID-vkQueueSubmit-pSubmits-10911

If any element of `pSubmits->pCommandBuffers` includes a [Queue Family Ownership Transfer Acquire Operation](#), the affected resource **must** not be modified in any way between the last matching release operation and the acquire operation

- VUID-vkQueueSubmit-pCommandBuffers-03220

If a command recorded into any element of `pCommandBuffers` was a `vkCmdBeginQuery` whose `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the [profiling lock](#) **must** have been held continuously on the `VkDevice` that `queue` was retrieved from, throughout recording of those command buffers

- VUID-vkQueueSubmit-pSubmits-02808

Any resource created with `VK_SHARING_MODE_EXCLUSIVE` that is read by an operation specified by `pSubmits` **must** not be owned by any queue family other than the one which `queue` belongs to, at the time it is executed

- VUID-vkQueueSubmit-pSubmits-04626

Any resource created with `VK_SHARING_MODE_CONCURRENT` that is accessed by an operation specified by `pSubmits` **must** have included the queue family of `queue` at resource creation time

- VUID-vkQueueSubmit-queue-06448

If `queue` was not created with `VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT`, there **must** be no element of `pSubmits` that includes a `VkProtectedSubmitInfo` structure in its `pNext` chain with `protectedSubmit` equal to `VK_TRUE`

Valid Usage (Implicit)

- VUID-vkQueueSubmit-queue-parameter

`queue` **must** be a valid `VkQueue` handle

- VUID-vkQueueSubmit-pSubmits-parameter

If `submitCount` is not 0, `pSubmits` **must** be a valid pointer to an array of `submitCount` valid `VkSubmitInfo` structures

- VUID-vkQueueSubmit-fence-parameter

If `fence` is not `VK_NULL_HANDLE`, `fence` **must** be a valid `VkFence` handle

- VUID-vkQueueSubmit-commonparent

Both of `fence`, and `queue` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `queue` **must** be externally synchronized
- Host access to `fence` **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
-	-	Any	-

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkSubmitInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSubmitInfo {
    VkStructureType      sType;
    const void*          pNext;
    uint32_t              waitSemaphoreCount;
    const VkSemaphore*    pWaitSemaphores;
    const VkPipelineStageFlags* pWaitDstStageMask;
    uint32_t              commandBufferCount;
    const VkCommandBuffer* pCommandBuffers;
    uint32_t              signalSemaphoreCount;
    const VkSemaphore*    pSignalSemaphores;
} VkSubmitInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `waitSemaphoreCount` is the number of semaphores upon which to wait before executing the command buffers for the batch.
- `pWaitSemaphores` is a pointer to an array of `VkSemaphore` handles upon which to wait before the command buffers for this batch begin execution. If semaphores to wait on are provided, they define a [semaphore wait operation](#).
- `pWaitDstStageMask` is a pointer to an array of pipeline stages at which each corresponding semaphore wait will occur.

- `commandBufferCount` is the number of command buffers to execute in the batch.
- `pCommandBuffers` is a pointer to an array of `VkCommandBuffer` handles to execute in the batch.
- `signalSemaphoreCount` is the number of semaphores to be signaled once the commands specified in `pCommandBuffers` have completed execution.
- `pSignalSemaphores` is a pointer to an array of `VkSemaphore` handles which will be signaled when the command buffers for this batch have completed execution. If semaphores to be signaled are provided, they define a [semaphore signal operation](#).

The order that command buffers appear in `pCommandBuffers` is used to determine [submission order](#), and thus all the [implicit ordering guarantees](#) that respect it. Other than these implicit ordering guarantees and any [explicit synchronization primitives](#), these command buffers **may** overlap or otherwise execute out of order.

Valid Usage

- VUID-VkSubmitInfo-pWaitDstStageMask-04090
If the `geometryShader` feature is not enabled, `pWaitDstStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- VUID-VkSubmitInfo-pWaitDstStageMask-04091
If the `tessellationShader` feature is not enabled, `pWaitDstStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-VkSubmitInfo-pWaitDstStageMask-07319
If the `attachmentFragmentShadingRate` feature is not enabled, `pWaitDstStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-VkSubmitInfo-pWaitDstStageMask-03937
If the `synchronization2` feature is not enabled, `pWaitDstStageMask` **must** not be `0`
- VUID-VkSubmitInfo-pCommandBuffers-00075
Each element of `pCommandBuffers` **must** not have been allocated with `VK_COMMAND_BUFFER_LEVEL_SECONDARY`
- VUID-VkSubmitInfo-pWaitDstStageMask-00078
Each element of `pWaitDstStageMask` **must** not include `VK_PIPELINE_STAGE_HOST_BIT`
- VUID-VkSubmitInfo-pWaitSemaphores-03239
If any element of `pWaitSemaphores` or `pSignalSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, then the `pNext` chain **must** include a `VkTimelineSemaphoreSubmitInfo` structure
- VUID-VkSubmitInfo-pNext-03240
If the `pNext` chain of this structure includes a `VkTimelineSemaphoreSubmitInfo` structure and any element of `pWaitSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, then its `waitSemaphoreValueCount` member **must** equal `waitSemaphoreCount`
- VUID-VkSubmitInfo-pNext-03241
If the `pNext` chain of this structure includes a `VkTimelineSemaphoreSubmitInfo` structure

and any element of `pSignalSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, then its `signalSemaphoreValueCount` member **must** equal `signalSemaphoreCount`

- VUID-VkSubmitInfo-pSignalSemaphores-03242

For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` **must** have a value greater than the current value of the semaphore when the semaphore signal operation is executed

- VUID-VkSubmitInfo-pWaitSemaphores-03243

For each element of `pWaitSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pWaitSemaphoreValues` **must** have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`

- VUID-VkSubmitInfo-pSignalSemaphores-03244

For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` **must** have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`

- VUID-VkSubmitInfo-pNext-04120

If the `pNext` chain of this structure does not include a `VkProtectedSubmitInfo` structure with `protectedSubmit` set to `VK_TRUE`, then each element of the `pCommandBuffers` array **must** be an unprotected command buffer

- VUID-VkSubmitInfo-pNext-04148

If the `pNext` chain of this structure includes a `VkProtectedSubmitInfo` structure with `protectedSubmit` set to `VK_TRUE`, then each element of the `pCommandBuffers` array **must** be a protected command buffer

Valid Usage (Implicit)

- VUID-VkSubmitInfo-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_SUBMIT_INFO`

- VUID-VkSubmitInfo-pNext-pNext

Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkDeviceGroupSubmitInfo`, `VkPerformanceQuerySubmitInfoKHR`, `VkProtectedSubmitInfo`, or `VkTimelineSemaphoreSubmitInfo`

- VUID-VkSubmitInfo-sType-unique

The `sType` value of each structure in the `pNext` chain **must** be unique

- VUID-VkSubmitInfo-pWaitSemaphores-parameter
If `waitSemaphoreCount` is not 0, `pWaitSemaphores` **must** be a valid pointer to an array of `waitSemaphoreCount` valid `VkSemaphore` handles
- VUID-VkSubmitInfo-pWaitDstStageMask-parameter
If `waitSemaphoreCount` is not 0, `pWaitDstStageMask` **must** be a valid pointer to an array of `waitSemaphoreCount` valid combinations of `VkPipelineStageFlagBits` values
- VUID-VkSubmitInfo-pCommandBuffers-parameter
If `commandBufferCount` is not 0, `pCommandBuffers` **must** be a valid pointer to an array of `commandBufferCount` valid `VkCommandBuffer` handles
- VUID-VkSubmitInfo-pSignalSemaphores-parameter
If `signalSemaphoreCount` is not 0, `pSignalSemaphores` **must** be a valid pointer to an array of `signalSemaphoreCount` valid `VkSemaphore` handles
- VUID-VkSubmitInfo-commonparent
Each of the elements of `pCommandBuffers`, the elements of `pSignalSemaphores`, and the elements of `pWaitSemaphores` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

To specify the values to use when waiting for and signaling semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, add a `VkTimelineSemaphoreSubmitInfo` structure to the `pNext` chain of the `VkSubmitInfo` structure when using `vkQueueSubmit`. The `VkTimelineSemaphoreSubmitInfo` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkTimelineSemaphoreSubmitInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           waitSemaphoreValueCount;
    const uint64_t*     pWaitSemaphoreValues;
    uint32_t           signalSemaphoreValueCount;
    const uint64_t*     pSignalSemaphoreValues;
} VkTimelineSemaphoreSubmitInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `waitSemaphoreValueCount` is the number of semaphore wait values specified in `pWaitSemaphoreValues`.
- `pWaitSemaphoreValues` is a pointer to an array of `waitSemaphoreValueCount` values for the corresponding semaphores in `VkSubmitInfo::pWaitSemaphores` to wait for.
- `signalSemaphoreValueCount` is the number of semaphore signal values specified in `pSignalSemaphoreValues`.
- `pSignalSemaphoreValues` is a pointer to an array `signalSemaphoreValueCount` values for the corresponding semaphores in `VkSubmitInfo::pSignalSemaphores` to set when signaled.

If the semaphore in `VkSubmitInfo::pWaitSemaphores` or `VkSubmitInfo::pSignalSemaphores`

corresponding to an entry in `pWaitSemaphoreValues` or `pSignalSemaphoreValues` respectively was not created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, the implementation **must** ignore the value in the `pWaitSemaphoreValues` or `pSignalSemaphoreValues` entry.

If the semaphore in `VkSubmitInfo::pWaitSemaphores` or `VkSubmitInfo::pSignalSemaphores` corresponding to an entry in `pWaitSemaphoreValues` or `pSignalSemaphoreValues` respectively was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, and has `NvSciSyncObj` as the payload, the value in the `pWaitSemaphoreValues` or `pSignalSemaphoreValues` entry **must** be calculated by application via `NvSciSync` APIs.

Valid Usage (Implicit)

- VUID-VkTimelineSemaphoreSubmitInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_TIMELINE_SEMAPHORE_SUBMIT_INFO`
- VUID-VkTimelineSemaphoreSubmitInfo-pWaitSemaphoreValues-parameter
If `waitSemaphoreValueCount` is not 0, and `pWaitSemaphoreValues` is not NULL, `pWaitSemaphoreValues` **must** be a valid pointer to an array of `waitSemaphoreValueCount` `uint64_t` values
- VUID-VkTimelineSemaphoreSubmitInfo-pSignalSemaphoreValues-parameter
If `signalSemaphoreValueCount` is not 0, and `pSignalSemaphoreValues` is not NULL, `pSignalSemaphoreValues` **must** be a valid pointer to an array of `signalSemaphoreValueCount` `uint64_t` values

If the `pNext` chain of `VkSubmitInfo` includes a `VkProtectedSubmitInfo` structure, then the structure indicates whether the batch is protected. The `VkProtectedSubmitInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkProtectedSubmitInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           protectedSubmit;
} VkProtectedSubmitInfo;
```

- `protectedSubmit` specifies whether the batch is protected. If `protectedSubmit` is `VK_TRUE`, the batch is protected. If `protectedSubmit` is `VK_FALSE`, the batch is unprotected. If the `VkSubmitInfo::pNext` chain does not include this structure, the batch is unprotected.

Valid Usage (Implicit)

- VUID-VkProtectedSubmitInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PROTECTED_SUBMIT_INFO`

If the `pNext` chain of `VkSubmitInfo` includes a `VkDeviceGroupSubmitInfo` structure, then that structure includes device indices and masks specifying which physical devices execute semaphore operations and command buffers.

The `VkDeviceGroupSubmitInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupSubmitInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           waitSemaphoreCount;
    const uint32_t*     pWaitSemaphoreDeviceIndices;
    uint32_t           commandBufferCount;
    const uint32_t*     pCommandBufferDeviceMasks;
    uint32_t           signalSemaphoreCount;
    const uint32_t*     pSignalSemaphoreDeviceIndices;
} VkDeviceGroupSubmitInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `waitSemaphoreCount` is the number of elements in the `pWaitSemaphoreDeviceIndices` array.
- `pWaitSemaphoreDeviceIndices` is a pointer to an array of `waitSemaphoreCount` device indices indicating which physical device executes the semaphore wait operation in the corresponding element of `VkSubmitInfo::pWaitSemaphores`.
- `commandBufferCount` is the number of elements in the `pCommandBufferDeviceMasks` array.
- `pCommandBufferDeviceMasks` is a pointer to an array of `commandBufferCount` device masks indicating which physical devices execute the command buffer in the corresponding element of `VkSubmitInfo::pCommandBuffers`. A physical device executes the command buffer if the corresponding bit is set in the mask.
- `signalSemaphoreCount` is the number of elements in the `pSignalSemaphoreDeviceIndices` array.
- `pSignalSemaphoreDeviceIndices` is a pointer to an array of `signalSemaphoreCount` device indices indicating which physical device executes the semaphore signal operation in the corresponding element of `VkSubmitInfo::pSignalSemaphores`.

If this structure is not present, semaphore operations and command buffers execute on device index zero.

Valid Usage

- VUID-VkDeviceGroupSubmitInfo-waitSemaphoreCount-00082
`waitSemaphoreCount` **must** equal `VkSubmitInfo::waitSemaphoreCount`
- VUID-VkDeviceGroupSubmitInfo-commandBufferCount-00083
`commandBufferCount` **must** equal `VkSubmitInfo::commandBufferCount`
- VUID-VkDeviceGroupSubmitInfo-signalSemaphoreCount-00084
`signalSemaphoreCount` **must** equal `VkSubmitInfo::signalSemaphoreCount`
- VUID-VkDeviceGroupSubmitInfo-pWaitSemaphoreDeviceIndices-00085
All elements of `pWaitSemaphoreDeviceIndices` and `pSignalSemaphoreDeviceIndices` **must** be

valid device indices

- VUID-VkDeviceGroupSubmitInfo-pCommandBufferDeviceMasks-00086
All elements of `pCommandBufferDeviceMasks` **must** be valid device masks

Valid Usage (Implicit)

- VUID-VkDeviceGroupSubmitInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_SUBMIT_INFO`
- VUID-VkDeviceGroupSubmitInfo-pWaitSemaphoreDeviceIndices-parameter
If `waitSemaphoreCount` is not 0, `pWaitSemaphoreDeviceIndices` **must** be a valid pointer to an array of `waitSemaphoreCount` `uint32_t` values
- VUID-VkDeviceGroupSubmitInfo-pCommandBufferDeviceMasks-parameter
If `commandBufferCount` is not 0, `pCommandBufferDeviceMasks` **must** be a valid pointer to an array of `commandBufferCount` `uint32_t` values
- VUID-VkDeviceGroupSubmitInfo-pSignalSemaphoreDeviceIndices-parameter
If `signalSemaphoreCount` is not 0, `pSignalSemaphoreDeviceIndices` **must** be a valid pointer to an array of `signalSemaphoreCount` `uint32_t` values

If the `pNext` chain of `VkSubmitInfo` includes a `VkPerformanceQuerySubmitInfoKHR` structure, then the structure indicates which counter pass is active for the batch in that submit.

The `VkPerformanceQuerySubmitInfoKHR` structure is defined as:

```
// Provided by VK_KHR_performance_query
typedef struct VkPerformanceQuerySubmitInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           counterPassIndex;
} VkPerformanceQuerySubmitInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `counterPassIndex` specifies which counter pass index is active.

If the `VkSubmitInfo::pNext` chain does not include this structure, the batch defaults to use counter pass index 0.

Valid Usage

- VUID-VkPerformanceQuerySubmitInfoKHR-counterPassIndex-03221
`counterPassIndex` **must** be less than the number of counter passes required by any queries within the batch. The required number of counter passes for a performance query is obtained by calling `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`

Valid Usage (Implicit)

- `VUID-VkPerformanceQuerySubmitInfoKHR-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_PERFORMANCE_QUERY_SUBMIT_INFO_KHR`

6.6. Queue Forward Progress

When using binary semaphores, the application **must** ensure that command buffer submissions will be able to complete without any subsequent operations by the application on any queue. After any call to `vkQueueSubmit` (or other queue operation), for every queued wait on a semaphore created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` there **must** be a prior signal of that semaphore that will not be consumed by a different wait on the semaphore.

When using timeline semaphores, wait-before-signal behavior is well-defined and applications **can** submit work via `vkQueueSubmit` defining a [timeline semaphore wait operation](#) before submitting a corresponding [semaphore signal operation](#). For each [timeline semaphore wait operation](#) defined by a call to `vkQueueSubmit`, the application **must** ensure that a corresponding [semaphore signal operation](#) is executed before forward progress can be made.

If a command buffer submission waits for any events to be signaled, the application **must** ensure that command buffer submissions will be able to complete without any subsequent operations by the application. Events signaled by the host **must** be signaled before the command buffer waits on those events.

NOTE

The ability for commands to wait on the host to set an events was originally added to allow low-latency updates to resources between host and device. However, to ensure quality of service, implementations would necessarily detect extended stalls in execution and timeout after a short period. As this period is not defined in the Vulkan specification, it is impossible to correctly validate any application with any wait period. Since the original users of this functionality were highly limited and platform-specific, this functionality is now considered defunct and should not be used.

6.7. Secondary Command Buffer Execution

Secondary command buffers **must** not be directly submitted to a queue. To record a secondary command buffer to execute as part of a primary command buffer, call:

```
// Provided by VK_VERSION_1_0
void vkCmdExecuteCommands(
    VkCommandBuffer          commandBuffer,
    uint32_t                 commandBufferCount,
    const VkCommandBuffer*   pCommandBuffers);
```

- `commandBuffer` is a handle to a primary command buffer that the secondary command buffers

are executed in.

- `commandBufferCount` is the length of the `pCommandBuffers` array.
- `pCommandBuffers` is a pointer to an array of `commandBufferCount` secondary command buffer handles, which are recorded to execute in the primary command buffer in the order they are listed in the array.

If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, and it was recorded into any other primary command buffer which is currently in the `executable` or `recording` state, that primary command buffer becomes `invalid`.

Valid Usage

- VUID-vkCmdExecuteCommands-pCommandBuffers-00088
Each element of `pCommandBuffers` **must** have been allocated with a `level` of `VK_COMMAND_BUFFER_LEVEL_SECONDARY`
- VUID-vkCmdExecuteCommands-pCommandBuffers-00089
Each element of `pCommandBuffers` **must** be in the `pending` or `executable` state
- VUID-vkCmdExecuteCommands-pCommandBuffers-00091
If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it **must** not be in the `pending` state
- VUID-vkCmdExecuteCommands-pCommandBuffers-00092
If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it **must** not have already been recorded to `commandBuffer`
- VUID-vkCmdExecuteCommands-pCommandBuffers-00093
If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it **must** not appear more than once in `pCommandBuffers`
- VUID-vkCmdExecuteCommands-pCommandBuffers-00094
Each element of `pCommandBuffers` **must** have been allocated from a `VkCommandPool` that was created for the same queue family as the `VkCommandPool` from which `commandBuffer` was allocated
- VUID-vkCmdExecuteCommands-pCommandBuffers-00096
If this command is called within a render pass instance, each element of `pCommandBuffers` **must** have been recorded with the `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`
- VUID-vkCmdExecuteCommands-pCommandBuffers-00099
If this command is called within a render pass instance, and any element of `pCommandBuffers` was recorded with `VkCommandBufferInheritanceInfo::framebuffer` not equal to `VK_NULL_HANDLE`, that `VkFramebuffer` **must** match the `VkFramebuffer` used in the current render pass instance
- VUID-vkCmdExecuteCommands-contents-09680
If this command is called within a render pass instance begun with `vkCmdBeginRenderPass`, and `vkCmdNextSubpass` has not been called in the current

render pass instance, the `contents` parameter of `vkCmdBeginRenderPass` **must** have been `VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS`

- VUID-vkCmdExecuteCommands-None-09681

If this command is called within a render pass instance begun with `vkCmdBeginRenderPass`, and `vkCmdNextSubpass` has been called in the current render pass instance, the `contents` parameter of the last call to `vkCmdNextSubpass` **must** have been `VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS`

- VUID-vkCmdExecuteCommands-pCommandBuffers-06019

If this command is called within a render pass instance begun with `vkCmdBeginRenderPass`, each element of `pCommandBuffers` **must** have been recorded with `VkCommandBufferInheritanceInfo::subpass` set to the index of the subpass which the given command buffer will be executed in

- VUID-vkCmdExecuteCommands-pBeginInfo-06020

If this command is called within a render pass instance begun with `vkCmdBeginRenderPass`, the render passes specified in the `pBeginInfo->pInheritanceInfo->renderPass` members of the `vkBeginCommandBuffer` commands used to begin recording each element of `pCommandBuffers` **must** be `compatible` with the current render pass

- VUID-vkCmdExecuteCommands-pCommandBuffers-00100

If `vkCmdExecuteCommands` is not being called within a render pass instance, each element of `pCommandBuffers` **must** not have been recorded with the `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`

- VUID-vkCmdExecuteCommands-commandBuffer-00101

If the `inheritedQueries` feature is not enabled, `commandBuffer` **must** not have any queries `active`

- VUID-vkCmdExecuteCommands-commandBuffer-00102

If `commandBuffer` has a `VK_QUERY_TYPE_OCCLUSION` query `active`, then each element of `pCommandBuffers` **must** have been recorded with `VkCommandBufferInheritanceInfo::occlusionQueryEnable` set to `VK_TRUE`

- VUID-vkCmdExecuteCommands-commandBuffer-00103

If `commandBuffer` has a `VK_QUERY_TYPE_OCCLUSION` query `active`, then each element of `pCommandBuffers` **must** have been recorded with `VkCommandBufferInheritanceInfo::queryFlags` having all bits set that are set for the query

- VUID-vkCmdExecuteCommands-commandBuffer-00104

If `commandBuffer` has a `VK_QUERY_TYPE_PIPELINE_STATISTICS` query `active`, then each element of `pCommandBuffers` **must** have been recorded with `VkCommandBufferInheritanceInfo::pipelineStatistics` having all bits set that are set in the `VkQueryPool` the query uses

- VUID-vkCmdExecuteCommands-pCommandBuffers-00105

Each element of `pCommandBuffers` **must** not begin any query types that are `active` in `commandBuffer`

- VUID-vkCmdExecuteCommands-commandBuffer-07594

`commandBuffer` **must** not have any queries other than `VK_QUERY_TYPE_OCCLUSION` and `VK_QUERY_TYPE_PIPELINE_STATISTICS` `active`

- VUID-vkCmdExecuteCommands-commandBuffer-01820

If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, each element of `pCommandBuffers` **must** be a protected command buffer

- VUID-vkCmdExecuteCommands-commandBuffer-01821

If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, each element of `pCommandBuffers` **must** be an unprotected command buffer

- VUID-vkCmdExecuteCommands-commandBuffer-06533

If this command is called within a render pass instance and any recorded command in `commandBuffer` in the current subpass will write to an image subresource as an attachment, commands recorded in elements of `pCommandBuffers` **must** not read from the memory backing that image subresource in any other way

- VUID-vkCmdExecuteCommands-commandBuffer-06534

If this command is called within a render pass instance and any recorded command in `commandBuffer` in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, commands recorded in elements of `pCommandBuffers` **must** not write to that image subresource as an attachment

- VUID-vkCmdExecuteCommands-pCommandBuffers-06535

If this command is called within a render pass instance and any recorded command in a given element of `pCommandBuffers` will write to an image subresource as an attachment, commands recorded in elements of `pCommandBuffers` at a higher index **must** not read from the memory backing that image subresource in any other way

- VUID-vkCmdExecuteCommands-pCommandBuffers-06536

If this command is called within a render pass instance and any recorded command in a given element of `pCommandBuffers` will read from an image subresource used as an attachment in any way other than as an attachment, commands recorded in elements of `pCommandBuffers` at a higher index **must** not write to that image subresource as an attachment

- VUID-vkCmdExecuteCommands-commandBuffer-09375

`commandBuffer` **must** not be a [secondary command buffer](#)

Valid Usage (Implicit)

- VUID-vkCmdExecuteCommands-commandBuffer-parameter

`commandBuffer` **must** be a valid [VkCommandBuffer](#) handle

- VUID-vkCmdExecuteCommands-pCommandBuffers-parameter

`pCommandBuffers` **must** be a valid pointer to an array of `commandBufferCount` valid [VkCommandBuffer](#) handles

- VUID-vkCmdExecuteCommands-commandBuffer-recording

`commandBuffer` **must** be in the [recording state](#)

- VUID-vkCmdExecuteCommands-commandBuffer-cmdpool

The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, `VK_QUEUE_GRAPHICS_BIT`, or `VK_QUEUE_TRANSFER_BIT` operations

- VUID-vkCmdExecuteCommands-commandBufferCount-arraylength

`commandBufferCount` **must** be greater than 0

- VUID-vkCmdExecuteCommands-commonparent

Both of `commandBuffer`, and the elements of `pCommandBuffers` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_TRANSFER_BIT	Indirection

6.8. Command Buffer Device Mask

Each command buffer has a piece of state storing the current device mask of the command buffer. This mask controls which physical devices within the logical device all subsequent commands will execute on, including state-setting commands, action commands, and synchronization commands.

Scissor and viewport state (excluding the count of each) **can** be different values on each physical device (only when set as dynamic state), and each physical device will render using its local copy of the state. Other state is shared between physical devices, such that all physical devices use the most recently set values for the state. However, when recording an action command that uses a piece of state, the most recent command that set that state **must** have included all physical devices that execute the action command in its current device mask.

The command buffer's device mask is orthogonal to the `pCommandBufferDeviceMasks` member of `VkDeviceGroupSubmitInfo`. Commands only execute on a physical device if the device index is set in both device masks.

If the `pNext` chain of `VkCommandBufferBeginInfo` includes a `VkDeviceGroupCommandBufferBeginInfo` structure, then that structure includes an initial device mask for the command buffer.

The `VkDeviceGroupCommandBufferBeginInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupCommandBufferBeginInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           deviceMask;
} VkDeviceGroupCommandBufferBeginInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceMask` is the initial value of the command buffer's device mask.

The initial device mask also acts as an upper bound on the set of devices that **can** ever be in the device mask in the command buffer.

If this structure is not present, the initial value of a command buffer's device mask includes all physical devices in the logical device when the command buffer begins recording.

Valid Usage

- VUID-VkDeviceGroupCommandBufferBeginInfo-deviceMask-00106
`deviceMask` **must** be a valid device mask value
- VUID-VkDeviceGroupCommandBufferBeginInfo-deviceMask-00107
`deviceMask` **must** not be zero

Valid Usage (Implicit)

- VUID-VkDeviceGroupCommandBufferBeginInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_COMMAND_BUFFER_BEGIN_INFO`

To update the current device mask of a command buffer, call:

```
// Provided by VK_VERSION_1_1
void vkCmdSetDeviceMask(
    VkCommandBuffer          commandBuffer,
    uint32_t                 deviceMask);
```

- `commandBuffer` is command buffer whose current device mask is modified.
- `deviceMask` is the new value of the current device mask.

`deviceMask` is used to filter out subsequent commands from executing on all physical devices whose bit indices are not set in the mask, except commands beginning a render pass instance, commands transitioning to the next subpass in the render pass instance, and commands ending a render pass instance, which always execute on the set of physical devices whose bit indices are included in the

`deviceMask` member of the `VkDeviceGroupRenderPassBeginInfo` structure passed to the command beginning the corresponding render pass instance.

Valid Usage

- VUID-vkCmdSetDeviceMask-deviceMask-00108
`deviceMask` **must** be a valid device mask value
- VUID-vkCmdSetDeviceMask-deviceMask-00109
`deviceMask` **must** not be zero
- VUID-vkCmdSetDeviceMask-deviceMask-00110
`deviceMask` **must** not include any set bits that were not in the `VkDeviceGroupCommandBufferBeginInfo::deviceMask` value when the command buffer began recording
- VUID-vkCmdSetDeviceMask-deviceMask-00111
If `vkCmdSetDeviceMask` is called inside a render pass instance, `deviceMask` **must** not include any set bits that were not in the `VkDeviceGroupRenderPassBeginInfo::deviceMask` value when the render pass instance began recording

Valid Usage (Implicit)

- VUID-vkCmdSetDeviceMask-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDeviceMask-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdSetDeviceMask-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, `VK_QUEUE_GRAPHICS_BIT`, or `VK_QUEUE_TRANSFER_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_TRANSFER_BIT	State

Chapter 7. Synchronization and Cache Control

Synchronization of access to resources is primarily the responsibility of the application in Vulkan. The order of execution of commands with respect to the host and other commands on the device has few implicit guarantees, and needs to be explicitly specified. Memory caches and other optimizations are also explicitly managed, requiring that the flow of data through the system is largely under application control.

Whilst some implicit guarantees exist between commands, five explicit synchronization mechanisms are exposed by Vulkan:

Fences

Fences **can** be used to communicate to the host that execution of some task on the device has completed, controlling resource access between host and device.

Semaphores

Semaphores **can** be used to control resource access across multiple queues.

Events

Events provide a fine-grained synchronization primitive which **can** be signaled either within a command buffer or by the host, and **can** be waited upon within a command buffer or queried on the host. Events **can** be used to control resource access within a single queue.

Pipeline Barriers

Pipeline barriers also provide synchronization control within a command buffer, but at a single point, rather than with separate signal and wait operations. Pipeline barriers **can** be used to control resource access within a single queue.

Render Pass Objects

Render pass objects provide a synchronization framework for rendering tasks, built upon the concepts in this chapter. Many cases that would otherwise need an application to use other synchronization primitives **can** be expressed more efficiently as part of a render pass. Render pass objects **can** be used to control resource access within a single queue.

7.1. Execution and Memory Dependencies

An *operation* is an arbitrary amount of work to be executed on the host, a device, or an external entity such as a presentation engine. Synchronization commands introduce explicit *execution dependencies*, and *memory dependencies* between two sets of operations defined by the command's two *synchronization scopes*.

The synchronization scopes define which other operations a synchronization command is able to create execution dependencies with. Any type of operation that is not in a synchronization command's synchronization scopes will not be included in the resulting dependency. For example, for many synchronization commands, the synchronization scopes **can** be limited to just operations executing in specific [pipeline stages](#), which allows other pipeline stages to be excluded from a

dependency. Other scoping options are possible, depending on the particular command.

An *execution dependency* is a guarantee that for two sets of operations, the first set **must** happen-before the second set. If an operation happens-before another operation, then the first operation **must** complete before the second operation is initiated. More precisely:

- Let **Ops₁** and **Ops₂** be separate sets of operations.
- Let **Sync** be a synchronization command.
- Let **Scope_{1st}** and **Scope_{2nd}** be the synchronization scopes of **Sync**.
- Let **ScopedOps₁** be the intersection of sets **Ops₁** and **Scope_{1st}**.
- Let **ScopedOps₂** be the intersection of sets **Ops₂** and **Scope_{2nd}**.
- Submitting **Ops₁**, **Sync** and **Ops₂** for execution, in that order, will result in execution dependency **ExeDep** between **ScopedOps₁** and **ScopedOps₂**.
- Execution dependency **ExeDep** guarantees that **ScopedOps₁** happen-before **ScopedOps₂**.

An *execution dependency chain* is a sequence of execution dependencies that form a happens-before relation between the first dependency's **ScopedOps₁** and the final dependency's **ScopedOps₂**. For each consecutive pair of execution dependencies, a chain exists if the intersection of **Scope_{2nd}** in the first dependency and **Scope_{1st}** in the second dependency is not an empty set. The formation of a single execution dependency from an execution dependency chain can be described by substituting the following in the description of execution dependencies:

- Let **Sync** be a set of synchronization commands that generate an execution dependency chain.
- Let **Scope_{1st}** be the first synchronization scope of the first command in **Sync**.
- Let **Scope_{2nd}** be the second synchronization scope of the last command in **Sync**.

Execution dependencies alone are not sufficient to guarantee that values resulting from writes in one set of operations **can** be read from another set of operations.

Three additional types of operations are used to control memory access. *Availability operations* cause the values generated by specified memory write accesses to become *available* to a memory domain for future access. Any available value remains available until a subsequent write to the same memory location occurs (whether it is made available or not) or the memory is freed. *Memory domain operations* cause writes that are available to a source memory domain to become available to a destination memory domain (an example of this is making writes available to the host domain available to the device domain). *Visibility operations* cause values available to a memory domain to become *visible* to specified memory accesses.

Availability, visibility, memory domains, and memory domain operations are formally defined in the [Availability and Visibility](#) section of the [Memory Model](#) chapter. Which API operations perform each of these operations is defined in [Availability, Visibility, and Domain Operations](#).

A *memory dependency* is an execution dependency which includes availability and visibility operations such that:

- The first set of operations happens-before the availability operation.

- The availability operation happens-before the visibility operation.
- The visibility operation happens-before the second set of operations.

Once written values are made visible to a particular type of memory access, they **can** be read or written by that type of memory access. Most synchronization commands in Vulkan define a memory dependency.

The specific memory accesses that are made available and visible are defined by the *access scopes* of a memory dependency. Any type of access that is in a memory dependency's first access scope and occurs in **ScopedOps₁** is made available. Any type of access that is in a memory dependency's second access scope and occurs in **ScopedOps₂** has any available writes made visible to it. Any type of operation that is not in a synchronization command's access scopes will not be included in the resulting dependency.

A memory dependency enforces availability and visibility of memory accesses and execution order between two sets of operations. Adding to the description of [execution dependency chains](#):

- Let **MemOps₁** be the set of memory accesses performed by **ScopedOps₁**.
- Let **MemOps₂** be the set of memory accesses performed by **ScopedOps₂**.
- Let **AccessScope_{1st}** be the first access scope of the first command in the **Sync** chain.
- Let **AccessScope_{2nd}** be the second access scope of the last command in the **Sync** chain.
- Let **ScopedMemOps₁** be the intersection of sets **MemOps₁** and **AccessScope_{1st}**.
- Let **ScopedMemOps₂** be the intersection of sets **MemOps₂** and **AccessScope_{2nd}**.
- Submitting **Ops₁**, **Sync**, and **Ops₂** for execution, in that order, will result in a memory dependency **MemDep** between **ScopedOps₁** and **ScopedOps₂**.
- Memory dependency **MemDep** guarantees that:
 - Memory writes in **ScopedMemOps₁** are made available.
 - Available memory writes, including those from **ScopedMemOps₁**, are made visible to **ScopedMemOps₂**.

NOTE

Execution and memory dependencies are used to solve data hazards, i.e. to ensure that read and write operations occur in a well-defined order. Write-after-read hazards can be solved with just an execution dependency, but read-after-write and write-after-write hazards need appropriate memory dependencies to be included between them. If an application does not include dependencies to solve these hazards, the results and execution orders of memory accesses are undefined.

7.1.1. Image Layout Transitions

Image subresources **can** be transitioned from one [layout](#) to another as part of a [memory dependency](#) (e.g. by using an [image memory barrier](#)). When a layout transition is specified in a memory dependency, it happens-after the availability operations in the memory dependency, and happens-before the visibility operations. Image layout transitions **may** perform read and write accesses on all memory bound to the image subresource range, so applications **must** ensure that all memory writes have been made [available](#) before a layout transition is executed. Available memory

is automatically made visible to a layout transition, and writes performed by a layout transition are automatically made available.

Layout transitions always apply to a particular image subresource range, and specify both an old layout and new layout. The old layout **must** either be `VK_IMAGE_LAYOUT_UNDEFINED`, or match the current layout of the image subresource range. If the old layout matches the current layout of the image subresource range, the transition preserves the contents of that range. If the old layout is `VK_IMAGE_LAYOUT_UNDEFINED`, the contents of that range **may** be discarded.

NOTE

Image layout transitions with `VK_IMAGE_LAYOUT_UNDEFINED` allow the implementation to discard the image subresource range, which can provide performance or power benefits. Tile-based architectures may be able to avoid flushing tile data to memory, and immediate style renderers may be able to achieve fast metadata clears to reinitialize frame buffer compression state, or similar.

If the contents of an attachment are not needed after a render pass completes, then applications **should** use `VK_ATTACHMENT_STORE_OP_DONT_CARE`.

As image layout transitions **may** perform read and write accesses on the memory bound to the image, if the image subresource affected by the layout transition is bound to peer memory for any device in the current device mask then the memory heap the bound memory comes from **must** support the `VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT` and `VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT` capabilities as returned by `vkGetDeviceGroupPeerMemoryFeatures`.

NOTE

Applications **must** ensure that layout transitions happen-after all operations accessing the image with the old layout, and happen-before any operations that will access the image with the new layout. Layout transitions are potentially read/write operations, so not defining appropriate memory dependencies to guarantee this will result in a data race.

Image layout transitions interact with [memory aliasing](#).

Layout transitions that are performed via image memory barriers execute in their entirety in [submission order](#), relative to other image layout transitions submitted to the same queue, including those performed by [render passes](#). This ordering of image layout transitions only applies if the implementation performs actual read/write operations during the transition. An application **must** not rely on ordering of image layout transitions to influence ordering of other commands.

The image layout of each image subresource of a depth/stencil image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` is dependent on the last sample locations used to render to the image subresource as a depth/stencil attachment, thus when the `image` member of an [image memory barrier](#) is an image created with this flag the application **can** chain a `VkSampleLocationsInfoEXT` structure to the `pNext` chain of `VkImageMemoryBarrier2` or `VkImageMemoryBarrier` to specify the sample locations to use during any image layout transition.

If the `VkSampleLocationsInfoEXT` structure does not match the sample location state last used to render to the image subresource range specified by `subresourceRange`, or if no `VkSampleLocationsInfoEXT` structure is present, then the contents of the given image subresource range becomes undefined as if `oldLayout` would equal `VK_IMAGE_LAYOUT_UNDEFINED`.

7.1.2. Pipeline Stages

The work performed by an [action command](#) consists of multiple operations, which are performed as a sequence of logically independent steps known as *pipeline stages*. The exact pipeline stages executed depend on the particular command that is used, and current command buffer state when the command was recorded.

NOTE Operations performed by synchronization commands (e.g. [availability and visibility operations](#)) are not executed by a defined pipeline stage. However other commands can still synchronize with them by using the [synchronization scopes](#) to create a [dependency chain](#).

Execution of operations across pipeline stages **must** adhere to [implicit ordering guarantees](#), particularly including [pipeline stage order](#). Otherwise, execution across pipeline stages **may** overlap or execute out of order with regards to other stages, unless otherwise enforced by an execution dependency.

Several of the synchronization commands include pipeline stage parameters, restricting the [synchronization scopes](#) for that command to just those stages. This allows fine grained control over the exact execution dependencies and accesses performed by action commands. Implementations **should** use these pipeline stages to avoid unnecessary stalls or cache flushing.

Bits which **can** be set in a [VkPipelineStageFlags2](#) mask, specifying stages of execution, are:

```
// Flag bits for VkPipelineStageFlagBits2
typedef VkFlags64 VkPipelineStageFlagBits2;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_NONE = 0ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TOP_OF_PIPE_BIT =
0x00000001ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT =
0x00000002ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT =
0x00000004ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT =
0x00000008ULL;
static const VkPipelineStageFlagBits2
VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT = 0x00000010ULL;
static const VkPipelineStageFlagBits2
VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT = 0x00000020ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT =
0x00000040ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT =
0x00000080ULL;

```

- **VK_PIPELINE_STAGE_2_NONE** specifies no stages of execution.
- **VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT** specifies the stage of the pipeline where indirect

command parameters are consumed.

- `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT` specifies the stage of the pipeline where index buffers are consumed.
- `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT` specifies the stage of the pipeline where vertex buffers are consumed.
- `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT` is equivalent to the logical OR of:
 - `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT`
 - `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT`
- `VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT` specifies the vertex shader stage.
- `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` specifies the tessellation control shader stage.
- `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT` specifies the tessellation evaluation shader stage.
- `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT` specifies the geometry shader stage.
- `VK_PIPELINE_STAGE_2_PRE_RASTERIZATION_SHADERS_BIT` is equivalent to specifying all supported [pre-rasterization shader stages](#):
 - `VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT`
 - `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT`
 - `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`
 - `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`
- `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT` specifies the fragment shader stage.
- `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT` specifies the stage of the pipeline where early fragment tests (depth and stencil tests before fragment shading) are performed. This stage also includes [render pass load operations](#) for framebuffer attachments with a depth/stencil format.
- `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT` specifies the stage of the pipeline where late fragment tests (depth and stencil tests after fragment shading) are performed. This stage also includes [render pass store operations](#) for framebuffer attachments with a depth/stencil format.
- `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT` specifies the stage of the pipeline where final color values are output from the pipeline. This stage includes [blending](#), [logic operations](#), render pass [load](#) and [store](#) operations for color attachments, [render pass multisample resolve operations](#), and [vkCmdClearAttachments](#).
- `VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT` specifies the compute shader stage.
- `VK_PIPELINE_STAGE_2_HOST_BIT` specifies a pseudo-stage indicating execution on the host of reads/writes of device memory. This stage is not invoked by any commands recorded in a command buffer.
- `VK_PIPELINE_STAGE_2_COPY_BIT` specifies the execution of all [copy commands](#), including [vkCmdCopyQueryPoolResults](#).
- `VK_PIPELINE_STAGE_2_BLIT_BIT` specifies the execution of [vkCmdBlitImage](#).
- `VK_PIPELINE_STAGE_2_RESOLVE_BIT` specifies the execution of [vkCmdResolveImage](#).

- `VK_PIPELINE_STAGE_2_CLEAR_BIT` specifies the execution of [clear commands](#), with the exception of `vkCmdClearAttachments`.
- `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT` is equivalent to specifying all of:
 - `VK_PIPELINE_STAGE_2_COPY_BIT`
 - `VK_PIPELINE_STAGE_2_BLIT_BIT`
 - `VK_PIPELINE_STAGE_2_RESOLVE_BIT`
 - `VK_PIPELINE_STAGE_2_CLEAR_BIT`
 - `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`
- `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT` specifies the execution of all graphics pipeline stages, and is equivalent to the logical OR of:
 - `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`
 - `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`
 - `VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT`
 - `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT`
 - `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`
 - `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`
 - `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT`
 - `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`
 - `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`
 - `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`
 - `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT` specifies all operations performed by all commands supported on the queue it is used with.
- `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` specifies the stage of the pipeline where the [fragment shading rate attachment](#) is read to determine the fragment shading rate for portions of a rasterized primitive.
- `VK_PIPELINE_STAGE_2_TOP_OF_PIPE_BIT` is equivalent to `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT` with `VkAccessFlags2` set to `0` when specified in the second synchronization scope, but equivalent to `VK_PIPELINE_STAGE_2_NONE` in the first scope.
- `VK_PIPELINE_STAGE_2_BOTTOM_OF_PIPE_BIT` is equivalent to `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT` with `VkAccessFlags2` set to `0` when specified in the first synchronization scope, but equivalent to `VK_PIPELINE_STAGE_2_NONE` in the second scope.

NOTE

The `TOP` and `BOTTOM` pipeline stages are legacy, and applications should prefer `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT` and `VK_PIPELINE_STAGE_2_NONE`.

NOTE

The `VkPipelineStageFlags2` bitmask goes beyond the 31 individual bit flags allowable within a C99 enum, which is how `VkPipelineStageFlagBits` is defined. The first 31 values are common to both, and are interchangeable.

`VkPipelineStageFlags2` is a bitmask type for setting a mask of zero or more `VkPipelineStageFlagBits2` flags:

```
typedef VkFlags64 VkPipelineStageFlags2;
```

```
// Provided by VK_KHR_synchronization2
typedef VkPipelineStageFlags2 VkPipelineStageFlags2KHR;
```

Bits which **can** be set in a `VkPipelineStageFlags` mask, specifying stages of execution, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkPipelineStageFlagBits {
    VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT = 0x00000001,
    VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT = 0x00000002,
    VK_PIPELINE_STAGE_VERTEX_INPUT_BIT = 0x00000004,
    VK_PIPELINE_STAGE_VERTEX_SHADER_BIT = 0x00000008,
    VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT = 0x00000010,
    VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT = 0x00000020,
    VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT = 0x00000040,
    VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT = 0x00000080,
    VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT = 0x00000100,
    VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT = 0x00000200,
    VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT = 0x00000400,
    VK_PIPELINE_STAGE_COMPUTE_SHADER_BIT = 0x00000800,
    VK_PIPELINE_STAGE_TRANSFER_BIT = 0x00001000,
    VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT = 0x00002000,
    VK_PIPELINE_STAGE_HOST_BIT = 0x00004000,
    VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT = 0x00008000,
    VK_PIPELINE_STAGE_ALL_COMMANDS_BIT = 0x00010000,
    VK_PIPELINE_STAGE_NONE = 0,
    // Provided by VK_KHR_fragment_shading_rate
    VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR = 0x00400000,
    // Provided by VK_KHR_synchronization2
    VK_PIPELINE_STAGE_NONE_KHR = VK_PIPELINE_STAGE_NONE,
} VkPipelineStageFlagBits;
```

These values all have the same meaning as the equivalently named values for `VkPipelineStageFlags2`.

- `VK_PIPELINE_STAGE_NONE` specifies no stages of execution.
- `VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT` specifies the stage of the pipeline where `VkDrawIndirect*` / `VkDispatchIndirect*` / `VkTraceRaysIndirect*` data structures are consumed.
- `VK_PIPELINE_STAGE_VERTEX_INPUT_BIT` specifies the stage of the pipeline where vertex and index buffers are consumed.
- `VK_PIPELINE_STAGE_VERTEX_SHADER_BIT` specifies the vertex shader stage.

- `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` specifies the tessellation control shader stage.
- `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT` specifies the tessellation evaluation shader stage.
- `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT` specifies the geometry shader stage.
- `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT` specifies the fragment shader stage.
- `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` specifies the stage of the pipeline where early fragment tests (depth and stencil tests before fragment shading) are performed. This stage also includes [render pass load operations](#) for framebuffer attachments with a depth/stencil format.
- `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` specifies the stage of the pipeline where late fragment tests (depth and stencil tests after fragment shading) are performed. This stage also includes [render pass store operations](#) for framebuffer attachments with a depth/stencil format.
- `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` specifies the stage of the pipeline after blending where the final color values are output from the pipeline. This stage includes [blending](#), [logic operations](#), render pass [load](#) and [store](#) operations for color attachments, [render pass multisample resolve operations](#), and [vkCmdClearAttachments](#).
- `VK_PIPELINE_STAGE_COMPUTE_SHADER_BIT` specifies the execution of a compute shader.
- `VK_PIPELINE_STAGE_TRANSFER_BIT` specifies the following commands:
 - All [copy commands](#), including [vkCmdCopyQueryPoolResults](#)
 - [vkCmdBlitImage2KHR](#) and [vkCmdBlitImage](#)
 - [vkCmdResolveImage2KHR](#) and [vkCmdResolveImage](#)
 - All [clear commands](#), with the exception of [vkCmdClearAttachments](#)
- `VK_PIPELINE_STAGE_HOST_BIT` specifies a pseudo-stage indicating execution on the host of reads/writes of device memory. This stage is not invoked by any commands recorded in a command buffer.
- `VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT` specifies the execution of all graphics pipeline stages, and is equivalent to the logical OR of:
 - `VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT`
 - `VK_PIPELINE_STAGE_VERTEX_INPUT_BIT`
 - `VK_PIPELINE_STAGE_VERTEX_SHADER_BIT`
 - `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT`
 - `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
 - `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
 - `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT`
 - `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT`
 - `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT`
 - `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`
 - `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` specifies all operations performed by all commands supported on the queue it is used with.
- `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` specifies the stage of the pipeline where the [fragment shading rate attachment](#) is read to determine the fragment shading rate for portions of a rasterized primitive.
- `VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT` is equivalent to `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` with `VkAccessFlags` set to `0` when specified in the second synchronization scope, but specifies no stage of execution when specified in the first scope.
- `VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT` is equivalent to `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` with `VkAccessFlags` set to `0` when specified in the first synchronization scope, but specifies no stage of execution when specified in the second scope.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineStageFlags;
```

`VkPipelineStageFlags` is a bitmask type for setting a mask of zero or more [VkPipelineStageFlagBits](#).

If a synchronization command includes a source stage mask, its first [synchronization scope](#) only includes execution of the pipeline stages specified in that mask and any [logically earlier](#) stages. Its first [access scope](#) only includes memory accesses performed by pipeline stages explicitly specified in the source stage mask.

If a synchronization command includes a destination stage mask, its second [synchronization scope](#) only includes execution of the pipeline stages specified in that mask and any [logically later](#) stages. Its second [access scope](#) only includes memory accesses performed by pipeline stages explicitly specified in the destination stage mask.

NOTE

Note that [access scopes](#) do not interact with the logically earlier or later stages for either scope - only the stages the application specifies are considered part of each access scope.

Certain pipeline stages are only available on queues that support a particular set of operations. The following table lists, for each pipeline stage flag, which queue capability flag **must** be supported by the queue. When multiple flags are enumerated in the second column of the table, it means that the pipeline stage is supported on the queue if it supports any of the listed capability flags. For further details on queue capabilities see [Physical Device Enumeration](#) and [Queues](#).

Table 4. Supported Pipeline Stage Flags

Pipeline stage flag	Required queue capability flag
<code>VK_PIPELINE_STAGE_2_NONE</code>	None required
<code>VK_PIPELINE_STAGE_2_TOP_OF_PIPE_BIT</code>	None required
<code>VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT</code>	<code>VK_QUEUE_GRAPHICS_BIT</code> or <code>VK_QUEUE_COMPUTE_BIT</code>
<code>VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT</code>	<code>VK_QUEUE_GRAPHICS_BIT</code>

Pipeline stage flag	Required queue capability flag
VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT	VK_QUEUE_COMPUTE_BIT
VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT	VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT or VK_QUEUE_TRANSFER_BIT
VK_PIPELINE_STAGE_2_BOTTOM_OF_PIPE_BIT	None required
VK_PIPELINE_STAGE_2_HOST_BIT	None required
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT	None required
VK_PIPELINE_STAGE_2_COPY_BIT	VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT or VK_QUEUE_TRANSFER_BIT
VK_PIPELINE_STAGE_2_RESOLVE_BIT	VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT or VK_QUEUE_TRANSFER_BIT
VK_PIPELINE_STAGE_2_BLIT_BIT	VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT or VK_QUEUE_TRANSFER_BIT
VK_PIPELINE_STAGE_2_CLEAR_BIT	VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT or VK_QUEUE_TRANSFER_BIT
VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_PRE_RASTERIZATION_SHADERS_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR	VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT or VK_QUEUE_TRANSFER_BIT

Pipeline stages that execute as a result of a command logically complete execution in a specific order, such that completion of a logically later pipeline stage **must** not happen-before completion of a logically earlier stage. This means that including any stage in the source stage mask for a particular synchronization command also implies that any logically earlier stages are included in **Scope_{1st}** for that command.

Similarly, initiation of a logically earlier pipeline stage **must** not happen-after initiation of a logically later pipeline stage. Including any given stage in the destination stage mask for a particular synchronization command also implies that any logically later stages are included in **Scope_{2nd}** for that command.

NOTE

Implementations **may** not support synchronization at every pipeline stage for every synchronization operation. If a pipeline stage that an implementation does not support synchronization for appears in a source stage mask, it **may** substitute any logically later stage in its place for the first synchronization scope. If a pipeline stage that an implementation does not support synchronization for appears in a destination stage mask, it **may** substitute any logically earlier stage in its place for the second synchronization scope.

For example, if an implementation is unable to signal an event immediately after vertex shader execution is complete, it **may** instead signal the event after color attachment output has completed.

If an implementation makes such a substitution, it **must** not affect the semantics of execution or memory dependencies or image and buffer memory barriers.

Graphics pipelines are executable on queues supporting **VK_QUEUE_GRAPHICS_BIT**. Stages executed by graphics pipelines **can** only be specified in commands recorded for queues supporting **VK_QUEUE_GRAPHICS_BIT**.

The graphics pipeline executes the following stages, with the logical ordering of the stages matching the order specified here:

- **VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT**
- **VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT**
- **VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT**
- **VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT**
- **VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT**
- **VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT**
- **VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT**
- **VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR**
- **VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT**
- **VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT**
- **VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT**
- **VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT**

For the compute pipeline, the following stages occur in this order:

- **VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT**
- **VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT**

For the transfer pipeline, the following stages occur in this order:

- `VK_PIPELINE_STAGE_2_TRANSFER_BIT`

For host operations, only one pipeline stage occurs, so no order is guaranteed:

- `VK_PIPELINE_STAGE_2_HOST_BIT`

7.1.3. Access Types

Memory in Vulkan **can** be accessed from within shader invocations and via some fixed-function stages of the pipeline. The *access type* is a function of the [descriptor type](#) used, or how a fixed-function stage accesses memory.

Some synchronization commands take sets of access types as parameters to define the [access scopes](#) of a memory dependency. If a synchronization command includes a *source access mask*, its first [access scope](#) only includes accesses via the access types specified in that mask. Similarly, if a synchronization command includes a *destination access mask*, its second [access scope](#) only includes accesses via the access types specified in that mask.

Bits which **can** be set in the `srcAccessMask` and `dstAccessMask` members of `VkMemoryBarrier2KHR`, `VkImageMemoryBarrier2KHR`, and `VkBufferMemoryBarrier2KHR`, specifying access behavior, are:

```
// Flag bits for VkAccessFlagBits2
typedef VkFlags64 VkAccessFlagBits2;
static const VkAccessFlagBits2 VK_ACCESS_2_NONE = 0ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT = 0x00000001ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_INDEX_READ_BIT = 0x00000002ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT = 0x00000004ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_UNIFORM_READ_BIT = 0x00000008ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT = 0x00000010ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_SHADER_READ_BIT = 0x00000020ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_SHADER_WRITE_BIT = 0x00000040ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT = 0x00000080ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT = 0x00000100ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT =
0x00000200ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT =
0x00000400ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_TRANSFER_READ_BIT = 0x00000800ULL;

typedef VkAccessFlagBits2 VkAccessFlagBits2KHR;
```

- `VK_ACCESS_2_NONE` specifies no accesses.
- `VK_ACCESS_2_MEMORY_READ_BIT` specifies all read accesses. It is always valid in any access mask, and is treated as equivalent to setting all `READ` access flags that are valid where it is used.
- `VK_ACCESS_2_MEMORY_WRITE_BIT` specifies all write accesses. It is always valid in any access mask, and is treated as equivalent to setting all `WRITE` access flags that are valid where it is used.
- `VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT` specifies read access to command data read from indirect buffers as part of an indirect drawing or dispatch command. Such access occurs in the `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT` pipeline stage.
- `VK_ACCESS_2_INDEX_READ_BIT` specifies read access to an index buffer as part of an indexed drawing command, bound by `vkCmdBindIndexBuffer`. Such access occurs in the `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT` pipeline stage.
- `VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT` specifies read access to a vertex buffer as part of a drawing command, bound by `vkCmdBindVertexBuffers`. Such access occurs in the `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT` pipeline stage.
- `VK_ACCESS_2_UNIFORM_READ_BIT` specifies read access to a `uniform buffer` in any shader pipeline stage.
- `VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT` specifies read access to an `input attachment` within a render pass during fragment shading. Such access occurs in the `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT` pipeline stage.
- `VK_ACCESS_2_SHADER_SAMPLED_READ_BIT` specifies read access to a `uniform texel buffer` or `sampled image` in any shader pipeline stage.
- `VK_ACCESS_2_SHADER_STORAGE_READ_BIT` specifies read access to a `storage buffer`, `physical storage buffer`, `storage texel buffer`, or `storage image` in any shader pipeline stage.
- `VK_ACCESS_2_SHADER_READ_BIT` is equivalent to the logical OR of:
 - `VK_ACCESS_2_SHADER_SAMPLED_READ_BIT`
 - `VK_ACCESS_2_SHADER_STORAGE_READ_BIT`
- `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT` specifies write access to a `storage buffer`, `physical storage buffer`, `storage texel buffer`, or `storage image` in any shader pipeline stage.
- `VK_ACCESS_2_SHADER_WRITE_BIT` is equivalent to `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT`.
- `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT` specifies read access to a `color attachment`, such as via `blending` (other than `advanced blend operations`), `logic operations` or certain `render pass load operations`. Such access occurs in the `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage.
- `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT` specifies write access to a `color attachment` during a `render pass` or via certain render pass `load`, `store`, and `multisample resolve` operations. Such access occurs in the `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage.
- `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT` specifies read access to a `depth/stencil`

attachment, via [depth or stencil operations](#) or certain [render pass load operations](#). Such access occurs in the `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT` or `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT` pipeline stages.

- `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT` specifies write access to a [depth/stencil attachment](#), via [depth or stencil operations](#) or certain render pass [load](#) and [store](#) operations. Such access occurs in the `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT` or `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT` pipeline stages.
- `VK_ACCESS_2_TRANSFER_READ_BIT` specifies read access to an image or buffer in a [copy](#) operation. Such access occurs in the `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, or `VK_PIPELINE_STAGE_2_RESOLVE_BIT` pipeline stages.
- `VK_ACCESS_2_TRANSFER_WRITE_BIT` specifies write access to an image or buffer in a [clear](#) or [copy](#) operation. Such access occurs in the `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, `VK_PIPELINE_STAGE_2_CLEAR_BIT`, or `VK_PIPELINE_STAGE_2_RESOLVE_BIT` pipeline stages.
- `VK_ACCESS_2_HOST_READ_BIT` specifies read access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the `VK_PIPELINE_STAGE_2_HOST_BIT` pipeline stage.
- `VK_ACCESS_2_HOST_WRITE_BIT` specifies write access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the `VK_PIPELINE_STAGE_2_HOST_BIT` pipeline stage.
- `VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT` specifies read access to [color attachments](#), including [advanced blend operations](#). Such access occurs in the `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage.
- `VK_ACCESS_2_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR` specifies read access to a fragment shading rate attachment during rasterization. Such access occurs in the `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` pipeline stage.

NOTE

In situations where an application wishes to select all access types for a given set of pipeline stages, `VK_ACCESS_2_MEMORY_READ_BIT` or `VK_ACCESS_2_MEMORY_WRITE_BIT` can be used. This is particularly useful when specifying stages that only have a single access type.

NOTE

The `VkAccessFlags2` bitmask goes beyond the 31 individual bit flags allowable within a C99 enum, which is how [VkAccessFlagBits](#) is defined. The first 31 values are common to both, and are interchangeable.

`VkAccessFlags2` is a bitmask type for setting a mask of zero or more [VkAccessFlagBits2](#):

```
typedef VkFlags64 VkAccessFlags2;
```

```
// Provided by VK_KHR_synchronization2
typedef VkAccessFlags2 VkAccessFlags2KHR;
```

Bits which **can** be set in the `srcAccessMask` and `dstAccessMask` members of `VkSubpassDependency`, `VkSubpassDependency2`, `VkMemoryBarrier`, `VkBufferMemoryBarrier`, and `VkImageMemoryBarrier`, specifying access behavior, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkAccessFlagBits {
    VK_ACCESS_INDIRECT_COMMAND_READ_BIT = 0x00000001,
    VK_ACCESS_INDEX_READ_BIT = 0x00000002,
    VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT = 0x00000004,
    VK_ACCESS_UNIFORM_READ_BIT = 0x00000008,
    VK_ACCESS_INPUT_ATTACHMENT_READ_BIT = 0x00000010,
    VK_ACCESS_SHADER_READ_BIT = 0x00000020,
    VK_ACCESS_SHADER_WRITE_BIT = 0x00000040,
    VK_ACCESS_COLOR_ATTACHMENT_READ_BIT = 0x00000080,
    VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT = 0x00000100,
    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT = 0x00000200,
    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT = 0x00000400,
    VK_ACCESS_TRANSFER_READ_BIT = 0x00000800,
    VK_ACCESS_TRANSFER_WRITE_BIT = 0x00001000,
    VK_ACCESS_HOST_READ_BIT = 0x00002000,
    VK_ACCESS_HOST_WRITE_BIT = 0x00004000,
    VK_ACCESS_MEMORY_READ_BIT = 0x00008000,
    VK_ACCESS_MEMORY_WRITE_BIT = 0x00010000,
    VK_ACCESS_NONE = 0,
    // Provided by VK_EXT_blend_operation_advanced
    VK_ACCESS_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT = 0x00080000,
    // Provided by VK_KHR_fragment_shading_rate
    VK_ACCESS_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR = 0x00800000,
    // Provided by VK_KHR_synchronization2
    VK_ACCESS_NONE_KHR = VK_ACCESS_NONE,
} VkAccessFlagBits;
```

These values all have the same meaning as the equivalently named values for `VkAccessFlags2`.

- `VK_ACCESS_NONE` specifies no accesses.
- `VK_ACCESS_MEMORY_READ_BIT` specifies all read accesses. It is always valid in any access mask, and is treated as equivalent to setting all **READ** access flags that are valid where it is used.
- `VK_ACCESS_MEMORY_WRITE_BIT` specifies all write accesses. It is always valid in any access mask, and is treated as equivalent to setting all **WRITE** access flags that are valid where it is used.
- `VK_ACCESS_INDIRECT_COMMAND_READ_BIT` specifies read access to indirect command data read as part of an indirect drawing or dispatching command. Such access occurs in the `VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT` pipeline stage.
- `VK_ACCESS_INDEX_READ_BIT` specifies read access to an index buffer as part of an indexed drawing command, bound by `vkCmdBindIndexBuffer`. Such access occurs in the `VK_PIPELINE_STAGE_VERTEX_INPUT_BIT` pipeline stage.
- `VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT` specifies read access to a vertex buffer as part of a drawing command, bound by `vkCmdBindVertexBuffers`. Such access occurs in the

VK_PIPELINE_STAGE_VERTEX_INPUT_BIT pipeline stage.

- VK_ACCESS_UNIFORM_READ_BIT specifies read access to a [uniform buffer](#) in any shader pipeline stage.
- VK_ACCESS_INPUT_ATTACHMENT_READ_BIT specifies read access to an [input attachment](#) within a render pass during fragment shading. Such access occurs in the VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT pipeline stage.
- VK_ACCESS_SHADER_READ_BIT specifies read access to a [uniform texel buffer](#), [sampled image](#), [storage buffer](#), [physical storage buffer](#), [storage texel buffer](#), or [storage image](#) in any shader pipeline stage.
- VK_ACCESS_SHADER_WRITE_BIT specifies write access to a [storage buffer](#), [physical storage buffer](#), [storage texel buffer](#), or [storage image](#) in any shader pipeline stage.
- VK_ACCESS_COLOR_ATTACHMENT_READ_BIT specifies read access to a [color attachment](#), such as via [blending](#) (other than [advanced blend operations](#)), [logic operations](#) or certain [render pass load operations](#). Such access occurs in the VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT pipeline stage.
- VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT specifies write access to a [color](#), [resolve](#), or [depth/stencil resolve attachment](#) during a [render pass](#) or via certain render pass [load](#) and [store](#) operations. Such access occurs in the VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT pipeline stage.
- VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT specifies read access to a [depth/stencil attachment](#), via [depth or stencil operations](#) or certain [render pass load operations](#). Such access occurs in the VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT or VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT pipeline stages.
- VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT specifies write access to a [depth/stencil attachment](#), via [depth or stencil operations](#) or certain render pass [load](#) and [store](#) operations. Such access occurs in the VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT or VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT pipeline stages.
- VK_ACCESS_TRANSFER_READ_BIT specifies read access to an image or buffer in a [copy](#) operation. Such access occurs in the VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT pipeline stage.
- VK_ACCESS_TRANSFER_WRITE_BIT specifies write access to an image or buffer in a [clear](#) or [copy](#) operation. Such access occurs in the VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT pipeline stage.
- VK_ACCESS_HOST_READ_BIT specifies read access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the VK_PIPELINE_STAGE_HOST_BIT pipeline stage.
- VK_ACCESS_HOST_WRITE_BIT specifies write access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the VK_PIPELINE_STAGE_HOST_BIT pipeline stage.
- VK_ACCESS_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT specifies read access to [color attachments](#), including [advanced blend operations](#). Such access occurs in the VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT pipeline stage.
- VK_ACCESS_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR specifies read access to a fragment shading rate attachment during rasterization. Such access occurs in the VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR pipeline stage.

Certain access types are only performed by a subset of pipeline stages. Any synchronization command that takes both stage masks and access masks uses both to define the [access scopes](#) - only the specified access types performed by the specified stages are included in the access scope. An application **must** not specify an access flag in a synchronization command if it does not include a pipeline stage in the corresponding stage mask that is able to perform accesses of that type. The following table lists, for each access flag, which pipeline stages **can** perform that type of access.

Table 5. Supported Access Types

Access flag	Supported pipeline stages
VK_ACCESS_2_NONE	Any
VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT	VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT,
VK_ACCESS_2_INDEX_READ_BIT	VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT, VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT
VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT	VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT, VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT
VK_ACCESS_2_UNIFORM_READ_BIT	VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT, VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT, VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT, VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT, VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT, VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT,
VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT	VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT,
VK_ACCESS_2_SHADER_READ_BIT	VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT, VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT, VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT, VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT, VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT, VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT,
VK_ACCESS_2_SHADER_WRITE_BIT	VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT, VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT, VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT, VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT, VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT, VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT,
VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT	VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT, VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT
VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT	VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT

Access flag	Supported pipeline stages
VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT	VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT, VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT
VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT	VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT
VK_ACCESS_2_TRANSFER_READ_BIT	VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT, VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_RESOLVE_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR,
VK_ACCESS_2_TRANSFER_WRITE_BIT	VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT, VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_RESOLVE_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, VK_PIPELINE_STAGE_2_CLEAR_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR,
VK_ACCESS_2_HOST_READ_BIT	VK_PIPELINE_STAGE_2_HOST_BIT
VK_ACCESS_2_HOST_WRITE_BIT	VK_PIPELINE_STAGE_2_HOST_BIT
VK_ACCESS_2_MEMORY_READ_BIT	Any
VK_ACCESS_2_MEMORY_WRITE_BIT	Any
VK_ACCESS_2_SHADER_SAMPLED_READ_BIT	VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT, VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT, VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT, VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT, VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT, VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT,
VK_ACCESS_2_SHADER_STORAGE_READ_BIT	VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT, VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT, VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT, VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT, VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT, VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT,

Access flag	Supported pipeline stages
VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT	VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT, VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT, VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT, VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT, VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT, VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT,
VK_ACCESS_2_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR	VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT	VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkAccessFlags;
```

VkAccessFlags is a bitmask type for setting a mask of zero or more [VkAccessFlagBits](#).

If a memory object does not have the **VK_MEMORY_PROPERTY_HOST_COHERENT_BIT** property, then [vkFlushMappedMemoryRanges](#) **must** be called in order to guarantee that writes to the memory object from the host are made available to the host domain, where they **can** be further made available to the device domain via a domain operation. Similarly, [vkInvalidateMappedMemoryRanges](#) **must** be called to guarantee that writes which are available to the host domain are made visible to host operations.

If the memory object does have the **VK_MEMORY_PROPERTY_HOST_COHERENT_BIT** property flag, writes to the memory object from the host are automatically made available to the host domain. Similarly, writes made available to the host domain are automatically made visible to the host.

NOTE

[Queue submission commands](#) automatically perform a [domain operation from host to device](#) for all writes performed before the command executes, so in most cases an explicit memory barrier is not needed for this case. In the few circumstances where a submit does not occur between the host write and the device read access, writes **can** be made available by using an explicit memory barrier.

7.1.4. Framebuffer Region Dependencies

[Pipeline stages](#) that operate on, or with respect to, the framebuffer are collectively the *framebuffer-space* pipeline stages. These stages are:

- VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT
- VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT
- VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT
- VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT

For these pipeline stages, an execution or memory dependency from the first set of operations to the second set **can** either be a single *framebuffer-global* dependency, or split into multiple *framebuffer-local* dependencies. A dependency with non-framebuffer-space pipeline stages is neither framebuffer-global nor framebuffer-local.

A *framebuffer region* is a set of sample (x, y, layer, sample) coordinates that is a subset of the entire framebuffer.

Both [synchronization scopes](#) of a framebuffer-local dependency include only the operations performed within corresponding framebuffer regions (as defined below). No ordering guarantees are made between different framebuffer regions for a framebuffer-local dependency.

Both [synchronization scopes](#) of a framebuffer-global dependency include operations on all framebuffer-regions.

If the first synchronization scope includes operations on pixels/fragments with N samples and the second synchronization scope includes operations on pixels/fragments with M samples, where N does not equal M, then a framebuffer region containing all samples at a given (x, y, layer) coordinate in the first synchronization scope corresponds to a region containing all samples at the same coordinate in the second synchronization scope. In other words, it is a pixel granularity dependency. If N equals M, then a framebuffer region containing a single (x, y, layer, sample) coordinate in the first synchronization scope corresponds to a region containing the same sample at the same coordinate in the second synchronization scope. In other words, it is a sample granularity dependency.

NOTE

Since fragment shader invocations are not specified to run in any particular groupings, the size of a framebuffer region is implementation-dependent, not known to the application, and **must** be assumed to be no larger than specified above.

NOTE

Practically, the pixel vs. sample granularity dependency means that if an input attachment has a different number of samples than the pipeline's [rasterizationSamples](#), then a fragment **can** access any sample in the input attachment's pixel even if it only uses framebuffer-local dependencies. If the input attachment has the same number of samples, then the fragment **can** only access the covered samples in its input [SampleMask](#) (i.e. the fragment operations happen-after a framebuffer-local dependency for each sample the fragment covers). To access samples that are not covered, a framebuffer-global dependency is required.

If a synchronization command includes a [dependencyFlags](#) parameter, and specifies the [VK_DEPENDENCY_BY_REGION_BIT](#) flag, then it defines framebuffer-local dependencies for the framebuffer-space pipeline stages in that synchronization command, for all framebuffer regions. If no [dependencyFlags](#) parameter is included, or the [VK_DEPENDENCY_BY_REGION_BIT](#) flag is not specified, then a framebuffer-global dependency is specified for those stages. The [VK_DEPENDENCY_BY_REGION_BIT](#) flag does not affect the dependencies between non-framebuffer-space pipeline stages, nor does it affect the dependencies between framebuffer-space and non-framebuffer-space pipeline stages.

NOTE

Framebuffer-local dependencies are more efficient for most architectures; particularly tile-based architectures - which can keep framebuffer-regions entirely in on-chip registers and thus avoid external bandwidth across such a dependency. Including a framebuffer-global dependency in your rendering will usually force all implementations to flush data to memory, or to a higher level cache, breaking any potential locality optimizations.

7.1.5. View-Local Dependencies

In a render pass instance that has `multiview` enabled, dependencies **can** be either view-local or view-global.

A view-local dependency only includes operations from a single `source view` from the source subpass in the first synchronization scope, and only includes operations from a single `destination view` from the destination subpass in the second synchronization scope. A view-global dependency includes all views in the view mask of the source and destination subpasses in the corresponding synchronization scopes.

If a synchronization command includes a `dependencyFlags` parameter and specifies the `VK_DEPENDENCY_VIEW_LOCAL_BIT` flag, then it defines view-local dependencies for that synchronization command, for all views. If no `dependencyFlags` parameter is included or the `VK_DEPENDENCY_VIEW_LOCAL_BIT` flag is not specified, then a view-global dependency is specified.

7.1.6. Device-Local Dependencies

Dependencies **can** be either device-local or non-device-local. A device-local dependency acts as multiple separate dependencies, one for each physical device that executes the synchronization command, where each dependency only includes operations from that physical device in both synchronization scopes. A non-device-local dependency is a single dependency where both synchronization scopes include operations from all physical devices that participate in the synchronization command. For subpass dependencies, all physical devices in the `VkDeviceGroupRenderPassBeginInfo::deviceMask` participate in the dependency, and for pipeline barriers all physical devices that are set in the command buffer's current device mask participate in the dependency.

If a synchronization command includes a `dependencyFlags` parameter and specifies the `VK_DEPENDENCY_DEVICE_GROUP_BIT` flag, then it defines a non-device-local dependency for that synchronization command. If no `dependencyFlags` parameter is included or the `VK_DEPENDENCY_DEVICE_GROUP_BIT` flag is not specified, then it defines device-local dependencies for that synchronization command, for all participating physical devices.

Semaphore and event dependencies are device-local and only execute on the one physical device that performs the dependency.

7.2. Implicit Synchronization Guarantees

A small number of implicit ordering guarantees are provided by Vulkan, ensuring that the order in which commands are submitted is meaningful, and avoiding unnecessary complexity in common

operations.

Submission order is a fundamental ordering in Vulkan, giving meaning to the order in which [action and synchronization commands](#) are recorded and submitted to a single queue. Explicit and implicit ordering guarantees between commands in Vulkan all work on the premise that this ordering is meaningful. This order does not itself define any execution or memory dependencies; synchronization commands and other orderings within the API use this ordering to define their scopes.

Submission order for any given set of commands is based on the order in which they were recorded to command buffers and then submitted. This order is determined as follows:

1. The initial order is determined by the order in which [vkQueueSubmit](#) and [vkQueueSubmit2KHR](#) commands are executed on the host, for a single queue, from first to last.
2. The order in which [VkSubmitInfo](#) structures are specified in the [pSubmits](#) parameter of [vkQueueSubmit](#), or in which [VkSubmitInfo2](#) structures are specified in the [pSubmits](#) parameter of [vkQueueSubmit2KHR](#), from lowest index to highest.
3. The order in which command buffers are specified in the [pCommandBuffers](#) member of [VkSubmitInfo](#) or [VkSubmitInfo2](#) from lowest index to highest.
4. The order in which commands outside of a render pass were recorded to a command buffer on the host, from first to last.
5. The order in which commands inside a single subpass were recorded to a command buffer on the host, from first to last.

NOTE

When using a [render pass object](#) with multiple subpasses, commands in different subpasses have no defined submission order relative to each other, regardless of the order in which the subpasses were recorded. Commands within a subpass are still ordered relative to other commands in the same subpass, and those outside of the render pass.

[State commands](#) do not execute any operations on the device, instead they set the state of the command buffer when they execute on the host, in the order that they are recorded. [Action commands](#) consume the current state of the command buffer when they are recorded, and will execute state changes on the device as required to match the recorded state.

[The order of primitives passing through the graphics pipeline](#) and [image layout transitions as part of an image memory barrier](#) provide additional guarantees based on submission order.

Execution of [pipeline stages](#) within a given command also has a loose ordering, dependent only on a single command.

Signal operation order is a fundamental ordering in Vulkan, giving meaning to the order in which semaphore and fence signal operations occur when submitted to a single queue. The signal operation order for queue operations is determined as follows:

1. The initial order is determined by the order in which [vkQueueSubmit](#) and [vkQueueSubmit2KHR](#) commands are executed on the host, for a single queue, from first to last.

2. The order in which `VkSubmitInfo` structures are specified in the `pSubmits` parameter of `vkQueueSubmit`, or in which `VkSubmitInfo2` structures are specified in the `pSubmits` parameter of `vkQueueSubmit2KHR`, from lowest index to highest.
3. The fence signal operation defined by the `fence` parameter of a `vkQueueSubmit` or `vkQueueSubmit2KHR` command is ordered after all semaphore signal operations defined by that command.

Semaphore signal operations defined by a single `VkSubmitInfo` or `VkSubmitInfo2` structure are unordered with respect to other semaphore signal operations defined within the same structure.

The `vkSignalSemaphore` command does not execute on a queue but instead performs the signal operation from the host. The semaphore signal operation defined by executing a `vkSignalSemaphore` command happens-after the `vkSignalSemaphore` command is invoked and happens-before the command returns.

NOTE

When signaling timeline semaphores, it is the responsibility of the application to ensure that they are ordered such that the semaphore value is strictly increasing. Because the first synchronization scope for a semaphore signal operation contains all semaphore signal operations which occur earlier in submission order, all semaphore signal operations contained in any given batch are guaranteed to happen-after all semaphore signal operations contained in any previous batches. However, no ordering guarantee is provided between the semaphore signal operations defined within a single batch. This, combined with the requirement that timeline semaphore values strictly increase, means that it is invalid to signal the same timeline semaphore twice within a single batch.

If an application wishes to ensure that some semaphore signal operation happens-after some other semaphore signal operation, it can submit a separate batch containing only semaphore signal operations, which will happen-after the semaphore signal operations in any earlier batches.

When signaling a semaphore from the host, the only ordering guarantee is that the signal operation happens-after when `vkSignalSemaphore` is called and happens-before it returns. Therefore, it is invalid to call `vkSignalSemaphore` while there are any outstanding signal operations on that semaphore from any queue submissions unless those queue submissions have some dependency which ensures that they happen-after the host signal operation. One example of this would be if the pending signal operation is, itself, waiting on the same semaphore at a lower value and the call to `vkSignalSemaphore` signals that lower value. Furthermore, if there are two or more processes or threads signaling the same timeline semaphore from the host, the application must ensure that the `vkSignalSemaphore` with the lower semaphore value returns before `vkSignalSemaphore` is called with the higher value.

7.3. Fences

Fences are a synchronization primitive that **can** be used to insert a dependency from a queue to the host. Fences have two states - signaled and unsignaled. A fence **can** be signaled as part of the execution of a `queue submission` command. Fences **can** be unsignaled on the host with

[vkResetFences](#). Fences **can** be waited on by the host with the [vkWaitForFences](#) command, and the current state **can** be queried with [vkGetFenceStatus](#).

The internal data of a fence **may** include a reference to any resources and pending work associated with signal or unsignal operations performed on that fence object, collectively referred to as the fence's *payload*. Mechanisms to import and export that internal data to and from fences are provided [below](#). These mechanisms indirectly enable applications to share fence state between two or more fences and other synchronization primitives across process and API boundaries.

Fences are represented by [VkFence](#) handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkFence)
```

To create a fence, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateFence(
    VkDevice                                device,
    const VkFenceCreateInfo*                pCreateInfo,
    const VkAllocationCallbacks*            pAllocator,
    VkFence*                                 pFence);
```

- [device](#) is the logical device that creates the fence.
- [pCreateInfo](#) is a pointer to a [VkFenceCreateInfo](#) structure containing information about how the fence is to be created.
- [pAllocator](#) controls host memory allocation as described in the [Memory Allocation](#) chapter.
- [pFence](#) is a pointer to a handle in which the resulting fence object is returned.

If [VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations](#) is [VK_TRUE](#), [vkCreateFence](#) **must** not return [VK_ERROR_OUT_OF_HOST_MEMORY](#).

Valid Usage

- VUID-vkCreateFence-device-05068
The number of fences currently allocated from [device](#) plus 1 **must** be less than or equal to the total number of fences requested via [VkDeviceObjectReservationCreateInfo::fenceRequestCount](#) specified when [device](#) was created
- VUID-vkCreateFence-pNext-05106
If the [pNext](#) chain of [VkFenceCreateInfo](#) includes [VkExportFenceSciSyncInfoNV](#), then [VkFenceCreateInfo::flags](#) **must** not include [VK_FENCE_CREATE_SIGNALED_BIT](#)

Valid Usage (Implicit)

- VUID-vkCreateFence-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkCreateFence-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkFenceCreateInfo](#) structure
- VUID-vkCreateFence-pAllocator-null
pAllocator **must** be **NULL**
- VUID-vkCreateFence-pFence-parameter
pFence **must** be a valid pointer to a [VkFence](#) handle
- VUID-vkCreateFence-device-queuecount
The device **must** have been created with at least **1** queue

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_UNKNOWN**
- **VK_ERROR_VALIDATION_FAILED**

The [VkFenceCreateInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkFenceCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkFenceCreateFlags  flags;
} VkFenceCreateInfo;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of [VkFenceCreateFlagBits](#) specifying the initial state and behavior of the fence.

Valid Usage (Implicit)

- VUID-VkFenceCreateInfo-sType-sType

sType must be `VK_STRUCTURE_TYPE_FENCE_CREATE_INFO`

- `VOID-VkFenceCreateInfo-pNext-pNext`

Each **pNext** member of any structure (including this one) in the **pNext** chain must be either `NULL` or a pointer to a valid instance of `VkExportFenceCreateInfo` or `VkExportFenceSciSyncInfoNV`

- `VOID-VkFenceCreateInfo-sType-unique`

The **sType** value of each structure in the **pNext** chain must be unique

- `VOID-VkFenceCreateInfo-flags-parameter`

flags must be a valid combination of `VkFenceCreateFlagBits` values

```
// Provided by VK_VERSION_1_0
typedef enum VkFenceCreateFlagBits {
    VK_FENCE_CREATE_SIGNALED_BIT = 0x00000001,
} VkFenceCreateFlagBits;
```

- `VK_FENCE_CREATE_SIGNALED_BIT` specifies that the fence object is created in the signaled state. Otherwise, it is created in the unsignaled state.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkFenceCreateFlags;
```

`VkFenceCreateFlags` is a bitmask type for setting a mask of zero or more `VkFenceCreateFlagBits`.

To create a fence whose payload **can** be exported to external handles, add a `VkExportFenceCreateInfo` structure to the **pNext** chain of the `VkFenceCreateInfo` structure. The `VkExportFenceCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExportFenceCreateInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkExternalFenceHandleTypeFlags handleTypes;
} VkExportFenceCreateInfo;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **handleTypes** is a bitmask of `VkExternalFenceHandleTypeFlagBits` specifying one or more fence handle types the application **can** export from the resulting fence. The application **can** request multiple handle types for the same fence.

Valid Usage

- `VOID-VkExportFenceCreateInfo-handleTypes-01446`

The bits in `handleTypes` **must** be supported and compatible, as reported by `VkExternalFenceProperties`

- VUID-VkExportFenceCreateInfo-pNext-05107

If the `pNext` chain includes a `VkExportFenceSciSyncInfoNV` structure, the `VkPhysicalDeviceExternalSciSyncFeaturesNV::sciSyncFence` and `VkPhysicalDeviceExternalSciSyncFeaturesNV::sciSyncExport` features, or the `VkPhysicalDeviceExternalSciSync2FeaturesNV::sciSyncFence` and `VkPhysicalDeviceExternalSciSync2FeaturesNV::sciSyncExport` features, **must** be enabled

Valid Usage (Implicit)

- VUID-VkExportFenceCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_EXPORT_FENCE_CREATE_INFO`
- VUID-VkExportFenceCreateInfo-handleTypes-parameter
`handleTypes` **must** be a valid combination of `VkExternalFenceHandleTypeFlagBits` values

To export a POSIX file descriptor representing the payload of a fence, call:

```
// Provided by VK_KHR_external_fence_fd
VkResult vkGetFenceFdKHR(
    VkDevice device,
    const VkFenceGetFdInfoKHR* pGetFdInfo,
    int* pFd);
```

- `device` is the logical device that created the fence being exported.
- `pGetFdInfo` is a pointer to a `VkFenceGetFdInfoKHR` structure containing parameters of the export operation.
- `pFd` will return the file descriptor representing the fence payload.

Each call to `vkGetFenceFdKHR` **must** create a new file descriptor and transfer ownership of it to the application. To avoid leaking resources, the application **must** release ownership of the file descriptor when it is no longer needed.

NOTE

Ownership can be released in many ways. For example, the application can call `close()` on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a fence payload.

If `pGetFdInfo->handleType` is `VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT` and the fence is signaled at the time `vkGetFenceFdKHR` is called, `pFd` **may** return the value `-1` instead of a valid file descriptor.

Where supported by the operating system, the implementation **must** set the file descriptor to be closed automatically when an `execve` system call is made.

Exporting a file descriptor from a fence **may** have side effects depending on the transference of the specified handle type, as described in [Importing Fence State](#).

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetFenceFdKHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkGetFenceFdKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetFenceFdKHR-pGetFdInfo-parameter
`pGetFdInfo` **must** be a valid pointer to a valid `VkFenceGetFdInfoKHR` structure
- VUID-vkGetFenceFdKHR-pFd-parameter
`pFd` **must** be a valid pointer to an `int` value

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkFenceGetFdInfoKHR` structure is defined as:

```
// Provided by VK_KHR_external_fence_fd
typedef struct VkFenceGetFdInfoKHR {
    VkStructureType          sType;
    const void*              pNext;
    VkFence                  fence;
    VkExternalFenceHandleTypeFlagBits handleType;
} VkFenceGetFdInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fence` is the fence from which state will be exported.
- `handleType` is a `VkExternalFenceHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the file descriptor returned depend on the value of `handleType`. See `VkExternalFenceHandleTypeFlagBits` for a description of the properties of the defined external fence handle types.

Valid Usage

- VUID-VkFenceGetFdInfoKHR-handleType-01453
`handleType` **must** have been included in `VkExportFenceCreateInfo::handleTypes` when `fence`'s current payload was created
- VUID-VkFenceGetFdInfoKHR-handleType-01454
If `handleType` refers to a handle type with copy payload transference semantics, `fence` **must** be signaled, or have an associated `fence signal operation` pending execution
- VUID-VkFenceGetFdInfoKHR-fence-01455
`fence` **must** not currently have its payload replaced by an imported payload as described below in `Importing Fence Payloads` unless that imported payload's handle type was included in `VkExternalFenceProperties::exportFromImportedHandleTypes` for `handleType`
- VUID-VkFenceGetFdInfoKHR-handleType-01456
`handleType` **must** be defined as a POSIX file descriptor handle

Valid Usage (Implicit)

- VUID-VkFenceGetFdInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_FENCE_GET_FD_INFO_KHR`
- VUID-VkFenceGetFdInfoKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkFenceGetFdInfoKHR-fence-parameter
`fence` **must** be a valid `VkFence` handle
- VUID-VkFenceGetFdInfoKHR-handleType-parameter
`handleType` **must** be a valid `VkExternalFenceHandleTypeFlagBits` value

To specify additional attributes of `NvSciSync` handles exported from a fence, add a `VkExportFenceSciSyncInfoNV` structure to the `pNext` chain of the `VkFenceCreateInfo` structure. The `VkExportFenceSciSyncInfoNV` structure is defined as:

```
// Provided by VK_NV_external_sci_sync, VK_NV_external_sci_sync2
typedef struct VkExportFenceSciSyncInfoNV {
    VkStructureType    sType;
    const void*        pNext;
    NvSciSyncAttrList  pAttributes;
} VkExportFenceSciSyncInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pAttributes` is an opaque `NvSciSyncAttrList` describing the attributes of the `NvSciSync` object that will be exported.

If [VkExportFenceCreateInfo](#) is not present in the same [pNext](#) chain, this structure is ignored. If the [pNext](#) chain of [VkFenceCreateInfo](#) includes a [VkExportFenceCreateInfo](#) structure with a [NvSciSync handleType](#), but either [VkExportFenceSciSyncInfoNV](#) is not included in the [pNext](#) chain, or it is included but [pAttributes](#) is [NULL](#), [vkCreateFence](#) will return [VK_ERROR_INITIALIZATION_FAILED](#).

The [pAttributes](#) **must** be a reconciled [NvSciSyncAttrList](#). Before exporting the [NvSciSync](#) handles, applications **must** use the [vkGetPhysicalDeviceSciSyncAttributesNV](#) command to get the unreconciled [NvSciSyncAttrList](#) and then use the [NvSciSync](#) API to reconcile it.

Valid Usage

- VUID-VkExportFenceSciSyncInfoNV-pAttributes-05108
[pAttributes](#) **must** be a reconciled [NvSciSyncAttrList](#)

Valid Usage (Implicit)

- VUID-VkExportFenceSciSyncInfoNV-sType-sType
[sType](#) **must** be [VK_STRUCTURE_TYPE_EXPORT_FENCE_SCI_SYNC_INFO_NV](#)

To obtain the implementation-specific [NvSciSync](#) attributes in an unreconciled [NvSciSyncAttrList](#), call:

```
// Provided by VK_NV_external_sci_sync, VK_NV_external_sci_sync2
VkResult vkGetPhysicalDeviceSciSyncAttributesNV(
    VkPhysicalDevice          physicalDevice,
    const VkSciSyncAttributesInfoNV* pSciSyncAttributesInfo,
    NvSciSyncAttrList          pAttributes);
```

- [physicalDevice](#) is the handle to the physical device that will be used to determine the attributes.
- [pSciSyncAttributesInfo](#) is a pointer to a [VkSciSyncAttributesInfoNV](#) structure containing information about how the attributes are to be filled.
- [pAttributes](#) is an opaque [NvSciSyncAttrList](#) in which the implementation will set the requested attributes.

On success, [pAttributes](#) will contain an unreconciled [NvSciSyncAttrList](#) whose private attributes and some public attributes are filled in by the implementation. If the attributes of [physicalDevice](#) could not be obtained, [VK_ERROR_INITIALIZATION_FAILED](#) is returned.

Valid Usage

- VUID-vkGetPhysicalDeviceSciSyncAttributesNV-pSciSyncAttributesInfo-05109
If [pSciSyncAttributesInfo->primitiveType](#) is [VK_SCI_SYNC_PRIMITIVE_TYPE_FENCE_NV](#) then [VkPhysicalDeviceExternalSciSyncFeaturesNV::sciSyncFence](#) or [VkPhysicalDeviceExternalSciSync2FeaturesNV::sciSyncFence](#) **must** be enabled

- VUID-vkGetPhysicalDeviceSciSyncAttributesNV-pSciSyncAttributesInfo-05110
If `pSciSyncAttributesInfo->primitiveType` is `VK_SCI_SYNC_PRIMITIVE_TYPE_SEMAPHORE_NV` then `VkPhysicalDeviceExternalSciSyncFeaturesNV::sciSyncSemaphore` or `VkPhysicalDeviceExternalSciSync2FeaturesNV::sciSyncSemaphore2` **must** be enabled
- VUID-vkGetPhysicalDeviceSciSyncAttributesNV-pAttributes-05111
`pAttributes` **must** be a valid `NvSciSyncAttrList` and **must** not be `NULL`

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSciSyncAttributesNV-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceSciSyncAttributesNV-pSciSyncAttributesInfo-parameter
`pSciSyncAttributesInfo` **must** be a valid pointer to a valid `VkSciSyncAttributesInfoNV` structure

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkSciSyncAttributesInfoNV` structure is defined as:

```
// Provided by VK_NV_external_sci_sync, VK_NV_external_sci_sync2
typedef struct VkSciSyncAttributesInfoNV {
    VkStructureType      sType;
    const void*          pNext;
    VkSciSyncClientTypeNV clientType;
    VkSciSyncPrimitiveTypeNV primitiveType;
} VkSciSyncAttributesInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `clientType` is the permission type of client.
- `primitiveType` is the synchronization primitive type.

`NvSciSync` disallows multi-signalers, therefore clients **must** specify their permission types as one of `signaler`, `waiter` or `signaler_waiter`. In addition, `NvSciSync` requires clients to specify which

primitive type is to be used in synchronization, hence clients also need to provide the primitive type ([VkFence](#) or [VkSemaphore](#)) that will be used.

Valid Usage (Implicit)

- VUID-VkSciSyncAttributesInfoNV-sType-sType
sType must be `VK_STRUCTURE_TYPE_SCI_SYNC_ATTRIBUTES_INFO_NV`
- VUID-VkSciSyncAttributesInfoNV-pNext-pNext
pNext must be `NULL`
- VUID-VkSciSyncAttributesInfoNV-clientType-parameter
clientType must be a valid [VkSciSyncClientTypeNV](#) value
- VUID-VkSciSyncAttributesInfoNV-primitiveType-parameter
primitiveType must be a valid [VkSciSyncPrimitiveTypeNV](#) value

The [VkSciSyncClientTypeNV](#) enum is defined as:

```
// Provided by VK_NV_external_sci_sync, VK_NV_external_sci_sync2
typedef enum VkSciSyncClientTypeNV {
    VK_SCI_SYNC_CLIENT_TYPE_SIGNALER_NV = 0,
    VK_SCI_SYNC_CLIENT_TYPE_WAITER_NV = 1,
    VK_SCI_SYNC_CLIENT_TYPE_SIGNALER_WAITER_NV = 2,
} VkSciSyncClientTypeNV;
```

- `VK_SCI_SYNC_CLIENT_TYPE_SIGNALER_NV` specifies the permission of the client as signaler. It indicates that the client can only signal the created fence or semaphore and disallows waiting on it.
- `VK_SCI_SYNC_CLIENT_TYPE_WAITER_NV` specifies the permission of the client as waiter. It indicates that the client can only wait on the imported fence or semaphore and disallows signaling it. This type of permission is only used when the client imports `NvSciSync` handles, and export is not allowed.
- `VK_SCI_SYNC_CLIENT_TYPE_SIGNALER_WAITER_NV` specifies the permission of client as both signaler and waiter. It indicates that the client **can** signal and wait on the created fence or semaphore.

The [VkSciSyncPrimitiveTypeNV](#) enum is defined as:

```
// Provided by VK_NV_external_sci_sync, VK_NV_external_sci_sync2
typedef enum VkSciSyncPrimitiveTypeNV {
    VK_SCI_SYNC_PRIMITIVE_TYPE_FENCE_NV = 0,
    VK_SCI_SYNC_PRIMITIVE_TYPE_SEMAPHORE_NV = 1,
} VkSciSyncPrimitiveTypeNV;
```

- `VK_SCI_SYNC_PRIMITIVE_TYPE_FENCE_NV` specifies that the synchronization primitive type the client will create is a [VkFence](#).
- `VK_SCI_SYNC_PRIMITIVE_TYPE_SEMAPHORE_NV` specifies that the synchronization primitive type the

client will create is a [VkSemaphore](#).

To export a [NvSciSyncFence](#) handle representing the payload of a fence, call:

```
// Provided by VK_NV_external_sci_sync, VK_NV_external_sci_sync2
VkResult vkGetFenceSciSyncFenceNV(
    VkDevice          device,
    const VkFenceGetSciSyncInfoNV* pGetSciSyncHandleInfo,
    void*             pHandle);
```

- [device](#) is the logical device that created the fence being exported.
- [pGetSciSyncHandleInfo](#) is a pointer to a [VkFenceGetSciSyncInfoNV](#) structure containing parameters of the export operation.
- [pHandle](#) is a pointer to a [NvSciSyncFence](#) which will contain the fence payload on return.

Each call to [vkGetFenceSciSyncFenceNV](#) will duplicate the underlying [NvSciSyncFence](#) handle and transfer the ownership of the [NvSciSyncFence](#) handle to the application. To avoid leaking resources, the application **must** release of the ownership of the [NvSciSyncFence](#) handle when it is no longer needed.

Valid Usage

- VUID-vkGetFenceSciSyncFenceNV-pGetSciSyncHandleInfo-05112
[pGetSciSyncHandleInfo->handleType](#) **must** be
[VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_FENCE_BIT_NV](#)
- VUID-vkGetFenceSciSyncFenceNV-sciSyncFence-05113
[VkPhysicalDeviceExternalSciSyncFeaturesNV::sciSyncFence](#) or
[VkPhysicalDeviceExternalSciSync2FeaturesNV::sciSyncFence](#) **must** be enabled

Valid Usage (Implicit)

- VUID-vkGetFenceSciSyncFenceNV-device-parameter
[device](#) **must** be a valid [VkDevice](#) handle
- VUID-vkGetFenceSciSyncFenceNV-pGetSciSyncHandleInfo-parameter
[pGetSciSyncHandleInfo](#) **must** be a valid pointer to a valid [VkFenceGetSciSyncInfoNV](#) structure
- VUID-vkGetFenceSciSyncFenceNV-pHandle-parameter
[pHandle](#) **must** be a pointer value

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- `VK_ERROR_INVALID_EXTERNAL_HANDLE`
- `VK_ERROR_NOT_PERMITTED`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

To export a `NvSciSyncObj` handle representing the payload of a fence, call:

```
// Provided by VK_NV_external_sci_sync, VK_NV_external_sci_sync2
VkResult vkGetFenceSciSyncObjNV(
    VkDevice          device,
    const VkFenceGetSciSyncInfoNV* pGetSciSyncHandleInfo,
    void*             pHandle);
```

- `device` is the logical device that created the fence being exported.
- `pGetSciSyncHandleInfo` is a pointer to a `VkFenceGetSciSyncInfoNV` structure containing parameters of the export operation.
- `pHandle` will return the `NvSciSyncObj` handle representing the fence payload.

Each call to `vkGetFenceSciSyncObjNV` will duplicate the underlying `NvSciSyncObj` handle and transfer the ownership of the `NvSciSyncObj` handle to the application. To avoid leaking resources, the application **must** release of the ownership of the `NvSciSyncObj` handle when it is no longer needed.

Valid Usage

- VUID-vkGetFenceSciSyncObjNV-pGetSciSyncHandleInfo-05114
`pGetSciSyncHandleInfo->handleType` **must** be
`VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_OBJ_BIT_NV`
- VUID-vkGetFenceSciSyncObjNV-sciSyncFence-05115
`VkPhysicalDeviceExternalSciSyncFeaturesNV::sciSyncFence` **or**
`VkPhysicalDeviceExternalSciSync2FeaturesNV::sciSyncFence` **must** be enabled

Valid Usage (Implicit)

- VUID-vkGetFenceSciSyncObjNV-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetFenceSciSyncObjNV-pGetSciSyncHandleInfo-parameter
`pGetSciSyncHandleInfo` **must** be a valid pointer to a valid `VkFenceGetSciSyncInfoNV` structure
- VUID-vkGetFenceSciSyncObjNV-pHandle-parameter
`pHandle` **must** be a pointer value

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_INVALID_EXTERNAL_HANDLE`
- `VK_ERROR_NOT_PERMITTED`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkFenceGetSciSyncInfoNV` structure is defined as:

```
// Provided by VK_NV_external_sci_sync, VK_NV_external_sci_sync2
typedef struct VkFenceGetSciSyncInfoNV {
    VkStructureType          sType;
    const void*              pNext;
    VkFence                  fence;
    VkExternalFenceHandleTypeFlagBits handleType;
} VkFenceGetSciSyncInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fence` is the fence from which state will be exported.
- `handleType` is the type of `NvSciSync` handle (`NvSciSyncObj` or `NvSciSyncFence`) representing the fence payload that will be exported.

If `handleType` is `VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_OBJ_BIT_NV`, a `NvSciSyncObj` will be exported. If `handleType` is `VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_FENCE_BIT_NV`, a `NvSciSyncFence` will be exported.

Valid Usage (Implicit)

- VUID-VkFenceGetSciSyncInfoNV-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_FENCE_GET_SCI_SYNC_INFO_NV`
- VUID-VkFenceGetSciSyncInfoNV-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkFenceGetSciSyncInfoNV-fence-parameter
`fence` **must** be a valid `VkFence` handle
- VUID-VkFenceGetSciSyncInfoNV-handleType-parameter
`handleType` **must** be a valid `VkExternalFenceHandleTypeFlagBits` value

To destroy a fence, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyFence(
    VkDevice          device,
    VkFence           fence,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the fence.
- **fence** is the handle of the fence to destroy.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroyFence-fence-01120
All [queue submission](#) commands that refer to **fence** **must** have completed execution

Valid Usage (Implicit)

- VUID-vkDestroyFence-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkDestroyFence-fence-parameter
If **fence** is not [VK_NULL_HANDLE](#), **fence** **must** be a valid [VkFence](#) handle
- VUID-vkDestroyFence-pAllocator-null
pAllocator **must** be [NULL](#)
- VUID-vkDestroyFence-fence-parent
If **fence** is a valid handle, it **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **fence** **must** be externally synchronized

To query the status of a fence from the host, call:

```
// Provided by VK_VERSION_1_0
VkResult vkGetFenceStatus(
    VkDevice          device,
    VkFence           fence);
```

- **device** is the logical device that owns the fence.
- **fence** is the handle of the fence to query.

Upon success, `vkGetFenceStatus` returns the status of the fence object, with the following return codes:

Table 6. Fence Object Status Codes

Status	Meaning
VK_SUCCESS	The fence specified by <code>fence</code> is signaled.
VK_NOT_READY	The fence specified by <code>fence</code> is unsignaled.
VK_ERROR_DEVICE_LOST	The device has been lost. See Lost Device .

If a [queue submission](#) command is pending execution, then the value returned by this command **may** immediately be out of date.

If the device has been lost (see [Lost Device](#)), `vkGetFenceStatus` **may** return any of the above status codes. If the device has been lost and `vkGetFenceStatus` is called repeatedly, it will eventually return either `VK_SUCCESS` or `VK_ERROR_DEVICE_LOST`.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetFenceStatus` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkGetFenceStatus-device-parameter
`device` **must** be a valid [VkDevice](#) handle
- VUID-vkGetFenceStatus-fence-parameter
`fence` **must** be a valid [VkFence](#) handle
- VUID-vkGetFenceStatus-fence-parent
`fence` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- `VK_NOT_READY`
- `VK_SUCCESS`

Failure

- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

To set the state of fences to unsignaled from the host, call:

```
// Provided by VK_VERSION_1_0
VkResult vkResetFences(
    VkDevice          device,
    uint32_t          fenceCount,
    const VkFence*    pFences);
```

- **device** is the logical device that owns the fences.
- **fenceCount** is the number of fences to reset.
- **pFences** is a pointer to an array of fence handles to reset.

If any member of **pFences** currently has its **payload imported** with temporary permanence, that fence's prior permanent payload is first restored. The remaining operations described therefore operate on the restored payload.

When **vkResetFences** is executed on the host, it defines a *fence unsignal operation* for each fence, which resets the fence to the unsignaled state.

If any member of **pFences** is already in the unsignaled state when **vkResetFences** is executed, then **vkResetFences** has no effect on that fence.

Valid Usage

- VUID-vkResetFences-pFences-01123
Each element of **pFences** **must** not be currently associated with any queue command that has not yet completed execution on that queue

Valid Usage (Implicit)

- VUID-vkResetFences-device-parameter
device **must** be a valid **VkDevice** handle
- VUID-vkResetFences-pFences-parameter
pFences **must** be a valid pointer to an array of **fenceCount** valid **VkFence** handles
- VUID-vkResetFences-fenceCount-arraylength
fenceCount **must** be greater than 0
- VUID-vkResetFences-pFences-parent
Each element of **pFences** **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to each member of **pFences** **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

When a fence is submitted to a queue as part of a [queue submission](#) command, it defines a memory dependency on the batches that were submitted as part of that command, and defines a *fence signal operation* which sets the fence to the signaled state.

The first [synchronization scope](#) includes every batch submitted in the same [queue submission](#) command. Fence signal operations that are defined by `vkQueueSubmit` or `vkQueueSubmit2KHR` additionally include in the first synchronization scope all commands that occur earlier in [submission order](#). Fence signal operations that are defined by `vkQueueSubmit` or `vkQueueSubmit2KHR` additionally include in the first synchronization scope any semaphore and fence signal operations that occur earlier in [signal operation order](#).

The second [synchronization scope](#) only includes the fence signal operation.

The first [access scope](#) includes all memory access performed by the device.

The second [access scope](#) is empty.

To wait for one or more fences to enter the signaled state on the host, call:

```
// Provided by VK_VERSION_1_0
VkResult vkWaitForFences(
    VkDevice          device,
    uint32_t          fenceCount,
    const VkFence*     pFences,
    VkBool32          waitAll,
    uint64_t           timeout);
```

- `device` is the logical device that owns the fences.
- `fenceCount` is the number of fences to wait on.
- `pFences` is a pointer to an array of `fenceCount` fence handles.
- `waitAll` is the condition that **must** be satisfied to successfully unblock the wait. If `waitAll` is `VK_TRUE`, then the condition is that all fences in `pFences` are signaled. Otherwise, the condition is that at least one fence in `pFences` is signaled.
- `timeout` is the timeout period in units of nanoseconds. `timeout` is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which **may** be substantially longer

than one nanosecond, and **may** be longer than the requested period.

If the condition is satisfied when `vkWaitForFences` is called, then `vkWaitForFences` returns immediately. If the condition is not satisfied at the time `vkWaitForFences` is called, then `vkWaitForFences` will block and wait until the condition is satisfied or the `timeout` has expired, whichever is sooner.

If `timeout` is zero, then `vkWaitForFences` does not wait, but simply returns the current state of the fences. `VK_TIMEOUT` will be returned in this case if the condition is not satisfied, even though no actual wait was performed.

If the condition is satisfied before the `timeout` has expired, `vkWaitForFences` returns `VK_SUCCESS`. Otherwise, `vkWaitForFences` returns `VK_TIMEOUT` after the `timeout` has expired.

If device loss occurs (see [Lost Device](#)) before the timeout has expired, `vkWaitForFences` **must** return in finite time with either `VK_SUCCESS` or `VK_ERROR_DEVICE_LOST`.

NOTE

While we guarantee that `vkWaitForFences` **must** return in finite time, no guarantees are made that it returns immediately upon device loss. However, the application can reasonably expect that the delay will be on the order of seconds and that calling `vkWaitForFences` will not result in a permanently (or seemingly permanently) dead process.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkWaitForFences` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkWaitForFences-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkWaitForFences-pFences-parameter
`pFences` **must** be a valid pointer to an array of `fenceCount` valid `VkFence` handles
- VUID-vkWaitForFences-fenceCount-arraylength
`fenceCount` **must** be greater than 0
- VUID-vkWaitForFences-pFences-parent
Each element of `pFences` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- `VK_SUCCESS`
- `VK_TIMEOUT`

Failure

- `VK_ERROR_DEVICE_LOST`

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

An execution dependency is defined by waiting for a fence to become signaled, either via `vkWaitForFences` or by polling on `vkGetFenceStatus`.

The first [synchronization scope](#) includes only the fence signal operation.

The second [synchronization scope](#) includes the host operations of `vkWaitForFences` or `vkGetFenceStatus` indicating that the fence has become signaled.

NOTE

Signaling a fence and waiting on the host does not guarantee that the results of memory accesses will be visible to the host, as the access scope of a memory dependency defined by a fence only includes device access. A [memory barrier](#) or other memory dependency **must** be used to guarantee this. See the description of [host access types](#) for more information.

7.3.1. Alternate Methods to Signal Fences

Besides submitting a fence to a queue as part of a [queue submission](#) command, a fence **may** also be signaled when a particular event occurs on a device or display.

To create a fence that will be signaled when an event occurs on a device, call:

```
// Provided by VK_EXT_display_control
VkResult vkRegisterDeviceEventEXT(
    VkDevice                                device,
    const VkDeviceEventInfoEXT*             pDeviceInfo,
    const VkAllocationCallbacks*            pAllocator,
    VkFence*                                pFence);
```

- `device` is a logical device on which the event **may** occur.
- `pDeviceInfo` is a pointer to a [VkDeviceEventInfoEXT](#) structure describing the event of interest to the application.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pFence` is a pointer to a handle in which the resulting fence object is returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkRegisterDeviceEventEXT` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkRegisterDeviceEventEXT-device-parameter

device must be a valid [VkDevice](#) handle

- VUID-vkRegisterDeviceEventEXT-pDeviceEventInfo-parameter
pDeviceEventInfo must be a valid pointer to a valid [VkDeviceEventInfoEXT](#) structure
- VUID-vkRegisterDeviceEventEXT-pAllocator-null
pAllocator must be **NULL**
- VUID-vkRegisterDeviceEventEXT-pFence-parameter
pFence must be a valid pointer to a [VkFence](#) handle

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_UNKNOWN**
- **VK_ERROR_VALIDATION_FAILED**

The [VkDeviceEventInfoEXT](#) structure is defined as:

```
// Provided by VK_EXT_display_control
typedef struct VkDeviceEventInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    VkDeviceEventTypeEXT deviceEvent;
} VkDeviceEventInfoEXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **deviceEvent** is a [VkDeviceEventTypeEXT](#) value specifying when the fence will be signaled.

Valid Usage (Implicit)

- VUID-VkDeviceEventInfoEXT-sType-sType
sType must be **VK_STRUCTURE_TYPE_DEVICE_EVENT_INFO_EXT**
- VUID-VkDeviceEventInfoEXT-pNext-pNext
pNext must be **NULL**
- VUID-VkDeviceEventInfoEXT-deviceEvent-parameter
deviceEvent must be a valid [VkDeviceEventTypeEXT](#) value

Possible values of [VkDeviceEventInfoEXT::deviceEvent](#), specifying when a fence will be signaled,

are:

```
// Provided by VK_EXT_display_control
typedef enum VkDeviceEventTypeEXT {
    VK_DEVICE_EVENT_TYPE_DISPLAY_HOTPLUG_EXT = 0,
} VkDeviceEventTypeEXT;
```

- `VK_DEVICE_EVENT_TYPE_DISPLAY_HOTPLUG_EXT` specifies that the fence is signaled when a display is plugged into or unplugged from the specified device. Applications **can** use this notification to determine when they need to re-enumerate the available displays on a device.

To create a fence that will be signaled when an event occurs on a `VkDisplayKHR` object, call:

```
// Provided by VK_EXT_display_control
VkResult vkRegisterDisplayEventEXT(
    VkDevice          device,
    VkDisplayKHR      display,
    const VkDisplayEventInfoEXT* pDisplayEventInfo,
    const VkAllocationCallbacks* pAllocator,
    VkFence*          pFence);
```

- `device` is a logical device associated with `display`
- `display` is the display on which the event **may** occur.
- `pDisplayEventInfo` is a pointer to a `VkDisplayEventInfoEXT` structure describing the event of interest to the application.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pFence` is a pointer to a handle in which the resulting fence object is returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkRegisterDisplayEventEXT` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkRegisterDisplayEventEXT-device-parameter `device` **must** be a valid `VkDevice` handle
- VUID-vkRegisterDisplayEventEXT-display-parameter `display` **must** be a valid `VkDisplayKHR` handle
- VUID-vkRegisterDisplayEventEXT-pDisplayEventInfo-parameter `pDisplayEventInfo` **must** be a valid pointer to a valid `VkDisplayEventInfoEXT` structure
- VUID-vkRegisterDisplayEventEXT-pAllocator-null `pAllocator` **must** be `NULL`
- VUID-vkRegisterDisplayEventEXT-pFence-parameter `pFence` **must** be a valid pointer to a `VkFence` handle

- VUID-vkRegisterDisplayEventEXT-commonparent
Both of **device**, and **display** **must** have been created, allocated, or retrieved from the same **VkPhysicalDevice**

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_UNKNOWN**
- **VK_ERROR_VALIDATION_FAILED**

The **VkDisplayEventInfoEXT** structure is defined as:

```
// Provided by VK_EXT_display_control
typedef struct VkDisplayEventInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    VkDisplayEventTypeEXT displayEvent;
} VkDisplayEventInfoEXT;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **displayEvent** is a **VkDisplayEventTypeEXT** specifying when the fence will be signaled.

Valid Usage (Implicit)

- VUID-VkDisplayEventInfoEXT-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_DISPLAY_EVENT_INFO_EXT**
- VUID-VkDisplayEventInfoEXT-pNext-pNext
pNext **must** be **NULL**
- VUID-VkDisplayEventInfoEXT-displayEvent-parameter
displayEvent **must** be a valid **VkDisplayEventTypeEXT** value

Possible values of **VkDisplayEventInfoEXT::displayEvent**, specifying when a fence will be signaled, are:

```
// Provided by VK_EXT_display_control
typedef enum VkDisplayEventTypeEXT {
    VK_DISPLAY_EVENT_TYPE_FIRST_PIXEL_OUT_EXT = 0,
} VkDisplayEventTypeEXT;
```

- `VK_DISPLAY_EVENT_TYPE_FIRST_PIXEL_OUT_EXT` specifies that the fence is signaled when the first pixel of the next display refresh cycle leaves the display engine for the display.

7.3.2. Importing Fence Payloads

Applications **can** import a fence payload into an existing fence using an external fence handle. The effects of the import operation will be either temporary or permanent, as specified by the application. If the import is temporary, the fence will be *restored* to its permanent state the next time that fence is passed to [vkResetFences](#).

NOTE

Restoring a fence to its prior permanent payload is a distinct operation from resetting a fence payload. See [vkResetFences](#) for more detail.

Performing a subsequent temporary import on a fence before resetting it has no effect on this requirement; the next unsignal of the fence **must** still restore its last permanent state. A permanent payload import behaves as if the target fence was destroyed, and a new fence was created with the same handle but the imported payload. Because importing a fence payload temporarily or permanently detaches the existing payload from a fence, similar usage restrictions to those applied to `vkDestroyFence` are applied to any command that imports a fence payload. Which of these import types is used is referred to as the import operation's *permanence*. Each handle type supports either one or both types of permanence.

The implementation **must** perform the import operation by either referencing or copying the payload referred to by the specified external fence handle, depending on the handle's type. The import method used is referred to as the handle type's *transference*. When using handle types with reference transference, importing a payload to a fence adds the fence to the set of all fences sharing that payload. This set includes the fence from which the payload was exported. Fence signaling, waiting, and resetting operations performed on any fence in the set **must** behave as if the set were a single fence. Importing a payload using handle types with copy transference creates a duplicate copy of the payload at the time of import, but makes no further reference to it. Fence signaling, waiting, and resetting operations performed on the target of copy imports **must** not affect any other fence or payload.

Export operations have the same transference as the specified handle type's import operations. Additionally, exporting a fence payload to a handle with copy transference has the same side effects on the source fence's payload as executing a fence reset operation. If the fence was using a temporarily imported payload, the fence's prior permanent payload will be restored.

NOTE

The table [Handle Types Supported by VkImportFenceFdInfoKHR](#) defines the permanence and transference of each handle type.

[External synchronization](#) allows implementations to modify an object's internal state, i.e. payload,

without internal synchronization. However, for fences sharing a payload across processes, satisfying the external synchronization requirements of `VkFence` parameters as if all fences in the set were the same object is sometimes infeasible. Satisfying valid usage constraints on the state of a fence would similarly require impractical coordination or levels of trust between processes. Therefore, these constraints only apply to a specific fence handle, not to its payload. For distinct fence objects which share a payload:

- If multiple commands which queue a signal operation, or which unsignal a fence, are called concurrently, behavior will be as if the commands were called in an arbitrary sequential order.
- If a queue submission command is called with a fence that is sharing a payload, and the payload is already associated with another queue command that has not yet completed execution, either one or both of the commands will cause the fence to become signaled when they complete execution.
- If a fence payload is reset while it is associated with a queue command that has not yet completed execution, the payload will become unsignaled, but **may** become signaled again when the command completes execution.
- In the preceding cases, any of the devices associated with the fences sharing the payload **may** be lost, or any of the queue submission or fence reset commands **may** return `VK_ERROR_INITIALIZATION_FAILED`.

Other than these non-deterministic results, behavior is well defined. In particular:

- The implementation **must** not crash or enter an internally inconsistent state where future valid Vulkan commands might cause undefined results,
- Timeouts on future wait commands on fences sharing the payload **must** be effective.

NOTE

These rules allow processes to synchronize access to shared memory without trusting each other. However, such processes must still be cautious not to use the shared fence for more than synchronizing access to the shared memory. For example, a process should not use a fence with shared payload to tell when commands it submitted to a queue have completed and objects used by those commands may be destroyed, since the other process can accidentally or maliciously cause the fence to signal before the commands actually complete.

When a fence is using an imported payload, its `VkExportFenceCreateInfo::handleTypes` value is specified when creating the fence from which the payload was exported, rather than specified when creating the fence. Additionally, `VkExternalFenceProperties::exportFromImportedHandleTypes` restricts which handle types **can** be exported from such a fence based on the specific handle type used to import the current payload. Passing a fence to `vkAcquireNextImageKHR` is equivalent to temporarily importing a fence payload to that fence.

NOTE

Because the exportable handle types of an imported fence correspond to its current imported payload, and `vkAcquireNextImageKHR` behaves the same as a temporary import operation for which the source fence is opaque to the application, applications have no way of determining whether any external handle types **can** be exported from a fence in this state. Therefore, applications **must** not attempt to export handles from fences using a temporarily imported payload from

When importing a fence payload, it is the responsibility of the application to ensure the external handles meet all valid usage requirements. However, implementations **must** perform sufficient validation of external handles to ensure that the operation results in a valid fence which will not cause program termination, device loss, queue stalls, host thread stalls, or corruption of other resources when used as allowed according to its import parameters. If the external handle provided does not meet these requirements, the implementation **must** fail the fence payload import operation with the error code `VK_ERROR_INVALID_EXTERNAL_HANDLE`.

To import a fence payload from a POSIX file descriptor, call:

```
// Provided by VK_KHR_external_fence_fd
VkResult vkImportFenceFdKHR(
    VkDevice device,
    const VkImportFenceFdInfoKHR* pImportFenceFdInfo);
```

- `device` is the logical device that created the fence.
- `pImportFenceFdInfo` is a pointer to a `VkImportFenceFdInfoKHR` structure specifying the fence and import parameters.

Importing a fence payload from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application **must** not perform any operations on the file descriptor after a successful import.

Applications **can** import the same fence payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkImportFenceFdKHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkImportFenceFdKHR-fence-01463
`fence` **must** not be associated with any queue command that has not yet completed execution on that queue

Valid Usage (Implicit)

- VUID-vkImportFenceFdKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkImportFenceFdKHR-pImportFenceFdInfo-parameter
`pImportFenceFdInfo` **must** be a valid pointer to a valid `VkImportFenceFdInfoKHR` structure

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_INVALID_EXTERNAL_HANDLE`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkImportFenceFdInfoKHR` structure is defined as:

```
// Provided by VK_KHR_external_fence_fd
typedef struct VkImportFenceFdInfoKHR {
    VkStructureType      sType;
    const void*          pNext;
    VkFence              fence;
    VkFenceImportFlags    flags;
    VkExternalFenceHandleTypeFlagBits handleType;
    int                  fd;
} VkImportFenceFdInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fence` is the fence into which the payload will be imported.
- `flags` is a bitmask of `VkFenceImportFlagBits` specifying additional parameters for the fence payload import operation.
- `handleType` is a `VkExternalFenceHandleTypeFlagBits` value specifying the type of `fd`.
- `fd` is the external handle to import.

The handle types supported by `handleType` are:

Table 7. Handle Types Supported by `VkImportFenceFdInfoKHR`

Handle Type	Transference	Permanence Supported
<code>VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_FD_BIT</code>	Reference	Temporary,Permanent
<code>VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT</code>	Copy	Temporary

Valid Usage

- VUID-VkImportFenceFdInfoKHR-handleType-01464

handleType **must** be a value included in the [Handle Types Supported by VkImportFenceFdInfoKHR](#) table

- VUID-VkImportFenceFdInfoKHR-fd-01541
fd **must** obey any requirements listed for **handleType** in [external fence handle types compatibility](#)
- VUID-VkImportFenceFdInfoKHR-handleType-07306
If **handleType** refers to a handle type with copy payload transference semantics, **flags** **must** contain `VK_FENCE_IMPORT_TEMPORARY_BIT`

If **handleType** is `VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT`, the special value `-1` for **fd** is treated like a valid sync file descriptor referring to an object that has already signaled. The import operation will succeed and the **VkFence** will have a temporarily imported payload as if a valid file descriptor had been provided.

NOTE

This special behavior for importing an invalid sync file descriptor allows easier interoperability with other system APIs which use the convention that an invalid sync file descriptor represents work that has already completed and does not need to be waited for. It is consistent with the option for implementations to return a `-1` file descriptor when exporting a `VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT` from a **VkFence** which is signaled.

Valid Usage (Implicit)

- VUID-VkImportFenceFdInfoKHR-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_IMPORT_FENCE_FD_INFO_KHR`
- VUID-VkImportFenceFdInfoKHR-pNext-pNext
pNext **must** be `NULL`
- VUID-VkImportFenceFdInfoKHR-fence-parameter
fence **must** be a valid [VkFence](#) handle
- VUID-VkImportFenceFdInfoKHR-flags-parameter
flags **must** be a valid combination of [VkFenceImportFlagBits](#) values
- VUID-VkImportFenceFdInfoKHR-handleType-parameter
handleType **must** be a valid [VkExternalFenceHandleTypeFlagBits](#) value

Host Synchronization

- Host access to **fence** **must** be externally synchronized

To import a fence payload from a **NvSciSyncFence** handle, call:

```
// Provided by VK_NV_external_sci_sync, VK_NV_external_sci_sync2
VkResult vkImportFenceSciSyncFenceNV(
    VkDevice device,
    const VkImportFenceSciSyncInfoNV* pImportFenceSciSyncInfo);
```

- **device** is the logical device that created the fence.
- **pImportFenceSciSyncInfo** is a pointer to a [VkImportFenceSciSyncInfoNV](#) structure containing parameters of the import operation

Importing a fence payload from **NvSciSyncFence** does not transfer ownership of the handle to the Vulkan implementation. Vulkan will make a copy of **NvSciSyncFence** when importing it. The application **must** release ownership using the NvSciSync API when the handle is no longer needed.

Valid Usage

- VUID-vkImportFenceSciSyncFenceNV-sciSyncImport-05140
[VkPhysicalDeviceExternalSciSyncFeaturesNV::sciSyncImport](#) and
[VkPhysicalDeviceExternalSciSyncFeaturesNV::sciSyncFence](#), or
[VkPhysicalDeviceExternalSciSync2FeaturesNV::sciSyncImport](#) and
[VkPhysicalDeviceExternalSciSync2FeaturesNV::sciSyncFence](#) **must** be enabled
- VUID-vkImportFenceSciSyncFenceNV-fence-05141
fence **must** not be associated with any queue command that has not yet completed execution on that queue
- VUID-vkImportFenceSciSyncFenceNV-pImportFenceSciSyncInfo-05142
pImportFenceSciSyncInfo->handleType **must** be
[VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_FENCE_BIT_NV](#)

Valid Usage (Implicit)

- VUID-vkImportFenceSciSyncFenceNV-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkImportFenceSciSyncFenceNV-pImportFenceSciSyncInfo-parameter
pImportFenceSciSyncInfo **must** be a valid pointer to a valid [VkImportFenceSciSyncInfoNV](#) structure

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_INVALID_EXTERNAL_HANDLE](#)
- [VK_ERROR_NOT_PERMITTED](#)

- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

To import a fence payload from a `NvSciSyncObj` handle, call:

```
// Provided by VK_NV_external_sci_sync, VK_NV_external_sci_sync2
VkResult vkImportFenceSciSyncObjNV(
    VkDevice device,
    const VkImportFenceSciSyncInfoNV* pImportFenceSciSyncInfo);
```

- `device` is the logical device that created the fence.
- `pImportFenceSciSyncInfo` is a pointer to a `VkImportFenceSciSyncInfoNV` structure containing parameters of the import operation

Importing a fence payload from a `NvSciSyncObj` does not transfer ownership of the handle to the Vulkan implementation. Vulkan will make a new reference to the `NvSciSyncObj` object when importing it. The application **must** release ownership using the `NvSciSync` API when the handle is no longer needed.

The application **must** not import the same `NvSciSyncObj` with signaler access permissions into multiple instances of `VkFence`, and **must** not import into the same instance from which it was exported.

Valid Usage

- VUID-vkImportFenceSciSyncObjNV-sciSyncImport-05143
`VkPhysicalDeviceExternalSciSyncFeaturesNV::sciSyncImport` and
`VkPhysicalDeviceExternalSciSyncFeaturesNV::sciSyncFence`, or
`VkPhysicalDeviceExternalSciSync2FeaturesNV::sciSyncImport` and
`VkPhysicalDeviceExternalSciSync2FeaturesNV::sciSyncFence` **must** be enabled
- VUID-vkImportFenceSciSyncObjNV-fence-05144
`fence` **must** not be associated with any queue command that has not yet completed execution on that queue
- VUID-vkImportFenceSciSyncObjNV-pImportFenceSciSyncInfo-05145
`pImportFenceSciSyncInfo->handleType` **must** be
`VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_OBJ_BIT_NV`

Valid Usage (Implicit)

- VUID-vkImportFenceSciSyncObjNV-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkImportFenceSciSyncObjNV-pImportFenceSciSyncInfo-parameter
`pImportFenceSciSyncInfo` **must** be a valid pointer to a valid `VkImportFenceSciSyncInfoNV` structure

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_INVALID_EXTERNAL_HANDLE`
- `VK_ERROR_NOT_PERMITTED`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkImportFenceSciSyncInfoNV` structure is defined as:

```
// Provided by VK_NV_external_sci_sync, VK_NV_external_sci_sync2
typedef struct VkImportFenceSciSyncInfoNV {
    VkStructureType          sType;
    const void*              pNext;
    VkFence                  fence;
    VkExternalFenceHandleTypeFlagBits handleType;
    void*                    handle;
} VkImportFenceSciSyncInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fence` is the fence into which the state will be imported.
- `handleType` specifies the type of `handle`.
- `handle` is the external handle to import.

The handle types supported by `handleType` are:

Table 8. Handle Types Supported by `VkImportFenceSciSyncInfoNV`

Handle Type	Transference	Permanence Supported
<code>VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_OBJ_BIT_NV</code>	Reference	Permanent
<code>VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_FENCE_BIT_NV</code>	Copy	Temporary

Valid Usage (Implicit)

- `VUID-VkImportFenceSciSyncInfoNV-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_FENCE_SCI_SYNC_INFO_NV`

- VUID-VkImportFenceSciSyncInfoNV-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkImportFenceSciSyncInfoNV-fence-parameter
`fence` **must** be a valid `VkFence` handle
- VUID-VkImportFenceSciSyncInfoNV-handleType-parameter
`handleType` **must** be a valid `VkExternalFenceHandleTypeFlagBits` value
- VUID-VkImportFenceSciSyncInfoNV-handle-parameter
`handle` **must** be a pointer value

Host Synchronization

- Host access to `fence` **must** be externally synchronized

Bits which **can** be set in

- `VkImportFenceFdInfoKHR::flags`

specifying additional parameters of a fence import operation are:

```
// Provided by VK_VERSION_1_1
typedef enum VkFenceImportFlagBits {
    VK_FENCE_IMPORT_TEMPORARY_BIT = 0x00000001,
} VkFenceImportFlagBits;
```

- `VK_FENCE_IMPORT_TEMPORARY_BIT` specifies that the fence payload will be imported only temporarily, as described in [Importing Fence Payloads](#), regardless of the permanence of `handleType`.

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkFenceImportFlags;
```

`VkFenceImportFlags` is a bitmask type for setting a mask of zero or more `VkFenceImportFlagBits`.

7.4. Semaphores

Semaphores are a synchronization primitive that **can** be used to insert a dependency between queue operations or between a queue operation and the host. [Binary semaphores](#) have two states - signaled and unsignaled. [Timeline semaphores](#) have a strictly increasing 64-bit unsigned integer payload and are signaled with respect to a particular reference value. A semaphore **can** be signaled after execution of a queue operation is completed, and a queue operation **can** wait for a semaphore to become signaled before it begins execution. A timeline semaphore **can** additionally be signaled from the host with the `vkSignalSemaphore` command and waited on from the host with the `vkWaitSemaphores` command.

The internal data of a semaphore **may** include a reference to any resources and pending work associated with signal or unsignal operations performed on that semaphore object, collectively referred to as the semaphore's *payload*. Mechanisms to import and export that internal data to and from semaphores are provided [below](#). These mechanisms indirectly enable applications to share semaphore state between two or more semaphores and other synchronization primitives across process and API boundaries.

Semaphores are represented by `VkSemaphore` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSemaphore)
```

To create a semaphore, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateSemaphore(
    VkDevice                                device,
    const VkSemaphoreCreateInfo*            pCreateInfo,
    const VkAllocationCallbacks*           pAllocator,
    VkSemaphore*                            pSemaphore);
```

- `device` is the logical device that creates the semaphore.
- `pCreateInfo` is a pointer to a [VkSemaphoreCreateInfo](#) structure containing information about how the semaphore is to be created.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pSemaphore` is a pointer to a handle in which the resulting semaphore object is returned.

If [VkSemaphoreSciSyncCreateInfoNV](#) is included in the `pNext` chain of [VkSemaphoreCreateInfo](#), [VkSemaphoreSciSyncCreateInfoNV::semaphorePool](#) **may** be accessed any time the resulting semaphore is accessed.

If [VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations](#) is `VK_TRUE`, `vkCreateSemaphore` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkCreateSemaphore-device-05068

The number of semaphores currently allocated from `device` plus 1 **must** be less than or equal to the total number of semaphores requested via [VkDeviceObjectReservationCreateInfo::semaphoreRequestCount](#) specified when `device` was created

Valid Usage (Implicit)

- VUID-vkCreateSemaphore-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCreateSemaphore-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkSemaphoreCreateInfo` structure
- VUID-vkCreateSemaphore-pAllocator-null
`pAllocator` **must** be `NULL`
- VUID-vkCreateSemaphore-pSemaphore-parameter
`pSemaphore` **must** be a valid pointer to a `VkSemaphore` handle
- VUID-vkCreateSemaphore-device-queuecount
The device **must** have been created with at least `1` queue

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkSemaphoreCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSemaphoreCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkSemaphoreCreateFlags flags;
} VkSemaphoreCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.

Valid Usage

- VUID-VkSemaphoreCreateInfo-pNext-05118
If the `pNext` chain includes `VkExportSemaphoreSciSyncInfoNV`, it **must** also include

`VkSemaphoreTypeCreateInfo` with a `VkSemaphoreTypeCreateInfo::semaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`

- VUID-VkSemaphoreCreateInfo-pNext-05146

If the `pNext` chain includes `VkSemaphoreSciSyncCreateInfoNV`, it **must** also include `VkSemaphoreTypeCreateInfo` with a `VkSemaphoreTypeCreateInfo::semaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`

Valid Usage (Implicit)

- VUID-VkSemaphoreCreateInfo-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_SEMAPHORE_CREATE_INFO`

- VUID-VkSemaphoreCreateInfo-pNext-pNext

Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkExportSemaphoreCreateInfo`, `VkExportSemaphoreSciSyncInfoNV`, `VkSemaphoreSciSyncCreateInfoNV`, or `VkSemaphoreTypeCreateInfo`

- VUID-VkSemaphoreCreateInfo-sType-unique

The `sType` value of each structure in the `pNext` chain **must** be unique

- VUID-VkSemaphoreCreateInfo-flags-zero bitmask

`flags` **must** be 0

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkSemaphoreCreateFlags;
```

`VkSemaphoreCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkSemaphoreTypeCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkSemaphoreTypeCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkSemaphoreType    semaphoreType;
    uint64_t           initialValue;
} VkSemaphoreTypeCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphoreType` is a `VkSemaphoreType` value specifying the type of the semaphore.
- `initialValue` is the initial payload value if `semaphoreType` is `VK_SEMAPHORE_TYPE_TIMELINE`.

To create a semaphore of a specific type, add a `VkSemaphoreTypeCreateInfo` structure to the

`VkSemaphoreCreateInfo::pNext` chain.

If no `VkSemaphoreTypeCreateInfo` structure is included in the `pNext` chain of `VkSemaphoreCreateInfo`, then the created semaphore will have a default `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`.

If `VkSemaphoreSciSyncCreateInfoNV` structure is included in the `pNext` chain of `VkSemaphoreTypeCreateInfo`, `initialValue` is ignored.

Valid Usage

- VUID-VkSemaphoreTypeCreateInfo-timelineSemaphore-03252
If the `timelineSemaphore` feature is not enabled, `semaphoreType` **must** not equal `VK_SEMAPHORE_TYPE_TIMELINE`
- VUID-VkSemaphoreTypeCreateInfo-semaphoreType-03279
If `semaphoreType` is `VK_SEMAPHORE_TYPE_BINARY`, `initialValue` **must** be zero
- VUID-VkSemaphoreTypeCreateInfo-pNext-05119
If the `pNext` chain includes `VkExportSemaphoreSciSyncInfoNV`, `initialValue` **must** be zero

Valid Usage (Implicit)

- VUID-VkSemaphoreTypeCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SEMAPHORE_TYPE_CREATE_INFO`
- VUID-VkSemaphoreTypeCreateInfo-semaphoreType-parameter
`semaphoreType` **must** be a valid `VkSemaphoreType` value

Possible values of `VkSemaphoreTypeCreateInfo::semaphoreType`, specifying the type of a semaphore, are:

```
// Provided by VK_VERSION_1_2
typedef enum VkSemaphoreType {
    VK_SEMAPHORE_TYPE_BINARY = 0,
    VK_SEMAPHORE_TYPE_TIMELINE = 1,
} VkSemaphoreType;
```

- `VK_SEMAPHORE_TYPE_BINARY` specifies a *binary semaphore* type that has a boolean payload indicating whether the semaphore is currently signaled or unsignaled. When created, the semaphore is in the unsignaled state.
- `VK_SEMAPHORE_TYPE_TIMELINE` specifies a *timeline semaphore* type that has a strictly increasing 64-bit unsigned integer payload indicating whether the semaphore is signaled with respect to a particular reference value. When created, the semaphore payload has the value given by the `initialValue` field of `VkSemaphoreTypeCreateInfo`.

To create a semaphore whose payload **can** be exported to external handles, add a `VkExportSemaphoreCreateInfo` structure to the `pNext` chain of the `VkSemaphoreCreateInfo`

structure. The `VkExportSemaphoreCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExportSemaphoreCreateInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkExternalSemaphoreHandleTypeFlags handleTypes;
} VkExportSemaphoreCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleTypes` is a bitmask of `VkExternalSemaphoreHandleTypeFlagBits` specifying one or more semaphore handle types the application **can** export from the resulting semaphore. The application **can** request multiple handle types for the same semaphore.

Valid Usage

- VUID-VkExportSemaphoreCreateInfo-handleTypes-01124
The bits in `handleTypes` **must** be supported and compatible, as reported by `VkExternalSemaphoreProperties`
- VUID-VkExportSemaphoreCreateInfo-pNext-05120
If the `pNext` chain includes a `VkExportSemaphoreSciSyncInfoNV` structure, the `VkPhysicalDeviceExternalSciSyncFeaturesNV::sciSyncSemaphore` and `VkPhysicalDeviceExternalSciSyncFeaturesNV::sciSyncExport` features **must** be enabled

Valid Usage (Implicit)

- VUID-VkExportSemaphoreCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_EXPORT_SEMAPHORE_CREATE_INFO`
- VUID-VkExportSemaphoreCreateInfo-handleTypes-parameter
`handleTypes` **must** be a valid combination of `VkExternalSemaphoreHandleTypeFlagBits` values

To export a POSIX file descriptor representing the payload of a semaphore, call:

```
// Provided by VK_KHR_external_semaphore_fd
VkResult vkGetSemaphoreFdKHR(
    VkDevice          device,
    const VkSemaphoreGetFdInfoKHR* pGetFdInfo,
    int*              pFd);
```

- `device` is the logical device that created the semaphore being exported.
- `pGetFdInfo` is a pointer to a `VkSemaphoreGetFdInfoKHR` structure containing parameters of the

export operation.

- `pFd` will return the file descriptor representing the semaphore payload.

Each call to `vkGetSemaphoreFdKHR` **must** create a new file descriptor and transfer ownership of it to the application. To avoid leaking resources, the application **must** release ownership of the file descriptor when it is no longer needed.

NOTE

Ownership can be released in many ways. For example, the application can call `close()` on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a semaphore payload.

Where supported by the operating system, the implementation **must** set the file descriptor to be closed automatically when an `execve` system call is made.

Exporting a file descriptor from a semaphore **may** have side effects depending on the transference of the specified handle type, as described in [Importing Semaphore State](#).

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetSemaphoreFdKHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkGetSemaphoreFdKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetSemaphoreFdKHR-pGetFdInfo-parameter
`pGetFdInfo` **must** be a valid pointer to a valid `VkSemaphoreGetFdInfoKHR` structure
- VUID-vkGetSemaphoreFdKHR-pFd-parameter
`pFd` **must** be a valid pointer to an `int` value

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkSemaphoreGetFdInfoKHR` structure is defined as:

```
// Provided by VK_KHR_external_semaphore_fd
typedef struct VkSemaphoreGetFdInfoKHR {
    VkStructureType           sType;
    const void*               pNext;
    VkSemaphore               semaphore;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkSemaphoreGetFdInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **semaphore** is the semaphore from which state will be exported.
- **handleType** is a [VkExternalSemaphoreHandleTypeFlagBits](#) value specifying the type of handle requested.

The properties of the file descriptor returned depend on the value of **handleType**. See [VkExternalSemaphoreHandleTypeFlagBits](#) for a description of the properties of the defined external semaphore handle types.

Valid Usage

- VUID-VkSemaphoreGetFdInfoKHR-handleType-01132
handleType **must** have been included in [VkExportSemaphoreCreateInfo::handleTypes](#) when **semaphore**'s current payload was created
- VUID-VkSemaphoreGetFdInfoKHR-semaphore-01133
semaphore **must** not currently have its payload replaced by an imported payload as described below in [Importing Semaphore Payloads](#) unless that imported payload's handle type was included in [VkExternalSemaphoreProperties::exportFromImportedHandleTypes](#) for **handleType**
- VUID-VkSemaphoreGetFdInfoKHR-handleType-01134
If **handleType** refers to a handle type with copy payload transference semantics, as defined below in [Importing Semaphore Payloads](#), there **must** be no queue waiting on **semaphore**
- VUID-VkSemaphoreGetFdInfoKHR-handleType-01135
If **handleType** refers to a handle type with copy payload transference semantics, **semaphore** **must** be signaled, or have an associated [semaphore signal operation](#) pending execution
- VUID-VkSemaphoreGetFdInfoKHR-handleType-01136
handleType **must** be defined as a POSIX file descriptor handle
- VUID-VkSemaphoreGetFdInfoKHR-handleType-03253
If **handleType** refers to a handle type with copy payload transference semantics, **semaphore** **must** have been created with a [VkSemaphoreType](#) of **VK_SEMAPHORE_TYPE_BINARY**
- VUID-VkSemaphoreGetFdInfoKHR-handleType-03254
If **handleType** refers to a handle type with copy payload transference semantics, **semaphore** **must** have an associated semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends **must** have also been

Valid Usage (Implicit)

- VUID-VkSemaphoreGetFdInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SEMAPHORE_GET_FD_INFO_KHR`
- VUID-VkSemaphoreGetFdInfoKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkSemaphoreGetFdInfoKHR-semaphore-parameter
`semaphore` **must** be a valid `VkSemaphore` handle
- VUID-VkSemaphoreGetFdInfoKHR-handleType-parameter
`handleType` **must** be a valid `VkExternalSemaphoreHandleTypeFlagBits` value

To specify additional attributes of `NvSciSync` handles exported from a semaphore, add a `VkExportSemaphoreSciSyncInfoNV` structure to the `pNext` chain of the `VkSemaphoreCreateInfo` structure. The `VkExportSemaphoreSciSyncInfoNV` structure is defined as:

```
// Provided by VK_NV_external_sci_sync
typedef struct VkExportSemaphoreSciSyncInfoNV {
    VkStructureType    sType;
    const void*        pNext;
    NvSciSyncAttrList  pAttributes;
} VkExportSemaphoreSciSyncInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pAttributes` is an opaque `NvSciSyncAttrList` describing the attributes of the `NvSciSync` object that will be exported.

If `VkExportSemaphoreCreateInfo` is not present in the same `pNext` chain, this structure is ignored. If the `pNext` chain of `VkSemaphoreCreateInfo` includes a `VkExportSemaphoreCreateInfo` structure with a `NvSciSync` `handleType`, but either `VkExportSemaphoreSciSyncInfoNV` is not included in the `pNext` chain, or it is included but `pAttributes` is `NULL`, `vkCreateSemaphore` will return `VK_ERROR_INITIALIZATION_FAILED`.

The `pAttributes` **must** be a reconciled `NvSciSyncAttrList`. Before exporting a `NvSciSync` handle, the application **must** use the `vkGetPhysicalDeviceSciSyncAttributesNV` command to obtain the unreconciled `NvSciSyncAttrList` and then use the `NvSciSync` API to reconcile it.

Valid Usage

- VUID-VkExportSemaphoreSciSyncInfoNV-pAttributes-05121
`pAttributes` **must** be a reconciled `NvSciSyncAttrList`

Valid Usage (Implicit)

- VUID-VkExportSemaphoreSciSyncInfoNV-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_EXPORT_SEMAPHORE_SCI_SYNC_INFO_NV`

To export a `NvSciSyncObj` handle representing the payload of a semaphore, call:

```
// Provided by VK_NV_external_sci_sync
VkResult vkGetSemaphoreSciSyncObjNV(
    VkDevice device,
    const VkSemaphoreGetSciSyncInfoNV* pGetSciSyncInfo,
    void* pHandle);
```

- `device` is the logical device that created the semaphore being exported.
- `pGetSciSyncInfo` is a pointer to a `VkSemaphoreGetSciSyncInfoNV` structure containing parameters of the export operation.
- `pHandle` will return the `NvSciSyncObj` representing the semaphore payload.

Each call to `vkGetSemaphoreSciSyncObjNV` will duplicate the underlying `NvSciSyncObj` and transfer the ownership of the `NvSciSyncObj` handle to the application. To avoid leaking resources, the application **must** release ownership of the `NvSciSyncObj` when it is no longer needed.

Valid Usage

- VUID-vkGetSemaphoreSciSyncObjNV-sciSyncSemaphore-05147
`VkPhysicalDeviceExternalSciSyncFeaturesNV::sciSyncSemaphore` **must** be enabled

Valid Usage (Implicit)

- VUID-vkGetSemaphoreSciSyncObjNV-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetSemaphoreSciSyncObjNV-pGetSciSyncInfo-parameter
`pGetSciSyncInfo` **must** be a valid pointer to a valid `VkSemaphoreGetSciSyncInfoNV` structure
- VUID-vkGetSemaphoreSciSyncObjNV-pHandle-parameter
`pHandle` **must** be a pointer value

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_INVALID_EXTERNAL_HANDLE`
- `VK_ERROR_NOT_PERMITTED`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkSemaphoreGetSciSyncInfoNV` structure is defined as:

```
// Provided by VK_NV_external_sci_sync
typedef struct VkSemaphoreGetSciSyncInfoNV {
    VkStructureType          sType;
    const void*              pNext;
    VkSemaphore              semaphore;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkSemaphoreGetSciSyncInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is the semaphore from which state will be exported.
- `handleType` is the type of `NvSciSync` handle (`NvSciSyncObj`) representing the semaphore that will be exported.

Valid Usage

- VUID-VkSemaphoreGetSciSyncInfoNV-handleType-05122
`handleType` **must** be `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SCI_SYNC_OBJ_BIT_NV`
- VUID-VkSemaphoreGetSciSyncInfoNV-semaphore-05123
`semaphore` **must** have been created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`
- VUID-VkSemaphoreGetSciSyncInfoNV-semaphore-05129
`semaphore` **must** have been created with `VkExportSemaphoreSciSyncInfoNV` included `pNext` chain of `VkSemaphoreCreateInfo`, or previously imported by `vkImportSemaphoreSciSyncObjNV`

Valid Usage (Implicit)

- VUID-VkSemaphoreGetSciSyncInfoNV-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SEMAPHORE_GET_SCI_SYNC_INFO_NV`
- VUID-VkSemaphoreGetSciSyncInfoNV-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkSemaphoreGetSciSyncInfoNV-semaphore-parameter

semaphore must be a valid [VkSemaphore](#) handle

- VUID-VkSemaphoreGetSciSyncInfoNV-handleType-parameter **handleType** must be a valid [VkExternalSemaphoreHandleTypeFlagBits](#) value

The [VkSemaphoreSciSyncCreateInfoNV](#) structure is defined as:

```
// Provided by VK_NV_external_sci_sync2
typedef struct VkSemaphoreSciSyncCreateInfoNV {
    VkStructureType      sType;
    const void*          pNext;
    VkSemaphoreSciSyncPoolNV semaphorePool;
    const NvSciSyncFence* pFence;
} VkSemaphoreSciSyncCreateInfoNV;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **semaphorePool** is a [VkSemaphoreSciSyncPoolNV](#) handle.
- **pFence** is a pointer to a [NvSciSyncFence](#).

When [VkSemaphoreSciSyncCreateInfoNV](#) is included in [VkSemaphoreCreateInfo::pNext](#) chain, the semaphore is created from the [VkSemaphoreSciSyncPoolNV](#) handle that represents a [NvSciSyncObj](#) with one or more primitives. The [VkSemaphoreSciSyncCreateInfoNV::pFence](#) parameter provides the information to select the corresponding primitive represented by this semaphore. When a [NvSciSyncObj](#) with signaler permissions is imported to [VkSemaphoreSciSyncPoolNV](#), it only supports one primitive and [VkSemaphoreSciSyncCreateInfoNV::pFence](#) must be in the cleared state.

Valid Usage

- VUID-VkSemaphoreSciSyncCreateInfoNV-sciSyncSemaphore2-05148
The [VkPhysicalDeviceExternalSciSync2FeaturesNV::sciSyncSemaphore2](#) feature must be enabled

Valid Usage (Implicit)

- VUID-VkSemaphoreSciSyncCreateInfoNV-sType-sType
sType must be `VK_STRUCTURE_TYPE_SEMAPHORE_SCI_SYNC_CREATE_INFO_NV`
- VUID-VkSemaphoreSciSyncCreateInfoNV-semaphorePool-parameter
semaphorePool must be a valid [VkSemaphoreSciSyncPoolNV](#) handle
- VUID-VkSemaphoreSciSyncCreateInfoNV-pFence-parameter
pFence must be a valid pointer to a valid [NvSciSyncFence](#) value

To destroy a semaphore, call:

```
// Provided by VK_VERSION_1_0
void vkDestroySemaphore(
    VkDevice          device,
    VkSemaphore        semaphore,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the semaphore.
- **semaphore** is the handle of the semaphore to destroy.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

If **semaphore** was created with [VkSemaphoreSciSyncCreateInfoNV](#) present in the [VkSemaphoreCreateInfo::pNext](#) chain, **semaphore** **can** be destroyed immediately after all batches that refer to it are submitted. Otherwise, all submitted batches that refer to **semaphore** **must** have completed execution before it can be destroyed.

Valid Usage

- VUID-vkDestroySemaphore-semaphore-05149
If **semaphore** was not created with [VkSemaphoreSciSyncCreateInfoNV](#) present in the [VkSemaphoreCreateInfo::pNext](#) chain when it was created, all submitted batches that refer to **semaphore** **must** have completed execution

Valid Usage (Implicit)

- VUID-vkDestroySemaphore-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkDestroySemaphore-semaphore-parameter
If **semaphore** is not [VK_NULL_HANDLE](#), **semaphore** **must** be a valid [VkSemaphore](#) handle
- VUID-vkDestroySemaphore-pAllocator-null
pAllocator **must** be [NULL](#)
- VUID-vkDestroySemaphore-semaphore-parent
If **semaphore** is a valid handle, it **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **semaphore** **must** be externally synchronized

7.4.1. Semaphore SciSync Pools

A semaphore SciSync pool is used to represent a [NvSciSyncObj](#) with one or more primitives.

Semaphore SciSync pools are represented by `VkSemaphoreSciSyncPoolNV` handles:

```
// Provided by VK_NV_external_sci_sync2
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSemaphoreSciSyncPoolNV)
```

Semaphore SciSync pools **cannot** be freed [SCID-4].

If `VkPhysicalDeviceVulkanSC10Properties::deviceDestroyFreesMemory` is `VK_TRUE`, the memory is returned to the system and the reference to the `NvSciSyncObj` that was imported is released when the device is destroyed. Otherwise, it **may** not be returned to the system until the process is terminated.

To import a `NvSciSyncObj` with multiple primitives, use `vkCreateSemaphoreSciSyncPoolNV` to reserve a semaphore pool to map the multiple semaphores allocated by `NvSciSyncObj`. Then create a `VkSemaphore` from the semaphore pool using the index provided by the `NvSciSyncFence` when chaining the `VkSemaphoreSciSyncCreateInfoNV` structure to `VkSemaphoreCreateInfo`.

To create a `VkSemaphoreSciSyncPoolNV`, call:

```
// Provided by VK_NV_external_sci_sync2
VkResult vkCreateSemaphoreSciSyncPoolNV(
    VkDevice device,
    const VkSemaphoreSciSyncPoolCreateInfoNV* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSemaphoreSciSyncPoolNV* pSemaphorePool);
```

- `device` is the logical device that creates the semaphore pool.
- `pCreateInfo` is a pointer to a `VkSemaphoreSciSyncPoolCreateInfoNV` structure containing information about the semaphore SciSync pool being created.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pSemaphorePool` is a pointer to a handle in which the resulting semaphore pool object is returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkCreateSemaphoreSciSyncPoolNV` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkCreateSemaphoreSciSyncPoolNV-sciSyncSemaphore2-05151
The `VkPhysicalDeviceExternalSciSync2FeaturesNV::sciSyncSemaphore2` feature **must** be enabled
- VUID-vkCreateSemaphoreSciSyncPoolNV-device-05068
The number of semaphore pools currently allocated from `device` plus 1 **must** be less than or equal to the total number of semaphore pools requested via `VkDeviceSemaphoreSciSyncPoolReservationCreateInfoNV::semaphoreSciSyncPoolRequestCount` specified when `device` was created

Valid Usage (Implicit)

- VUID-vkCreateSemaphoreSciSyncPoolNV-device-parameter **device** **must** be a valid [VkDevice](#) handle
- VUID-vkCreateSemaphoreSciSyncPoolNV-pCreateInfo-parameter **pCreateInfo** **must** be a valid pointer to a valid [VkSemaphoreSciSyncPoolCreateInfoNV](#) structure
- VUID-vkCreateSemaphoreSciSyncPoolNV-pAllocator-null **pAllocator** **must** be `NULL`
- VUID-vkCreateSemaphoreSciSyncPoolNV-pSemaphorePool-parameter **pSemaphorePool** **must** be a valid pointer to a [VkSemaphoreSciSyncPoolNV](#) handle
- VUID-vkCreateSemaphoreSciSyncPoolNV-device-queuecount
The device **must** have been created with at least `1` queue

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkSemaphoreSciSyncPoolCreateInfoNV` structure is defined as:

```
// Provided by VK_NV_external_sci_sync2
typedef struct VkSemaphoreSciSyncPoolCreateInfoNV {
    VkStructureType    sType;
    const void*        pNext;
    NvSciSyncObj       handle;
} VkSemaphoreSciSyncPoolCreateInfoNV;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handle` is an external [NvSciSyncObj](#) to import.

During [vkCreateSemaphoreSciSyncPoolNV](#), the external `NvSciSyncObj` is imported to `VkSemaphoreSciSyncPoolNV`. The import does not transfer the ownership of the `NvSciSyncObj` to the implementation, but will increment the reference count of that object. The application **must** delete other references of the original `NvSciSyncObj` using [NvSciSync APIs](#) when it is no longer needed.

Applications **must** not import the same `NvSciSyncObj` with signaler access permissions to multiple instances of `VkSemaphoreSciSyncPoolNV`.

Valid Usage

- VUID-VkSemaphoreSciSyncPoolCreateInfoNV-handle-05152
`handle` **must** be a valid `NvSciSyncObj`

Valid Usage (Implicit)

- VUID-VkSemaphoreSciSyncPoolCreateInfoNV-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SEMAPHORE_SCI_SYNC_POOL_CREATE_INFO_NV`
- VUID-VkSemaphoreSciSyncPoolCreateInfoNV-pNext-pNext
`pNext` **must** be `NULL`

7.4.2. Semaphore Signaling

When a batch is submitted to a queue via a [queue submission](#), and it includes semaphores to be signaled, it defines a memory dependency on the batch, and defines *semaphore signal operations* which set the semaphores to the signaled state.

In case of semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the semaphore is considered signaled with respect to the counter value set to be signaled as specified in [VkTimelineSemaphoreSubmitInfo](#) or [VkSemaphoreSignalInfo](#).

The first [synchronization scope](#) includes every command submitted in the same batch. In the case of [vkQueueSubmit2KHR](#), the first synchronization scope is limited to the pipeline stage specified by [VkSemaphoreSubmitInfo::stageMask](#). Semaphore signal operations that are defined by [vkQueueSubmit](#) or [vkQueueSubmit2KHR](#) additionally include all commands that occur earlier in [submission order](#). Semaphore signal operations that are defined by [vkQueueSubmit](#) or [vkQueueSubmit2KHR](#) additionally include in the first synchronization scope any semaphore and fence signal operations that occur earlier in [signal operation order](#).

The second [synchronization scope](#) includes only the semaphore signal operation.

The first [access scope](#) includes all memory access performed by the device.

The second [access scope](#) is empty.

7.4.3. Semaphore Waiting

When a batch is submitted to a queue via a [queue submission](#), and it includes semaphores to be waited on, it defines a memory dependency between prior semaphore signal operations and the batch, and defines *semaphore wait operations*.

Such semaphore wait operations set the semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` to the unsignaled state. In case of semaphores created with a

`VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` a prior semaphore signal operation defines a memory dependency with a semaphore wait operation if the value the semaphore is signaled with is greater than or equal to the value the semaphore is waited with, thus the semaphore will continue to be considered signaled with respect to the counter value waited on as specified in `VkTimelineSemaphoreSubmitInfo`.

The first `synchronization scope` includes one `semaphore signal operation` for each semaphore waited on by this batch. The specific signal operation waited on for each semaphore **must** meet the following criteria:

- for binary semaphores, the signal operation is either earlier in `submission order` on the same queue, or is submitted by a command whose host operation happens-before this batch is submitted on the host
- for binary semaphores, no wait operation exists that happens-after the signal operation and happens-before this wait operation
- the signal operation is not guaranteed to happen-after the semaphore wait operation in this batch
- for timeline semaphores, the signal value is greater than or equal to the wait value

If multiple semaphore signal operations meet these criteria, any of those operations **may** be included in the first `synchronization scope`. When waiting on a binary semaphore, applications **must** ensure that exactly one semaphore signal operation meets these criteria.

The second `synchronization scope` includes every command submitted in the same batch. In the case of `vkQueueSubmit`, the second synchronization scope is limited to operations on the pipeline stages determined by the `destination stage mask` specified by the corresponding element of `pWaitDstStageMask`. In the case of `vkQueueSubmit2KHR`, the second synchronization scope is limited to the pipeline stage specified by `VkSemaphoreSubmitInfo::stageMask`. Also, in the case of either `vkQueueSubmit2KHR` or `vkQueueSubmit`, the second synchronization scope additionally includes all commands that occur later in `submission order`.

The first `access scope` is empty.

The second `access scope` includes all memory access performed by the device.

The semaphore wait operation happens-after the first set of operations in the execution dependency, and happens-before the second set of operations in the execution dependency.

NOTE

Unlike timeline semaphores, fences or events, waiting for a binary semaphore also unsignals that semaphore when the wait completes. Applications **must** ensure that between two such wait operations, the semaphore is signaled again, with execution dependencies used to ensure these occur in order. Binary semaphore waits and signals should thus occur in discrete 1:1 pairs.

NOTE

A common scenario for using `pWaitDstStageMask` with values other than `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` is when synchronizing a window system presentation operation against subsequent command buffers which render the next frame. In this case, a presentation image **must** not be overwritten until the

presentation operation completes, but other pipeline stages **can** execute without waiting. A mask of `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` prevents subsequent color attachment writes from executing until the semaphore signals. Some implementations **may** be able to execute transfer operations and/or pre-rasterization work before the semaphore is signaled.

If an image layout transition needs to be performed on a presentable image before it is used in a framebuffer, that **can** be performed as the first operation submitted to the queue after acquiring the image, and **should** not prevent other work from overlapping with the presentation operation. For example, a `VkImageMemoryBarrier` could use:

- `srcStageMask = VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`
- `srcAccessMask = 0`
- `dstStageMask = VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`
- `dstAccessMask = VK_ACCESS_COLOR_ATTACHMENT_READ_BIT | VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT.`
- `oldLayout = VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`
- `newLayout = VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

Alternatively, `oldLayout` **can** be `VK_IMAGE_LAYOUT_UNDEFINED`, if the image's contents need not be preserved.

This barrier accomplishes a dependency chain between previous presentation operations and subsequent color attachment output operations, with the layout transition performed in between, and does not introduce a dependency between previous work and any [pre-rasterization shader stages](#). More precisely, the semaphore signals after the presentation operation completes, the semaphore wait stalls the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` stage, and there is a dependency from that same stage to itself with the layout transition performed in between.

7.4.4. Semaphore State Requirements for Wait Operations

Before waiting on a semaphore, the application **must** ensure the semaphore is in a valid state for a wait operation. Specifically, when a [semaphore wait operation](#) is submitted to a queue:

- A binary semaphore **must** be signaled, or have an associated [semaphore signal operation](#) that is pending execution.
- Any [semaphore signal operations](#) on which the pending binary semaphore signal operation depends **must** also be completed or pending execution.
- There **must** be no other queue waiting on the same binary semaphore when the operation executes.

7.4.5. Host Operations on Semaphores

In addition to [semaphore signal operations](#) and [semaphore wait operations](#) submitted to device queues, timeline semaphores support the following host operations:

- Query the current counter value of the semaphore using the [vkGetSemaphoreCounterValue](#) command.
- Wait for a set of semaphores to reach particular counter values using the [vkWaitSemaphores](#) command.
- Signal the semaphore with a particular counter value from the host using the [vkSignalSemaphore](#) command.

To query the current counter value of a semaphore created with a [VkSemaphoreType](#) of [VK_SEMAPHORE_TYPE_TIMELINE](#) from the host, call:

```
// Provided by VK_VERSION_1_2
VkResult vkGetSemaphoreCounterValue(
    VkDevice          device,
    VkSemaphore       semaphore,
    uint64_t*         pValue);
```

- [device](#) is the logical device that owns the semaphore.
- [semaphore](#) is the handle of the semaphore to query.
- [pValue](#) is a pointer to a 64-bit integer value in which the current counter value of the semaphore is returned.

NOTE

If a [queue submission](#) command is pending execution, then the value returned by this command **may** immediately be out of date.

If [VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations](#) is [VK_TRUE](#), [vkGetSemaphoreCounterValue](#) **must** not return [VK_ERROR_OUT_OF_HOST_MEMORY](#).

Valid Usage

- VUID-vkGetSemaphoreCounterValue-semaphore-03255
[semaphore](#) **must** have been created with a [VkSemaphoreType](#) of [VK_SEMAPHORE_TYPE_TIMELINE](#)

Valid Usage (Implicit)

- VUID-vkGetSemaphoreCounterValue-device-parameter
[device](#) **must** be a valid [VkDevice](#) handle
- VUID-vkGetSemaphoreCounterValue-semaphore-parameter
[semaphore](#) **must** be a valid [VkSemaphore](#) handle

- VUID-vkGetSemaphoreCounterValue-pValue-parameter
`pValue` **must** be a valid pointer to a `uint64_t` value
- VUID-vkGetSemaphoreCounterValue-semaphore-parent
`semaphore` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

To wait for a set of semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` to reach particular counter values on the host, call:

```
// Provided by VK_VERSION_1_2
VkResult vkWaitSemaphores(
    VkDevice          device,
    const VkSemaphoreWaitInfo* pWaitInfo,
    uint64_t          timeout);
```

- `device` is the logical device that owns the semaphores.
- `pWaitInfo` is a pointer to a `VkSemaphoreWaitInfo` structure containing information about the wait condition.
- `timeout` is the timeout period in units of nanoseconds. `timeout` is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which **may** be substantially longer than one nanosecond, and **may** be longer than the requested period.

If the condition is satisfied when `vkWaitSemaphores` is called, then `vkWaitSemaphores` returns immediately. If the condition is not satisfied at the time `vkWaitSemaphores` is called, then `vkWaitSemaphores` will block and wait until the condition is satisfied or the `timeout` has expired, whichever is sooner.

If `timeout` is zero, then `vkWaitSemaphores` does not wait, but simply returns information about the current state of the semaphores. `VK_TIMEOUT` will be returned in this case if the condition is not satisfied, even though no actual wait was performed.

If the condition is satisfied before the `timeout` has expired, `vkWaitSemaphores` returns `VK_SUCCESS`. Otherwise, `vkWaitSemaphores` returns `VK_TIMEOUT` after the `timeout` has expired.

If device loss occurs (see [Lost Device](#)) before the timeout has expired, `vkWaitSemaphores` **must** return in finite time with either `VK_SUCCESS` or `VK_ERROR_DEVICE_LOST`.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkWaitSemaphores` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkWaitSemaphores-device-parameter `device` **must** be a valid [VkDevice](#) handle
- VUID-vkWaitSemaphores-pWaitInfo-parameter `pWaitInfo` **must** be a valid pointer to a valid [VkSemaphoreWaitInfo](#) structure

Return Codes

Success

- `VK_SUCCESS`
- `VK_TIMEOUT`

Failure

- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkSemaphoreWaitInfo` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkSemaphoreWaitInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkSemaphoreWaitFlags flags;
    uint32_t           semaphoreCount;
    const VkSemaphore* pSemaphores;
    const uint64_t*    pValues;
} VkSemaphoreWaitInfo;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of [VkSemaphoreWaitFlagBits](#) specifying additional parameters for the semaphore wait operation.

- `semaphoreCount` is the number of semaphores to wait on.
- `pSemaphores` is a pointer to an array of `semaphoreCount` semaphore handles to wait on.
- `pValues` is a pointer to an array of `semaphoreCount` timeline semaphore values.

Valid Usage

- VUID-VkSemaphoreWaitInfo-pSemaphores-03256
All of the elements of `pSemaphores` **must** reference a semaphore that was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`
- VUID-VkSemaphoreWaitInfo-pSemaphores-05124
If any of the semaphores in `pSemaphores` have `NvSciSyncObj` as payload, application **must** calculate the corresponding timeline semaphore values in `pValues` by calling `NvSciSync APIs`

Valid Usage (Implicit)

- VUID-VkSemaphoreWaitInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SEMAPHORE_WAIT_INFO`
- VUID-VkSemaphoreWaitInfo-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkSemaphoreWaitInfo-flags-parameter
`flags` **must** be a valid combination of `VkSemaphoreWaitFlagBits` values
- VUID-VkSemaphoreWaitInfo-pSemaphores-parameter
`pSemaphores` **must** be a valid pointer to an array of `semaphoreCount` valid `VkSemaphore` handles
- VUID-VkSemaphoreWaitInfo-pValues-parameter
`pValues` **must** be a valid pointer to an array of `semaphoreCount uint64_t` values
- VUID-VkSemaphoreWaitInfo-semaphoreCount-arraylength
`semaphoreCount` **must** be greater than `0`

Bits which **can** be set in `VkSemaphoreWaitInfo::flags`, specifying additional parameters of a semaphore wait operation, are:

```
// Provided by VK_VERSION_1_2
typedef enum VkSemaphoreWaitFlagBits {
    VK_SEMAPHORE_WAIT_ANY_BIT = 0x00000001,
} VkSemaphoreWaitFlagBits;
```

- `VK_SEMAPHORE_WAIT_ANY_BIT` specifies that the semaphore wait condition is that at least one of the semaphores in `VkSemaphoreWaitInfo::pSemaphores` has reached the value specified by the corresponding element of `VkSemaphoreWaitInfo::pValues`. If `VK_SEMAPHORE_WAIT_ANY_BIT` is not set, the semaphore wait condition is that all of the semaphores in `VkSemaphoreWaitInfo::pSemaphores`

have reached the value specified by the corresponding element of `VkSemaphoreWaitInfo::pValues`.

```
// Provided by VK_VERSION_1_2
typedef VkFlags VkSemaphoreWaitFlags;
```

`VkSemaphoreWaitFlags` is a bitmask type for setting a mask of zero or more `VkSemaphoreWaitFlagBits`.

To signal a semaphore created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` with a particular counter value, on the host, call:

```
// Provided by VK_VERSION_1_2
VkResult vkSignalSemaphore(
    VkDevice device,
    const VkSemaphoreSignalInfo* pSignalInfo);
```

- `device` is the logical device that owns the semaphore.
- `pSignalInfo` is a pointer to a `VkSemaphoreSignalInfo` structure containing information about the signal operation.

When `vkSignalSemaphore` is executed on the host, it defines and immediately executes a *semaphore signal operation* which sets the timeline semaphore to the given value.

The first synchronization scope is defined by the host execution model, but includes execution of `vkSignalSemaphore` on the host and anything that happened-before it.

The second synchronization scope is empty.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkSignalSemaphore` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkSignalSemaphore-device-parameter `device` **must** be a valid `VkDevice` handle
- VUID-vkSignalSemaphore-pSignalInfo-parameter `pSignalInfo` **must** be a valid pointer to a valid `VkSemaphoreSignalInfo` structure

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkSemaphoreSignalInfo` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkSemaphoreSignalInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkSemaphore        semaphore;
    uint64_t           value;
} VkSemaphoreSignalInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is the handle of the semaphore to signal.
- `value` is the value to signal.

Valid Usage

- VUID-VkSemaphoreSignalInfo-semaphore-03257
`semaphore` **must** have been created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`
- VUID-VkSemaphoreSignalInfo-value-03258
`value` **must** have a value greater than the current value of the semaphore
- VUID-VkSemaphoreSignalInfo-value-03259
`value` **must** be less than the value of any pending semaphore signal operations
- VUID-VkSemaphoreSignalInfo-value-03260
`value` **must** have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on `semaphore` by more than `maxTimelineSemaphoreValueDifference`
- VUID-VkSemaphoreSignalInfo-semaphores-05125
If `semaphores` has `NvSciSyncObj` as payload, application **must** calculate the corresponding timeline semaphore value in `value` by calling `NvSciSync` APIs

Valid Usage (Implicit)

- VUID-VkSemaphoreSignalInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SEMAPHORE_SIGNAL_INFO`
- VUID-VkSemaphoreSignalInfo-pNext-pNext

pNext **must** be NULL

- VUID-VkSemaphoreSignalInfo-semaphore-parameter semaphore **must** be a valid [VkSemaphore](#) handle

7.4.6. Importing Semaphore Payloads

Applications **can** import a semaphore payload into an existing semaphore using an external semaphore handle. The effects of the import operation will be either temporary or permanent, as specified by the application. If the import is temporary, the implementation **must** restore the semaphore to its prior permanent state after submitting the next semaphore wait operation. Performing a subsequent temporary import on a semaphore before performing a semaphore wait has no effect on this requirement; the next wait submitted on the semaphore **must** still restore its last permanent state. A permanent payload import behaves as if the target semaphore was destroyed, and a new semaphore was created with the same handle but the imported payload. Because importing a semaphore payload temporarily or permanently detaches the existing payload from a semaphore, similar usage restrictions to those applied to [vkDestroySemaphore](#) are applied to any command that imports a semaphore payload. Which of these import types is used is referred to as the import operation's *permanence*. Each handle type supports either one or both types of permanence.

The implementation **must** perform the import operation by either referencing or copying the payload referred to by the specified external semaphore handle, depending on the handle's type. The import method used is referred to as the handle type's *transference*. When using handle types with reference transference, importing a payload to a semaphore adds the semaphore to the set of all semaphores sharing that payload. This set includes the semaphore from which the payload was exported. Semaphore signaling and waiting operations performed on any semaphore in the set **must** behave as if the set were a single semaphore. Importing a payload using handle types with copy transference creates a duplicate copy of the payload at the time of import, but makes no further reference to it. Semaphore signaling and waiting operations performed on the target of copy imports **must** not affect any other semaphore or payload.

Export operations have the same transference as the specified handle type's import operations. Additionally, exporting a semaphore payload to a handle with copy transference has the same side effects on the source semaphore's payload as executing a semaphore wait operation. If the semaphore was using a temporarily imported payload, the semaphore's prior permanent payload will be restored.

NOTE

The permanence and transference of handle types can be found in:

- [Handle Types Supported by VkImportSemaphoreFdInfoKHR](#)

[External synchronization](#) allows implementations to modify an object's internal state, i.e. payload, without internal synchronization. However, for semaphores sharing a payload across processes, satisfying the external synchronization requirements of [VkSemaphore](#) parameters as if all semaphores in the set were the same object is sometimes infeasible. Satisfying the [wait operation state requirements](#) would similarly require impractical coordination or levels of trust between processes. Therefore, these constraints only apply to a specific semaphore handle, not to its

payload. For distinct semaphore objects which share a payload, if the semaphores are passed to separate queue submission commands concurrently, behavior will be as if the commands were called in an arbitrary sequential order. If the [wait operation state requirements](#) are violated for the shared payload by a queue submission command, or if a signal operation is queued for a shared payload that is already signaled or has a pending signal operation, effects **must** be limited to one or more of the following:

- Returning `VK_ERROR_INITIALIZATION_FAILED` from the command which resulted in the violation.
- Losing the logical device on which the violation occurred immediately or at a future time, resulting in a `VK_ERROR_DEVICE_LOST` error from subsequent commands, including the one causing the violation.
- Continuing execution of the violating command or operation as if the semaphore wait completed successfully after an implementation-dependent timeout. In this case, the state of the payload becomes undefined, and future operations on semaphores sharing the payload will be subject to these same rules. The semaphore **must** be destroyed or have its payload replaced by an import operation to again have a well-defined state.

NOTE

These rules allow processes to synchronize access to shared memory without trusting each other. However, such processes must still be cautious not to use the shared semaphore for more than synchronizing access to the shared memory. For example, a process should not use a shared semaphore as part of an execution dependency chain that, when complete, leads to objects being destroyed, if it does not trust other processes sharing the semaphore payload.

When a semaphore is using an imported payload, its `VkExportSemaphoreCreateInfo::handleTypes` value is specified when creating the semaphore from which the payload was exported, rather than specified when creating the semaphore. Additionally, `VkExternalSemaphoreProperties::exportFromImportedHandleTypes` restricts which handle types **can** be exported from such a semaphore based on the specific handle type used to import the current payload. Passing a semaphore to `vkAcquireNextImageKHR` is equivalent to temporarily importing a semaphore payload to that semaphore.

NOTE

Because the exportable handle types of an imported semaphore correspond to its current imported payload, and `vkAcquireNextImageKHR` behaves the same as a temporary import operation for which the source semaphore is opaque to the application, applications have no way of determining whether any external handle types **can** be exported from a semaphore in this state. Therefore, applications **must** not attempt to export external handles from semaphores using a temporarily imported payload from `vkAcquireNextImageKHR`.

When importing a semaphore payload, it is the responsibility of the application to ensure the external handles meet all valid usage requirements. However, implementations **must** perform sufficient validation of external handles to ensure that the operation results in a valid semaphore which will not cause program termination, device loss, queue stalls, or corruption of other resources when used as allowed according to its import parameters, and excepting those side effects allowed for violations of the [valid semaphore state for wait operations](#) rules. If the external handle provided does not meet these requirements, the implementation **must** fail the semaphore

payload import operation with the error code `VK_ERROR_INVALID_EXTERNAL_HANDLE`.

In addition, when importing a semaphore payload that is not compatible with the payload type corresponding to the `VkSemaphoreType` the semaphore was created with, the implementation **may** fail the semaphore payload import operation with the error code `VK_ERROR_INVALID_EXTERNAL_HANDLE`.

NOTE

As the introduction of the external semaphore handle type `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT` predates that of timeline semaphores, support for importing semaphore payloads from external handles of that type into semaphores created (implicitly or explicitly) with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` is preserved for backwards compatibility. However, applications **should** prefer importing such handle types into semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`.

To import a semaphore payload from a POSIX file descriptor, call:

```
// Provided by VK_KHR_external_semaphore_fd
VkResult vkImportSemaphoreFdKHR(
    VkDevice device,
    const VkImportSemaphoreFdInfoKHR* pImportSemaphoreFdInfo);
```

- `device` is the logical device that created the semaphore.
- `pImportSemaphoreFdInfo` is a pointer to a `VkImportSemaphoreFdInfoKHR` structure specifying the semaphore and import parameters.

Importing a semaphore payload from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application **must** not perform any operations on the file descriptor after a successful import.

Applications **can** import the same semaphore payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkImportSemaphoreFdKHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkImportSemaphoreFdKHR-semaphore-01142
`semaphore` **must** not be associated with any queue command that has not yet completed execution on that queue

Valid Usage (Implicit)

- VUID-vkImportSemaphoreFdKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkImportSemaphoreFdKHR-pImportSemaphoreFdInfo-parameter

`pImportSemaphoreFdInfo` **must** be a valid pointer to a valid `VkImportSemaphoreFdInfoKHR` structure

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_INVALID_EXTERNAL_HANDLE`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkImportSemaphoreFdInfoKHR` structure is defined as:

```
// Provided by VK_KHR_external_semaphore_fd
typedef struct VkImportSemaphoreFdInfoKHR {
    VkStructureType          sType;
    const void*              pNext;
    VkSemaphore              semaphore;
    VkSemaphoreImportFlags    flags;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
    int                      fd;
} VkImportSemaphoreFdInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is the semaphore into which the payload will be imported.
- `flags` is a bitmask of `VkSemaphoreImportFlagBits` specifying additional parameters for the semaphore payload import operation.
- `handleType` is a `VkExternalSemaphoreHandleTypeFlagBits` value specifying the type of `fd`.
- `fd` is the external handle to import.

The handle types supported by `handleType` are:

Table 9. Handle Types Supported by `VkImportSemaphoreFdInfoKHR`

Handle Type	Transference	Permanence Supported
<code>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT</code>	Reference	Temporary,Permanent
<code>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT</code>	Copy	Temporary

Valid Usage

- VUID-VkImportSemaphoreFdInfoKHR-handleType-01143
`handleType` **must** be a value included in the [Handle Types Supported by VkImportSemaphoreFdInfoKHR](#) table
- VUID-VkImportSemaphoreFdInfoKHR-fd-01544
`fd` **must** obey any requirements listed for `handleType` in [external semaphore handle types compatibility](#)
- VUID-VkImportSemaphoreFdInfoKHR-handleType-03263
If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT`, the `VkSemaphoreCreateInfo::flags` field **must** match that of the semaphore from which `fd` was exported
- VUID-VkImportSemaphoreFdInfoKHR-handleType-07307
If `handleType` refers to a handle type with copy payload transference semantics, `flags` **must** contain `VK_SEMAPHORE_IMPORT_TEMPORARY_BIT`
- VUID-VkImportSemaphoreFdInfoKHR-handleType-03264
If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT`, the `VkSemaphoreTypeCreateInfo::semaphoreType` field **must** match that of the semaphore from which `fd` was exported
- VUID-VkImportSemaphoreFdInfoKHR-flags-03323
If `flags` contains `VK_SEMAPHORE_IMPORT_TEMPORARY_BIT`, the `VkSemaphoreTypeCreateInfo::semaphoreType` field of the semaphore from which `fd` was exported **must** not be `VK_SEMAPHORE_TYPE_TIMELINE`

If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT`, the special value `-1` for `fd` is treated like a valid sync file descriptor referring to an object that has already signaled. The import operation will succeed and the `VkSemaphore` will have a temporarily imported payload as if a valid file descriptor had been provided.

NOTE

This special behavior for importing an invalid sync file descriptor allows easier interoperability with other system APIs which use the convention that an invalid sync file descriptor represents work that has already completed and does not need to be waited for. It is consistent with the option for implementations to return a `-1` file descriptor when exporting a `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT` from a `VkSemaphore` which is signaled.

Valid Usage (Implicit)

- VUID-VkImportSemaphoreFdInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_FD_INFO_KHR`
- VUID-VkImportSemaphoreFdInfoKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkImportSemaphoreFdInfoKHR-semaphore-parameter

semaphore **must** be a valid [VkSemaphore](#) handle

- VUID-VkImportSemaphoreFdInfoKHR-flags-parameter
flags **must** be a valid combination of [VkSemaphoreImportFlagBits](#) values
- VUID-VkImportSemaphoreFdInfoKHR-handleType-parameter
handleType **must** be a valid [VkExternalSemaphoreHandleTypeFlagBits](#) value

Host Synchronization

- Host access to **semaphore** **must** be externally synchronized

To import a semaphore payload from a [NvSciSyncObj](#), call:

```
// Provided by VK_NV_external_sci_sync
VkResult vkImportSemaphoreSciSyncObjNV(
    VkDevice device,
    const VkImportSemaphoreSciSyncInfoNV* pImportSemaphoreSciSyncInfo);
```

- **device** is the logical device that created the semaphore.
- **pImportSemaphoreSciSyncInfo** is a pointer to a [VkImportSemaphoreSciSyncInfoNV](#) structure containing parameters of the import operation

Importing a semaphore payload from [NvSciSyncObj](#) does not transfer ownership of the handle to the Vulkan implementation. When importing [NvSciSyncObj](#), Vulkan will make a new reference to that object, the application **must** release its ownership using [NvSciSync APIs](#) when that ownership is no longer needed.

Application **must** not import the same [NvSciSyncObj](#) with signaler access permissions into multiple instances of [VkSemaphore](#), and **must** not import into the same instance from which it was exported.

Valid Usage

- VUID-vkImportSemaphoreSciSyncObjNV-sciSyncImport-05155
[VkPhysicalDeviceExternalSciSyncFeaturesNV::sciSyncImport](#) and
[VkPhysicalDeviceExternalSciSyncFeaturesNV::sciSyncSemaphore](#) **must** be enabled

Valid Usage (Implicit)

- VUID-vkImportSemaphoreSciSyncObjNV-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkImportSemaphoreSciSyncObjNV-pImportSemaphoreSciSyncInfo-parameter
pImportSemaphoreSciSyncInfo **must** be a valid pointer to a valid [VkImportSemaphoreSciSyncInfoNV](#) structure

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_INVALID_EXTERNAL_HANDLE`
- `VK_ERROR_NOT_PERMITTED`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkImportSemaphoreSciSyncInfoNV` structure is defined as:

```
// Provided by VK_NV_external_sci_sync
typedef struct VkImportSemaphoreSciSyncInfoNV {
    VkStructureType          sType;
    const void*              pNext;
    VkSemaphore              semaphore;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
    void*                    handle;
} VkImportSemaphoreSciSyncInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is the semaphore into which the payload will be imported.
- `handleType` specifies the type of `handle`.
- `handle` is the external handle to import.

The handle types supported by `handleType` are:

Table 10. Handle Types Supported by `VkImportSemaphoreSciSyncInfoNV`

Handle Type	Transference	Permanence Supported
<code>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SCI_SYNC_OBJECT_NV</code>	Reference	Permanent

Valid Usage

- VUID-VkImportSemaphoreSciSyncInfoNV-handleType-05126
`handleType` **must** be a value included in the [Handle Types Supported by `VkImportSemaphoreSciSyncInfoNV`](#) table
- VUID-VkImportSemaphoreSciSyncInfoNV-semaphore-05127

`semaphore` **must** have been created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`

- VUID-VkImportSemaphoreSciSyncInfoNV-semaphore-05128
`semaphore` **must** not be associated with any queue command that has not yet completed execution on that queue

Valid Usage (Implicit)

- VUID-VkImportSemaphoreSciSyncInfoNV-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_SCI_SYNC_INFO_NV`
- VUID-VkImportSemaphoreSciSyncInfoNV-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkImportSemaphoreSciSyncInfoNV-semaphore-parameter
`semaphore` **must** be a valid `VkSemaphore` handle
- VUID-VkImportSemaphoreSciSyncInfoNV-handleType-parameter
`handleType` **must** be a valid `VkExternalSemaphoreHandleTypeFlagBits` value
- VUID-VkImportSemaphoreSciSyncInfoNV-handle-parameter
`handle` **must** be a pointer value

Host Synchronization

- Host access to `semaphore` **must** be externally synchronized

Bits which **can** be set in

- `VkImportSemaphoreFdInfoKHR::flags`

specifying additional parameters of a semaphore import operation are:

```
// Provided by VK_VERSION_1_1
typedef enum VkSemaphoreImportFlagBits {
    VK_SEMAPHORE_IMPORT_TEMPORARY_BIT = 0x00000001,
} VkSemaphoreImportFlagBits;
```

These bits have the following meanings:

- `VK_SEMAPHORE_IMPORT_TEMPORARY_BIT` specifies that the semaphore payload will be imported only temporarily, as described in [Importing Semaphore Payloads](#), regardless of the permanence of `handleType`.

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkSemaphoreImportFlags;
```

`VkSemaphoreImportFlags` is a bitmask type for setting a mask of zero or more `VkSemaphoreImportFlagBits`.

7.5. Events

Events are a synchronization primitive that **can** be used to insert a fine-grained dependency between commands submitted to the same queue, or between the host and a queue. Events **must** not be used to insert a dependency between commands submitted to different queues. Events have two states - signaled and unsignaled. An application **can** signal or unsignal an event either on the host or on the device. A device **can** be made to wait for an event to become signaled before executing further operations. No command exists to wait for an event to become signaled on the host, but the current state of an event **can** be queried.

Events are represented by `VkEvent` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkEvent)
```

To create an event, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateEvent(
    VkDevice                                device,
    const VkEventCreateInfo*                pCreateInfo,
    const VkAllocationCallbacks*            pAllocator,
    VkEvent*                                 pEvent);
```

- `device` is the logical device that creates the event.
- `pCreateInfo` is a pointer to a `VkEventCreateInfo` structure containing information about how the event is to be created.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pEvent` is a pointer to a handle in which the resulting event object is returned.

When created, the event object is in the unsignaled state.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkCreateEvent` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkCreateEvent-device-09672
`device` **must** support at least one queue family with one of the `VK_QUEUE_COMPUTE_BIT`, or `VK_QUEUE_GRAPHICS_BIT` capabilities
- VUID-vkCreateEvent-device-05068

The number of events currently allocated from `device` plus 1 **must** be less than or equal to the total number of events requested via `VkDeviceObjectReservationCreateInfo::eventRequestCount` specified when `device` was created

Valid Usage (Implicit)

- VUID-vkCreateEvent-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCreateEvent-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkEventCreateInfo` structure
- VUID-vkCreateEvent-pAllocator-null
`pAllocator` **must** be `NULL`
- VUID-vkCreateEvent-pEvent-parameter
`pEvent` **must** be a valid pointer to a `VkEvent` handle
- VUID-vkCreateEvent-device-queuecount
The device **must** have been created with at least 1 queue

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkEventCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkEventCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkEventCreateFlags flags;
} VkEventCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkEventCreateFlagBits` defining additional creation parameters.

Valid Usage (Implicit)

- VUID-VkEventCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_EVENT_CREATE_INFO`
- VUID-VkEventCreateInfo-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkEventCreateInfo-flags-parameter
`flags` **must** be a valid combination of `VkEventCreateFlagBits` values

```
// Provided by VK_VERSION_1_0
typedef enum VkEventCreateFlagBits {
    VK_EVENT_CREATE_DEVICE_ONLY_BIT = 0x00000001,
    // Provided by VK_KHR_synchronization2
    VK_EVENT_CREATE_DEVICE_ONLY_BIT_KHR = VK_EVENT_CREATE_DEVICE_ONLY_BIT,
} VkEventCreateFlagBits;
```

- `VK_EVENT_CREATE_DEVICE_ONLY_BIT` specifies that host event commands will not be used with this event.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkEventCreateFlags;
```

`VkEventCreateFlags` is a bitmask type for setting a mask of `VkEventCreateFlagBits`.

To destroy an event, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyEvent(
    VkDevice          device,
    VkEvent           event,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the event.
- `event` is the handle of the event to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroyEvent-event-01145
All submitted commands that refer to `event` **must** have completed execution

Valid Usage (Implicit)

- VUID-vkDestroyEvent-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkDestroyEvent-event-parameter
If **event** is not [VK_NULL_HANDLE](#), **event** **must** be a valid [VkEvent](#) handle
- VUID-vkDestroyEvent-pAllocator-null
pAllocator **must** be [NULL](#)
- VUID-vkDestroyEvent-event-parent
If **event** is a valid handle, it **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **event** **must** be externally synchronized

To query the state of an event from the host, call:

```
// Provided by VK_VERSION_1_0
VkResult vkGetEventStatus(
    VkDevice          device,
    VkEvent           event);
```

- **device** is the logical device that owns the event.
- **event** is the handle of the event to query.

Upon success, **vkGetEventStatus** returns the state of the event object with the following return codes:

Table 11. Event Object Status Codes

Status	Meaning
VK_EVENT_SET	The event specified by event is signaled.
VK_EVENT_RESET	The event specified by event is unsignaled.

If a **vkCmdSetEvent** or **vkCmdResetEvent** command is in a command buffer that is in the [pending state](#), then the value returned by this command **may** immediately be out of date.

The state of an event **can** be updated by the host. The state of the event is immediately changed, and subsequent calls to **vkGetEventStatus** will return the new state. If an event is already in the requested state, then updating it to the same state has no effect.

If [VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations](#) is [VK_TRUE](#), **vkGetEventStatus** **must** not return [VK_ERROR_OUT_OF_HOST_MEMORY](#).

Valid Usage

- VUID-vkGetEventStatus-event-03940
event **must** not have been created with `VK_EVENT_CREATE_DEVICE_ONLY_BIT`

Valid Usage (Implicit)

- VUID-vkGetEventStatus-device-parameter
device **must** be a valid `VkDevice` handle
- VUID-vkGetEventStatus-event-parameter
event **must** be a valid `VkEvent` handle
- VUID-vkGetEventStatus-event-parent
event **must** have been created, allocated, or retrieved from **device**

Return Codes

Success

- `VK_EVENT_RESET`
- `VK_EVENT_SET`

Failure

- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

To set the state of an event to signaled from the host, call:

```
// Provided by VK_VERSION_1_0
VkResult vkSetEvent(
    VkDevice          device,
    VkEvent           event);
```

- **device** is the logical device that owns the event.
- **event** is the event to set.

When `vkSetEvent` is executed on the host, it defines an *event signal operation* which sets the event to the signaled state.

If **event** is already in the signaled state when `vkSetEvent` is executed, then `vkSetEvent` has no effect,

and no event signal operation occurs.

NOTE

If a command buffer is waiting for an event to be signaled from the host, the application must signal the event before submitting the command buffer, as described in the [queue forward progress](#) section.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkSetEvent` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkSetEvent-event-03941
`event` **must** not have been created with `VK_EVENT_CREATE_DEVICE_ONLY_BIT`
- VUID-vkSetEvent-event-09543
`event` **must** not be waited on by a command buffer in the [pending state](#)

Valid Usage (Implicit)

- VUID-vkSetEvent-device-parameter
`device` **must** be a valid [VkDevice](#) handle
- VUID-vkSetEvent-event-parameter
`event` **must** be a valid [VkEvent](#) handle
- VUID-vkSetEvent-event-parent
`event` **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `event` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

To set the state of an event to unsignaled from the host, call:

```
// Provided by VK_VERSION_1_0
VkResult vkResetEvent(
    VkDevice          device,
    VkEvent            event);
```

- **device** is the logical device that owns the event.
- **event** is the event to reset.

When **vkResetEvent** is executed on the host, it defines an *event unsignal operation* which resets the event to the unsignaled state.

If **event** is already in the unsignaled state when **vkResetEvent** is executed, then **vkResetEvent** has no effect, and no event unsignal operation occurs.

Valid Usage

- VUID-vkResetEvent-event-03821
There **must** be an execution dependency between **vkResetEvent** and the execution of any **vkCmdWaitEvents** that includes **event** in its **pEvents** parameter
- VUID-vkResetEvent-event-03822
There **must** be an execution dependency between **vkResetEvent** and the execution of any **vkCmdWaitEvents2KHR** that includes **event** in its **pEvents** parameter
- VUID-vkResetEvent-event-03823
event **must** not have been created with **VK_EVENT_CREATE_DEVICE_ONLY_BIT**

Valid Usage (Implicit)

- VUID-vkResetEvent-device-parameter
device **must** be a valid **VkDevice** handle
- VUID-vkResetEvent-event-parameter
event **must** be a valid **VkEvent** handle
- VUID-vkResetEvent-event-parent
event **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **event** **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The state of an event **can** also be updated on the device by commands inserted in command buffers.

To signal an event from a device, call:

```
// Provided by VK_KHR_synchronization2
void vkCmdSetEvent2KHR(
    VkCommandBuffer          commandBuffer,
    VkEvent                  event,
    const VkDependencyInfo*  pDependencyInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `event` is the event that will be signaled.
- `pDependencyInfo` is a pointer to a `VkDependencyInfo` structure defining the first scopes of this operation.

When `vkCmdSetEvent2KHR` is submitted to a queue, it defines the first half of memory dependencies defined by `pDependencyInfo`, as well as an event signal operation which sets the event to the signaled state. A memory dependency is defined between the event signal operation and commands that occur earlier in submission order.

The first `synchronization scope` and `access scope` are defined by the union of all the memory dependencies defined by `pDependencyInfo`, and are applied to all operations that occur earlier in `submission order`. `Queue family ownership transfers` and `image layout transitions` defined by `pDependencyInfo` are also included in the first scopes.

The second `synchronization scope` includes only the event signal operation, and any `queue family ownership transfers` and `image layout transitions` defined by `pDependencyInfo`.

The second `access scope` includes only `queue family ownership transfers` and `image layout transitions`.

Future `vkCmdWaitEvents2KHR` commands rely on all values of each element in `pDependencyInfo` matching exactly with those used to signal the corresponding event. `vkCmdWaitEvents` **must** not be used to wait on the result of a signal operation defined by `vkCmdSetEvent2KHR`.

NOTE

The extra information provided by [vkCmdSetEvent2KHR](#) compared to [vkCmdSetEvent](#) allows implementations to more efficiently schedule the operations required to satisfy the requested dependencies. With [vkCmdSetEvent](#), the full dependency information is not known until [vkCmdWaitEvents](#) is recorded, forcing implementations to insert the required operations at that point and not before.

If [event](#) is already in the signaled state when [vkCmdSetEvent2KHR](#) is executed on the device, then [vkCmdSetEvent2KHR](#) has no effect, no event signal operation occurs, and no dependency is generated.

Valid Usage

- VUID-vkCmdSetEvent2-synchronization2-03824
The [synchronization2](#) feature **must** be enabled
- VUID-vkCmdSetEvent2-dependencyFlags-03825
The [dependencyFlags](#) member of [pDependencyInfo](#) **must** be 0
- VUID-vkCmdSetEvent2-srcStageMask-09391
The [srcStageMask](#) member of any element of the [pMemoryBarriers](#), [pBufferMemoryBarriers](#), or [pImageMemoryBarriers](#) members of [pDependencyInfo](#) **must** not include [VK_PIPELINE_STAGE_2_HOST_BIT](#)
- VUID-vkCmdSetEvent2-dstStageMask-09392
The [dstStageMask](#) member of any element of the [pMemoryBarriers](#), [pBufferMemoryBarriers](#), or [pImageMemoryBarriers](#) members of [pDependencyInfo](#) **must** not include [VK_PIPELINE_STAGE_2_HOST_BIT](#)
- VUID-vkCmdSetEvent2-commandBuffer-03826
The current device mask of [commandBuffer](#) **must** include exactly one physical device
- VUID-vkCmdSetEvent2-srcStageMask-03827
The [srcStageMask](#) member of any element of the [pMemoryBarriers](#), [pBufferMemoryBarriers](#), or [pImageMemoryBarriers](#) members of [pDependencyInfo](#) **must** only include pipeline stages valid for the queue family that was used to create the command pool that [commandBuffer](#) was allocated from
- VUID-vkCmdSetEvent2-dstStageMask-03828
The [dstStageMask](#) member of any element of the [pMemoryBarriers](#), [pBufferMemoryBarriers](#), or [pImageMemoryBarriers](#) members of [pDependencyInfo](#) **must** only include pipeline stages valid for the queue family that was used to create the command pool that [commandBuffer](#) was allocated from

Valid Usage (Implicit)

- VUID-vkCmdSetEvent2-commandBuffer-parameter
[commandBuffer](#) **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdSetEvent2-event-parameter
[event](#) **must** be a valid [VkEvent](#) handle

- VUID-vkCmdSetEvent2-pDependencyInfo-parameter
`pDependencyInfo` **must** be a valid pointer to a valid `VkDependencyInfo` structure
- VUID-vkCmdSetEvent2-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetEvent2-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, or `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetEvent2-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdSetEvent2-commonparent
Both of `commandBuffer`, and `event` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT	Synchronization

The `VkDependencyInfo` structure is defined as:

```
typedef struct VkDependencyInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkDependencyFlags     dependencyFlags;
    uint32_t              memoryBarrierCount;
    const VkMemoryBarrier2* pMemoryBarriers;
    uint32_t              bufferMemoryBarrierCount;
    const VkBufferMemoryBarrier2* pBufferMemoryBarriers;
    uint32_t              imageMemoryBarrierCount;
    const VkImageMemoryBarrier2* pImageMemoryBarriers;
} VkDependencyInfo;
```

```
// Provided by VK_KHR_synchronization2
typedef VkDependencyInfo VkDependencyInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `dependencyFlags` is a bitmask of `VkDependencyFlagBits` specifying how execution and memory dependencies are formed.
- `memoryBarrierCount` is the length of the `pMemoryBarriers` array.
- `pMemoryBarriers` is a pointer to an array of `VkMemoryBarrier2` structures defining memory dependencies between any memory accesses.
- `bufferMemoryBarrierCount` is the length of the `pBufferMemoryBarriers` array.
- `pBufferMemoryBarriers` is a pointer to an array of `VkBufferMemoryBarrier2` structures defining memory dependencies between buffer ranges.
- `imageMemoryBarrierCount` is the length of the `pImageMemoryBarriers` array.
- `pImageMemoryBarriers` is a pointer to an array of `VkImageMemoryBarrier2` structures defining memory dependencies between image subresources.

This structure defines a set of [memory dependencies](#), as well as [queue family ownership transfer operations](#) and [image layout transitions](#).

Each member of `pMemoryBarriers`, `pBufferMemoryBarriers`, and `pImageMemoryBarriers` defines a separate [memory dependency](#).

Valid Usage

- VUID-VkDependencyInfo-pMemoryBarriers-10605
For each element of `pMemoryBarriers`, the `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkDependencyInfo-pMemoryBarriers-10606
For each element of `pMemoryBarriers`, `pNext` **must** be `NULL`

Valid Usage (Implicit)

- VUID-VkDependencyInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEPENDENCY_INFO`
- VUID-VkDependencyInfo-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkDependencyInfo-dependencyFlags-parameter
`dependencyFlags` **must** be a valid combination of `VkDependencyFlagBits` values
- VUID-VkDependencyInfo-pMemoryBarriers-parameter
If `memoryBarrierCount` is not 0, `pMemoryBarriers` **must** be a valid pointer to an array of

`memoryBarrierCount` valid `VkMemoryBarrier2` structures

- VUID-VkDependencyInfo-pBufferMemoryBarriers-parameter
If `bufferMemoryBarrierCount` is not 0, `pBufferMemoryBarriers` **must** be a valid pointer to an array of `bufferMemoryBarrierCount` valid `VkBufferMemoryBarrier2` structures
- VUID-VkDependencyInfo-pImageMemoryBarriers-parameter
If `imageMemoryBarrierCount` is not 0, `pImageMemoryBarriers` **must** be a valid pointer to an array of `imageMemoryBarrierCount` valid `VkImageMemoryBarrier2` structures

To set the state of an event to signaled from a device, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetEvent(
    VkCommandBuffer          commandBuffer,
    VkEvent                  event,
    VkPipelineStageFlags     stageMask);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `event` is the event that will be signaled.
- `stageMask` specifies the `source stage mask` used to determine the first `synchronization scope`.

`vkCmdSetEvent` behaves identically to `vkCmdSetEvent2KHR`, except that it does not define an access scope, and **must** only be used with `vkCmdWaitEvents`, not `vkCmdWaitEvents2KHR`.

Valid Usage

- VUID-vkCmdSetEvent-stageMask-04090
If the `geometryShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- VUID-vkCmdSetEvent-stageMask-04091
If the `tessellationShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-vkCmdSetEvent-stageMask-07319
If the `attachmentFragmentShadingRate` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-vkCmdSetEvent-stageMask-03937
If the `synchronization2` feature is not enabled, `stageMask` **must** not be 0
- VUID-vkCmdSetEvent-stageMask-06457
Any pipeline stage included in `stageMask` **must** be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the [table of supported pipeline stages](#)
- VUID-vkCmdSetEvent-stageMask-01149

`stageMask` **must** not include `VK_PIPELINE_STAGE_HOST_BIT`

- VUID-vkCmdSetEvent-commandBuffer-01152

The current device mask of `commandBuffer` **must** include exactly one physical device

Valid Usage (Implicit)

- VUID-vkCmdSetEvent-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetEvent-event-parameter
`event` **must** be a valid `VkEvent` handle
- VUID-vkCmdSetEvent-stageMask-parameter
`stageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values
- VUID-vkCmdSetEvent-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdSetEvent-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, or `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetEvent-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdSetEvent-commonparent
Both of `commandBuffer`, and `event` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT	Synchronization

To unsignal the event from a device, call:

```
// Provided by VK_KHR_synchronization2
void vkCmdResetEvent2KHR(
    VkCommandBuffer          commandBuffer,
    VkEvent                  event,
    VkPipelineStageFlags2    stageMask);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `event` is the event that will be unsignaled.
- `stageMask` is a `VkPipelineStageFlags2` mask of pipeline stages used to determine the first `synchronization scope`.

When `vkCmdResetEvent2KHR` is submitted to a queue, it defines an execution dependency on commands that were submitted before it, and defines an event unsignal operation which resets the event to the unsignaled state.

The first `synchronization scope` includes all commands that occur earlier in `submission order`. The synchronization scope is limited to operations by `stageMask` or stages that are `logically earlier` than `stageMask`.

The second `synchronization scope` includes only the event unsignal operation.

If `event` is already in the unsignaled state when `vkCmdResetEvent2KHR` is executed on the device, then this command has no effect, no event unsignal operation occurs, and no execution dependency is generated.

Valid Usage

- VUID-vkCmdResetEvent2-stageMask-03929
If the `geometryShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`
- VUID-vkCmdResetEvent2-stageMask-03930
If the `tessellationShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-vkCmdResetEvent2-stageMask-07317
If the `attachmentFragmentShadingRate` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-vkCmdResetEvent2-synchronization2-03829
The `synchronization2` feature **must** be enabled
- VUID-vkCmdResetEvent2-stageMask-03830
`stageMask` **must** not include `VK_PIPELINE_STAGE_2_HOST_BIT`
- VUID-vkCmdResetEvent2-event-03831
There **must** be an execution dependency between `vkCmdResetEvent2KHR` and the execution of any `vkCmdWaitEvents` that includes `event` in its `pEvents` parameter

- VUID-vkCmdResetEvent2-event-03832
There **must** be an execution dependency between `vkCmdResetEvent2KHR` and the execution of any `vkCmdWaitEvents2KHR` that includes `event` in its `pEvents` parameter
- VUID-vkCmdResetEvent2-commandBuffer-03833
`commandBuffer`'s current device mask **must** include exactly one physical device

Valid Usage (Implicit)

- VUID-vkCmdResetEvent2-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdResetEvent2-event-parameter
`event` **must** be a valid `VkEvent` handle
- VUID-vkCmdResetEvent2-stageMask-parameter
`stageMask` **must** be a valid combination of `VkPipelineStageFlagBits2` values
- VUID-vkCmdResetEvent2-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdResetEvent2-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, or `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdResetEvent2-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdResetEvent2-commonparent
Both of `commandBuffer`, and `event` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT	Synchronization

To set the state of an event to unsignaled from a device, call:

```
// Provided by VK_VERSION_1_0
void vkCmdResetEvent(
    VkCommandBuffer          commandBuffer,
    VkEvent                  event,
    VkPipelineStageFlags     stageMask);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `event` is the event that will be unsignaled.
- `stageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the `source stage mask` used to determine when the `event` is unsignaled.

`vkCmdResetEvent` behaves identically to `vkCmdResetEvent2KHR`.

Valid Usage

- VUID-vkCmdResetEvent-stageMask-04090
If the `geometryShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- VUID-vkCmdResetEvent-stageMask-04091
If the `tessellationShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-vkCmdResetEvent-stageMask-07319
If the `attachmentFragmentShadingRate` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-vkCmdResetEvent-stageMask-03937
If the `synchronization2` feature is not enabled, `stageMask` **must** not be 0
- VUID-vkCmdResetEvent-stageMask-06458
Any pipeline stage included in `stageMask` **must** be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the [table of supported pipeline stages](#)
- VUID-vkCmdResetEvent-stageMask-01153
`stageMask` **must** not include `VK_PIPELINE_STAGE_HOST_BIT`
- VUID-vkCmdResetEvent-event-03834
There **must** be an execution dependency between `vkCmdResetEvent` and the execution of any `vkCmdWaitEvents` that includes `event` in its `pEvents` parameter
- VUID-vkCmdResetEvent-event-03835
There **must** be an execution dependency between `vkCmdResetEvent` and the execution of any `vkCmdWaitEvents2KHR` that includes `event` in its `pEvents` parameter
- VUID-vkCmdResetEvent-commandBuffer-01157

`commandBuffer`'s current device mask **must** include exactly one physical device

Valid Usage (Implicit)

- VUID-vkCmdResetEvent-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdResetEvent-event-parameter
`event` **must** be a valid `VkEvent` handle
- VUID-vkCmdResetEvent-stageMask-parameter
`stageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values
- VUID-vkCmdResetEvent-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdResetEvent-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, or `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdResetEvent-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdResetEvent-commonparent
Both of `commandBuffer`, and `event` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT	Synchronization

To wait for one or more events to enter the signaled state on a device, call:

```
// Provided by VK_KHR_synchronization2
void vkCmdWaitEvents2KHR(
    VkCommandBuffer                commandBuffer,
    uint32_t                       eventCount,
    const VkEvent*                 pEvents,
    const VkDependencyInfo*        pDependencyInfos);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `eventCount` is the length of the `pEvents` array.
- `pEvents` is a pointer to an array of `eventCount` events to wait on.
- `pDependencyInfos` is a pointer to an array of `eventCount` `VkDependencyInfo` structures, defining the second `synchronization scope`.

When `vkCmdWaitEvents2KHR` is submitted to a queue, it inserts memory dependencies according to the elements of `pDependencyInfos` and each corresponding element of `pEvents`. `vkCmdWaitEvents2KHR` **must** not be used to wait on event signal operations occurring on other queues, or signal operations executed by `vkCmdSetEvent`.

The first `synchronization scope` and `access scope` of each memory dependency defined by any element `i` of `pDependencyInfos` are applied to operations that occurred earlier in `submission order` than the last event signal operation on element `i` of `pEvents`.

Signal operations for an event at index `i` are only included if:

- The event was signaled by a `vkCmdSetEvent2KHR` command that occurred earlier in `submission order` with a `dependencyInfo` parameter exactly equal to the element of `pDependencyInfos` at index `i`; or
- The event was created without `VK_EVENT_CREATE_DEVICE_ONLY_BIT`, and the first `synchronization scope` defined by the element of `pDependencyInfos` at index `i` only includes host operations (`VK_PIPELINE_STAGE_2_HOST_BIT`).

The second `synchronization scope` and `access scope` of each memory dependency defined by any element `i` of `pDependencyInfos` are applied to operations that occurred later in `submission order` than `vkCmdWaitEvents2KHR`.

NOTE

`vkCmdWaitEvents2KHR` is used with `vkCmdSetEvent2KHR` to define a memory dependency between two sets of action commands, roughly in the same way as pipeline barriers, but split into two commands such that work between the two **may** execute unhindered.

NOTE

Applications should be careful to avoid race conditions when using events. There is no direct ordering guarantee between `vkCmdSetEvent2KHR` and `vkCmdResetEvent2KHR`, `vkCmdResetEvent`, or `vkCmdSetEvent`. Another execution dependency (e.g. a pipeline barrier or semaphore with `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`) is needed to prevent such a race condition.

Valid Usage

- VUID-vkCmdWaitEvents2-synchronization2-03836
The **synchronization2** feature **must** be enabled
- VUID-vkCmdWaitEvents2-pEvents-03837
Members of **pEvents** **must** not have been signaled by **vkCmdSetEvent**
- VUID-vkCmdWaitEvents2-pEvents-10788
For any element *i* of **pEvents**, if that event is signaled by **vkCmdSetEvent2KHR**, that command's **dependencyInfo** parameter **must** be exactly equal to the *i*th element of **pDependencyInfos**
- VUID-vkCmdWaitEvents2-pEvents-03839
For any element *i* of **pEvents**, if that event is signaled by **vkSetEvent**, barriers in the *i*th element of **pDependencyInfos** **must** include only host operations in their first **synchronization scope**
- VUID-vkCmdWaitEvents2-pEvents-03840
For any element *i* of **pEvents**, if barriers in the *i*th element of **pDependencyInfos** include only host operations, the *i*th element of **pEvents** **must** be signaled before **vkCmdWaitEvents2KHR** is executed
- VUID-vkCmdWaitEvents2-pEvents-03841
For any element *i* of **pEvents**, if barriers in the *i*th element of **pDependencyInfos** do not include host operations, the *i*th element of **pEvents** **must** be signaled by a corresponding **vkCmdSetEvent2KHR** that occurred earlier in **submission order**
- VUID-vkCmdWaitEvents2-srcStageMask-03842
The **srcStageMask** member of any element of the **pMemoryBarriers**, **pBufferMemoryBarriers**, or **pImageMemoryBarriers** members of **pDependencyInfos** **must** only include pipeline stages valid for the queue family that was used to create the command pool that **commandBuffer** was allocated from
- VUID-vkCmdWaitEvents2-dstStageMask-03843
The **dstStageMask** member of any element of the **pMemoryBarriers**, **pBufferMemoryBarriers**, or **pImageMemoryBarriers** members of **pDependencyInfos** **must** only include pipeline stages valid for the queue family that was used to create the command pool that **commandBuffer** was allocated from
- VUID-vkCmdWaitEvents2-dependencyFlags-10394
The **dependencyFlags** member of any element of **pDependencyInfo** **must** not include any of the following bits:
 - **VK_DEPENDENCY_BY_REGION_BIT**
 - **VK_DEPENDENCY_DEVICE_GROUP_BIT**
 - **VK_DEPENDENCY_VIEW_LOCAL_BIT**
- VUID-vkCmdWaitEvents2-dependencyFlags-03844
If this command is called inside a render pass instance, the **srcStageMask** member of any element of the **pMemoryBarriers**, **pBufferMemoryBarriers**, or **pImageMemoryBarriers** members of **pDependencyInfos** **must** not include **VK_PIPELINE_STAGE_2_HOST_BIT**

- VUID-vkCmdWaitEvents2-commandBuffer-03846
`commandBuffer`'s current device mask **must** include exactly one physical device

Valid Usage (Implicit)

- VUID-vkCmdWaitEvents2-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdWaitEvents2-pEvents-parameter
`pEvents` **must** be a valid pointer to an array of `eventCount` valid `VkEvent` handles
- VUID-vkCmdWaitEvents2-pDependencyInfos-parameter
`pDependencyInfos` **must** be a valid pointer to an array of `eventCount` valid `VkDependencyInfo` structures
- VUID-vkCmdWaitEvents2-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdWaitEvents2-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, or `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdWaitEvents2-eventCount-arraylength
`eventCount` **must** be greater than 0
- VUID-vkCmdWaitEvents2-commonparent
Both of `commandBuffer`, and the elements of `pEvents` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT	Synchronization

To wait for one or more events to enter the signaled state on a device, call:

```
// Provided by VK_VERSION_1_0
void vkCmdWaitEvents(
    VkCommandBuffer                commandBuffer,
    uint32_t                       eventCount,
    const VkEvent*                 pEvents,
    VkPipelineStageFlags           srcStageMask,
    VkPipelineStageFlags           dstStageMask,
    uint32_t                       memoryBarrierCount,
    const VkMemoryBarrier*         pMemoryBarriers,
    uint32_t                       bufferMemoryBarrierCount,
    const VkBufferMemoryBarrier*   pBufferMemoryBarriers,
    uint32_t                       imageMemoryBarrierCount,
    const VkImageMemoryBarrier*    pImageMemoryBarriers);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `eventCount` is the length of the `pEvents` array.
- `pEvents` is a pointer to an array of event object handles to wait on.
- `srcStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the [source stage mask](#).
- `dstStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the [destination stage mask](#).
- `memoryBarrierCount` is the length of the `pMemoryBarriers` array.
- `pMemoryBarriers` is a pointer to an array of `VkMemoryBarrier` structures.
- `bufferMemoryBarrierCount` is the length of the `pBufferMemoryBarriers` array.
- `pBufferMemoryBarriers` is a pointer to an array of `VkBufferMemoryBarrier` structures.
- `imageMemoryBarrierCount` is the length of the `pImageMemoryBarriers` array.
- `pImageMemoryBarriers` is a pointer to an array of `VkImageMemoryBarrier` structures.

`vkCmdWaitEvents` is largely similar to `vkCmdWaitEvents2KHR`, but **can** only wait on signal operations defined by `vkCmdSetEvent`. As `vkCmdSetEvent` does not define any access scopes, `vkCmdWaitEvents` defines the first access scope for each event signal operation in addition to its own access scopes.

NOTE	Since <code>vkCmdSetEvent</code> does not have any dependency information beyond a stage mask, implementations do not have the same opportunity to perform availability and visibility operations or image layout transitions in advance as they do with <code>vkCmdSetEvent2KHR</code> and <code>vkCmdWaitEvents2KHR</code> .

When `vkCmdWaitEvents` is submitted to a queue, it defines a memory dependency between prior event signal operations on the same queue or the host, and subsequent commands. `vkCmdWaitEvents` **must** not be used to wait on event signal operations occurring on other queues.

The first synchronization scope only includes event signal operations that operate on members of `pEvents`, and the operations that happened-before the event signal operations. Event signal operations performed by `vkCmdSetEvent` that occur earlier in [submission order](#) are included in the first synchronization scope, if the [logically latest](#) pipeline stage in their `stageMask` parameter is [logically earlier](#) than or equal to the [logically latest](#) pipeline stage in `srcStageMask`. Event signal

operations performed by `vkSetEvent` are only included in the first synchronization scope if `VK_PIPELINE_STAGE_HOST_BIT` is included in `srcStageMask`.

The second `synchronization scope` includes all commands that occur later in `submission order`. The second synchronization scope is limited to operations on the pipeline stages determined by the `destination stage mask` specified by `dstStageMask`.

The first `access scope` is limited to accesses in the pipeline stages determined by the `source stage mask` specified by `srcStageMask`. Within that, the first access scope only includes the first access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of `memory barriers`. If no memory barriers are specified, then the first access scope includes no accesses.

The second `access scope` is limited to accesses in the pipeline stages determined by the `destination stage mask` specified by `dstStageMask`. Within that, the second access scope only includes the second access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of `memory barriers`. If no memory barriers are specified, then the second access scope includes no accesses.

Valid Usage

- VUID-vkCmdWaitEvents-srcStageMask-04090
If the `geometryShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- VUID-vkCmdWaitEvents-srcStageMask-04091
If the `tessellationShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-vkCmdWaitEvents-srcStageMask-07319
If the `attachmentFragmentShadingRate` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-vkCmdWaitEvents-srcStageMask-03937
If the `synchronization2` feature is not enabled, `srcStageMask` **must** not be 0
- VUID-vkCmdWaitEvents-dstStageMask-04090
If the `geometryShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- VUID-vkCmdWaitEvents-dstStageMask-04091
If the `tessellationShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-vkCmdWaitEvents-dstStageMask-07319
If the `attachmentFragmentShadingRate` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-vkCmdWaitEvents-dstStageMask-03937
If the `synchronization2` feature is not enabled, `dstStageMask` **must** not be 0

- VUID-vkCmdWaitEvents-srcAccessMask-02815
The `srcAccessMask` member of each element of `pMemoryBarriers` **must** only include access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the [table of supported access types](#)
- VUID-vkCmdWaitEvents-dstAccessMask-02816
The `dstAccessMask` member of each element of `pMemoryBarriers` **must** only include access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the [table of supported access types](#)
- VUID-vkCmdWaitEvents-pBufferMemoryBarriers-02817
For any element of `pBufferMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `srcQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `srcAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the [table of supported access types](#)
- VUID-vkCmdWaitEvents-pBufferMemoryBarriers-02818
For any element of `pBufferMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `dstQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `dstAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the [table of supported access types](#)
- VUID-vkCmdWaitEvents-pImageMemoryBarriers-02819
For any element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `srcQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `srcAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the [table of supported access types](#)
- VUID-vkCmdWaitEvents-pImageMemoryBarriers-02820
For any element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `dstQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `dstAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the [table of supported access types](#)
- VUID-vkCmdWaitEvents-srcStageMask-06459
Any pipeline stage included in `srcStageMask` **must** be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the [table of supported pipeline stages](#)
- VUID-vkCmdWaitEvents-dstStageMask-06460
Any pipeline stage included in `dstStageMask` **must** be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that

`commandBuffer` was allocated from, as specified in the [table of supported pipeline stages](#)

- VUID-vkCmdWaitEvents-srcStageMask-01158
`srcStageMask` **must** be the bitwise OR of the `stageMask` parameter used in previous calls to `vkCmdSetEvent` with any of the elements of `pEvents` and `VK_PIPELINE_STAGE_HOST_BIT` if any of the elements of `pEvents` was set using `vkSetEvent`
- VUID-vkCmdWaitEvents-srcStageMask-07308
If this command is called inside a render pass instance, `srcStageMask` **must** not include `VK_PIPELINE_STAGE_HOST_BIT`
- VUID-vkCmdWaitEvents-srcQueueFamilyIndex-02803
The `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members of any element of `pBufferMemoryBarriers` or `pImageMemoryBarriers` **must** be equal
- VUID-vkCmdWaitEvents-commandBuffer-01167
`commandBuffer`'s current device mask **must** include exactly one physical device
- VUID-vkCmdWaitEvents-pEvents-03847
Elements of `pEvents` **must** not have been signaled by `vkCmdSetEvent2KHR`

Valid Usage (Implicit)

- VUID-vkCmdWaitEvents-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdWaitEvents-pEvents-parameter
`pEvents` **must** be a valid pointer to an array of `eventCount` valid `VkEvent` handles
- VUID-vkCmdWaitEvents-srcStageMask-parameter
`srcStageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values
- VUID-vkCmdWaitEvents-dstStageMask-parameter
`dstStageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values
- VUID-vkCmdWaitEvents-pMemoryBarriers-parameter
If `memoryBarrierCount` is not 0, `pMemoryBarriers` **must** be a valid pointer to an array of `memoryBarrierCount` valid `VkMemoryBarrier` structures
- VUID-vkCmdWaitEvents-pBufferMemoryBarriers-parameter
If `bufferMemoryBarrierCount` is not 0, `pBufferMemoryBarriers` **must** be a valid pointer to an array of `bufferMemoryBarrierCount` valid `VkBufferMemoryBarrier` structures
- VUID-vkCmdWaitEvents-pImageMemoryBarriers-parameter
If `imageMemoryBarrierCount` is not 0, `pImageMemoryBarriers` **must** be a valid pointer to an array of `imageMemoryBarrierCount` valid `VkImageMemoryBarrier` structures
- VUID-vkCmdWaitEvents-commandBuffer-recording
`commandBuffer` **must** be in the [recording state](#)
- VUID-vkCmdWaitEvents-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, or `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdWaitEvents-eventCount-arraylength

`eventCount` **must** be greater than 0

- `VUID-vkCmdWaitEvents-commonparent`

Both of `commandBuffer`, and the elements of `pEvents` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT	Synchronization

7.6. Pipeline Barriers

To record a pipeline barrier, call:

```
// Provided by VK_KHR_synchronization2
void vkCmdPipelineBarrier2KHR(
    VkCommandBuffer                commandBuffer,
    const VkDependencyInfo*        pDependencyInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `pDependencyInfo` is a pointer to a `VkDependencyInfo` structure defining the scopes of this operation.

When `vkCmdPipelineBarrier2KHR` is submitted to a queue, it defines memory dependencies between commands that were submitted to the same queue before it, and those submitted to the same queue after it.

The first `synchronization scope` and `access scope` of each memory dependency defined by `pDependencyInfo` are applied to operations that occurred earlier in `submission order`.

The second `synchronization scope` and `access scope` of each memory dependency defined by `pDependencyInfo` are applied to operations that occurred later in `submission order`.

If `vkCmdPipelineBarrier2KHR` is recorded within a render pass instance, the synchronization scopes are limited to a subset of operations within the same subpass or render pass instance.

Valid Usage

- VUID-vkCmdPipelineBarrier2-None-07889

If `vkCmdPipelineBarrier2KHR` is called within a render pass instance using a `VkRenderPass` object, the render pass **must** have been created with at least one subpass dependency that expresses a dependency from the current subpass to itself, does not include `VK_DEPENDENCY_BY_REGION_BIT` if this command does not, does not include `VK_DEPENDENCY_VIEW_LOCAL_BIT` if this command does not, and has [synchronization scopes](#) and [access scopes](#) that are all supersets of the scopes defined in this command

- VUID-vkCmdPipelineBarrier2-bufferMemoryBarrierCount-01178

If `vkCmdPipelineBarrier2KHR` is called within a render pass instance using a `VkRenderPass` object, it **must** not include any buffer memory barriers

- VUID-vkCmdPipelineBarrier2-image-04073

If `vkCmdPipelineBarrier2KHR` is called within a render pass instance using a `VkRenderPass` object, the `image` member of any image memory barrier included in this command **must** be an attachment used in the current subpass both as an input attachment, and as either a color, or depth/stencil attachment

- VUID-vkCmdPipelineBarrier2-oldLayout-01181

If `vkCmdPipelineBarrier2KHR` is called within a render pass instance, the `oldLayout` and `newLayout` members of any image memory barrier included in this command **must** be equal

- VUID-vkCmdPipelineBarrier2-srcQueueFamilyIndex-01182

If `vkCmdPipelineBarrier2KHR` is called within a render pass instance, the `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members of any memory barrier included in this command **must** be equal

- VUID-vkCmdPipelineBarrier2-None-07890

If `vkCmdPipelineBarrier2KHR` is called within a render pass instance, and the source stage masks of any memory barriers include [framebuffer-space stages](#), destination stage masks of all memory barriers **must** only include [framebuffer-space stages](#)

- VUID-vkCmdPipelineBarrier2-dependencyFlags-07891

If `vkCmdPipelineBarrier2KHR` is called within a render pass instance, and the source stage masks of any memory barriers include [framebuffer-space stages](#), then `dependencyFlags` **must** include `VK_DEPENDENCY_BY_REGION_BIT`

- VUID-vkCmdPipelineBarrier2-None-07892

If `vkCmdPipelineBarrier2KHR` is called within a render pass instance, the source and destination stage masks of any memory barriers **must** only include graphics pipeline stages

- VUID-vkCmdPipelineBarrier2-dependencyFlags-01186

If `vkCmdPipelineBarrier2KHR` is called outside of a render pass instance, the dependency flags **must** not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`

- VUID-vkCmdPipelineBarrier2-None-07893

If `vkCmdPipelineBarrier2KHR` is called inside a render pass instance, and there is more than one view in the current subpass, dependency flags **must** include `VK_DEPENDENCY_VIEW_LOCAL_BIT`

- VUID-vkCmdPipelineBarrier2-synchronization2-03848
The `synchronization2` feature **must** be enabled
- VUID-vkCmdPipelineBarrier2-srcStageMask-09673
The `srcStageMask` member of any element of the `pMemoryBarriers` member of `pDependencyInfo` **must** only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from
- VUID-vkCmdPipelineBarrier2-dstStageMask-09674
The `dstStageMask` member of any element of the `pMemoryBarriers` member of `pDependencyInfo` **must** only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from
- VUID-vkCmdPipelineBarrier2-srcStageMask-09675
If a buffer or image memory barrier does not specify an `acquire operation`, the respective `srcStageMask` member of the element of the `pBufferMemoryBarriers` or `pImageMemoryBarriers` members of `pDependencyInfo` **must** only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from
- VUID-vkCmdPipelineBarrier2-dstStageMask-09676
If a buffer or image memory barrier does not specify an `release operation`, the respective `dstStageMask` member of the element of the `pBufferMemoryBarriers` or `pImageMemoryBarriers` members of `pDependencyInfo` **must** only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from
- VUID-vkCmdPipelineBarrier2-srcQueueFamilyIndex-10387
If a buffer or image memory barrier specifies a `queue family ownership transfer operation`, either the `srcQueueFamilyIndex` or `dstQueueFamilyIndex` member of the element of the `pBufferMemoryBarriers` or `pImageMemoryBarriers` members of `pDependencyInfo` and the queue family index that was used to create the command pool that `commandBuffer` was allocated from **must** be equal

Valid Usage (Implicit)

- VUID-vkCmdPipelineBarrier2-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdPipelineBarrier2-pDependencyInfo-parameter
`pDependencyInfo` **must** be a valid pointer to a valid `VkDependencyInfo` structure
- VUID-vkCmdPipelineBarrier2-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdPipelineBarrier2-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, `VK_QUEUE_GRAPHICS_BIT`, or `VK_QUEUE_TRANSFER_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_TRANSFER_BIT	Synchronization

To record a pipeline barrier, call:

```
// Provided by VK_VERSION_1_0
void vkCmdPipelineBarrier(
    VkCommandBuffer          commandBuffer,
    VkPipelineStageFlags     srcStageMask,
    VkPipelineStageFlags     dstStageMask,
    VkDependencyFlags        dependencyFlags,
    uint32_t                 memoryBarrierCount,
    const VkMemoryBarrier*   pMemoryBarriers,
    uint32_t                 bufferMemoryBarrierCount,
    const VkBufferMemoryBarrier* pBufferMemoryBarriers,
    uint32_t                 imageMemoryBarrierCount,
    const VkImageMemoryBarrier* pImageMemoryBarriers);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `srcStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the [source stages](#).
- `dstStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the [destination stages](#).
- `dependencyFlags` is a bitmask of `VkDependencyFlagBits` specifying how execution and memory dependencies are formed.
- `memoryBarrierCount` is the length of the `pMemoryBarriers` array.
- `pMemoryBarriers` is a pointer to an array of `VkMemoryBarrier` structures.
- `bufferMemoryBarrierCount` is the length of the `pBufferMemoryBarriers` array.
- `pBufferMemoryBarriers` is a pointer to an array of `VkBufferMemoryBarrier` structures.

- `imageMemoryBarrierCount` is the length of the `pImageMemoryBarriers` array.
- `pImageMemoryBarriers` is a pointer to an array of `VkImageMemoryBarrier` structures.

`vkCmdPipelineBarrier` operates almost identically to `vkCmdPipelineBarrier2KHR`, except that the scopes and barriers are defined as direct parameters rather than being defined by a `VkDependencyInfo`.

When `vkCmdPipelineBarrier` is submitted to a queue, it defines a memory dependency between commands that were submitted to the same queue before it, and those submitted to the same queue after it.

If `vkCmdPipelineBarrier` was recorded outside a render pass instance, the first `synchronization scope` includes all commands that occur earlier in `submission order`. If `vkCmdPipelineBarrier` was recorded inside a render pass instance, the first synchronization scope includes only commands that occur earlier in `submission order` within the same subpass. In either case, the first synchronization scope is limited to operations on the pipeline stages determined by the `source stage mask` specified by `srcStageMask`.

If `vkCmdPipelineBarrier` was recorded outside a render pass instance, the second `synchronization scope` includes all commands that occur later in `submission order`. If `vkCmdPipelineBarrier` was recorded inside a render pass instance, the second synchronization scope includes only commands that occur later in `submission order` within the same subpass. In either case, the second synchronization scope is limited to operations on the pipeline stages determined by the `destination stage mask` specified by `dstStageMask`.

The first `access scope` is limited to accesses in the pipeline stages determined by the `source stage mask` specified by `srcStageMask`. Within that, the first access scope only includes the first access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of `memory barriers`. If no memory barriers are specified, then the first access scope includes no accesses.

The second `access scope` is limited to accesses in the pipeline stages determined by the `destination stage mask` specified by `dstStageMask`. Within that, the second access scope only includes the second access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of `memory barriers`. If no memory barriers are specified, then the second access scope includes no accesses.

If `dependencyFlags` includes `VK_DEPENDENCY_BY_REGION_BIT`, then any dependency between `framebuffer-space` pipeline stages is `framebuffer-local` - otherwise it is `framebuffer-global`.

Valid Usage

- VUID-vkCmdPipelineBarrier-srcStageMask-04090
If the `geometryShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- VUID-vkCmdPipelineBarrier-srcStageMask-04091
If the `tessellationShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or

VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT

- VUID-vkCmdPipelineBarrier-srcStageMask-07319
If the `attachmentFragmentShadingRate` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-vkCmdPipelineBarrier-srcStageMask-03937
If the `synchronization2` feature is not enabled, `srcStageMask` **must** not be 0
- VUID-vkCmdPipelineBarrier-dstStageMask-04090
If the `geometryShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- VUID-vkCmdPipelineBarrier-dstStageMask-04091
If the `tessellationShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-vkCmdPipelineBarrier-dstStageMask-07319
If the `attachmentFragmentShadingRate` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-vkCmdPipelineBarrier-dstStageMask-03937
If the `synchronization2` feature is not enabled, `dstStageMask` **must** not be 0
- VUID-vkCmdPipelineBarrier-srcAccessMask-02815
The `srcAccessMask` member of each element of `pMemoryBarriers` **must** only include access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the [table of supported access types](#)
- VUID-vkCmdPipelineBarrier-dstAccessMask-02816
The `dstAccessMask` member of each element of `pMemoryBarriers` **must** only include access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the [table of supported access types](#)
- VUID-vkCmdPipelineBarrier-pBufferMemoryBarriers-02817
For any element of `pBufferMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `srcQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `srcAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the [table of supported access types](#)
- VUID-vkCmdPipelineBarrier-pBufferMemoryBarriers-02818
For any element of `pBufferMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `dstQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `dstAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the [table of supported access types](#)
- VUID-vkCmdPipelineBarrier-pImageMemoryBarriers-02819
For any element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `srcQueueFamilyIndex` is the queue family

index that was used to create the command pool that `commandBuffer` was allocated from, then its `srcAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the [table of supported access types](#)

- VUID-vkCmdPipelineBarrier-pImageMemoryBarriers-02820

For any element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `dstQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `dstAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the [table of supported access types](#)

- VUID-vkCmdPipelineBarrier-None-07889

If `vkCmdPipelineBarrier` is called within a render pass instance using a `VkRenderPass` object, the render pass **must** have been created with at least one subpass dependency that expresses a dependency from the current subpass to itself, does not include `VK_DEPENDENCY_BY_REGION_BIT` if this command does not, does not include `VK_DEPENDENCY_VIEW_LOCAL_BIT` if this command does not, and has [synchronization scopes](#) and [access scopes](#) that are all supersets of the scopes defined in this command

- VUID-vkCmdPipelineBarrier-bufferMemoryBarrierCount-01178

If `vkCmdPipelineBarrier` is called within a render pass instance using a `VkRenderPass` object, it **must** not include any buffer memory barriers

- VUID-vkCmdPipelineBarrier-image-04073

If `vkCmdPipelineBarrier` is called within a render pass instance using a `VkRenderPass` object, the `image` member of any image memory barrier included in this command **must** be an attachment used in the current subpass both as an input attachment, and as either a color, or depth/stencil attachment

- VUID-vkCmdPipelineBarrier-oldLayout-01181

If `vkCmdPipelineBarrier` is called within a render pass instance, the `oldLayout` and `newLayout` members of any image memory barrier included in this command **must** be equal

- VUID-vkCmdPipelineBarrier-srcQueueFamilyIndex-01182

If `vkCmdPipelineBarrier` is called within a render pass instance, the `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members of any memory barrier included in this command **must** be equal

- VUID-vkCmdPipelineBarrier-None-07890

If `vkCmdPipelineBarrier` is called within a render pass instance, and the source stage masks of any memory barriers include [framebuffer-space stages](#), destination stage masks of all memory barriers **must** only include [framebuffer-space stages](#)

- VUID-vkCmdPipelineBarrier-dependencyFlags-07891

If `vkCmdPipelineBarrier` is called within a render pass instance, and the source stage masks of any memory barriers include [framebuffer-space stages](#), then `dependencyFlags` **must** include `VK_DEPENDENCY_BY_REGION_BIT`

- VUID-vkCmdPipelineBarrier-None-07892

If `vkCmdPipelineBarrier` is called within a render pass instance, the source and destination

stage masks of any memory barriers **must** only include graphics pipeline stages

- VUID-vkCmdPipelineBarrier-dependencyFlags-01186

If `vkCmdPipelineBarrier` is called outside of a render pass instance, the dependency flags **must** not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`

- VUID-vkCmdPipelineBarrier-None-07893

If `vkCmdPipelineBarrier` is called inside a render pass instance, and there is more than one view in the current subpass, dependency flags **must** include `VK_DEPENDENCY_VIEW_LOCAL_BIT`

- VUID-vkCmdPipelineBarrier-oldLayout-10758

If called within a render pass instance using a `VkRenderPass` object, the `oldLayout` member of any image memory barrier included in this command **must** be equal to the layout that the corresponding attachment uses during the subpass

- VUID-vkCmdPipelineBarrier-srcStageMask-06461

Any pipeline stage included in `srcStageMask` **must** be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the [table of supported pipeline stages](#)

- VUID-vkCmdPipelineBarrier-dstStageMask-06462

Any pipeline stage included in `dstStageMask` **must** be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the [table of supported pipeline stages](#)

- VUID-vkCmdPipelineBarrier-srcStageMask-09633

If either `srcStageMask` or `dstStageMask` includes `VK_PIPELINE_STAGE_HOST_BIT`, for any element of `pImageMemoryBarriers`, `srcQueueFamilyIndex` and `dstQueueFamilyIndex` **must** be equal

- VUID-vkCmdPipelineBarrier-srcStageMask-09634

If either `srcStageMask` or `dstStageMask` includes `VK_PIPELINE_STAGE_HOST_BIT`, for any element of `pBufferMemoryBarriers`, `srcQueueFamilyIndex` and `dstQueueFamilyIndex` **must** be equal

- VUID-vkCmdPipelineBarrier-srcQueueFamilyIndex-10388

If a buffer or image memory barrier specifies a [queue family ownership transfer operation](#), either the `srcQueueFamilyIndex` or `dstQueueFamilyIndex` member and the queue family index that was used to create the command pool that `commandBuffer` was allocated from **must** be equal

Valid Usage (Implicit)

- VUID-vkCmdPipelineBarrier-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdPipelineBarrier-srcStageMask-parameter
`srcStageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values

- VUID-vkCmdPipelineBarrier-dstStageMask-parameter
`dstStageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values

- VUID-vkCmdPipelineBarrier-dependencyFlags-parameter
`dependencyFlags` **must** be a valid combination of `VkDependencyFlagBits` values
- VUID-vkCmdPipelineBarrier-pMemoryBarriers-parameter
If `memoryBarrierCount` is not 0, `pMemoryBarriers` **must** be a valid pointer to an array of `memoryBarrierCount` valid `VkMemoryBarrier` structures
- VUID-vkCmdPipelineBarrier-pBufferMemoryBarriers-parameter
If `bufferMemoryBarrierCount` is not 0, `pBufferMemoryBarriers` **must** be a valid pointer to an array of `bufferMemoryBarrierCount` valid `VkBufferMemoryBarrier` structures
- VUID-vkCmdPipelineBarrier-pImageMemoryBarriers-parameter
If `imageMemoryBarrierCount` is not 0, `pImageMemoryBarriers` **must** be a valid pointer to an array of `imageMemoryBarrierCount` valid `VkImageMemoryBarrier` structures
- VUID-vkCmdPipelineBarrier-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdPipelineBarrier-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, `VK_QUEUE_GRAPHICS_BIT`, or `VK_QUEUE_TRANSFER_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_TRANSFER_BIT	Synchronization

Bits which **can** be set in `vkCmdPipelineBarrier::dependencyFlags`, specifying how execution and memory dependencies are formed, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkDependencyFlagBits {
    VK_DEPENDENCY_BY_REGION_BIT = 0x00000001,
    // Provided by VK_VERSION_1_1
    VK_DEPENDENCY_DEVICE_GROUP_BIT = 0x00000004,
    // Provided by VK_VERSION_1_1
    VK_DEPENDENCY_VIEW_LOCAL_BIT = 0x00000002,
} VkDependencyFlagBits;
```

- **VK_DEPENDENCY_BY_REGION_BIT** specifies that dependencies will be [framebuffer-local](#).
- **VK_DEPENDENCY_VIEW_LOCAL_BIT** specifies that dependencies will be [view-local](#).
- **VK_DEPENDENCY_DEVICE_GROUP_BIT** specifies that dependencies are [non-device-local](#).

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkDependencyFlags;
```

VkDependencyFlags is a bitmask type for setting a mask of zero or more [VkDependencyFlagBits](#).

7.7. Memory Barriers

Memory barriers are used to explicitly control access to buffer and image subresource ranges. Memory barriers are used to [transfer ownership between queue families](#), [change image layouts](#), and define [availability and visibility operations](#). They explicitly define the [access types](#) and buffer and image subresource ranges that are included in the [access scopes](#) of a memory dependency that is created by a synchronization command that includes them.

7.7.1. Global Memory Barriers

Global memory barriers apply to memory accesses involving all memory objects that exist at the time of its execution.

The **VkMemoryBarrier2** structure is defined as:

```
typedef struct VkMemoryBarrier2 {
    VkStructureType      sType;
    const void*          pNext;
    VkPipelineStageFlags2 srcStageMask;
    VkAccessFlags2       srcAccessMask;
    VkPipelineStageFlags2 dstStageMask;
    VkAccessFlags2       dstAccessMask;
} VkMemoryBarrier2;
```

```
// Provided by VK_KHR_synchronization2
typedef VkMemoryBarrier2 VkMemoryBarrier2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcStageMask` is a `VkPipelineStageFlags2` mask of pipeline stages to be included in the [first synchronization scope](#).
- `srcAccessMask` is a `VkAccessFlags2` mask of access flags to be included in the [first access scope](#).
- `dstStageMask` is a `VkPipelineStageFlags2` mask of pipeline stages to be included in the [second synchronization scope](#).
- `dstAccessMask` is a `VkAccessFlags2` mask of access flags to be included in the [second access scope](#).

This structure defines a [memory dependency](#) affecting all device memory.

The first [synchronization scope](#) and [access scope](#) described by this structure include only operations and memory accesses specified by the source stage mask and source access mask.

The second [synchronization scope](#) and [access scope](#) described by this structure include only operations and memory accesses specified by destination stage mask and destination access mask.

Valid Usage

- VUID-VkMemoryBarrier2-srcStageMask-03929
If the `geometryShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`
- VUID-VkMemoryBarrier2-srcStageMask-03930
If the `tessellationShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-VkMemoryBarrier2-srcStageMask-07317
If the `attachmentFragmentShadingRate` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-VkMemoryBarrier2-srcAccessMask-03900
If `srcAccessMask` includes `VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkMemoryBarrier2-srcAccessMask-03901
If `srcAccessMask` includes `VK_ACCESS_2_INDEX_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkMemoryBarrier2-srcAccessMask-03902
If `srcAccessMask` includes `VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkMemoryBarrier2-srcAccessMask-03903

If `srcAccessMask` includes `VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT`, `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03904

If `srcAccessMask` includes `VK_ACCESS_2_UNIFORM_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryBarrier2-srcAccessMask-03905

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_SAMPLED_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryBarrier2-srcAccessMask-03906

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryBarrier2-srcAccessMask-03907

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryBarrier2-srcAccessMask-07454

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryBarrier2-srcAccessMask-03909

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_WRITE_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryBarrier2-srcAccessMask-03910

If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03911

If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03912

If `dstAccessMask` includes `VK_ACCESS_2_INDEX_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-dstAccessMask-03902

If `dstAccessMask` includes `VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT`,

VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or
VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-03903

If `dstAccessMask` includes `VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT`, `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-dstAccessMask-03904

If `dstAccessMask` includes `VK_ACCESS_2_UNIFORM_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryBarrier2-dstAccessMask-03905

If `dstAccessMask` includes `VK_ACCESS_2_SHADER_SAMPLED_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryBarrier2-dstAccessMask-03906

If `dstAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryBarrier2-dstAccessMask-03907

If `dstAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryBarrier2-dstAccessMask-07454

If `dstAccessMask` includes `VK_ACCESS_2_SHADER_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryBarrier2-dstAccessMask-03909

If `dstAccessMask` includes `VK_ACCESS_2_SHADER_WRITE_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryBarrier2-dstAccessMask-03910

If `dstAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-dstAccessMask-03911

If `dstAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-dstAccessMask-03912

If `dstAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-dstAccessMask-03913
If `dstAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkMemoryBarrier2-dstAccessMask-03914
If `dstAccessMask` includes `VK_ACCESS_2_TRANSFER_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, `VK_PIPELINE_STAGE_2_RESOLVE_BIT`, `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkMemoryBarrier2-dstAccessMask-03915
If `dstAccessMask` includes `VK_ACCESS_2_TRANSFER_WRITE_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, `VK_PIPELINE_STAGE_2_RESOLVE_BIT`, `VK_PIPELINE_STAGE_2_CLEAR_BIT`, `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkMemoryBarrier2-dstAccessMask-03916
If `dstAccessMask` includes `VK_ACCESS_2_HOST_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_HOST_BIT`
- VUID-VkMemoryBarrier2-dstAccessMask-03917
If `dstAccessMask` includes `VK_ACCESS_2_HOST_WRITE_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_HOST_BIT`
- VUID-VkMemoryBarrier2-dstAccessMask-03926
If `dstAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

Valid Usage (Implicit)

- VUID-VkMemoryBarrier2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_MEMORY_BARRIER_2`
- VUID-VkMemoryBarrier2-srcStageMask-parameter
`srcStageMask` **must** be a valid combination of `VkPipelineStageFlagBits2` values
- VUID-VkMemoryBarrier2-srcAccessMask-parameter
`srcAccessMask` **must** be a valid combination of `VkAccessFlagBits2` values
- VUID-VkMemoryBarrier2-dstStageMask-parameter
`dstStageMask` **must** be a valid combination of `VkPipelineStageFlagBits2` values
- VUID-VkMemoryBarrier2-dstAccessMask-parameter
`dstAccessMask` **must** be a valid combination of `VkAccessFlagBits2` values

The `VkMemoryBarrier` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkMemoryBarrier {
    VkStructureType    sType;
    const void*        pNext;
    VkAccessFlags       srcAccessMask;
    VkAccessFlags       dstAccessMask;
} VkMemoryBarrier;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **srcAccessMask** is a bitmask of [VkAccessFlagBits](#) specifying a [source access mask](#).
- **dstAccessMask** is a bitmask of [VkAccessFlagBits](#) specifying a [destination access mask](#).

The first [access scope](#) is limited to access types in the [source access mask](#) specified by **srcAccessMask**.

The second [access scope](#) is limited to access types in the [destination access mask](#) specified by **dstAccessMask**.

Valid Usage (Implicit)

- VUID-VkMemoryBarrier-sType-sType
sType must be [VK_STRUCTURE_TYPE_MEMORY_BARRIER](#)
- VUID-VkMemoryBarrier-pNext-pNext
pNext must be **NULL**
- VUID-VkMemoryBarrier-srcAccessMask-parameter
srcAccessMask must be a valid combination of [VkAccessFlagBits](#) values
- VUID-VkMemoryBarrier-dstAccessMask-parameter
dstAccessMask must be a valid combination of [VkAccessFlagBits](#) values

7.7.2. Buffer Memory Barriers

Buffer memory barriers only apply to memory accesses involving a specific buffer range. That is, a memory dependency formed from a buffer memory barrier is [scoped](#) to access via the specified buffer range. Buffer memory barriers **can** also be used to define a [queue family ownership transfer](#) for the specified buffer range.

The [VkBufferMemoryBarrier2](#) structure is defined as:

```
typedef struct VkBufferMemoryBarrier2 {
    VkStructureType      sType;
    const void*          pNext;
    VkPipelineStageFlags2 srcStageMask;
    VkAccessFlags2       srcAccessMask;
    VkPipelineStageFlags2 dstStageMask;
    VkAccessFlags2       dstAccessMask;
    uint32_t             srcQueueFamilyIndex;
    uint32_t             dstQueueFamilyIndex;
    VkBuffer              buffer;
    VkDeviceSize          offset;
    VkDeviceSize          size;
} VkBufferMemoryBarrier2;
```

```
// Provided by VK_KHR_synchronization2
typedef VkBufferMemoryBarrier2 VkBufferMemoryBarrier2KHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **srcStageMask** is a [VkPipelineStageFlags2](#) mask of pipeline stages to be included in the [first synchronization scope](#).
- **srcAccessMask** is a [VkAccessFlags2](#) mask of access flags to be included in the [first access scope](#).
- **dstStageMask** is a [VkPipelineStageFlags2](#) mask of pipeline stages to be included in the [second synchronization scope](#).
- **dstAccessMask** is a [VkAccessFlags2](#) mask of access flags to be included in the [second access scope](#).
- **srcQueueFamilyIndex** is the source queue family for a [queue family ownership transfer](#).
- **dstQueueFamilyIndex** is the destination queue family for a [queue family ownership transfer](#).
- **buffer** is a handle to the buffer whose backing memory is affected by the barrier.
- **offset** is an offset in bytes into the backing memory for **buffer**; this is relative to the base offset as bound to the buffer (see [vkBindBufferMemory](#)).
- **size** is a size in bytes of the affected area of backing memory for **buffer**, or `VK_WHOLE_SIZE` to use the range from **offset** to the end of the buffer.

This structure defines a [memory dependency](#) limited to a range of a buffer, and **can** define a [queue family ownership transfer operation](#) for that range.

The first [synchronization scope](#) and [access scope](#) described by this structure include only operations and memory accesses specified by the source stage mask and the source access mask.

The second [synchronization scope](#) and [access scope](#) described by this structure include only operations and memory accesses specified by the destination stage mask and the destination access mask.

Both [access scopes](#) are limited to only memory accesses to [buffer](#) in the range defined by [offset](#) and [size](#).

If [buffer](#) was created with [VK_SHARING_MODE_EXCLUSIVE](#), and [srcQueueFamilyIndex](#) is not equal to [dstQueueFamilyIndex](#), this memory barrier defines a [queue family ownership transfer operation](#). When executed on a queue in the family identified by [srcQueueFamilyIndex](#), this barrier defines a [queue family release operation](#) for the specified buffer range, and the second synchronization scope does not apply to this operation. When executed on a queue in the family identified by [dstQueueFamilyIndex](#), this barrier defines a [queue family acquire operation](#) for the specified buffer range, and the first synchronization scope does not apply to this operation.

A [queue family ownership transfer operation](#) is also defined if the values are not equal, and either is one of the special queue family values reserved for external memory ownership transfers, as described in [Queue Family Ownership Transfer](#). A [queue family release operation](#) is defined when [dstQueueFamilyIndex](#) is one of those values, and a [queue family acquire operation](#) is defined when [srcQueueFamilyIndex](#) is one of those values.

Valid Usage

- VUID-VkBufferMemoryBarrier2-srcStageMask-03929
If the [geometryShader](#) feature is not enabled, [srcStageMask](#) **must** not contain [VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT](#)
- VUID-VkBufferMemoryBarrier2-srcStageMask-03930
If the [tessellationShader](#) feature is not enabled, [srcStageMask](#) **must** not contain [VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT](#) or [VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT](#)
- VUID-VkBufferMemoryBarrier2-srcStageMask-07317
If the [attachmentFragmentShadingRate](#) feature is not enabled, [srcStageMask](#) **must** not contain [VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR](#)
- VUID-VkBufferMemoryBarrier2-srcAccessMask-03900
If [srcAccessMask](#) includes [VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT](#), [srcStageMask](#) **must** include [VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT](#), [VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT](#), or [VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT](#)
- VUID-VkBufferMemoryBarrier2-srcAccessMask-03901
If [srcAccessMask](#) includes [VK_ACCESS_2_INDEX_READ_BIT](#), [srcStageMask](#) **must** include [VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT](#), [VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT](#), [VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT](#), or [VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT](#)
- VUID-VkBufferMemoryBarrier2-srcAccessMask-03902
If [srcAccessMask](#) includes [VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT](#), [srcStageMask](#) **must** include [VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT](#), [VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT](#), [VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT](#), or [VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT](#)
- VUID-VkBufferMemoryBarrier2-srcAccessMask-03903
If [srcAccessMask](#) includes [VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT](#), [srcStageMask](#) **must** include [VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT](#),

VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkBufferMemoryBarrier2-srcAccessMask-03904
If `srcAccessMask` includes `VK_ACCESS_2_UNIFORM_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_2_SHADER_BIT` stages
- VUID-VkBufferMemoryBarrier2-srcAccessMask-03905
If `srcAccessMask` includes `VK_ACCESS_2_SHADER_SAMPLED_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_2_SHADER_BIT` stages

If `dstAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkBufferMemoryBarrier2-dstAccessMask-03913
If `dstAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`, `dstStageMask`

must include VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03914

If `dstAccessMask` includes VK_ACCESS_2_TRANSFER_READ_BIT, `dstStageMask` **must** include VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, VK_PIPELINE_STAGE_2_RESOLVE_BIT, VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03915

If `dstAccessMask` includes VK_ACCESS_2_TRANSFER_WRITE_BIT, `dstStageMask` **must** include VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, VK_PIPELINE_STAGE_2_RESOLVE_BIT, VK_PIPELINE_STAGE_2_CLEAR_BIT, VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03916

If `dstAccessMask` includes VK_ACCESS_2_HOST_READ_BIT, `dstStageMask` **must** include VK_PIPELINE_STAGE_2_HOST_BIT

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03917

If `dstAccessMask` includes VK_ACCESS_2_HOST_WRITE_BIT, `dstStageMask` **must** include VK_PIPELINE_STAGE_2_HOST_BIT

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03926

If `dstAccessMask` includes VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT, `dstStageMask` **must** include VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkBufferMemoryBarrier2-offset-01187

`offset` **must** be less than the size of `buffer`

- VUID-VkBufferMemoryBarrier2-size-01188

If `size` is not equal to VK_WHOLE_SIZE, `size` **must** be greater than 0

- VUID-VkBufferMemoryBarrier2-size-01189

If `size` is not equal to VK_WHOLE_SIZE, `size` **must** be less than or equal to the size of `buffer` minus `offset`

- VUID-VkBufferMemoryBarrier2-buffer-01931

If `buffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-VkBufferMemoryBarrier2-buffer-09095

If `buffer` was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are not equal, `srcQueueFamilyIndex` **must** be VK_QUEUE_FAMILY_EXTERNAL, VK_QUEUE_FAMILY_FOREIGN_EXT, or a valid queue family

- VUID-VkBufferMemoryBarrier2-buffer-09096

If `buffer` was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are not equal, `dstQueueFamilyIndex` **must** be VK_QUEUE_FAMILY_EXTERNAL, VK_QUEUE_FAMILY_FOREIGN_EXT, or a valid queue family

- VUID-VkBufferMemoryBarrier2-srcQueueFamilyIndex-09099

If the VK_EXT_queue_family_foreign extension is not enabled `srcQueueFamilyIndex` **must**

not be `VK_QUEUE_FAMILY_FOREIGN_EXT`

- VUID-VkBufferMemoryBarrier2-dstQueueFamilyIndex-09100
If the `VK_EXT_queue_family_foreign` extension is not enabled `dstQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_FOREIGN_EXT`
- VUID-VkBufferMemoryBarrier2-srcStageMask-03851
If either `srcStageMask` or `dstStageMask` includes `VK_PIPELINE_STAGE_2_HOST_BIT`, `srcQueueFamilyIndex` and `dstQueueFamilyIndex` **must** be equal

Valid Usage (Implicit)

- VUID-VkBufferMemoryBarrier2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_BUFFER_MEMORY_BARRIER_2`
- VUID-VkBufferMemoryBarrier2-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkBufferMemoryBarrier2-srcStageMask-parameter
`srcStageMask` **must** be a valid combination of `VkPipelineStageFlagBits2` values
- VUID-VkBufferMemoryBarrier2-srcAccessMask-parameter
`srcAccessMask` **must** be a valid combination of `VkAccessFlagBits2` values
- VUID-VkBufferMemoryBarrier2-dstStageMask-parameter
`dstStageMask` **must** be a valid combination of `VkPipelineStageFlagBits2` values
- VUID-VkBufferMemoryBarrier2-dstAccessMask-parameter
`dstAccessMask` **must** be a valid combination of `VkAccessFlagBits2` values
- VUID-VkBufferMemoryBarrier2-buffer-parameter
`buffer` **must** be a valid `VkBuffer` handle

The `VkBufferMemoryBarrier` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkBufferMemoryBarrier {
    VkStructureType    sType;
    const void*        pNext;
    VkAccessFlags       srcAccessMask;
    VkAccessFlags       dstAccessMask;
    uint32_t            srcQueueFamilyIndex;
    uint32_t            dstQueueFamilyIndex;
    VkBuffer            buffer;
    VkDeviceSize        offset;
    VkDeviceSize        size;
} VkBufferMemoryBarrier;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `srcAccessMask` is a bitmask of `VkAccessFlagBits` specifying a [source access mask](#).
- `dstAccessMask` is a bitmask of `VkAccessFlagBits` specifying a [destination access mask](#).
- `srcQueueFamilyIndex` is the source queue family for a [queue family ownership transfer](#).
- `dstQueueFamilyIndex` is the destination queue family for a [queue family ownership transfer](#).
- `buffer` is a handle to the buffer whose backing memory is affected by the barrier.
- `offset` is an offset in bytes into the backing memory for `buffer`; this is relative to the base offset as bound to the buffer (see [vkBindBufferMemory](#)).
- `size` is a size in bytes of the affected area of backing memory for `buffer`, or `VK_WHOLE_SIZE` to use the range from `offset` to the end of the buffer.

The first [access scope](#) is limited to access to memory through the specified buffer range, via access types in the [source access mask](#) specified by `srcAccessMask`. If the source access mask includes `VK_ACCESS_HOST_WRITE_BIT`, a [memory domain operation](#) is performed where available memory in the host domain is also made available to the device domain.

The second [access scope](#) is limited to access to memory through the specified buffer range, via access types in the [destination access mask](#) specified by `dstAccessMask`. If the destination access mask includes `VK_ACCESS_HOST_WRITE_BIT` or `VK_ACCESS_HOST_READ_BIT`, a [memory domain operation](#) is performed where available memory in the device domain is also made available to the host domain.

NOTE	When <code>VK_MEMORY_PROPERTY_HOST_COHERENT_BIT</code> is used, available memory in host domain is automatically made visible to host domain, and any host write is automatically made available to host domain.

If `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, and `srcQueueFamilyIndex` is equal to the current queue family, then the memory barrier defines a [queue family release operation](#) for the specified buffer range, and the second synchronization scope of the calling command does not apply to this operation.

If `dstQueueFamilyIndex` is not equal to `srcQueueFamilyIndex`, and `dstQueueFamilyIndex` is equal to the current queue family, then the memory barrier defines a [queue family acquire operation](#) for the specified buffer range, and the first synchronization scope of the calling command does not apply to this operation.

Valid Usage

- VUID-VkBufferMemoryBarrier-offset-01187
`offset` **must** be less than the size of `buffer`
- VUID-VkBufferMemoryBarrier-size-01188
If `size` is not equal to `VK_WHOLE_SIZE`, `size` **must** be greater than 0
- VUID-VkBufferMemoryBarrier-size-01189
If `size` is not equal to `VK_WHOLE_SIZE`, `size` **must** be less than or equal to than the size of `buffer` minus `offset`
- VUID-VkBufferMemoryBarrier-buffer-01931

If **buffer** is non-sparse then it **must** be bound completely and contiguously to a single **VkDeviceMemory** object

- VUID-VkBufferMemoryBarrier-buffer-09095

If **buffer** was created with a sharing mode of **VK_SHARING_MODE_EXCLUSIVE**, and **srcQueueFamilyIndex** and **dstQueueFamilyIndex** are not equal, **srcQueueFamilyIndex** **must** be **VK_QUEUE_FAMILY_EXTERNAL**, **VK_QUEUE_FAMILY_FOREIGN_EXT**, or a valid queue family

- VUID-VkBufferMemoryBarrier-buffer-09096

If **buffer** was created with a sharing mode of **VK_SHARING_MODE_EXCLUSIVE**, and **srcQueueFamilyIndex** and **dstQueueFamilyIndex** are not equal, **dstQueueFamilyIndex** **must** be **VK_QUEUE_FAMILY_EXTERNAL**, **VK_QUEUE_FAMILY_FOREIGN_EXT**, or a valid queue family

- VUID-VkBufferMemoryBarrier-srcQueueFamilyIndex-09099

If the **VK_EXT_queue_family_foreign** extension is not enabled **srcQueueFamilyIndex** **must** not be **VK_QUEUE_FAMILY_FOREIGN_EXT**

- VUID-VkBufferMemoryBarrier-dstQueueFamilyIndex-09100

If the **VK_EXT_queue_family_foreign** extension is not enabled **dstQueueFamilyIndex** **must** not be **VK_QUEUE_FAMILY_FOREIGN_EXT**

- VUID-VkBufferMemoryBarrier-None-09049

If the **synchronization2** feature is not enabled, and **buffer** was created with a sharing mode of **VK_SHARING_MODE_CONCURRENT**, at least one of **srcQueueFamilyIndex** and **dstQueueFamilyIndex** **must** be **VK_QUEUE_FAMILY_IGNORED**

- VUID-VkBufferMemoryBarrier-None-09050

If the **synchronization2** feature is not enabled, and **buffer** was created with a sharing mode of **VK_SHARING_MODE_CONCURRENT**, **srcQueueFamilyIndex** **must** be **VK_QUEUE_FAMILY_IGNORED** or **VK_QUEUE_FAMILY_EXTERNAL**

- VUID-VkBufferMemoryBarrier-None-09051

If the **synchronization2** feature is not enabled, and **buffer** was created with a sharing mode of **VK_SHARING_MODE_CONCURRENT**, **dstQueueFamilyIndex** **must** be **VK_QUEUE_FAMILY_IGNORED** or **VK_QUEUE_FAMILY_EXTERNAL**

Valid Usage (Implicit)

- VUID-VkBufferMemoryBarrier-sType-sType

sType **must** be **VK_STRUCTURE_TYPE_BUFFER_MEMORY_BARRIER**

- VUID-VkBufferMemoryBarrier-pNext-pNext

pNext **must** be **NULL**

- VUID-VkBufferMemoryBarrier-buffer-parameter

buffer **must** be a valid **VkBuffer** handle

VK_WHOLE_SIZE is a special value indicating that the entire remaining length of a buffer or allocation following a given **offset** should be used. It **can** be specified for **VkBufferMemoryBarrier::size**, **vkMapMemory::size**, and other similar structures.

```
#define VK_WHOLE_SIZE
```

```
(~0ULL)
```

7.7.3. Image Memory Barriers

Image memory barriers only apply to memory accesses involving a specific image subresource range. That is, a memory dependency formed from an image memory barrier is [scoped](#) to access via the specified image subresource range. Image memory barriers **can** also be used to define [image layout transitions](#) or a [queue family ownership transfer](#) for the specified image subresource range.

The `VkImageMemoryBarrier2` structure is defined as:

```
typedef struct VkImageMemoryBarrier2 {
    VkStructureType      sType;
    const void*          pNext;
    VkPipelineStageFlags2 srcStageMask;
    VkAccessFlags2        srcAccessMask;
    VkPipelineStageFlags2 dstStageMask;
    VkAccessFlags2        dstAccessMask;
    VkImageLayout         oldLayout;
    VkImageLayout         newLayout;
    uint32_t              srcQueueFamilyIndex;
    uint32_t              dstQueueFamilyIndex;
    VkImage               image;
    VkImageSubresourceRange subresourceRange;
} VkImageMemoryBarrier2;
```

```
// Provided by VK_KHR_synchronization2
typedef VkImageMemoryBarrier2 VkImageMemoryBarrier2KHR;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcStageMask` is a [VkPipelineStageFlags2](#) mask of pipeline stages to be included in the [first synchronization scope](#).
- `srcAccessMask` is a [VkAccessFlags2](#) mask of access flags to be included in the [first access scope](#).
- `dstStageMask` is a [VkPipelineStageFlags2](#) mask of pipeline stages to be included in the [second synchronization scope](#).
- `dstAccessMask` is a [VkAccessFlags2](#) mask of access flags to be included in the [second access scope](#).
- `oldLayout` is the old layout in an [image layout transition](#).
- `newLayout` is the new layout in an [image layout transition](#).
- `srcQueueFamilyIndex` is the source queue family for a [queue family ownership transfer](#).
- `dstQueueFamilyIndex` is the destination queue family for a [queue family ownership transfer](#).

- **image** is a handle to the image affected by this barrier.
- **subresourceRange** describes the **image subresource range** within **image** that is affected by this barrier.

This structure defines a **memory dependency** limited to an image subresource range, and **can** define a **queue family ownership transfer operation** and **image layout transition** for that subresource range.

The first **synchronization scope** and **access scope** described by this structure include only operations and memory accesses specified by the source stage mask and the source access mask.

The second **synchronization scope** and **access scope** described by this structure include only operations and memory accesses specified by the destination stage mask and the destination access mask.

Both **access scopes** are limited to only memory accesses to **image** in the subresource range defined by **subresourceRange**.

If **image** was created with **VK_SHARING_MODE_EXCLUSIVE**, and **srcQueueFamilyIndex** is not equal to **dstQueueFamilyIndex**, this memory barrier defines a **queue family ownership transfer operation**. When executed on a queue in the family identified by **srcQueueFamilyIndex**, this barrier defines a **queue family release operation** for the specified image subresource range, and the second synchronization scope does not apply to this operation. When executed on a queue in the family identified by **dstQueueFamilyIndex**, this barrier defines a **queue family acquire operation** for the specified image subresource range, and the first synchronization scope does not apply to this operation.

A **queue family ownership transfer operation** is also defined if the values are not equal, and either is one of the special queue family values reserved for external memory ownership transfers, as described in **Queue Family Ownership Transfer**. A **queue family release operation** is defined when **dstQueueFamilyIndex** is one of those values, and a **queue family acquire operation** is defined when **srcQueueFamilyIndex** is one of those values.

If **oldLayout** is not equal to **newLayout**, then the memory barrier defines an **image layout transition** for the specified image subresource range. If this memory barrier defines a **queue family ownership transfer operation**, the layout transition is only executed once between the queues.

NOTE

When the old and new layout are equal, the layout values are ignored - data is preserved no matter what values are specified, or what layout the image is currently in.

If **image** has a **multi-planar format** and the image is *disjoint*, then including **VK_IMAGE_ASPECT_COLOR_BIT** in the **aspectMask** member of **subresourceRange** is equivalent to including **VK_IMAGE_ASPECT_PLANE_0_BIT**, **VK_IMAGE_ASPECT_PLANE_1_BIT**, and (for three-plane formats only) **VK_IMAGE_ASPECT_PLANE_2_BIT**.

Valid Usage

- VUID-VkImageMemoryBarrier2-srcStageMask-03929

If the `geometryShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`

- VUID-VkImageMemoryBarrier2-srcStageMask-03930

If the `tessellationShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`

- VUID-VkImageMemoryBarrier2-srcStageMask-07317

If the `attachmentFragmentShadingRate` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-VkImageMemoryBarrier2-srcAccessMask-03900

If `srcAccessMask` includes `VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkImageMemoryBarrier2-srcAccessMask-03901

If `srcAccessMask` includes `VK_ACCESS_2_INDEX_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkImageMemoryBarrier2-srcAccessMask-03902

If `srcAccessMask` includes `VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkImageMemoryBarrier2-srcAccessMask-03903

If `srcAccessMask` includes `VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT`, `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkImageMemoryBarrier2-srcAccessMask-03904

If `srcAccessMask` includes `VK_ACCESS_2_UNIFORM_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkImageMemoryBarrier2-srcAccessMask-03905

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_SAMPLED_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkImageMemoryBarrier2-srcAccessMask-03906

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkImageMemoryBarrier2-srcAccessMask-03907

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkImageMemoryBarrier2-srcAccessMask-07454
If `srcAccessMask` includes `VK_ACCESS_2_SHADER_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages
- VUID-VkImageMemoryBarrier2-srcAccessMask-03909
If `srcAccessMask` includes `VK_ACCESS_2_SHADER_WRITE_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages
- VUID-VkImageMemoryBarrier2-srcAccessMask-03910
If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkImageMemoryBarrier2-srcAccessMask-03911
If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkImageMemoryBarrier2-srcAccessMask-03912
If `srcAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkImageMemoryBarrier2-srcAccessMask-03913
If `srcAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkImageMemoryBarrier2-srcAccessMask-03914
If `srcAccessMask` includes `VK_ACCESS_2_TRANSFER_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, `VK_PIPELINE_STAGE_2_RESOLVE_BIT`, `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkImageMemoryBarrier2-srcAccessMask-03915
If `srcAccessMask` includes `VK_ACCESS_2_TRANSFER_WRITE_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, `VK_PIPELINE_STAGE_2_RESOLVE_BIT`, `VK_PIPELINE_STAGE_2_CLEAR_BIT`, `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkImageMemoryBarrier2-srcAccessMask-03916
If `srcAccessMask` includes `VK_ACCESS_2_HOST_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_HOST_BIT`
- VUID-VkImageMemoryBarrier2-srcAccessMask-03917
If `srcAccessMask` includes `VK_ACCESS_2_HOST_WRITE_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_HOST_BIT`
- VUID-VkImageMemoryBarrier2-srcAccessMask-03926
If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT`,

`srcStageMask` **must** include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkImageMemoryBarrier2-dstStageMask-03929
If the `geometryShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`
- VUID-VkImageMemoryBarrier2-dstStageMask-03930
If the `tessellationShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-VkImageMemoryBarrier2-dstStageMask-07317
If the `attachmentFragmentShadingRate` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-VkImageMemoryBarrier2-dstAccessMask-03900
If `dstAccessMask` includes `VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkImageMemoryBarrier2-dstAccessMask-03901
If `dstAccessMask` includes `VK_ACCESS_2_INDEX_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkImageMemoryBarrier2-dstAccessMask-03902
If `dstAccessMask` includes `VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkImageMemoryBarrier2-dstAccessMask-03903
If `dstAccessMask` includes `VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT`, `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkImageMemoryBarrier2-dstAccessMask-03904
If `dstAccessMask` includes `VK_ACCESS_2_UNIFORM_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages
- VUID-VkImageMemoryBarrier2-dstAccessMask-03905
If `dstAccessMask` includes `VK_ACCESS_2_SHADER_SAMPLED_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages
- VUID-VkImageMemoryBarrier2-dstAccessMask-03906
If `dstAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages
- VUID-VkImageMemoryBarrier2-dstAccessMask-03907

If `dstAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkImageMemoryBarrier2-dstAccessMask-07454

If `dstAccessMask` includes `VK_ACCESS_2_SHADER_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkImageMemoryBarrier2-dstAccessMask-03909

If `dstAccessMask` includes `VK_ACCESS_2_SHADER_WRITE_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkImageMemoryBarrier2-dstAccessMask-03910

If `dstAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkImageMemoryBarrier2-dstAccessMask-03911

If `dstAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkImageMemoryBarrier2-dstAccessMask-03912

If `dstAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkImageMemoryBarrier2-dstAccessMask-03913

If `dstAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkImageMemoryBarrier2-dstAccessMask-03914

If `dstAccessMask` includes `VK_ACCESS_2_TRANSFER_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, `VK_PIPELINE_STAGE_2_RESOLVE_BIT`, `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkImageMemoryBarrier2-dstAccessMask-03915

If `dstAccessMask` includes `VK_ACCESS_2_TRANSFER_WRITE_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, `VK_PIPELINE_STAGE_2_RESOLVE_BIT`, `VK_PIPELINE_STAGE_2_CLEAR_BIT`, `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkImageMemoryBarrier2-dstAccessMask-03916

If `dstAccessMask` includes `VK_ACCESS_2_HOST_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_HOST_BIT`

- VUID-VkImageMemoryBarrier2-dstAccessMask-03917

If `dstAccessMask` includes `VK_ACCESS_2_HOST_WRITE_BIT`, `dstStageMask` **must** include

VK_PIPELINE_STAGE_2_HOST_BIT

- VUID-VkImageMemoryBarrier2-dstAccessMask-03926

If `dstAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkImageMemoryBarrier2-oldLayout-01208

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`

- VUID-VkImageMemoryBarrier2-oldLayout-01209

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkImageMemoryBarrier2-oldLayout-01210

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkImageMemoryBarrier2-oldLayout-01211

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

- VUID-VkImageMemoryBarrier2-oldLayout-01212

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT`

- VUID-VkImageMemoryBarrier2-oldLayout-01213

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT`

- VUID-VkImageMemoryBarrier2-oldLayout-01197

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), `oldLayout` **must** be `VK_IMAGE_LAYOUT_UNDEFINED` or the current layout of the image subresources affected by the barrier

- VUID-VkImageMemoryBarrier2-newLayout-01198

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), `newLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`

- VUID-VkImageMemoryBarrier2-oldLayout-01658
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`
- VUID-VkImageMemoryBarrier2-oldLayout-01659
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`
- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-04065
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL` then `image` **must** have been created with at least one of `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`
- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-04066
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` set
- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-04067
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then `image` **must** have been created with at least one of `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`
- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-04068
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` set
- VUID-VkImageMemoryBarrier2-synchronization2-07793
If the `synchronization2` feature is not enabled, `oldLayout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`
- VUID-VkImageMemoryBarrier2-synchronization2-07794
If the `synchronization2` feature is not enabled, `newLayout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`
- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-03938
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL`, `image` **must** have been created with `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`
- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-03939

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL`, `image` **must** have been created with at least one of `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

- VUID-VkImageMemoryBarrier2-oldLayout-02088

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR` then `image` **must** have been created with `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` set

- VUID-VkImageMemoryBarrier2-image-09117

If `image` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are not equal, `srcQueueFamilyIndex` **must** be `VK_QUEUE_FAMILY_EXTERNAL`, `VK_QUEUE_FAMILY_FOREIGN_EXT`, or a valid queue family

- VUID-VkImageMemoryBarrier2-image-09118

If `image` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are not equal, `dstQueueFamilyIndex` **must** be `VK_QUEUE_FAMILY_EXTERNAL`, `VK_QUEUE_FAMILY_FOREIGN_EXT`, or a valid queue family

- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-09121

If the [VK_EXT_queue_family_foreign](#) extension is not enabled `srcQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_FOREIGN_EXT`

- VUID-VkImageMemoryBarrier2-dstQueueFamilyIndex-09122

If the [VK_EXT_queue_family_foreign](#) extension is not enabled `dstQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_FOREIGN_EXT`

- VUID-VkImageMemoryBarrier2-subresourceRange-01486

`subresourceRange.baseMipLevel` **must** be less than the `mipLevels` specified in [VkImageCreateInfo](#) when `image` was created

- VUID-VkImageMemoryBarrier2-subresourceRange-01724

If `subresourceRange.levelCount` is not `VK_REMAINING_MIP_LEVELS`, `subresourceRange.baseMipLevel + subresourceRange.levelCount` **must** be less than or equal to the `mipLevels` specified in [VkImageCreateInfo](#) when `image` was created

- VUID-VkImageMemoryBarrier2-subresourceRange-01488

`subresourceRange.baseArrayLayer` **must** be less than the `arrayLayers` specified in [VkImageCreateInfo](#) when `image` was created

- VUID-VkImageMemoryBarrier2-subresourceRange-01725

If `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `subresourceRange.baseArrayLayer + subresourceRange.layerCount` **must** be less than or equal to the `arrayLayers` specified in [VkImageCreateInfo](#) when `image` was created

- VUID-VkImageMemoryBarrier2-image-01932

If `image` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-VkImageMemoryBarrier2-image-09241

If `image` has a color format that is single-plane, then the `aspectMask` member of

`subresourceRange` **must** be `VK_IMAGE_ASPECT_COLOR_BIT`

- VUID-VkImageMemoryBarrier2-image-09242

If `image` has a color format and is not *disjoint*, then the `aspectMask` member of `subresourceRange` **must** be `VK_IMAGE_ASPECT_COLOR_BIT`

- VUID-VkImageMemoryBarrier2-image-01672

If `image` has a `multi-planar format` and the image is *disjoint*, then the `aspectMask` member of `subresourceRange` **must** include at least one `multi-planar aspect mask` bit or `VK_IMAGE_ASPECT_COLOR_BIT`

- VUID-VkImageMemoryBarrier2-image-03320

If `image` has a depth/stencil format with both depth and stencil and the `separateDepthStencilLayouts` feature is not enabled, then the `aspectMask` member of `subresourceRange` **must** include both `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`

- VUID-VkImageMemoryBarrier2-image-03319

If `image` has a depth/stencil format with both depth and stencil and the `separateDepthStencilLayouts` feature is enabled, then the `aspectMask` member of `subresourceRange` **must** include either or both `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`

- VUID-VkImageMemoryBarrier2-image-10749

If `image` has a depth-only format then the `aspectMask` member of `subresourceRange` **must** be `VK_IMAGE_ASPECT_DEPTH_BIT`

- VUID-VkImageMemoryBarrier2-image-10750

If `image` has a stencil-only format then the `aspectMask` member of `subresourceRange` **must** be `VK_IMAGE_ASPECT_STENCIL_BIT`

- VUID-VkImageMemoryBarrier2-aspectMask-08702

If the `aspectMask` member of `subresourceRange` includes `VK_IMAGE_ASPECT_DEPTH_BIT`, `oldLayout` and `newLayout` **must** not be one of `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkImageMemoryBarrier2-aspectMask-08703

If the `aspectMask` member of `subresourceRange` includes `VK_IMAGE_ASPECT_STENCIL_BIT`, `oldLayout` and `newLayout` **must** not be one of `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`

- VUID-VkImageMemoryBarrier2-subresourceRange-09601

`subresourceRange.aspectMask` **must** be valid for the `format` the `image` was created with

- VUID-VkImageMemoryBarrier2-srcStageMask-03854

If either `srcStageMask` or `dstStageMask` includes `VK_PIPELINE_STAGE_2_HOST_BIT`, `srcQueueFamilyIndex` and `dstQueueFamilyIndex` **must** be equal

- VUID-VkImageMemoryBarrier2-srcStageMask-03855

If `srcStageMask` includes `VK_PIPELINE_STAGE_2_HOST_BIT`, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a `queue family ownership transfer` or `oldLayout` and `newLayout` define an `image layout transition`, `oldLayout` **must** be one of `VK_IMAGE_LAYOUT_PREINITIALIZED`, `VK_IMAGE_LAYOUT_UNDEFINED`, or `VK_IMAGE_LAYOUT_GENERAL`

Valid Usage (Implicit)

- VUID-VkImageMemoryBarrier2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_MEMORY_BARRIER_2`
- VUID-VkImageMemoryBarrier2-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkSampleLocationsInfoEXT`
- VUID-VkImageMemoryBarrier2-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkImageMemoryBarrier2-srcStageMask-parameter
`srcStageMask` **must** be a valid combination of `VkPipelineStageFlagBits2` values
- VUID-VkImageMemoryBarrier2-srcAccessMask-parameter
`srcAccessMask` **must** be a valid combination of `VkAccessFlagBits2` values
- VUID-VkImageMemoryBarrier2-dstStageMask-parameter
`dstStageMask` **must** be a valid combination of `VkPipelineStageFlagBits2` values
- VUID-VkImageMemoryBarrier2-dstAccessMask-parameter
`dstAccessMask` **must** be a valid combination of `VkAccessFlagBits2` values
- VUID-VkImageMemoryBarrier2-oldLayout-parameter
`oldLayout` **must** be a valid `VkImageLayout` value
- VUID-VkImageMemoryBarrier2-newLayout-parameter
`newLayout` **must** be a valid `VkImageLayout` value
- VUID-VkImageMemoryBarrier2-image-parameter
`image` **must** be a valid `VkImage` handle
- VUID-VkImageMemoryBarrier2-subresourceRange-parameter
`subresourceRange` **must** be a valid `VkImageSubresourceRange` structure

The `VkImageMemoryBarrier` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkImageMemoryBarrier {
    VkStructureType    sType;
    const void*        pNext;
    VkAccessFlags       srcAccessMask;
    VkAccessFlags       dstAccessMask;
    VkImageLayout       oldLayout;
    VkImageLayout       newLayout;
    uint32_t            srcQueueFamilyIndex;
    uint32_t            dstQueueFamilyIndex;
    VkImage             image;
    VkImageSubresourceRange subresourceRange;
} VkImageMemoryBarrier;
```

- `sType` is a `VkStructureType` value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcAccessMask` is a bitmask of `VkAccessFlagBits` specifying a [source access mask](#).
- `dstAccessMask` is a bitmask of `VkAccessFlagBits` specifying a [destination access mask](#).
- `oldLayout` is the old layout in an [image layout transition](#).
- `newLayout` is the new layout in an [image layout transition](#).
- `srcQueueFamilyIndex` is the source queue family for a [queue family ownership transfer](#).
- `dstQueueFamilyIndex` is the destination queue family for a [queue family ownership transfer](#).
- `image` is a handle to the image affected by this barrier.
- `subresourceRange` describes the [image subresource range](#) within `image` that is affected by this barrier.

The first [access scope](#) is limited to access to memory through the specified image subresource range, via access types in the [source access mask](#) specified by `srcAccessMask`. If `srcAccessMask` includes `VK_ACCESS_HOST_WRITE_BIT`, memory writes performed by that access type are also made visible, as that access type is not performed through a resource.

The second [access scope](#) is limited to access to memory through the specified image subresource range, via access types in the [destination access mask](#) specified by `dstAccessMask`. If `dstAccessMask` includes `VK_ACCESS_HOST_WRITE_BIT` or `VK_ACCESS_HOST_READ_BIT`, available memory writes are also made visible to accesses of those types, as those access types are not performed through a resource.

If `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, and `srcQueueFamilyIndex` is equal to the current queue family, then the memory barrier defines a [queue family release operation](#) for the specified image subresource range, and the second synchronization scope of the calling command does not apply to this operation.

If `dstQueueFamilyIndex` is not equal to `srcQueueFamilyIndex`, and `dstQueueFamilyIndex` is equal to the current queue family, then the memory barrier defines a [queue family acquire operation](#) for the specified image subresource range, and the first synchronization scope of the calling command does not apply to this operation.

If the `synchronization2` feature is not enabled or `oldLayout` is not equal to `newLayout`, `oldLayout` and `newLayout` define an [image layout transition](#) for the specified image subresource range.

NOTE

If the `synchronization2` feature is enabled, when the old and new layout are equal, the layout values are ignored - data is preserved no matter what values are specified, or what layout the image is currently in.

If `image` has a [multi-planar format](#) and the image is *disjoint*, then including `VK_IMAGE_ASPECT_COLOR_BIT` in the `aspectMask` member of `subresourceRange` is equivalent to including `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, and (for three-plane formats only) `VK_IMAGE_ASPECT_PLANE_2_BIT`.

Valid Usage

- VUID-VkImageMemoryBarrier-oldLayout-01208
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`
- VUID-VkImageMemoryBarrier-oldLayout-01209
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`
- VUID-VkImageMemoryBarrier-oldLayout-01210
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`
- VUID-VkImageMemoryBarrier-oldLayout-01211
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`
- VUID-VkImageMemoryBarrier-oldLayout-01212
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT`
- VUID-VkImageMemoryBarrier-oldLayout-01213
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT`
- VUID-VkImageMemoryBarrier-oldLayout-01197
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), `oldLayout` **must** be `VK_IMAGE_LAYOUT_UNDEFINED` or the current layout of the image subresources affected by the barrier
- VUID-VkImageMemoryBarrier-newLayout-01198
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), `newLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`
- VUID-VkImageMemoryBarrier-oldLayout-01658
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is

VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL then **image must** have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier-oldLayout-01659

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL then **image must** have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04065

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL then **image must** have been created with at least one of VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, VK_IMAGE_USAGE_SAMPLED_BIT, or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04066

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL then **image must** have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT set

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04067

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL then **image must** have been created with at least one of VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, VK_IMAGE_USAGE_SAMPLED_BIT, or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04068

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL then **image must** have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT set

- VUID-VkImageMemoryBarrier-synchronization2-07793

If the `synchronization2` feature is not enabled, `oldLayout` **must** not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- VUID-VkImageMemoryBarrier-synchronization2-07794

If the `synchronization2` feature is not enabled, `newLayout` **must** not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-03938

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL, **image must** have been created with VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT or VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-03939

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL, **image must** have been created with at least one of

VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, VK_IMAGE_USAGE_SAMPLED_BIT, or
VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier-oldLayout-02088
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR` then `image` **must** have been created with `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` set
- VUID-VkImageMemoryBarrier-image-09117
If `image` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are not equal, `srcQueueFamilyIndex` **must** be `VK_QUEUE_FAMILY_EXTERNAL`, `VK_QUEUE_FAMILY_FOREIGN_EXT`, or a valid queue family
- VUID-VkImageMemoryBarrier-image-09118
If `image` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are not equal, `dstQueueFamilyIndex` **must** be `VK_QUEUE_FAMILY_EXTERNAL`, `VK_QUEUE_FAMILY_FOREIGN_EXT`, or a valid queue family
- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-09121
If the [VK_EXT_queue_family_foreign](#) extension is not enabled `srcQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_FOREIGN_EXT`
- VUID-VkImageMemoryBarrier-dstQueueFamilyIndex-09122
If the [VK_EXT_queue_family_foreign](#) extension is not enabled `dstQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_FOREIGN_EXT`
- VUID-VkImageMemoryBarrier-subresourceRange-01486
`subresourceRange.baseMipLevel` **must** be less than the `mipLevels` specified in [VkImageCreateInfo](#) when `image` was created
- VUID-VkImageMemoryBarrier-subresourceRange-01724
If `subresourceRange.levelCount` is not `VK_REMAINING_MIP_LEVELS`, `subresourceRange.baseMipLevel + subresourceRange.levelCount` **must** be less than or equal to the `mipLevels` specified in [VkImageCreateInfo](#) when `image` was created
- VUID-VkImageMemoryBarrier-subresourceRange-01488
`subresourceRange.baseArrayLayer` **must** be less than the `arrayLayers` specified in [VkImageCreateInfo](#) when `image` was created
- VUID-VkImageMemoryBarrier-subresourceRange-01725
If `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `subresourceRange.baseArrayLayer + subresourceRange.layerCount` **must** be less than or equal to the `arrayLayers` specified in [VkImageCreateInfo](#) when `image` was created
- VUID-VkImageMemoryBarrier-image-01932
If `image` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-VkImageMemoryBarrier-image-09241
If `image` has a color format that is single-plane, then the `aspectMask` member of `subresourceRange` **must** be `VK_IMAGE_ASPECT_COLOR_BIT`
- VUID-VkImageMemoryBarrier-image-09242
If `image` has a color format and is not *disjoint*, then the `aspectMask` member of

subresourceRange **must** be VK_IMAGE_ASPECT_COLOR_BIT

- VUID-VkImageMemoryBarrier-image-01672

If **image** has a multi-planar format and the image is *disjoint*, then the aspectMask member of subresourceRange **must** include at least one multi-planar aspect mask bit or VK_IMAGE_ASPECT_COLOR_BIT

- VUID-VkImageMemoryBarrier-image-03320

If **image** has a depth/stencil format with both depth and stencil and the separateDepthStencilLayouts feature is not enabled, then the aspectMask member of subresourceRange **must** include both VK_IMAGE_ASPECT_DEPTH_BIT and VK_IMAGE_ASPECT_STENCIL_BIT

- VUID-VkImageMemoryBarrier-image-03319

If **image** has a depth/stencil format with both depth and stencil and the separateDepthStencilLayouts feature is enabled, then the aspectMask member of subresourceRange **must** include either or both VK_IMAGE_ASPECT_DEPTH_BIT and VK_IMAGE_ASPECT_STENCIL_BIT

- VUID-VkImageMemoryBarrier-image-10749

If **image** has a depth-only format then the aspectMask member of subresourceRange **must** be VK_IMAGE_ASPECT_DEPTH_BIT

- VUID-VkImageMemoryBarrier-image-10750

If **image** has a stencil-only format then the aspectMask member of subresourceRange **must** be VK_IMAGE_ASPECT_STENCIL_BIT

- VUID-VkImageMemoryBarrier-aspectMask-08702

If the aspectMask member of subresourceRange includes VK_IMAGE_ASPECT_DEPTH_BIT, oldLayout and newLayout **must** not be one of VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkImageMemoryBarrier-aspectMask-08703

If the aspectMask member of subresourceRange includes VK_IMAGE_ASPECT_STENCIL_BIT, oldLayout and newLayout **must** not be one of VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL

- VUID-VkImageMemoryBarrier-subresourceRange-09601

subresourceRange.aspectMask **must** be valid for the format the **image** was created with

- VUID-VkImageMemoryBarrier-None-09052

If the synchronization2 feature is not enabled, and **image** was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, at least one of srcQueueFamilyIndex and dstQueueFamilyIndex **must** be VK_QUEUE_FAMILY_IGNORED

- VUID-VkImageMemoryBarrier-None-09053

If the synchronization2 feature is not enabled, and **image** was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, srcQueueFamilyIndex **must** be VK_QUEUE_FAMILY_IGNORED or VK_QUEUE_FAMILY_EXTERNAL

- VUID-VkImageMemoryBarrier-None-09054

If the synchronization2 feature is not enabled, and **image** was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, dstQueueFamilyIndex **must** be VK_QUEUE_FAMILY_IGNORED or VK_QUEUE_FAMILY_EXTERNAL

Valid Usage (Implicit)

- VUID-VkImageMemoryBarrier-sType-sType
sType must be `VK_STRUCTURE_TYPE_IMAGE_MEMORY_BARRIER`
- VUID-VkImageMemoryBarrier-pNext-pNext
pNext must be `NULL` or a pointer to a valid instance of `VkSampleLocationsInfoEXT`
- VUID-VkImageMemoryBarrier-sType-unique
The **sType** value of each structure in the **pNext** chain **must** be unique
- VUID-VkImageMemoryBarrier-oldLayout-parameter
oldLayout must be a valid `VkImageLayout` value
- VUID-VkImageMemoryBarrier-newLayout-parameter
newLayout must be a valid `VkImageLayout` value
- VUID-VkImageMemoryBarrier-image-parameter
image must be a valid `VkImage` handle
- VUID-VkImageMemoryBarrier-subresourceRange-parameter
subresourceRange must be a valid `VkImageSubresourceRange` structure

7.7.4. Queue Family Ownership Transfer

Resources created with a `VkSharingMode` of `VK_SHARING_MODE_EXCLUSIVE` **must** have their ownership explicitly transferred from one queue family to another in order to access their content in a well-defined manner on a queue in a different queue family.

The special queue family index `VK_QUEUE_FAMILY_IGNORED` indicates that a queue family parameter or member is ignored.

```
#define VK_QUEUE_FAMILY_IGNORED          (~0U)
```

Resources shared with external APIs or instances using external memory **must** also explicitly manage ownership transfers between local and external queues (or equivalent constructs in external APIs) regardless of the `VkSharingMode` specified when creating them.

The special queue family index `VK_QUEUE_FAMILY_EXTERNAL` represents any queue external to the resource's current Vulkan instance, as long as the queue uses the same underlying device group or physical device, and the same driver version as the resource's `VkDevice`, as indicated by `VkPhysicalDeviceIDProperties::deviceUUID` and `VkPhysicalDeviceIDProperties::driverUUID`.

```
#define VK_QUEUE_FAMILY_EXTERNAL          (~1U)
```

The special queue family index `VK_QUEUE_FAMILY_FOREIGN_EXT` represents any queue external to the resource's current Vulkan instance, regardless of the queue's underlying physical device or driver version. This includes, for example, queues for fixed-function image processing devices, media codec devices, and display devices, as well as all queues that use the same underlying device group

or physical device, and the same driver version as the resource's [VkDevice](#).

```
#define VK_QUEUE_FAMILY_FOREIGN_EXT    (~2U)
```

If memory dependencies are correctly expressed between uses of such a resource between two queues in different families, but no ownership transfer is defined, the contents of that resource are undefined for any read accesses performed by the second queue family.

NOTE	If an application does not need the contents of a resource to remain valid when transferring from one queue family to another, then the ownership transfer should be skipped.
NOTE	Applications should expect transfers to/from <code>VK_QUEUE_FAMILY_FOREIGN_EXT</code> to be more expensive than transfers to/from <code>VK_QUEUE_FAMILY_EXTERNAL_KHR</code> .

A queue family ownership transfer consists of two distinct parts:

1. Release exclusive ownership from the source queue family
2. Acquire exclusive ownership for the destination queue family

An application **must** ensure that these operations occur in the correct order by defining an execution dependency between them, e.g. using a semaphore.

A *release operation* is used to release exclusive ownership of a range of a buffer or image subresource range. A release operation is defined by executing a [buffer memory barrier](#) (for a buffer range) or an [image memory barrier](#) (for an image subresource range) using a pipeline barrier command, on a queue from the source queue family. The `srcQueueFamilyIndex` parameter of the barrier **must** be the source queue family index, and the `dstQueueFamilyIndex` parameter to the destination queue family index. The destination access mask is ignored for such a barrier, such that no visibility operation is executed - the value of this mask does not affect the validity of the barrier. The release operation happens-after the availability operation. `dstStageMask` is also ignored for such a barrier as defined by [buffer memory ownership transfer](#) and [image memory ownership transfer](#). After a release operation is performed, the contents and image layout (if applicable) of the released resource are undefined until a matching acquire operation is performed.

NOTE	It is valid to never call the acquire operation after a release, and instead simply start using the resource on any queue (even the releasing queue), but the contents should be reinitialized before being read. In the case of images, an image layout transition away from <code>VK_IMAGE_LAYOUT_UNDEFINED</code> is also required. Executing an acquire operation after this without another release is invalid.

An *acquire operation* is used to acquire exclusive ownership of a range of a buffer or image subresource range. An acquire operation is defined by executing a [buffer memory barrier](#) (for a buffer range) or an [image memory barrier](#) (for an image subresource range) using a pipeline barrier command, on a queue from the destination queue family. The buffer range or image subresource range specified in an acquire operation **must** match exactly that of a previous release operation. The `srcQueueFamilyIndex` parameter of the barrier **must** be the source queue family

index, and the `dstQueueFamilyIndex` parameter to the destination queue family index. The source access mask is ignored for such a barrier, such that no availability operation is executed - the value of this mask does not affect the validity of the barrier. The acquire operation happens-before the visibility operation. `srcStageMask` is also ignored for such a barrier as defined by [buffer memory ownership transfer](#) and [image memory ownership transfer](#). Applications **must** not execute an acquire operation on any resource where it has been modified in any way other than a matching release operation.

NOTE

Whilst it is not invalid to provide destination or source access masks for memory barriers used for release or acquire operations, respectively, they have no practical effect. Access after a release operation has undefined results, and so visibility for those accesses has no practical effect. Similarly, write access before an acquire operation will produce undefined results for future access, so availability of those writes has no practical use. In an earlier version of the specification, these were required to match on both sides - but this was subsequently relaxed. These masks **should** be set to 0.

NOTE

To ensure that an acquire and release operation are valid, the release operation must happen-before the acquire operation. Often, semaphores are used for this directly, with the semaphore signaling after a release and then waiting before an acquire. `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` is the only valid stage to wait on or wait for these operations, as the acquire and release operations do not occur in a defined stage.

If the transfer is via an image memory barrier, and an [image layout transition](#) is desired, then the values of `oldLayout` and `newLayout` in the *release operation's* memory barrier **must** be equal to values of `oldLayout` and `newLayout` in the *acquire operation's* memory barrier. Although the image layout transition is submitted twice, it will only be executed once. A layout transition specified in this way happens-after the *release operation* and happens-before the *acquire operation*.

If the values of `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are equal, no ownership transfer is performed, and the barrier operates as if they were both set to `VK_QUEUE_FAMILY_IGNORED`.

Queue family ownership transfers **may** perform read and write accesses on all memory bound to the image subresource or buffer range, so applications **must** ensure that all memory writes have been made [available](#) before a queue family ownership transfer is executed. Available memory is automatically made visible to queue family release and acquire operations, and writes performed by those operations are automatically made available.

Once a queue family has acquired ownership of a buffer range or image subresource range of a `VK_SHARING_MODE_EXCLUSIVE` resource, its contents are undefined to other queue families unless ownership is transferred. The contents of any portion of another resource which aliases memory that is bound to the transferred buffer or image subresource range are undefined after a release or acquire operation.

NOTE

Because [events](#) **cannot** be used directly for inter-queue synchronization, and because `vkCmdSetEvent` does not have the queue family index or memory barrier parameters needed by a *release operation*, the release and acquire operations of a

queue family ownership transfer **can** only be performed using `vkCmdPipelineBarrier`.

7.8. Wait Idle Operations

To wait on the host for the completion of outstanding queue operations for a given queue, call:

```
// Provided by VK_VERSION_1_0
VkResult vkQueueWaitIdle(
    VkQueue queue);
```

- `queue` is the queue on which to wait.

`vkQueueWaitIdle` is equivalent to having submitted a valid fence to every previously executed `queue submission command` that accepts a fence, then waiting for all of those fences to signal using `vkWaitForFences` with an infinite timeout and `waitAll` set to `VK_TRUE`.

Even though `vkQueuePresentKHR` does not accept a fence, for the purpose of `vkQueueWaitIdle` it behaves as if it signals a fence payload that is managed by the implementation and has no associated `VkFence` handle. See the `vkQueuePresentKHR` documentation for details.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkQueueWaitIdle` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkQueueWaitIdle-queue-parameter `queue` **must** be a valid `VkQueue` handle

Host Synchronization

- Host access to `queue` **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
-	-	Any	-

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

To wait on the host for the completion of outstanding queue operations for all queues on a given logical device, call:

```
// Provided by VK_VERSION_1_0
VkResult vkDeviceWaitIdle(
    VkDevice device);
```

- `device` is the logical device to idle.

`vkDeviceWaitIdle` is equivalent to calling `vkQueueWaitIdle` for all queues owned by `device`.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkDeviceWaitIdle` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkDeviceWaitIdle-device-parameter `device` **must** be a valid `VkDevice` handle

Host Synchronization

- Host access to all `VkQueue` objects created from `device` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_DEVICE_LOST`

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

7.9. Host Write Ordering Guarantees

When batches of command buffers are submitted to a queue via a [queue submission command](#), it defines a memory dependency with prior host operations, and execution of command buffers submitted to the queue.

The first [synchronization scope](#) includes execution of `vkQueueSubmit` on the host and anything that happened-before it, as defined by the host memory model.

NOTE

Some systems allow writes that do not directly integrate with the host memory model; these have to be synchronized by the application manually. One example of this is non-temporal store instructions on x86; to ensure these happen-before submission, applications should call `_mm_sfence()`.

The second [synchronization scope](#) includes all commands submitted in the same [queue submission](#), and all commands that occur later in [submission order](#).

The first [access scope](#) includes all host writes to mappable device memory that are available to the host memory domain.

The second [access scope](#) includes all memory access performed by the device.

7.10. Synchronization and Multiple Physical Devices

If a logical device includes more than one physical device, then fences, semaphores, and events all still have a single instance of the signaled state.

A fence becomes signaled when all physical devices complete the necessary queue operations.

Semaphore wait and signal operations all include a device index that is the sole physical device that performs the operation. These indices are provided in the [VkDeviceGroupSubmitInfo](#) structures. Semaphores are not exclusively owned by any physical device. For example, a semaphore can be signaled by one physical device and then waited on by a different physical device.

An event **can** only be waited on by the same physical device that signaled it (or the host).

7.11. Calibrated Timestamps

In order to be able to correlate the time a particular operation took place at on timelines of different time domains (e.g. a device operation vs. a host operation), Vulkan allows querying calibrated timestamps from multiple time domains.

To query calibrated timestamps from a set of time domains, call:

```
// Provided by VK_KHR_calibrated_timestamps
VkResult vkGetCalibratedTimestampsKHR(
    VkDevice          device,
    uint32_t          timestampCount,
    const VkCalibratedTimestampInfoKHR* pTimestampInfos,
    uint64_t*          pTimestamps,
    uint64_t*          pMaxDeviation);
```

- **device** is the logical device used to perform the query.
- **timestampCount** is the number of timestamps to query.
- **pTimestampInfos** is a pointer to an array of **timestampCount** [VkCalibratedTimestampInfoKHR](#) structures, describing the time domains the calibrated timestamps should be captured from.
- **pTimestamps** is a pointer to an array of **timestampCount** 64-bit unsigned integer values in which the requested calibrated timestamp values are returned.
- **pMaxDeviation** is a pointer to a 64-bit unsigned integer value in which the strictly positive maximum deviation, in nanoseconds, of the calibrated timestamp values is returned.

NOTE

The maximum deviation **may** vary between calls to [vkGetCalibratedTimestampsKHR](#) even for the same set of time domains due to implementation and platform specific reasons. It is the application's responsibility to assess whether the returned maximum deviation makes the timestamp values suitable for any particular purpose and **can** choose to re-issue the timestamp calibration call pursuing a lower deviation value.

Calibrated timestamp values **can** be extrapolated to estimate future coinciding timestamp values, however, depending on the nature of the time domains and other properties of the platform extrapolating values over a sufficiently long period of time **may** no longer be accurate enough to fit any particular purpose, so applications are expected to re-calibrate the timestamps on a regular basis.

Valid Usage

- VUID-vkGetCalibratedTimestampsKHR-timeDomain-09246
The **timeDomain** value of each [VkCalibratedTimestampInfoKHR](#) in **pTimestampInfos** **must** be unique

If [VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations](#) is **VK_TRUE**, [vkGetCalibratedTimestampsKHR](#) **must** not return **VK_ERROR_OUT_OF_HOST_MEMORY**.

Valid Usage (Implicit)

- VUID-vkGetCalibratedTimestampsKHR-device-parameter

device **must** be a valid [VkDevice](#) handle

- VUID-vkGetCalibratedTimestampsKHR-pTimestampInfos-parameter
pTimestampInfos **must** be a valid pointer to an array of **timestampCount** valid [VkCalibratedTimestampInfoKHR](#) structures
- VUID-vkGetCalibratedTimestampsKHR-pTimestamps-parameter
pTimestamps **must** be a valid pointer to an array of **timestampCount** **uint64_t** values
- VUID-vkGetCalibratedTimestampsKHR-pMaxDeviation-parameter
pMaxDeviation **must** be a valid pointer to a **uint64_t** value
- VUID-vkGetCalibratedTimestampsKHR-timestampCount-arraylength
timestampCount **must** be greater than **0**

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_UNKNOWN**
- **VK_ERROR_VALIDATION_FAILED**

The [VkCalibratedTimestampInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_calibrated_timestamps
typedef struct VkCalibratedTimestampInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkTimeDomainKHR    timeDomain;
} VkCalibratedTimestampInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **timeDomain** is a [VkTimeDomainKHR](#) value specifying the time domain from which the calibrated timestamp value should be returned.

Valid Usage

- VUID-VkCalibratedTimestampInfoKHR-timeDomain-02354
timeDomain **must** be one of the [VkTimeDomainKHR](#) values returned by [vkGetPhysicalDeviceCalibrateableTimeDomainsKHR](#)

Valid Usage (Implicit)

- VUID-VkCalibratedTimestampInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_CALIBRATED_TIMESTAMP_INFO_KHR`
- VUID-VkCalibratedTimestampInfoKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkCalibratedTimestampInfoKHR-timeDomain-parameter
`timeDomain` **must** be a valid `VkTimeDomainKHR` value

The set of supported time domains consists of:

```
// Provided by VK_KHR_calibrated_timestamps
typedef enum VkTimeDomainKHR {
    VK_TIME_DOMAIN_DEVICE_KHR = 0,
    VK_TIME_DOMAIN_CLOCK_MONOTONIC_KHR = 1,
    VK_TIME_DOMAIN_CLOCK_MONOTONIC_RAW_KHR = 2,
    VK_TIME_DOMAIN_QUERY_PERFORMANCE_COUNTER_KHR = 3,
} VkTimeDomainKHR;
```

- `VK_TIME_DOMAIN_DEVICE_KHR` specifies the device time domain. Timestamp values in this time domain use the same units and are comparable with device timestamp values captured using `vkCmdWriteTimestamp` or `vkCmdWriteTimestamp2KHR` and are defined to be incrementing according to the `timestampPeriod` of the device.
- `VK_TIME_DOMAIN_CLOCK_MONOTONIC_KHR` specifies the `CLOCK_MONOTONIC` time domain available on POSIX platforms. Timestamp values in this time domain are in units of nanoseconds and are comparable with platform timestamp values captured using the POSIX `clock_gettime` API as computed by this example:

NOTE

An implementation supporting `VK_KHR_calibrated_timestamps` will use the same time domain for all its `VkQueue` so that timestamp values reported for `VK_TIME_DOMAIN_DEVICE_KHR` can be matched to any timestamp captured through `vkCmdWriteTimestamp` or `vkCmdWriteTimestamp2KHR`.

```
struct timespec tv;
clock_gettime(CLOCK_MONOTONIC, &tv);
return tv.tv_nsec + tv.tv_sec*1000000000ull;
```

- `VK_TIME_DOMAIN_CLOCK_MONOTONIC_RAW_KHR` specifies the `CLOCK_MONOTONIC_RAW` time domain available on POSIX platforms. Timestamp values in this time domain are in units of nanoseconds and are comparable with platform timestamp values captured using the POSIX `clock_gettime` API as computed by this example:

```
struct timespec tv;
clock_gettime(CLOCK_MONOTONIC_RAW, &tv);
```

```
return tv.tv_nsec + tv.tv_sec*1000000000ull;
```

- `VK_TIME_DOMAIN_QUERY_PERFORMANCE_COUNTER_KHR` specifies the performance counter (QPC) time domain available on Windows. Timestamp values in this time domain are in the same units as those provided by the Windows QueryPerformanceCounter API and are comparable with platform timestamp values captured using that API as computed by this example:

```
LARGE_INTEGER counter;  
QueryPerformanceCounter(&counter);  
return counter.QuadPart;
```

Chapter 8. Render Pass

Draw commands **must** be recorded within a *render pass instance*. Each render pass instance defines a set of image resources, referred to as *attachments*, used during rendering.

A render pass object represents a collection of attachments, subpasses, and dependencies between the subpasses, and describes how the attachments are used over the course of the subpasses.

Render passes are represented by **VkRenderPass** handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkRenderPass)
```

An *attachment description* describes the properties of an attachment including its format, sample count, and how its contents are treated at the beginning and end of each render pass instance.

A *subpass* represents a phase of rendering that reads and writes a subset of the attachments in a render pass. Rendering commands are recorded into a particular subpass of a render pass instance.

A *subpass description* describes the subset of attachments that is involved in the execution of a subpass. Each subpass **can** read from some attachments as *input attachments*, write to some as *color attachments* or *depth/stencil attachments*, and perform *multisample resolve operations* to *resolve attachments*. A subpass description **can** also include a set of *preserve attachments*, which are attachments that are not read or written by the subpass but whose contents **must** be preserved throughout the subpass.

A subpass *uses an attachment* if the attachment is a color, depth/stencil, resolve, depth/stencil resolve, fragment shading rate, or input attachment for that subpass (as determined by the **pColorAttachments**, **pDepthStencilAttachment**, **pResolveAttachments**, **VkSubpassDescriptionDepthStencilResolve::pDepthStencilResolveAttachment**, **VkFragmentShadingRateAttachmentInfoKHR::pFragmentShadingRateAttachment->attachment**, and **pInputAttachments** members of **VkSubpassDescription**, respectively). A subpass does not use an attachment if that attachment is preserved by the subpass. The *first use of an attachment* is in the lowest numbered subpass that uses that attachment. Similarly, the *last use of an attachment* is in the highest numbered subpass that uses that attachment.

The subpasses in a render pass all render to the same dimensions, and fragments for pixel (x,y,layer) in one subpass **can** only read attachment contents written by previous subpasses at that same (x,y,layer) location. For multi-pixel fragments, the pixel read from an input attachment is selected from the pixels covered by that fragment in an implementation-dependent manner. However, this selection **must** be made consistently for any fragment with the same shading rate for the lifetime of the **VkDevice**.

NOTE

By describing a complete set of subpasses in advance, render passes provide the implementation an opportunity to optimize the storage and transfer of attachment data between subpasses.

In practice, this means that subpasses with a simple framebuffer-space dependency

may be merged into a single tiled rendering pass, keeping the attachment data on-chip for the duration of a render pass instance. However, it is also quite common for a render pass to only contain a single subpass.

Subpass dependencies describe [execution and memory dependencies](#) between subpasses.

A *subpass dependency chain* is a sequence of subpass dependencies in a render pass, where the source subpass of each subpass dependency (after the first) equals the destination subpass of the previous dependency.

Execution of subpasses **may** overlap or execute out of order with regards to other subpasses, unless otherwise enforced by an execution dependency. Each subpass only respects [submission order](#) for commands recorded in the same subpass, and the [vkCmdBeginRenderPass](#) and [vkCmdEndRenderPass](#) commands that delimit the render pass - commands within other subpasses are not included. This affects most other [implicit ordering guarantees](#).

A render pass describes the structure of subpasses and attachments independent of any specific image views for the attachments. The specific image views that will be used for the attachments, and their dimensions, are specified in [VkFramebuffer](#) objects. Framebuffers are created with respect to a specific render pass that the framebuffer is compatible with (see [Render Pass Compatibility](#)). Collectively, a render pass and a framebuffer define the complete render target state for one or more subpasses as well as the algorithmic dependencies between the subpasses.

The various pipeline stages of the drawing commands for a given subpass **may** execute concurrently and/or out of order, both within and across drawing commands, whilst still respecting [pipeline order](#). However for a given (x,y,layer,sample) sample location, certain per-sample operations are performed in [rasterization order](#).

[VK_ATTACHMENT_UNUSED](#) is a constant indicating that a render pass attachment is not used.

```
#define VK_ATTACHMENT_UNUSED (~0U)
```

8.1. Render Pass Creation

To create a render pass, call:

WARNING

This functionality is superseded by [Vulkan Version 1.2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
VkResult vkCreateRenderPass(
    VkDevice                                device,
    const VkRenderPassCreateInfo*          pCreateInfo,
    const VkAllocationCallbacks*          pAllocator,
    VkRenderPass*                          pRenderPass);
```

- [device](#) is the logical device that creates the render pass.

- `pCreateInfo` is a pointer to a `VkRenderPassCreateInfo` structure describing the parameters of the render pass.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pRenderPass` is a pointer to a `VkRenderPass` handle in which the resulting render pass object is returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkCreateRenderPass` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkCreateRenderPass-device-10000
`device` **must** support at least one queue family with the `VK_QUEUE_GRAPHICS_BIT` capability
- VUID-vkCreateRenderPass-device-05068
The number of render passes currently allocated from `device` plus 1 **must** be less than or equal to the total number of render passes requested via `VkDeviceObjectReservationCreateInfo::renderPassRequestCount` specified when `device` was created
- VUID-vkCreateRenderPass-subpasses-device-05089
The number of subpasses currently allocated from `device` across all `VkRenderPass` objects plus `pCreateInfo->subpassCount` **must** be less than or equal to the total number of subpasses requested via `VkDeviceObjectReservationCreateInfo::subpassDescriptionRequestCount` specified when `device` was created
- VUID-vkCreateRenderPass-attachments-device-05089
The number of attachments currently allocated from `device` across all `VkRenderPass` objects plus `pCreateInfo->attachmentCount` **must** be less than or equal to the total number of attachments requested via `VkDeviceObjectReservationCreateInfo::attachmentDescriptionRequestCount` specified when `device` was created

Valid Usage (Implicit)

- VUID-vkCreateRenderPass-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCreateRenderPass-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkRenderPassCreateInfo` structure
- VUID-vkCreateRenderPass-pAllocator-null
`pAllocator` **must** be `NULL`
- VUID-vkCreateRenderPass-pRenderPass-parameter
`pRenderPass` **must** be a valid pointer to a `VkRenderPass` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkRenderPassCreateInfo` structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef struct VkRenderPassCreateInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkRenderPassCreateFlags flags;
    uint32_t             attachmentCount;
    const VkAttachmentDescription* pAttachments;
    uint32_t             subpassCount;
    const VkSubpassDescription* pSubpasses;
    uint32_t             dependencyCount;
    const VkSubpassDependency* pDependencies;
} VkRenderPassCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `attachmentCount` is the number of attachments used by this render pass.
- `pAttachments` is a pointer to an array of `attachmentCount` `VkAttachmentDescription` structures describing the attachments used by the render pass.
- `subpassCount` is the number of subpasses to create.
- `pSubpasses` is a pointer to an array of `subpassCount` `VkSubpassDescription` structures describing each subpass.
- `dependencyCount` is the number of memory dependencies between pairs of subpasses.
- `pDependencies` is a pointer to an array of `dependencyCount` `VkSubpassDependency` structures describing dependencies between pairs of subpasses.

NOTE

Care should be taken to avoid a data race here; if any subpasses access attachments with overlapping memory locations, and one of those accesses is a write, a subpass dependency needs to be included between them.

Valid Usage

- VUID-VkRenderPassCreateInfo-attachment-00834

If the `attachment` member of any element of `pInputAttachments`, `pColorAttachments`, `pResolveAttachments` or `pDepthStencilAttachment`, or any element of `pPreserveAttachments` in any element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED`, then it **must** be less than `attachmentCount`

- VUID-VkRenderPassCreateInfo-pAttachments-00836

For any member of `pAttachments` with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkRenderPassCreateInfo-pAttachments-02511

For any member of `pAttachments` with a `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkRenderPassCreateInfo-pAttachments-01566

For any member of `pAttachments` with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`

- VUID-VkRenderPassCreateInfo-pAttachments-01567

For any member of `pAttachments` with a `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkRenderPassCreateInfo-pNext-01926

If the `pNext` chain includes a `VkRenderPassInputAttachmentAspectCreateInfo` structure, the `subpass` member of each element of its `pAspectReferences` member **must** be less than `subpassCount`

- VUID-VkRenderPassCreateInfo-pNext-01927

If the `pNext` chain includes a `VkRenderPassInputAttachmentAspectCreateInfo` structure, the `inputAttachmentIndex` member of each element of its `pAspectReferences` member **must** be less than the value of `inputAttachmentCount` in the element of `pSubpasses` identified by its `subpass` member

- VUID-VkRenderPassCreateInfo-pNext-01963

If the `pNext` chain includes a `VkRenderPassInputAttachmentAspectCreateInfo` structure, for any element of the `pInputAttachments` member of any element of `pSubpasses` where the `attachment` member is not `VK_ATTACHMENT_UNUSED`, the `aspectMask` member of the corresponding element of `VkRenderPassInputAttachmentAspectCreateInfo::pAspectReferences` **must** only include aspects that are present in images of the format

specified by the element of `pAttachments` at `attachment`

- VUID-VkRenderPassCreateInfo-pNext-01928

If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, and its `subpassCount` member is not zero, that member **must** be equal to the value of `subpassCount`

- VUID-VkRenderPassCreateInfo-pNext-01929

If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, if its `dependencyCount` member is not zero, it **must** be equal to `dependencyCount`

- VUID-VkRenderPassCreateInfo-pNext-01930

If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, for each non-zero element of `pViewOffsets`, the `srcSubpass` and `dstSubpass` members of `pDependencies` at the same index **must** not be equal

- VUID-VkRenderPassCreateInfo-pNext-02512

If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, for any element of `pDependencies` with a `dependencyFlags` member that does not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`, the corresponding element of the `pViewOffsets` member of that `VkRenderPassMultiviewCreateInfo` instance **must** be 0

- VUID-VkRenderPassCreateInfo-pNext-02513

If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, elements of its `pViewMasks` member **must** either all be 0, or all not be 0

- VUID-VkRenderPassCreateInfo-pNext-02514

If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, and each element of its `pViewMasks` member is 0, the `dependencyFlags` member of each element of `pDependencies` **must** not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`

- VUID-VkRenderPassCreateInfo-pNext-02515

If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, and each element of its `pViewMasks` member is 0, its `correlationMaskCount` member **must** be 0

- VUID-VkRenderPassCreateInfo-pDependencies-00837

For any element of `pDependencies`, if the `srcSubpass` is not `VK_SUBPASS_EXTERNAL`, all stage flags included in the `srcStageMask` member of that dependency **must** be `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` or a pipeline stage supported by the `pipeline` identified by the `pipelineBindPoint` member of the source subpass

- VUID-VkRenderPassCreateInfo-pDependencies-00838

For any element of `pDependencies`, if the `dstSubpass` is not `VK_SUBPASS_EXTERNAL`, all stage flags included in the `dstStageMask` member of that dependency **must** be `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` or a pipeline stage supported by the `pipeline` identified by the `pipelineBindPoint` member of the destination subpass

- VUID-VkRenderPassCreateInfo-pDependencies-06866

For any element of `pDependencies`, if its `srcSubpass` is not `VK_SUBPASS_EXTERNAL`, it **must** be less than `subpassCount`

- VUID-VkRenderPassCreateInfo-pDependencies-06867

For any element of `pDependencies`, if its `dstSubpass` is not `VK_SUBPASS_EXTERNAL`, it **must** be less than `subpassCount`

- VUID-VkRenderPassCreateInfo-subpassCount-05050

`subpassCount` **must** be less than or equal to `maxRenderPassSubpasses`

- VUID-VkRenderPassCreateInfo-dependencyCount-05051
`dependencyCount` **must** be less than or equal to `maxRenderPassDependencies`
- VUID-VkRenderPassCreateInfo-attachmentCount-05052
`attachmentCount` **must** be less than or equal to `maxFramebufferAttachments`
- VUID-VkRenderPassCreateInfo-None-10915

If any subpass preserves an attachment, there **must** be a subpass dependency from a prior subpass which uses or preserves that attachment

Valid Usage (Implicit)

- VUID-VkRenderPassCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_CREATE_INFO`
- VUID-VkRenderPassCreateInfo-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkRenderPassInputAttachmentAspectCreateInfo` or `VkRenderPassMultiviewCreateInfo`
- VUID-VkRenderPassCreateInfo-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkRenderPassCreateInfo-flags-zerobitmask
`flags` **must** be `0`
- VUID-VkRenderPassCreateInfo-pAttachments-parameter
If `attachmentCount` is not `0`, `pAttachments` **must** be a valid pointer to an array of `attachmentCount` valid `VkAttachmentDescription` structures
- VUID-VkRenderPassCreateInfo-pSubpasses-parameter
`pSubpasses` **must** be a valid pointer to an array of `subpassCount` valid `VkSubpassDescription` structures
- VUID-VkRenderPassCreateInfo-pDependencies-parameter
If `dependencyCount` is not `0`, `pDependencies` **must** be a valid pointer to an array of `dependencyCount` valid `VkSubpassDependency` structures
- VUID-VkRenderPassCreateInfo-subpassCount-arraylength
`subpassCount` **must** be greater than `0`

Bits which **can** be set in `VkRenderPassCreateInfo::flags`, describing additional properties of the render pass, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkRenderPassCreateFlagBits {
} VkRenderPassCreateFlagBits;
```

NOTE

All bits for this type are defined by extensions, and none of those extensions are

enabled in this build of the specification.

WARNING

This functionality is superseded by [Vulkan Version 1.2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkRenderPassCreateFlags;
```

`VkRenderPassCreateFlags` is a bitmask type for setting a mask of zero or more `VkRenderPassCreateFlagBits`.

If the `VkRenderPassCreateInfo::pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, then that structure includes an array of view masks, view offsets, and correlation masks for the render pass.

The `VkRenderPassMultiviewCreateInfo` structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_1
typedef struct VkRenderPassMultiviewCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           subpassCount;
    const uint32_t*     pViewMasks;
    uint32_t           dependencyCount;
    const int32_t*      pViewOffsets;
    uint32_t           correlationMaskCount;
    const uint32_t*     pCorrelationMasks;
} VkRenderPassMultiviewCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `subpassCount` is zero or the number of subpasses in the render pass.
- `pViewMasks` is a pointer to an array of `subpassCount` view masks, where each mask is a bitfield of view indices describing which views rendering is broadcast to in each subpass, when multiview is enabled. If `subpassCount` is zero, each view mask is treated as zero.
- `dependencyCount` is zero or the number of dependencies in the render pass.
- `pViewOffsets` is a pointer to an array of `dependencyCount` view offsets, one for each dependency. If `dependencyCount` is zero, each dependency's view offset is treated as zero. Each view offset controls which views in the source subpass the views in the destination subpass depend on.
- `correlationMaskCount` is zero or the number of correlation masks.
- `pCorrelationMasks` is a pointer to an array of `correlationMaskCount` view masks indicating sets of

views that **may** be more efficient to render concurrently.

When a subpass uses a non-zero view mask, *multiview* functionality is considered to be enabled. Multiview is all-or-nothing for a render pass - that is, either all subpasses **must** have a non-zero view mask (though some subpasses **may** have only one view) or all **must** be zero. Multiview causes all drawing and clear commands in the subpass to behave as if they were broadcast to each view, where a view is represented by one layer of the framebuffer attachments. All draws and clears are broadcast to each *view index* whose bit is set in the view mask. The view index is provided in the *ViewIndex* shader input variable, and color, depth/stencil, and input attachments all read/write the layer of the framebuffer corresponding to the view index.

If the view mask is zero for all subpasses, multiview is considered to be disabled and all drawing commands execute normally, without this additional broadcasting.

Some implementations **may** not support multiview in conjunction with *geometry shaders* or *tessellation shaders*.

When multiview is enabled, the *VK_DEPENDENCY_VIEW_LOCAL_BIT* bit in a dependency **can** be used to express a view-local dependency, meaning that each view in the destination subpass depends on a single view in the source subpass. Unlike pipeline barriers, a subpass dependency **can** potentially have a different view mask in the source subpass and the destination subpass. If the dependency is view-local, then each view (*dstView*) in the destination subpass depends on the view *dstView + pViewOffsets[dependency]* in the source subpass. If there is not such a view in the source subpass, then this dependency does not affect that view in the destination subpass. If the dependency is not view-local, then all views in the destination subpass depend on all views in the source subpass, and the view offset is ignored. A non-zero view offset is not allowed in a self-dependency.

The elements of *pCorrelationMasks* are a set of masks of views indicating that views in the same mask **may** exhibit spatial coherency between the views, making it more efficient to render them concurrently. Correlation masks **must** not have a functional effect on the results of the multiview rendering.

When multiview is enabled, at the beginning of each subpass all non-render pass state is undefined. In particular, each time *vkCmdBeginRenderPass* or *vkCmdNextSubpass* is called the graphics pipeline **must** be bound, any relevant descriptor sets or vertex/index buffers **must** be bound, and any relevant dynamic state or push constants **must** be set before they are used.

Valid Usage

- VUID-VkRenderPassMultiviewCreateInfo-pCorrelationMasks-00841
Each view index **must** not be set in more than one element of *pCorrelationMasks*
- VUID-VkRenderPassMultiviewCreateInfo-multiview-06555
If the *multiview* feature is not enabled, each element of *pViewMasks* **must** be 0
- VUID-VkRenderPassMultiviewCreateInfo-pViewMasks-06697
The index of the most significant bit in each element of *pViewMasks* **must** be less than *maxMultiviewViewCount*

Valid Usage (Implicit)

- VUID-VkRenderPassMultiviewCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_MULTIVIEW_CREATE_INFO`
- VUID-VkRenderPassMultiviewCreateInfo-pViewMasks-parameter
If `subpassCount` is not 0, `pViewMasks` **must** be a valid pointer to an array of `subpassCount` `uint32_t` values
- VUID-VkRenderPassMultiviewCreateInfo-pViewOffsets-parameter
If `dependencyCount` is not 0, `pViewOffsets` **must** be a valid pointer to an array of `dependencyCount` `int32_t` values
- VUID-VkRenderPassMultiviewCreateInfo-pCorrelationMasks-parameter
If `correlationMaskCount` is not 0, `pCorrelationMasks` **must** be a valid pointer to an array of `correlationMaskCount` `uint32_t` values

The `VkAttachmentDescription` structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef struct VkAttachmentDescription {
    VkAttachmentDescriptionFlags    flags;
    VkFormat                       format;
    VkSampleCountFlagBits          samples;
    VkAttachmentLoadOp              loadOp;
    VkAttachmentStoreOp             storeOp;
    VkAttachmentLoadOp              stencilLoadOp;
    VkAttachmentStoreOp             stencilStoreOp;
    VkImageLayout                   initialLayout;
    VkImageLayout                   finalLayout;
} VkAttachmentDescription;
```

- `flags` is a bitmask of `VkAttachmentDescriptionFlagBits` specifying additional properties of the attachment.
- `format` is a `VkFormat` value specifying the format of the image view that will be used for the attachment.
- `samples` is a `VkSampleCountFlagBits` value specifying the number of samples of the image.
- `loadOp` is a `VkAttachmentLoadOp` value specifying how the contents of color and depth components of the attachment are treated at the beginning of the subpass where it is first used.
- `storeOp` is a `VkAttachmentStoreOp` value specifying how the contents of color and depth components of the attachment are treated at the end of the subpass where it is last used.
- `stencilLoadOp` is a `VkAttachmentLoadOp` value specifying how the contents of stencil components of the attachment are treated at the beginning of the subpass where it is first used.

- `stencilStoreOp` is a `VkAttachmentStoreOp` value specifying how the contents of stencil components of the attachment are treated at the end of the last subpass where it is used.
- `initialLayout` is the layout the attachment image subresource will be in when a render pass instance begins.
- `finalLayout` is the layout the attachment image subresource will be transitioned to when a render pass instance ends.

If the attachment uses a color format, then `loadOp` and `storeOp` are used, and `stencilLoadOp` and `stencilStoreOp` are ignored. If the format has depth and/or stencil components, `loadOp` and `storeOp` apply only to the depth data, while `stencilLoadOp` and `stencilStoreOp` define how the stencil data is handled. `loadOp` and `stencilLoadOp` define the `load operations` for the attachment. `storeOp` and `stencilStoreOp` define the `store operations` for the attachment. If an attachment is not used by any subpass, `loadOp`, `storeOp`, `stencilStoreOp`, and `stencilLoadOp` will be ignored for that attachment, and no load or store ops will be performed. However, any transition specified by `initialLayout` and `finalLayout` will still be executed.

If `flags` includes `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT`, then the attachment is treated as if it shares physical memory with another attachment in the same render pass. This information limits the ability of the implementation to reorder certain operations (like layout transitions and the `loadOp`) such that it is not improperly reordered against other uses of the same physical memory via a different attachment. This is described in more detail below.

If a render pass uses multiple attachments that alias the same device memory, those attachments **must** each include the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` bit in their attachment description flags. Attachments aliasing the same memory occurs in multiple ways:

- Multiple attachments being assigned the same image view as part of framebuffer creation.
- Attachments using distinct image views that correspond to the same image subresource of an image.
- Attachments using views of distinct image subresources which are bound to overlapping memory ranges.

NOTE

Render passes **must** include subpass dependencies (either directly or via a subpass dependency chain) between any two subpasses that operate on the same attachment or aliasing attachments and those subpass dependencies **must** include execution and memory dependencies separating uses of the aliases, if at least one of those subpasses writes to one of the aliases. These dependencies **must** not include the `VK_DEPENDENCY_BY_REGION_BIT` if the aliases are views of distinct image subresources which overlap in memory.

Multiple attachments that alias the same memory **must** not be used in a single subpass. A given attachment index **must** not be used multiple times in a single subpass, with one exception: two subpass attachments **can** use the same attachment index if at least one use is as an input attachment and neither use is as a resolve or preserve attachment. In other words, the same view **can** be used simultaneously as an input and color or depth/stencil attachment, but **must** not be used as multiple color or depth/stencil attachments nor as resolve or preserve attachments.

If a set of attachments alias each other, then all except the first to be used in the render pass **must** use an `initialLayout` of `VK_IMAGE_LAYOUT_UNDEFINED`, since the earlier uses of the other aliases make their contents undefined. Once an alias has been used and a different alias has been used after it, the first alias **must** not be used in any later subpasses. However, an application **can** assign the same image view to multiple aliasing attachment indices, which allows that image view to be used multiple times even if other aliases are used in between.

NOTE

Once an attachment needs the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` bit, there **should** be no additional cost of introducing additional aliases, and using these additional aliases **may** allow more efficient clearing of the attachments on multiple uses via `VK_ATTACHMENT_LOAD_OP_CLEAR`.

Valid Usage

- VUID-VkAttachmentDescription-format-06699
If `format` includes a color or depth component and `loadOp` is `VK_ATTACHMENT_LOAD_OP_LOAD`, then `initialLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED`
- VUID-VkAttachmentDescription-finalLayout-00843
`finalLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`
- VUID-VkAttachmentDescription-format-03280
If `format` is a color format, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkAttachmentDescription-format-03281
If `format` is a depth/stencil format, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`
- VUID-VkAttachmentDescription-format-03282
If `format` is a color format, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkAttachmentDescription-format-03283
If `format` is a depth/stencil format, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`
- VUID-VkAttachmentDescription-format-06487
If `format` is a color format, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`
- VUID-VkAttachmentDescription-format-06488
If `format` is a color format, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`
- VUID-VkAttachmentDescription-separateDepthStencilLayouts-03284
If the `separateDepthStencilLayouts` feature is not enabled, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`,

VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL,

- VUID-VkAttachmentDescription-separateDepthStencilLayouts-03285

If the `separateDepthStencilLayouts` feature is not enabled, `finalLayout` **must** not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL,

- VUID-VkAttachmentDescription-format-03286

If `format` is a color format, `initialLayout` **must** not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkAttachmentDescription-format-03287

If `format` is a color format, `finalLayout` **must** not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkAttachmentDescription-format-06906

If `format` is a depth/stencil format which includes both depth and stencil components,
`initialLayout` **must** not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkAttachmentDescription-format-06907

If `format` is a depth/stencil format which includes both depth and stencil components,
`finalLayout` **must** not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkAttachmentDescription-format-03290

If `format` is a depth/stencil format which includes only the depth component,
`initialLayout` **must** not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkAttachmentDescription-format-03291

If `format` is a depth/stencil format which includes only the depth component, `finalLayout`
must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkAttachmentDescription-synchronization2-06908

If the `synchronization2` feature is not enabled, `initialLayout` **must** not be
VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- VUID-VkAttachmentDescription-synchronization2-06909

If the `synchronization2` feature is not enabled, `finalLayout` **must** not be
VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- VUID-VkAttachmentDescription-samples-08745

`samples` **must** be a valid `VkSampleCountFlagBits` value that is set in
`imageCreateSampleCounts` (as defined in [Image Creation Limits](#)) for the given `format`

- VUID-VkAttachmentDescription-format-06698

format **must** not be `VK_FORMAT_UNDEFINED`

- VUID-VkAttachmentDescription-format-06700

If **format** includes a stencil component and **stencilLoadOp** is `VK_ATTACHMENT_LOAD_OP_LOAD`, then **initialLayout** **must** not be `VK_IMAGE_LAYOUT_UNDEFINED`

- VUID-VkAttachmentDescription-format-03292

If **format** is a depth/stencil format which includes only the stencil component, **initialLayout** **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`

- VUID-VkAttachmentDescription-format-03293

If **format** is a depth/stencil format which includes only the stencil component, **finalLayout** **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`

- VUID-VkAttachmentDescription-format-06242

If **format** is a depth/stencil format which includes both depth and stencil components, **initialLayout** **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`

- VUID-VkAttachmentDescription-format-06243

If **format** is a depth/stencil format which includes both depth and stencil components, **finalLayout** **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`

Valid Usage (Implicit)

- VUID-VkAttachmentDescription-flags-parameter

flags **must** be a valid combination of `VkAttachmentDescriptionFlagBits` values

- VUID-VkAttachmentDescription-format-parameter

format **must** be a valid `VkFormat` value

- VUID-VkAttachmentDescription-samples-parameter

samples **must** be a valid `VkSampleCountFlagBits` value

- VUID-VkAttachmentDescription-loadOp-parameter

loadOp **must** be a valid `VkAttachmentLoadOp` value

- VUID-VkAttachmentDescription-storeOp-parameter

storeOp **must** be a valid `VkAttachmentStoreOp` value

- VUID-VkAttachmentDescription-stencilLoadOp-parameter

stencilLoadOp **must** be a valid `VkAttachmentLoadOp` value

- VUID-VkAttachmentDescription-stencilStoreOp-parameter

stencilStoreOp **must** be a valid `VkAttachmentStoreOp` value

- VUID-VkAttachmentDescription-initialLayout-parameter

initialLayout **must** be a valid `VkImageLayout` value

- VUID-VkAttachmentDescription-finalLayout-parameter

finalLayout **must** be a valid `VkImageLayout` value

Bits which **can** be set in `VkAttachmentDescription::flags`, describing additional properties of the attachment, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkAttachmentDescriptionFlagBits {
    VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT = 0x00000001,
} VkAttachmentDescriptionFlagBits;
```

- `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` specifies that the attachment aliases the same device memory as other attachments.

WARNING

This functionality is superseded by [Vulkan Version 1.2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkAttachmentDescriptionFlags;
```

`VkAttachmentDescriptionFlags` is a bitmask type for setting a mask of zero or more `VkAttachmentDescriptionFlagBits`.

The `VkRenderPassInputAttachmentAspectCreateInfo` structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_1
typedef struct VkRenderPassInputAttachmentAspectCreateInfo {
    VkStructureType             sType;
    const void*                 pNext;
    uint32_t                    aspectReferenceCount;
    const VkInputAttachmentAspectReference* pAspectReferences;
} VkRenderPassInputAttachmentAspectCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `aspectReferenceCount` is the number of elements in the `pAspectReferences` array.
- `pAspectReferences` is a pointer to an array of `aspectReferenceCount` `VkInputAttachmentAspectReference` structures containing a mask describing which aspect(s) **can** be accessed for a given input attachment within a given subpass.

To specify which aspects of an input attachment **can** be read, add a `VkRenderPassInputAttachmentAspectCreateInfo` structure to the `pNext` chain of the `VkRenderPassCreateInfo` structure:

An application **can** access any aspect of an input attachment that does not have a specified aspect

mask in the `pAspectReferences` array. Otherwise, an application **must** not access aspect(s) of an input attachment other than those in its specified aspect mask.

Valid Usage (Implicit)

- VUID-VkRenderPassInputAttachmentAspectCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_INPUT_ATTACHMENT_ASPECT_CREATE_INFO`
- VUID-VkRenderPassInputAttachmentAspectCreateInfo-pAspectReferences-parameter
`pAspectReferences` **must** be a valid pointer to an array of `aspectReferenceCount` valid `VkInputAttachmentAspectReference` structures
- VUID-VkRenderPassInputAttachmentAspectCreateInfo-aspectReferenceCount-arraylength
`aspectReferenceCount` **must** be greater than 0

The `VkInputAttachmentAspectReference` structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_1
typedef struct VkInputAttachmentAspectReference {
    uint32_t          subpass;
    uint32_t          inputAttachmentIndex;
    VkImageAspectFlags aspectMask;
} VkInputAttachmentAspectReference;
```

- `subpass` is an index into the `pSubpasses` array of the parent `VkRenderPassCreateInfo` structure.
- `inputAttachmentIndex` is an index into the `pInputAttachments` of the specified subpass.
- `aspectMask` is a mask of which aspect(s) **can** be accessed within the specified subpass.

This structure specifies an aspect mask for a specific input attachment of a specific subpass in the render pass.

`subpass` and `inputAttachmentIndex` index into the render pass as:

```
pCreateInfo->pSubpasses[subpass].pInputAttachments[inputAttachmentIndex]
```

Valid Usage

- VUID-VkInputAttachmentAspectReference-aspectMask-01964
`aspectMask` **must** not include `VK_IMAGE_ASPECT_METADATA_BIT`
- VUID-VkInputAttachmentAspectReference-aspectMask-02250
`aspectMask` **must** not include `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT` for any index *i*

Valid Usage (Implicit)

- VUID-VkInputAttachmentAspectReference-aspectMask-parameter **aspectMask** must be a valid combination of [VkImageAspectFlagBits](#) values
- VUID-VkInputAttachmentAspectReference-aspectMask-requiredbitmask **aspectMask** must not be 0

The [VkSubpassDescription](#) structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef struct VkSubpassDescription {
    VkSubpassDescriptionFlags    flags;
    VkPipelineBindPoint          pipelineBindPoint;
    uint32_t                     inputAttachmentCount;
    const VkAttachmentReference* pInputAttachments;
    uint32_t                     colorAttachmentCount;
    const VkAttachmentReference* pColorAttachments;
    const VkAttachmentReference* pResolveAttachments;
    const VkAttachmentReference* pDepthStencilAttachment;
    uint32_t                     preserveAttachmentCount;
    const uint32_t*              pPreserveAttachments;
} VkSubpassDescription;
```

- **flags** is a bitmask of [VkSubpassDescriptionFlagBits](#) specifying usage of the subpass.
- **pipelineBindPoint** is a [VkPipelineBindPoint](#) value specifying the pipeline type supported for this subpass.
- **inputAttachmentCount** is the number of input attachments.
- **pInputAttachments** is a pointer to an array of [VkAttachmentReference](#) structures defining the input attachments for this subpass and their layouts.
- **colorAttachmentCount** is the number of color attachments.
- **pColorAttachments** is a pointer to an array of **colorAttachmentCount** [VkAttachmentReference](#) structures defining the color attachments for this subpass and their layouts.
- **pResolveAttachments** is **NULL** or a pointer to an array of **colorAttachmentCount** [VkAttachmentReference](#) structures defining the resolve attachments for this subpass and their layouts.
- **pDepthStencilAttachment** is a pointer to a [VkAttachmentReference](#) structure specifying the depth/stencil attachment for this subpass and its layout.
- **preserveAttachmentCount** is the number of preserved attachments.
- **pPreserveAttachments** is a pointer to an array of **preserveAttachmentCount** render pass attachment

indices identifying attachments that are not used by this subpass, but whose contents **must** be preserved throughout the subpass.

Each element of the `pInputAttachments` array corresponds to an input attachment index in a fragment shader, i.e. if a shader declares an image variable decorated with a `InputAttachmentIndex` value of `X`, then it uses the attachment provided in `pInputAttachments[X]`. Input attachments **must** also be bound to the pipeline in a descriptor set. If the `attachment` member of any element of `pInputAttachments` is `VK_ATTACHMENT_UNUSED`, the application **must** not read from the corresponding input attachment index. Fragment shaders **can** use subpass input variables to access the contents of an input attachment at the fragment's (x_f, y_f) framebuffer coordinates and layer.

Each element of the `pColorAttachments` array corresponds to an output location in the shader, i.e. if the shader declares an output variable decorated with a `Location` value of `X`, then it uses the attachment provided in `pColorAttachments[X]`. If the `attachment` member of any element of `pColorAttachments` is `VK_ATTACHMENT_UNUSED`, or if `Color Write Enable` has been disabled for the corresponding attachment index, then writes to the corresponding location by a fragment shader are discarded.

If `pResolveAttachments` is not `NULL`, each of its elements corresponds to a color attachment (the element in `pColorAttachments` at the same index), and a `multisample resolve operation` is defined for each attachment unless the resolve attachment index is `VK_ATTACHMENT_UNUSED`.

Similarly, if `VkSubpassDescriptionDepthStencilResolve::pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, it corresponds to the depth/stencil attachment in `pDepthStencilAttachment`, and `multisample resolve operation` for depth and stencil are defined by `VkSubpassDescriptionDepthStencilResolve::depthResolveMode` and `VkSubpassDescriptionDepthStencilResolve::stencilResolveMode`, respectively. If `VkSubpassDescriptionDepthStencilResolve::depthResolveMode` is `VK_RESOLVE_MODE_NONE` or the `pDepthStencilResolveAttachment` does not have a depth aspect, no resolve operation is performed for the depth attachment. If `VkSubpassDescriptionDepthStencilResolve::stencilResolveMode` is `VK_RESOLVE_MODE_NONE` or the `pDepthStencilResolveAttachment` does not have a stencil aspect, no resolve operation is performed for the stencil attachment.

If the image subresource range referenced by the depth/stencil attachment is created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT`, then the `multisample resolve operation` uses the sample locations state specified in the `sampleLocationsInfo` member of the element of the `VkRenderPassSampleLocationsBeginInfoEXT::pPostSubpassSampleLocations` for the subpass.

If `pDepthStencilAttachment` is `NULL`, or if its attachment index is `VK_ATTACHMENT_UNUSED`, it indicates that no depth/stencil attachment will be used in the subpass.

The contents of an attachment within the render area become undefined at the start of a subpass `S` if all of the following conditions are true:

- The attachment is used as a color, depth/stencil, or resolve attachment in any subpass in the render pass.
- There is a subpass `S1` that uses or preserves the attachment, and a subpass dependency from `S1` to `S`.

- The attachment is not used or preserved in subpass **S**.

For color attachments, this operation will be performed in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage, with any image accesses performed via `VK_ACCESS_INPUT_ATTACHMENT_READ_BIT`, `VK_ACCESS_COLOR_ATTACHMENT_READ_BIT`, and `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`. For depth/stencil attachments, this operation **may** be performed in either the `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` or `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` pipeline stage, with any image accesses performed via `VK_ACCESS_INPUT_ATTACHMENT_READ_BIT`, `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT`, and `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`.

Once the contents of an attachment become undefined in subpass **S**, they remain undefined for subpasses in subpass dependency chains starting with subpass **S** until they are written again. However, they remain valid for subpasses in other subpass dependency chains starting with subpass **S**₁ if all subpasses in each chain use or preserve the attachment.

NOTE

If a subpass has multiple dependency chains where some of the chains preserve the attachment, and others do not, the contents of the attachment are undefined for that subpass.

Valid Usage

- VUID-VkSubpassDescription-attachment-06912

If the `attachment` member of an element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`

- VUID-VkSubpassDescription-attachment-06913

If the `attachment` member of an element of `pColorAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`

- VUID-VkSubpassDescription-attachment-06914

If the `attachment` member of an element of `pResolveAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`

- VUID-VkSubpassDescription-attachment-06915

If the `attachment` member of `pDepthStencilAttachment` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`

- VUID-VkSubpassDescription-attachment-06916

If the `attachment` member of an element of `pColorAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`

- VUID-VkSubpassDescription-attachment-06917

If the `attachment` member of an element of `pResolveAttachments` is not

VK_ATTACHMENT_UNUSED, its layout member **must** not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

- VUID-VkSubpassDescription-attachment-06918

If the `attachment` member of an element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`

- VUID-VkSubpassDescription-attachment-06919

If the `attachment` member of an element of `pColorAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkSubpassDescription-attachment-06920

If the `attachment` member of an element of `pResolveAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkSubpassDescription-attachment-06921

If the `attachment` member of an element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR`

- VUID-VkSubpassDescription-attachment-06922

If the `attachment` member of an element of `pColorAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`

- VUID-VkSubpassDescription-attachment-06923

If the `attachment` member of an element of `pResolveAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`

- VUID-VkSubpassDescription-pipelineBindPoint-04952

`pipelineBindPoint` **must** be `VK_PIPELINE_BIND_POINT_GRAPHICS`

- VUID-VkSubpassDescription-colorAttachmentCount-00845

`colorAttachmentCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxColorAttachments`

- VUID-VkSubpassDescription-loadOp-00846

If the first use of an attachment in this render pass is as an input attachment, and the attachment is not also used as a color or depth/stencil attachment in the same subpass, then `loadOp` **must** not be `VK_ATTACHMENT_LOAD_OP_CLEAR`

- VUID-VkSubpassDescription-pResolveAttachments-00847

If `pResolveAttachments` is not `NULL`, for each resolve attachment that is not `VK_ATTACHMENT_UNUSED`, the corresponding color attachment **must** not be `VK_ATTACHMENT_UNUSED`

- VUID-VkSubpassDescription-pResolveAttachments-00848

If `pResolveAttachments` is not `NULL`, for each resolve attachment that is not

VK_ATTACHMENT_UNUSED, the corresponding color attachment **must** not have a sample count of VK_SAMPLE_COUNT_1_BIT

- VUID-VkSubpassDescription-pResolveAttachments-00849
If `pResolveAttachments` is not `NULL`, each resolve attachment that is not `VK_ATTACHMENT_UNUSED` **must** have a sample count of `VK_SAMPLE_COUNT_1_BIT`
- VUID-VkSubpassDescription-pResolveAttachments-00850
If `pResolveAttachments` is not `NULL`, each resolve attachment that is not `VK_ATTACHMENT_UNUSED` **must** have the same `VkFormat` as its corresponding color attachment
- VUID-VkSubpassDescription-pColorAttachments-09430
All attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have the same sample count
- VUID-VkSubpassDescription-pInputAttachments-02647
All attachments in `pInputAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have image formats whose `potential format features` contain at least `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` or `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`
- VUID-VkSubpassDescription-pColorAttachments-02648
All attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have image formats whose `potential format features` contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`
- VUID-VkSubpassDescription-pResolveAttachments-02649
All attachments in `pResolveAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have image formats whose `potential format features` contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`
- VUID-VkSubpassDescription-pDepthStencilAttachment-02650
If `pDepthStencilAttachment` is not `NULL` and the attachment is not `VK_ATTACHMENT_UNUSED` then it **must** have an image format whose `potential format features` contain `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`
- VUID-VkSubpassDescription-pDepthStencilAttachment-01418
If `pDepthStencilAttachment` is not `VK_ATTACHMENT_UNUSED` and any attachments in `pColorAttachments` are not `VK_ATTACHMENT_UNUSED`, they **must** have the same sample count
- VUID-VkSubpassDescription-attachment-00853
Each element of `pPreserveAttachments` **must** not be `VK_ATTACHMENT_UNUSED`
- VUID-VkSubpassDescription-pPreserveAttachments-00854
Each element of `pPreserveAttachments` **must** not also be an element of any other member of the subpass description
- VUID-VkSubpassDescription-layout-02519
If any attachment is used by more than one `VkAttachmentReference` member, then each use **must** use the same `layout`
- VUID-VkSubpassDescription-pDepthStencilAttachment-04438
`pDepthStencilAttachment` and `pColorAttachments` **must** not contain references to the same attachment
- VUID-VkSubpassDescription-inputAttachmentCount-05053

`inputAttachmentCount` **must** be less than or equal to `maxSubpassInputAttachments`

- VUID-VkSubpassDescription-preserveAttachmentCount-05054

`preserveAttachmentCount` **must** be less than or equal to `maxSubpassPreserveAttachments`

Valid Usage (Implicit)

- VUID-VkSubpassDescription-flags-zeroBitmask
`flags` **must** be 0
- VUID-VkSubpassDescription-pipelineBindPoint-parameter
`pipelineBindPoint` **must** be a valid `VkPipelineBindPoint` value
- VUID-VkSubpassDescription-pInputAttachments-parameter
If `inputAttachmentCount` is not 0, `pInputAttachments` **must** be a valid pointer to an array of `inputAttachmentCount` valid `VkAttachmentReference` structures
- VUID-VkSubpassDescription-pColorAttachments-parameter
If `colorAttachmentCount` is not 0, `pColorAttachments` **must** be a valid pointer to an array of `colorAttachmentCount` valid `VkAttachmentReference` structures
- VUID-VkSubpassDescription-pResolveAttachments-parameter
If `colorAttachmentCount` is not 0, and `pResolveAttachments` is not NULL, `pResolveAttachments` **must** be a valid pointer to an array of `colorAttachmentCount` valid `VkAttachmentReference` structures
- VUID-VkSubpassDescription-pDepthStencilAttachment-parameter
If `pDepthStencilAttachment` is not NULL, `pDepthStencilAttachment` **must** be a valid pointer to a valid `VkAttachmentReference` structure
- VUID-VkSubpassDescription-pPreserveAttachments-parameter
If `preserveAttachmentCount` is not 0, `pPreserveAttachments` **must** be a valid pointer to an array of `preserveAttachmentCount` `uint32_t` values

Bits which **can** be set in `VkSubpassDescription::flags`, specifying usage of the subpass, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkSubpassDescriptionFlagBits {
} VkSubpassDescriptionFlagBits;
```

NOTE

All bits for this type are defined by extensions, and none of those extensions are enabled in this build of the specification.

WARNING

This functionality is superseded by [Vulkan Version 1.2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkSubpassDescriptionFlags;
```

`VkSubpassDescriptionFlags` is a bitmask type for setting a mask of zero or more `VkSubpassDescriptionFlagBits`.

The `VkAttachmentReference` structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef struct VkAttachmentReference {
    uint32_t      attachment;
    VkImageLayout layout;
} VkAttachmentReference;
```

- `attachment` is either an integer value identifying an attachment at the corresponding index in `VkRenderPassCreateInfo::pAttachments`, or `VK_ATTACHMENT_UNUSED` to signify that this attachment is not used.
- `layout` is a `VkImageLayout` value specifying the layout the attachment uses during the subpass.

Valid Usage

- VUID-VkAttachmentReference-layout-03077
If `attachment` is not `VK_ATTACHMENT_UNUSED`, `layout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_PREINITIALIZED`, or `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`
- VUID-VkAttachmentReference-separateDepthStencilLayouts-03313
If the `separateDepthStencilLayouts` feature is not enabled, and `attachment` is not `VK_ATTACHMENT_UNUSED`, `layout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`,
- VUID-VkAttachmentReference-synchronization2-06910
If the `synchronization2` feature is not enabled, `layout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`

Valid Usage (Implicit)

- VUID-VkAttachmentReference-layout-parameter
`layout` **must** be a valid `VkImageLayout` value

`VK_SUBPASS_EXTERNAL` is a special subpass index value expanding synchronization scope outside a subpass. It is described in more detail by [VkSubpassDependency](#).

```
#define VK_SUBPASS_EXTERNAL (~0U)
```

The `VkSubpassDependency` structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef struct VkSubpassDependency {
    uint32_t          srcSubpass;
    uint32_t          dstSubpass;
    VkPipelineStageFlags srcStageMask;
    VkPipelineStageFlags dstStageMask;
    VkAccessFlags      srcAccessMask;
    VkAccessFlags      dstAccessMask;
    VkDependencyFlags  dependencyFlags;
} VkSubpassDependency;
```

- `srcSubpass` is the subpass index of the first subpass in the dependency, or `VK_SUBPASS_EXTERNAL`.
- `dstSubpass` is the subpass index of the second subpass in the dependency, or `VK_SUBPASS_EXTERNAL`.
- `srcStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the [source stage mask](#). If set to `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT`, it is equivalent to setting it to `VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT`.
- `dstStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the [destination stage mask](#). If set to `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT`, it is equivalent to setting it to `VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT`.
- `srcAccessMask` is a bitmask of `VkAccessFlagBits` specifying a [source access mask](#).
- `dstAccessMask` is a bitmask of `VkAccessFlagBits` specifying a [destination access mask](#).
- `dependencyFlags` is a bitmask of `VkDependencyFlagBits`.

If `srcSubpass` is equal to `dstSubpass` then the `VkSubpassDependency` does not directly define a [dependency](#). Instead, it enables pipeline barriers to be used in a render pass instance within the identified subpass, where the scopes of one pipeline barrier **must** be a subset of those described by one subpass dependency. Subpass dependencies specified in this way that include [framebuffer-space stages](#) in the `srcStageMask` **must** only include [framebuffer-space stages](#) in `dstStageMask`, and **must** include `VK_DEPENDENCY_BY_REGION_BIT`. When a subpass dependency is specified in this way for a subpass that has more than one view in its view mask, its `dependencyFlags` **must** include `VK_DEPENDENCY_VIEW_LOCAL_BIT`.

If `srcSubpass` and `dstSubpass` are not equal, when a render pass instance which includes a subpass dependency is submitted to a queue, it defines a [dependency](#) between the subpasses identified by `srcSubpass` and `dstSubpass`.

If `srcSubpass` is equal to `VK_SUBPASS_EXTERNAL`, the first [synchronization scope](#) includes commands that occur earlier in [submission order](#) than the `vkCmdBeginRenderPass` used to begin the render pass instance. Otherwise, the first set of commands includes all commands submitted as part of the

subpass instance identified by `srcSubpass` and any `load`, `store`, or `multisample resolve` operations on attachments used in `srcSubpass`. In either case, the first synchronization scope is limited to operations on the pipeline stages determined by the `source stage mask` specified by `srcStageMask`.

If `dstSubpass` is equal to `VK_SUBPASS_EXTERNAL`, the second `synchronization scope` includes commands that occur later in `submission order` than the `vkCmdEndRenderPass` used to end the render pass instance. Otherwise, the second set of commands includes all commands submitted as part of the subpass instance identified by `dstSubpass` and any `load`, `store`, and `multisample resolve` operations on attachments used in `dstSubpass`. In either case, the second synchronization scope is limited to operations on the pipeline stages determined by the `destination stage mask` specified by `dstStageMask`.

The first `access scope` is limited to accesses in the pipeline stages determined by the `source stage mask` specified by `srcStageMask`. It is also limited to access types in the `source access mask` specified by `srcAccessMask`.

The second `access scope` is limited to accesses in the pipeline stages determined by the `destination stage mask` specified by `dstStageMask`. It is also limited to access types in the `destination access mask` specified by `dstAccessMask`.

The `availability and visibility operations` defined by a subpass dependency affect the execution of `image layout transitions` within the render pass.

For non-attachment resources, the memory dependency expressed by subpass dependency is nearly identical to that of a `VkMemoryBarrier` (with matching `srcAccessMask` and `dstAccessMask` parameters) submitted as a part of a `vkCmdPipelineBarrier` (with matching `srcStageMask` and `dstStageMask` parameters). The only difference being that its scopes are limited to the identified subpasses rather than potentially affecting everything before and after.

NOTE

For attachments however, subpass dependencies work more like a `VkImageMemoryBarrier` defined similarly to the `VkMemoryBarrier` above, the queue family indices set to `VK_QUEUE_FAMILY_IGNORED`, and layouts as follows:

- The equivalent to `oldLayout` is the attachment's layout according to the subpass description for `srcSubpass`.
- The equivalent to `newLayout` is the attachment's layout according to the subpass description for `dstSubpass`.

Valid Usage

- VUID-VkSubpassDependency-srcStageMask-04090

If the `geometryShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- VUID-VkSubpassDependency-srcStageMask-04091

If the `tessellationShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- VUID-VkSubpassDependency-srcStageMask-07319
If the `attachmentFragmentShadingRate` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-VkSubpassDependency-srcStageMask-03937
If the `synchronization2` feature is not enabled, `srcStageMask` **must** not be `0`
- VUID-VkSubpassDependency-dstStageMask-04090
If the `geometryShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- VUID-VkSubpassDependency-dstStageMask-04091
If the `tessellationShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-VkSubpassDependency-dstStageMask-07319
If the `attachmentFragmentShadingRate` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-VkSubpassDependency-dstStageMask-03937
If the `synchronization2` feature is not enabled, `dstStageMask` **must** not be `0`
- VUID-VkSubpassDependency-srcSubpass-00864
`srcSubpass` **must** be less than or equal to `dstSubpass`, unless one of them is `VK_SUBPASS_EXTERNAL`, to avoid cyclic dependencies and ensure a valid execution order
- VUID-VkSubpassDependency-srcSubpass-00865
`srcSubpass` and `dstSubpass` **must** not both be equal to `VK_SUBPASS_EXTERNAL`
- VUID-VkSubpassDependency-srcSubpass-06809
If `srcSubpass` is equal to `dstSubpass` and `srcStageMask` includes a `framebuffer-space stage`, `dstStageMask` **must** only contain `framebuffer-space stages`
- VUID-VkSubpassDependency-srcAccessMask-00868
Any access flag included in `srcAccessMask` **must** be supported by one of the pipeline stages in `srcStageMask`, as specified in the `table of supported access types`
- VUID-VkSubpassDependency-dstAccessMask-00869
Any access flag included in `dstAccessMask` **must** be supported by one of the pipeline stages in `dstStageMask`, as specified in the `table of supported access types`
- VUID-VkSubpassDependency-srcSubpass-02243
If `srcSubpass` equals `dstSubpass`, and `srcStageMask` and `dstStageMask` both include a `framebuffer-space stage`, then `dependencyFlags` **must** include `VK_DEPENDENCY_BY_REGION_BIT`
- VUID-VkSubpassDependency-dependencyFlags-02520
If `dependencyFlags` includes `VK_DEPENDENCY_VIEW_LOCAL_BIT`, `srcSubpass` **must** not be equal to `VK_SUBPASS_EXTERNAL`
- VUID-VkSubpassDependency-dependencyFlags-02521
If `dependencyFlags` includes `VK_DEPENDENCY_VIEW_LOCAL_BIT`, `dstSubpass` **must** not be equal to `VK_SUBPASS_EXTERNAL`
- VUID-VkSubpassDependency-srcSubpass-00872
If `srcSubpass` equals `dstSubpass` and that subpass has more than one bit set in the view

mask, then `dependencyFlags` **must** include `VK_DEPENDENCY_VIEW_LOCAL_BIT`

Valid Usage (Implicit)

- `VUID-VkSubpassDependency-srcStageMask-parameter`
`srcStageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values
- `VUID-VkSubpassDependency-dstStageMask-parameter`
`dstStageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values
- `VUID-VkSubpassDependency-srcAccessMask-parameter`
`srcAccessMask` **must** be a valid combination of `VkAccessFlagBits` values
- `VUID-VkSubpassDependency-dstAccessMask-parameter`
`dstAccessMask` **must** be a valid combination of `VkAccessFlagBits` values
- `VUID-VkSubpassDependency-dependencyFlags-parameter`
`dependencyFlags` **must** be a valid combination of `VkDependencyFlagBits` values

When multiview is enabled, the execution of the multiple views of one subpass **may** not occur simultaneously or even back-to-back, and rather **may** be interleaved with the execution of other subpasses. The load and store operations apply to attachments on a per-view basis. For example, an attachment using `VK_ATTACHMENT_LOAD_OP_CLEAR` will have each view cleared on first use, but the first use of one view may be temporally distant from the first use of another view.

NOTE

A good mental model for multiview is to think of a multiview subpass as if it were a collection of individual (per-view) subpasses that are logically grouped together and described as a single multiview subpass in the API. Similarly, a multiview attachment can be thought of like several individual attachments that happen to be layers in a single image. A view-local dependency between two multiview subpasses acts like a set of one-to-one dependencies between corresponding pairs of per-view subpasses. A view-global dependency between two multiview subpasses acts like a set of $N \times M$ dependencies between all pairs of per-view subpasses in the source and destination. Thus, it is a more compact representation which also makes clear the commonality and reuse that is present between views in a subpass. This interpretation motivates the answers to questions like “when does the load op apply” - it is on the first use of each view of an attachment, as if each view was a separate attachment.

The content of each view follows the description in [attachment content behavior](#). In particular, if an attachment is preserved, all views within the attachment are preserved.

If there is no subpass dependency from `VK_SUBPASS_EXTERNAL` to the first subpass that uses an attachment, then an implicit subpass dependency exists from `VK_SUBPASS_EXTERNAL` to the first subpass it is used in. The implicit subpass dependency only exists if there exists an automatic layout transition away from `initialLayout`. The subpass dependency operates as if defined with the following parameters:

```

VkSubpassDependency implicitDependency = {
    .srcSubpass = VK_SUBPASS_EXTERNAL,
    .dstSubpass = firstSubpass, // First subpass attachment is used in
    .srcStageMask = VK_PIPELINE_STAGE_NONE,
    .dstStageMask = VK_PIPELINE_STAGE_ALL_COMMANDS_BIT,
    .srcAccessMask = 0,
    .dstAccessMask = VK_ACCESS_INPUT_ATTACHMENT_READ_BIT |
                    VK_ACCESS_COLOR_ATTACHMENT_READ_BIT |
                    VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT |
                    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT |
                    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT,
    .dependencyFlags = 0
};

```

Similarly, if there is no subpass dependency from the last subpass that uses an attachment to `VK_SUBPASS_EXTERNAL`, then an implicit subpass dependency exists from the last subpass it is used in to `VK_SUBPASS_EXTERNAL`. The implicit subpass dependency only exists if there exists an automatic layout transition into `finalLayout`. The subpass dependency operates as if defined with the following parameters:

```

VkSubpassDependency implicitDependency = {
    .srcSubpass = lastSubpass, // Last subpass attachment is used in
    .dstSubpass = VK_SUBPASS_EXTERNAL,
    .srcStageMask = VK_PIPELINE_STAGE_ALL_COMMANDS_BIT,
    .dstStageMask = VK_PIPELINE_STAGE_NONE,
    .srcAccessMask = VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT |
                    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT,
    .dstAccessMask = 0,
    .dependencyFlags = 0
};

```

As subpasses **may** overlap or execute out of order with regards to other subpasses unless a subpass dependency chain describes otherwise, the layout transitions required between subpasses **cannot** be known to an application. Instead, an application provides the layout that each attachment **must** be in at the start and end of a render pass, and the layout it **must** be in during each subpass it is used in. The implementation then **must** execute layout transitions between subpasses in order to guarantee that the images are in the layouts required by each subpass, and in the final layout at the end of the render pass.

Automatic layout transitions apply to the entire image subresource attached to the framebuffer. If multiview is not enabled and the attachment is a view of a 1D or 2D image, the automatic layout transitions apply to the number of layers specified by `VkFramebufferCreateInfo::layers`. If multiview is enabled and the attachment is a view of a 1D or 2D image, the automatic layout transitions apply to the layers corresponding to views which are used by some subpass in the render pass, even if that subpass does not reference the given attachment. If the attachment view is a 2D or 2D array view of a 3D image, even if the attachment view only refers to a subset of the slices of the selected mip level of the 3D image, automatic layout transitions apply to the entire

subresource referenced which is the entire mip level in this case.

Automatic layout transitions away from the layout used in a subpass happen-after the availability operations for all dependencies with that subpass as the `srcSubpass`.

Automatic layout transitions into the layout used in a subpass happen-before the visibility operations for all dependencies with that subpass as the `dstSubpass`.

Automatic layout transitions away from `initialLayout` happen-after the availability operations for all dependencies with a `srcSubpass` equal to `VK_SUBPASS_EXTERNAL`, where `dstSubpass` uses the attachment that will be transitioned. For attachments created with `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT`, automatic layout transitions away from `initialLayout` happen-after the availability operations for all dependencies with a `srcSubpass` equal to `VK_SUBPASS_EXTERNAL`, where `dstSubpass` uses any aliased attachment.

Automatic layout transitions into `finalLayout` happen-before the visibility operations for all dependencies with a `dstSubpass` equal to `VK_SUBPASS_EXTERNAL`, where `srcSubpass` uses the attachment that will be transitioned. For attachments created with `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT`, automatic layout transitions into `finalLayout` happen-before the visibility operations for all dependencies with a `dstSubpass` equal to `VK_SUBPASS_EXTERNAL`, where `srcSubpass` uses any aliased attachment.

The image layout of the depth aspect of a depth/stencil attachment referring to an image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` is dependent on the last sample locations used to render to the attachment, thus automatic layout transitions use the sample locations state specified in `VkRenderPassSampleLocationsBeginInfoEXT`.

Automatic layout transitions of an attachment referring to a depth/stencil image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` use the sample locations the image subresource range referenced by the attachment was last rendered with. If the current render pass does not use the attachment as a depth/stencil attachment in any subpass that happens-before, the automatic layout transition uses the sample locations state specified in the `sampleLocationsInfo` member of the element of the `VkRenderPassSampleLocationsBeginInfoEXT::pAttachmentInitialSampleLocations` array for which the `attachmentIndex` member equals the attachment index of the attachment, if one is specified. Otherwise, the automatic layout transition uses the sample locations state specified in the `sampleLocationsInfo` member of the element of the `VkRenderPassSampleLocationsBeginInfoEXT::pPostSubpassSampleLocations` array for which the `subpassIndex` member equals the index of the subpass that last used the attachment as a depth/stencil attachment, if one is specified.

If no sample locations state has been specified for an automatic layout transition performed on an attachment referring to a depth/stencil image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` the contents of the depth aspect of the depth/stencil attachment become undefined as if the layout of the attachment was transitioned from the `VK_IMAGE_LAYOUT_UNDEFINED` layout.

If two subpasses use the same attachment, and both subpasses use the attachment in a read-only layout, no subpass dependency needs to be specified between those subpasses. If an implementation treats those layouts separately, it **must** insert an implicit subpass dependency

between those subpasses to separate the uses in each layout. The subpass dependency operates as if defined with the following parameters:

```
// Used for input attachments
VkPipelineStageFlags inputAttachmentStages = VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT;
VkAccessFlags inputAttachmentDstAccess = VK_ACCESS_INPUT_ATTACHMENT_READ_BIT;

// Used for depth/stencil attachments
VkPipelineStageFlags depthStencilAttachmentStages =
VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT |
VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT;
VkAccessFlags depthStencilAttachmentDstAccess =
VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT;

VkSubpassDependency implicitDependency = {
    .srcSubpass = firstSubpass;
    .dstSubpass = secondSubpass;
    .srcStageMask = inputAttachmentStages | depthStencilAttachmentStages;
    .dstStageMask = inputAttachmentStages | depthStencilAttachmentStages;
    .srcAccessMask = 0;
    .dstAccessMask = inputAttachmentDstAccess | depthStencilAttachmentDstAccess;
    .dependencyFlags = 0;
};
```

A more extensible version of render pass creation is also defined below.

To create a render pass, call:

```
// Provided by VK_VERSION_1_2
VkResult vkCreateRenderPass2(
    VkDevice                                device,
    const VkRenderPassCreateInfo2*          pCreateInfo,
    const VkAllocationCallbacks*            pAllocator,
    VkRenderPass*                           pRenderPass);
```

- **device** is the logical device that creates the render pass.
- **pCreateInfo** is a pointer to a [VkRenderPassCreateInfo2](#) structure describing the parameters of the render pass.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.
- **pRenderPass** is a pointer to a [VkRenderPass](#) handle in which the resulting render pass object is returned.

This command is functionally identical to [vkCreateRenderPass](#), but includes extensible substructures that include **sType** and **pNext** parameters, allowing them to be more easily extended.

If [VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations](#) is **VK_TRUE**, **vkCreateRenderPass2** **must** not return **VK_ERROR_OUT_OF_HOST_MEMORY**.

Valid Usage

- VUID-vkCreateRenderPass2-device-10001
device **must** support at least one queue family with the `VK_QUEUE_GRAPHICS_BIT` capability
- VUID-vkCreateRenderPass2-device-05068
The number of render passes currently allocated from **device** plus 1 **must** be less than or equal to the total number of render passes requested via `VkDeviceObjectReservationCreateInfo::renderPassRequestCount` specified when **device** was created
- VUID-vkCreateRenderPass2-subpasses-device-05089
The number of subpasses currently allocated from **device** across all `VkRenderPass` objects plus `pCreateInfo->subpassCount` **must** be less than or equal to the total number of subpasses requested via `VkDeviceObjectReservationCreateInfo::subpassDescriptionRequestCount` specified when **device** was created
- VUID-vkCreateRenderPass2-attachments-device-05089
The number of attachments currently allocated from **device** across all `VkRenderPass` objects plus `pCreateInfo->attachmentCount` **must** be less than or equal to the total number of attachments requested via `VkDeviceObjectReservationCreateInfo::attachmentDescriptionRequestCount` specified when **device** was created

Valid Usage (Implicit)

- VUID-vkCreateRenderPass2-device-parameter
device **must** be a valid `VkDevice` handle
- VUID-vkCreateRenderPass2-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid `VkRenderPassCreateInfo2` structure
- VUID-vkCreateRenderPass2-pAllocator-null
pAllocator **must** be `NULL`
- VUID-vkCreateRenderPass2-pRenderPass-parameter
pRenderPass **must** be a valid pointer to a `VkRenderPass` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkRenderPassCreateInfo2` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkRenderPassCreateInfo2 {
    VkStructureType      sType;
    const void*          pNext;
    VkRenderPassCreateFlags flags;
    uint32_t             attachmentCount;
    const VkAttachmentDescription2* pAttachments;
    uint32_t             subpassCount;
    const VkSubpassDescription2* pSubpasses;
    uint32_t             dependencyCount;
    const VkSubpassDependency2* pDependencies;
    uint32_t             correlatedViewMaskCount;
    const uint32_t*       pCorrelatedViewMasks;
} VkRenderPassCreateInfo2;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `attachmentCount` is the number of attachments used by this render pass.
- `pAttachments` is a pointer to an array of `attachmentCount` `VkAttachmentDescription2` structures describing the attachments used by the render pass.
- `subpassCount` is the number of subpasses to create.
- `pSubpasses` is a pointer to an array of `subpassCount` `VkSubpassDescription2` structures describing each subpass.
- `dependencyCount` is the number of dependencies between pairs of subpasses.
- `pDependencies` is a pointer to an array of `dependencyCount` `VkSubpassDependency2` structures describing dependencies between pairs of subpasses.
- `correlatedViewMaskCount` is the number of correlation masks.
- `pCorrelatedViewMasks` is a pointer to an array of view masks indicating sets of views that **may** be more efficient to render concurrently.

Parameters defined by this structure with the same name as those in `VkRenderPassCreateInfo` have the identical effect to those parameters; the child structures are variants of those used in `VkRenderPassCreateInfo` which add `sType` and `pNext` parameters, allowing them to be extended.

If the `VkSubpassDescription2::viewMask` member of any element of `pSubpasses` is not zero, *multiview* functionality is considered to be enabled for this render pass.

`correlatedViewMaskCount` and `pCorrelatedViewMasks` have the same effect as `VkRenderPassMultiviewCreateInfo::correlationMaskCount` and `VkRenderPassMultiviewCreateInfo::pCorrelationMasks`, respectively.

Valid Usage

- VUID-VkRenderPassCreateInfo2-None-03049

If any two subpasses operate on attachments with overlapping ranges of the same `VkDeviceMemory` object, and at least one subpass writes to that area of `VkDeviceMemory`, a subpass dependency **must** be included (either directly or via some intermediate subpasses) between them

- VUID-VkRenderPassCreateInfo2-attachment-03050

If the `attachment` member of any element of `pInputAttachments`, `pColorAttachments`, `pResolveAttachments` or `pDepthStencilAttachment`, or the attachment indexed by any element of `pPreserveAttachments` in any element of `pSubpasses` is bound to a range of a `VkDeviceMemory` object that overlaps with any other attachment in any subpass (including the same subpass), the `VkAttachmentDescription2` structures describing them **must** include `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` in `flags`

- VUID-VkRenderPassCreateInfo2-attachment-03051

If the `attachment` member of any element of `pInputAttachments`, `pColorAttachments`, `pResolveAttachments` or `pDepthStencilAttachment`, or any element of `pPreserveAttachments` in any element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED`, then it **must** be less than `attachmentCount`

- VUID-VkRenderPassCreateInfo2-pSubpasses-06473

If the `pSubpasses` `pNext` chain includes a `VkSubpassDescriptionDepthStencilResolve` structure and the `pDepthStencilResolveAttachment` member is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, then `attachment` **must** be less than `attachmentCount`

- VUID-VkRenderPassCreateInfo2-pAttachments-02522

For any member of `pAttachments` with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`,
`VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, or
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`

- VUID-VkRenderPassCreateInfo2-pAttachments-02523

For any member of `pAttachments` with a `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`,
`VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, or
`VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkRenderPassCreateInfo2-pDependencies-03054

For any element of `pDependencies`, if the `srcSubpass` is not `VK_SUBPASS_EXTERNAL`, all stage flags included in the `srcStageMask` member of that dependency **must** be `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` or a pipeline stage supported by the `pipeline` identified by the `pipelineBindPoint` member of the source subpass

- VUID-VkRenderPassCreateInfo2-pDependencies-03055

For any element of `pDependencies`, if the `dstSubpass` is not `VK_SUBPASS_EXTERNAL`, all stage flags included in the `dstStageMask` member of that dependency **must** be `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` or a pipeline stage supported by the `pipeline`

identified by the `pipelineBindPoint` member of the destination subpass

- VUID-VkRenderPassCreateInfo2-pCorrelatedViewMasks-03056
The set of bits included in any element of `pCorrelatedViewMasks` **must** not overlap with the set of bits included in any other element of `pCorrelatedViewMasks`
- VUID-VkRenderPassCreateInfo2-viewMask-03057
If the `VkSubpassDescription2::viewMask` member of all elements of `pSubpasses` is 0, `correlatedViewMaskCount` **must** be 0
- VUID-VkRenderPassCreateInfo2-viewMask-03058
The `VkSubpassDescription2::viewMask` member of all elements of `pSubpasses` **must** either all be 0, or all not be 0
- VUID-VkRenderPassCreateInfo2-viewMask-03059
If the `VkSubpassDescription2::viewMask` member of all elements of `pSubpasses` is 0, the `dependencyFlags` member of any element of `pDependencies` **must** not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`
- VUID-VkRenderPassCreateInfo2-pDependencies-03060
For any element of `pDependencies` where its `srcSubpass` member equals its `dstSubpass` member, if the `viewMask` member of the corresponding element of `pSubpasses` includes more than one bit, its `dependencyFlags` member **must** include `VK_DEPENDENCY_VIEW_LOCAL_BIT`
- VUID-VkRenderPassCreateInfo2-attachment-02525
If the `attachment` member of any element of the `pInputAttachments` member of any element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED`, the `aspectMask` member of that element of `pInputAttachments` **must** only include aspects that are present in images of the format specified by the element of `pAttachments` specified by `attachment`
- VUID-VkRenderPassCreateInfo2-srcSubpass-02526
The `srcSubpass` member of each element of `pDependencies` **must** be less than `subpassCount`
- VUID-VkRenderPassCreateInfo2-dstSubpass-02527
The `dstSubpass` member of each element of `pDependencies` **must** be less than `subpassCount`
- VUID-VkRenderPassCreateInfo2-pAttachments-04585
If any element of `pAttachments` is used as a fragment shading rate attachment in any subpass, it **must** not be used as any other attachment in the render pass
- VUID-VkRenderPassCreateInfo2-pAttachments-09387
If any element of `pAttachments` is used as a fragment shading rate attachment, the `loadOp` for that attachment **must** not be `VK_ATTACHMENT_LOAD_OP_CLEAR`
- VUID-VkRenderPassCreateInfo2-pAttachments-04586
If any element of `pAttachments` is used as a fragment shading rate attachment in any subpass, it **must** have an image format whose `potential format features` contain `VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-VkRenderPassCreateInfo2-subpassCount-05055
`subpassCount` **must** be less than or equal to `maxRenderPassSubpasses`
- VUID-VkRenderPassCreateInfo2-dependencyCount-05056
`dependencyCount` **must** be less than or equal to `maxRenderPassDependencies`

- VUID-VkRenderPassCreateInfo2-attachmentCount-05057
`attachmentCount` **must** be less than or equal to `maxFramebufferAttachments`
- VUID-VkRenderPassCreateInfo2-attachment-06244
If the `attachment` member of the `pDepthStencilAttachment` member of an element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED`, the `layout` member of that same structure is either `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, and the `pNext` chain of that structure does not include a `VkAttachmentReferenceStencilLayout` structure, then the element of `pAttachments` with an index equal to `attachment` **must** not have a `format` that includes both depth and stencil components
- VUID-VkRenderPassCreateInfo2-attachment-06245
If the `attachment` member of the `pDepthStencilAttachment` member of an element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED` and the `layout` member of that same structure is either `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, then the element of `pAttachments` with an index equal to `attachment` **must** have a `format` that includes only a stencil component
- VUID-VkRenderPassCreateInfo2-attachment-06246
If the `attachment` member of the `pDepthStencilAttachment` member of an element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED` and the `layout` member of that same structure is either `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, then the element of `pAttachments` with an index equal to `attachment` **must** not have a `format` that includes only a stencil component
- VUID-VkRenderPassCreateInfo2-None-10916
If any subpass preserves an attachment, there **must** be a subpass dependency from a prior subpass which uses or preserves that attachment

Valid Usage (Implicit)

- VUID-VkRenderPassCreateInfo2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_CREATE_INFO_2`
- VUID-VkRenderPassCreateInfo2-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkRenderPassCreateInfo2-flags-zero bitmask
`flags` **must** be `0`
- VUID-VkRenderPassCreateInfo2-pAttachments-parameter
If `attachmentCount` is not `0`, `pAttachments` **must** be a valid pointer to an array of `attachmentCount` valid `VkAttachmentDescription2` structures
- VUID-VkRenderPassCreateInfo2-pSubpasses-parameter
`pSubpasses` **must** be a valid pointer to an array of `subpassCount` valid `VkSubpassDescription2` structures
- VUID-VkRenderPassCreateInfo2-pDependencies-parameter
If `dependencyCount` is not `0`, `pDependencies` **must** be a valid pointer to an array of `dependencyCount` valid `VkSubpassDependency2` structures

- VUID-VkRenderPassCreateInfo2-pCorrelatedViewMasks-parameter
If `correlatedViewMaskCount` is not 0, `pCorrelatedViewMasks` **must** be a valid pointer to an array of `correlatedViewMaskCount` `uint32_t` values
- VUID-VkRenderPassCreateInfo2-subpassCount-arraylength
`subpassCount` **must** be greater than 0

The `VkAttachmentDescription2` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentDescription2 {
    VkStructureType      sType;
    const void*          pNext;
    VkAttachmentDescriptionFlags flags;
    VkFormat              format;
    VkSampleCountFlagBits samples;
    VkAttachmentLoadOp    loadOp;
    VkAttachmentStoreOp   storeOp;
    VkAttachmentLoadOp    stencilLoadOp;
    VkAttachmentStoreOp   stencilStoreOp;
    VkImageLayout         initialLayout;
    VkImageLayout         finalLayout;
} VkAttachmentDescription2;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkAttachmentDescriptionFlagBits` specifying additional properties of the attachment.
- `format` is a `VkFormat` value specifying the format of the image that will be used for the attachment.
- `samples` is a `VkSampleCountFlagBits` value specifying the number of samples of the image.
- `loadOp` is a `VkAttachmentLoadOp` value specifying how the contents of color and depth components of the attachment are treated at the beginning of the subpass where it is first used.
- `storeOp` is a `VkAttachmentStoreOp` value specifying how the contents of color and depth components of the attachment are treated at the end of the subpass where it is last used.
- `stencilLoadOp` is a `VkAttachmentLoadOp` value specifying how the contents of stencil components of the attachment are treated at the beginning of the subpass where it is first used.
- `stencilStoreOp` is a `VkAttachmentStoreOp` value specifying how the contents of stencil components of the attachment are treated at the end of the last subpass where it is used.
- `initialLayout` is the layout the attachment image subresource will be in when a render pass instance begins.
- `finalLayout` is the layout the attachment image subresource will be transitioned to when a render pass instance ends.

Parameters defined by this structure with the same name as those in [VkAttachmentDescription](#) have the identical effect to those parameters.

If the `separateDepthStencilLayouts` feature is enabled, and `format` is a depth/stencil format, `initialLayout` and `finalLayout` **can** be set to a layout that only specifies the layout of the depth aspect.

If the `pNext` chain includes a [VkAttachmentDescriptionStencilLayout](#) structure, then the `stencilInitialLayout` and `stencilFinalLayout` members specify the initial and final layouts of the stencil aspect of a depth/stencil format, and `initialLayout` and `finalLayout` only apply to the depth aspect. For depth-only formats, the [VkAttachmentDescriptionStencilLayout](#) structure is ignored. For stencil-only formats, the initial and final layouts of the stencil aspect are taken from the [VkAttachmentDescriptionStencilLayout](#) structure if present, or `initialLayout` and `finalLayout` if not present.

If `format` is a depth/stencil format, and either `initialLayout` or `finalLayout` does not specify a layout for the stencil aspect, then the application **must** specify the initial and final layouts of the stencil aspect by including a [VkAttachmentDescriptionStencilLayout](#) structure in the `pNext` chain.

`loadOp` and `storeOp` are ignored for fragment shading rate attachments. No access to the shading rate attachment is performed in `loadOp` and `storeOp`. Instead, access to `VK_ACCESS_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR` is performed as fragments are rasterized.

Valid Usage

- VUID-VkAttachmentDescription2-format-06699
If `format` includes a color or depth component and `loadOp` is `VK_ATTACHMENT_LOAD_OP_LOAD`, then `initialLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED`
- VUID-VkAttachmentDescription2-finalLayout-00843
`finalLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`
- VUID-VkAttachmentDescription2-format-03280
If `format` is a color format, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkAttachmentDescription2-format-03281
If `format` is a depth/stencil format, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`
- VUID-VkAttachmentDescription2-format-03282
If `format` is a color format, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkAttachmentDescription2-format-03283
If `format` is a depth/stencil format, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`
- VUID-VkAttachmentDescription2-format-06487
If `format` is a color format, `initialLayout` **must** not be

VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

- VUID-VkAttachmentDescription2-format-06488

If `format` is a color format, `finalLayout` **must** not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

- VUID-VkAttachmentDescription2-separateDepthStencilLayouts-03284

If the `separateDepthStencilLayouts` feature is not enabled, `initialLayout` **must** not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL,

- VUID-VkAttachmentDescription2-separateDepthStencilLayouts-03285

If the `separateDepthStencilLayouts` feature is not enabled, `finalLayout` **must** not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL,

- VUID-VkAttachmentDescription2-format-03286

If `format` is a color format, `initialLayout` **must** not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkAttachmentDescription2-format-03287

If `format` is a color format, `finalLayout` **must** not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkAttachmentDescription2-format-06906

If `format` is a depth/stencil format which includes both depth and stencil components,
`initialLayout` **must** not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkAttachmentDescription2-format-06907

If `format` is a depth/stencil format which includes both depth and stencil components,
`finalLayout` **must** not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkAttachmentDescription2-format-03290

If `format` is a depth/stencil format which includes only the depth component,
`initialLayout` **must** not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkAttachmentDescription2-format-03291

If `format` is a depth/stencil format which includes only the depth component, `finalLayout`
must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkAttachmentDescription2-synchronization2-06908

If the `synchronization2` feature is not enabled, `initialLayout` **must** not be

VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- VUID-VkAttachmentDescription2-synchronization2-06909

If the `synchronization2` feature is not enabled, `finalLayout` **must** not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- VUID-VkAttachmentDescription2-samples-08745

`samples` **must** be a valid `VkSampleCountFlagBits` value that is set in `imageCreateSampleCounts` (as defined in [Image Creation Limits](#)) for the given `format`

- VUID-VkAttachmentDescription2-pNext-06704

If the `pNext` chain does not include a `VkAttachmentDescriptionStencilLayout` structure, `format` includes a stencil component, and `stencilLoadOp` is VK_ATTACHMENT_LOAD_OP_LOAD, then `initialLayout` **must** not be VK_IMAGE_LAYOUT_UNDEFINED

- VUID-VkAttachmentDescription2-pNext-06705

If the `pNext` chain includes a `VkAttachmentDescriptionStencilLayout` structure, `format` includes a stencil component, and `stencilLoadOp` is VK_ATTACHMENT_LOAD_OP_LOAD, then `VkAttachmentDescriptionStencilLayout::stencilInitialLayout` **must** not be VK_IMAGE_LAYOUT_UNDEFINED

- VUID-VkAttachmentDescription2-format-06249

If `format` is a depth/stencil format which includes both depth and stencil components, and `initialLayout` is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, the `pNext` chain **must** include a `VkAttachmentDescriptionStencilLayout` structure

- VUID-VkAttachmentDescription2-format-06250

If `format` is a depth/stencil format which includes both depth and stencil components, and `finalLayout` is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, the `pNext` chain **must** include a `VkAttachmentDescriptionStencilLayout` structure

- VUID-VkAttachmentDescription2-format-06247

If the `pNext` chain does not include a `VkAttachmentDescriptionStencilLayout` structure and `format` only includes a stencil component, `initialLayout` **must** not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL

- VUID-VkAttachmentDescription2-format-06248

If the `pNext` chain does not include a `VkAttachmentDescriptionStencilLayout` structure and `format` only includes a stencil component, `finalLayout` **must** not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL

- VUID-VkAttachmentDescription2-format-09332

`format` **must** not be VK_FORMAT_UNDEFINED

Valid Usage (Implicit)

- VUID-VkAttachmentDescription2-sType-sType

`sType` **must** be VK_STRUCTURE_TYPE_ATTACHMENT_DESCRIPTION_2

- VUID-VkAttachmentDescription2-pNext-pNext

`pNext` **must** be NULL or a pointer to a valid instance of

VkAttachmentDescriptionStencilLayout

- VUID-VkAttachmentDescription2-sType-unique
The **sType** value of each structure in the **pNext** chain **must** be unique
- VUID-VkAttachmentDescription2-flags-parameter
flags **must** be a valid combination of **VkAttachmentDescriptionFlagBits** values
- VUID-VkAttachmentDescription2-format-parameter
format **must** be a valid **VkFormat** value
- VUID-VkAttachmentDescription2-samples-parameter
samples **must** be a valid **VkSampleCountFlagBits** value
- VUID-VkAttachmentDescription2-loadOp-parameter
loadOp **must** be a valid **VkAttachmentLoadOp** value
- VUID-VkAttachmentDescription2-storeOp-parameter
storeOp **must** be a valid **VkAttachmentStoreOp** value
- VUID-VkAttachmentDescription2-stencilLoadOp-parameter
stencilLoadOp **must** be a valid **VkAttachmentLoadOp** value
- VUID-VkAttachmentDescription2-stencilStoreOp-parameter
stencilStoreOp **must** be a valid **VkAttachmentStoreOp** value
- VUID-VkAttachmentDescription2-initialLayout-parameter
initialLayout **must** be a valid **VkImageLayout** value
- VUID-VkAttachmentDescription2-finalLayout-parameter
finalLayout **must** be a valid **VkImageLayout** value

The **VkAttachmentDescriptionStencilLayout** structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentDescriptionStencilLayout {
    VkStructureType    sType;
    void*              pNext;
    VkImageLayout       stencilInitialLayout;
    VkImageLayout       stencilFinalLayout;
} VkAttachmentDescriptionStencilLayout;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **stencilInitialLayout** is the layout the stencil aspect of the attachment image subresource will be in when a render pass instance begins.
- **stencilFinalLayout** is the layout the stencil aspect of the attachment image subresource will be transitioned to when a render pass instance ends.

Valid Usage

- VUID-VkAttachmentDescriptionStencilLayout-stencilInitialLayout-03308
stencilInitialLayout **must** not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL
- VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-03309
stencilFinalLayout **must** not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL
- VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-03310
stencilFinalLayout **must** not be VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED

Valid Usage (Implicit)

- VUID-VkAttachmentDescriptionStencilLayout-sType-sType
sType **must** be VK_STRUCTURE_TYPE_ATTACHMENT_DESCRIPTION_STENCIL_LAYOUT
- VUID-VkAttachmentDescriptionStencilLayout-stencilInitialLayout-parameter
stencilInitialLayout **must** be a valid [VkImageLayout](#) value
- VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-parameter
stencilFinalLayout **must** be a valid [VkImageLayout](#) value

The [VkSubpassDescription2](#) structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkSubpassDescription2 {
    VkStructureType           sType;
    const void*               pNext;
    VkSubpassDescriptionFlags flags;
    VkPipelineBindPoint       pipelineBindPoint;
    uint32_t                  viewMask;
    uint32_t                  inputAttachmentCount;
    const VkAttachmentReference2* pInputAttachments;
    uint32_t                  colorAttachmentCount;
    const VkAttachmentReference2* pColorAttachments;
    const VkAttachmentReference2* pResolveAttachments;
    const VkAttachmentReference2* pDepthStencilAttachment;
    uint32_t                  preserveAttachmentCount;
    const uint32_t*           pPreserveAttachments;
} VkSubpassDescription2;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of [VkSubpassDescriptionFlagBits](#) specifying usage of the subpass.
- **pipelineBindPoint** is a [VkPipelineBindPoint](#) value specifying the pipeline type supported for this subpass.
- **viewMask** is a bitfield of view indices describing which views rendering is broadcast to in this subpass, when multiview is enabled.
- **inputAttachmentCount** is the number of input attachments.
- **pInputAttachments** is a pointer to an array of [VkAttachmentReference2](#) structures defining the input attachments for this subpass and their layouts.
- **colorAttachmentCount** is the number of color attachments.
- **pColorAttachments** is a pointer to an array of **colorAttachmentCount** [VkAttachmentReference2](#) structures defining the color attachments for this subpass and their layouts.
- **pResolveAttachments** is **NULL** or a pointer to an array of **colorAttachmentCount** [VkAttachmentReference2](#) structures defining the resolve attachments for this subpass and their layouts.
- **pDepthStencilAttachment** is a pointer to a [VkAttachmentReference2](#) structure specifying the depth/stencil attachment for this subpass and its layout.
- **preserveAttachmentCount** is the number of preserved attachments.
- **pPreserveAttachments** is a pointer to an array of **preserveAttachmentCount** render pass attachment indices identifying attachments that are not used by this subpass, but whose contents **must** be preserved throughout the subpass.

Parameters defined by this structure with the same name as those in [VkSubpassDescription](#) have the identical effect to those parameters.

`viewMask` has the same effect for the described subpass as `VkRenderPassMultiviewCreateInfo::pViewMasks` has on each corresponding subpass.

If a `VkFragmentShadingRateAttachmentInfoKHR` structure is included in the `pNext` chain, `pFragmentShadingRateAttachment` is not `NULL`, and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, the identified attachment defines a fragment shading rate attachment for that subpass.

Valid Usage

- VUID-VkSubpassDescription2-attachment-06912
If the `attachment` member of an element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`
- VUID-VkSubpassDescription2-attachment-06913
If the `attachment` member of an element of `pColorAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`
- VUID-VkSubpassDescription2-attachment-06914
If the `attachment` member of an element of `pResolveAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`
- VUID-VkSubpassDescription2-attachment-06915
If the `attachment` member of `pDepthStencilAttachment` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`
- VUID-VkSubpassDescription2-attachment-06916
If the `attachment` member of an element of `pColorAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`
- VUID-VkSubpassDescription2-attachment-06917
If the `attachment` member of an element of `pResolveAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`
- VUID-VkSubpassDescription2-attachment-06918
If the `attachment` member of an element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`
- VUID-VkSubpassDescription2-attachment-06919
If the `attachment` member of an element of `pColorAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkSubpassDescription2-attachment-06920
If the `attachment` member of an element of `pResolveAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkSubpassDescription2-attachment-06921
If the `attachment` member of an element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR`
- VUID-VkSubpassDescription2-attachment-06922
If the `attachment` member of an element of `pColorAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`
- VUID-VkSubpassDescription2-attachment-06923
If the `attachment` member of an element of `pResolveAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`
- VUID-VkSubpassDescription2-attachment-06251
If the `attachment` member of `pDepthStencilAttachment` is not `VK_ATTACHMENT_UNUSED` and its `pNext` chain includes a `VkAttachmentReferenceStencilLayout` structure, the `layout` member of `pDepthStencilAttachment` **must** not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkSubpassDescription2-pipelineBindPoint-04953
`pipelineBindPoint` **must** be `VK_PIPELINE_BIND_POINT_GRAPHICS`
- VUID-VkSubpassDescription2-colorAttachmentCount-03063
`colorAttachmentCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxColorAttachments`
- VUID-VkSubpassDescription2-loadOp-03064
If the first use of an attachment in this render pass is as an input attachment, and the attachment is not also used as a color or depth/stencil attachment in the same subpass, then `loadOp` **must** not be `VK_ATTACHMENT_LOAD_OP_CLEAR`
- VUID-VkSubpassDescription2-pResolveAttachments-03065
If `pResolveAttachments` is not `NULL`, for each resolve attachment that does not have the value `VK_ATTACHMENT_UNUSED`, the corresponding color attachment **must** not have the value `VK_ATTACHMENT_UNUSED`
- VUID-VkSubpassDescription2-pResolveAttachments-03066
If `pResolveAttachments` is not `NULL`, for each resolve attachment that is not `VK_ATTACHMENT_UNUSED`, the corresponding color attachment **must** not have a sample count of `VK_SAMPLE_COUNT_1_BIT`
- VUID-VkSubpassDescription2-pResolveAttachments-03068
Each element of `pResolveAttachments` **must** have the same `VkFormat` as its corresponding color attachment
- VUID-VkSubpassDescription2-pResolveAttachments-03067

If `pResolveAttachments` is not `NULL`, each resolve attachment that is not `VK_ATTACHMENT_UNUSED` **must** have a sample count of `VK_SAMPLE_COUNT_1_BIT`

- VUID-VkSubpassDescription2-pInputAttachments-02897

All attachments in `pInputAttachments` that are not `VK_ATTACHMENT_UNUSED`

must have image formats whose `potential format features` contain at least `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` or `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkSubpassDescription2-pColorAttachments-02898

All attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have image formats whose `potential format features` contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`

- VUID-VkSubpassDescription2-pResolveAttachments-02899

All attachments in `pResolveAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have image formats whose `potential format features` contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`

- VUID-VkSubpassDescription2-pDepthStencilAttachment-02900

If `pDepthStencilAttachment` is not `NULL` and the attachment is not `VK_ATTACHMENT_UNUSED` then it **must** have an image format whose `potential format features` contain `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkSubpassDescription2-multisampledRenderToSingleSampled-06872

All attachments in `pDepthStencilAttachment` or `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have the same sample count

- VUID-VkSubpassDescription2-attachment-03073

Each element of `pPreserveAttachments` **must** not be `VK_ATTACHMENT_UNUSED`

- VUID-VkSubpassDescription2-pPreserveAttachments-03074

Each element of `pPreserveAttachments` **must** not also be an element of any other member of the subpass description

- VUID-VkSubpassDescription2-layout-02528

If any attachment is used by more than one `VkAttachmentReference2` member, then each use **must** use the same `layout`

- VUID-VkSubpassDescription2-attachment-02799

If the `attachment` member of any element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, then the `aspectMask` member **must** be a valid combination of `VkImageAspectFlagBits`

- VUID-VkSubpassDescription2-attachment-02800

If the `attachment` member of any element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, then the `aspectMask` member **must** not be `0`

- VUID-VkSubpassDescription2-attachment-02801

If the `attachment` member of any element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, then the `aspectMask` member **must** not include `VK_IMAGE_ASPECT_METADATA_BIT`

- VUID-VkSubpassDescription2-attachment-04563

If the `attachment` member of any element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, then the `aspectMask` member **must** not include `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT` for any index `i`

- VUID-VkSubpassDescription2-pDepthStencilAttachment-04440
An attachment **must** not be used in both `pDepthStencilAttachment` and `pColorAttachments`
- VUID-VkSubpassDescription2-inputAttachmentCount-05058
`inputAttachmentCount` **must** be less than or equal to `maxSubpassInputAttachments`
- VUID-VkSubpassDescription2-preserveAttachmentCount-05059
`preserveAttachmentCount` **must** be less than or equal to `maxSubpassPreserveAttachments`
- VUID-VkSubpassDescription2-multiview-06558
If the `multiview` feature is not enabled, `viewMask` **must** be 0
- VUID-VkSubpassDescription2-viewMask-06706
The index of the most significant bit in `viewMask` **must** be less than `maxMultiviewViewCount`

Valid Usage (Implicit)

- VUID-VkSubpassDescription2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SUBPASS_DESCRIPTION_2`
- VUID-VkSubpassDescription2-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkFragmentShadingRateAttachmentInfoKHR` or `VkSubpassDescriptionDepthStencilResolve`
- VUID-VkSubpassDescription2-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkSubpassDescription2-flags-zero bitmask
`flags` **must** be 0
- VUID-VkSubpassDescription2-pipelineBindPoint-parameter
`pipelineBindPoint` **must** be a valid `VkPipelineBindPoint` value
- VUID-VkSubpassDescription2-pInputAttachments-parameter
If `inputAttachmentCount` is not 0, `pInputAttachments` **must** be a valid pointer to an array of `inputAttachmentCount` valid `VkAttachmentReference2` structures
- VUID-VkSubpassDescription2-pColorAttachments-parameter
If `colorAttachmentCount` is not 0, `pColorAttachments` **must** be a valid pointer to an array of `colorAttachmentCount` valid `VkAttachmentReference2` structures
- VUID-VkSubpassDescription2-pResolveAttachments-parameter
If `colorAttachmentCount` is not 0, and `pResolveAttachments` is not `NULL`, `pResolveAttachments` **must** be a valid pointer to an array of `colorAttachmentCount` valid `VkAttachmentReference2` structures
- VUID-VkSubpassDescription2-pDepthStencilAttachment-parameter
If `pDepthStencilAttachment` is not `NULL`, `pDepthStencilAttachment` **must** be a valid pointer to a valid `VkAttachmentReference2` structure
- VUID-VkSubpassDescription2-pPreserveAttachments-parameter
If `preserveAttachmentCount` is not 0, `pPreserveAttachments` **must** be a valid pointer to an array of `preserveAttachmentCount` `uint32_t` values

The `VkSubpassDescriptionDepthStencilResolve` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkSubpassDescriptionDepthStencilResolve {
    VkStructureType           sType;
    const void*               pNext;
    VkResolveModeFlagBits     depthResolveMode;
    VkResolveModeFlagBits     stencilResolveMode;
    const VkAttachmentReference2* pDepthStencilResolveAttachment;
} VkSubpassDescriptionDepthStencilResolve;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `depthResolveMode` is a `VkResolveModeFlagBits` value describing the depth resolve mode.
- `stencilResolveMode` is a `VkResolveModeFlagBits` value describing the stencil resolve mode.
- `pDepthStencilResolveAttachment` is `NULL` or a pointer to a `VkAttachmentReference2` structure defining the depth/stencil resolve attachment for this subpass and its layout.

If the `pNext` chain of `VkSubpassDescription2` includes a `VkSubpassDescriptionDepthStencilResolve` structure, then that structure describes [multisample resolve operations](#) for the depth/stencil attachment in a subpass. If this structure is not included in the `pNext` chain of `VkSubpassDescription2`, or if it is and either `pDepthStencilResolveAttachment` is `NULL` or its attachment index is `VK_ATTACHMENT_UNUSED`, it indicates that no depth/stencil resolve attachment will be used in the subpass.

Valid Usage

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03177
If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `pDepthStencilAttachment` **must** not be `NULL` or have the value `VK_ATTACHMENT_UNUSED`
- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03179
If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `pDepthStencilAttachment` **must** not have a sample count of `VK_SAMPLE_COUNT_1_BIT`
- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03180
If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `pDepthStencilResolveAttachment` **must** have a sample count of `VK_SAMPLE_COUNT_1_BIT`
- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-02651
If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED` then it **must** have an image format whose [potential format features](#) contain `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`
- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03181

If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED` and `VkFormat` of `pDepthStencilResolveAttachment` has a depth component, then the `VkFormat` of `pDepthStencilAttachment` **must** have a depth component with the same number of bits and `numeric format`

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03182
If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, and `VkFormat` of `pDepthStencilResolveAttachment` has a stencil component, then the `VkFormat` of `pDepthStencilAttachment` **must** have a stencil component with the same number of bits and `numeric format`
- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03178
If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `depthResolveMode` and `stencilResolveMode` **must** not both be `VK_RESOLVE_MODE_NONE`
- VUID-VkSubpassDescriptionDepthStencilResolve-depthResolveMode-03183
If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED` and the `VkFormat` of `pDepthStencilResolveAttachment` has a depth component, then the value of `depthResolveMode` **must** be one of the bits set in `VkPhysicalDeviceDepthStencilResolveProperties::supportedDepthResolveModes` or `VK_RESOLVE_MODE_NONE`
- VUID-VkSubpassDescriptionDepthStencilResolve-stencilResolveMode-03184
If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED` and the `VkFormat` of `pDepthStencilResolveAttachment` has a stencil component, then the value of `stencilResolveMode` **must** be one of the bits set in `VkPhysicalDeviceDepthStencilResolveProperties::supportedStencilResolveModes` or `VK_RESOLVE_MODE_NONE`
- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03185
If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, the `VkFormat` of `pDepthStencilResolveAttachment` has both depth and stencil components, `VkPhysicalDeviceDepthStencilResolveProperties::independentResolve` is `VK_FALSE`, and `VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone` is `VK_FALSE`, then the values of `depthResolveMode` and `stencilResolveMode` **must** be identical
- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03186
If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, the `VkFormat` of `pDepthStencilResolveAttachment` has both depth and stencil components, `VkPhysicalDeviceDepthStencilResolveProperties::independentResolve` is `VK_FALSE` and `VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone` is `VK_TRUE`, then the values of `depthResolveMode` and `stencilResolveMode` **must** be identical or one of them **must** be `VK_RESOLVE_MODE_NONE`

Valid Usage (Implicit)

- VUID-VkSubpassDescriptionDepthStencilResolve-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SUBPASS_DESCRIPTION_DEPTH_STENCIL_RESOLVE`
- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-

parameter

If `pDepthStencilResolveAttachment` is not `NULL`, `pDepthStencilResolveAttachment` **must** be a valid pointer to a valid `VkAttachmentReference2` structure

The `VkFragmentShadingRateAttachmentInfoKHR` structure is defined as:

```
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkFragmentShadingRateAttachmentInfoKHR {
    VkStructureType           sType;
    const void*               pNext;
    const VkAttachmentReference2* pFragmentShadingRateAttachment;
    VkExtent2D                shadingRateAttachmentTexelSize;
} VkFragmentShadingRateAttachmentInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pFragmentShadingRateAttachment` is `NULL` or a pointer to a `VkAttachmentReference2` structure defining the fragment shading rate attachment for this subpass.
- `shadingRateAttachmentTexelSize` specifies the size of the portion of the framebuffer corresponding to each texel in `pFragmentShadingRateAttachment`.

If no shading rate attachment is specified, or if this structure is not specified, the implementation behaves as if a valid shading rate attachment was specified with all texels specifying a single pixel per fragment.

Valid Usage

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04524
If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** be equal to `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR`
- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04525
If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.width` **must** be a power of two value
- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04526
If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.width` **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSize.width`
- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04527

If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.width` **must** be greater than or equal to `minFragmentShadingRateAttachmentTexelSize.width`

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04528

If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.height` **must** be a power of two value

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04529

If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.height` **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSize.height`

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04530

If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.height` **must** be greater than or equal to `minFragmentShadingRateAttachmentTexelSize.height`

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04531

If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, the quotient of `shadingRateAttachmentTexelSize.width` and `shadingRateAttachmentTexelSize.height` **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04532

If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, the quotient of `shadingRateAttachmentTexelSize.height` and `shadingRateAttachmentTexelSize.width` **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`

Valid Usage (Implicit)

- VUID-VkFragmentShadingRateAttachmentInfoKHR-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_FRAGMENT_SHADING_RATE_ATTACHMENT_INFO_KHR`

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-parameter

If `pFragmentShadingRateAttachment` is not `NULL`, `pFragmentShadingRateAttachment` **must** be a valid pointer to a valid [VkAttachmentReference2](#) structure

The `VkAttachmentReference2` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentReference2 {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           attachment;
    VkImageLayout       layout;
    VkImageAspectFlags aspectMask;
} VkAttachmentReference2;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **attachment** is either an integer value identifying an attachment at the corresponding index in **VkRenderPassCreateInfo2::pAttachments**, or **VK_ATTACHMENT_UNUSED** to signify that this attachment is not used.
- **layout** is a **VkImageLayout** value specifying the layout the attachment uses during the subpass.
- **aspectMask** is a mask of which aspect(s) **can** be accessed within the specified subpass as an input attachment.

Parameters defined by this structure with the same name as those in **VkAttachmentReference** have the identical effect to those parameters.

aspectMask is ignored when this structure is used to describe anything other than an input attachment reference.

If the **separateDepthStencilLayouts** feature is enabled, and **attachment** has a depth/stencil format, **layout** **can** be set to a layout that only specifies the layout of the depth aspect.

If **layout** only specifies the layout of the depth aspect of the attachment, the layout of the stencil aspect is specified by the **stencilLayout** member of a **VkAttachmentReferenceStencilLayout** structure included in the **pNext** chain. Otherwise, **layout** describes the layout for all relevant image aspects.

Valid Usage

- VUID-VkAttachmentReference2-layout-03077
If **attachment** is not **VK_ATTACHMENT_UNUSED**, **layout** **must** not be **VK_IMAGE_LAYOUT_UNDEFINED**, **VK_IMAGE_LAYOUT_PREINITIALIZED**, or **VK_IMAGE_LAYOUT_PRESENT_SRC_KHR**
- VUID-VkAttachmentReference2-separateDepthStencilLayouts-03313
If the **separateDepthStencilLayouts** feature is not enabled, and **attachment** is not **VK_ATTACHMENT_UNUSED**, **layout** **must** not be **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL**, **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL**, **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL**, or **VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL**,
- VUID-VkAttachmentReference2-synchronization2-06910
If the **synchronization2** feature is not enabled, **layout** **must** not be **VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR** or **VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR**

Valid Usage (Implicit)

- VUID-VkAttachmentReference2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_ATTACHMENT_REFERENCE_2`
- VUID-VkAttachmentReference2-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkAttachmentReferenceStencilLayout`
- VUID-VkAttachmentReference2-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkAttachmentReference2-layout-parameter
`layout` **must** be a valid `VkImageLayout` value

The `VkAttachmentReferenceStencilLayout` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentReferenceStencilLayout {
    VkStructureType    sType;
    void*              pNext;
    VkImageLayout       stencilLayout;
} VkAttachmentReferenceStencilLayout;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stencilLayout` is a `VkImageLayout` value specifying the layout the stencil aspect of the attachment uses during the subpass.

Valid Usage

- VUID-VkAttachmentReferenceStencilLayout-stencilLayout-03318
`stencilLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_PREINITIALIZED`, `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`

Valid Usage (Implicit)

- VUID-VkAttachmentReferenceStencilLayout-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_ATTACHMENT_REFERENCE_STENCIL_LAYOUT`

- VUID-VkAttachmentReferenceStencilLayout-stencilLayout-parameter **stencilLayout** must be a valid [VkImageLayout](#) value

The [VkSubpassDependency2](#) structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkSubpassDependency2 {
    VkStructureType      sType;
    const void*          pNext;
    uint32_t             srcSubpass;
    uint32_t             dstSubpass;
    VkPipelineStageFlags srcStageMask;
    VkPipelineStageFlags dstStageMask;
    VkAccessFlags        srcAccessMask;
    VkAccessFlags        dstAccessMask;
    VkDependencyFlags    dependencyFlags;
    int32_t              viewOffset;
} VkSubpassDependency2;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **srcSubpass** is the subpass index of the first subpass in the dependency, or `VK_SUBPASS_EXTERNAL`.
- **dstSubpass** is the subpass index of the second subpass in the dependency, or `VK_SUBPASS_EXTERNAL`.
- **srcStageMask** is a bitmask of [VkPipelineStageFlagBits](#) specifying the [source stage mask](#). If set to `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT`, it is equivalent to setting it to `VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT`.
- **dstStageMask** is a bitmask of [VkPipelineStageFlagBits](#) specifying the [destination stage mask](#). If set to `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT`, it is equivalent to setting it to `VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT`.
- **srcAccessMask** is a bitmask of [VkAccessFlagBits](#) specifying a [source access mask](#).
- **dstAccessMask** is a bitmask of [VkAccessFlagBits](#) specifying a [destination access mask](#).
- **dependencyFlags** is a bitmask of [VkDependencyFlagBits](#).
- **viewOffset** controls which views in the source subpass the views in the destination subpass depend on.

Parameters defined by this structure with the same name as those in [VkSubpassDependency](#) have the identical effect to those parameters.

viewOffset has the same effect for the described subpass dependency as [VkRenderPassMultiviewCreateInfo::pViewOffsets](#) has on each corresponding subpass dependency.

If a [VkMemoryBarrier2](#) is included in the **pNext** chain, **srcStageMask**, **dstStageMask**, **srcAccessMask**, and **dstAccessMask** parameters are ignored. The synchronization and access scopes instead are

defined by the parameters of [VkMemoryBarrier2](#). If either `srcStageMask` or `dstStageMask` are set to `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT`, it is equivalent to setting `VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT`.

Valid Usage

- VUID-VkSubpassDependency2-srcStageMask-04090
If the `geometryShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- VUID-VkSubpassDependency2-srcStageMask-04091
If the `tessellationShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-VkSubpassDependency2-srcStageMask-07319
If the `attachmentFragmentShadingRate` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-VkSubpassDependency2-srcStageMask-03937
If the `synchronization2` feature is not enabled, `srcStageMask` **must** not be `0`
- VUID-VkSubpassDependency2-dstStageMask-04090
If the `geometryShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- VUID-VkSubpassDependency2-dstStageMask-04091
If the `tessellationShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-VkSubpassDependency2-dstStageMask-07319
If the `attachmentFragmentShadingRate` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-VkSubpassDependency2-dstStageMask-03937
If the `synchronization2` feature is not enabled, `dstStageMask` **must** not be `0`
- VUID-VkSubpassDependency2-srcSubpass-03084
`srcSubpass` **must** be less than or equal to `dstSubpass`, unless one of them is `VK_SUBPASS_EXTERNAL`, to avoid cyclic dependencies and ensure a valid execution order
- VUID-VkSubpassDependency2-srcSubpass-03085
`srcSubpass` and `dstSubpass` **must** not both be equal to `VK_SUBPASS_EXTERNAL`
- VUID-VkSubpassDependency2-srcSubpass-06810
If `srcSubpass` is equal to `dstSubpass` and `srcStageMask` includes a [framebuffer-space stage](#), `dstStageMask` **must** only contain [framebuffer-space stages](#)
- VUID-VkSubpassDependency2-srcAccessMask-03088
Any access flag included in `srcAccessMask` **must** be supported by one of the pipeline stages in `srcStageMask`, as specified in the [table of supported access types](#)
- VUID-VkSubpassDependency2-dstAccessMask-03089
Any access flag included in `dstAccessMask` **must** be supported by one of the pipeline stages

in `dstStageMask`, as specified in the [table of supported access types](#)

- VUID-VkSubpassDependency2-dependencyFlags-03090
If `dependencyFlags` includes `VK_DEPENDENCY_VIEW_LOCAL_BIT`, `srcSubpass` **must** not be equal to `VK_SUBPASS_EXTERNAL`
- VUID-VkSubpassDependency2-dependencyFlags-03091
If `dependencyFlags` includes `VK_DEPENDENCY_VIEW_LOCAL_BIT`, `dstSubpass` **must** not be equal to `VK_SUBPASS_EXTERNAL`
- VUID-VkSubpassDependency2-srcSubpass-02245
If `srcSubpass` equals `dstSubpass`, and `srcStageMask` and `dstStageMask` both include a [framebuffer-space stage](#), then `dependencyFlags` **must** include `VK_DEPENDENCY_BY_REGION_BIT`
- VUID-VkSubpassDependency2-viewOffset-02530
If `viewOffset` is not equal to 0, `srcSubpass` **must** not be equal to `dstSubpass`
- VUID-VkSubpassDependency2-dependencyFlags-03092
If `dependencyFlags` does not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`, `viewOffset` **must** be 0

Valid Usage (Implicit)

- VUID-VkSubpassDependency2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SUBPASS_DEPENDENCY_2`
- VUID-VkSubpassDependency2-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of [VkMemoryBarrier2](#)
- VUID-VkSubpassDependency2-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkSubpassDependency2-srcStageMask-parameter
`srcStageMask` **must** be a valid combination of [VkPipelineStageFlagBits](#) values
- VUID-VkSubpassDependency2-dstStageMask-parameter
`dstStageMask` **must** be a valid combination of [VkPipelineStageFlagBits](#) values
- VUID-VkSubpassDependency2-srcAccessMask-parameter
`srcAccessMask` **must** be a valid combination of [VkAccessFlagBits](#) values
- VUID-VkSubpassDependency2-dstAccessMask-parameter
`dstAccessMask` **must** be a valid combination of [VkAccessFlagBits](#) values
- VUID-VkSubpassDependency2-dependencyFlags-parameter
`dependencyFlags` **must** be a valid combination of [VkDependencyFlagBits](#) values

To destroy a render pass, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyRenderPass(
    VkDevice                device,
    VkRenderPass            renderPass,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the render pass.
- **renderPass** is the handle of the render pass to destroy.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroyRenderPass-renderPass-00873
All submitted commands that refer to **renderPass** **must** have completed execution

Valid Usage (Implicit)

- VUID-vkDestroyRenderPass-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkDestroyRenderPass-renderPass-parameter
If **renderPass** is not [VK_NULL_HANDLE](#), **renderPass** **must** be a valid [VkRenderPass](#) handle
- VUID-vkDestroyRenderPass-pAllocator-null
pAllocator **must** be [NULL](#)
- VUID-vkDestroyRenderPass-renderPass-parent
If **renderPass** is a valid handle, it **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **renderPass** **must** be externally synchronized

8.2. Render Pass Compatibility

Framebuffers and graphics pipelines are created based on a specific render pass object. They **must** only be used with that render pass object, or one compatible with it.

Two attachment references are compatible if they have matching format and sample count, or are both [VK_ATTACHMENT_UNUSED](#).

Two arrays of attachment references are compatible if all corresponding pairs of attachments are compatible. If the arrays are of different lengths, attachment references not present in the smaller array are treated as [VK_ATTACHMENT_UNUSED](#). If the pointer that would contain the reference is [NULL](#), the attachment reference is treated as [VK_ATTACHMENT_UNUSED](#).

Two render passes are compatible if their corresponding color, input, resolve, and depth/stencil attachment references are compatible and if they are otherwise identical except for:

- Initial and final image layout in attachment descriptions
- Load and store operations in attachment descriptions

- Image layout in attachment references

As an additional special case, if two render passes have a single subpass, the resolve attachment reference compatibility requirements are ignored.

A framebuffer is compatible with a render pass if it was created using the same render pass or a compatible render pass.

8.3. Framebuffers

Render passes operate in conjunction with *framebuffers*. Framebuffers represent a collection of specific memory attachments that a render pass instance uses.

Framebuffers are represented by `VkFramebuffer` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkFramebuffer)
```

To create a framebuffer, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateFramebuffer(
    VkDevice                                device,
    const VkFramebufferCreateInfo*          pCreateInfo,
    const VkAllocationCallbacks*           pAllocator,
    VkFramebuffer*                          pFramebuffer);
```

- `device` is the logical device that creates the framebuffer.
- `pCreateInfo` is a pointer to a `VkFramebufferCreateInfo` structure describing additional information about framebuffer creation.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pFramebuffer` is a pointer to a `VkFramebuffer` handle in which the resulting framebuffer object is returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkCreateFramebuffer` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkCreateFramebuffer-device-10002
`device` **must** support at least one queue family with the `VK_QUEUE_GRAPHICS_BIT` capability
- VUID-vkCreateFramebuffer-pCreateInfo-02777
If `pCreateInfo->flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, and `attachmentCount` is not 0, each element of `pCreateInfo->pAttachments` **must** have been created on `device`

- VUID-vkCreateFramebuffer-device-05068

The number of framebuffers currently allocated from **device** plus 1 **must** be less than or equal to the total number of framebuffers requested via `VkDeviceObjectReservationCreateInfo::framebufferRequestCount` specified when **device** was created

Valid Usage (Implicit)

- VUID-vkCreateFramebuffer-device-parameter
device **must** be a valid `VkDevice` handle
- VUID-vkCreateFramebuffer-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid `VkFramebufferCreateInfo` structure
- VUID-vkCreateFramebuffer-pAllocator-null
pAllocator **must** be `NULL`
- VUID-vkCreateFramebuffer-pFramebuffer-parameter
pFramebuffer **must** be a valid pointer to a `VkFramebuffer` handle
- VUID-vkCreateFramebuffer-device-queuecount
The device **must** have been created with at least 1 queue

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkFramebufferCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkFramebufferCreateInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkFramebufferCreateFlags flags;
    VkRenderPass          renderPass;
    uint32_t              attachmentCount;
    const VkImageView*    pAttachments;
    uint32_t              width;
    uint32_t              height;
    uint32_t              layers;
} VkFramebufferCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkFramebufferCreateFlagBits`
- `renderPass` is a render pass defining what render passes the framebuffer will be compatible with. See [Render Pass Compatibility](#) for details. The implementation **must** not access this object outside of the duration of the command this structure is passed to.
- `attachmentCount` is the number of attachments.
- `pAttachments` is a pointer to an array of `VkImageView` handles, each of which will be used as the corresponding attachment in a render pass instance. If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, this parameter is ignored.
- `width`, `height` and `layers` define the dimensions of the framebuffer. If the render pass uses multiview, then `layers` **must** be one and each attachment requires a number of layers that is greater than the maximum bit index set in the view mask in the subpasses in which it is used.

For any depth/stencil attachments used by this framebuffer in `pAttachments`, the `aspectMask` is ignored.

It is legal for a subpass to use no color or depth/stencil attachments, either because it has no attachment references or because all of them are `VK_ATTACHMENT_UNUSED`. This kind of subpass **can** use shader side effects such as image stores and atomics to produce an output. In this case, the subpass continues to use the `width`, `height`, and `layers` of the framebuffer to define the dimensions of the rendering area, and the `rasterizationSamples` from each pipeline's `VkPipelineMultisampleStateCreateInfo` to define the number of samples used in rasterization; however, if `VkPhysicalDeviceFeatures::variableMultisampleRate` is `VK_FALSE`, then all pipelines to be bound with the subpass **must** have the same value for `VkPipelineMultisampleStateCreateInfo::rasterizationSamples`. In all such cases, `rasterizationSamples` **must** be a valid `VkSampleCountFlagBits` value that is set in `VkPhysicalDeviceLimits::framebufferNoAttachmentsSampleCounts`.

Valid Usage

- VUID-VkFramebufferCreateInfo-attachmentCount-00876

`attachmentCount` **must** be equal to the attachment count specified in `renderPass`

- VUID-VkFramebufferCreateInfo-flags-02778

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT` and `attachmentCount` is not 0, `pAttachments` **must** be a valid pointer to an array of `attachmentCount` valid `VkImageView` handles

- VUID-VkFramebufferCreateInfo-pAttachments-00877

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as a color attachment or resolve attachment by `renderPass` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`

- VUID-VkFramebufferCreateInfo-pAttachments-02633

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as a depth/stencil attachment by `renderPass` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkFramebufferCreateInfo-pAttachments-02634

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as a depth/stencil resolve attachment by `renderPass` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkFramebufferCreateInfo-pAttachments-00879

If `renderpass` is not `VK_NULL_HANDLE`, `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as an input attachment by `renderPass` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

- VUID-VkFramebufferCreateInfo-pAttachments-00880

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` **must** have been created with a `VkFormat` value that matches the `VkFormat` specified by the corresponding `VkAttachmentDescription` in `renderPass`

- VUID-VkFramebufferCreateInfo-pAttachments-00881

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` **must** have been created with a `samples` value that matches the `samples` value specified by the corresponding `VkAttachmentDescription` in `renderPass`

- VUID-VkFramebufferCreateInfo-flags-04533

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as an input, color, resolve, or depth/stencil attachment by `renderPass` **must** have been created with a `VkImageCreateInfo::extent.width` greater than or equal to `width`

- VUID-VkFramebufferCreateInfo-flags-04534

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as an input, color, resolve, or depth/stencil attachment by `renderPass` **must** have been created with a `VkImageCreateInfo::extent.height` greater than or equal to `height`

- VUID-VkFramebufferCreateInfo-flags-04535

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as an input, color, resolve, or depth/stencil attachment by `renderPass` **must** have been created with a `VkImageViewCreateInfo`

`::subresourceRange.layerCount` greater than or equal to `layers`

- VUID-VkFramebufferCreateInfo-renderPass-04536

If `renderPass` was specified with non-zero view masks, each element of `pAttachments` that is used as an input, color, resolve, or depth/stencil attachment by `renderPass` **must** have a `layerCount` greater than the index of the most significant bit set in any of those view masks

- VUID-VkFramebufferCreateInfo-flags-04537

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, and `renderPass` was specified with non-zero view masks, each element of `pAttachments` that is used as a `fragment shading rate attachment` by `renderPass` **must** have a `layerCount` that is either 1, or greater than the index of the most significant bit set in any of those view masks

- VUID-VkFramebufferCreateInfo-flags-04538

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, and `renderPass` was not specified with non-zero view masks, each element of `pAttachments` that is used as a `fragment shading rate attachment` by `renderPass` **must** have a `layerCount` that is either 1, or greater than `layers`

- VUID-VkFramebufferCreateInfo-flags-04539

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, an element of `pAttachments` that is used as a `fragment shading rate attachment` **must** have a width at least as large as $\lceil \text{width} / \text{texelWidth} \rceil$, where `texelWidth` is the largest value of `shadingRateAttachmentTexelSize.width` in a `VkFragmentShadingRateAttachmentInfoKHR` which references that attachment

- VUID-VkFramebufferCreateInfo-flags-04540

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, an element of `pAttachments` that is used as a `fragment shading rate attachment` **must** have a height at least as large as $\lceil \text{height} / \text{texelHeight} \rceil$, where `texelHeight` is the largest value of `shadingRateAttachmentTexelSize.height` in a `VkFragmentShadingRateAttachmentInfoKHR` which references that attachment

- VUID-VkFramebufferCreateInfo-pAttachments-00883

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` **must** only specify a single mip level

- VUID-VkFramebufferCreateInfo-pAttachments-00884

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` **must** have been created with the identity swizzle

- VUID-VkFramebufferCreateInfo-width-00885

`width` **must** be greater than 0

- VUID-VkFramebufferCreateInfo-width-00886

`width` **must** be less than or equal to `maxFramebufferWidth`

- VUID-VkFramebufferCreateInfo-height-00887

`height` **must** be greater than 0

- VUID-VkFramebufferCreateInfo-height-00888

`height` **must** be less than or equal to `maxFramebufferHeight`

- VUID-VkFramebufferCreateInfo-layers-00889

`layers` **must** be greater than 0

- VUID-VkFramebufferCreateInfo-layers-00890
layers **must** be less than or equal to maxFramebufferLayers
- VUID-VkFramebufferCreateInfo-renderPass-02531
If renderPass was specified with non-zero view masks, layers **must** be 1
- VUID-VkFramebufferCreateInfo-pAttachments-00891
If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is a 2D or 2D array image view taken from a 3D image **must** not be a depth/stencil format
- VUID-VkFramebufferCreateInfo-flags-03189
If the imagelessFramebuffer feature is not enabled, flags **must** not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT
- VUID-VkFramebufferCreateInfo-flags-03190
If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the pNext chain **must** include a VkFramebufferAttachmentsCreateInfo structure
- VUID-VkFramebufferCreateInfo-flags-03191
If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the attachmentImageInfoCount member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain **must** be equal to either zero or attachmentCount
- VUID-VkFramebufferCreateInfo-flags-04541
If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the width member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain that is used as an input, color, resolve or depth/stencil attachment in renderPass **must** be greater than or equal to width
- VUID-VkFramebufferCreateInfo-flags-04542
If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the height member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain that is used as an input, color, resolve or depth/stencil attachment in renderPass **must** be greater than or equal to height
- VUID-VkFramebufferCreateInfo-flags-04543
If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the width member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain that is used as a fragment shading rate attachment **must** be greater than or equal to $\lceil \text{width} / \text{texelWidth} \rceil$, where texelWidth is the largest value of shadingRateAttachmentTexelSize.width in a VkFragmentShadingRateAttachmentInfoKHR which references that attachment
- VUID-VkFramebufferCreateInfo-flags-04544
If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the height member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain that is used as a fragment shading rate attachment **must** be greater than or equal to $\lceil \text{height} / \text{texelHeight} \rceil$, where texelHeight is the largest value of shadingRateAttachmentTexelSize.height in a VkFragmentShadingRateAttachmentInfoKHR which references that attachment
- VUID-VkFramebufferCreateInfo-flags-04545
If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the layerCount member of any

element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure in the `pNext` chain that is used as a `fragment shading rate attachment` **must** be either 1, or greater than or equal to `layers`

- VUID-VkFramebufferCreateInfo-flags-04587

If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT` and `renderPass` was specified with non-zero view masks, the `layerCount` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure in the `pNext` chain that is used as a `fragment shading rate attachment` **must** be either 1, or greater than the index of the most significant bit set in any of those view masks

- VUID-VkFramebufferCreateInfo-renderPass-03198

If `multiview` is enabled for `renderPass` and `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `layerCount` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain used as an input, color, resolve, or depth/stencil attachment in `renderPass` **must** be greater than the maximum bit index set in the view mask in the subpasses in which it is used in `renderPass`

- VUID-VkFramebufferCreateInfo-renderPass-04546

If `multiview` is not enabled for `renderPass` and `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `layerCount` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain used as an input, color, resolve, or depth/stencil attachment in `renderPass` **must** be greater than or equal to `layers`

- VUID-VkFramebufferCreateInfo-flags-03201

If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `usage` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain that refers to an attachment used as a color attachment or resolve attachment by `renderPass` **must** include `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`

- VUID-VkFramebufferCreateInfo-flags-03202

If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `usage` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain that refers to an attachment used as a depth/stencil attachment by `renderPass` **must** include `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkFramebufferCreateInfo-flags-03204

If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `usage` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain that refers to an attachment used as an input attachment by `renderPass` **must** include `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

- VUID-VkFramebufferCreateInfo-flags-03205

If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, at least one element of the `pViewFormats` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain **must** be equal to the corresponding value of `VkAttachmentDescription::format` used to create `renderPass`

- VUID-VkFramebufferCreateInfo-flags-04113

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` **must** have been created with `VkImageViewCreateInfo::viewType` not equal to `VK_IMAGE_VIEW_TYPE_3D`

- VUID-VkFramebufferCreateInfo-flags-04548

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as a fragment shading rate attachment by `renderPass` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-VkFramebufferCreateInfo-flags-04549

If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `usage` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain that refers to an attachment used as a fragment shading rate attachment by `renderPass` **must** include `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-VkFramebufferCreateInfo-attachmentCount-05060

`attachmentCount` **must** be less than or equal to `maxFramebufferAttachments`

Valid Usage (Implicit)

- VUID-VkFramebufferCreateInfo-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_FRAMEBUFFER_CREATE_INFO`

- VUID-VkFramebufferCreateInfo-pNext-pNext

`pNext` **must** be `NULL` or a pointer to a valid instance of `VkFramebufferAttachmentsCreateInfo`

- VUID-VkFramebufferCreateInfo-sType-unique

The `sType` value of each structure in the `pNext` chain **must** be unique

- VUID-VkFramebufferCreateInfo-flags-parameter

`flags` **must** be a valid combination of `VkFramebufferCreateFlagBits` values

- VUID-VkFramebufferCreateInfo-renderPass-parameter

`renderPass` **must** be a valid `VkRenderPass` handle

- VUID-VkFramebufferCreateInfo-commonparent

Both of `renderPass`, and the elements of `pAttachments` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

The `VkFramebufferAttachmentsCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkFramebufferAttachmentsCreateInfo {
    VkStructureType          sType;
    const void*              pNext;
    uint32_t                 attachmentImageInfoCount;
    const VkFramebufferAttachmentImageInfo* pAttachmentImageInfos;
} VkFramebufferAttachmentsCreateInfo;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **attachmentImageInfoCount** is the number of attachments being described.
- **pAttachmentImageInfos** is a pointer to an array of [VkFramebufferAttachmentImageInfo](#) structures, each structure describing a number of parameters of the corresponding attachment in a render pass instance.

Valid Usage (Implicit)

- VUID-VkFramebufferAttachmentsCreateInfo-sType-sType
sType must be **VK_STRUCTURE_TYPE_FRAMEBUFFER_ATTACHMENTS_CREATE_INFO**
- VUID-VkFramebufferAttachmentsCreateInfo-pAttachmentImageInfos-parameter
If **attachmentImageInfoCount** is not 0, **pAttachmentImageInfos must** be a valid pointer to an array of **attachmentImageInfoCount** valid [VkFramebufferAttachmentImageInfo](#) structures

The [VkFramebufferAttachmentImageInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkFramebufferAttachmentImageInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkImageCreateFlags        flags;
    VkImageUsageFlags         usage;
    uint32_t                 width;
    uint32_t                 height;
    uint32_t                 layerCount;
    uint32_t                 viewFormatCount;
    const VkFormat*          pViewFormats;
} VkFramebufferAttachmentImageInfo;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of [VkImageCreateFlagBits](#), matching the value of [VkImageCreateInfo::flags](#) used to create an image that will be used with this framebuffer.
- **usage** is a bitmask of [VkImageUsageFlagBits](#), matching the value of [VkImageCreateInfo::usage](#)

used to create an image used with this framebuffer.

- **width** is the width of the image view used for rendering.
- **height** is the height of the image view used for rendering.
- **layerCount** is the number of array layers of the image view used for rendering.
- **viewFormatCount** is the number of entries in the **pViewFormats** array, matching the value of **VkImageFormatListCreateInfo::viewFormatCount** used to create an image used with this framebuffer.
- **pViewFormats** is a pointer to an array of **VkFormat** values specifying all of the formats which **can** be used when creating views of the image, matching the value of **VkImageFormatListCreateInfo::pViewFormats** used to create an image used with this framebuffer.

Images that **can** be used with the framebuffer when beginning a render pass, as specified by **VkRenderPassAttachmentBeginInfo**, **must** be created with parameters that are identical to those specified here.

Valid Usage

- VUID-VkFramebufferAttachmentImageInfo-viewFormatCount-09536
If **viewFormatCount** is not 0, each element of **pViewFormats** **must** not be **VK_FORMAT_UNDEFINED**

Valid Usage (Implicit)

- VUID-VkFramebufferAttachmentImageInfo-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_FRAMEBUFFER_ATTACHMENT_IMAGE_INFO**
- VUID-VkFramebufferAttachmentImageInfo-pNext-pNext
pNext **must** be **NULL**
- VUID-VkFramebufferAttachmentImageInfo-flags-parameter
flags **must** be a valid combination of **VkImageCreateFlagBits** values
- VUID-VkFramebufferAttachmentImageInfo-usage-parameter
usage **must** be a valid combination of **VkImageUsageFlagBits** values
- VUID-VkFramebufferAttachmentImageInfo-usage-requiredbitmask
usage **must** not be 0
- VUID-VkFramebufferAttachmentImageInfo-pViewFormats-parameter
If **viewFormatCount** is not 0, **pViewFormats** **must** be a valid pointer to an array of **viewFormatCount** valid **VkFormat** values

Bits which **can** be set in **VkFramebufferCreateInfo::flags**, specifying options for framebuffers, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkFramebufferCreateFlagBits {
    // Provided by VK_VERSION_1_2
    VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT = 0x00000001,
} VkFramebufferCreateFlagBits;
```

- `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT` specifies that image views are not specified, and only attachment compatibility information will be provided via a `VkFramebufferAttachmentImageInfo` structure.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkFramebufferCreateFlags;
```

`VkFramebufferCreateFlags` is a bitmask type for setting a mask of zero or more `VkFramebufferCreateFlagBits`.

To destroy a framebuffer, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyFramebuffer(
    VkDevice          device,
    VkFramebuffer     framebuffer,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the framebuffer.
- `framebuffer` is the handle of the framebuffer to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroyFramebuffer-framebuffer-00892
All submitted commands that refer to `framebuffer` **must** have completed execution

Valid Usage (Implicit)

- VUID-vkDestroyFramebuffer-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkDestroyFramebuffer-framebuffer-parameter
If `framebuffer` is not `VK_NULL_HANDLE`, `framebuffer` **must** be a valid `VkFramebuffer` handle
- VUID-vkDestroyFramebuffer-pAllocator-null
`pAllocator` **must** be `NULL`

- VUID-vkDestroyFramebuffer-framebuffer-parent

If `framebuffer` is a valid handle, it **must** have been created, allocated, or retrieved from device

Host Synchronization

- Host access to `framebuffer` **must** be externally synchronized

8.4. Render Pass Load Operations

Render pass load operations define the initial values of an attachment during a render pass instance.

Load operations for attachments with a depth/stencil format execute in the `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` pipeline stage. Load operations for attachments with a color format execute in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage. The load operation for each sample in an attachment happens-before any recorded command which accesses the sample in that render pass instance via that attachment or an alias. In a render pass object with multiple `subpasses`, load operations are performed in the first subpass which uses an attachment.

NOTE

Because load operations always happen first, external synchronization with attachment access only needs to synchronize the load operations with previous commands; not the operations within the render pass instance.

Load operations only update values within the defined render area for the render pass instance. However, any writes performed by a load operation (as defined by its access masks) to a given attachment **may** read and write back any memory locations within the image subresource bound for that attachment. For depth/stencil images, writes to one aspect **may** also result in read-modify-write operations for the other aspect.

NOTE

As entire subresources could be accessed by load operations, applications cannot safely access values outside of the render area during a render pass instance when a load operation that modifies values is used.

Load operations that **can** be used for a render pass are:

```
// Provided by VK_VERSION_1_0
typedef enum VkAttachmentLoadOp {
    VK_ATTACHMENT_LOAD_OP_LOAD = 0,
    VK_ATTACHMENT_LOAD_OP_CLEAR = 1,
    VK_ATTACHMENT_LOAD_OP_DONT_CARE = 2,
} VkAttachmentLoadOp;
```

- `VK_ATTACHMENT_LOAD_OP_LOAD` specifies that the previous contents of the image within the render

area will be preserved as the initial values. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_READ_BIT`.

- `VK_ATTACHMENT_LOAD_OP_CLEAR` specifies that the contents within the render area will be cleared to a uniform value, which is specified when a render pass instance is begun. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.
- `VK_ATTACHMENT_LOAD_OP_DONT_CARE` specifies that the previous contents within the area need not be preserved; the contents of the attachment will be undefined inside the render area. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.

During a render pass instance, input and color attachments with color formats that have a component size of 8, 16, or 32 bits **must** be represented in the attachment's format throughout the instance. Attachments with other floating- or fixed-point color formats, or with depth components **may** be represented in a format with a precision higher than the attachment format, but **must** be represented with the same range. When such a component is loaded via the `loadOp`, it will be converted into an implementation-dependent format used by the render pass. Such components **must** be converted from the render pass format, to the format of the attachment, before they are resolved or stored at the end of a render pass instance via `storeOp`. Conversions occur as described in [Numeric Representation and Computation](#) and [Fixed-Point Data Conversions](#).

8.5. Render Pass Store Operations

Render pass store operations define how values written to an attachment during a render pass instance are stored to memory.

Store operations for attachments with a depth/stencil format execute in the `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` pipeline stage. Store operations for attachments with a color format execute in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage. The store operation for each sample in an attachment happens-after any recorded command which accesses the sample via that attachment or an alias. In a render pass object with multiple [subpasses](#), store operations are performed in the last subpass which uses an attachment.

NOTE

Because store operations always happen after other accesses in a render pass instance, external synchronization with attachment access in an earlier render pass only needs to synchronize with the store operations; not the operations within the render pass instance.

Store operations only update values within the defined render area for the render pass instance. However, any writes performed by a store operation (as defined by its access masks) to a given attachment **may** read and write back any memory locations within the image subresource bound for that attachment. For depth/stencil images, writes to one aspect **may** also result in read-modify-write operations for the other aspect.

NOTE

As entire subresources could be accessed by store operations, applications cannot safely access values outside of the render area via aliased resources during a render pass instance when a store operation that modifies values is used.

Possible values of `VkAttachmentDescription::storeOp` and `stencilStoreOp`, specifying how the contents of the attachment are treated, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkAttachmentStoreOp {
    VK_ATTACHMENT_STORE_OP_STORE = 0,
    VK_ATTACHMENT_STORE_OP_DONT_CARE = 1,
} VkAttachmentStoreOp;
```

- `VK_ATTACHMENT_STORE_OP_STORE` specifies the contents generated during the render pass and within the render area are written to memory. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.
- `VK_ATTACHMENT_STORE_OP_DONT_CARE` specifies the contents within the render area are not needed after rendering, and **may** be discarded; the contents of the attachment will be undefined inside the render area. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.

NOTE

`VK_ATTACHMENT_STORE_OP_DONT_CARE` **can** cause contents generated during previous render passes to be discarded before reaching memory, even if no write to the attachment occurs during the current render pass.

8.6. Render Pass Multisample Resolve Operations

Render pass multisample resolve operations combine sample values from a single pixel in a multisample attachment and store the result to the corresponding pixel in a single sample attachment.

Multisample resolve operations for attachments execute in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage. A final resolve operation for all pixels in the render area happens-after any recorded command which writes a pixel via the multisample attachment to be resolved or an explicit alias of it in the subpass that it is specified. Any single sample attachment specified for use in a multisample resolve operation **may** have its contents modified at any point once rendering begins for the render pass instance. Reads from the multisample attachment can be synchronized with `VK_ACCESS_COLOR_ATTACHMENT_READ_BIT`. Access to the single sample attachment can be synchronized with `VK_ACCESS_COLOR_ATTACHMENT_READ_BIT` and `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`. These pipeline stage and access types are used whether the attachments are color or depth/stencil attachments.

When using render pass objects, a subpass dependency specified with the above pipeline stages and access flags will ensure synchronization with multisample resolve operations for any

attachments that were last accessed by that subpass. This allows later subpasses to read resolved values as input attachments.

Resolve operations only update values within the defined render area for the render pass instance. However, any writes performed by a resolve operation (as defined by its access masks) to a given attachment **may** read and write back any memory locations within the image subresource bound for that attachment. For depth/stencil images, writes to one aspect **may** also result in read-modify-write operations for the other aspect.

NOTE

As entire subresources could be accessed by multisample resolve operations, applications cannot safely access values outside of the render area via aliased resources during a render pass instance when a multisample resolve operation is performed.

Multisample values in a multisample attachment are combined according to the resolve mode used:

```
// Provided by VK_VERSION_1_2
typedef enum VkResolveModeFlagBits {
    VK_RESOLVE_MODE_NONE = 0,
    VK_RESOLVE_MODE_SAMPLE_ZERO_BIT = 0x00000001,
    VK_RESOLVE_MODE_AVERAGE_BIT = 0x00000002,
    VK_RESOLVE_MODE_MIN_BIT = 0x00000004,
    VK_RESOLVE_MODE_MAX_BIT = 0x00000008,
} VkResolveModeFlagBits;
```

- `VK_RESOLVE_MODE_NONE` specifies that no resolve operation is done.
- `VK_RESOLVE_MODE_SAMPLE_ZERO_BIT` specifies that result of the resolve operation is equal to the value of sample 0.
- `VK_RESOLVE_MODE_AVERAGE_BIT` specifies that result of the resolve operation is the average of the sample values.
- `VK_RESOLVE_MODE_MIN_BIT` specifies that result of the resolve operation is the minimum of the sample values.
- `VK_RESOLVE_MODE_MAX_BIT` specifies that result of the resolve operation is the maximum of the sample values.

If no resolve mode is otherwise specified, `VK_RESOLVE_MODE_AVERAGE_BIT` is used.

If `VK_RESOLVE_MODE_AVERAGE_BIT` is used, and the source format is a floating-point or normalized type, the sample values for each pixel are resolved with implementation-defined numerical precision.

If the [numeric format](#) of the resolve attachment uses sRGB encoding, the implementation **should** convert samples from nonlinear to linear before averaging samples as described in the “sRGB EOTF” section of the [Khronos Data Format Specification](#). In this case, the implementation **must** convert the linear averaged value to nonlinear before writing the resolved result to resolve attachment.

```
// Provided by VK_VERSION_1_2
typedef VkFlags VkResolveModeFlags;
```

`VkResolveModeFlags` is a bitmask type for setting a mask of zero or more `VkResolveModeFlagBits`.

8.7. Render Pass Commands

An application records the commands for a render pass instance one subpass at a time, by beginning a render pass instance, iterating over the subpasses to record commands for that subpass, and then ending the render pass instance.

To begin a render pass instance, call:

WARNING

This functionality is superseded by [Vulkan Version 1.2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
void vkCmdBeginRenderPass(
    VkCommandBuffer                commandBuffer,
    const VkRenderPassBeginInfo*   pRenderPassBegin,
    VkSubpassContents              contents);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pRenderPassBegin` is a pointer to a `VkRenderPassBeginInfo` structure specifying the render pass to begin an instance of, and the framebuffer the instance uses.
- `contents` is a `VkSubpassContents` value specifying how the commands in the first subpass will be provided.

After beginning a render pass instance, the command buffer is ready to record the commands for the first subpass of that render pass.

Valid Usage

- VUID-vkCmdBeginRenderPass-initialLayout-00895
If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`
- VUID-vkCmdBeginRenderPass-initialLayout-01758
If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is

VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL,
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL, or
VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-vkCmdBeginRenderPass-initialLayout-02842

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-vkCmdBeginRenderPass-stencilInitialLayout-02843

If any of the `stencilInitialLayout` or `stencilFinalLayout` member of the `VkAttachmentDescriptionStencilLayout` structures or the `stencilLayout` member of the `VkAttachmentReferenceStencilLayout` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-vkCmdBeginRenderPass-initialLayout-00897

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

- VUID-vkCmdBeginRenderPass-initialLayout-00898

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_TRANSFER_SRC_BIT`

- VUID-vkCmdBeginRenderPass-initialLayout-00899

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is

`VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_TRANSFER_DST_BIT`

- VUID-vkCmdBeginRenderPass-initialLayout-00900

If the `initialLayout` member of any of the `VkAttachmentDescription` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is not `VK_IMAGE_LAYOUT_UNDEFINED`, then each such `initialLayout` **must** be equal to the current layout of the corresponding attachment image subresource of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin`

- VUID-vkCmdBeginRenderPass-srcStageMask-06451

The `srcStageMask` members of any element of the `pDependencies` member of `VkRenderPassCreateInfo` used to create `renderPass` **must** be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` used to create the command pool which `commandBuffer` was allocated from

- VUID-vkCmdBeginRenderPass-dstStageMask-06452

The `dstStageMask` members of any element of the `pDependencies` member of `VkRenderPassCreateInfo` used to create `renderPass` **must** be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` used to create the command pool which `commandBuffer` was allocated from

- VUID-vkCmdBeginRenderPass-framebuffer-02532

For any attachment in `framebuffer` that is used by `renderPass` and is bound to memory locations that are also bound to another attachment used by `renderPass`, and if at least one of those uses causes either attachment to be written to, both attachments **must** have had the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` set

- VUID-vkCmdBeginRenderPass-framebuffer-09045

If any attachments specified in `framebuffer` are used by `renderPass` and are bound to overlapping memory locations, there **must** be only one that is used as a color attachment, depth/stencil, or resolve attachment in any subpass

Valid Usage (Implicit)

- VUID-vkCmdBeginRenderPass-commandBuffer-parameter

`commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdBeginRenderPass-pRenderPassBegin-parameter

`pRenderPassBegin` **must** be a valid pointer to a valid `VkRenderPassBeginInfo` structure

- VUID-vkCmdBeginRenderPass-contents-parameter

`contents` **must** be a valid `VkSubpassContents` value

- VUID-vkCmdBeginRenderPass-commandBuffer-recording

`commandBuffer` **must** be in the `recording` state

- VUID-vkCmdBeginRenderPass-commandBuffer-cmdpool

The `VkCommandPool` that `commandBuffer` was allocated from **must** support

VK_QUEUE_GRAPHICS_BIT operations

- VUID-vkCmdBeginRenderPass-renderpass

This command **must** only be called outside of a render pass instance

- VUID-vkCmdBeginRenderPass-bufferlevel
commandBuffer **must** be a primary VkCommandBuffer

Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary	Outside	VK_QUEUE_GRAPHICS_BIT	Action State Synchronization

Alternatively to begin a render pass, call:

```
// Provided by VK_VERSION_1_2
void vkCmdBeginRenderPass2(
    VkCommandBuffer                commandBuffer,
    const VkRenderPassBeginInfo*   pRenderPassBegin,
    const VkSubpassBeginInfo*      pSubpassBeginInfo);
```

- commandBuffer is the command buffer in which to record the command.
- pRenderPassBegin is a pointer to a VkRenderPassBeginInfo structure specifying the render pass to begin an instance of, and the framebuffer the instance uses. After recording this command, the render pass and framebuffer **may** be accessed at any point that commandBuffer is in the recording or pending state until it is reset.
- pSubpassBeginInfo is a pointer to a VkSubpassBeginInfo structure containing information about the subpass which is about to begin rendering.

After beginning a render pass instance, the command buffer is ready to record the commands for the first subpass of that render pass.

Valid Usage

- VUID-vkCmdBeginRenderPass2-framebuffer-02779

Both the `framebuffer` and `renderPass` members of `pRenderPassBegin` **must** have been created on the same `VkDevice` that `commandBuffer` was allocated on

- VUID-vkCmdBeginRenderPass2-initialLayout-03094

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`

- VUID-vkCmdBeginRenderPass2-initialLayout-03096

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-vkCmdBeginRenderPass2-initialLayout-02844

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-vkCmdBeginRenderPass2-stencilInitialLayout-02845

If any of the `stencilInitialLayout` or `stencilFinalLayout` member of the `VkAttachmentDescriptionStencilLayout` structures or the `stencilLayout` member of the `VkAttachmentReferenceStencilLayout` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-vkCmdBeginRenderPass2-initialLayout-03097

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have

been created with a `usage` value including `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

- VUID-vkCmdBeginRenderPass2-initialLayout-03098

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_TRANSFER_SRC_BIT`

- VUID-vkCmdBeginRenderPass2-initialLayout-03099

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_TRANSFER_DST_BIT`

- VUID-vkCmdBeginRenderPass2-initialLayout-03100

If the `initialLayout` member of any of the `VkAttachmentDescription` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is not `VK_IMAGE_LAYOUT_UNDEFINED`, then each such `initialLayout` **must** be equal to the current layout of the corresponding attachment image subresource of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin`

- VUID-vkCmdBeginRenderPass2-srcStageMask-06453

The `srcStageMask` members of any element of the `pDependencies` member of `VkRenderPassCreateInfo` used to create `renderPass` **must** be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` used to create the command pool which `commandBuffer` was allocated from

- VUID-vkCmdBeginRenderPass2-dstStageMask-06454

The `dstStageMask` members of any element of the `pDependencies` member of `VkRenderPassCreateInfo` used to create `renderPass` **must** be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` used to create the command pool which `commandBuffer` was allocated from

- VUID-vkCmdBeginRenderPass2-framebuffer-02533

For any attachment in `framebuffer` that is used by `renderPass` and is bound to memory locations that are also bound to another attachment used by `renderPass`, and if at least one of those uses causes either attachment to be written to, both attachments **must** have had the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` set

- VUID-vkCmdBeginRenderPass2-framebuffer-09046

If any attachments specified in `framebuffer` are used by `renderPass` and are bound to overlapping memory locations, there **must** be only one that is used as a color attachment, depth/stencil, or resolve attachment in any subpass

Valid Usage (Implicit)

- VUID-vkCmdBeginRenderPass2-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdBeginRenderPass2-pRenderPassBegin-parameter
`pRenderPassBegin` **must** be a valid pointer to a valid `VkRenderPassBeginInfo` structure
- VUID-vkCmdBeginRenderPass2-pSubpassBeginInfo-parameter
`pSubpassBeginInfo` **must** be a valid pointer to a valid `VkSubpassBeginInfo` structure
- VUID-vkCmdBeginRenderPass2-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdBeginRenderPass2-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdBeginRenderPass2-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdBeginRenderPass2-bufferlevel
`commandBuffer` **must** be a primary `VkCommandBuffer`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary	Outside	VK_QUEUE_GRAPHICS_BIT	Action State Synchronization

The `VkRenderPassBeginInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkRenderPassBeginInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkRenderPass        renderPass;
    VkFramebuffer       framebuffer;
    VkRect2D            renderArea;
    uint32_t            clearValueCount;
    const VkClearColor* pClearValues;
} VkRenderPassBeginInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `renderPass` is the render pass to begin an instance of.
- `framebuffer` is the framebuffer containing the attachments that are used with the render pass.
- `renderArea` is the render area that is affected by the render pass instance, and is described in more detail below.
- `clearValueCount` is the number of elements in `pClearValues`.
- `pClearValues` is a pointer to an array of `clearValueCount` `VkClearColor` structures containing clear values for each attachment, if the attachment uses a `loadOp` value of `VK_ATTACHMENT_LOAD_OP_CLEAR` or if the attachment has a depth/stencil format and uses a `stencilLoadOp` value of `VK_ATTACHMENT_LOAD_OP_CLEAR`. The array is indexed by attachment number. Only elements corresponding to cleared attachments are used. Other elements of `pClearValues` are ignored.

`renderArea` is the render area that is affected by the render pass instance. The effects of attachment load, store and multisample resolve operations are restricted to the pixels whose x and y coordinates fall within the render area on all attachments. The render area extends to all layers of `framebuffer`. The application **must** ensure (using scissor if necessary) that all rendering is contained within the render area. The render area **must** be contained within the framebuffer dimensions.

NOTE There **may** be a performance cost for using a render area smaller than the framebuffer, unless it matches the render area granularity for the render pass.

Valid Usage

- VUID-VkRenderPassBeginInfo-clearValueCount-00902
`clearValueCount` **must** be greater than the largest attachment index in `renderPass` specifying a `loadOp` (or `stencilLoadOp`, if the attachment has a depth/stencil format) of `VK_ATTACHMENT_LOAD_OP_CLEAR`
- VUID-VkRenderPassBeginInfo-clearValueCount-04962
If `clearValueCount` is not 0, `pClearValues` **must** be a valid pointer to an array of `clearValueCount` `VkClearColor` unions
- VUID-VkRenderPassBeginInfo-renderPass-00904

`renderPass` **must** be `compatible` with the `renderPass` member of the `VkFramebufferCreateInfo` structure specified when creating `framebuffer`

- VUID-VkRenderPassBeginInfo-None-08996
If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.extent.width` **must** be greater than 0
- VUID-VkRenderPassBeginInfo-None-08997
If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.extent.height` **must** be greater than 0
- VUID-VkRenderPassBeginInfo-pNext-02850
If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.x` **must** be greater than or equal to 0
- VUID-VkRenderPassBeginInfo-pNext-02851
If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.y` **must** be greater than or equal to 0
- VUID-VkRenderPassBeginInfo-pNext-02852
If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.x` + `renderArea.extent.width` **must** be less than or equal to `VkFramebufferCreateInfo::width` the `framebuffer` was created with
- VUID-VkRenderPassBeginInfo-pNext-02853
If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.y` + `renderArea.extent.height` **must** be less than or equal to `VkFramebufferCreateInfo::height` the `framebuffer` was created with
- VUID-VkRenderPassBeginInfo-pNext-02856
If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, `offset.x` + `extent.width` of each element of `pDeviceRenderAreas` **must** be less than or equal to `VkFramebufferCreateInfo::width` the `framebuffer` was created with
- VUID-VkRenderPassBeginInfo-pNext-02857
If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, `offset.y` + `extent.height` of each element of `pDeviceRenderAreas` **must** be less than or equal to `VkFramebufferCreateInfo::height` the `framebuffer` was created with
- VUID-VkRenderPassBeginInfo-framebuffer-03207
If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that did not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, and the `pNext` chain includes a `VkRenderPassAttachmentBeginInfo` structure, its `attachmentCount` **must** be zero
- VUID-VkRenderPassBeginInfo-framebuffer-03208
If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `attachmentCount` of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be equal

to the value of `VkFramebufferAttachmentsCreateInfo::attachmentImageInfoCount` used to create `framebuffer`

- VUID-VkRenderPassBeginInfo-framebuffer-02780

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** have been created on the same `VkDevice` as `framebuffer` and `renderPass`

- VUID-VkRenderPassBeginInfo-framebuffer-03209

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` of an image created with a value of `VkImageCreateInfo::flags` equal to the `flags` member of the corresponding element of `VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos` used to create `framebuffer`

- VUID-VkRenderPassBeginInfo-framebuffer-04627

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` with an `inherited usage` equal to the `usage` member of the corresponding element of `VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos` used to create `framebuffer`

- VUID-VkRenderPassBeginInfo-framebuffer-03211

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` with a `width` equal to the `width` member of the corresponding element of `VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos` used to create `framebuffer`

- VUID-VkRenderPassBeginInfo-framebuffer-03212

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` with a `height` equal to the `height` member of the corresponding element of `VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos` used to create `framebuffer`

- VUID-VkRenderPassBeginInfo-framebuffer-03213

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` of an image created with a value of `VkImageViewCreateInfo::subresourceRange.layerCount` equal to the `layerCount` member of the corresponding element of `VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos` used to create `framebuffer`

- VUID-VkRenderPassBeginInfo-framebuffer-03214

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a

`VkImageView` of an image created with a value of `VkImageFormatListCreateInfo::viewFormatCount` equal to the `viewFormatCount` member of the corresponding element of `VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos` used to create `framebuffer`

- VUID-VkRenderPassBeginInfo-framebuffer-03215

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` of an image created with a set of elements in `VkImageFormatListCreateInfo::pViewFormats` equal to the set of elements in the `pViewFormats` member of the corresponding element of `VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos` used to create `framebuffer`

- VUID-VkRenderPassBeginInfo-framebuffer-03216

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` of an image created with a value of `VkImageViewCreateInfo::format` equal to the corresponding value of `VkAttachmentDescription::format` in `renderPass`

- VUID-VkRenderPassBeginInfo-framebuffer-09047

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` of an image created with a value of `VkImageCreateInfo::samples` equal to the corresponding value of `VkAttachmentDescription::samples` in `renderPass`

Valid Usage (Implicit)

- VUID-VkRenderPassBeginInfo-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_BEGIN_INFO`

- VUID-VkRenderPassBeginInfo-pNext-pNext

Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkDeviceGroupRenderPassBeginInfo`, `VkRenderPassAttachmentBeginInfo`, or `VkRenderPassSampleLocationsBeginInfoEXT`

- VUID-VkRenderPassBeginInfo-sType-unique

The `sType` value of each structure in the `pNext` chain **must** be unique

- VUID-VkRenderPassBeginInfo-renderPass-parameter

`renderPass` **must** be a valid `VkRenderPass` handle

- VUID-VkRenderPassBeginInfo-framebuffer-parameter

`framebuffer` **must** be a valid `VkFramebuffer` handle

- VUID-VkRenderPassBeginInfo-commonparent

Both of `framebuffer`, and `renderPass` **must** have been created, allocated, or retrieved from the same `VkDevice`

The image layout of the depth aspect of a depth/stencil attachment referring to an image created

with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` is dependent on the last sample locations used to render to the image subresource, thus preserving the contents of such depth/stencil attachments across subpass boundaries requires the application to specify these sample locations whenever a layout transition of the attachment **may** occur. This information **can** be provided by adding a `VkRenderPassSampleLocationsBeginInfoEXT` structure to the `pNext` chain of `VkRenderPassBeginInfo`.

The `VkRenderPassSampleLocationsBeginInfoEXT` structure is defined as:

```
// Provided by VK_EXT_sample_locations
typedef struct VkRenderPassSampleLocationsBeginInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    uint32_t                 attachmentInitialSampleLocationsCount;
    const VkAttachmentSampleLocationsEXT* pAttachmentInitialSampleLocations;
    uint32_t                 postSubpassSampleLocationsCount;
    const VkSubpassSampleLocationsEXT* pPostSubpassSampleLocations;
} VkRenderPassSampleLocationsBeginInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `attachmentInitialSampleLocationsCount` is the number of elements in the `pAttachmentInitialSampleLocations` array.
- `pAttachmentInitialSampleLocations` is a pointer to an array of `attachmentInitialSampleLocationsCount` `VkAttachmentSampleLocationsEXT` structures specifying the attachment indices and their corresponding sample location state. Each element of `pAttachmentInitialSampleLocations` **can** specify the sample location state to use in the automatic layout transition performed to transition a depth/stencil attachment from the initial layout of the attachment to the image layout specified for the attachment in the first subpass using it.
- `postSubpassSampleLocationsCount` is the number of elements in the `pPostSubpassSampleLocations` array.
- `pPostSubpassSampleLocations` is a pointer to an array of `postSubpassSampleLocationsCount` `VkSubpassSampleLocationsEXT` structures specifying the subpass indices and their corresponding sample location state. Each element of `pPostSubpassSampleLocations` **can** specify the sample location state to use in the automatic layout transition performed to transition the depth/stencil attachment used by the specified subpass to the image layout specified in a dependent subpass or to the final layout of the attachment in case the specified subpass is the last subpass using that attachment. In addition, if `VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations` is `VK_FALSE`, each element of `pPostSubpassSampleLocations` **must** specify the sample location state that matches the sample locations used by all pipelines that will be bound to a command buffer during the specified subpass. If `variableSampleLocations` is `VK_TRUE`, the sample locations used for rasterization do not depend on `pPostSubpassSampleLocations`.

Valid Usage (Implicit)

- VUID-VkRenderPassSampleLocationsBeginInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_SAMPLE_LOCATIONS_BEGIN_INFO_EXT`
- VUID-VkRenderPassSampleLocationsBeginInfoEXT-pAttachmentInitialSampleLocations-parameter
If `attachmentInitialSampleLocationsCount` is not 0, `pAttachmentInitialSampleLocations` **must** be a valid pointer to an array of `attachmentInitialSampleLocationsCount` valid `VkAttachmentSampleLocationsEXT` structures
- VUID-VkRenderPassSampleLocationsBeginInfoEXT-pPostSubpassSampleLocations-parameter
If `postSubpassSampleLocationsCount` is not 0, `pPostSubpassSampleLocations` **must** be a valid pointer to an array of `postSubpassSampleLocationsCount` valid `VkSubpassSampleLocationsEXT` structures

The `VkAttachmentSampleLocationsEXT` structure is defined as:

```
// Provided by VK_EXT_sample_locations
typedef struct VkAttachmentSampleLocationsEXT {
    uint32_t          attachmentIndex;
    VkSampleLocationsInfoEXT sampleLocationsInfo;
} VkAttachmentSampleLocationsEXT;
```

- `attachmentIndex` is the index of the attachment for which the sample locations state is provided.
- `sampleLocationsInfo` is the sample locations state to use for the layout transition of the given attachment from the initial layout of the attachment to the image layout specified for the attachment in the first subpass using it.

If the image referenced by the framebuffer attachment at index `attachmentIndex` was not created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` then the values specified in `sampleLocationsInfo` are ignored.

Valid Usage

- VUID-VkAttachmentSampleLocationsEXT-attachmentIndex-01531
`attachmentIndex` **must** be less than the `attachmentCount` specified in `VkRenderPassCreateInfo` the render pass specified by `VkRenderPassBeginInfo::renderPass` was created with

Valid Usage (Implicit)

- VUID-VkAttachmentSampleLocationsEXT-sampleLocationsInfo-parameter
`sampleLocationsInfo` **must** be a valid `VkSampleLocationsInfoEXT` structure

The `VkSubpassSampleLocationsEXT` structure is defined as:

```
// Provided by VK_EXT_sample_locations
typedef struct VkSubpassSampleLocationsEXT {
    uint32_t          subpassIndex;
    VkSampleLocationsInfoEXT sampleLocationsInfo;
} VkSubpassSampleLocationsEXT;
```

- `subpassIndex` is the index of the subpass for which the sample locations state is provided.
- `sampleLocationsInfo` is the sample locations state to use for the layout transition of the depth/stencil attachment away from the image layout the attachment is used with in the subpass specified in `subpassIndex`.

If the image referenced by the depth/stencil attachment used in the subpass identified by `subpassIndex` was not created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` or if the subpass does not use a depth/stencil attachment, and `VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations` is `VK_TRUE` then the values specified in `sampleLocationsInfo` are ignored.

Valid Usage

- VUID-VkSubpassSampleLocationsEXT-subpassIndex-01532
`subpassIndex` **must** be less than the `subpassCount` specified in `VkRenderPassCreateInfo` the render pass specified by `VkRenderPassBeginInfo::renderPass` was created with

Valid Usage (Implicit)

- VUID-VkSubpassSampleLocationsEXT-sampleLocationsInfo-parameter
`sampleLocationsInfo` **must** be a valid `VkSampleLocationsInfoEXT` structure

The `VkSubpassBeginInfo` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkSubpassBeginInfo {
    VkStructureType sType;
    const void*     pNext;
    VkSubpassContents contents;
} VkSubpassBeginInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `contents` is a `VkSubpassContents` value specifying how the commands in the next subpass will be provided.

Valid Usage (Implicit)

- VUID-VkSubpassBeginInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SUBPASS_BEGIN_INFO`
- VUID-VkSubpassBeginInfo-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkSubpassBeginInfo-contents-parameter
`contents` **must** be a valid `VkSubpassContents` value

Possible values of `vkCmdBeginRenderPass::contents`, specifying how the commands in the first subpass will be provided, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkSubpassContents {
    VK_SUBPASS_CONTENTS_INLINE = 0,
    VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS = 1,
} VkSubpassContents;
```

- `VK_SUBPASS_CONTENTS_INLINE` specifies that the contents of the subpass will be recorded inline in the primary command buffer, and secondary command buffers **must** not be executed within the subpass.
- `VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS` specifies that the contents are recorded in secondary command buffers that will be called from the primary command buffer, and `vkCmdExecuteCommands` is the only valid command in the command buffer until `vkCmdNextSubpass` or `vkCmdEndRenderPass`.

If the `pNext` chain of `VkRenderPassBeginInfo` includes a `VkDeviceGroupRenderPassBeginInfo` structure, then that structure includes a device mask and set of render areas for the render pass instance.

The `VkDeviceGroupRenderPassBeginInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupRenderPassBeginInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           deviceMask;
    uint32_t           deviceRenderAreaCount;
    const VkRect2D*    pDeviceRenderAreas;
} VkDeviceGroupRenderPassBeginInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceMask` is the device mask for the render pass instance.
- `deviceRenderAreaCount` is the number of elements in the `pDeviceRenderAreas` array.

- `pDeviceRenderAreas` is a pointer to an array of `VkRect2D` structures defining the render area for each physical device.

The `deviceMask` serves several purposes. It is an upper bound on the set of physical devices that **can** be used during the render pass instance, and the initial device mask when the render pass instance begins. In addition, commands transitioning to the next subpass in a render pass instance and commands ending the render pass instance, and, accordingly render pass `load`, `store`, and `multisample resolve` operations and subpass dependencies corresponding to the render pass instance, are executed on the physical devices included in the device mask provided here.

If `deviceRenderAreaCount` is not zero, then the elements of `pDeviceRenderAreas` override the value of `VkRenderPassBeginInfo::renderArea`, and provide a render area specific to each physical device. These render areas serve the same purpose as `VkRenderPassBeginInfo::renderArea`, including controlling the region of attachments that are cleared by `VK_ATTACHMENT_LOAD_OP_CLEAR` and that are resolved into resolve attachments.

If this structure is not present, the render pass instance's device mask is the value of `VkDeviceGroupCommandBufferBeginInfo::deviceMask`. If this structure is not present or if `deviceRenderAreaCount` is zero, `VkRenderPassBeginInfo::renderArea` is used for all physical devices.

Valid Usage

- VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00905
`deviceMask` **must** be a valid device mask value
- VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00906
`deviceMask` **must** not be zero
- VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00907
`deviceMask` **must** be a subset of the command buffer's initial device mask
- VUID-VkDeviceGroupRenderPassBeginInfo-deviceRenderAreaCount-00908
`deviceRenderAreaCount` **must** either be zero or equal to the number of physical devices in the logical device
- VUID-VkDeviceGroupRenderPassBeginInfo-offset-06166
The `offset.x` member of any element of `pDeviceRenderAreas` **must** be greater than or equal to 0
- VUID-VkDeviceGroupRenderPassBeginInfo-offset-06167
The `offset.y` member of any element of `pDeviceRenderAreas` **must** be greater than or equal to 0
- VUID-VkDeviceGroupRenderPassBeginInfo-offset-06168
The sum of the `offset.x` and `extent.width` members of any element of `pDeviceRenderAreas` **must** be less than or equal to `maxFramebufferWidth`
- VUID-VkDeviceGroupRenderPassBeginInfo-offset-06169
The sum of the `offset.y` and `extent.height` members of any element of `pDeviceRenderAreas` **must** be less than or equal to `maxFramebufferHeight`
- VUID-VkDeviceGroupRenderPassBeginInfo-extent-08998
The `extent.width` member of any element of `pDeviceRenderAreas` **must** be greater than 0

- VUID-VkDeviceGroupRenderPassBeginInfo-extent-08999
The `extent.height` member of any element of `pDeviceRenderAreas` **must** be greater than 0

Valid Usage (Implicit)

- VUID-VkDeviceGroupRenderPassBeginInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_RENDER_PASS_BEGIN_INFO`
- VUID-VkDeviceGroupRenderPassBeginInfo-pDeviceRenderAreas-parameter
If `deviceRenderAreaCount` is not 0, `pDeviceRenderAreas` **must** be a valid pointer to an array of `deviceRenderAreaCount` `VkRect2D` structures

The `VkRenderPassAttachmentBeginInfo` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkRenderPassAttachmentBeginInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           attachmentCount;
    const VkImageView* pAttachments;
} VkRenderPassAttachmentBeginInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `attachmentCount` is the number of attachments.
- `pAttachments` is a pointer to an array of `VkImageView` handles, each of which will be used as the corresponding attachment in the render pass instance.

Valid Usage

- VUID-VkRenderPassAttachmentBeginInfo-pAttachments-03218
Each element of `pAttachments` **must** only specify a single mip level
- VUID-VkRenderPassAttachmentBeginInfo-pAttachments-03219
Each element of `pAttachments` **must** have been created with the `identity swizzle`
- VUID-VkRenderPassAttachmentBeginInfo-pAttachments-04114
Each element of `pAttachments` **must** have been created with `VkImageViewCreateInfo::viewType` not equal to `VK_IMAGE_VIEW_TYPE_3D`

Valid Usage (Implicit)

- VUID-VkRenderPassAttachmentBeginInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_ATTACHMENT_BEGIN_INFO`

- VUID-VkRenderPassAttachmentBeginInfo-pAttachments-parameter
If `attachmentCount` is not 0, `pAttachments` **must** be a valid pointer to an array of `attachmentCount` valid `VkImageView` handles

To query the render area granularity, call:

```
// Provided by VK_VERSION_1_0
void vkGetRenderAreaGranularity(
    VkDevice          device,
    VkRenderPass      renderPass,
    VkExtent2D*       pGranularity);
```

- `device` is the logical device that owns the render pass.
- `renderPass` is a handle to a render pass.
- `pGranularity` is a pointer to a `VkExtent2D` structure in which the granularity is returned.

The conditions leading to an optimal `renderArea` are:

- the `offset.x` member in `renderArea` is a multiple of the `width` member of the returned `VkExtent2D` (the horizontal granularity).
- the `offset.y` member in `renderArea` is a multiple of the `height` member of the returned `VkExtent2D` (the vertical granularity).
- either the `extent.width` member in `renderArea` is a multiple of the horizontal granularity or `offset.x+extent.width` is equal to the `width` of the `framebuffer` in the `VkRenderPassBeginInfo`.
- either the `extent.height` member in `renderArea` is a multiple of the vertical granularity or `offset.y+extent.height` is equal to the `height` of the `framebuffer` in the `VkRenderPassBeginInfo`.

Subpass dependencies are not affected by the render area, and apply to the entire image subresources attached to the framebuffer as specified in the description of [automatic layout transitions](#). Similarly, pipeline barriers are valid even if their effect extends outside the render area.

Valid Usage (Implicit)

- VUID-vkGetRenderAreaGranularity-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetRenderAreaGranularity-renderPass-parameter
`renderPass` **must** be a valid `VkRenderPass` handle
- VUID-vkGetRenderAreaGranularity-pGranularity-parameter
`pGranularity` **must** be a valid pointer to a `VkExtent2D` structure
- VUID-vkGetRenderAreaGranularity-renderPass-parent
`renderPass` **must** have been created, allocated, or retrieved from `device`

To transition to the next subpass in the render pass instance after recording the commands for a subpass, call:

WARNING

This functionality is superseded by [Vulkan Version 1.2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
void vkCmdNextSubpass(
    VkCommandBuffer                commandBuffer,
    VkSubpassContents              contents);
```

- `commandBuffer` is the command buffer in which to record the command.
- `contents` specifies how the commands in the next subpass will be provided, in the same fashion as the corresponding parameter of [vkCmdBeginRenderPass](#).

The subpass index for a render pass begins at zero when `vkCmdBeginRenderPass` is recorded, and increments each time `vkCmdNextSubpass` is recorded.

After transitioning to the next subpass, the application **can** record the commands for that subpass.

Valid Usage

- VUID-vkCmdNextSubpass-None-00909

The current subpass index **must** be less than the number of subpasses in the render pass minus one

Valid Usage (Implicit)

- VUID-vkCmdNextSubpass-commandBuffer-parameter
`commandBuffer` **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdNextSubpass-contents-parameter
`contents` **must** be a valid [VkSubpassContents](#) value
- VUID-vkCmdNextSubpass-commandBuffer-recording
`commandBuffer` **must** be in the [recording state](#)
- VUID-vkCmdNextSubpass-commandBuffer-cmdpool
The [VkCommandPool](#) that `commandBuffer` was allocated from **must** support [VK_QUEUE_GRAPHICS_BIT](#) operations
- VUID-vkCmdNextSubpass-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdNextSubpass-bufferlevel
`commandBuffer` **must** be a primary [VkCommandBuffer](#)

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary	Inside	VK_QUEUE_GRAPHICS_BIT	Action State Synchronization

To transition to the next subpass in the render pass instance after recording the commands for a subpass, call:

```
// Provided by VK_VERSION_1_2
void vkCmdNextSubpass2(
    VkCommandBuffer                commandBuffer,
    const VkSubpassBeginInfo*      pSubpassBeginInfo,
    const VkSubpassEndInfo*        pSubpassEndInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pSubpassBeginInfo` is a pointer to a `VkSubpassBeginInfo` structure containing information about the subpass which is about to begin rendering.
- `pSubpassEndInfo` is a pointer to a `VkSubpassEndInfo` structure containing information about how the previous subpass will be ended.

`vkCmdNextSubpass2` is semantically identical to `vkCmdNextSubpass`, except that it is extensible, and that `contents` is provided as part of an extensible structure instead of as a flat parameter.

Valid Usage

- VUID-vkCmdNextSubpass2-None-03102
The current subpass index **must** be less than the number of subpasses in the render pass minus one

Valid Usage (Implicit)

- VUID-vkCmdNextSubpass2-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdNextSubpass2-pSubpassBeginInfo-parameter
`pSubpassBeginInfo` **must** be a valid pointer to a valid `VkSubpassBeginInfo` structure
- VUID-vkCmdNextSubpass2-pSubpassEndInfo-parameter
`pSubpassEndInfo` **must** be a valid pointer to a valid `VkSubpassEndInfo` structure
- VUID-vkCmdNextSubpass2-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdNextSubpass2-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdNextSubpass2-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdNextSubpass2-bufferlevel
`commandBuffer` **must** be a primary `VkCommandBuffer`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary	Inside	VK_QUEUE_GRAPHICS_BIT	Action State Synchronization

To record a command to end a render pass instance after recording the commands for the last subpass, call:

WARNING

This functionality is superseded by [Vulkan Version 1.2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
void vkCmdEndRenderPass(
    VkCommandBuffer                commandBuffer);
```

- `commandBuffer` is the command buffer in which to end the current render pass instance.

Ending a render pass instance performs any multisample resolve operations on the final subpass.

Valid Usage

- VUID-vkCmdEndRenderPass-None-00910
The current subpass index **must** be equal to the number of subpasses in the render pass minus one
- VUID-vkCmdEndRenderPass-None-07004
If `vkCmdBeginQuery*` was called within a subpass of the render pass, the corresponding `vkCmdEndQuery*` **must** have been called subsequently within the same subpass

Valid Usage (Implicit)

- VUID-vkCmdEndRenderPass-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdEndRenderPass-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdEndRenderPass-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdEndRenderPass-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdEndRenderPass-bufferlevel
`commandBuffer` **must** be a primary `VkCommandBuffer`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary	Inside	VK_QUEUE_GRAPHICS_BIT	Action State Synchronization

To record a command to end a render pass instance after recording the commands for the last subpass, call:

```
// Provided by VK_VERSION_1_2
void vkCmdEndRenderPass2(
    VkCommandBuffer                      commandBuffer,
    const VkSubpassEndInfo*             pSubpassEndInfo);
```

- **commandBuffer** is the command buffer in which to end the current render pass instance.
- **pSubpassEndInfo** is a pointer to a [VkSubpassEndInfo](#) structure containing information about how the last subpass will be ended.

vkCmdEndRenderPass2 is semantically identical to [vkCmdEndRenderPass](#), except that it is extensible.

Valid Usage

- VUID-vkCmdEndRenderPass2-None-03103
The current subpass index **must** be equal to the number of subpasses in the render pass minus one
- VUID-vkCmdEndRenderPass2-None-07005
If **vkCmdBeginQuery*** was called within a subpass of the render pass, the corresponding **vkCmdEndQuery*** **must** have been called subsequently within the same subpass

Valid Usage (Implicit)

- VUID-vkCmdEndRenderPass2-commandBuffer-parameter
commandBuffer **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdEndRenderPass2-pSubpassEndInfo-parameter
pSubpassEndInfo **must** be a valid pointer to a valid [VkSubpassEndInfo](#) structure
- VUID-vkCmdEndRenderPass2-commandBuffer-recording
commandBuffer **must** be in the [recording state](#)
- VUID-vkCmdEndRenderPass2-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support [VK_QUEUE_GRAPHICS_BIT](#) operations
- VUID-vkCmdEndRenderPass2-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdEndRenderPass2-bufferlevel
commandBuffer **must** be a primary [VkCommandBuffer](#)

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary	Inside	VK_QUEUE_GRAPHICS_BIT	Action State Synchronization

The `VkSubpassEndInfo` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkSubpassEndInfo {
    VkStructureType    sType;
    const void*        pNext;
} VkSubpassEndInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

Valid Usage (Implicit)

- VUID-VkSubpassEndInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SUBPASS_END_INFO`
- VUID-VkSubpassEndInfo-pNext-pNext
`pNext` **must** be `NULL`

8.8. Common Render Pass Data Races (Informative)

Due to the complexity of how rendering is performed, there are several ways an application can accidentally introduce a data race, usually by doing something that may seem benign but actually cannot be supported. This section indicates a number of the more common cases as guidelines to help avoid them.

8.8.1. Sampling From a Read-Only Attachment

Vulkan includes read-only layouts for depth/stencil images, that allow the images to be both read during a render pass for the purposes of depth/stencil tests, and read as a non-attachment.

However, because `VK_ATTACHMENT_STORE_OP_STORE` and `VK_ATTACHMENT_STORE_OP_DONT_CARE` may perform write operations, even if no recorded command writes to an attachment, reading from an image while also using it as an attachment with these store operations can result in a data race. If the reads from the non-attachment are performed in a fragment shader where the accessed samples match those covered by the fragment shader, no data race will occur as store operations

are guaranteed to operate after fragment shader execution for the set of samples the fragment covers. Notably, input attachments can also be used for this case. Reading other samples or in any other shader stage can result in unexpected behavior due to the potential for a data race, and validation errors should be generated for doing so. In practice, many applications have shipped reading samples outside of the covered fragment without any observable issue, but there is no guarantee that this will always work, and it is not advisable to rely on this in new or re-worked code bases.

8.8.2. Non-Overlapping Access Between Resources

When relying on non-overlapping accesses between attachments and other resources, it is important to note that [load](#) and [store](#) operations have fairly wide alignment requirements - potentially affecting entire subresources and adjacent depth/stencil aspects. This makes it invalid to access a non-attachment subresource that is simultaneously being used as an attachment where either access performs a write operation.

8.8.3. Depth/Stencil and Input Attachments

When rendering to only the depth OR stencil aspect of an image, an input attachment accessing the other aspect will always result in a data race.

8.8.4. Synchronization Options

There are several synchronization options available to synchronize between accesses to resources within a render pass. Some of the options are outlined below:

- A [VkSubpassDependency](#) in a render pass object can synchronize attachment writes and [multisample resolve operations](#) from a prior subpass for subsequent input attachment reads.
- A [vkCmdPipelineBarrier](#) inside a subpass can synchronize prior attachment writes in the subpass with subsequent input attachment reads.
- If a subresource is used as two separate non-attachment resources, writes to a pixel or individual sample in a fragment shader can be synchronized with access to the same pixel or sample in another fragment shader by using one of the [fragment interlock](#) execution modes.

Chapter 9. Shaders

A shader specifies programmable operations that execute for each vertex, control point, tessellated vertex, primitive, fragment, or workgroup in the corresponding stage(s) of the graphics and compute pipelines.

Graphics pipelines include vertex shader execution as a result of [primitive assembly](#), followed, if enabled, by tessellation control and evaluation shaders operating on [patches](#), geometry shaders, if enabled, operating on primitives, and fragment shaders, if present, operating on fragments generated by [Rasterization](#). In this specification, vertex, tessellation control, tessellation evaluation and geometry shaders are collectively referred to as [pre-rasterization shader stages](#) and occur in the logical pipeline before rasterization. The fragment shader occurs logically after rasterization.

Only the compute shader stage is included in a compute pipeline. Compute shaders operate on compute invocations in a workgroup.

Shaders **can** read from input variables, and read from and write to output variables. Input and output variables **can** be used to transfer data between shader stages, or to allow the shader to interact with values that exist in the execution environment. Similarly, the execution environment provides constants describing capabilities.

Shader variables are associated with execution environment-provided inputs and outputs using *built-in* decorations in the shader. The available decorations for each stage are documented in the following subsections.

9.1. Shader Modules

Shader modules contain *shader code* and one or more entry points. Shaders are selected from a shader module by specifying an entry point as part of [pipeline](#) creation. The stages of a pipeline **can** use shaders that come from different modules. The shader code defining a shader module **must** be in the SPIR-V format, as described by the [Vulkan Environment for SPIR-V](#) appendix.

Shader modules are represented by `VkShaderModule` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkShaderModule)
```

Shader modules are not used in Vulkan SC, but the type has been retained for compatibility [\[SCID-8\]](#).

In Vulkan SC, the shader modules and pipeline state are supplied to an offline compiler which creates a pipeline cache entry which is loaded at [pipeline](#) creation time.

Accordingly, SPIR-V module validation rules defined in the [Vulkan Environment for SPIR-V](#) section are only indirectly applied in Vulkan SC, as the SPIR-V modules that **must** adhere to these validation rules are the inputs of the [offline pipeline cache compilation](#) process, while the Vulkan SC API only consumes the implementation-specific pipeline caches resulting from this process. However, violations of SPIR-V module validation rules **may** be detected and reported by validation

layers when the corresponding pipeline cache entry contains [stage validation index](#) entries with SPIR-V module data.

For completeness, this specification also includes the following shader module creation valid usage clauses that are expected to be referred to by validation layers to report SPIR-V module validation errors:

- Let **pCode** be a pointer to the SPIR-V module data of the [pipeline cache stage validation index entry](#).
- Let **codeSize** be the corresponding member of the [VkPipelineCacheStageValidationIndexEntry](#) structure describing the [pipeline cache stage validation index entry](#).

Valid Usage

- VUID-VkShaderModuleCreateInfo-codeSize-08735
If **pCode** is a pointer to SPIR-V code, **codeSize** **must** be a multiple of 4
- VUID-VkShaderModuleCreateInfo-pCode-08736
If **pCode** is a pointer to SPIR-V code, **pCode** **must** point to valid SPIR-V code, formatted and packed as described by the [Khronos SPIR-V Specification](#)
- VUID-VkShaderModuleCreateInfo-pCode-08737
If **pCode** is a pointer to SPIR-V code, **pCode** **must** adhere to the validation rules described by the [Validation Rules within a Module](#) section of the [SPIR-V Environment](#) appendix
- VUID-VkShaderModuleCreateInfo-pCode-08738
If **pCode** is a pointer to SPIR-V code, **pCode** **must** declare the **Shader** capability for SPIR-V code
- VUID-VkShaderModuleCreateInfo-pCode-08739
If **pCode** is a pointer to SPIR-V code, **pCode** **must** not declare any capability that is not supported by the API, as described by the [Capabilities](#) section of the [SPIR-V Environment](#) appendix
- VUID-VkShaderModuleCreateInfo-pCode-08740
If **pCode** is a pointer to SPIR-V code, and **pCode** declares any of the capabilities listed in the [SPIR-V Environment](#) appendix, one of the corresponding requirements **must** be satisfied
- VUID-VkShaderModuleCreateInfo-pCode-08741
If **pCode** is a pointer to SPIR-V code, **pCode** **must** not declare any SPIR-V extension that is not supported by the API, as described by the [Extension](#) section of the [SPIR-V Environment](#) appendix
- VUID-VkShaderModuleCreateInfo-pCode-08742
If **pCode** is a pointer to SPIR-V code, and **pCode** declares any of the SPIR-V extensions listed in the [SPIR-V Environment](#) appendix, one of the corresponding requirements **must** be satisfied

9.2. Binding Shaders

Before a shader can be used it **must** be first bound to the command buffer.

Calling `vkCmdBindPipeline` binds all stages corresponding to the `VkPipelineBindPoint`.

The following table describes the relationship between shader stages and pipeline bind points:

Shader stage	Pipeline bind point	behavior controlled
• <code>VK_SHADER_STAGE_VERTEX_BIT</code> • <code>VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT</code> • <code>VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT</code> • <code>VK_SHADER_STAGE_GEOMETRY_BIT</code> • <code>VK_SHADER_STAGE_FRAGMENT_BIT</code>	<code>VK_PIPELINE_BIND_POINT_GRAPHICS</code>	all <code>drawing commands</code>
• <code>VK_SHADER_STAGE_COMPUTE_BIT</code>	<code>VK_PIPELINE_BIND_POINT_COMPUTE</code>	all <code>dispatch commands</code>

9.3. Shader Execution

At each stage of the pipeline, multiple invocations of a shader **may** execute simultaneously. Further, invocations of a single shader produced as the result of different commands **may** execute simultaneously. The relative execution order of invocations of the same shader type is undefined. Shader invocations **may** complete in a different order than that in which the primitives they originated from were drawn or dispatched by the application. However, fragment shader outputs are written to attachments in `rasterization order`.

The relative execution order of invocations of different shader types is largely undefined. However, when invoking a shader whose inputs are generated from a previous pipeline stage, the shader invocations from the previous stage are guaranteed to have executed far enough to generate input values for all required inputs.

9.3.1. Shader Termination

A shader invocation that is *terminated* has finished executing instructions.

Executing `OpReturn` in the entry point, or executing `OpTerminateInvocation` in any function will terminate an invocation. Implementations **may** also terminate a shader invocation when `OpKill` is executed in any function; otherwise it becomes a `helper invocation`.

In addition to the above conditions, `helper invocations` **may** be terminated when all non-helper invocations in the same `derivative group` either terminate or become `helper invocations`.

A shader stage for a given command completes execution when all invocations for that stage have

terminated.

NOTE

Depending on the implementation, `OpKill` will be functionally equivalent to either `OpTerminateInvocation` or `OpDemoteToHelperInvocation`. To obtain the most predictable behavior, shader authors should use `OpTerminateInvocation` or `OpDemoteToHelperInvocation` rather than `OpKill` wherever possible.

9.4. Shader Out-of-Bounds Memory Access

Shader accesses to memory are not automatically bounds checked by the implementation. Applications **must** not execute operations that would access out of bounds memory locations unless some form of bounds checking is enabled. An access is considered out of bounds if any part of the access is outside of any specified memory range, whether that is the array length specified in a shader or a range specified in the API (e.g. descriptor size).

NOTE

External tooling such as the Vulkan Validation Layers can be used to help validate that accesses are not out of bounds.

An access **can** be independently out of bounds for each range that applies; if one is bounds checked and the others are not, behavior is still undefined.

For example, given the following shader declaration

NOTE

```
// Buffer type
struct MySSBO {
    uint32_t data[2];
};
```

accessing `data` at an index greater than 1 is undefined behavior, whether the underlying buffer is bigger than that or not.

Vulkan provides functionality that enables automatic bounds checking in some cases, as outlined below.

NOTE

Automatic bounds checking can be used to ensure that accesses outside of certain bounds have predictable results, acting as a safety net for untrusted code, or simply as a way for applications to avoid their own bounds checks. While there may be a performance cost for enabling these features, they should not be slower than an application performing equivalent checks. Automatic checks do not necessarily account for all possible bounds - e.g. [Robust Buffer Access](#) will not prevent undefined behavior in the buffer access example in the prior note.

9.4.1. Robust Buffer Access

Robust buffer access **can** be enabled by the `robustBufferAccess` feature.

When robust buffer access is enabled, access to a buffer via a descriptor is bounds checked against the range specified for the descriptor, and access to vertex input data is bounds checked against the bound vertex buffer range. Reads from a vertex input **may** instead be bounds checked against a range rounded down to the nearest multiple of the stride of its binding.

NOTE

The range of a descriptor is not necessarily equivalent to the size of the underlying resource; applications may suballocate descriptors from larger buffers, for instance. The APIs specifying the descriptor range vary between resource types and descriptor interfaces, but for example include the ranges specified by [VkDescriptorBufferInfo](#) or [VkBufferViewCreateInfo](#).

If any vertex input read is outside of the checked range, all other vertex input reads through the same binding in the same shader invocation **may** behave as if they were outside of the checked range.

If any access to a uniform, storage, uniform texel, or storage texel buffer is outside of the checked range, any access of the same type (write, read-modify-write, or read) to the same buffer that is less than 16 bytes away from the first access **may** behave as if it is also outside of the checked range.

Any non-atomic access to a uniform, storage, uniform texel, or storage texel buffer wider than 32-bits **may** be treated as multiple 32-bit accesses that are separately bounds checked.

Writes to a storage or storage texel buffer outside of the checked range will either be discarded, or modify values within the memory range(s) bound to the underlying buffer (including outside of the checked range). They will not modify any other memory.

NOTE

Non-atomic writes outside of the checked range **can** lead to data races, as the application has no control over where the data will be written.

Atomic read-modify-write operations to a storage or storage texel buffer outside of the checked range will behave the same as a write outside of the checked range, but will return an undefined value.

Reading a uniform, storage, uniform texel, or storage texel buffer outside of the checked range will return one of the following values:

- Values from anywhere within the memory range(s) bound to the underlying buffer object, which **may** include bytes beyond the size of the buffer itself.
- Zero values
- For 4-component vectors, a value of (0,0,0,x), where x is any of
 - 0, 1, or the maximum positive integer value for integer components
 - 0.0 or 1.0 for floating-point components
- The value of the last store to the same out-of-bounds location in the same shader invocation.
 - Using the **Volatile/VolatileTexel** memory/image operand, the **Volatile** memory semantic, or the **Volatile** decoration to load the value will prevent prior stored values from being returned.

NOTE

Getting the value of the previous store is possible as implementations are free to optimize multiple accesses in the general case. There are several ways this **can** be prevented, but using volatile loads is by far the simplest.

Reads from a vertex input outside of the checked range will produce one of the following values:

- Values from anywhere within the memory range(s) bound to the underlying buffer object, which **may** include bytes beyond the size of the buffer itself, converted via [input extraction](#).
- Zero values, converted via [input extraction](#).
- Zero values
- For 4-component vectors, a value of (0,0,0,x), where x is any of
 - 0, 1, or the maximum positive integer value for integer components
 - 0.0 or 1.0 for floating-point components

9.4.2. Robust Buffer Access 2

Robust buffer access 2 **can** be enabled by the `robustBufferAccess2` feature.

When robust buffer access 2 is enabled, access to a buffer via a descriptor is bounds checked against the range specified for the descriptor, and access to vertex input data is bounds checked against the bound vertex buffer range, similarly to [Robust Buffer Access](#), but with tighter bounds on the results.

Accesses to a uniform buffer **may** instead be bounds checked against a range rounded up to `robustUniformBufferAccessSizeAlignment`. Accesses inside the aligned range **may** behave as if they are in bounds, even if they are outside of the unaligned descriptor range, and access memory accordingly. The same is true for accesses to a storage buffer, using the `robustStorageBufferAccessSizeAlignment` limit instead.

NOTE

To avoid unexpected data races between neighboring descriptor ranges, applications may wish to ensure suballocated ranges of buffers are aligned to these limits.

Any access to a uniform, storage, uniform texel, or storage texel buffer wider than 32-bits **may** be treated as multiple 32-bit accesses that are separately bounds checked.

NOTE

Accesses to null descriptors are not considered out-of-bounds and have separate behavior controlled by the `nullDescriptor` feature.

Writes to a storage or storage texel buffer outside of the checked range will not modify any memory.

Atomic read-modify-write operations to a storage or storage texel buffer outside of the checked range will behave the same as a write outside of the checked range, but will return an undefined value.

Reads from a uniform or storage buffer outside of the checked range will return zero values. If a

value was previously written to the same out of bounds location in the same shader invocation, that value **may** be returned instead; using the `Volatile/VolatileTexel` memory/image operand, the `Volatile` memory semantic, or the `Volatile` decoration to load the value will prevent prior stored values from being returned.

Reading a uniform texel or storage texel buffer outside of the checked range will produce zero values, but `component substitution` will still be applied based on the buffer view's format, with the resulting value returned to the shader. If a value was previously written to the same out of bounds location in the same shader invocation, that value **may** be returned instead; using the `Volatile/VolatileTexel` memory/image operand, the `Volatile` memory semantic, or the `Volatile` decoration to load the value will prevent prior stored values from being returned.

Reads from a vertex input outside of the checked range will produce zero values, but `input extraction` will still be applied, filling missing G, B, or A components with (0,0,1).

9.4.3. Image Sampling

Sampling operations on an image descriptor are always well-defined when coordinates exceeding the dimensions specified for the descriptor are accessed, as described in the [Wrapping Operation](#) section.

9.4.4. Robust Image Access

Robust image access **can** be enabled by the `robustImageAccess` feature.

If robust image access is enabled, accesses to image descriptors are bounds checked against the image view dimensions specified for the descriptor.

Writes or atomic read-modify-write operations to a storage image outside of the checked dimensions will not modify any memory.

Reads, atomic read-modify-write operations, or fetches from images outside of the checked dimensions will return zero values, with (0,0,1) or [eq]#(0,0,0) values [inserted for missing G, B, or A components](#) based on the format.

If a value was previously written to the same out of bounds location in the same shader invocation, that value **may** be returned instead; using the `VolatileTexel` image operand, the `Volatile` memory semantic, or the `Volatile` decoration to load the value will prevent prior stored values from being returned.

9.4.5. Robust Image Access 2

NOTE

This is largely identical to [Robust Image Access](#); the only difference being that the alpha channel must be replaced with 1, rather than 1 or 0, for out of bounds texel access.

Robust image access 2 **can** be enabled by the `robustImageAccess2` feature.

If robust image access 2 is enabled, accesses to image descriptors are bounds checked against the

image view dimensions specified for the descriptor.

Writes or atomic read-modify-write operations to a storage image outside of the checked dimensions will not modify any memory.

Reads, atomic read-modify-write operations, or fetches from images outside of the checked dimensions will return zero values, with (0,0,1) values [inserted for missing G, B, or A components](#) based on the format.

If a value was previously written to the same out of bounds location in the same shader invocation, that value **may** be returned instead; using the `VolatileTexel` image operand, the `Volatile` memory semantic, or the `Volatile` decoration to load the value will prevent prior stored values from being returned.

9.5. Shader Memory Access Ordering

The order in which image or buffer memory is read or written by shaders is largely undefined. For some shader types (vertex, tessellation evaluation, and in some cases, fragment), even the number of shader invocations that **may** perform loads and stores is undefined.

In particular, the following rules apply:

- [Vertex](#) and [tessellation evaluation](#) shaders will be invoked at least once for each unique vertex, as defined in those sections.
- [Fragment](#) shaders will be invoked zero or more times, as defined in that section.
- The relative execution order of invocations of the same shader type is undefined. A store issued by a shader when working on primitive B might complete prior to a store for primitive A, even if primitive A is specified prior to primitive B. This applies even to fragment shaders; while fragment shader outputs are always written to the framebuffer in [rasterization order](#), stores executed by fragment shader invocations are not.
- The relative execution order of invocations of different shader types is largely undefined.

NOTE

The above limitations on shader invocation order make some forms of synchronization between shader invocations within a single set of primitives unimplementable. For example, having one invocation poll memory written by another invocation assumes that the other invocation has been launched and will complete its writes in finite time.

The [Memory Model](#) appendix defines the terminology and rules for how to correctly communicate between shader invocations, such as when a write is [Visible-To](#) a read, and what constitutes a [Data Race](#). Applications **must** not cause a data race.

9.6. Shader Inputs and Outputs

Data is passed into and out of shaders using variables with input or output storage class, respectively. User-defined inputs and outputs are connected between stages by matching their `Location` decorations. Additionally, data **can** be provided by or communicated to special functions

provided by the execution environment using **BuiltIn** decorations.

In many cases, the same **BuiltIn** decoration **can** be used in multiple shader stages with similar meaning. The specific behavior of variables decorated as **BuiltIn** is documented in the following sections.

9.7. Vertex Shaders

Each vertex shader invocation operates on one vertex and its associated **vertex attribute** data, and outputs one vertex and associated data. Graphics pipelines **must** include a vertex shader, and the vertex shader stage is always the first shader stage in the graphics pipeline.

9.7.1. Vertex Shader Execution

A vertex shader **must** be executed at least once for each vertex specified by a drawing command. If the subpass includes multiple views in its view mask, the shader **may** be invoked separately for each view. During execution, the shader is presented with the index of the vertex and instance for which it has been invoked. Input variables declared in the vertex shader are filled by the implementation with the values of vertex attributes associated with the invocation being executed.

If the same vertex is specified multiple times in a drawing command (e.g. by including the same index value multiple times in an index buffer) the implementation **may** reuse the results of vertex shading if it can statically determine that the vertex shader invocations will produce identical results.

NOTE

It is implementation-dependent when and if results of vertex shading are reused, and thus how many times the vertex shader will be executed. This is true also if the vertex shader contains stores or atomic operations (see **vertexPipelineStoresAndAtomics**).

9.8. Tessellation Control Shaders

The tessellation control shader is used to read an input patch provided by the application and to produce an output patch. Each tessellation control shader invocation operates on an input patch (after all control points in the patch are processed by a vertex shader) and its associated data, and outputs a single control point of the output patch and its associated data, and **can** also output additional per-patch data. The input patch is sized according to the **patchControlPoints** member of **VkPipelineTessellationStateCreateInfo**, as part of input assembly.

The input patch can also be dynamically sized with **patchControlPoints** parameter of **vkCmdSetPatchControlPointsEXT**.

To **dynamically set** the number of control points per patch, call:

```
// Provided by VK_EXT_extended_dynamic_state2
void vkCmdSetPatchControlPointsEXT(
    VkCommandBuffer          commandBuffer,
    uint32_t                 patchControlPoints);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `patchControlPoints` specifies the number of control points per patch.

This command sets the number of control points per patch for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineTessellationStateCreateInfo::patchControlPoints` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetPatchControlPointsEXT-None-09422
At least one of the following **must** be true:
 - The `extendedDynamicState2PatchControlPoints` feature is enabled
- VUID-vkCmdSetPatchControlPointsEXT-patchControlPoints-04874
`patchControlPoints` **must** be greater than zero and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`

Valid Usage (Implicit)

- VUID-vkCmdSetPatchControlPointsEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetPatchControlPointsEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetPatchControlPointsEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_GRAPHIC S_BIT	State

The size of the output patch is controlled by the `OpExecutionMode OutputVertices` specified in the tessellation control or tessellation evaluation shaders, which **must** be specified in at least one of the shaders. The size of the input and output patches **must** each be greater than zero and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`.

9.8.1. Tessellation Control Shader Execution

A tessellation control shader is invoked at least once for each *output* vertex in a patch. If the subpass includes multiple views in its view mask, the shader **may** be invoked separately for each view.

Inputs to the tessellation control shader are generated by the vertex shader. Each invocation of the tessellation control shader **can** read the attributes of any incoming vertices and their associated data. The invocations corresponding to a given patch execute logically in parallel, with undefined relative execution order. However, the `OpControlBarrier` instruction **can** be used to provide limited control of the execution order by synchronizing invocations within a patch, effectively dividing tessellation control shader execution into a set of phases. Tessellation control shaders will read undefined values if one invocation reads a per-vertex or per-patch output written by another invocation at any point during the same phase, or if two invocations attempt to write different values to the same per-patch output in a single phase.

9.9. Tessellation Evaluation Shaders

The Tessellation Evaluation Shader operates on an input patch of control points and their associated data, and a single input barycentric coordinate indicating the invocation's relative position within the subdivided patch, and outputs a single vertex and its associated data.

9.9.1. Tessellation Evaluation Shader Execution

A tessellation evaluation shader is invoked at least once for each unique vertex generated by the tessellator. If the subpass includes multiple views in its view mask, the shader **may** be invoked separately for each view.

9.10. Geometry Shaders

The geometry shader operates on a group of vertices and their associated data assembled from a single input primitive, and emits zero or more output primitives and the group of vertices and their associated data required for each output primitive.

9.10.1. Geometry Shader Execution

A geometry shader is invoked at least once for each primitive produced by the tessellation stages, or at least once for each primitive generated by [primitive assembly](#) when tessellation is not in use. A shader can request that the geometry shader runs multiple [instances](#). A geometry shader is invoked at least once for each instance. If the subpass includes multiple views in its view mask, the shader **may** be invoked separately for each view.

9.11. Fragment Shaders

Fragment shaders are invoked as a [fragment operation](#) in a graphics pipeline. Each fragment shader invocation operates on a single fragment and its associated data. With few exceptions, fragment shaders do not have access to any data associated with other fragments and are considered to execute in isolation of fragment shader invocations associated with other fragments.

9.12. Compute Shaders

Compute shaders are invoked via [dispatching commands](#). In general, they have access to similar resources as shader stages executing as part of a graphics pipeline.

Compute workloads are formed from groups of work items called workgroups and processed by the compute shader in the current compute pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Compute shaders execute in *global workgroups* which are divided into a number of *local workgroups* with a size that **can** be set by assigning a value to the [LocalSize](#) execution mode or via an object decorated by the [WorkgroupSize](#) decoration. An invocation within a local workgroup **can** share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup.

9.13. Interpolation Decorations

Variables in the [Input](#) storage class in a fragment shader's interface are interpolated from the values specified by the primitive being rasterized.

NOTE

Interpolation decorations can be present on input and output variables in pre-rasterization shaders but have no effect on the interpolation performed.

An undecorated input variable will be interpolated with perspective-correct interpolation according to the primitive type being rasterized. [Lines](#) and [polygons](#) are interpolated in the same way as the primitive's clip coordinates. If the [NoPerspective](#) decoration is present, linear interpolation is instead used for [lines](#) and [polygons](#). For points, as there is only a single vertex, input values are never interpolated and instead take the value written for the single vertex.

If the [Flat](#) decoration is present on an input variable, the value is not interpolated, and instead takes its value directly from the [provoking vertex](#). Fragment shader inputs that are signed or unsigned integers, integer vectors, or any double-precision floating-point type **must** be decorated with [Flat](#).

Interpolation of input variables is performed at an implementation-defined position within the fragment area being shaded. The position is further constrained as follows:

- If the **Centroid** decoration is used, the interpolation position used for the variable **must** also fall within the bounds of the primitive being rasterized.
- If the **Sample** decoration is used, the interpolation position used for the variable **must** be at the position of the sample being shaded by the current fragment shader invocation.
- If a sample count of 1 is used, the interpolation position **must** be at the center of the fragment area.

NOTE

As **Centroid** constrains the interpolation position to lie within the covered area of the primitive, using it may cause the position to differ between neighboring fragments when it otherwise would not. Derivatives calculated based on these differing locations can produce inconsistent results compared to undecorated inputs. Thus using **Centroid** with input variables used in derivative calculations is not recommended.

9.14. Static Use

A SPIR-V module declares a global object in memory using the **OpVariable** instruction, which results in a pointer **x** to that object. A specific entry point in a SPIR-V module is said to *statically use* that object if that entry point's call tree contains a function containing a instruction with **x** as an **id** operand. A shader entry point also *statically uses* any variables explicitly declared in its interface.

9.15. Scope

A *scope* describes a set of shader invocations, where each such set is a *scope instance*. Each invocation belongs to one or more scope instances, but belongs to no more than one scope instance for each scope.

The operations available between invocations in a given scope instance vary, with smaller scopes generally able to perform more operations, and with greater efficiency.

9.15.1. Cross Device

All invocations executed in a Vulkan instance fall into a single *cross device scope instance*.

Whilst the **CrossDevice** scope is defined in SPIR-V, it is disallowed in Vulkan. API **synchronization** commands **can** be used to communicate between devices.

9.15.2. Device

All invocations executed on a single device form a *device scope instance*.

If the **vulkanMemoryModel** and **vulkanMemoryModelDeviceScope** features are enabled, this scope is represented in SPIR-V by the **Device Scope**, which **can** be used as a **Memory Scope** for barrier and atomic operations.

If both the `shaderDeviceClock` and `vulkanMemoryModelDeviceScope` features are enabled, using the `Device Scope` with the `OpReadClockKHR` instruction will read from a clock that is consistent across invocations in the same device scope instance.

There is no method to synchronize the execution of these invocations within SPIR-V, and this **can** only be done with API synchronization primitives.

Invocations executing on different devices in a device group operate in separate device scope instances.

9.15.3. Queue Family

Invocations executed by queues in a given queue family form a *queue family scope instance*.

This scope is identified in SPIR-V as the `QueueFamily Scope` if the `vulkanMemoryModel` feature is enabled, or if not, the `Device Scope`, which **can** be used as a `Memory Scope` for barrier and atomic operations.

If the `shaderDeviceClock` feature is enabled, but the `vulkanMemoryModelDeviceScope` feature is not enabled, using the `Device Scope` with the `OpReadClockKHR` instruction will read from a clock that is consistent across invocations in the same queue family scope instance.

There is no method to synchronize the execution of these invocations within SPIR-V, and this **can** only be done with API synchronization primitives.

Each invocation in a queue family scope instance **must** be in the same [device scope instance](#).

9.15.4. Command

Any shader invocations executed as the result of a single command such as `vkCmdDispatch` or `vkCmdDraw` form a *command scope instance*. For indirect drawing commands with `drawCount` greater than one, invocations from separate draws are in separate command scope instances.

There is no specific `Scope` for communication across invocations in a command scope instance. As this has a clear boundary at the API level, coordination here **can** be performed in the API, rather than in SPIR-V.

Each invocation in a command scope instance **must** be in the same [queue-family scope instance](#).

For shaders without defined [workgroups](#), this set of invocations forms an *invocation group* as defined in the [SPIR-V specification](#).

9.15.5. Primitive

Any fragment shader invocations executed as the result of rasterization of a single primitive form a *primitive scope instance*.

There is no specific `Scope` for communication across invocations in a primitive scope instance.

Any generated [helper invocations](#) are included in this scope instance.

Each invocation in a primitive scope instance **must** be in the same [command scope instance](#).

Any input variables decorated with **Flat** are uniform within a primitive scope instance.

9.15.6. Workgroup

A *local workgroup* is a set of invocations that can synchronize and share data with each other using memory in the **Workgroup** storage class.

The **Workgroup Scope** can be used as both an **Execution Scope** and **Memory Scope** for barrier and atomic operations.

Each invocation in a local workgroup **must** be in the same [command scope instance](#).

Only compute shaders have defined workgroups - other shader types **cannot** use workgroup functionality. For shaders that have defined workgroups, this set of invocations forms an *invocation group* as defined in the [SPIR-V specification](#).

The amount of storage consumed by the variables declared with the **Workgroup** storage class is implementation-dependent. However, the amount of storage consumed may not exceed the largest block size that would be obtained if all active variables declared with **Workgroup** storage class were assigned offsets in an arbitrary order by successively taking the smallest valid offset according to the [Standard Storage Buffer Layout](#) rules, and with **Boolean** values considered as 32-bit integer values for the purpose of this calculation. (This is equivalent to using the GLSL std430 layout rules.)

9.15.7. Subgroup

A *subgroup* (see the subsection “Control Flow” of section 2 of the SPIR-V 1.3 Revision 1 specification) is a set of invocations that can synchronize and share data with each other efficiently.

The **Subgroup Scope** can be used as both an **Execution Scope** and **Memory Scope** for barrier and atomic operations. Other [subgroup features](#) allow the use of [group operations](#) with subgroup scope.

If the **shaderSubgroupClock** feature is enabled, using the **Subgroup Scope** with the **OpReadClockKHR** instruction will read from a clock that is consistent across invocations in the same subgroup.

For [shaders that have defined workgroups](#), each invocation in a subgroup **must** be in the same [local workgroup](#).

In other shader stages, each invocation in a subgroup **must** be in the same [device scope instance](#).

Only [shader stages that support subgroup operations](#) have defined subgroups.

NOTE

Subgroups are not guaranteed to be a subset of a single command in [shaders that do not have defined workgroups](#). Values that are guaranteed to be uniform for a given command or sub command may then not be uniform for the subgroup, and vice versa. As such, applications must take care when dealing with mixed uniformity.

A somewhat common example of this would something like trying to optimize access to per-draw data using subgroup operations:

```

buffer { uint draw_data[]; };

flat in int vDrawID; // Passed through from vertex shader

void main()
{
    uint local_draw_data = subgroupBroadcastFirst(draw_data
[local_draw_data]);
}

```

This can be done in an attempt to optimize the shader to only perform the loads once per subgroup. However, if the implementation packs multiple draws into a single subgroup, invocations from draws with a different drawID are now receiving data from the wrong invocation. Applications should rely on implementations to do this kind of optimization automatically where the implementation can, rather than trying to force it.

9.15.8. Quad

A *quad scope instance* is formed of four shader invocations.

In a fragment shader, each invocation in a quad scope instance is formed of invocations in neighboring framebuffer locations (x_i, y_i) , where:

- i is the index of the invocation within the scope instance.
- w and h are the number of pixels the fragment covers in the x and y axes.
- w and h are identical for all participating invocations.
- $(x_0) = (x_1 - w) = (x_2) = (x_3 - w)$
- $(y_0) = (y_1) = (y_2 - h) = (y_3 - h)$
- Each invocation has the same layer and sample indices.

In all shaders, each invocation in a quad scope instance is formed of invocations in adjacent subgroup invocation indices (s_i) , where:

- i is the index of the invocation within the quad scope instance.
- $(s_0) = (s_1 - 1) = (s_2 - 2) = (s_3 - 3)$
- s_0 is an integer multiple of 4.

Each invocation in a quad scope instance **must** be in the same [subgroup](#).

In a fragment shader, each invocation in a quad scope instance **must** be in the same [primitive scope instance](#).

Fragment and compute shaders have defined quad scope instances. If the [quadOperationsInAllStages](#) limit is supported, any [shader stages that support subgroup operations](#) also have defined quad scope instances.

9.15.9. Fragment Interlock

A *fragment interlock scope instance* is formed of fragment shader invocations based on their framebuffer locations (x,y,layer,sample), executed by commands inside a single [subpass](#).

The specific set of invocations included varies based on the execution mode as follows:

- If the [SampleInterlockOrderedEXT](#) or [SampleInterlockUnorderedEXT](#) execution modes are used, only invocations with identical framebuffer locations (x,y,layer,sample) are included.
- If the [PixelInterlockOrderedEXT](#) or [PixelInterlockUnorderedEXT](#) execution modes are used, fragments with different sample ids are also included.
- If the [ShadingRateInterlockOrderedEXT](#) or [ShadingRateInterlockUnorderedEXT](#) execution modes are used, fragments from neighboring framebuffer locations are also included. The [fragment shading rate](#) determines these fragments.

Only fragment shaders with one of the above execution modes have defined fragment interlock scope instances.

There is no specific [Scope](#) value for communication across invocations in a fragment interlock scope instance. However, this is implicitly used as a memory scope by [OpBeginInvocationInterlockEXT](#) and [OpEndInvocationInterlockEXT](#).

Each invocation in a fragment interlock scope instance **must** be in the same [queue family scope instance](#).

9.15.10. Invocation

The smallest *scope* is a single invocation; this is represented by the [Invocation Scope](#) in SPIR-V.

Fragment shader invocations **must** be in a [primitive scope instance](#).

Invocations in [fragment shaders that have a defined fragment interlock scope](#) **must** be in a [fragment interlock scope instance](#).

Invocations in [shaders that have defined workgroups](#) **must** be in a [local workgroup](#).

Invocations in [shaders that have a defined subgroup scope](#) **must** be in a [subgroup](#).

Invocations in [shaders that have a defined quad scope](#) **must** be in a [quad scope instance](#).

All invocations in all stages **must** be in a [command scope instance](#).

9.16. Group Operations

Group operations are executed by multiple invocations within a [scope instance](#); with each invocation involved in calculating the result. This provides a mechanism for efficient communication between invocations in a particular scope instance.

Group operations all take a [Scope](#) defining the desired [scope instance](#) to operate within. Only the [Subgroup](#) scope **can** be used for these operations; the [subgroupSupportedOperations](#) limit defines

which types of operation **can** be used.

9.16.1. Basic Group Operations

Basic group operations include the use of `OpGroupNonUniformElect`, `OpControlBarrier`, `OpMemoryBarrier`, and atomic operations.

`OpGroupNonUniformElect` **can** be used to choose a single invocation to perform a task for the whole group. Only the invocation with the lowest id in the group will return `true`.

The [Memory Model](#) appendix defines the operation of barriers and atomics.

9.16.2. Vote Group Operations

The vote group operations allow invocations within a group to compare values across a group. The types of votes enabled are:

- Do all active group invocations agree that an expression is true?
- Do any active group invocations evaluate an expression to true?
- Do all active group invocations have the same value of an expression?

NOTE

These operations are useful in combination with control flow in that they allow for developers to check whether conditions match across the group and choose potentially faster code-paths in these cases.

9.16.3. Arithmetic Group Operations

The arithmetic group operations allow invocations to perform scans and reductions across a group. The operators supported are add, mul, min, max, and, or, xor.

For reductions, every invocation in a group will obtain the cumulative result of these operators applied to all values in the group. For exclusive scans, each invocation in a group will obtain the cumulative result of these operators applied to all values in invocations with a lower index in the group. Inclusive scans are identical to exclusive scans, except the cumulative result includes the operator applied to the value in the current invocation.

The order in which these operators are applied is implementation-dependent.

9.16.4. Ballot Group Operations

The ballot group operations allow invocations to perform more complex votes across the group. The ballot functionality allows all invocations within a group to provide a boolean value and get as a result what each invocation provided as their boolean value. The broadcast functionality allows values to be broadcast from an invocation to all other invocations within the group.

9.16.5. Shuffle Group Operations

The shuffle group operations allow invocations to read values from other invocations within a

group.

9.16.6. Shuffle Relative Group Operations

The shuffle relative group operations allow invocations to read values from other invocations within the group relative to the current invocation in the group. The relative operations supported allow data to be shifted up and down through the invocations within a group.

9.16.7. Clustered Group Operations

The clustered group operations allow invocations to perform an operation among partitions of a group, such that the operation is only performed within the group invocations within a partition. The partitions for clustered group operations are consecutive power-of-two size groups of invocations and the cluster size **must** be known at pipeline creation time. The operations supported are add, mul, min, max, and, or, xor.

9.17. Quad Group Operations

Quad group operations (`OpGroupNonUniformQuad*`) are a specialized type of [group operations](#) that only operate on [quad scope instances](#). Whilst these instructions do include a `Scope` parameter, this scope is always overridden; only the [quad scope instance](#) is included in its execution scope.

Fragment shaders that statically execute either `OpGroupNonUniformQuadBroadcast` or `OpGroupNonUniformQuadSwap` **must** launch sufficient invocations to ensure their correct operation; additional [helper invocations](#) are launched for framebuffer locations not covered by rasterized fragments if necessary.

The index used to select participating invocations is `i`, as described for a [quad scope instance](#), defined as the *quad index* in the [SPIR-V specification](#).

For `OpGroupNonUniformQuadBroadcast` this value is equal to `Index`. For `OpGroupNonUniformQuadSwap`, it is equal to the implicit `Index` used by each participating invocation.

9.18. Derivative Operations

Derivative operations calculate the partial derivative for an expression `P` as a function of an invocation's `x` and `y` coordinates.

Derivative operations operate on a set of invocations known as a *derivative group* as defined in the [SPIR-V specification](#).

A derivative group in a fragment shader is equivalent to the [primitive scope instance](#).

Derivatives are calculated assuming that `P` is piecewise linear and continuous within the derivative group.

The following control-flow restrictions apply to derivative operations:

- dynamic instances of explicit derivative instructions (`OpDPdx*`, `OpDPdy*`, and `OpFwidth*`) **must** be

executed in control flow that is uniform within a derivative group.

- dynamic instances of implicit derivative operations **can** be executed in control flow that is not uniform within the derivative group, but results are undefined.

Fragment shaders that statically execute derivative operations **must** launch sufficient invocations to ensure their correct operation; additional [helper invocations](#) are launched for framebuffer locations not covered by rasterized fragments if necessary.

Derivative operations calculate their results as the difference between the result of P across invocations in the quad. For fine derivative operations ([OpDPdxFine](#) and [OpDPdyFine](#)), the values of $DPdx(P_i)$ are calculated as

$$DPdx(P_0) = DPdx(P_1) = P_1 - P_0$$

$$DPdx(P_2) = DPdx(P_3) = P_3 - P_2$$

and the values of $DPdy(P_i)$ are calculated as

$$DPdy(P_0) = DPdy(P_2) = P_2 - P_0$$

$$DPdy(P_1) = DPdy(P_3) = P_3 - P_1$$

where i is the index of each invocation as described in [Quad](#).

Coarse derivative operations ([OpDPdxCoarse](#) and [OpDPdyCoarse](#)), calculate their results in roughly the same manner, but **may** only calculate two values instead of four (one for each of $DPdx$ and $DPdy$), reusing the same result no matter the originating invocation. If an implementation does this, it **should** use the fine derivative calculations described for P_0 .

NOTE

Derivative values are calculated between fragments rather than pixels. If the fragment shader invocations involved in the calculation cover multiple pixels, these operations cover a wider area, resulting in larger derivative values. This in turn will result in a coarser LOD being selected for image sampling operations using derivatives.

Applications may want to account for this when using multi-pixel fragments; if pixel derivatives are desired, applications should use explicit derivative operations and divide the results by the size of the fragment in each dimension as follows:

$$DPdx(P_n)' = DPdx(P_n) / w$$

$$DPdy(P_n)' = DPdy(P_n) / h$$

where w and h are the size of the fragments in the quad, and $DPdx(P_n)$ and $DPdy(P_n)$ are the pixel derivatives.

The results for `OpDPdx` and `OpDPdy` **may** be calculated as either fine or coarse derivatives, with implementations favoring the most efficient approach. Implementations **must** choose coarse or fine consistently between the two.

Executing `OpFwidthFine`, `OpFwidthCoarse`, or `OpFwidth` is equivalent to executing the corresponding `OpDPdx*` and `OpDPdy*` instructions, taking the absolute value of the results, and summing them.

Executing an `OpImage*Sample*ImplicitLod` instruction is equivalent to executing `OpDPdx(Coordinate)` and `OpDPdy(Coordinate)`, and passing the results as the `Grad` operands `dx` and `dy`.

NOTE

It is expected that using the `ImplicitLod` variants of sampling functions will be substantially more efficient than using the `ExplicitLod` variants with explicitly generated derivatives.

9.19. Helper Invocations

When performing `derivative` or `quad group` operations in a fragment shader, additional invocations **may** be spawned in order to ensure correct results. These additional invocations are known as *helper invocations* and **can** be identified by a non-zero value in the `HelperInvocation` built-in. Stores and atomics performed by helper invocations **must** not have any effect on memory except for the `Function`, `Private` and `Output` storage classes, and values returned by atomic instructions in helper invocations are undefined.

NOTE

While storage to `Output` storage class has an effect even in helper invocations, it does not mean that helper invocations have an effect on the framebuffer. `Output` variables in fragment shaders can be read from as well, and they behave more like `Private` variables for the duration of the shader invocation.

Helper invocations **may** be considered inactive for `group operations` other than `derivative` and `quad group` operations. All invocations in a quad scope instance **may** become permanently inactive at any point once the only remaining invocations in that quad scope instance are helper invocations.

Chapter 10. Pipelines

The following [figure](#) shows a block diagram of the Vulkan pipelines. Some Vulkan commands specify geometric objects to be drawn or computational work to be performed, while others specify state controlling how objects are handled by the various pipeline stages, or control data transfer between memory organized as images and buffers. Commands are effectively sent through a processing pipeline, such as a *graphics pipeline*, or a *compute pipeline*.

The first stage of the [graphics pipeline](#) ([Input Assembler](#)) assembles vertices to form geometric primitives such as points, lines, and triangles, based on a requested primitive topology. In the next stage ([Vertex Shader](#)) vertices **can** be transformed, computing positions and attributes for each vertex. If [tessellation](#) and/or [geometry](#) shaders are supported, they **can** then generate multiple primitives from a single input primitive, possibly changing the primitive topology or generating additional attribute data in the process.

The final resulting primitives are [clipped](#) to a clip volume in preparation for the next stage, [Rasterization](#). The rasterizer produces a series of *fragments* associated with a region of the framebuffer, from a two-dimensional description of a point, line segment, or triangle. These fragments are processed by [fragment operations](#) to determine whether generated values will be written to the framebuffer. [Fragment shading](#) determines the values to be written to the framebuffer attachments. Framebuffer operations then read and write the color and depth/stencil attachments of the framebuffer for a given subpass of a [render pass instance](#). The attachments **can** be used as input attachments in the fragment shader in a later subpass of the same render pass.

The [compute pipeline](#) is a separate pipeline from the graphics pipeline, which operates on one-, two-, or three-dimensional workgroups which **can** read from and write to buffer and image memory.

This ordering is meant only as a tool for describing Vulkan, not as a strict rule of how Vulkan is implemented, and we present it only as a means to organize the various operations of the pipelines. Actual ordering guarantees between pipeline stages are explained in detail in the [synchronization chapter](#).

Figure 2. Block diagram of the Vulkan pipeline

Each pipeline is controlled by a monolithic object created from a description of all of the shader stages and any relevant fixed-function stages. [Linking](#) the whole pipeline together allows the optimization of shaders based on their input/outputs and eliminates expensive draw time state validation.

A pipeline object is bound to the current state using [vkCmdBindPipeline](#). Any pipeline object state that is specified as [dynamic](#) is not applied to the current state when the pipeline object is bound, but is instead set by dynamic state setting commands.

No state, including dynamic state, is inherited from one command buffer to another.

Compute, and graphics pipelines are each represented by [VkPipeline](#) handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipeline)
```

10.1. Multiple Pipeline Creation

Multiple pipelines **can** be created in a single call by commands such as:

- [vkCreateGraphicsPipelines](#),
- [vkCreateComputePipelines](#).

The creation commands are passed an array [pCreateInfo](#)s of [Vk*PipelineCreateInfo](#) structures specifying parameters of each pipeline to be created, and return a corresponding array of handles in [pPipelines](#). Each element index *i* of [pPipelines](#) is created based on the corresponding element *i* of [pCreateInfo](#)s.

Applications **can** group together similar pipelines to be created in a single call, and implementations are encouraged to look for reuse opportunities when creating a group.

When attempting to create many pipelines in a single command, it is possible that creation **may** fail for a subset of them. In this case, the corresponding elements of `pPipelines` will be `VK_NULL_HANDLE`. If creation fails for a pipeline despite valid arguments (for example, due to out of memory errors), the `VkResult` code returned by the pipeline creation command will indicate why. The implementation will attempt to create all pipelines, and only return `VK_NULL_HANDLE` values for those that actually failed.

If creation fails for multiple pipelines, the returned `VkResult` **must** be the return value of any one of the pipelines which did not succeed. An application **can** reliably clean up from a failed call by iterating over the `pPipelines` array and destroying every element that is not `VK_NULL_HANDLE`.

If the entire command fails and no pipelines are created, all elements of `pPipelines` will be `VK_NULL_HANDLE`.

10.2. Pipeline Creation Flags

When creating a pipeline, the application **can** specify a set of flags that control how the pipeline is created and certain aspects of its behavior and capabilities. These flags are specified by setting the `flags` member of the pipeline creation structure to a bitmask of `VkPipelineCreateFlagBits`.

Bits which **can** be set in

- `VkGraphicsPipelineCreateInfo::flags`
- `VkComputePipelineCreateInfo::flags`

specify how a pipeline is created, and are:

```
// Provided by VK_VERSION_1_0
typedef enum VkPipelineCreateFlagBits {
    VK_PIPELINE_CREATE_DISABLE_OPTIMIZATION_BIT = 0x00000001,
    // Provided by VK_VERSION_1_1
    VK_PIPELINE_CREATE_DISPATCH_BASE_BIT = 0x00000010,
    // Provided by VK_VERSION_1_1
    VK_PIPELINE_CREATE_VIEW_INDEX_FROM_DEVICE_INDEX_BIT = 0x00000008,
    // Provided by VK_VERSION_1_1
    // VK_PIPELINE_CREATE_DISPATCH_BASE is a legacy alias
    VK_PIPELINE_CREATE_DISPATCH_BASE = VK_PIPELINE_CREATE_DISPATCH_BASE_BIT,
} VkPipelineCreateFlagBits;
```

- `VK_PIPELINE_CREATE_DISABLE_OPTIMIZATION_BIT` specifies that the created pipeline will not be optimized. Using this flag **may** reduce the time taken to create the pipeline.
- `VK_PIPELINE_CREATE_VIEW_INDEX_FROM_DEVICE_INDEX_BIT` specifies that any shader input variables decorated as `ViewIndex` will be assigned values as if they were decorated as `DeviceIndex`.
- `VK_PIPELINE_CREATE_DISPATCH_BASE_BIT` specifies that a compute pipeline **can** be used with

[vkCmdDispatchBase](#) with a non-zero base workgroup.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineCreateFlags;
```

[VkPipelineCreateFlags](#) is a bitmask type for setting a mask of zero or more [VkPipelineCreateFlagBits](#).

10.3. Compute Pipelines

Compute pipelines consist of a single static compute shader stage and the pipeline layout.

The compute pipeline represents a compute shader and is created by calling [vkCreateComputePipelines](#) with an offline compiled pipeline provided in [pipelineCache](#) and the pipeline identified by [VkPipelineOfflineCreateInfo](#) structure in the [pNext](#) chain of [VkComputePipelineCreateInfo](#) structure.

To create compute pipelines, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateComputePipelines(
    VkDevice                device,
    VkPipelineCache         pipelineCache,
    uint32_t                createInfoCount,
    const VkComputePipelineCreateInfo* pCreateInfos,
    const VkAllocationCallbacks* pAllocator,
    VkPipeline*             pPipelines);
```

- [device](#) is the logical device that creates the compute pipelines.
- [pipelineCache](#) is the handle of a valid [VkPipelineCache](#) object. The implementation **must** not access this object outside of the duration of this command.
- [createInfoCount](#) is the length of the [pCreateInfos](#) and [pPipelines](#) arrays.
- [pCreateInfos](#) is a pointer to an array of [VkComputePipelineCreateInfo](#) structures.
- [pAllocator](#) controls host memory allocation as described in the [Memory Allocation](#) chapter.
- [pPipelines](#) is a pointer to an array of [VkPipeline](#) handles in which the resulting compute pipeline objects are returned.

Pipelines are created and returned as described for [Multiple Pipeline Creation](#).

If a pipeline creation fails due to:

- The identified pipeline not being present in [pipelineCache](#)
- The [pNext](#) chain not including a [VkPipelineOfflineCreateInfo](#) structure

the operation will continue as specified in [Multiple Pipeline Creation](#) and the command will return

VK_ERROR_NO_PIPELINE_MATCH.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkCreateComputePipelines` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkCreateComputePipelines-device-09661
`device` **must** support at least one queue family with the `VK_QUEUE_COMPUTE_BIT` capability
- VUID-vkCreateComputePipelines-device-05068
The number of compute pipelines currently allocated from `device` plus `createInfoCount` **must** be less than or equal to the total number of compute pipelines requested via `VkDeviceObjectReservationCreateInfo::computePipelineRequestCount` specified when `device` was created

Valid Usage (Implicit)

- VUID-vkCreateComputePipelines-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCreateComputePipelines-pipelineCache-parameter
`pipelineCache` **must** be a valid `VkPipelineCache` handle
- VUID-vkCreateComputePipelines-pCreateInfos-parameter
`pCreateInfos` **must** be a valid pointer to an array of `createInfoCount` valid `VkComputePipelineCreateInfo` structures
- VUID-vkCreateComputePipelines-pAllocator-null
`pAllocator` **must** be `NULL`
- VUID-vkCreateComputePipelines-pPipelines-parameter
`pPipelines` **must** be a valid pointer to an array of `createInfoCount` `VkPipeline` handles
- VUID-vkCreateComputePipelines-createInfoCount-arraylength
`createInfoCount` **must** be greater than `0`
- VUID-vkCreateComputePipelines-pipelineCache-parent
`pipelineCache` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_NO_PIPELINE_MATCH`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

- `VK_ERROR_OUT_OF_POOL_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkComputePipelineCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkComputePipelineCreateInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkPipelineCreateFlags    flags;
    VkPipelineShaderStageCreateInfo stage;
    VkPipelineLayout         layout;
    VkPipeline               basePipelineHandle;
    int32_t                  basePipelineIndex;
} VkComputePipelineCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPipelineCreateFlagBits` specifying how the pipeline will be generated.
- `stage` is a `VkPipelineShaderStageCreateInfo` structure describing the compute shader.
- `layout` is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.
- `basePipelineHandle` is a pipeline to derive from. This is not used in Vulkan SC [SCID-8].
- `basePipelineIndex` is an index into the `pCreateInfo` parameter to use as a pipeline to derive from. This is not used in Vulkan SC [SCID-8].

The parameters `basePipelineHandle` and `basePipelineIndex` are described in more detail in [Pipeline Derivatives](#).

Valid Usage

- VUID-VkComputePipelineCreateInfo-None-09497
`flags` **must** be a valid combination of `VkPipelineCreateFlagBits` values
- VUID-VkComputePipelineCreateInfo-basePipelineHandle-05024
`basePipelineHandle` **must** be `VK_NULL_HANDLE`
- VUID-VkComputePipelineCreateInfo-basePipelineIndex-05025
`basePipelineIndex` **must** be zero
- VUID-VkComputePipelineCreateInfo-layout-07987
If a push constant block is declared in a shader, a push constant range in `layout` **must** match the shader stage
- VUID-VkComputePipelineCreateInfo-layout-10069

If a push constant block is declared in a shader, the block must be contained inside the push constant range in **layout** that matches the stage

- VUID-VkComputePipelineCreateInfo-layout-07988
If a **resource variable** is declared in a shader, the corresponding descriptor set in **layout** **must** match the shader stage
- VUID-VkComputePipelineCreateInfo-layout-07990
If a **resource variable** is declared in a shader, the corresponding descriptor set in **layout** **must** match the descriptor type
- VUID-VkComputePipelineCreateInfo-layout-07991
If a **resource variable** is declared in a shader as an array, the corresponding descriptor set in **layout** **must** match the descriptor count
- VUID-VkComputePipelineCreateInfo-stage-00701
The **stage** member of **stage** **must** be **VK_SHADER_STAGE_COMPUTE_BIT**
- VUID-VkComputePipelineCreateInfo-stage-00702
The shader code for the entry point identified by **stage** and the rest of the state identified by this structure **must** adhere to the pipeline linking rules described in the **Shader Interfaces** chapter
- VUID-VkComputePipelineCreateInfo-layout-01687
The number of resources in **layout** accessible to the compute shader stage **must** be less than or equal to **VkPhysicalDeviceLimits::maxPerStageResources**

Valid Usage (Implicit)

- VUID-VkComputePipelineCreateInfo-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_COMPUTE_PIPELINE_CREATE_INFO**
- VUID-VkComputePipelineCreateInfo-pNext-pNext
pNext **must** be **NULL** or a pointer to a valid instance of **VkPipelineOfflineCreateInfo**
- VUID-VkComputePipelineCreateInfo-sType-unique
The **sType** value of each structure in the **pNext** chain **must** be unique
- VUID-VkComputePipelineCreateInfo-stage-parameter
stage **must** be a valid **VkPipelineShaderStageCreateInfo** structure
- VUID-VkComputePipelineCreateInfo-layout-parameter
layout **must** be a valid **VkPipelineLayout** handle
- VUID-VkComputePipelineCreateInfo-commonparent
Both of **basePipelineHandle**, and **layout** that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same **VkDevice**

The **VkPipelineShaderStageCreateInfo** structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineShaderStageCreateInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkPipelineShaderStageCreateFlags flags;
    VkShaderStageFlagBits    stage;
    VkShaderModule            module;
    const char*              pName;
    const VkSpecializationInfo* pSpecializationInfo;
} VkPipelineShaderStageCreateInfo;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of [VkPipelineShaderStageCreateFlagBits](#) specifying how the pipeline shader stage will be generated.
- **stage** is a [VkShaderStageFlagBits](#) value specifying a single pipeline stage.
- **module** is a [VkShaderModule](#) object containing the shader code for this stage. The implementation **must** not access this object outside of the duration of the command this structure is passed to. This is not used in Vulkan SC [\[SCID-8\]](#).
- **pName** is a pointer to a null-terminated UTF-8 string specifying the entry point name of the shader for this stage.
- **pSpecializationInfo** is a pointer to a [VkSpecializationInfo](#) structure, as described in [Specialization Constants](#), or `NULL`.

In Vulkan SC, the pipeline compilation process occurs [offline](#). Accordingly, **module** **must** be [VK_NULL_HANDLE](#), and the **pName** and **pSpecializationInfo** parameters are not used at runtime and **should** be ignored by the implementation. If provided, the application **must** set the **pName** and **pSpecializationInfo** parameters to the values that were specified for the offline compilation of this pipeline.

Valid Usage

- VUID-VkPipelineShaderStageCreateInfo-stage-00704
If the [geometryShader](#) feature is not enabled, **stage** **must** not be [VK_SHADER_STAGE_GEOMETRY_BIT](#)
- VUID-VkPipelineShaderStageCreateInfo-stage-00705
If the [tessellationShader](#) feature is not enabled, **stage** **must** not be [VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT](#) or [VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT](#)
- VUID-VkPipelineShaderStageCreateInfo-stage-00706
stage **must** not be [VK_SHADER_STAGE_ALL_GRAPHICS](#), or [VK_SHADER_STAGE_ALL](#)
- VUID-VkPipelineShaderStageCreateInfo-module-05026
module **must** be [VK_NULL_HANDLE](#)

- VUID-VkPipelineShaderStageCreateInfo-pName-05027
If `pName` is not `NULL`, it **must** be the name of an `OpEntryPoint` in the SPIR-V shader module used for offline compilation of this pipeline with an execution model that matches `stage`
- VUID-VkPipelineShaderStageCreateInfo-maxClipDistances-00708
If the identified entry point includes any variable in its interface that is declared with the `ClipDistance BuiltIn` decoration, that variable **must** not have an array size greater than `VkPhysicalDeviceLimits::maxClipDistances`
- VUID-VkPipelineShaderStageCreateInfo-maxCullDistances-00709
If the identified entry point includes any variable in its interface that is declared with the `CullDistance BuiltIn` decoration, that variable **must** not have an array size greater than `VkPhysicalDeviceLimits::maxCullDistances`
- VUID-VkPipelineShaderStageCreateInfo-maxCombinedClipAndCullDistances-00710
If the identified entry point includes variables in its interface that are declared with the `ClipDistance BuiltIn` decoration and variables in its interface that are declared with the `CullDistance BuiltIn` decoration, those variables **must** not have array sizes which sum to more than `VkPhysicalDeviceLimits::maxCombinedClipAndCullDistances`
- VUID-VkPipelineShaderStageCreateInfo-maxSampleMaskWords-00711
If the identified entry point includes any variable in its interface that is declared with the `SampleMask BuiltIn` decoration, that variable **must** not have an array size greater than `VkPhysicalDeviceLimits::maxSampleMaskWords`
- VUID-VkPipelineShaderStageCreateInfo-stage-00713
If `stage` is `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` or `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, and the identified entry point has an `OpExecutionMode` instruction specifying a patch size with `OutputVertices`, the patch size **must** be greater than `0` and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`
- VUID-VkPipelineShaderStageCreateInfo-stage-00714
If `stage` is `VK_SHADER_STAGE_GEOMETRY_BIT`, the identified entry point **must** have an `OpExecutionMode` instruction specifying a maximum output vertex count that is greater than `0` and less than or equal to `VkPhysicalDeviceLimits::maxGeometryOutputVertices`
- VUID-VkPipelineShaderStageCreateInfo-stage-00715
If `stage` is `VK_SHADER_STAGE_GEOMETRY_BIT`, the identified entry point **must** have an `OpExecutionMode` instruction specifying an invocation count that is greater than `0` and less than or equal to `VkPhysicalDeviceLimits::maxGeometryShaderInvocations`
- VUID-VkPipelineShaderStageCreateInfo-stage-02596
If `stage` is either `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, or `VK_SHADER_STAGE_GEOMETRY_BIT`, and the identified entry point writes to `Layer` for any primitive, it **must** write the same value to `Layer` for all vertices of a given primitive
- VUID-VkPipelineShaderStageCreateInfo-stage-02597
If `stage` is either `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, or `VK_SHADER_STAGE_GEOMETRY_BIT`, and the identified entry point writes to `ViewportIndex` for any primitive, it **must** write the same value to `ViewportIndex` for all vertices of a given primitive

- VUID-VkPipelineShaderStageCreateInfo-stage-06685
If `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, and the identified entry point writes to `FragDepth` in any execution path, all execution paths that are not exclusive to helper invocations **must** either discard the fragment, or write or initialize the value of `FragDepth`
- VUID-VkPipelineShaderStageCreateInfo-stage-06686
If `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, and the identified entry point writes to `FragStencilRefEXT` in any execution path, all execution paths that are not exclusive to helper invocations **must** either discard the fragment, or write or initialize the value of `FragStencilRefEXT`
- VUID-VkPipelineShaderStageCreateInfo-flags-02784
If `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag set, the `subgroupSizeControl` feature **must** be enabled
- VUID-VkPipelineShaderStageCreateInfo-flags-02785
If `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` flag set, the `computeFullSubgroups` feature **must** be enabled
- VUID-VkPipelineShaderStageCreateInfo-flags-08988
If `flags` includes `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT`, `stage` **must** be `VK_SHADER_STAGE_COMPUTE_BIT`
- VUID-VkPipelineShaderStageCreateInfo-pNext-02754
If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain, `flags` **must** not have the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag set
- VUID-VkPipelineShaderStageCreateInfo-pNext-02755
If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain, the `subgroupSizeControl` feature **must** be enabled, and `stage` **must** be a valid bit specified in `requiredSubgroupSizeStages`
- VUID-VkPipelineShaderStageCreateInfo-pNext-02756
If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain and `stage` is `VK_SHADER_STAGE_COMPUTE_BIT`, the local workgroup size of the shader **must** be less than or equal to the product of `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo::requiredSubgroupSize` and `maxComputeWorkgroupSubgroups`
- VUID-VkPipelineShaderStageCreateInfo-pNext-02757
If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain, and `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` flag set, the local workgroup size in the X dimension of the pipeline **must** be a multiple of `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo::requiredSubgroupSize`
- VUID-VkPipelineShaderStageCreateInfo-flags-02758
If `flags` has both the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` and `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flags set, the local workgroup size in the X dimension of the pipeline **must** be a multiple of `maxSubgroupSize`
- VUID-VkPipelineShaderStageCreateInfo-flags-02759
If `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` flag set and

`flags` does not have the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag set and no `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain, the local workgroup size in the X dimension of the pipeline **must** be a multiple of `subgroupSize`

Valid Usage (Implicit)

- VUID-VkPipelineShaderStageCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_CREATE_INFO`
- VUID-VkPipelineShaderStageCreateInfo-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkDebugUtilsObjectNameInfoEXT` or `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo`
- VUID-VkPipelineShaderStageCreateInfo-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkPipelineShaderStageCreateInfo-flags-parameter
`flags` **must** be a valid combination of `VkPipelineShaderStageCreateFlagBits` values
- VUID-VkPipelineShaderStageCreateInfo-stage-parameter
`stage` **must** be a valid `VkShaderStageFlagBits` value
- VUID-VkPipelineShaderStageCreateInfo-module-parameter
If `module` is not `VK_NULL_HANDLE`, `module` **must** be a valid `VkShaderModule` handle
- VUID-VkPipelineShaderStageCreateInfo-pName-parameter
If `pName` is not `NULL`, `pName` **must** be a null-terminated UTF-8 string
- VUID-VkPipelineShaderStageCreateInfo-pSpecializationInfo-parameter
If `pSpecializationInfo` is not `NULL`, `pSpecializationInfo` **must** be a valid pointer to a valid `VkSpecializationInfo` structure

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineShaderStageCreateFlags;
```

`VkPipelineShaderStageCreateFlags` is a bitmask type for setting a mask of zero or more `VkPipelineShaderStageCreateFlagBits`.

Possible values of the `flags` member of `VkPipelineShaderStageCreateInfo` specifying how a pipeline shader stage is created, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkPipelineShaderStageCreateFlagBits {
    VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT = 0x00000001,
    VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT = 0x00000002,
    // Provided by VK_EXT_subgroup_size_control
    VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT =
VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT,
    // Provided by VK_EXT_subgroup_size_control
    VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT =
VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT,
} VkPipelineShaderStageCreateFlagBits;
```

- `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` specifies that the **SubgroupSize** **may** vary in the shader stage.
- `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` specifies that the subgroup sizes **must** be launched with all invocations active in the compute stage.

NOTE If `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` and `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT` are specified and `minSubgroupSize` does not equal `maxSubgroupSize` and no **required subgroup size** is specified, then the only way to guarantee that the 'X' dimension of the local workgroup size is a multiple of **SubgroupSize** is to make it a multiple of **maxSubgroupSize**. Under these conditions, you are guaranteed full subgroups but not any particular subgroup size.

Bits which **can** be set by commands and structures, specifying one or more shader stages, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkShaderStageFlagBits {
    VK_SHADER_STAGE_VERTEX_BIT = 0x00000001,
    VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT = 0x00000002,
    VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT = 0x00000004,
    VK_SHADER_STAGE_GEOMETRY_BIT = 0x00000008,
    VK_SHADER_STAGE_FRAGMENT_BIT = 0x00000010,
    VK_SHADER_STAGE_COMPUTE_BIT = 0x00000020,
    VK_SHADER_STAGE_ALL_GRAPHICS = 0x0000001F,
    VK_SHADER_STAGE_ALL = 0x7FFFFFFF,
} VkShaderStageFlagBits;
```

- `VK_SHADER_STAGE_VERTEX_BIT` specifies the vertex stage.
- `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` specifies the tessellation control stage.
- `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` specifies the tessellation evaluation stage.
- `VK_SHADER_STAGE_GEOMETRY_BIT` specifies the geometry stage.
- `VK_SHADER_STAGE_FRAGMENT_BIT` specifies the fragment stage.
- `VK_SHADER_STAGE_COMPUTE_BIT` specifies the compute stage.

- `VK_SHADER_STAGE_ALL_GRAPHICS` is a combination of bits used as shorthand to specify all graphics stages defined above (excluding the compute stage).
- `VK_SHADER_STAGE_ALL` is a combination of bits used as shorthand to specify all shader stages supported by the device, including all additional stages which are introduced by extensions.

NOTE

`VK_SHADER_STAGE_ALL_GRAPHICS` only includes the original five graphics stages included in Vulkan 1.0, and not any stages added by extensions. Thus, it may not have the desired effect in all cases.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkShaderStageFlags;
```

`VkShaderStageFlags` is a bitmask type for setting a mask of zero or more `VkShaderStageFlagBits`.

The `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is defined as:

```
typedef struct VkPipelineShaderStageRequiredSubgroupSizeCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           requiredSubgroupSize;
} VkPipelineShaderStageRequiredSubgroupSizeCreateInfo;
```

```
// Provided by VK_EXT_subgroup_size_control
typedef VkPipelineShaderStageRequiredSubgroupSizeCreateInfo
VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `requiredSubgroupSize` is an unsigned integer value specifying the required subgroup size for the newly created pipeline shader stage.

If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain of `VkPipelineShaderStageCreateInfo`, it specifies that the pipeline shader stage being compiled has a required subgroup size.

Valid Usage

- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-requiredSubgroupSize-02760
`requiredSubgroupSize` **must** be a power-of-two integer
- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-requiredSubgroupSize-02761
`requiredSubgroupSize` **must** be greater or equal to `minSubgroupSize`

- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-requiredSubgroupSize-02762
`requiredSubgroupSize` **must** be less than or equal to `maxSubgroupSize`

Valid Usage (Implicit)

- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-sType-sType **must** be `VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_REQUIRED_SUBGROUP_SIZE_CREATE_INFO`

10.4. Graphics Pipelines

Graphics pipelines consist of multiple shader stages, multiple fixed-function pipeline stages, and a pipeline layout.

To create graphics pipelines, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateGraphicsPipelines(
    VkDevice          device,
    VkPipelineCache    pipelineCache,
    uint32_t          createInfoCount,
    const VkGraphicsPipelineCreateInfo* pCreateInfos,
    const VkAllocationCallbacks* pAllocator,
    VkPipeline*        pPipelines);
```

- `device` is the logical device that creates the graphics pipelines.
- `pipelineCache` is the handle of a valid `VkPipelineCache` object. The implementation **must** not access this object outside of the duration of this command.
- `createInfoCount` is the length of the `pCreateInfos` and `pPipelines` arrays.
- `pCreateInfos` is a pointer to an array of `VkGraphicsPipelineCreateInfo` structures.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pPipelines` is a pointer to an array of `VkPipeline` handles in which the resulting graphics pipeline objects are returned.

The `VkGraphicsPipelineCreateInfo` structure includes an array of `VkPipelineShaderStageCreateInfo` structures for each of the desired active shader stages, as well as creation information for all relevant fixed-function stages, and a pipeline layout.

Pipelines are created and returned as described for [Multiple Pipeline Creation](#).

If a pipeline creation fails due to:

- The identified pipeline not being present in `pipelineCache`

- The `pNext` chain not including a `VkPipelineOfflineCreateInfo` structure

the operation will continue as specified in [Multiple Pipeline Creation](#) and the command will return `VK_ERROR_NO_PIPELINE_MATCH`.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkCreateGraphicsPipelines` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkCreateGraphicsPipelines-device-09662
`device` **must** support at least one queue family with the `VK_QUEUE_GRAPHICS_BIT` capability
- VUID-vkCreateGraphicsPipelines-device-05068
The number of graphics pipelines currently allocated from `device` plus `createInfoCount` **must** be less than or equal to the total number of graphics pipelines requested via `VkDeviceObjectReservationCreateInfo::graphicsPipelineRequestCount` specified when `device` was created

Valid Usage (Implicit)

- VUID-vkCreateGraphicsPipelines-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCreateGraphicsPipelines-pipelineCache-parameter
`pipelineCache` **must** be a valid `VkPipelineCache` handle
- VUID-vkCreateGraphicsPipelines-pCreateInfos-parameter
`pCreateInfos` **must** be a valid pointer to an array of `createInfoCount` valid `VkGraphicsPipelineCreateInfo` structures
- VUID-vkCreateGraphicsPipelines-pAllocator-null
`pAllocator` **must** be `NULL`
- VUID-vkCreateGraphicsPipelines-pPipelines-parameter
`pPipelines` **must** be a valid pointer to an array of `createInfoCount` `VkPipeline` handles
- VUID-vkCreateGraphicsPipelines-createInfoCount-arraylength
`createInfoCount` **must** be greater than `0`
- VUID-vkCreateGraphicsPipelines-pipelineCache-parent
`pipelineCache` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_NO_PIPELINE_MATCH`

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_POOL_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkGraphicsPipelineCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkGraphicsPipelineCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkPipelineCreateFlags     flags;
    uint32_t                  stageCount;
    const VkPipelineShaderStageCreateInfo* pStages;
    const VkPipelineVertexInputStateCreateInfo* pVertexInputState;
    const VkPipelineInputAssemblyStateCreateInfo* pInputAssemblyState;
    const VkPipelineTessellationStateCreateInfo* pTessellationState;
    const VkPipelineViewportStateCreateInfo* pViewportState;
    const VkPipelineRasterizationStateCreateInfo* pRasterizationState;
    const VkPipelineMultisampleStateCreateInfo* pMultisampleState;
    const VkPipelineDepthStencilStateCreateInfo* pDepthStencilState;
    const VkPipelineColorBlendStateCreateInfo* pColorBlendState;
    const VkPipelineDynamicStateCreateInfo* pDynamicState;
    VkPipelineLayout          layout;
    VkRenderPass              renderPass;
    uint32_t                  subpass;
    VkPipeline                basePipelineHandle;
    int32_t                   basePipelineIndex;
} VkGraphicsPipelineCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPipelineCreateFlagBits` specifying how the pipeline will be generated.
- `stageCount` is the number of entries in the `pStages` array.
- `pStages` is a pointer to an array of `stageCount` `VkPipelineShaderStageCreateInfo` structures describing the set of the shader stages to be included in the graphics pipeline.
- `pVertexInputState` is a pointer to a `VkPipelineVertexInputStateCreateInfo` structure. It **can** be `NULL` if the pipeline is created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state set.
- `pInputAssemblyState` is a pointer to a `VkPipelineInputAssemblyStateCreateInfo` structure which determines input assembly behavior for vertex shading, as described in [Drawing Commands](#).
- `pTessellationState` is a pointer to a `VkPipelineTessellationStateCreateInfo` structure defining tessellation state used by tessellation shaders. It **can** be `NULL` if the pipeline is created with the

`VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state set.

- `pViewportState` is a pointer to a `VkPipelineViewportStateCreateInfo` structure defining viewport state used when rasterization is enabled.
- `pRasterizationState` is a pointer to a `VkPipelineRasterizationStateCreateInfo` structure defining rasterization state.
- `pMultisampleState` is a pointer to a `VkPipelineMultisampleStateCreateInfo` structure defining multisample state used when rasterization is enabled.
- `pDepthStencilState` is a pointer to a `VkPipelineDepthStencilStateCreateInfo` structure defining depth/stencil state used when rasterization is enabled for depth or stencil attachments accessed during rendering.
- `pColorBlendState` is a pointer to a `VkPipelineColorBlendStateCreateInfo` structure defining color blend state used when rasterization is enabled for any color attachments accessed during rendering.
- `pDynamicState` is a pointer to a `VkPipelineDynamicStateCreateInfo` structure defining which properties of the pipeline state object are dynamic and **can** be changed independently of the pipeline state. This **can** be `NULL`, which means no state in the pipeline is considered dynamic.
- `layout` is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.
- `renderPass` is a handle to a render pass object describing the environment in which the pipeline will be used. The pipeline **must** only be used with a render pass instance compatible with the one provided. See [Render Pass Compatibility](#) for more information. The implementation **must** not access this object outside of the duration of the command this structure is passed to.
- `subpass` is the index of the subpass in the render pass where this pipeline will be used.
- `basePipelineHandle` is a pipeline to derive from. This is not used in Vulkan SC [\[SCID-8\]](#).
- `basePipelineIndex` is an index into the `pCreateInfos` parameter to use as a pipeline to derive from. This is not used in Vulkan SC [\[SCID-8\]](#).

The parameters `basePipelineHandle` and `basePipelineIndex` are described in more detail in [Pipeline Derivatives](#).

The state required for a graphics pipeline is divided into [vertex input state](#), [pre-rasterization shader state](#), [fragment shader state](#), and [fragment output state](#).

Vertex Input State

Vertex input state is defined by:

- [VkPipelineVertexInputStateCreateInfo](#)
- [VkPipelineInputAssemblyStateCreateInfo](#)

This state **must** be specified to create a [complete graphics pipeline](#).

Pre-Rasterization Shader State

Pre-rasterization shader state is defined by:

- [VkPipelineShaderStageCreateInfo](#) entries for:
 - Vertex shaders
 - Tessellation control shaders
 - Tessellation evaluation shaders
 - Geometry shaders
- Within the [VkPipelineLayout](#), the full pipeline layout **must** be specified.
- [VkPipelineViewportStateCreateInfo](#)
- [VkPipelineRasterizationStateCreateInfo](#)
- [VkPipelineTessellationStateCreateInfo](#)
- [VkRenderPass](#) and **subpass** parameter
- [VkPipelineDiscardRectangleStateCreateInfoEXT](#)
- [VkPipelineFragmentShadingRateStateCreateInfoKHR](#)

This state **must** be specified to create a [complete graphics pipeline](#).

Fragment Shader State

Fragment shader state is defined by:

- A [VkPipelineShaderStageCreateInfo](#) entry for the fragment shader
- Within the [VkPipelineLayout](#), the full pipeline layout **must** be specified.
- [VkPipelineMultisampleStateCreateInfo](#)
- [VkPipelineDepthStencilStateCreateInfo](#)
- [VkRenderPass](#) and **subpass** parameter
- [VkPipelineFragmentShadingRateStateCreateInfoKHR](#)

If **rasterizerDiscardEnable** is **VK_FALSE** or **VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE** is used, this state **must** be specified to create a [complete graphics pipeline](#).

Fragment Output State

Fragment output state is defined by:

- [VkPipelineColorBlendStateCreateInfo](#)
- [VkRenderPass](#) and **subpass** parameter
- [VkPipelineMultisampleStateCreateInfo](#)

If **rasterizerDiscardEnable** is **VK_FALSE** or **VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE** is used, this state **must** be specified to create a [complete graphics pipeline](#).

Dynamic State

Dynamic state values set via **pDynamicState** **must** be ignored if the state they correspond to is not otherwise statically set by one of the state subsets used to create the pipeline. For example, if a pipeline only included [pre-rasterization shader state](#), then any dynamic state value corresponding

to depth or stencil testing has no effect.

Complete Graphics Pipelines

A complete graphics pipeline always includes [pre-rasterization shader state](#), with other subsets included depending on that state as specified in the above sections.

In Vulkan SC, the pipeline compilation process occurs [offline](#) and the [pStages](#) are not needed at runtime and **may** be omitted. If omitted, [stageCount](#) **must** be 0 and [pStages](#) **must** be `NULL`. If provided, the values **must** match the values specified to the offline compiler.

Valid Usage

- VUID-VkGraphicsPipelineCreateInfo-None-09497
[flags](#) **must** be a valid combination of [VkPipelineCreateFlagBits](#) values
- VUID-VkGraphicsPipelineCreateInfo-basePipelineHandle-05024
[basePipelineHandle](#) **must** be `VK_NULL_HANDLE`
- VUID-VkGraphicsPipelineCreateInfo-basePipelineIndex-05025
[basePipelineIndex](#) **must** be zero
- VUID-VkGraphicsPipelineCreateInfo-layout-07987
If a push constant block is declared in a shader, a push constant range in [layout](#) **must** match the shader stage
- VUID-VkGraphicsPipelineCreateInfo-layout-10069
If a push constant block is declared in a shader, the block must be contained inside the push constant range in [layout](#) that matches the stage
- VUID-VkGraphicsPipelineCreateInfo-layout-07988
If a [resource variable](#) is declared in a shader, the corresponding descriptor set in [layout](#) **must** match the shader stage
- VUID-VkGraphicsPipelineCreateInfo-layout-07990
If a [resource variable](#) is declared in a shader, the corresponding descriptor set in [layout](#) **must** match the descriptor type
- VUID-VkGraphicsPipelineCreateInfo-layout-07991
If a [resource variable](#) is declared in a shader as an array, the corresponding descriptor set in [layout](#) **must** match the descriptor count
- VUID-VkGraphicsPipelineCreateInfo-stage-02096
If the pipeline requires [pre-rasterization shader state](#) the [stage](#) member of one element of [pStages](#) **must** be `VK_SHADER_STAGE_VERTEX_BIT`
- VUID-VkGraphicsPipelineCreateInfo-pStages-00729
If the pipeline requires [pre-rasterization shader state](#) and [pStages](#) includes a tessellation control shader stage, it **must** include a tessellation evaluation shader stage
- VUID-VkGraphicsPipelineCreateInfo-pStages-00730
If the pipeline requires [pre-rasterization shader state](#) and [pStages](#) includes a tessellation evaluation shader stage, it **must** include a tessellation control shader stage
- VUID-VkGraphicsPipelineCreateInfo-pStages-09022

If the pipeline requires [pre-rasterization shader state](#) and [pStages](#) includes a tessellation control shader stage, [pTessellationState](#) **must** be a valid pointer to a valid [VkPipelineTessellationStateCreateInfo](#) structure

- VUID-VkGraphicsPipelineCreateInfo-pStages-00732

If the pipeline requires [pre-rasterization shader state](#) and [pStages](#) includes tessellation shader stages, the shader code of at least one stage **must** contain an [OpExecutionMode](#) instruction specifying the type of subdivision in the pipeline

- VUID-VkGraphicsPipelineCreateInfo-pStages-00733

If the pipeline requires [pre-rasterization shader state](#) and [pStages](#) includes tessellation shader stages, and the shader code of both stages contain an [OpExecutionMode](#) instruction specifying the type of subdivision in the pipeline, they **must** both specify the same subdivision mode

- VUID-VkGraphicsPipelineCreateInfo-pStages-00734

If the pipeline requires [pre-rasterization shader state](#) and [pStages](#) includes tessellation shader stages, the shader code of at least one stage **must** contain an [OpExecutionMode](#) instruction specifying the output patch size in the pipeline

- VUID-VkGraphicsPipelineCreateInfo-pStages-00735

If the pipeline requires [pre-rasterization shader state](#) and [pStages](#) includes tessellation shader stages, and the shader code of both contain an [OpExecutionMode](#) instruction specifying the out patch size in the pipeline, they **must** both specify the same patch size

- VUID-VkGraphicsPipelineCreateInfo-pStages-08888

If the pipeline is being created with [pre-rasterization shader state](#) and [vertex input state](#) and [pStages](#) includes tessellation shader stages, the [topology](#) member of [pInputAssembly](#) **must** be [VK_PRIMITIVE_TOPOLOGY_PATCH_LIST](#)

- VUID-VkGraphicsPipelineCreateInfo-topology-08889

If the pipeline is being created with [pre-rasterization shader state](#) and [vertex input state](#) and the [topology](#) member of [pInputAssembly](#) is [VK_PRIMITIVE_TOPOLOGY_PATCH_LIST](#), then [pStages](#) **must** include tessellation shader stages

- VUID-VkGraphicsPipelineCreateInfo-TessellationEvaluation-07723

If the pipeline is being created with a [TessellationEvaluation Execution Model](#), no [Geometry Execution Model](#), uses the [PointMode Execution Mode](#), and the [shaderTessellationAndGeometryPointSize](#) feature is enabled, a [PointSize](#) decorated variable **must** be written to

- VUID-VkGraphicsPipelineCreateInfo-topology-08773

If the pipeline is being created with a [Vertex Execution Model](#) and no [TessellationEvaluation](#) or [Geometry Execution Model](#), and the [topology](#) member of [pInputAssembly](#) is [VK_PRIMITIVE_TOPOLOGY_POINT_LIST](#), a [PointSize](#) decorated variable **must** be written to

- VUID-VkGraphicsPipelineCreateInfo-TessellationEvaluation-07724

If the pipeline is being created with a [TessellationEvaluation Execution Model](#), no [Geometry Execution Model](#), uses the [PointMode Execution Mode](#), and the [shaderTessellationAndGeometryPointSize](#) feature is not enabled, a [PointSize](#) decorated variable **must** not be written to

- VUID-VkGraphicsPipelineCreateInfo-shaderTessellationAndGeometryPointSize-08776

If the pipeline is being created with a **Geometry Execution Model**, uses the **OutputPoints Execution Mode**, and the **shaderTessellationAndGeometryPointSize** feature is enabled, a **PointSize** decorated variable **must** be written to for every vertex emitted

- VUID-VkGraphicsPipelineCreateInfo-Geometry-07726

If the pipeline is being created with a **Geometry Execution Model**, uses the **OutputPoints Execution Mode**, and the **shaderTessellationAndGeometryPointSize** feature is not enabled, a **PointSize** decorated variable **must** not be written to

- VUID-VkGraphicsPipelineCreateInfo-pStages-00738

If the pipeline requires **pre-rasterization shader state** and **pStages** includes a geometry shader stage, and does not include any tessellation shader stages, its shader code **must** contain an **OpExecutionMode** instruction specifying an input primitive type that is **compatible** with the primitive topology specified in **pInputAssembly**

- VUID-VkGraphicsPipelineCreateInfo-pStages-00739

If the pipeline requires **pre-rasterization shader state** and **pStages** includes a geometry shader stage, and also includes tessellation shader stages, its shader code **must** contain an **OpExecutionMode** instruction specifying an input primitive type that is **compatible** with the primitive topology that is output by the tessellation stages

- VUID-VkGraphicsPipelineCreateInfo-pStages-00740

If the pipeline requires **pre-rasterization shader state** and **fragment shader state**, it includes both a fragment shader and a geometry shader, and the fragment shader code reads from an input variable that is decorated with **PrimitiveId**, then the geometry shader code **must** write to a matching output variable, decorated with **PrimitiveId**, in all execution paths

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06038

If **renderPass** is not **VK_NULL_HANDLE** and the pipeline is being created with **fragment shader state** the fragment shader **must** not read from any input attachment that is defined as **VK_ATTACHMENT_UNUSED** in **subpass**

- VUID-VkGraphicsPipelineCreateInfo-pStages-00742

If the pipeline requires **pre-rasterization shader state** and multiple pre-rasterization shader stages are included in **pStages**, the shader code for the entry points identified by those **pStages** and the rest of the state identified by this structure **must** adhere to the pipeline linking rules described in the **Shader Interfaces** chapter

- VUID-VkGraphicsPipelineCreateInfo-None-04889

If the pipeline requires **pre-rasterization shader state** and **fragment shader state**, the fragment shader and last **pre-rasterization shader stage** and any relevant state **must** adhere to the pipeline linking rules described in the **Shader Interfaces** chapter

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06041

If **renderPass** is not **VK_NULL_HANDLE**, and the pipeline is being created with **fragment output interface state**, then for each color attachment in the subpass, if the **potential format features** of the format of the corresponding attachment description do not contain **VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT**, then the **blendEnable** member of the corresponding element of the **pAttachments** member of **pColorBlendState** **must** be **VK_FALSE**

- VUID-VkGraphicsPipelineCreateInfo-renderPass-07609

If **renderPass** is not **VK_NULL_HANDLE**, the pipeline is being created with **fragment output**

interface state, the `pColorBlendState` pointer is not `NULL`, the `attachmentCount` member of `pColorBlendState` is not ignored, and the subpass uses color attachments, the `attachmentCount` member of `pColorBlendState` **must** be equal to the `colorAttachmentCount` used to create subpass

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04130
If the pipeline requires `pre-rasterization shader state`, and `pViewportState->pViewports` is not dynamic, then `pViewportState->pViewports` **must** be a valid pointer to an array of `pViewportState->viewportCount` valid `VkViewport` structures
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04131
If the pipeline requires `pre-rasterization shader state`, and `pViewportState->pScissors` is not dynamic, then `pViewportState->pScissors` **must** be a valid pointer to an array of `pViewportState->scissorCount` `VkRect2D` structures
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-00749
If the pipeline requires `pre-rasterization shader state`, and the `wideLines` feature is not enabled, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_LINE_WIDTH`, the `lineWidth` member of `pRasterizationState` **must** be `1.0`
- VUID-VkGraphicsPipelineCreateInfo-rasterizerDiscardEnable-09024
If the pipeline requires `pre-rasterization shader state`, and the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state is enabled or the `rasterizerDiscardEnable` member of `pRasterizationState` is `VK_FALSE`, `pViewportState` **must** be a valid pointer to a valid `VkPipelineViewportStateCreateInfo` structure
- VUID-VkGraphicsPipelineCreateInfo-pMultisampleState-09026
If the pipeline requires `fragment output interface state`, `pMultisampleState` **must** be a valid pointer to a valid `VkPipelineMultisampleStateCreateInfo` structure
- VUID-VkGraphicsPipelineCreateInfo-pMultisampleState-09027
If `pMultisampleState` is not `NULL` it **must** be a valid pointer to a valid `VkPipelineMultisampleStateCreateInfo` structure
- VUID-VkGraphicsPipelineCreateInfo-alphaToCoverageEnable-08891
If the pipeline is being created with `fragment shader state`, the `VkPipelineMultisampleStateCreateInfo::alphaToCoverageEnable` is not ignored and is `VK_TRUE`, then the `Fragment Output Interface` **must** contain a variable for the alpha Component word in Location 0 at Index 0
- VUID-VkGraphicsPipelineCreateInfo-renderPass-09028
If `renderPass` is not `VK_NULL_HANDLE`, the pipeline is being created with `fragment shader state`, and subpass uses a depth/stencil attachment, `pDepthStencilState` **must** be a valid pointer to a valid `VkPipelineDepthStencilStateCreateInfo` structure
- VUID-VkGraphicsPipelineCreateInfo-pDepthStencilState-09029
If `pDepthStencilState` is not `NULL` it **must** be a valid pointer to a valid `VkPipelineDepthStencilStateCreateInfo` structure
- VUID-VkGraphicsPipelineCreateInfo-renderPass-09030
If `renderPass` is not `VK_NULL_HANDLE`, the pipeline is being created with `fragment output interface state`, and subpass uses color attachments, `pColorBlendState` **must** be a valid pointer to a valid `VkPipelineColorBlendStateCreateInfo` structure

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-00754
If the pipeline requires [pre-rasterization shader state](#), the [depthBiasClamp](#) feature is not enabled, no element of the [pDynamicStates](#) member of [pDynamicState](#) is [VK_DYNAMIC_STATE_DEPTH_BIAS](#), and the [depthBiasEnable](#) member of [pRasterizationState](#) is [VK_TRUE](#), the [depthBiasClamp](#) member of [pRasterizationState](#) **must** be [0.0](#)
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-02510
If the pipeline requires [fragment shader state](#), the [VK_EXT_depth_range_unrestricted](#) extension is not enabled and no element of the [pDynamicStates](#) member of [pDynamicState](#) is [VK_DYNAMIC_STATE_DEPTH_BOUNDS](#), and the [depthBoundsTestEnable](#) member of [pDepthStencilState](#) is [VK_TRUE](#), the [minDepthBounds](#) and [maxDepthBounds](#) members of [pDepthStencilState](#) **must** be between [0.0](#) and [1.0](#), inclusive
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-10913
If the pipeline requires [fragment shader state](#), no element of the [pDynamicStates](#) member of [pDynamicState](#) is [VK_DYNAMIC_STATE_DEPTH_BOUNDS](#), and [pDynamicStates](#) includes [VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE](#) or the [depthBoundsTestEnable](#) member of [pDepthStencilState](#) is [VK_TRUE](#), [minDepthBounds](#) **must** be less than or equal to [maxDepthBounds](#)
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07610
If the pipeline requires [fragment shader state](#) or [fragment output interface state](#), and [rasterizationSamples](#) and [sampleLocationsInfo](#) are not dynamic, and [VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable](#) included in the [pNext](#) chain of [pMultisampleState](#) is [VK_TRUE](#), [sampleLocationsInfo.sampleLocationGridSize.width](#) **must** evenly divide [VkMultisamplePropertiesEXT::maxSampleLocationGridSize.width](#) as returned by [vkGetPhysicalDeviceMultisamplePropertiesEXT](#) with a [samples](#) parameter equaling [rasterizationSamples](#)
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07611
If the pipeline requires [fragment shader state](#) or [fragment output interface state](#), and [rasterizationSamples](#) and [sampleLocationsInfo](#) are not dynamic, and [VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable](#) the included in the [pNext](#) chain of [pMultisampleState](#) is [VK_TRUE](#) or [VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT](#) is used, [sampleLocationsInfo.sampleLocationGridSize.height](#) **must** evenly divide [VkMultisamplePropertiesEXT::maxSampleLocationGridSize.height](#) as returned by [vkGetPhysicalDeviceMultisamplePropertiesEXT](#) with a [samples](#) parameter equaling [rasterizationSamples](#)
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07612
If the pipeline requires [fragment shader state](#) or [fragment output interface state](#), and [rasterizationSamples](#) and [sampleLocationsInfo](#) are not dynamic, and [VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable](#) included in the [pNext](#) chain of [pMultisampleState](#) is [VK_TRUE](#) or [VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT](#) is used, [sampleLocationsInfo.sampleLocationsPerPixel](#) **must** equal [rasterizationSamples](#)
- VUID-VkGraphicsPipelineCreateInfo-sampleLocationsEnable-01524
If the pipeline requires [fragment shader state](#), and the [sampleLocationsEnable](#) member of a [VkPipelineSampleLocationsStateCreateInfoEXT](#) structure included in the [pNext](#) chain of

`pMultisampleState` is `VK_TRUE`, the fragment shader code **must** not statically use the extended instruction `InterpolateAtSample`

- VUID-VkGraphicsPipelineCreateInfo-subpass-00758
If the pipeline requires `fragment output interface state`, `rasterizationSamples` is not dynamic, and `subpass` does not use any color and/or depth/stencil attachments, then the `rasterizationSamples` member of `pMultisampleState` **must** follow the rules for a `zero-attachment subpass`
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06046
If `renderPass` is not `VK_NULL_HANDLE`, `subpass` **must** be a valid subpass within `renderPass`
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06047
If `renderPass` is not `VK_NULL_HANDLE`, the pipeline is being created with `pre-rasterization shader state`, `subpass` `viewMask` is not `0`, and `multiviewTessellationShader` is not enabled, then `pStages` **must** not include tessellation shaders
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06048
If `renderPass` is not `VK_NULL_HANDLE`, the pipeline is being created with `pre-rasterization shader state`, `subpass` `viewMask` is not `0`, and `multiviewGeometryShader` is not enabled, then `pStages` **must** not include a geometry shader
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06050
If `renderPass` is not `VK_NULL_HANDLE` and the pipeline is being created with `pre-rasterization shader state`, and `subpass` `viewMask` is not `0`, then all of the shaders in the pipeline **must** not include variables decorated with the `Layer` built-in decoration in their interfaces
- VUID-VkGraphicsPipelineCreateInfo-flags-00764
`flags` **must** not contain the `VK_PIPELINE_CREATE_DISPATCH_BASE_BIT` flag
- VUID-VkGraphicsPipelineCreateInfo-pStages-01565
If the pipeline requires `fragment shader state` and an input attachment was referenced by an `aspectMask` at `renderPass` creation time, the fragment shader **must** only read from the aspects that were specified for that input attachment
- VUID-VkGraphicsPipelineCreateInfo-layout-01688
The number of resources in `layout` accessible to each shader stage that is used by the pipeline **must** be less than or equal to `VkPhysicalDeviceLimits::maxPerStageResources`
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04058
If the pipeline requires `pre-rasterization shader state`, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT`, and if `pNext` chain includes a `VkPipelineDiscardRectangleStateCreateInfoEXT` structure, and if its `discardRectangleCount` member is not `0`, then its `pDiscardRectangles` member **must** be a valid pointer to an array of `discardRectangleCount` `VkRect2D` structures
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07855
If `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` is included in the `pDynamicStates` array then the implementation **must** support at least `specVersion 2` of the `VK_EXT_discard_rectangles` extension
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07856
If `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` is included in the `pDynamicStates` array

then the implementation **must** support at least `specVersion 2` of the `VK_EXT_discard_rectangles` extension

- VUID-VkGraphicsPipelineCreateInfo-pStages-02097

If the pipeline requires `vertex input state`, and `pVertexInputState` is not dynamic, then `pVertexInputState` **must** be a valid pointer to a valid `VkPipelineVertexInputStateCreateInfo` structure

- VUID-VkGraphicsPipelineCreateInfo-Input-07904

If the pipeline is being created with `vertex input state` and `pVertexInputState` is not dynamic, then all variables with the `Input` storage class decorated with `Location` in the `Vertex Execution Model OpEntryPoint` **must** contain a location in `VkVertexInputAttributeDescription::location`

- VUID-VkGraphicsPipelineCreateInfo-Input-08733

If the pipeline requires `vertex input state` and `pVertexInputState` is not dynamic, then the numeric type associated with all `Input` variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` **must** be the same as `VkVertexInputAttributeDescription::format`

- VUID-VkGraphicsPipelineCreateInfo-pVertexInputState-08929

If the pipeline is being created with `vertex input state` and `pVertexInputState` is not dynamic, and `VkVertexInputAttributeDescription::format` has a 64-bit component, then the scalar width associated with all `Input` variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` **must** be 64-bit

- VUID-VkGraphicsPipelineCreateInfo-pVertexInputState-08930

If the pipeline is being created with `vertex input state` and `pVertexInputState` is not dynamic, and the scalar width associated with a `Location` decorated `Input` variable in the `Vertex Execution Model OpEntryPoint` is 64-bit, then the corresponding `VkVertexInputAttributeDescription::format` **must** have a 64-bit component

- VUID-VkGraphicsPipelineCreateInfo-pVertexInputState-09198

If the pipeline is being created with `vertex input state` and `pVertexInputState` is not dynamic, and `VkVertexInputAttributeDescription::format` has a 64-bit component, then all `Input` variables at the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` **must** not use components that are not present in the format

- VUID-VkGraphicsPipelineCreateInfo-dynamicPrimitiveTopologyUnrestricted-09031

If the pipeline requires `vertex input state`, `pInputAssemblyState` **must** be a valid pointer to a valid `VkPipelineInputAssemblyStateCreateInfo` structure

- VUID-VkGraphicsPipelineCreateInfo-pInputAssemblyState-09032

If `pInputAssemblyState` is not `NULL` it **must** be a valid pointer to a valid `VkPipelineInputAssemblyStateCreateInfo` structure

- VUID-VkGraphicsPipelineCreateInfo-lineRasterizationMode-02766

If the pipeline requires `pre-rasterization shader state` and at least one of `fragment output interface state` or `fragment shader state`, and `pMultisampleState` is not `NULL`, the `lineRasterizationMode` member of a `VkPipelineRasterizationLineStateCreateInfo` structure included in the `pNext` chain of `pRasterizationState` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM` or `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH`, then the `alphaToCoverageEnable`, `alphaToOneEnable`, and `sampleShadingEnable` members of

`pMultisampleState` **must** all be `VK_FALSE`

- VUID-VkGraphicsPipelineCreateInfo-stippledLineEnable-02767

If the pipeline requires `pre-rasterization shader state`, the `stippledLineEnable` member of `VkPipelineRasterizationLineStateCreateInfo` is `VK_TRUE`, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_LINE_STIPPLE`, then the `lineStippleFactor` member of `VkPipelineRasterizationLineStateCreateInfo` **must** be in the range [1,256]

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03378

If the `extendedDynamicState` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_CULL_MODE`, `VK_DYNAMIC_STATE_FRONT_FACE`, `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY`, `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT`, `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT`, `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE`, `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE`, `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE`, `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP`, `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE`, `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE`, or `VK_DYNAMIC_STATE_STENCIL_OP`

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03379

If the pipeline requires `pre-rasterization shader state`, and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` is included in the `pDynamicStates` array then `viewportCount` **must** be zero

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03380

If the pipeline requires `pre-rasterization shader state`, and `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` is included in the `pDynamicStates` array then `scissorCount` **must** be zero

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04132

If the pipeline requires `pre-rasterization shader state`, and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` is included in the `pDynamicStates` array then `VK_DYNAMIC_STATE_VIEWPORT` **must** not be present

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04133

If the pipeline requires `pre-rasterization shader state`, and `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` is included in the `pDynamicStates` array then `VK_DYNAMIC_STATE_SCISSOR` **must** not be present

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04868

If the `extendedDynamicState2` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE`, `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE`, or `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE`

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04869

If the `extendedDynamicState2LogicOp` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_LOGIC_OP_EXT`

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04870

If the `extendedDynamicState2PatchControlPoints` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT`

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04494
If the pipeline requires [pre-rasterization shader state](#) or [fragment shader state](#) and [VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR](#) is not included in `pDynamicState->pDynamicStates`, [VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width](#) **must** be greater than or equal to 1
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04495
If the pipeline requires [pre-rasterization shader state](#) or [fragment shader state](#) and [VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR](#) is not included in `pDynamicState->pDynamicStates`, [VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height](#) **must** be greater than or equal to 1
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04496
If the pipeline requires [pre-rasterization shader state](#) or [fragment shader state](#) and [VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR](#) is not included in `pDynamicState->pDynamicStates`, [VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width](#) **must** be a power-of-two value
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04497
If the pipeline requires [pre-rasterization shader state](#) or [fragment shader state](#) and [VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR](#) is not included in `pDynamicState->pDynamicStates`, [VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height](#) **must** be a power-of-two value
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04498
If the pipeline requires [pre-rasterization shader state](#) or [fragment shader state](#) and [VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR](#) is not included in `pDynamicState->pDynamicStates`, [VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width](#) **must** be less than or equal to 4
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04499
If the pipeline requires [pre-rasterization shader state](#) or [fragment shader state](#) and [VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR](#) is not included in `pDynamicState->pDynamicStates`, [VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height](#) **must** be less than or equal to 4
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04500
If the pipeline requires [pre-rasterization shader state](#) or [fragment shader state](#) and [VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR](#) is not included in `pDynamicState->pDynamicStates`, and the [pipelineFragmentShadingRate](#) feature is not enabled, [VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width](#) and [VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height](#) **must** both be equal to 1
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06567
If the pipeline requires [pre-rasterization shader state](#) or [fragment shader state](#) and [VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR](#) is not included in `pDynamicState->pDynamicStates`, [VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps\[0\]](#) **must** be a valid [VkFragmentShadingRateCombinerOpKHR](#) value
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06568
If the pipeline requires [pre-rasterization shader state](#) or [fragment shader state](#) and [VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR](#) is not included in `pDynamicState->pDynamicStates`, [VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps\[0\]](#) **must** be a valid [VkFragmentShadingRateCombinerOpKHR](#) value

`>pDynamicStates`, `VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[1]` **must** be a valid `VkFragmentShadingRateCombinerOpKHR` value

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04501

If the pipeline requires `pre-rasterization shader state` or `fragment shader state` and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, and the `primitiveFragmentShadingRate` feature is not enabled, `VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[0]` **must** be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04502

If the pipeline requires `pre-rasterization shader state` or `fragment shader state` and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, and the `attachmentFragmentShadingRate` feature is not enabled, `VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[1]` **must** be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`

- VUID-VkGraphicsPipelineCreateInfo-primitiveFragmentShadingRateWithMultipleViewports-04503

If the pipeline requires `pre-rasterization shader state` and the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` is not included in `pDynamicState->pDynamicStates`, and `VkPipelineViewportStateCreateInfo::viewportCount` is greater than 1, entry points specified in `pStages` **must** not write to the `PrimitiveShadingRateKHR` built-in

- VUID-VkGraphicsPipelineCreateInfo-primitiveFragmentShadingRateWithMultipleViewports-04504

If the pipeline requires `pre-rasterization shader state` and the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, and entry points specified in `pStages` write to the `ViewportIndex` built-in, they **must** not also write to the `PrimitiveShadingRateKHR` built-in

- VUID-VkGraphicsPipelineCreateInfo-fragmentShadingRateNonTrivialCombinerOps-04506

If the pipeline requires `pre-rasterization shader state` or `fragment shader state`, the `fragmentShadingRateNonTrivialCombinerOps` limit is not supported, and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, elements of `VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps` **must** be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` or `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR`

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04807

If the pipeline requires `pre-rasterization shader state` and the `vertexInputDynamicState` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT`

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04800

If the `colorWriteEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT`

- VUID-VkGraphicsPipelineCreateInfo-pStages-06600

If the pipeline requires `pre-rasterization shader state` or `fragment shader state`, `pStages` **must** be a valid pointer to an array of `stageCount` valid `VkPipelineShaderStageCreateInfo` structures

- VUID-VkGraphicsPipelineCreateInfo-stageCount-09587
If the pipeline does not require [pre-rasterization shader state](#) or [fragment shader state](#), **stageCount** **must** be zero
- VUID-VkGraphicsPipelineCreateInfo-pRasterizationState-06601
If the pipeline requires [pre-rasterization shader state](#), **pRasterizationState** **must** be a valid pointer to a valid [VkPipelineRasterizationStateCreateInfo](#) structure
- VUID-VkGraphicsPipelineCreateInfo-layout-06602
If the pipeline requires [fragment shader state](#) or [pre-rasterization shader state](#), **layout** **must** be a valid [VkPipelineLayout](#) handle
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06603
If the pipeline requires [pre-rasterization shader state](#), [fragment shader state](#), or [fragment output state](#), **renderPass** **must** be a valid [VkRenderPass](#) handle
- VUID-VkGraphicsPipelineCreateInfo-stageCount-09530
If the pipeline requires [pre-rasterization shader state](#), **stageCount** **must** be greater than 0
- VUID-VkGraphicsPipelineCreateInfo-conservativePointAndLineRasterization-08892
If **conservativePointAndLineRasterization** is not supported and the [effective rasterization input topology](#) is in line or point topology class, then [VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode](#) **must** be **VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT**
- VUID-VkGraphicsPipelineCreateInfo-pStages-06894
If the pipeline requires [pre-rasterization shader state](#) but not [fragment shader state](#), elements of **pStages** **must** not have **stage** set to **VK_SHADER_STAGE_FRAGMENT_BIT**
- VUID-VkGraphicsPipelineCreateInfo-pStages-06895
If the pipeline requires [fragment shader state](#) but not [pre-rasterization shader state](#), elements of **pStages** **must** not have **stage** set to a shader stage which participates in pre-rasterization
- VUID-VkGraphicsPipelineCreateInfo-pStages-06896
If the pipeline requires [pre-rasterization shader state](#), all elements of **pStages** **must** have a **stage** set to a shader stage which participates in [fragment shader state](#) or [pre-rasterization shader state](#)
- VUID-VkGraphicsPipelineCreateInfo-stage-06897
If the pipeline requires [fragment shader state](#) and/or [pre-rasterization shader state](#), any value of **stage** **must** not be set in more than one element of **pStages**
- VUID-VkGraphicsPipelineCreateInfo-None-08893
The pipeline **must** be created with [pre-rasterization shader state](#)
- VUID-VkGraphicsPipelineCreateInfo-pStages-08894
If **pStages** includes a vertex shader stage, the pipeline **must** be created with [vertex input state](#)
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-08896
If **pDynamicState->pDynamicStates** includes **VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE**, or if it does not and **pRasterizationState->rasterizerDiscardEnable** is **VK_FALSE**, the pipeline **must** be created with [fragment shader state](#) and [fragment output interface state](#)
- VUID-VkGraphicsPipelineCreateInfo-None-09043

If the format of any color attachment is `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`, the `colorWriteMask` member of the corresponding element of `pColorBlendState->pAttachments` **must** either include all of `VK_COLOR_COMPONENT_R_BIT`, `VK_COLOR_COMPONENT_G_BIT`, and `VK_COLOR_COMPONENT_B_BIT`, or none of them

Valid Usage (Implicit)

- `VUID-VkGraphicsPipelineCreateInfo-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_CREATE_INFO`
- `VUID-VkGraphicsPipelineCreateInfo-pNext-pNext`
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkPipelineDiscardRectangleStateCreateInfoEXT`, `VkPipelineFragmentShadingRateStateCreateInfoKHR`, or `VkPipelineOfflineCreateInfo`
- `VUID-VkGraphicsPipelineCreateInfo-sType-unique`
The `sType` value of each structure in the `pNext` chain **must** be unique
- `VUID-VkGraphicsPipelineCreateInfo-pDynamicState-parameter`
If `pDynamicState` is not `NULL`, `pDynamicState` **must** be a valid pointer to a valid `VkPipelineDynamicStateCreateInfo` structure
- `VUID-VkGraphicsPipelineCreateInfo-commonparent`
Each of `basePipelineHandle`, `layout`, and `renderPass` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

The `VkPipelineDynamicStateCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineDynamicStateCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkPipelineDynamicStateCreateFlags flags;
    uint32_t           dynamicStateCount;
    const VkDynamicState* pDynamicStates;
} VkPipelineDynamicStateCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `dynamicStateCount` is the number of elements in the `pDynamicStates` array.
- `pDynamicStates` is a pointer to an array of `VkDynamicState` values specifying which pieces of pipeline state will use the values from dynamic state commands rather than from pipeline state creation information.

Valid Usage

- VUID-VkPipelineDynamicStateCreateInfo-pDynamicStates-01442
Each element of `pDynamicStates` **must** be unique

Valid Usage (Implicit)

- VUID-VkPipelineDynamicStateCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_DYNAMIC_STATE_CREATE_INFO`
- VUID-VkPipelineDynamicStateCreateInfo-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkPipelineDynamicStateCreateInfo-flags-zeroBitmask
`flags` **must** be `0`
- VUID-VkPipelineDynamicStateCreateInfo-pDynamicStates-parameter
If `dynamicStateCount` is not `0`, `pDynamicStates` **must** be a valid pointer to an array of `dynamicStateCount` valid `VkDynamicState` values

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineDynamicStateCreateFlags;
```

`VkPipelineDynamicStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

The source of different pieces of dynamic state is specified by the `VkPipelineDynamicStateCreateInfo::pDynamicStates` property of the currently active pipeline, each of whose elements **must** be one of the values:

```
// Provided by VK_VERSION_1_0
typedef enum VkDynamicState {
    VK_DYNAMIC_STATE_VIEWPORT = 0,
    VK_DYNAMIC_STATE_SCISSOR = 1,
    VK_DYNAMIC_STATE_LINE_WIDTH = 2,
    VK_DYNAMIC_STATE_DEPTH_BIAS = 3,
    VK_DYNAMIC_STATE_BLEND_CONSTANTS = 4,
    VK_DYNAMIC_STATE_DEPTH_BOUNDS = 5,
    VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK = 6,
    VK_DYNAMIC_STATE_STENCIL_WRITE_MASK = 7,
    VK_DYNAMIC_STATE_STENCIL_REFERENCE = 8,
    VK_DYNAMIC_STATE_CULL_MODE = 1000267000,
    VK_DYNAMIC_STATE_FRONT_FACE = 1000267001,
    VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY = 1000267002,
    VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT = 1000267003,
    VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT = 1000267004,
    VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE = 1000267005,
```

```

VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE = 1000267006,
VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE = 1000267007,
VK_DYNAMIC_STATE_DEPTH_COMPARE_OP = 1000267008,
VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE = 1000267009,
VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE = 1000267010,
VK_DYNAMIC_STATE_STENCIL_OP = 1000267011,
VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE = 1000377001,
VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE = 1000377002,

// Provided by VK_EXT_extended_dynamic_state2
VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT =
VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE,
// Provided by VK_KHR_line_rasterization
VK_DYNAMIC_STATE_LINE_STIPPLE_KHR = VK_DYNAMIC_STATE_LINE_STIPPLE,
} VkDynamicState;

```

- **VK_DYNAMIC_STATE_VIEWPORT** specifies that the **pViewports** state in **VkPipelineViewportStateCreateInfo** will be ignored and **must** be set dynamically with **vkCmdSetViewport** before any drawing commands. The number of viewports used by a pipeline is still specified by the **viewportCount** member of **VkPipelineViewportStateCreateInfo**.
- **VK_DYNAMIC_STATE_SCISSOR** specifies that the **pScissors** state in **VkPipelineViewportStateCreateInfo** will be ignored and **must** be set dynamically with **vkCmdSetScissor** before any drawing commands. The number of scissor rectangles used by a pipeline is still specified by the **scissorCount** member of **VkPipelineViewportStateCreateInfo**.
- **VK_DYNAMIC_STATE_LINE_WIDTH** specifies that the **lineWidth** state in **VkPipelineRasterizationStateCreateInfo** will be ignored and **must** be set dynamically with **vkCmdSetLineWidth** before any drawing commands that generate line primitives for the rasterizer.
- **VK_DYNAMIC_STATE_DEPTH_BIAS** specifies that the **depthBiasConstantFactor**, **depthBiasClamp** and **depthBiasSlopeFactor** states in **VkPipelineRasterizationStateCreateInfo** will be ignored and **must** be set dynamically with **vkCmdSetDepthBias** before any draws are performed with **depth bias enabled**.
- **VK_DYNAMIC_STATE_BLEND_CONSTANTS** specifies that the **blendConstants** state in **VkPipelineColorBlendStateCreateInfo** will be ignored and **must** be set dynamically with **vkCmdSetBlendConstants** before any draws are performed with a pipeline state with **VkPipelineColorBlendAttachmentState** member **blendEnable** set to **VK_TRUE** and any of the blend functions using a constant blend color.
- **VK_DYNAMIC_STATE_DEPTH_BOUNDS** specifies that the **minDepthBounds** and **maxDepthBounds** states of **VkPipelineDepthStencilStateCreateInfo** will be ignored and **must** be set dynamically with **vkCmdSetDepthBounds** before any draws are performed with a pipeline state with **VkPipelineDepthStencilStateCreateInfo** member **depthBoundsTestEnable** set to **VK_TRUE**.
- **VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK** specifies that the **compareMask** state in **VkPipelineDepthStencilStateCreateInfo** for both **front** and **back** will be ignored and **must** be set dynamically with **vkCmdSetStencilCompareMask** before any draws are performed with a pipeline state with **VkPipelineDepthStencilStateCreateInfo** member **stencilTestEnable** set to

VK_TRUE

- **VK_DYNAMIC_STATE_STENCIL_WRITE_MASK** specifies that the **writeMask** state in **VkPipelineDepthStencilStateCreateInfo** for both **front** and **back** will be ignored and **must** be set dynamically with **vkCmdSetStencilWriteMask** before any draws are performed with a pipeline state with **VkPipelineDepthStencilStateCreateInfo** member **stencilTestEnable** set to **VK_TRUE**
- **VK_DYNAMIC_STATE_STENCIL_REFERENCE** specifies that the **reference** state in **VkPipelineDepthStencilStateCreateInfo** for both **front** and **back** will be ignored and **must** be set dynamically with **vkCmdSetStencilReference** before any draws are performed with a pipeline state with **VkPipelineDepthStencilStateCreateInfo** member **stencilTestEnable** set to **VK_TRUE**
- **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT** specifies that the **pDiscardRectangles** state in **VkPipelineDiscardRectangleStateCreateInfoEXT** will be ignored and **must** be set dynamically with **vkCmdSetDiscardRectangleEXT** before any draw or clear commands.
- **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT** specifies that the presence of the **VkPipelineDiscardRectangleStateCreateInfoEXT** structure in the **VkGraphicsPipelineCreateInfo** chain with a **discardRectangleCount** greater than zero does not implicitly enable discard rectangles and they **must** be enabled dynamically with **vkCmdSetDiscardRectangleEnableEXT** before any draw commands. This is available on implementations that support at least **specVersion 2** of the **VK_EXT_discard_rectangles** extension.
- **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT** specifies that the **discardRectangleMode** state in **VkPipelineDiscardRectangleStateCreateInfoEXT** will be ignored and **must** be set dynamically with **vkCmdSetDiscardRectangleModeEXT** before any draw commands. This is available on implementations that support at least **specVersion 2** of the **VK_EXT_discard_rectangles** extension.
- **VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT** specifies that the **sampleLocationsInfo** state in **VkPipelineSampleLocationsStateCreateInfoEXT** will be ignored and **must** be set dynamically with **vkCmdSetSampleLocationsEXT** before any draw or clear commands. Enabling custom sample locations is still indicated by the **sampleLocationsEnable** member of **VkPipelineSampleLocationsStateCreateInfoEXT**.
- **VK_DYNAMIC_STATE_LINE_STIPPLE** specifies that the **lineStippleFactor** and **lineStipplePattern** state in **VkPipelineRasterizationLineStateCreateInfo** will be ignored and **must** be set dynamically with **vkCmdSetLineStippleKHR** before any draws are performed with a pipeline state with **VkPipelineRasterizationLineStateCreateInfo** member **stippledLineEnable** set to **VK_TRUE**.
- **VK_DYNAMIC_STATE_CULL_MODE** specifies that the **cullMode** state in **VkPipelineRasterizationStateCreateInfo** will be ignored and **must** be set dynamically with **vkCmdSetCullModeEXT** before any drawing commands.
- **VK_DYNAMIC_STATE_FRONT_FACE** specifies that the **frontFace** state in **VkPipelineRasterizationStateCreateInfo** will be ignored and **must** be set dynamically with **vkCmdSetFrontFaceEXT** before any drawing commands.
- **VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY** specifies that the **topology** state in **VkPipelineInputAssemblyStateCreateInfo** only specifies the **topology class**, and the specific topology order and adjacency **must** be set dynamically with **vkCmdSetPrimitiveTopologyEXT** before any drawing commands.
- **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** specifies that the **viewportCount** and **pViewports** state in **VkPipelineViewportStateCreateInfo** will be ignored and **must** be set dynamically with

`vkCmdSetViewportWithCountEXT` before any draw call.

- `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` specifies that the `scissorCount` and `pScissors` state in `VkPipelineViewportStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetScissorWithCountEXT` before any draw call.
- `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE` specifies that the `stride` state in `VkVertexInputBindingDescription` will be ignored and **must** be set dynamically with `vkCmdBindVertexBuffers2EXT` before any draw call.
- `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` specifies that the `depthTestEnable` state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthTestEnableEXT` before any draw call.
- `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` specifies that the `depthWriteEnable` state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthWriteEnableEXT` before any draw call.
- `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` specifies that the `depthCompareOp` state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthCompareOpEXT` before any draw call.
- `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` specifies that the `depthBoundsTestEnable` state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthBoundsTestEnableEXT` before any draw call.
- `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` specifies that the `stencilTestEnable` state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetStencilTestEnableEXT` before any draw call.
- `VK_DYNAMIC_STATE_STENCIL_OP` specifies that the `failOp`, `passOp`, `depthFailOp`, and `compareOp` states in `VkPipelineDepthStencilStateCreateInfo` for both `front` and `back` will be ignored and **must** be set dynamically with `vkCmdSetStencilOpEXT` before any draws are performed with a pipeline state with `VkPipelineDepthStencilStateCreateInfo` member `stencilTestEnable` set to `VK_TRUE`.
- `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` specifies that the `patchControlPoints` state in `VkPipelineTessellationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetPatchControlPointsEXT` before any drawing commands.
- `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` specifies that the `rasterizerDiscardEnable` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetRasterizerDiscardEnableEXT` before any drawing commands.
- `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` specifies that the `depthBiasEnable` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthBiasEnableEXT` before any drawing commands.
- `VK_DYNAMIC_STATE_LOGIC_OP_EXT` specifies that the `logicOp` state in `VkPipelineColorBlendStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetLogicOpEXT` before any drawing commands.
- `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` specifies that the `primitiveRestartEnable` state in `VkPipelineInputAssemblyStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetPrimitiveRestartEnableEXT` before any drawing commands.
- `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` specifies that state in

`VkPipelineFragmentShadingRateStateCreateInfoKHR` will be ignored and **must** be set dynamically with `vkCmdSetFragmentShadingRateKHR` before any drawing commands.

- `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` specifies that the `pVertexInputState` state will be ignored and **must** be set dynamically with `vkCmdSetVertexInputEXT` before any drawing commands
- `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` specifies that the `pColorWriteEnables` state in `VkPipelineColorWriteCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetColorWriteEnableEXT` before any draw call.

10.4.1. Valid Combinations of Stages for Graphics Pipelines

If tessellation shader stages are omitted, the tessellation shading and fixed-function stages of the pipeline are skipped.

If a geometry shader is omitted, the geometry shading stage is skipped.

If a fragment shader is omitted, fragment color outputs have undefined values, and the fragment depth value is determined by `Fragment Operations` state. This **can** be useful for depth-only rendering.

Presence of a shader stage in a pipeline is derived from the `pipeline cache` entry identified by `VkPipelineOfflineCreateInfo::pipelineIdentifier`.

Presence of some of the fixed-function stages in the pipeline is implicitly derived from enabled shaders and provided state. For example, the fixed-function tessellator is always present when the pipeline has valid Tessellation Control and Tessellation Evaluation shaders.

For example:

- Depth/stencil-only rendering in a subpass with no color attachments
 - Active Pipeline Shader Stages
 - Vertex Shader
 - Required: Fixed-Function Pipeline Stages
 - `VkPipelineVertexInputStateCreateInfo`
 - `VkPipelineInputAssemblyStateCreateInfo`
 - `VkPipelineViewportStateCreateInfo`
 - `VkPipelineRasterizationStateCreateInfo`
 - `VkPipelineMultisampleStateCreateInfo`
 - `VkPipelineDepthStencilStateCreateInfo`
- Color-only rendering in a subpass with no depth/stencil attachment
 - Active Pipeline Shader Stages
 - Vertex Shader
 - Fragment Shader
 - Required: Fixed-Function Pipeline Stages

- [VkPipelineVertexInputStateCreateInfo](#)
- [VkPipelineInputAssemblyStateCreateInfo](#)
- [VkPipelineViewportStateCreateInfo](#)
- [VkPipelineRasterizationStateCreateInfo](#)
- [VkPipelineMultisampleStateCreateInfo](#)
- [VkPipelineColorBlendStateCreateInfo](#)
- Rendering pipeline with tessellation and geometry shaders
 - Active Pipeline Shader Stages
 - Vertex Shader
 - Tessellation Control Shader
 - Tessellation Evaluation Shader
 - Geometry Shader
 - Fragment Shader
 - Required: Fixed-Function Pipeline Stages
 - [VkPipelineVertexInputStateCreateInfo](#)
 - [VkPipelineInputAssemblyStateCreateInfo](#)
 - [VkPipelineTessellationStateCreateInfo](#)
 - [VkPipelineViewportStateCreateInfo](#)
 - [VkPipelineRasterizationStateCreateInfo](#)
 - [VkPipelineMultisampleStateCreateInfo](#)
 - [VkPipelineDepthStencilStateCreateInfo](#)
 - [VkPipelineColorBlendStateCreateInfo](#)

10.5. Pipeline Destruction

To destroy a pipeline, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyPipeline(
    VkDevice          device,
    VkPipeline        pipeline,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the pipeline.
- **pipeline** is the handle of the pipeline to destroy.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroyPipeline-pipeline-00765
All submitted commands that refer to **pipeline** **must** have completed execution

Valid Usage (Implicit)

- VUID-vkDestroyPipeline-device-parameter
device **must** be a valid **VkDevice** handle
- VUID-vkDestroyPipeline-pipeline-parameter
If **pipeline** is not **VK_NULL_HANDLE**, **pipeline** **must** be a valid **VkPipeline** handle
- VUID-vkDestroyPipeline-pAllocator-null
pAllocator **must** be **NULL**
- VUID-vkDestroyPipeline-pipeline-parent
If **pipeline** is a valid handle, it **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **pipeline** **must** be externally synchronized

10.6. Pipeline Derivatives

A pipeline derivative is a child pipeline created from a parent pipeline, where the child and parent are expected to have much commonality.

Pipeline derivatives are not supported in Vulkan SC due to the use of read-only offline generated pipeline caches [SCID-8].

10.7. Pipeline Cache

Pipeline cache objects allow the application to load multiple binary pipeline objects generated by an offline cache creation tool into pipeline cache objects. The cache can then be used during pipeline creation to load offline pipeline data.

Pipeline cache objects are represented by **VkPipelineCache** handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipelineCache)
```

10.7.1. Creating a Pipeline Cache

To create pipeline cache objects, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreatePipelineCache(
    VkDevice                                device,
    const VkPipelineCacheCreateInfo*        pCreateInfo,
    const VkAllocationCallbacks*           pAllocator,
    VkPipelineCache*                        pPipelineCache);
```

- **device** is the logical device that creates the pipeline cache object.
- **pCreateInfo** is a pointer to a [VkPipelineCacheCreateInfo](#) structure containing initial parameters for the pipeline cache object.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.
- **pPipelineCache** is a pointer to a [VkPipelineCache](#) handle in which the resulting pipeline cache object is returned.

If the pipeline cache data pointed to by [VkPipelineCacheCreateInfo::pInitialData](#) is not compatible with the device, pipeline cache creation will fail and **VK_ERROR_INVALID_PIPELINE_CACHE_DATA** will be returned.

Once created, a pipeline cache **can** be passed to the [vkCreateGraphicsPipelines](#) and [vkCreateComputePipelines](#) commands. The pipeline cache passed into these commands will be queried by the implementation for matching pipelines on pipeline creation. After the cache is created, its contents cannot be updated. The use of the pipeline cache object in these commands is internally synchronized, and the same pipeline cache object **can** be used in multiple threads simultaneously.

If [VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations](#) is **VK_TRUE**, [vkCreatePipelineCache](#) **must** not return **VK_ERROR_OUT_OF_HOST_MEMORY**.

Valid Usage

- VUID-vkCreatePipelineCache-pCreateInfo-05045
The values of the **flags**, **initialDataSize**, and **pInitialData** members of the structure pointed to by **pCreateInfo** and the data pointed to by **pCreateInfo->pInitialData** **must** be the same as specified in one of the elements of the **pPipelineCacheCreateInfos** array member of a [VkDeviceObjectReservationCreateInfo](#) structure specified in the **pNext** chain of the [VkDeviceCreateInfo](#) structure **device** was created with
- VUID-vkCreatePipelineCache-device-05068
The number of pipeline caches currently allocated from **device** plus 1 **must** be less than or equal to the total number of pipeline caches requested via [VkDeviceObjectReservationCreateInfo::pipelineCacheRequestCount](#) specified when **device** was created

Valid Usage (Implicit)

- VUID-vkCreatePipelineCache-device-parameter
device must be a valid [VkDevice](#) handle
- VUID-vkCreatePipelineCache-pCreateInfo-parameter
pCreateInfo must be a valid pointer to a valid [VkPipelineCacheCreateInfo](#) structure
- VUID-vkCreatePipelineCache-pAllocator-null
pAllocator must be **NULL**
- VUID-vkCreatePipelineCache-pPipelineCache-parameter
pPipelineCache must be a valid pointer to a [VkPipelineCache](#) handle

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_INVALID_PIPELINE_CACHE_DATA**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_UNKNOWN**
- **VK_ERROR_VALIDATION_FAILED**

The [VkPipelineCacheCreateInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineCacheCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkPipelineCacheCreateFlags flags;
    size_t              initialDataSize;
    const void*        pInitialData;
} VkPipelineCacheCreateInfo;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of [VkPipelineCacheCreateFlagBits](#) specifying the behavior of the pipeline cache.
- **initialDataSize** is the number of bytes in **pInitialData**.
- **pInitialData** is a pointer to pipeline cache data that has been generated offline. If the pipeline cache data is incompatible (as defined below) with the device,

`VK_ERROR_INVALID_PIPELINE_CACHE_DATA` is returned. If `VK_PIPELINE_CACHE_CREATE_USE_APPLICATION_STORAGE_BIT` is set in `flags`, `pInitialData` **may** only be accessed by the implementation during commands using the `VkPipelineCache` object.

NOTE

If `VK_PIPELINE_CACHE_CREATE_USE_APPLICATION_STORAGE_BIT` is set, the memory pointed to by `pInitialData` **can** be modified or released by the application only after any pipeline cache objects created using it have been destroyed.

Valid Usage

- VUID-VkPipelineCacheCreateInfo-flags-05043
`flags` **must** include `VK_PIPELINE_CACHE_CREATE_READ_ONLY_BIT`
- VUID-VkPipelineCacheCreateInfo-flags-05044
`flags` **must** include `VK_PIPELINE_CACHE_CREATE_USE_APPLICATION_STORAGE_BIT`
- VUID-VkPipelineCacheCreateInfo-pInitialData-05139
The pipeline cache data pointed to by `pInitialData` **must** not contain any pipelines with duplicate pipeline identifiers

Valid Usage (Implicit)

- VUID-VkPipelineCacheCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_CACHE_CREATE_INFO`
- VUID-VkPipelineCacheCreateInfo-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkPipelineCacheCreateInfo-flags-parameter
`flags` **must** be a valid combination of `VkPipelineCacheCreateFlagBits` values
- VUID-VkPipelineCacheCreateInfo-pInitialData-parameter
`pInitialData` **must** be a valid pointer to an array of `initialDataSize` bytes
- VUID-VkPipelineCacheCreateInfo-initialDataSize-arraylength
`initialDataSize` **must** be greater than `0`

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineCacheCreateFlags;
```

`VkPipelineCacheCreateFlags` is a bitmask type for setting a mask of zero or more `VkPipelineCacheCreateFlagBits`.

Bits which **can** be set in `VkPipelineCacheCreateInfo::flags`, specifying behavior of the pipeline cache, are:

```
// Provided by VKSC_VERSION_1_0
typedef enum VkPipelineCacheCreateFlagBits {
    // Provided by VKSC_VERSION_1_0
    VK_PIPELINE_CACHE_CREATE_READ_ONLY_BIT = 0x00000002,
    // Provided by VKSC_VERSION_1_0
    VK_PIPELINE_CACHE_CREATE_USE_APPLICATION_STORAGE_BIT = 0x00000004,
} VkPipelineCacheCreateFlagBits;
```

- `VK_PIPELINE_CACHE_CREATE_READ_ONLY_BIT` specifies that the new pipeline cache will be read-only.
- `VK_PIPELINE_CACHE_CREATE_USE_APPLICATION_STORAGE_BIT` specifies that the application will maintain the contents of the memory pointed to by `pInitialData` for the lifetime of the pipeline cache object created, avoiding the need for the implementation to make a copy of the data. The memory pointed to by `pInitialData` **can** be modified or released by the application only after any pipeline cache objects created using it have been destroyed.

10.7.2. Pipeline Cache Header

Applications **must** load data from [offline compiled](#) pipeline caches into pipeline cache objects. The results of pipeline compilations **may** depend on the vendor ID, device ID, driver version, and other details of the target device. To allow detection of pipeline cache data that is incompatible with the device, the pipeline cache data **must** begin with a valid pipeline cache header.

NOTE

Structures described in this section are not part of the Vulkan API and are only used to describe the representation of data elements in pipeline cache data. Accordingly, the valid usage clauses defined for structures defined in this section do not define valid usage conditions for APIs accepting pipeline cache data as input, as providing invalid pipeline cache data as input to any Vulkan API commands will result in the runtime error `VK_ERROR_INVALID_PIPELINE_CACHE_DATA`.

Version one of the pipeline cache header is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineCacheHeaderVersionOne {
    uint32_t          headerSize;
    VkPipelineCacheHeaderVersion headerVersion;
    uint32_t          vendorID;
    uint32_t          deviceID;
    uint8_t           pipelineCacheUUID[VK_UUID_SIZE];
} VkPipelineCacheHeaderVersionOne;
```

- `headerSize` is the length in bytes of the pipeline cache header.
- `headerVersion` is a `VkPipelineCacheHeaderVersion` value specifying the version of the header. A consumer of the pipeline cache **should** use the cache version to interpret the remainder of the cache header. `headerVersion` **must** be written as exactly 4 bytes.
- `vendorID` is the `VkPhysicalDeviceProperties::vendorID` of the implementation.

- `deviceId` is the `VkPhysicalDeviceProperties::deviceId` of the implementation.
- `pipelineCacheUUID` is the `VkPhysicalDeviceProperties::pipelineCacheUUID` of the implementation.

Unlike most structures declared by the Vulkan API, all fields of this structure are written with the least significant byte first, regardless of host byte-order.

The C language specification does not define the packing of structure members. This layout assumes tight structure member packing, with members laid out in the order listed in the structure, and the intended size of the structure is 56 bytes. If a compiler produces code that diverges from that pattern, applications **must** employ another method to set values at the correct offsets.

Valid Usage

- VUID-VkPipelineCacheHeaderVersionOne-headerSize-05075
`headerSize` **must** be 56
- VUID-VkPipelineCacheHeaderVersionOne-headerVersion-05076
`headerVersion` **must** be `VK_PIPELINE_CACHE_HEADER_VERSION_SAFETY_CRITICAL_ONE`
- VUID-VkPipelineCacheHeaderVersionOne-headerSize-08990
`headerSize` **must** not exceed the size of the pipeline cache

Valid Usage (Implicit)

- VUID-VkPipelineCacheHeaderVersionOne-headerVersion-parameter
`headerVersion` **must** be a valid `VkPipelineCacheHeaderVersion` value

Possible values of the `headerVersion` value of the pipeline cache header are:

```
// Provided by VK_VERSION_1_0
typedef enum VkPipelineCacheHeaderVersion {
    VK_PIPELINE_CACHE_HEADER_VERSION_ONE = 1,
    // Provided by VKSC_VERSION_1_0
    VK_PIPELINE_CACHE_HEADER_VERSION_SAFETY_CRITICAL_ONE = 1000298001,
} VkPipelineCacheHeaderVersion;
```

- `VK_PIPELINE_CACHE_HEADER_VERSION_ONE` specifies version one of the pipeline cache, described by `VkPipelineCacheHeaderVersionOne`.
- `VK_PIPELINE_CACHE_HEADER_VERSION_SAFETY_CRITICAL_ONE` specifies version one of the pipeline cache for Vulkan SC, described by `VkPipelineCacheHeaderVersionSafetyCriticalOne`.

Version one of the pipeline cache header for Vulkan SC is defined as:

```
// Provided by VKSC_VERSION_1_0
typedef struct VkPipelineCacheHeaderVersionSafetyCriticalOne {
    VkPipelineCacheHeaderVersionOne    headerVersionOne;
    VkPipelineCacheValidationVersion    validationVersion;
    uint32_t                           implementationData;
    uint32_t                           pipelineIndexCount;
    uint32_t                           pipelineIndexStride;
    uint64_t                           pipelineIndexOffset;
} VkPipelineCacheHeaderVersionSafetyCriticalOne;
```

- `headerVersionOne` is a [VkPipelineCacheHeaderVersionOne](#) structure.
- `validationVersion` is a [VkPipelineCacheValidationVersion](#) enum value specifying the version of any validation information that is included in this pipeline cache. `validationVersion` **must** be written as exactly 4 bytes.
- `implementationData` is 4 bytes of padding to ensure structure members are consistently aligned on all platforms. The contents of this field **may** be used for implementation-specific information.
- `pipelineIndexCount` is the number of entries contained in the pipeline cache index.
- `pipelineIndexStride` is the number of bytes between consecutive pipeline cache index entries.
- `pipelineIndexOffset` is the offset in bytes from the beginning of the pipeline cache header to the pipeline cache index.

The [pipeline cache index](#) consists of `pipelineIndexCount` [VkPipelineCacheSafetyCriticalIndexEntry](#) structures containing an index of all the pipelines in this cache. The pipeline cache index is located starting at `pipelineIndexOffset` bytes into the cache and the location of pipeline `i` is calculated as: `pipelineIndexOffset + i × pipelineIndexStride`. The [VkPipelineCacheSafetyCriticalIndexEntry](#) structures **may** not be tightly packed, enabling additional implementation-specific data to be stored with each entry, or for future extensibility.

NOTE

Because the pipeline cache index is keyed by pipeline identifier, applications and offline compilers must ensure that there are no pipelines with identical pipeline identifiers in the same pipeline cache.

Unlike most structures declared by the Vulkan API, all fields of this structure are written with the least significant byte first, regardless of host byte-order.

The C language specification does not define the packing of structure members. This layout assumes tight structure member packing, with members laid out in the order listed in the structure, and the intended size of the structure is 56 bytes. If a compiler produces code that diverges from that pattern, applications **must** employ another method to set values at the correct offsets.

Valid Usage

- VUID-VkPipelineCacheHeaderVersionSafetyCriticalOne-validationVersion-05077
`validationVersion` **must** be `VK_PIPELINE_CACHE_VALIDATION_VERSION_SAFETY_CRITICAL_ONE`

- VUID-VkPipelineCacheHeaderVersionSafetyCriticalOne-pipelineIndexStride-05078 `pipelineIndexStride` **must** be greater than or equal to 56 (the size of the `VkPipelineCacheSafetyCriticalIndexEntry` structure)
- VUID-VkPipelineCacheHeaderVersionSafetyCriticalOne-pipelineIndexOffset-05079 `pipelineIndexOffset + pipelineIndexCount × pipelineIndexStride` **must** not exceed the size of the pipeline cache

Valid Usage (Implicit)

- VUID-VkPipelineCacheHeaderVersionSafetyCriticalOne-headerVersionOne-parameter `headerVersionOne` **must** be a valid `VkPipelineCacheHeaderVersionOne` structure
- VUID-VkPipelineCacheHeaderVersionSafetyCriticalOne-validationVersion-parameter `validationVersion` **must** be a valid `VkPipelineCacheValidationVersion` value

The `VkPipelineCacheValidationVersion` enumeration determines the contents of the pipeline cache validation information. Possible values are:

```
// Provided by VKSC_VERSION_1_0
typedef enum VkPipelineCacheValidationVersion {
    VK_PIPELINE_CACHE_VALIDATION_VERSION_SAFETY_CRITICAL_ONE = 1,
} VkPipelineCacheValidationVersion;
```

- `VK_PIPELINE_CACHE_VALIDATION_VERSION_SAFETY_CRITICAL_ONE` specifies version one of the pipeline cache validation information for Vulkan SC.

Each pipeline cache index entry consists of a `VkPipelineCacheSafetyCriticalIndexEntry` structure:

```
// Provided by VKSC_VERSION_1_0
typedef struct VkPipelineCacheSafetyCriticalIndexEntry {
    uint8_t      pipelineIdentifier[VK_UUID_SIZE];
    uint64_t     pipelineMemorySize;
    uint64_t     jsonSize;
    uint64_t     jsonOffset;
    uint32_t     stageIndexCount;
    uint32_t     stageIndexStride;
    uint64_t     stageIndexOffset;
} VkPipelineCacheSafetyCriticalIndexEntry;
```

- `pipelineIdentifier` is the `pipeline identifier` indicating which pipeline the information is associated with.
- `pipelineMemorySize` is the number of bytes of pipeline memory required for this pipeline. This is the minimum value that **can** be successfully used for `VkPipelineOfflineCreateInfo::poolEntrySize` when this pipeline is used.
- `jsonSize` is the size in bytes of the pipeline JSON data representing the pipeline state for this

pipeline. This value **may** be zero, indicating the JSON data is not present in the pipeline cache for this pipeline.

- **jsonOffset** is the offset in bytes from the beginning of the pipeline cache header to the pipeline JSON data for this pipeline. This value **must** be zero if the JSON data is not present in the pipeline cache for this pipeline.
- **stageIndexCount** is the number of entries in the pipeline cache stage validation index for this pipeline. This value **may** be zero, indicating that no stage validation information is present in the pipeline cache for this pipeline.
- **stageIndexStride** is the number of bytes between consecutive stage validation index entries.
- **stageIndexOffset** is the offset in bytes from the beginning of the pipeline cache header to the **stage validation index** for this pipeline. This value **must** be zero if no stage validation information is present for this pipeline.

The JSON data and the stage validation index are **optionally** included in the pipeline cache index entry. They are only intended to be used for validation and debugging. If present they **must** include both the JSON data and the corresponding SPIR-V modules that were used by the offline compiler to compile the pipeline cache entry.

The data at **jsonOffset** consists of a byte stream of **jsonSize** bytes of UTF-8 encoded JSON that was used by the **offline pipeline compiler** to create this pipeline cache entry.

The **stage validation index** consists of **stageIndexCount** **VkPipelineCacheStageValidationIndexEntry** structures which provide the SPIR-V modules used by this pipeline and these are provided in the same order as provided to the **VkPipelineShaderStageCreateInfo** structure(s) in the **Vk*PipelineCreateInfo** structure for this pipeline. The stage validation index is located at **stageIndexOffset** bytes into the cache and the location of stage **i** is calculated as: **stageIndexOffset + i × stageIndexStride**. The **VkPipelineCacheStageValidationIndexEntry** structures **may** not be tightly packed, enabling additional implementation-specific data to be stored with each entry, or for future extensibility.

Unlike most structures declared by the Vulkan API, all fields of this structure are written with the least significant byte first, regardless of host byte-order.

The C language specification does not define the packing of structure members. This layout assumes tight structure member packing, with members laid out in the order listed in the structure, and the intended size of the structure is 56 bytes. If a compiler produces code that diverges from that pattern, applications **must** employ another method to set values at the correct offsets.

Valid Usage

- VUID-VkPipelineCacheSafetyCriticalIndexEntry-jsonSize-05080
If **jsonSize** is 0, **jsonOffset** **must** be 0
- VUID-VkPipelineCacheSafetyCriticalIndexEntry-jsonSize-05081
If **jsonSize** is 0, **stageIndexCount** **must** be 0
- VUID-VkPipelineCacheSafetyCriticalIndexEntry-jsonSize-08991
If **jsonSize** is not 0, **jsonOffset + jsonSize** **must** not exceed the size of the pipeline cache

- VUID-VkPipelineCacheSafetyCriticalIndexEntry-stageIndexCount-05082
If `stageIndexCount` is 0, `stageIndexOffset` and `stageIndexStride` **must** be 0
- VUID-VkPipelineCacheSafetyCriticalIndexEntry-stageIndexCount-05083
If `stageIndexCount` is not 0, `stageIndexStride` **must** be greater than or equal to 16 (the size of the `VkPipelineCacheStageValidationIndexEntry` structure)
- VUID-VkPipelineCacheSafetyCriticalIndexEntry-stageIndexCount-05084
If `stageIndexCount` is not 0, `stageIndexOffset` + `stageIndexCount` × `stageIndexStride` **must** not exceed the size of the pipeline cache

Each pipeline cache stage validation index entry consists of a `VkPipelineCacheStageValidationIndexEntry` structure:

```
// Provided by VKSC_VERSION_1_0
typedef struct VkPipelineCacheStageValidationIndexEntry {
    uint64_t    codeSize;
    uint64_t    codeOffset;
} VkPipelineCacheStageValidationIndexEntry;
```

- `codeSize` is the size in bytes of the SPIR-V module for this pipeline stage.
- `codeOffset` is the offset in bytes from the beginning of the pipeline cache header to the SPIR-V module for this pipeline stage.

The data at `codeOffset` consists of `codeSize` bytes of SPIR-V module as described in [Appendix A](#) that was used by the [offline pipeline compiler](#) for this shader stage when creating this pipeline cache entry.

Unlike most structures declared by the Vulkan API, all fields of this structure are written with the least significant byte first, regardless of host byte-order.

The C language specification does not define the packing of structure members. This layout assumes tight structure member packing, with members laid out in the order listed in the structure, and the intended size of the structure is 16 bytes. If a compiler produces code that diverges from that pattern, applications **must** employ another method to set values at the correct offsets.

Valid Usage

- VUID-VkPipelineCacheStageValidationIndexEntry-codeSize-05085
`codeSize` **must** be greater than 0
- VUID-VkPipelineCacheStageValidationIndexEntry-codeSize-05086
`codeSize` **must** be a multiple of 4
- VUID-VkPipelineCacheStageValidationIndexEntry-codeOffset-05087
`codeOffset` + `codeSize` **must** not exceed the size of the pipeline cache

10.7.3. Destroying a Pipeline Cache

To destroy a pipeline cache, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyPipelineCache(
    VkDevice          device,
    VkPipelineCache   pipelineCache,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the pipeline cache object.
- **pipelineCache** is the handle of the pipeline cache to destroy.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage (Implicit)

- VUID-vkDestroyPipelineCache-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkDestroyPipelineCache-pipelineCache-parameter
If **pipelineCache** is not [VK_NULL_HANDLE](#), **pipelineCache** **must** be a valid [VkPipelineCache](#) handle
- VUID-vkDestroyPipelineCache-pAllocator-null
pAllocator **must** be [NULL](#)
- VUID-vkDestroyPipelineCache-pipelineCache-parent
If **pipelineCache** is a valid handle, it **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **pipelineCache** **must** be externally synchronized

10.8. Offline Pipeline Compilation

In Vulkan SC, the pipeline compilation process occurs offline [\[SCID-8\]](#).

The [SPIR-V shader module](#) and pipeline state are supplied to an offline pipeline cache compiler which creates a pipeline cache entry for the pipeline. The set of pipeline cache entries are combined offline into one or more [pipeline caches](#). At application runtime, the offline generated pipeline cache is provided to device creation as part of the [VkDeviceObjectReservationCreateInfo](#) structure and then loaded into a [VkPipelineCache](#) object by the application. The device, pipeline, and pipeline cache creation functions **can** extract implementation-specific information from the pipeline cache. The specific pipeline to be loaded from the cache is specified at pipeline creation time using a [pipeline identifier](#). The pipeline state that is provided at runtime to pipeline creation

must match the state that was specified to the offline pipeline cache compiler when the pipeline cache entry was created offline (with the exception of the [VkPipelineShaderStageCreateInfo](#) structure).

In order to assist with the specification of pipeline state for the offline pipeline cache compiler, Khronos has defined a *pipeline JSON schema* to represent the pipeline state required to compile a SPIR-V module to device-specific machine code and a set of utilities to help with reading and writing of the JSON files. See <https://github.com/KhronosGroup/VulkanSC-Docs/wiki/JSON-schema> for more information.

10.9. Pipeline Memory Reservation

Pipeline memory is allocated from a pool that is reserved at device creation time. The offline pipeline cache compiler writes the pipeline memory size requirements for each pipeline into the pipeline's [VkPipelineCacheSafetyCriticalIndexEntry::pipelineMemorySize](#) entry in the [pipeline cache index](#). The offline pipeline cache compiler **may** also report it separately. The elements of [VkDeviceObjectReservationCreateInfo::pPipelinePoolSizes](#) are requests for [poolEntryCount](#) pool entries each of pool size [poolEntrySize](#), and any pipeline with a [VkPipelineCacheSafetyCriticalIndexEntry::pipelineMemorySize](#) less than or equal to [VkPipelineOfflineCreateInfo::poolEntrySize](#) **can** be placed in one of those pool entries. The application **should** request a set of pool sizes that best suits its anticipated worst-case usage.

On implementations where [VkPhysicalDeviceVulkanSC10Properties::recyclePipelineMemory](#) is [VK_FALSE](#), the memory for the pipeline pool is not recycled when a pipeline is destroyed, and once an entry has been used it **cannot** be reused. On implementations where [VkPhysicalDeviceVulkanSC10Properties::recyclePipelineMemory](#) is [VK_TRUE](#), the memory for the pipeline pool is recycled when a pipeline is destroyed, and the entry it was using becomes available to be reused.

10.10. Pipeline Identifier

A *pipeline identifier* is an identifier that can be used to identify a specific pipeline independently from the pipeline description, shader stages and any relevant fixed-function stages, that were used to create the pipeline object.

The [VkPipelineOfflineCreateInfo](#) structure allows an identifier to be specified for the pipeline at pipeline creation via the [pNext](#) field of the [VkGraphicsPipelineCreateInfo](#), and [VkComputePipelineCreateInfo](#) structures. If a [VkPipelineOfflineCreateInfo](#) structure is not included in the [pNext](#) chain then pipeline creation will fail and [VK_ERROR_NO_PIPELINE_MATCH](#) will be returned by the corresponding [vkCreate*Pipelines](#) command.

The identifier **must** be used by the implementation to match against the existing content of the pipeline cache at pipeline creation. This is required for Vulkan SC where pipelines are generated offline and there is no shader code in the pipeline cache to match at runtime.

NOTE

The identifier values must be specified or generated during the offline pipeline cache generation and embedded in to the pipeline cache blob.

The `VkPipelineOfflineCreateInfo` structure is defined as:

```
// Provided by VKSC_VERSION_1_0
typedef struct VkPipelineOfflineCreateInfo {
    VkStructureType      sType;
    const void*          pNext;
    uint8_t              pipelineIdentifier[VK_UUID_SIZE];
    VkPipelineMatchControl matchControl;
    VkDeviceSize          poolEntrySize;
} VkPipelineOfflineCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pipelineIdentifier` is an array of `VK_UUID_SIZE` `uint8_t` values representing an identifier for the pipeline.
- `matchControl` is a `VkPipelineMatchControl` value specifying the type of identifier being used and how the match should be performed.
- `poolEntrySize` is the size of the entry in pipeline memory to use for this pipeline. It **must** be a size that was requested via `VkPipelinePoolSize` when the device was created.

If a match in the pipeline cache is not found then `VK_ERROR_NO_PIPELINE_MATCH` will be returned to the application.

If `poolEntrySize` is too small for the pipeline, or the number of entries for the requested pool size exceeds the reserved count for that pool size, pipeline creation will fail and `VK_ERROR_OUT_OF_POOL_MEMORY` will be returned by the corresponding `vkCreate*Pipelines` command.

Valid Usage

- VUID-VkPipelineOfflineCreateInfo-poolEntrySize-05028
`poolEntrySize` **must** be one of the sizes requested via `VkPipelinePoolSize` when the device was created
- VUID-VkPipelineOfflineCreateInfo-recyclePipelineMemory-05029
If `VkPhysicalDeviceVulkanSC10Properties::recyclePipelineMemory` is `VK_TRUE`, the number of currently existing pipelines created with this same value of `poolEntrySize` plus 1 **must** be less than or equal to the sum of the `VkPipelinePoolSize::poolEntryCount` values with the same value of `poolEntrySize`
- VUID-VkPipelineOfflineCreateInfo-recyclePipelineMemory-05030
If `VkPhysicalDeviceVulkanSC10Properties::recyclePipelineMemory` is `VK_FALSE`, the total number of pipelines ever created with this same value of `poolEntrySize` plus 1 **must** be less than or equal to the sum of the `VkPipelinePoolSize::poolEntryCount` values with the same value of `poolEntrySize`

Valid Usage (Implicit)

- VUID-VkPipelineOfflineCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_OFFLINE_CREATE_INFO`
- VUID-VkPipelineOfflineCreateInfo-matchControl-parameter
`matchControl` **must** be a valid `VkPipelineMatchControl` value

Possible values of the `matchControl` member of `VkPipelineOfflineCreateInfo`

```
// Provided by VKSC_VERSION_1_0
typedef enum VkPipelineMatchControl {
    VK_PIPELINE_MATCH_CONTROL_APPLICATION_UUID_EXACT_MATCH = 0,
} VkPipelineMatchControl;
```

are:

- `VK_PIPELINE_MATCH_CONTROL_APPLICATION_UUID_EXACT_MATCH` specifies that the identifier is a UUID generated by the application and the identifiers **must** be an exact match.

10.11. Specialization Constants

Specialization constants are a mechanism whereby constants in a SPIR-V module **can** have their constant value specified at the time the `VkPipeline` is compiled offline. This allows a SPIR-V module to have constants that **can** be modified at compilation time rather than in the SPIR-V source. The `pSpecializationInfo` parameters are not used at runtime and **should** be ignored by the implementation. If provided, the application **must** set the `pSpecializationInfo` parameters to the values that were specified for the offline compilation of this pipeline.

NOTE

Specialization constants are useful to allow a compute shader to have its local workgroup size changed at pipeline compilation time, for example.

Each `VkPipelineShaderStageCreateInfo` structure contains a `pSpecializationInfo` member, which **can** be `NULL` to indicate no specialization constants, or point to a `VkSpecializationInfo` structure.

The `VkSpecializationInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSpecializationInfo {
    uint32_t                mapEntryCount;
    const VkSpecializationMapEntry* pMapEntries;
    size_t                  dataSize;
    const void*              pData;
} VkSpecializationInfo;
```

- `mapEntryCount` is the number of entries in the `pMapEntries` array.

- `pMapEntries` is a pointer to an array of `VkSpecializationMapEntry` structures, which map constant IDs to offsets in `pData`.
- `dataSize` is the byte size of the `pData` buffer.
- `pData` contains the actual constant values to specialize with.

Valid Usage

- VUID-VkSpecializationInfo-offset-00773
The `offset` member of each element of `pMapEntries` **must** be less than `dataSize`
- VUID-VkSpecializationInfo-pMapEntries-00774
The `size` member of each element of `pMapEntries` **must** be less than or equal to `dataSize` minus `offset`
- VUID-VkSpecializationInfo-constantID-04911
The `constantID` value of each element of `pMapEntries` **must** be unique within `pMapEntries`

Valid Usage (Implicit)

- VUID-VkSpecializationInfo-pMapEntries-parameter
If `mapEntryCount` is not 0, `pMapEntries` **must** be a valid pointer to an array of `mapEntryCount` valid `VkSpecializationMapEntry` structures
- VUID-VkSpecializationInfo-pData-parameter
If `dataSize` is not 0, `pData` **must** be a valid pointer to an array of `dataSize` bytes

The `VkSpecializationMapEntry` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSpecializationMapEntry {
    uint32_t    constantID;
    uint32_t    offset;
    size_t      size;
} VkSpecializationMapEntry;
```

- `constantID` is the ID of the specialization constant in SPIR-V.
- `offset` is the byte offset of the specialization constant value within the supplied data buffer.
- `size` is the byte size of the specialization constant value within the supplied data buffer.

If a `constantID` value is not a specialization constant ID used in the shader, that map entry does not affect the behavior of the pipeline.

Valid Usage

- VUID-VkSpecializationMapEntry-constantID-00776

For a `constantID` specialization constant declared in a shader, `size` **must** match the byte size of the `constantID`. If the specialization constant is of type `boolean`, `size` **must** be the byte size of `VkBool32`

In human readable SPIR-V:

```
OpDecorate %x SpecId 13 ; decorate .x component of WorkgroupSize with ID 13
OpDecorate %y SpecId 42 ; decorate .y component of WorkgroupSize with ID 42
OpDecorate %z SpecId 3 ; decorate .z component of WorkgroupSize with ID 3
OpDecorate %wgsz BuiltIn WorkgroupSize ; decorate WorkgroupSize onto constant
%i32 = OpTypeInt 32 0 ; declare an unsigned 32-bit type
%uvec3 = OpTypeVector %i32 3 ; declare a 3 element vector type of unsigned 32-bit
%x = OpSpecConstant %i32 1 ; declare the .x component of WorkgroupSize
%y = OpSpecConstant %i32 1 ; declare the .y component of WorkgroupSize
%z = OpSpecConstant %i32 1 ; declare the .z component of WorkgroupSize
%wgsz = OpSpecConstantComposite %uvec3 %x %y %z ; declare WorkgroupSize
```

From the above we have three specialization constants, one for each of the x, y and z elements of the WorkgroupSize vector.

Now to specialize the above via the specialization constants mechanism:

```
const VkSpecializationMapEntry entries[] =
{
    {
        .constantID = 13,
        .offset = 0 * sizeof(uint32_t),
        .size = sizeof(uint32_t)
    },
    {
        .constantID = 42,
        .offset = 1 * sizeof(uint32_t),
        .size = sizeof(uint32_t)
    },
    {
        .constantID = 3,
        .offset = 2 * sizeof(uint32_t),
        .size = sizeof(uint32_t)
    }
};

const uint32_t data[] = { 16, 8, 4 }; // our workgroup size is 16x8x4

const VkSpecializationInfo info =
{
    .mapEntryCount = 3,
    .pMapEntries = entries,
    .dataSize = 3 * sizeof(uint32_t),
```

```

        .pData = data,
    };

```

Then when calling `vkCreateComputePipelines`, and passing the `VkSpecializationInfo` we defined as the `pSpecializationInfo` parameter of `VkPipelineShaderStageCreateInfo`, we will create a compute pipeline with the runtime specified local workgroup size.

Another example would be that an application has a SPIR-V module that has some platform-dependent constants they wish to use.

In human readable SPIR-V:

```

OpDecorate %1 SpecId 0 ; decorate our signed 32-bit integer constant
OpDecorate %2 SpecId 12 ; decorate our 32-bit floating-point constant
%i32 = OpTypeInt 32 1 ; declare a signed 32-bit type
%float = OpTypeFloat 32 ; declare a 32-bit floating-point type
%1 = OpSpecConstant %i32 -1 ; some signed 32-bit integer constant
%2 = OpSpecConstant %float 0.5 ; some 32-bit floating-point constant

```

From the above we have two specialization constants, one is a signed 32-bit integer and the second is a 32-bit floating-point value.

Now to specialize the above via the specialization constants mechanism:

```

struct SpecializationData {
    int32_t data0;
    float data1;
};

const VkSpecializationMapEntry entries[] =
{
    {
        .constantID = 0,
        .offset = offsetof(SpecializationData, data0),
        .size = sizeof(SpecializationData::data0)
    },
    {
        .constantID = 12,
        .offset = offsetof(SpecializationData, data1),
        .size = sizeof(SpecializationData::data1)
    }
};

SpecializationData data;
data.data0 = -42; // set the data for the 32-bit integer
data.data1 = 42.0f; // set the data for the 32-bit floating-point

const VkSpecializationInfo info =
{

```

```
.mapEntryCount = 2,
.pMapEntries = entries,
.dataSize = sizeof(data),
.pdata = &data,
};
```

It is legal for a SPIR-V module with specializations to be compiled into a pipeline where no specialization information was provided. SPIR-V specialization constants contain default values such that if a specialization is not provided, the default value will be used. In the examples above, it would be valid for an application to only specialize some of the specialization constants within the SPIR-V module, and let the other constants use their default values encoded within the `OpSpecConstant` declarations.

10.12. Pipeline Binding

Once a pipeline has been created, it **can** be bound to the command buffer using the command:

```
// Provided by VK_VERSION_1_0
void vkCmdBindPipeline(
    VkCommandBuffer          commandBuffer,
    VkPipelineBindPoint      pipelineBindPoint,
    VkPipeline                pipeline);
```

- `commandBuffer` is the command buffer that the pipeline will be bound to.
- `pipelineBindPoint` is a `VkPipelineBindPoint` value specifying to which bind point the pipeline is bound. Binding one does not disturb the others.
- `pipeline` is the pipeline to be bound.

Once bound, a pipeline binding affects subsequent commands that interact with the given pipeline type in the command buffer until a different pipeline of the same type is bound to the bind point. Commands that do not interact with the `given pipeline` type **must** not be affected by the pipeline state.

Valid Usage

- VUID-vkCmdBindPipeline-pipelineBindPoint-00777
If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_COMPUTE`, the `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- VUID-vkCmdBindPipeline-pipelineBindPoint-00778
If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_GRAPHICS`, the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdBindPipeline-pipelineBindPoint-00779
If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_COMPUTE`, `pipeline` **must** be a compute pipeline
- VUID-vkCmdBindPipeline-pipelineBindPoint-00780

If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_GRAPHICS`, `pipeline` **must** be a graphics pipeline

- VUID-vkCmdBindPipeline-pipeline-00781

If the `variableMultisampleRate` feature is not supported, `pipeline` is a graphics pipeline, the current subpass **uses no attachments**, and this is not the first call to this function with a graphics pipeline after transitioning to the current subpass, then the sample count specified by this pipeline **must** match that set in the previous pipeline

- VUID-vkCmdBindPipeline-variableSampleLocations-01525

If `VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations` is `VK_FALSE`, and `pipeline` is a graphics pipeline created with a `renderPass` that is not `VK_NULL_HANDLE` and with a `VkPipelineSampleLocationsStateCreateInfoEXT` structure having its `sampleLocationsEnable` member set to `VK_TRUE` but without `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` enabled then the current render pass instance **must** have been begun by specifying a `VkRenderPassSampleLocationsBeginInfoEXT` structure whose `pPostSubpassSampleLocations` member contains an element with a `subpassIndex` matching the current subpass index and the `sampleLocationsInfo` member of that element **must** match the `sampleLocationsInfo` specified in `VkPipelineSampleLocationsStateCreateInfoEXT` when the pipeline was created

- VUID-vkCmdBindPipeline-commandBuffer-04809

If `commandBuffer` is a secondary command buffer with `VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D` enabled and `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_GRAPHICS` and `pipeline` was created with `VkPipelineDiscardRectangleStateCreateInfoEXT` structure and its `discardRectangleCount` member is not `0`, or the pipeline was created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` enabled, then the pipeline **must** have been created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` enabled

Valid Usage (Implicit)

- VUID-vkCmdBindPipeline-commandBuffer-parameter

`commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdBindPipeline-pipelineBindPoint-parameter

`pipelineBindPoint` **must** be a valid `VkPipelineBindPoint` value

- VUID-vkCmdBindPipeline-pipeline-parameter

`pipeline` **must** be a valid `VkPipeline` handle

- VUID-vkCmdBindPipeline-commandBuffer-recording

`commandBuffer` **must** be in the `recording state`

- VUID-vkCmdBindPipeline-commandBuffer-cmdpool

The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, or `VK_QUEUE_GRAPHICS_BIT` operations

- VUID-vkCmdBindPipeline-commonparent

Both of `commandBuffer`, and `pipeline` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT	State

Possible values of `vkCmdBindPipeline::pipelineBindPoint`, specifying the bind point of a pipeline object, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkPipelineBindPoint {
    VK_PIPELINE_BIND_POINT_GRAPHICS = 0,
    VK_PIPELINE_BIND_POINT_COMPUTE = 1,
} VkPipelineBindPoint;
```

- `VK_PIPELINE_BIND_POINT_COMPUTE` specifies binding as a compute pipeline.
- `VK_PIPELINE_BIND_POINT_GRAPHICS` specifies binding as a graphics pipeline.

10.13. Dynamic State

When a pipeline object is bound, any pipeline object state that is not specified as dynamic is applied to the command buffer state. Pipeline object state that is specified as dynamic is not applied to the command buffer state at this time.

Instead, dynamic state **can** be modified at any time and persists for the lifetime of the command buffer, or until modified by another dynamic state setting command, or made invalid by binding a pipeline in which that state is statically specified.

When a pipeline object is bound, the following applies to each state parameter:

- If the state is not specified as dynamic in the new pipeline object, then that command buffer state is overwritten by the state in the new pipeline object. Before any draw or dispatch call with this pipeline there **must** not have been any calls to any of the corresponding dynamic state setting commands after this pipeline was bound.

- If the state is specified as dynamic in the new pipeline object, then that command buffer state is not disturbed. Before any draw or dispatch call with this pipeline there **must** have been at least one call to each of the corresponding dynamic state setting commands. The state-setting commands **must** be recorded after command buffer recording was begun, or after the last command binding a pipeline object with that state specified as static, whichever was the latter.
- If the state is not included (corresponding pointer in [VkGraphicsPipelineCreateInfo](#) was **NULL** or was ignored) in the new pipeline object, then that command buffer state is not disturbed.

Dynamic state that does not affect the result of operations **can** be left undefined.

NOTE

For example, if blending is disabled by the pipeline object state then the dynamic color blend constants do not need to be specified in the command buffer, even if this state is specified as dynamic in the pipeline object.

NOTE

Applications running on Vulkan implementations advertising a [VkPhysicalDeviceDriverProperties::conformanceVersion](#) less than 1.3.8.0 should be aware that rebinding the bound pipeline object may not reapply static state.

Chapter 11. Memory Allocation

Vulkan memory is broken up into two categories, *host memory* and *device memory*.

11.1. Host Memory

Host memory is memory needed by the Vulkan implementation for non-device-visible storage.

NOTE This memory **may** be used to store the implementation's representation and state of Vulkan objects.

The Vulkan SC implementation will perform its own host memory allocations. Support for application-provided memory allocation, as supported in Base Vulkan, has been removed in Vulkan SC.

`VkAllocationCallbacks` is not supported and pointers to this type **must** be `NULL` [SCID-2], [SCID-8].

```
// Provided by VK_VERSION_1_0
typedef struct VkAllocationCallbacks {
    void*                                pUserData;
    PFN_vkAllocationFunction             pfnAllocation;
    PFN_vkReallocationFunction           pfnReallocation;
    PFN_vkFreeFunction                   pfnFree;
    PFN_vkInternalAllocationNotification pfnInternalAllocation;
    PFN_vkInternalFreeNotification       pfnInternalFree;
} VkAllocationCallbacks;
```

11.2. Device Memory

Device memory is memory that is visible to the device—for example the contents of the image or buffer objects, which **can** be natively used by the device.

11.2.1. Device Memory Properties

Memory properties of a physical device describe the memory heaps and memory types available.

To query memory properties, call:

WARNING This functionality is superseded by [Vulkan Version 1.1](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceMemoryProperties(
    VkPhysicalDevice             physicalDevice,
    VkPhysicalDeviceMemoryProperties* pMemoryProperties);
```

- `physicalDevice` is the handle to the device to query.
- `pMemoryProperties` is a pointer to a `VkPhysicalDeviceMemoryProperties` structure in which the properties are returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceMemoryProperties-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceMemoryProperties-pMemoryProperties-parameter `pMemoryProperties` **must** be a valid pointer to a `VkPhysicalDeviceMemoryProperties` structure

The `VkPhysicalDeviceMemoryProperties` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceMemoryProperties {
    uint32_t      memoryTypeCount;
    VkMemoryType  memoryTypes[VK_MAX_MEMORY_TYPES];
    uint32_t      memoryHeapCount;
    VkMemoryHeap  memoryHeaps[VK_MAX_MEMORY_HEAPS];
} VkPhysicalDeviceMemoryProperties;
```

- `memoryTypeCount` is the number of valid elements in the `memoryTypes` array.
- `memoryTypes` is an array of `VK_MAX_MEMORY_TYPES` `VkMemoryType` structures describing the *memory types* that **can** be used to access memory allocated from the heaps specified by `memoryHeaps`.
- `memoryHeapCount` is the number of valid elements in the `memoryHeaps` array.
- `memoryHeaps` is an array of `VK_MAX_MEMORY_HEAPS` `VkMemoryHeap` structures describing the *memory heaps* from which memory **can** be allocated.

The `VkPhysicalDeviceMemoryProperties` structure describes a number of *memory heaps* as well as a number of *memory types* that **can** be used to access memory allocated in those heaps. Each heap describes a memory resource of a particular size, and each memory type describes a set of memory properties (e.g. host cached vs. uncached) that **can** be used with a given memory heap. Allocations using a particular memory type will consume resources from the heap indicated by that memory type's heap index. More than one memory type **may** share each heap, and the heaps and memory types provide a mechanism to advertise an accurate size of the physical memory resources while allowing the memory to be used with a variety of different properties.

The number of memory heaps is given by `memoryHeapCount` and is less than or equal to `VK_MAX_MEMORY_HEAPS`. Each heap is described by an element of the `memoryHeaps` array as a `VkMemoryHeap` structure. The number of memory types available across all memory heaps is given by `memoryTypeCount` and is less than or equal to `VK_MAX_MEMORY_TYPES`. Each memory type is described by an element of the `memoryTypes` array as a `VkMemoryType` structure.

At least one heap **must** include `VK_MEMORY_HEAP_DEVICE_LOCAL_BIT` in `VkMemoryHeap::flags`. If there are multiple heaps that all have similar performance characteristics, they **may** all include `VK_MEMORY_HEAP_DEVICE_LOCAL_BIT`. In a unified memory architecture (UMA) system there is often only a single memory heap which is considered to be equally “local” to the host and to the device, and such an implementation **must** advertise the heap as device-local.

Each memory type returned by `vkGetPhysicalDeviceMemoryProperties` **must** have its `propertyFlags` set to one of the following values:

- 0
- `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT`
- `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT`
- `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT`
- `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT`
- `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT`
- `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT`
- `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT`
- `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT`
- `VK_MEMORY_PROPERTY_PROTECTED_BIT`
- `VK_MEMORY_PROPERTY_PROTECTED_BIT | VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT`

There **must** be at least one memory type with both the `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` and `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` bits set in its `propertyFlags`. There **must** be at least one memory type with the `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT` bit set in its `propertyFlags`.

For each pair of elements **X** and **Y** returned in `memoryTypes`, **X** **must** be placed at a lower index position than **Y** if:

- the set of bit flags returned in the `propertyFlags` member of **X** is a strict subset of the set of bit flags returned in the `propertyFlags` member of **Y**; or
- the `propertyFlags` members of **X** and **Y** are equal, and **X** belongs to a memory heap with greater performance (as determined in an implementation-specific manner)

NOTE

There is no ordering requirement between **X** and **Y** elements for the case their **propertyFlags** members are not in a subset relation. That potentially allows more than one possible way to order the same set of memory types. Notice that the [list of all allowed memory property flag combinations](#) is written in a valid order. But if instead **VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT** was before **VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT**, the list would still be in a valid order.

This ordering requirement enables applications to use a simple search loop to select the desired memory type along the lines of:

```
// Find a memory in 'memoryTypeBitsRequirement' that includes all of
// 'requiredProperties'
int32_t findProperties(const VkPhysicalDeviceMemoryProperties* pMemoryProperties,
                     uint32_t memoryTypeBitsRequirement,
                     VkMemoryPropertyFlags requiredProperties) {
    const uint32_t memoryCount = pMemoryProperties->memoryTypeCount;
    for (uint32_t memoryIndex = 0; memoryIndex < memoryCount; ++memoryIndex) {
        const uint32_t memoryTypeBits = (1 << memoryIndex);
        const bool isRequiredMemoryType = memoryTypeBitsRequirement & memoryTypeBits;

        const VkMemoryPropertyFlags properties =
            pMemoryProperties->memoryTypes[memoryIndex].propertyFlags;
        const bool hasRequiredProperties =
            (properties & requiredProperties) == requiredProperties;

        if (isRequiredMemoryType && hasRequiredProperties)
            return static_cast<int32_t>(memoryIndex);
    }

    // failed to find memory type
    return -1;
}

// Try to find an optimal memory type, or if it does not exist try fallback memory
// type
// 'device' is the VkDevice
// 'image' is the VkImage that requires memory to be bound
// 'memoryProperties' properties as returned by vkGetPhysicalDeviceMemoryProperties
// 'requiredProperties' are the property flags that must be present
// 'optimalProperties' are the property flags that are preferred by the application
VkMemoryRequirements memoryRequirements;
vkGetImageMemoryRequirements(device, image, &memoryRequirements);
int32_t memoryType =
    findProperties(&memoryProperties, memoryRequirements.memoryTypeBits,
optimalProperties);
if (memoryType == -1) // not found; try fallback properties
    memoryType =
        findProperties(&memoryProperties, memoryRequirements.memoryTypeBits,
```

```
requiredProperties);
```

`VK_MAX_MEMORY_TYPES` is the length of an array of `VkMemoryType` structures describing memory types, as returned in `VkPhysicalDeviceMemoryProperties::memoryTypes`.

```
#define VK_MAX_MEMORY_TYPES 32U
```

`VK_MAX_MEMORY_HEAPS` is the length of an array of `VkMemoryHeap` structures describing memory heaps, as returned in `VkPhysicalDeviceMemoryProperties::memoryHeaps`.

```
#define VK_MAX_MEMORY_HEAPS 16U
```

To query memory properties, call:

```
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceMemoryProperties2(
    VkPhysicalDevice          physicalDevice,
    VkPhysicalDeviceMemoryProperties2* pMemoryProperties);
```

- `physicalDevice` is the handle to the device to query.
- `pMemoryProperties` is a pointer to a `VkPhysicalDeviceMemoryProperties2` structure in which the properties are returned.

`vkGetPhysicalDeviceMemoryProperties2` behaves similarly to `vkGetPhysicalDeviceMemoryProperties`, with the ability to return extended information in a `pNext` chain of output structures.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceMemoryProperties2-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceMemoryProperties2-pMemoryProperties-parameter `pMemoryProperties` **must** be a valid pointer to a `VkPhysicalDeviceMemoryProperties2` structure

The `VkPhysicalDeviceMemoryProperties2` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceMemoryProperties2 {
    VkStructureType    sType;
    void*              pNext;
    VkPhysicalDeviceMemoryProperties memoryProperties;
} VkPhysicalDeviceMemoryProperties2;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryProperties` is a `VkPhysicalDeviceMemoryProperties` structure which is populated with the same values as in `vkGetPhysicalDeviceMemoryProperties`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMemoryProperties2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MEMORY_PROPERTIES_2`
- VUID-VkPhysicalDeviceMemoryProperties2-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkPhysicalDeviceMemoryBudgetPropertiesEXT`
- VUID-VkPhysicalDeviceMemoryProperties2-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique

The `VkMemoryHeap` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkMemoryHeap {
    VkDeviceSize      size;
    VkMemoryHeapFlags flags;
} VkMemoryHeap;
```

- `size` is the total memory size in bytes in the heap.
- `flags` is a bitmask of `VkMemoryHeapFlagBits` specifying attribute flags for the heap.

Bits which **may** be set in `VkMemoryHeap::flags`, indicating attribute flags for the heap, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkMemoryHeapFlagBits {
    VK_MEMORY_HEAP_DEVICE_LOCAL_BIT = 0x00000001,
    // Provided by VK_VERSION_1_1
    VK_MEMORY_HEAP_MULTI_INSTANCE_BIT = 0x00000002,
    // Provided by VKSC_VERSION_1_0
    VK_MEMORY_HEAP_SEU_SAFE_BIT = 0x00000004,
} VkMemoryHeapFlagBits;
```

- `VK_MEMORY_HEAP_DEVICE_LOCAL_BIT` specifies that the heap corresponds to device-local memory. Device-local memory **may** have different performance characteristics than host-local memory, and **may** support different memory property flags.
- `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` specifies that in a logical device representing more than one physical device, there is a per-physical device instance of the heap memory. By default, an allocation from such a heap will be replicated to each physical device's instance of the heap.

- `VK_MEMORY_HEAP_SEU_SAFE_BIT` specifies that the heap is protected against single event upsets.

NOTE

Many safety critical environments are required to contend with single event upsets (SEUs). It is typical for host memory to include automatic error detection (EDC) or correction (ECC) on platforms where this a concern. `VK_MEMORY_HEAP_SEU_SAFE_BIT` is used to denote device memory heaps that have this protection.

SEU-safe memory **may** have different performance characteristics than SEU-unsafe memory.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkMemoryHeapFlags;
```

`VkMemoryHeapFlags` is a bitmask type for setting a mask of zero or more `VkMemoryHeapFlagBits`.

The `VkMemoryType` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkMemoryType {
    VkMemoryPropertyFlags    propertyFlags;
    uint32_t                 heapIndex;
} VkMemoryType;
```

- `heapIndex` describes which memory heap this memory type corresponds to, and **must** be less than `memoryHeapCount` from the `VkPhysicalDeviceMemoryProperties` structure.
- `propertyFlags` is a bitmask of `VkMemoryPropertyFlagBits` of properties for this memory type.

Bits which **may** be set in `VkMemoryType::propertyFlags`, indicating properties of a memory type, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkMemoryPropertyFlagBits {
    VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT = 0x00000001,
    VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT = 0x00000002,
    VK_MEMORY_PROPERTY_HOST_COHERENT_BIT = 0x00000004,
    VK_MEMORY_PROPERTY_HOST_CACHED_BIT = 0x00000008,
    VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT = 0x00000010,
    // Provided by VK_VERSION_1_1
    VK_MEMORY_PROPERTY_PROTECTED_BIT = 0x00000020,
} VkMemoryPropertyFlagBits;
```

- `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT` bit specifies that memory allocated with this type is the most efficient for device access. This property will be set if and only if the memory type belongs to a heap with the `VK_MEMORY_HEAP_DEVICE_LOCAL_BIT` set.
- `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` bit specifies that memory allocated with this type **can** be mapped for host access using `vkMapMemory`.

- `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` bit specifies that the host cache management commands `vkFlushMappedMemoryRanges` and `vkInvalidateMappedMemoryRanges` are not needed to manage [availability and visibility](#) on the host.
- `VK_MEMORY_PROPERTY_HOST_CACHED_BIT` bit specifies that memory allocated with this type is cached on the host. Host memory accesses to uncached memory are slower than to cached memory, however uncached memory is always host coherent.
- `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` bit specifies that the memory type only allows device access to the memory. Memory types **must** not have both `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` and `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` set. Additionally, the object's backing memory **may** be provided by the implementation lazily as specified in [Lazily Allocated Memory](#).
- `VK_MEMORY_PROPERTY_PROTECTED_BIT` bit specifies that the memory type only allows device access to the memory, and allows protected queue operations to access the memory. Memory types **must** not have `VK_MEMORY_PROPERTY_PROTECTED_BIT` set and any of `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` set, or `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` set, or `VK_MEMORY_PROPERTY_HOST_CACHED_BIT` set.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkMemoryPropertyFlags;
```

`VkMemoryPropertyFlags` is a bitmask type for setting a mask of zero or more [VkMemoryPropertyFlagBits](#).

If the `VkPhysicalDeviceMemoryBudgetPropertiesEXT` structure is included in the `pNext` chain of [VkPhysicalDeviceMemoryProperties2](#), it is filled with the current memory budgets and usages.

The `VkPhysicalDeviceMemoryBudgetPropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_memory_budget
typedef struct VkPhysicalDeviceMemoryBudgetPropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkDeviceSize        heapBudget[VK_MAX_MEMORY_HEAPS];
    VkDeviceSize        heapUsage[VK_MAX_MEMORY_HEAPS];
} VkPhysicalDeviceMemoryBudgetPropertiesEXT;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `heapBudget` is an array of `VK_MAX_MEMORY_HEAPS` [VkDeviceSize](#) values in which memory budgets are returned, with one element for each memory heap. A heap's budget is a rough estimate of how much memory the process **can** allocate from that heap before allocations **may** fail or cause performance degradation. The budget includes any currently allocated device memory.
- `heapUsage` is an array of `VK_MAX_MEMORY_HEAPS` [VkDeviceSize](#) values in which memory usages are returned, with one element for each memory heap. A heap's usage is an estimate of how much memory the process is currently using in that heap.

The values returned in this structure are not invariant. The `heapBudget` and `heapUsage` values **must** be zero for array elements greater than or equal to `VkPhysicalDeviceMemoryProperties::memoryHeapCount`. The `heapBudget` value **must** be non-zero for array elements less than `VkPhysicalDeviceMemoryProperties::memoryHeapCount`. The `heapBudget` value **must** be less than or equal to `VkMemoryHeap::size` for each heap.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMemoryBudgetPropertiesEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MEMORY_BUDGET_PROPERTIES_EXT`

11.2.2. Device Memory Objects

A Vulkan device operates on data in device memory via memory objects that are represented in the API by a `VkDeviceMemory` handle:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDeviceMemory)
```

Device memory **cannot** be freed [SCID-4]. If `VkPhysicalDeviceVulkanSC10Properties::deviceDestroyFreesMemory` is `VK_TRUE`, the memory is returned to the system when the device is destroyed. Otherwise, it **may** not be returned to the system until the process is terminated.

11.2.3. Device Memory Allocation

To allocate memory objects, call:

```
// Provided by VK_VERSION_1_0
VkResult vkAllocateMemory(
    VkDevice                device,
    const VkMemoryAllocateInfo* pAllocateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDeviceMemory*          pMemory);
```

- `device` is the logical device that owns the memory.
- `pAllocateInfo` is a pointer to a `VkMemoryAllocateInfo` structure describing parameters of the allocation. A successfully returned allocation **must** use the requested parameters—no substitution is permitted by the implementation.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pMemory` is a pointer to a `VkDeviceMemory` handle in which information about the allocated memory is returned.

Allocations returned by `vkAllocateMemory` are guaranteed to meet any alignment requirement of the implementation. For example, if an implementation requires 128 byte alignment for images and 64 byte alignment for buffers, the device memory returned through this mechanism would be 128-

byte aligned. This ensures that applications **can** correctly suballocate objects of different types (with potentially different alignment requirements) in the same memory object.

When memory is allocated, its contents are undefined with the following constraint:

- The contents of unprotected memory **must** not be a function of the contents of data protected memory objects, even if those memory objects were previously freed.

NOTE	The contents of memory allocated by one application should not be a function of data from protected memory objects of another application, even if those memory objects were previously freed.

The maximum number of valid memory allocations that **can** exist simultaneously within a `VkDevice` **may** be restricted by implementation- or platform-dependent limits. The `maxMemoryAllocationCount` feature describes the number of allocations that **can** exist simultaneously before encountering these internal limits.

NOTE	Many protected memory implementations involve complex hardware and system software support, and often have additional and much lower limits on the number of simultaneous protected memory allocations (from memory types with the <code>VK_MEMORY_PROPERTY_PROTECTED_BIT</code> property) than for non-protected memory allocations. These limits can be system-wide, and depend on a variety of factors outside of the Vulkan implementation, so they cannot be queried in Vulkan. Applications should use as few allocations as possible from such memory types by suballocating aggressively, and be prepared for allocation failure even when there is apparently plenty of capacity remaining in the memory heap. As a guideline, the Vulkan conformance test suite requires that at least 80 minimum-size allocations can exist concurrently when no other uses of protected memory are active in the system.

Some platforms **may** have a limit on the maximum size of a single allocation. For example, certain systems **may** fail to create allocations with a size greater than or equal to 4GB. Such a limit is implementation-dependent, and if such a failure occurs then the error `VK_ERROR_OUT_OF_DEVICE_MEMORY` **must** be returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkAllocateMemory` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkAllocateMemory-pAllocateInfo-01713
`pAllocateInfo->allocationSize` **must** be less than or equal to `VkPhysicalDeviceMemoryProperties::memoryHeaps[memindex].size` where `memindex` = `VkPhysicalDeviceMemoryProperties::memoryTypes[pAllocateInfo->memoryTypeIndex].heapIndex` as returned by `vkGetPhysicalDeviceMemoryProperties` for the `VkPhysicalDevice` that `device` was created from
- VUID-vkAllocateMemory-pAllocateInfo-01714
`pAllocateInfo->memoryTypeIndex` **must** be less than `VkPhysicalDeviceMemoryProperties`

`::memoryTypeCount` as returned by `vkGetPhysicalDeviceMemoryProperties` for the `VkPhysicalDevice` that `device` was created from

- VUID-vkAllocateMemory-maxMemoryAllocationCount-04101
There **must** be less than `VkPhysicalDeviceLimits::maxMemoryAllocationCount` device memory allocations currently allocated on the device
- VUID-vkAllocateMemory-device-05068
The number of device memory objects currently allocated from `device` plus 1 **must** be less than or equal to the total number of device memory objects requested via `VkDeviceObjectReservationCreateInfo::deviceMemoryRequestCount` specified when `device` was created

Valid Usage (Implicit)

- VUID-vkAllocateMemory-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkAllocateMemory-pAllocateInfo-parameter
`pAllocateInfo` **must** be a valid pointer to a valid `VkMemoryAllocateInfo` structure
- VUID-vkAllocateMemory-pAllocator-null
`pAllocator` **must** be `NULL`
- VUID-vkAllocateMemory-pMemory-parameter
`pMemory` **must** be a valid pointer to a `VkDeviceMemory` handle
- VUID-vkAllocateMemory-device-queuecount
The device **must** have been created with at least 1 queue

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_INVALID_EXTERNAL_HANDLE`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkMemoryAllocateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkMemoryAllocateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceSize        allocationSize;
    uint32_t            memoryTypeIndex;
} VkMemoryAllocateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `allocationSize` is the size of the allocation in bytes.
- `memoryTypeIndex` is an index identifying a memory type from the `memoryTypes` array of the `VkPhysicalDeviceMemoryProperties` structure.

The internal data of an allocated device memory object **must** include a reference to implementation-specific resources, referred to as the memory object's *payload*. Applications **can** also import and export that internal data to and from device memory objects to share data between Vulkan instances and other compatible APIs. A `VkMemoryAllocateInfo` structure defines a memory import operation if its `pNext` chain includes one of the following structures:

- `VkImportMemoryFdInfoKHR` with a non-zero `handleType` value
- `VkImportMemoryHostPointerInfoEXT` with a non-zero `handleType` value
- `VkImportMemorySciBufInfoNV` with a non-zero `handleType` value
- `VkImportScreenBufferInfoQNX` with a non-`NULL` `buffer` value

If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCI_BUF_BIT_NV`, `allocationSize` is ignored. The implementation **must** query the size of this allocation from the `NvSciBufAttrList` associated with the external `NvSciBufObj`.

Whether device memory objects constructed via a memory import operation hold a reference to their payload depends on the properties of the handle type used to perform the import, as defined below for each valid handle type. Importing memory **must** not modify the content of the memory. Implementations **must** ensure that importing memory does not enable the importing Vulkan instance to access any memory or resources in other Vulkan instances other than that corresponding to the memory object imported. Implementations **must** also ensure accessing imported memory which has not been initialized does not allow the importing Vulkan instance to obtain data from the exporting Vulkan instance or vice-versa.

NOTE

How exported and imported memory is isolated is left to the implementation, but applications should be aware that such isolation **may** prevent implementations from placing multiple exportable memory objects in the same physical or virtual page. Hence, applications **should** avoid creating many small external memory objects whenever possible.

Importing memory **must** not increase overall heap usage within a system. However, it **must** affect

the following per-process values:

- `VkPhysicalDeviceLimits::maxMemoryAllocationCount`
- `VkPhysicalDeviceMemoryBudgetPropertiesEXT::heapUsage`

When performing a memory import operation, it is the responsibility of the application to ensure the external handles and their associated payloads meet all valid usage requirements. However, implementations **must** perform sufficient validation of external handles and payloads to ensure that the operation results in a valid memory object which will not cause program termination, device loss, queue stalls, or corruption of other resources when used as allowed according to its allocation parameters. If the external handle provided does not meet these requirements, the implementation **must** fail the memory import operation with the error code `VK_ERROR_INVALID_EXTERNAL_HANDLE`.

Valid Usage

- VUID-VkMemoryAllocateInfo-allocationSize-07897
If the parameters do not define an `import` or `export` operation, `allocationSize` **must** be greater than 0
- VUID-VkMemoryAllocateInfo-None-06657
The parameters **must** not define more than one `import` operation
- VUID-VkMemoryAllocateInfo-allocationSize-07899
If the parameters define an export operation, `allocationSize` **must** be greater than 0
- VUID-VkMemoryAllocateInfo-allocationSize-01742
If the parameters define an import operation, the external handle specified was created by the Vulkan API, and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT`, then the values of `allocationSize` and `memoryTypeIndex` **must** match those specified when the payload being imported was created
- VUID-VkMemoryAllocateInfo-memoryTypeIndex-00648
If the parameters define an import operation and the external handle is a POSIX file descriptor created outside of the Vulkan API, the value of `memoryTypeIndex` **must** be one of those returned by `vkGetMemoryFdPropertiesKHR`
- VUID-VkMemoryAllocateInfo-memoryTypeIndex-01872
If the `protectedMemory` feature is not enabled, the `VkMemoryAllocateInfo::memoryTypeIndex` **must** not indicate a memory type that reports `VK_MEMORY_PROPERTY_PROTECTED_BIT`
- VUID-VkMemoryAllocateInfo-memoryTypeIndex-01744
If the parameters define an import operation and the external handle is a host pointer, the value of `memoryTypeIndex` **must** be one of those returned by `vkGetMemoryHostPointerPropertiesEXT`
- VUID-VkMemoryAllocateInfo-allocationSize-01745
If the parameters define an import operation and the external handle is a host pointer, `allocationSize` **must** be an integer multiple of `VkPhysicalDeviceExternalMemoryHostPropertiesEXT::minImportedHostPointerAlignment`

- VUID-VkMemoryAllocateInfo-screenBufferImport-08941
If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX`, `VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX::screenBufferImport` **must** be enabled
- VUID-VkMemoryAllocateInfo-allocationSize-08942
If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX`, `allocationSize` **must** be the size returned by `vkGetScreenBufferPropertiesQNX` for the QNX Screen buffer
- VUID-VkMemoryAllocateInfo-memoryTypeIndex-08943
If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX`, `memoryTypeIndex` **must** be one of those returned by `vkGetScreenBufferPropertiesQNX` for the QNX Screen buffer
- VUID-VkMemoryAllocateInfo-pNext-08944
If the parameters define an import operation, the external handle is a QNX Screen buffer, and the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` with `image` that is not `VK_NULL_HANDLE`, the QNX Screen's buffer **must** be a valid QNX Screen buffer
- VUID-VkMemoryAllocateInfo-pNext-08945
If the parameters define an import operation, the external handle is an QNX Screen buffer, and the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` with `image` that is not `VK_NULL_HANDLE`, the format of `image` **must** be `VK_FORMAT_UNDEFINED` or the format returned by `vkGetScreenBufferPropertiesQNX` in `VkScreenBufferFormatPropertiesQNX::format` for the QNX Screen buffer
- VUID-VkMemoryAllocateInfo-pNext-08946
If the parameters define an import operation, the external handle is a QNX Screen buffer, and the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` structure with `image` that is not `VK_NULL_HANDLE`, the width, height, and array layer dimensions of `image` and the QNX Screen buffer's `_screen_buffer` **must** be identical
- VUID-VkMemoryAllocateInfo-opaqueCaptureAddress-03329
If `VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress` is not zero, `VkMemoryAllocateFlagsInfo::flags` **must** include `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT`
- VUID-VkMemoryAllocateInfo-flags-03330
If `VkMemoryAllocateFlagsInfo::flags` includes `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT`, the `bufferDeviceAddressCaptureReplay` feature **must** be enabled
- VUID-VkMemoryAllocateInfo-flags-03331
If `VkMemoryAllocateFlagsInfo::flags` includes `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT`, the `bufferDeviceAddress` feature **must** be enabled
- VUID-VkMemoryAllocateInfo-pNext-03332
If the `pNext` chain includes a `VkImportMemoryHostPointerInfoEXT` structure, `VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress` **must** be zero
- VUID-VkMemoryAllocateInfo-opaqueCaptureAddress-03333
If the parameters define an import operation,

`VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress` **must** be zero

- VUID-VkMemoryAllocateInfo-pNext-05097
If the `pNext` chain includes a `VkExportMemorySciBufInfoNV` structure, the `sciBufExport` feature **must** be enabled
- VUID-VkMemoryAllocateInfo-pNext-05098
If the `pNext` chain includes a `VkImportMemorySciBufInfoNV` structure, the `sciBufImport` feature **must** be enabled
- VUID-VkMemoryAllocateInfo-memoryTypeIndex-05099
If the parameters define an import operation and the external handle is a `NvSciBufObj`, the value of `memoryTypeIndex` **must** be one of those returned by `vkGetPhysicalDeviceExternalMemorySciBufPropertiesNV`

Valid Usage (Implicit)

- VUID-VkMemoryAllocateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_INFO`
- VUID-VkMemoryAllocateInfo-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkExportMemoryAllocateInfo`, `VkExportMemorySciBufInfoNV`, `VkImportMemoryFdInfoKHR`, `VkImportMemoryHostPointerInfoEXT`, `VkImportMemorySciBufInfoNV`, `VkImportScreenBufferInfoQNX`, `VkMemoryAllocateFlagsInfo`, `VkMemoryDedicatedAllocateInfo`, or `VkMemoryOpaqueCaptureAddressAllocateInfo`
- VUID-VkMemoryAllocateInfo-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique

If the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` structure, then that structure includes a handle of the sole buffer or image resource that the memory **can** be bound to.

The `VkMemoryDedicatedAllocateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkMemoryDedicatedAllocateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkImage             image;
    VkBuffer            buffer;
} VkMemoryDedicatedAllocateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `image` is `VK_NULL_HANDLE` or a handle of an image which this memory will be bound to.
- `buffer` is `VK_NULL_HANDLE` or a handle of a buffer which this memory will be bound to.

Valid Usage

- VUID-VkMemoryDedicatedAllocateInfo-image-01432
At least one of **image** and **buffer** **must** be [VK_NULL_HANDLE](#)
- VUID-VkMemoryDedicatedAllocateInfo-image-02964
If **image** is not [VK_NULL_HANDLE](#) and the memory is not an imported QNX Screen buffer , [VkMemoryAllocateInfo::allocationSize](#) **must** be greater than or equal to the [VkMemoryRequirements::size](#) of the image
- VUID-VkMemoryDedicatedAllocateInfo-image-01434
If **image** is not [VK_NULL_HANDLE](#), **image** **must** have been created without [VK_IMAGE_CREATE_SPARSE_BINDING_BIT](#) set in [VkImageCreateInfo::flags](#)
- VUID-VkMemoryDedicatedAllocateInfo-buffer-02965
If **buffer** is not [VK_NULL_HANDLE](#) and the memory is not an imported QNX Screen buffer , [VkMemoryAllocateInfo::allocationSize](#) **must** be greater than or equal to the [VkMemoryRequirements::size](#) of the buffer
- VUID-VkMemoryDedicatedAllocateInfo-buffer-01436
If **buffer** is not [VK_NULL_HANDLE](#), **buffer** **must** have been created without [VK_BUFFER_CREATE_SPARSE_BINDING_BIT](#) set in [VkBufferCreateInfo::flags](#)
- VUID-VkMemoryDedicatedAllocateInfo-image-01878
If **image** is not [VK_NULL_HANDLE](#) and [VkMemoryAllocateInfo](#) defines a memory import operation with handle type [VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT](#), the memory being imported **must** also be a dedicated image allocation and **image** **must** be identical to the image associated with the imported memory
- VUID-VkMemoryDedicatedAllocateInfo-buffer-01879
If **buffer** is not [VK_NULL_HANDLE](#) and [VkMemoryAllocateInfo](#) defines a memory import operation with handle type [VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT](#), the memory being imported **must** also be a dedicated buffer allocation and **buffer** **must** be identical to the buffer associated with the imported memory

Valid Usage (Implicit)

- VUID-VkMemoryDedicatedAllocateInfo-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_MEMORY_DEDICATED_ALLOCATE_INFO](#)
- VUID-VkMemoryDedicatedAllocateInfo-image-parameter
If **image** is not [VK_NULL_HANDLE](#), **image** **must** be a valid [VkImage](#) handle
- VUID-VkMemoryDedicatedAllocateInfo-buffer-parameter
If **buffer** is not [VK_NULL_HANDLE](#), **buffer** **must** be a valid [VkBuffer](#) handle
- VUID-VkMemoryDedicatedAllocateInfo-commonparent
Both of **buffer**, and **image** that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same [VkDevice](#)

When allocating memory whose payload **may** be exported to another process or Vulkan instance,

add a [VkExportMemoryAllocateInfo](#) structure to the **pNext** chain of the [VkMemoryAllocateInfo](#) structure, specifying the handle types that **may** be exported.

The [VkExportMemoryAllocateInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExportMemoryAllocateInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkExternalMemoryHandleTypeFlags handleTypes;
} VkExportMemoryAllocateInfo;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **handleTypes** is zero or a bitmask of [VkExternalMemoryHandleTypeFlagBits](#) specifying one or more memory handle types the application **can** export from the resulting allocation. The application **can** request multiple handle types for the same allocation.

Valid Usage

- VUID-VkExportMemoryAllocateInfo-handleTypes-09860

The bits in **handleTypes** **must** be supported and compatible, as reported by [VkExternalImageFormatProperties](#), or [VkExternalBufferProperties](#)

Valid Usage (Implicit)

- VUID-VkExportMemoryAllocateInfo-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_EXPORT_MEMORY_ALLOCATE_INFO](#)
- VUID-VkExportMemoryAllocateInfo-handleTypes-parameter
handleTypes **must** be a valid combination of [VkExternalMemoryHandleTypeFlagBits](#) values

11.2.4. File Descriptor External Memory

To import memory from a POSIX file descriptor handle, add a [VkImportMemoryFdInfoKHR](#) structure to the **pNext** chain of the [VkMemoryAllocateInfo](#) structure. The [VkImportMemoryFdInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_external_memory_fd
typedef struct VkImportMemoryFdInfoKHR {
    VkStructureType           sType;
    const void*               pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
    int                        fd;
} VkImportMemoryFdInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the handle type of `fd`.
- `fd` is the external handle to import.

Importing memory from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application **must** not perform any operations on the file descriptor after a successful import. The imported memory object holds a reference to its payload.

Applications **can** import the same payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance. In all cases, each import operation **must** create a distinct `VkDeviceMemory` object.

Valid Usage

- VUID-VkImportMemoryFdInfoKHR-handleType-09862
If `handleType` is not `0`, it **must** be supported for import, as reported by `VkExternalImageFormatProperties` or `VkExternalBufferProperties`
- VUID-VkImportMemoryFdInfoKHR-fd-00668
The memory from which `fd` was exported **must** have been created on the same underlying physical device as `device`
- VUID-VkImportMemoryFdInfoKHR-handleType-00669
If `handleType` is not `0`, it **must** be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT`
- VUID-VkImportMemoryFdInfoKHR-handleType-00670
If `handleType` is not `0`, `fd` **must** be a valid handle of the type specified by `handleType`
- VUID-VkImportMemoryFdInfoKHR-fd-01746
The memory represented by `fd` **must** have been created from a physical device and driver that is compatible with `device` and `handleType`, as described in [External Memory Handle Types Compatibility](#)
- VUID-VkImportMemoryFdInfoKHR-fd-01520
`fd` **must** obey any requirements listed for `handleType` in [external memory handle types compatibility](#)

Valid Usage (Implicit)

- VUID-VkImportMemoryFdInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_MEMORY_FD_INFO_KHR`
- VUID-VkImportMemoryFdInfoKHR-handleType-parameter
If `handleType` is not `0`, `handleType` **must** be a valid `VkExternalMemoryHandleTypeFlagBits` value

To export a POSIX file descriptor referencing the payload of a Vulkan device memory object, call:

```
// Provided by VK_KHR_external_memory_fd
VkResult vkGetMemoryFdKHR(
    VkDevice device,
    const VkMemoryGetFdInfoKHR* pGetFdInfo,
    int* pFd);
```

- `device` is the logical device that created the device memory being exported.
- `pGetFdInfo` is a pointer to a `VkMemoryGetFdInfoKHR` structure containing parameters of the export operation.
- `pFd` will return a file descriptor referencing the payload of the device memory object.

Each call to `vkGetMemoryFdKHR` **must** create a new file descriptor holding a reference to the memory object's payload and transfer ownership of the file descriptor to the application. To avoid leaking resources, the application **must** release ownership of the file descriptor using the `close` system call when it is no longer needed, or by importing a Vulkan memory object from it. Where supported by the operating system, the implementation **must** set the file descriptor to be closed automatically when an `execve` system call is made.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetMemoryFdKHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkGetMemoryFdKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetMemoryFdKHR-pGetFdInfo-parameter
`pGetFdInfo` **must** be a valid pointer to a valid `VkMemoryGetFdInfoKHR` structure
- VUID-vkGetMemoryFdKHR-pFd-parameter
`pFd` **must** be a valid pointer to an `int` value

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkMemoryGetFdInfoKHR` structure is defined as:

```
// Provided by VK_KHR_external_memory_fd
typedef struct VkMemoryGetFdInfoKHR {
    VkStructureType      sType;
    const void*          pNext;
    VkDeviceMemory       memory;
    VkExternalMemoryHandleTypeFlagBits handleType;
} VkMemoryGetFdInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memory` is the memory object from which the handle will be exported.
- `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the file descriptor exported depend on the value of `handleType`. See `VkExternalMemoryHandleTypeFlagBits` for a description of the properties of the defined external memory handle types.

NOTE

The size of the exported file **may** be larger than the size requested by `VkMemoryAllocateInfo::allocationSize`. If `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT`, then the application **can** query the file's actual size with `lseek`.

Valid Usage

- VUID-VkMemoryGetFdInfoKHR-handleType-00671
`handleType` **must** have been included in `VkExportMemoryAllocateInfo::handleTypes` when `memory` was created
- VUID-VkMemoryGetFdInfoKHR-handleType-00672
`handleType` **must** be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT` or

Valid Usage (Implicit)

- VUID-VkMemoryGetFdInfoKHR-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_MEMORY_GET_FD_INFO_KHR`
- VUID-VkMemoryGetFdInfoKHR-pNext-pNext
pNext **must** be `NULL`
- VUID-VkMemoryGetFdInfoKHR-memory-parameter
memory **must** be a valid `VkDeviceMemory` handle
- VUID-VkMemoryGetFdInfoKHR-handleType-parameter
handleType **must** be a valid `VkExternalMemoryHandleTypeFlagBits` value

POSIX file descriptor memory handles compatible with Vulkan **may** also be created by non-Vulkan APIs using methods beyond the scope of this specification. To determine the correct parameters to use when importing such handles, call:

```
// Provided by VK_KHR_external_memory_fd
VkResult vkGetMemoryFdPropertiesKHR(
    VkDevice                device,
    VkExternalMemoryHandleTypeFlagBits handleType,
    int                     fd,
    VkMemoryFdPropertiesKHR* pMemoryFdProperties);
```

- **device** is the logical device that will be importing **fd**.
- **handleType** is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of the handle **fd**.
- **fd** is the handle which will be imported.
- **pMemoryFdProperties** is a pointer to a `VkMemoryFdPropertiesKHR` structure in which the properties of the handle **fd** are returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetMemoryFdPropertiesKHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkGetMemoryFdPropertiesKHR-fd-00673
fd **must** point to a valid POSIX file descriptor memory handle
- VUID-vkGetMemoryFdPropertiesKHR-handleType-00674
handleType **must** not be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT`

Valid Usage (Implicit)

- VUID-vkGetMemoryFdPropertiesKHR-device-parameter **device** must be a valid [VkDevice](#) handle
- VUID-vkGetMemoryFdPropertiesKHR-handleType-parameter **handleType** must be a valid [VkExternalMemoryHandleTypeFlagBits](#) value
- VUID-vkGetMemoryFdPropertiesKHR-pMemoryFdProperties-parameter **pMemoryFdProperties** must be a valid pointer to a [VkMemoryFdPropertiesKHR](#) structure

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_INVALID_EXTERNAL_HANDLE](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkMemoryFdPropertiesKHR](#) structure returned is defined as:

```
// Provided by VK_KHR_external_memory_fd
typedef struct VkMemoryFdPropertiesKHR {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           memoryTypeBits;
} VkMemoryFdPropertiesKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is [NULL](#) or a pointer to a structure extending this structure.
- **memoryTypeBits** is a bitmask containing one bit set for every memory type which the specified file descriptor **can** be imported as.

Valid Usage (Implicit)

- VUID-VkMemoryFdPropertiesKHR-sType-sType **sType** must be [VK_STRUCTURE_TYPE_MEMORY_FD_PROPERTIES_KHR](#)
- VUID-VkMemoryFdPropertiesKHR-pNext-pNext **pNext** must be [NULL](#)

11.2.5. Host External Memory

To import memory from a host pointer, add a [VkImportMemoryHostPointerInfoEXT](#) structure to the `pNext` chain of the [VkMemoryAllocateInfo](#) structure. The [VkImportMemoryHostPointerInfoEXT](#) structure is defined as:

```
// Provided by VK_EXT_external_memory_host
typedef struct VkImportMemoryHostPointerInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
    void*                    pHostPointer;
} VkImportMemoryHostPointerInfoEXT;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleType` is a [VkExternalMemoryHandleTypeFlagBits](#) value specifying the handle type.
- `pHostPointer` is the host pointer to import from.

Importing memory from a host pointer shares ownership of the memory between the host and the Vulkan implementation. The application **can** continue to access the memory through the host pointer but it is the application's responsibility to synchronize device and non-device access to the payload as defined in [Host Access to Device Memory Objects](#).

Applications **can** import the same payload into multiple instances of Vulkan and multiple times into a given Vulkan instance. However, implementations **may** fail to import the same payload multiple times into a given physical device due to platform constraints.

Importing memory from a particular host pointer **may** not be possible due to additional platform-specific restrictions beyond the scope of this specification in which case the implementation **must** fail the memory import operation with the error code `VK_ERROR_INVALID_EXTERNAL_HANDLE_KHR`.

Whether device memory objects imported from a host pointer hold a reference to their payload is undefined. As such, the application **must** ensure that the imported memory range remains valid and accessible for the lifetime of the imported memory object.

Implementations **may** support importing host pointers for memory types which are not host-visible. In this case, after a successful call to [vkAllocateMemory](#), the memory range imported from `pHostPointer` **must** not be accessed by the application until the [VkDeviceMemory](#) has been destroyed. Memory contents for the host memory becomes undefined on import, and is left undefined after the [VkDeviceMemory](#) has been destroyed. Applications **must** also not access host memory which is mapped to the same physical memory as `pHostPointer`, but mapped to a different host pointer while the [VkDeviceMemory](#) handle is valid. Implementations running on general-purpose operating systems **should** not support importing host pointers for memory types which are not host-visible.

NOTE

Using host pointers to back non-host visible allocations is a platform-specific use

case, and applications should not attempt to do this unless instructed by the platform.

Valid Usage

- VUID-VkImportMemoryHostPointerInfoEXT-handleType-01747
If `handleType` is not `0`, it **must** be supported for import, as reported in [VkExternalMemoryProperties](#)
- VUID-VkImportMemoryHostPointerInfoEXT-handleType-01748
If `handleType` is not `0`, it **must** be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT`
- VUID-VkImportMemoryHostPointerInfoEXT-pHostPointer-01749
`pHostPointer` **must** be a pointer aligned to an integer multiple of `VkPhysicalDeviceExternalMemoryHostPropertiesEXT::minImportedHostPointerAlignment`
- VUID-VkImportMemoryHostPointerInfoEXT-handleType-01750
If `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT`, `pHostPointer` **must** be a pointer to `allocationSize` number of bytes of host memory, where `allocationSize` is the member of the `VkMemoryAllocateInfo` structure this structure is chained to
- VUID-VkImportMemoryHostPointerInfoEXT-handleType-01751
If `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT`, `pHostPointer` **must** be a pointer to `allocationSize` number of bytes of host mapped foreign memory, where `allocationSize` is the member of the `VkMemoryAllocateInfo` structure this structure is chained to

Valid Usage (Implicit)

- VUID-VkImportMemoryHostPointerInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_MEMORY_HOST_POINTER_INFO_EXT`
- VUID-VkImportMemoryHostPointerInfoEXT-handleType-parameter
`handleType` **must** be a valid [VkExternalMemoryHandleTypeFlagBits](#) value
- VUID-VkImportMemoryHostPointerInfoEXT-pHostPointer-parameter
`pHostPointer` **must** be a pointer value

To determine the correct parameters to use when importing host pointers, call:

```
// Provided by VK_EXT_external_memory_host
VkResult vkGetMemoryHostPointerPropertiesEXT(
    VkDevice                                device,
    VkExternalMemoryHandleTypeFlagBits      handleType,
    const void*                             pHostPointer,
    VkMemoryHostPointerPropertiesEXT*        pMemoryHostPointerProperties);
```

- `device` is the logical device that will be importing `pHostPointer`.
- `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of the handle `pHostPointer`.
- `pHostPointer` is the host pointer to import from.
- `pMemoryHostPointerProperties` is a pointer to a `VkMemoryHostPointerPropertiesEXT` structure in which the host pointer properties are returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetMemoryHostPointerPropertiesEXT` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkGetMemoryHostPointerPropertiesEXT-handleType-01752
`handleType` **must** be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT`
- VUID-vkGetMemoryHostPointerPropertiesEXT-pHostPointer-01753
`pHostPointer` **must** be a pointer aligned to an integer multiple of `VkPhysicalDeviceExternalMemoryHostPropertiesEXT::minImportedHostPointerAlignment`
- VUID-vkGetMemoryHostPointerPropertiesEXT-handleType-01754
If `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT`, `pHostPointer` **must** be a pointer to host memory
- VUID-vkGetMemoryHostPointerPropertiesEXT-handleType-01755
If `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT`, `pHostPointer` **must** be a pointer to host mapped foreign memory

Valid Usage (Implicit)

- VUID-vkGetMemoryHostPointerPropertiesEXT-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetMemoryHostPointerPropertiesEXT-handleType-parameter
`handleType` **must** be a valid `VkExternalMemoryHandleTypeFlagBits` value
- VUID-vkGetMemoryHostPointerPropertiesEXT-pHostPointer-parameter
`pHostPointer` **must** be a pointer value
- VUID-vkGetMemoryHostPointerPropertiesEXT-pMemoryHostPointerProperties-parameter
`pMemoryHostPointerProperties` **must** be a valid pointer to a `VkMemoryHostPointerPropertiesEXT` structure

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_INVALID_EXTERNAL_HANDLE`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkMemoryHostPointerPropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_external_memory_host
typedef struct VkMemoryHostPointerPropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           memoryTypeBits;
} VkMemoryHostPointerPropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryTypeBits` is a bitmask containing one bit set for every memory type which the specified host pointer **can** be imported as.

The value returned by `memoryTypeBits` **should** only include bits that identify memory types which are host visible. Implementations **may** include bits that identify memory types which are not host visible. Behavior for imported pointers of such types is defined by `VkImportMemoryHostPointerInfoEXT`.

Valid Usage (Implicit)

- VUID-VkMemoryHostPointerPropertiesEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_MEMORY_HOST_POINTER_PROPERTIES_EXT`
- VUID-VkMemoryHostPointerPropertiesEXT-pNext-pNext
`pNext` **must** be `NULL`

11.2.6. NvSciBuf External Memory

To export a `NvSciBufObj` from memory, add a `VkExportMemorySciBufInfoNV` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure. The `VkExportMemorySciBufInfoNV` structure is defined as:

```
// Provided by VK_NV_external_memory_sci_buf
typedef struct VkExportMemorySciBufInfoNV {
    VkStructureType    sType;
    const void*        pNext;
    NvSciBufAttrList    pAttributes;
} VkExportMemorySciBufInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pAttributes` is an opaque `NvSciBufAttrList` describing the attributes of the `NvSciBuf` object that will be exported.

If `VkExportMemoryAllocateInfo` is not present in the same `pNext` chain, this structure is ignored.

If the `pNext` chain of `VkMemoryAllocateInfo` includes a `VkExportMemoryAllocateInfo` structure with a `handleType` mask containing the `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCI_BUF_BIT_NV` bit, but either `VkExportMemorySciBufInfoNV` is not included in the `pNext` chain, or it is included but `pAttributes` is `NULL`, `vkAllocateMemory` will return `VK_ERROR_INITIALIZATION_FAILED`.

The `pAttributes` parameter **must** be a reconciled `NvSciBufAttrList`. `NvSciBufAttrList` consists of both public and private attributes. It is the application's responsibility to set the public attributes. To set the private attributes, the application **must** use the `vkGetPhysicalDeviceSciBufAttributesNV` command. The `NvSciBufAttrList` is then reconciled using the `NvSciBuf` APIs.

Valid Usage

- VUID-VkExportMemorySciBufInfoNV-pAttributes-05100
`pAttributes` **must** be a reconciled `NvSciBufAttrList`

Valid Usage (Implicit)

- VUID-VkExportMemorySciBufInfoNV-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_EXPORT_MEMORY_SCI_BUF_INFO_NV`

To fill the private attributes of an unreconciled `NvSciBufAttrList`, call:

```
// Provided by VK_NV_external_memory_sci_buf
VkResult vkGetPhysicalDeviceSciBufAttributesNV(
    VkPhysicalDevice    physicalDevice,
    NvSciBufAttrList     pAttributes);
```

- `physicalDevice` is the handle to the physical device that will be used to determine the attributes.
- `pAttributes` is an opaque `NvSciBufAttrList` in which the implementation will set the requested attributes.

On success, `pAttributes` will contain an unreconciled `NvSciBufAttrList` whose private attributes are filled in by the implementation. If the private attributes of `physicalDevice` could not be obtained, `VK_ERROR_INITIALIZATION_FAILED` is returned.

Valid Usage

- VUID-vkGetPhysicalDeviceSciBufAttributesNV-pAttributes-05101
`pAttributes` **must** be a valid `NvSciBufAttrList` and **must** not be `NULL`

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSciBufAttributesNV-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

To import memory from a `NvSciBufObj`, add a `VkImportMemorySciBufInfoNV` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure.

The `VkImportMemorySciBufInfoNV` structure is defined as:

```
// Provided by VK_NV_external_memory_sci_buf
typedef struct VkImportMemorySciBufInfoNV {
    VkStructureType           sType;
    const void*               pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
    NvSciBufObj               handle;
} VkImportMemorySciBufInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleType` specifies the type of handle or name.
- `handle` is the external handle to import.

Importing memory from a `NvSciBufObj` does not transfer ownership of the `NvSciBufObj` from the application to the Vulkan implementation. Vulkan will increment the reference count of the underlying memory of the imported `NvSciBufObj`. The application **must** release its ownership using `NvSciBuf APIs` when that ownership is no longer needed.

Applications **can** import the same payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance. In all cases, each import operation **must** create a distinct `VkDeviceMemory` object.

After successfully importing the `NvSciBufObj` to `VkDeviceMemory`, the application **can** use it as a normal `VkDeviceMemory` object. It is the application's responsibility to synchronize the different `NvSciBufObj` accesses.

Valid Usage

- VUID-VkImportMemorySciBufInfoNV-handleType-05102
`handleType` **must** be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCI_BUF_BIT_NV`

Valid Usage (Implicit)

- VUID-VkImportMemorySciBufInfoNV-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_MEMORY_SCI_BUF_INFO_NV`
- VUID-VkImportMemorySciBufInfoNV-handleType-parameter
`handleType` **must** be a valid `VkExternalMemoryHandleTypeFlagBits` value

To export a `NvSciBufObj` representing the payload of a Vulkan device memory object, call:

```
// Provided by VK_NV_external_memory_sci_buf
VkResult vkGetMemorySciBufNV(
    VkDevice          device,
    const VkMemoryGetSciBufInfoNV* pGetSciBufInfo,
    NvSciBufObj*      pHandle);
```

- `device` is the logical device that created the device memory being exported.
- `pGetSciBufInfo` is a pointer to a `VkMemoryGetSciBufInfoNV` structure containing parameters of the export operation.
- `pHandle` will return the `NvSciBufObj` representing the payload of the device memory object.

A call to `vkGetMemorySciBufNV` will not transfer the ownership of the `NvSciBufObj` handle to the application. The application will hold a reference to the `NvSciBufObj`, but it does not add a reference count to the `NvSciBufObj`, so the application **must** not release it.

Valid Usage (Implicit)

- VUID-vkGetMemorySciBufNV-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkGetMemorySciBufNV-pGetSciBufInfo-parameter
pGetSciBufInfo **must** be a valid pointer to a valid [VkMemoryGetSciBufInfoNV](#) structure
- VUID-vkGetMemorySciBufNV-pHandle-parameter
pHandle **must** be a valid pointer to a [NvSciBufObj](#) value

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_INITIALIZATION_FAILED](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkMemoryGetSciBufInfoNV](#) structure is defined as:

```
// Provided by VK_NV_external_memory_sci_buf
typedef struct VkMemoryGetSciBufInfoNV {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceMemory      memory;
    VkExternalMemoryHandleTypeFlagBits handleType;
} VkMemoryGetSciBufInfoNV;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is [NULL](#) or a pointer to a structure extending this structure.
- **memory** is the memory object from which the handle will be exported.
- **handleType** is the type of handle requested.

Valid Usage

- VUID-VkMemoryGetSciBufInfoNV-handleType-05103
handleType **must** be [VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCI_BUF_BIT_NV](#)

Valid Usage (Implicit)

- VUID-VkMemoryGetSciBufInfoNV-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_MEMORY_GET_SCI_BUF_INFO_NV`
- VUID-VkMemoryGetSciBufInfoNV-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkMemoryGetSciBufInfoNV-memory-parameter
`memory` **must** be a valid `VkDeviceMemory` handle
- VUID-VkMemoryGetSciBufInfoNV-handleType-parameter
`handleType` **must** be a valid `VkExternalMemoryHandleTypeFlagBits` value

A `NvSciBufObj` handle compatible with Vulkan **can** also be created by non-Vulkan APIs using methods beyond the scope of this specification. To determine the correct parameters to use when importing such handles, call:

```
// Provided by VK_NV_external_memory_sci_buf
VkResult vkGetPhysicalDeviceExternalMemorySciBufPropertiesNV(
    VkPhysicalDevice          physicalDevice,
    VkExternalMemoryHandleTypeFlagBits handleType,
    NvSciBufObj               handle,
    VkMemorySciBufPropertiesNV* pMemorySciBufProperties);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `handleType` is the type of the handle `handle`.
- `handle` is the `NvSciBufObj` handle which will be imported.
- `pMemorySciBufProperties` is a pointer to a `VkMemorySciBufPropertiesNV` structure.

This command will return properties of `handle`, it contains the memory type bitmask that **can** be used to determine the `VkMemoryAllocateInfo::memoryTypeIndex` when calling `vkAllocateMemory`.

Valid Usage

- VUID-vkGetPhysicalDeviceExternalMemorySciBufPropertiesNV-handleType-05104
`handleType` **must** be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCI_BUF_BIT_NV`
- VUID-vkGetPhysicalDeviceExternalMemorySciBufPropertiesNV-sciBufImport-05105
`VkPhysicalDeviceExternalMemorySciBufFeaturesNV::sciBufImport` **must** be enabled

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceExternalMemorySciBufPropertiesNV-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceExternalMemorySciBufPropertiesNV-handleType-parameter

`handleType` **must** be a valid `VkExternalMemoryHandleTypeFlagBits` value

- VUID-vkGetPhysicalDeviceExternalMemorySciBufPropertiesNV-pMemorySciBufProperties-parameter

`pMemorySciBufProperties` **must** be a valid pointer to a `VkMemorySciBufPropertiesNV` structure

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_INVALID_EXTERNAL_HANDLE`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkMemorySciBufPropertiesNV` structure is defined as:

```
// Provided by VK_NV_external_memory_sci_buf
typedef struct VkMemorySciBufPropertiesNV {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           memoryTypeBits;
} VkMemorySciBufPropertiesNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryTypeBits` is a bitmask containing one bit set for every memory type for which the specified `NvSciBufObj` handle **can** be imported.

Valid Usage (Implicit)

- VUID-VkMemorySciBufPropertiesNV-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_MEMORY_SCI_BUF_PROPERTIES_NV`
- VUID-VkMemorySciBufPropertiesNV-pNext-pNext
`pNext` **must** be `NULL`

11.2.7. QNX Screen Buffer External Memory

To import memory created outside of the current Vulkan instance from a QNX Screen buffer, add a `VkImportScreenBufferInfoQNX` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure.

The `VkImportScreenBufferInfoQNX` structure is defined as:

```
// Provided by VK_QNX_external_memory_screen_buffer
typedef struct VkImportScreenBufferInfoQNX {
    VkStructureType      sType;
    const void*          pNext;
    struct _screen_buffer* buffer;
} VkImportScreenBufferInfoQNX;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `buffer` is a pointer to a `struct _screen_buffer`, the QNX Screen buffer to import

The implementation **may** not acquire a reference to the imported Screen buffer. Therefore, the application **must** ensure that the object referred to by `buffer` stays valid as long as the device memory to which it is imported is being used.

Valid Usage

- VUID-VkImportScreenBufferInfoQNX-buffer-08966
If `buffer` is not `NULL`, QNX Screen Buffers **must** be supported for import, as reported by `VkExternalImageFormatProperties` or `VkExternalBufferProperties`
- VUID-VkImportScreenBufferInfoQNX-buffer-08967
`buffer` is not `NULL`, it **must** be a pointer to `valid QNX Screen buffer`

Valid Usage (Implicit)

- VUID-VkImportScreenBufferInfoQNX-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_SCREEN_BUFFER_INFO_QNX`

To determine the memory parameters to use when importing a QNX Screen buffer, call:

```
// Provided by VK_QNX_external_memory_screen_buffer
VkResult vkGetScreenBufferPropertiesQNX(
    VkDevice          device,
    const struct _screen_buffer* buffer,
    VkScreenBufferPropertiesQNX* pProperties);
```

- `device` is the logical device that will be importing `buffer`.
- `buffer` is the QNX Screen buffer which will be imported.
- `pProperties` is a pointer to a `VkScreenBufferPropertiesQNX` structure in which the properties of `buffer` are returned.

Valid Usage

- VUID-vkGetScreenBufferPropertiesQNX-buffer-08968
buffer must be a [valid QNX Screen buffer](#)

Valid Usage (Implicit)

- VUID-vkGetScreenBufferPropertiesQNX-device-parameter
device must be a valid [VkDevice](#) handle
- VUID-vkGetScreenBufferPropertiesQNX-buffer-parameter
buffer must be a valid pointer to a valid [_screen_buffer](#) value
- VUID-vkGetScreenBufferPropertiesQNX-pProperties-parameter
pProperties must be a valid pointer to a [VkScreenBufferPropertiesQNX](#) structure

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkScreenBufferPropertiesQNX](#) structure returned is defined as:

```
// Provided by VK_QNX_external_memory_screen_buffer
typedef struct VkScreenBufferPropertiesQNX {
    VkStructureType    sType;
    void*              pNext;
    VkDeviceSize        allocationSize;
    uint32_t            memoryTypeBits;
} VkScreenBufferPropertiesQNX;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is [NULL](#) or a pointer to a structure extending this structure.
- **allocationSize** is the size of the external memory.
- **memoryTypeBits** is a bitmask containing one bit set for every memory type which the specified Screen buffer **can** be imported as.

Valid Usage (Implicit)

- VUID-VkScreenBufferPropertiesQNX-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SCREEN_BUFFER_PROPERTIES_QNX`
- VUID-VkScreenBufferPropertiesQNX-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkScreenBufferFormatPropertiesQNX`
- VUID-VkScreenBufferPropertiesQNX-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique

To obtain format properties of a QNX Screen buffer, include a `VkScreenBufferFormatPropertiesQNX` structure in the `pNext` chain of the `VkScreenBufferPropertiesQNX` structure passed to `vkGetScreenBufferPropertiesQNX`. This structure is defined as:

```
// Provided by VK_QNX_external_memory_screen_buffer
typedef struct VkScreenBufferFormatPropertiesQNX {
    VkStructureType    sType;
    void*              pNext;
    VkFormat            format;
    uint64_t           externalFormat;
    uint64_t           screenUsage;
    VkFormatFeatureFlags formatFeatures;
    VkComponentMapping  samplerYcbcrConversionComponents;
    VkSamplerYcbcrModelConversion suggestedYcbcrModel;
    VkSamplerYcbcrRange suggestedYcbcrRange;
    VkChromaLocation    suggestedXChromaOffset;
    VkChromaLocation    suggestedYChromaOffset;
} VkScreenBufferFormatPropertiesQNX;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `format` is the Vulkan format corresponding to the Screen buffer's format or `VK_FORMAT_UNDEFINED` if there is not an equivalent Vulkan format.
- `externalFormat` is an implementation-defined external format identifier for use with `VkExternalFormatQNX`. It **must** not be zero.
- `screenUsage` is an implementation-defined external usage identifier for the QNX Screen buffer.
- `formatFeatures` describes the capabilities of this external format when used with an image bound to memory imported from `buffer`.
- `samplerYcbcrConversionComponents` is the component swizzle that **should** be used in `VkSamplerYcbcrConversionCreateInfo`.
- `suggestedYcbcrModel` is a suggested color model to use in the `VkSamplerYcbcrConversionCreateInfo`.
- `suggestedYcbcrRange` is a suggested numerical value range to use in

[VkSamplerYcbcrConversionCreateInfo](#).

- `suggestedXChromaOffset` is a suggested X chroma offset to use in [VkSamplerYcbcrConversionCreateInfo](#).
- `suggestedYChromaOffset` is a suggested Y chroma offset to use in [VkSamplerYcbcrConversionCreateInfo](#).

If the QNX Screen buffer has one of the formats listed in the [QNX Screen Format Equivalence table](#), then `format` **must** have the equivalent Vulkan format listed in the table. Otherwise, `format` **may** be `VK_FORMAT_UNDEFINED`, indicating the QNX Screen buffer **can** only be used with an external format. The `formatFeatures` member **must** include `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT` and **should** include `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT`.

Valid Usage (Implicit)

- `VUID-VkScreenBufferFormatPropertiesQNX-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_SCREEN_BUFFER_FORMAT_PROPERTIES_QNX`

11.2.8. Device Group Memory Allocations

If the `pNext` chain of [VkMemoryAllocateInfo](#) includes a [VkMemoryAllocateFlagsInfo](#) structure, then that structure includes flags and a device mask controlling how many instances of the memory will be allocated.

The [VkMemoryAllocateFlagsInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkMemoryAllocateFlagsInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkMemoryAllocateFlags flags;
    uint32_t           deviceMask;
} VkMemoryAllocateFlagsInfo;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of [VkMemoryAllocateFlagBits](#) controlling the allocation.
- `deviceMask` is a mask of physical devices in the logical device, indicating that memory **must** be allocated on each device in the mask, if `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` is set in `flags`.

If `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` is not set, the number of instances allocated depends on whether `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` is set in the memory heap. If `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` is set, then memory is allocated for every physical device in the logical device (as if `deviceMask` has bits set for all device indices). If `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` is not set, then a single instance of memory is allocated (as if

`deviceMask` is set to one).

On some implementations, allocations from a multi-instance heap **may** consume memory on all physical devices even if the `deviceMask` excludes some devices. If `VkPhysicalDeviceGroupProperties::subsetAllocation` is `VK_TRUE`, then memory is only consumed for the devices in the device mask.

NOTE

In practice, most allocations on a multi-instance heap will be allocated across all physical devices. Unicast allocation support is an optional optimization for a minority of allocations.

Valid Usage

- VUID-VkMemoryAllocateFlagsInfo-deviceMask-00675
If `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` is set, `deviceMask` **must** be a valid device mask
- VUID-VkMemoryAllocateFlagsInfo-deviceMask-00676
If `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` is set, `deviceMask` **must** not be zero

Valid Usage (Implicit)

- VUID-VkMemoryAllocateFlagsInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_FLAGS_INFO`
- VUID-VkMemoryAllocateFlagsInfo-flags-parameter
`flags` **must** be a valid combination of `VkMemoryAllocateFlagBits` values

Bits which **can** be set in `VkMemoryAllocateFlagsInfo::flags`, controlling device memory allocation, are:

```
// Provided by VK_VERSION_1_1
typedef enum VkMemoryAllocateFlagBits {
    VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT = 0x00000001,
    // Provided by VK_VERSION_1_2
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT = 0x00000002,
    // Provided by VK_VERSION_1_2
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT = 0x00000004,
} VkMemoryAllocateFlagBits;
```

- `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` specifies that memory will be allocated for the devices in `VkMemoryAllocateFlagsInfo::deviceMask`.
- `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT` specifies that the memory **can** be attached to a buffer object created with the `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT` bit set in `usage`, and that the memory handle **can** be used to retrieve an opaque address via `vkGetDeviceMemoryOpaqueCaptureAddress`.
- `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT` specifies that the memory's address **can**

be saved and reused on a subsequent run (e.g. for trace capture and replay), see [VkBufferOpaqueCaptureAddressCreateInfo](#) for more detail.

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkMemoryAllocateFlags;
```

[VkMemoryAllocateFlags](#) is a bitmask type for setting a mask of zero or more [VkMemoryAllocateFlagBits](#).

11.2.9. Opaque Capture Address Allocation

To request a specific device address for a memory allocation, add a [VkMemoryOpaqueCaptureAddressAllocateInfo](#) structure to the [pNext](#) chain of the [VkMemoryAllocateInfo](#) structure. The [VkMemoryOpaqueCaptureAddressAllocateInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkMemoryOpaqueCaptureAddressAllocateInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint64_t           opaqueCaptureAddress;
} VkMemoryOpaqueCaptureAddressAllocateInfo;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is `NULL` or a pointer to a structure extending this structure.
- [opaqueCaptureAddress](#) is the opaque capture address requested for the memory allocation.

If [opaqueCaptureAddress](#) is zero, no specific address is requested.

If [opaqueCaptureAddress](#) is not zero, it **should** be an address retrieved from [vkGetDeviceMemoryOpaqueCaptureAddress](#) on an identically created memory allocation on the same implementation.

NOTE

In most cases, it is expected that a non-zero [opaqueAddress](#) is an address retrieved from [vkGetDeviceMemoryOpaqueCaptureAddress](#) on an identically created memory allocation. If this is not the case, it is likely that [VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS](#) errors will occur.

This is, however, not a strict requirement because trace capture/replay tools may need to adjust memory allocation parameters for imported memory.

If this structure is not present, it is as if [opaqueCaptureAddress](#) is zero.

Valid Usage (Implicit)

- VUID-VkMemoryOpaqueCaptureAddressAllocateInfo-sType-sType

sType **must** be VK_STRUCTURE_TYPE_MEMORY_OPAQUE_CAPTURE_ADDRESS_ALLOCATE_INFO

11.2.10. Host Access to Device Memory Objects

Memory objects created with `vkAllocateMemory` are not directly host accessible.

Memory objects created with the memory property `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` are considered *mappable*. Memory objects **must** be mappable in order to be successfully mapped on the host.

To retrieve a host virtual address pointer to a region of a mappable memory object, call:

```
// Provided by VK_VERSION_1_0
VkResult vkMapMemory(
    VkDevice          device,
    VkDeviceMemory    memory,
    VkDeviceSize      offset,
    VkDeviceSize      size,
    VkMemoryMapFlags  flags,
    void**            ppData);
```

- `device` is the logical device that owns the memory.
- `memory` is the `VkDeviceMemory` object to be mapped.
- `offset` is a zero-based byte offset from the beginning of the memory object.
- `size` is the size of the memory range to map, or `VK_WHOLE_SIZE` to map from `offset` to the end of the allocation.
- `flags` is reserved for future use.
- `ppData` is a pointer to a `void*` variable in which a host-accessible pointer to the beginning of the mapped range is returned. The value of the returned pointer minus `offset` **must** be aligned to `VkPhysicalDeviceLimits::minMemoryMapAlignment`.

After a successful call to `vkMapMemory` the memory object `memory` is considered to be currently *host mapped*.

NOTE

It is an application error to call `vkMapMemory` on a memory object that is already *host mapped*.

NOTE

`vkMapMemory` will fail if the implementation is unable to allocate an appropriately sized contiguous virtual address range, e.g. due to virtual address space fragmentation or platform limits. In such cases, `vkMapMemory` **must** return `VK_ERROR_MEMORY_MAP_FAILED`. The application **can** improve the likelihood of success by reducing the size of the mapped range and/or removing unneeded mappings using `vkUnmapMemory`.

`vkMapMemory` does not check whether the device memory is currently in use before returning the

host-accessible pointer. The application **must** guarantee that any previously submitted command that writes to this range has completed before the host reads from or writes to that range, and that any previously submitted command that reads from that range has completed before the host writes to that region (see [here](#) for details on fulfilling such a guarantee). If the device memory was allocated without the `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` set, these guarantees **must** be made for an extended range: the application **must** round down the start of the range to the nearest multiple of `VkPhysicalDeviceLimits::nonCoherentAtomSize`, and round the end of the range up to the nearest multiple of `VkPhysicalDeviceLimits::nonCoherentAtomSize`.

While a range of device memory is host mapped, the application is responsible for synchronizing both device and host access to that memory range.

NOTE

It is important for the application developer to become meticulously familiar with all of the mechanisms described in the chapter on [Synchronization and Cache Control](#) as they are crucial to maintaining memory access ordering.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkMapMemory` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkMapMemory-memory-00678
`memory` **must** not be currently host mapped
- VUID-vkMapMemory-offset-00679
`offset` **must** be less than the size of `memory`
- VUID-vkMapMemory-size-00680
If `size` is not equal to `VK_WHOLE_SIZE`, `size` **must** be greater than 0
- VUID-vkMapMemory-size-00681
If `size` is not equal to `VK_WHOLE_SIZE`, `size` **must** be less than or equal to the size of the `memory` minus `offset`
- VUID-vkMapMemory-memory-00682
`memory` **must** have been created with a memory type that reports `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT`

Valid Usage (Implicit)

- VUID-vkMapMemory-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkMapMemory-memory-parameter
`memory` **must** be a valid `VkDeviceMemory` handle
- VUID-vkMapMemory-flags-zero bitmask
`flags` **must** be 0
- VUID-vkMapMemory-ppData-parameter
`ppData` **must** be a valid pointer to a pointer value

- VUID-vkMapMemory-memory-parent
`memory` **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `memory` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_MEMORY_MAP_FAILED`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkMemoryMapFlags;
```

`VkMemoryMapFlags` is a bitmask type for setting a mask of zero or more `VkMemoryMapFlagBits`.

Two commands are provided to enable applications to work with non-coherent memory allocations: `vkFlushMappedMemoryRanges` and `vkInvalidateMappedMemoryRanges`.

NOTE

If the memory object was created with the `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` set, `vkFlushMappedMemoryRanges` and `vkInvalidateMappedMemoryRanges` are unnecessary and **may** have a performance cost. However, [availability and visibility operations](#) still need to be managed on the device. See the description of [host access types](#) for more information.

NOTE

While memory objects imported from a handle type of `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT` are inherently mapped to host address space, they are not considered to be host mapped device memory unless they are explicitly host mapped using `vkMapMemory`. That means flushing or invalidating host caches with respect to host accesses performed on such memory through the original host pointer specified at import time is the responsibility of the application and **must** be performed with appropriate synchronization primitives provided by the platform which are outside the scope of Vulkan. `vkFlushMappedMemoryRanges` and `vkInvalidateMappedMemoryRanges`, however,

can still be used on such memory objects to synchronize host accesses performed through the host pointer of the host mapped device memory range returned by `vkMapMemory`.

After a successful call to `vkMapMemory` the memory object `memory` is considered to be currently *host mapped*.

To flush ranges of non-coherent memory from the host caches, call:

```
// Provided by VK_VERSION_1_0
VkResult vkFlushMappedMemoryRanges(
    VkDevice          device,
    uint32_t          memoryRangeCount,
    const VkMappedMemoryRange* pMemoryRanges);
```

- `device` is the logical device that owns the memory ranges.
- `memoryRangeCount` is the length of the `pMemoryRanges` array.
- `pMemoryRanges` is a pointer to an array of `VkMappedMemoryRange` structures describing the memory ranges to flush.

`vkFlushMappedMemoryRanges` guarantees that host writes to the memory ranges described by `pMemoryRanges` are made available to the host memory domain, such that they **can** be made available to the device memory domain via `memory domain operations` using the `VK_ACCESS_HOST_WRITE_BIT` access type.

The first `synchronization scope` includes all host operations that happened-before it, as defined by the host memory model.

NOTE

Some systems allow writes that do not directly integrate with the host memory model; these have to be synchronized by the application manually. One example of this is non-temporal store instructions on x86; to ensure these happen-before submission, applications should call `_mm_sfence()`.

The second `synchronization scope` is empty.

The first `access scope` includes host writes to the specified memory ranges.

NOTE

When a host write to a memory location is made available in this way, each whole aligned set of `nonCoherentAtomSize` bytes that the memory location exists in will also be made available as if they were written by the host. For example, with a `nonCoherentAtomSize` of 128, if an application writes to the first byte of a memory object via a host mapping, the first 128 bytes of the memory object will be made available by this command. While the value of the following 127 bytes will be unchanged, this does count as an access for the purpose of synchronization, so care must be taken to avoid data races.

The second `access scope` is empty.

Unmapping non-coherent memory does not implicitly flush the host mapped memory, and host writes that have not been flushed **may** not ever be visible to the device. However, implementations **must** ensure that writes that have not been flushed do not become visible to any other memory.

NOTE

The above guarantee avoids a potential memory corruption in scenarios where host writes to a mapped memory object have not been flushed before the memory is unmapped (or freed), and the virtual address range is subsequently reused for a different mapping (or memory allocation).

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkFlushMappedMemoryRanges` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkFlushMappedMemoryRanges-device-parameter `device` **must** be a valid `VkDevice` handle
- VUID-vkFlushMappedMemoryRanges-pMemoryRanges-parameter `pMemoryRanges` **must** be a valid pointer to an array of `memoryRangeCount` valid `VkMappedMemoryRange` structures
- VUID-vkFlushMappedMemoryRanges-memoryRangeCount-arraylength `memoryRangeCount` **must** be greater than `0`

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

To invalidate ranges of non-coherent memory from the host caches, call:

```
// Provided by VK_VERSION_1_0
VkResult vkInvalidateMappedMemoryRanges(
    VkDevice          device,
    uint32_t          memoryRangeCount,
    const VkMappedMemoryRange* pMemoryRanges);
```

- `device` is the logical device that owns the memory ranges.
- `memoryRangeCount` is the length of the `pMemoryRanges` array.

- `pMemoryRanges` is a pointer to an array of `VkMappedMemoryRange` structures describing the memory ranges to invalidate.

`vkInvalidateMappedMemoryRanges` guarantees that device writes to the memory ranges described by `pMemoryRanges`, which have been made available to the host memory domain using the `VK_ACCESS_HOST_WRITE_BIT` and `VK_ACCESS_HOST_READ_BIT` access types, are made visible to the host. If a range of non-coherent memory is written by the host and then invalidated without first being flushed, its contents are undefined.

The first `synchronization scope` includes all host operations that happened-before it, as defined by the host memory model.

NOTE	This function does not synchronize with device operations directly - other host <code>synchronization operations</code> that depend on device operations such as <code>vkWaitForFences</code> must be executed beforehand. So for any non-coherent device write to be made visible to the host, there has to be a dependency chain along the following lines: 1. Device write 2. Device memory barrier including host reads in its second scope 3. Signal on the device (e.g. a <code>fence signal operation</code>) 4. Wait on the host (e.g. <code>vkWaitForFences</code>) 5. <code>vkInvalidateMappedMemoryRanges</code>

The second `synchronization scope` includes all host operations that happen-after it, as defined by the host memory model.

The first `access scope` is empty.

The second `access scope` includes host reads to the specified memory ranges.

NOTE	When a device write to a memory location is made visible to the host in this way, each whole aligned set of <code>nonCoherentAtomSize</code> bytes that the memory location exists in will also be made visible as if they were written by the device. For example, with a <code>nonCoherentAtomSize</code> of 128, if an application writes to the first byte of a memory object on the device, the first 128 bytes of the memory object will be made visible by this command. While the value of the following 127 bytes will be unchanged, this does count as an access for the purpose of synchronization, so care must be taken to avoid data races.
NOTE	Mapping non-coherent memory does not implicitly invalidate that memory.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkInvalidateMappedMemoryRanges` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkInvalidateMappedMemoryRanges-device-parameter **device** must be a valid [VkDevice](#) handle
- VUID-vkInvalidateMappedMemoryRanges-pMemoryRanges-parameter **pMemoryRanges** must be a valid pointer to an array of [memoryRangeCount](#) valid [VkMappedMemoryRange](#) structures
- VUID-vkInvalidateMappedMemoryRanges-memoryRangeCount-arraylength **memoryRangeCount** must be greater than 0

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkMappedMemoryRange](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkMappedMemoryRange {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceMemory      memory;
    VkDeviceSize        offset;
    VkDeviceSize        size;
} VkMappedMemoryRange;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is [NULL](#) or a pointer to a structure extending this structure.
- **memory** is the memory object to which this range belongs.
- **offset** is the zero-based byte offset from the beginning of the memory object.
- **size** is either the size of range, or [VK_WHOLE_SIZE](#) to affect the range from **offset** to the end of the current mapping of the allocation.

Valid Usage

- VUID-VkMappedMemoryRange-memory-00684
memory must be currently host mapped
- VUID-VkMappedMemoryRange-size-00685
If **size** is not equal to **VK_WHOLE_SIZE**, **offset** and **size must** specify a range contained within the currently mapped range of **memory**
- VUID-VkMappedMemoryRange-size-00686
If **size** is equal to **VK_WHOLE_SIZE**, **offset must** be within the currently mapped range of **memory**
- VUID-VkMappedMemoryRange-offset-00687
offset must be a multiple of **VkPhysicalDeviceLimits::nonCoherentAtomSize**
- VUID-VkMappedMemoryRange-size-01389
If **size** is equal to **VK_WHOLE_SIZE**, the end of the current mapping of **memory must** either be a multiple of **VkPhysicalDeviceLimits::nonCoherentAtomSize** bytes from the beginning of the memory object, or be equal to the end of the memory object
- VUID-VkMappedMemoryRange-size-01390
If **size** is not equal to **VK_WHOLE_SIZE**, **size must** either be a multiple of **VkPhysicalDeviceLimits::nonCoherentAtomSize**, or **offset** plus **size must** equal the size of **memory**

Valid Usage (Implicit)

- VUID-VkMappedMemoryRange-sType-sType
sType must be **VK_STRUCTURE_TYPE_MAPPED_MEMORY_RANGE**
- VUID-VkMappedMemoryRange-pNext-pNext
pNext must be **NULL**
- VUID-VkMappedMemoryRange-memory-parameter
memory must be a valid **VkDeviceMemory** handle

To unmap a memory object once host access to it is no longer needed by the application, call:

```
// Provided by VK_VERSION_1_0
void vkUnmapMemory(
    VkDevice          device,
    VkDeviceMemory    memory);
```

- **device** is the logical device that owns the memory.
- **memory** is the memory object to be unmapped.

Valid Usage

- VUID-vkUnmapMemory-memory-00689
memory must be currently host mapped

Valid Usage (Implicit)

- VUID-vkUnmapMemory-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkUnmapMemory-memory-parameter
memory **must** be a valid [VkDeviceMemory](#) handle
- VUID-vkUnmapMemory-memory-parent
memory **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **memory** **must** be externally synchronized

11.2.11. Lazily Allocated Memory

If the memory object is allocated from a heap with the [VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT](#) bit set, that object's backing memory **may** be provided by the implementation lazily. The actual committed size of the memory **may** initially be as small as zero (or as large as the requested size), and monotonically increases as additional memory is needed.

A memory type with this flag set is only allowed to be bound to a [VkImage](#) whose usage flags include [VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT](#).

NOTE

Using lazily allocated memory objects for framebuffer attachments that are not needed once a render pass instance has completed **may** allow some implementations to never allocate memory for such attachments.

To determine the amount of lazily-allocated memory that is currently committed for a memory object, call:

```
// Provided by VK_VERSION_1_0
void vkGetDeviceMemoryCommitment(
    VkDevice          device,
    VkDeviceMemory    memory,
    VkDeviceSize*     pCommittedMemoryInBytes);
```

- **device** is the logical device that owns the memory.
- **memory** is the memory object being queried.
- **pCommittedMemoryInBytes** is a pointer to a [VkDeviceSize](#) value in which the number of bytes currently committed is returned, on success.

The implementation **may** update the commitment at any time, and the value returned by this query **may** be out of date.

The implementation guarantees to allocate any committed memory from the `heapIndex` indicated by the memory type that the memory object was created with.

Valid Usage

- VUID-vkGetDeviceMemoryCommitment-memory-00690
`memory` **must** have been created with a memory type that reports `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT`

Valid Usage (Implicit)

- VUID-vkGetDeviceMemoryCommitment-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetDeviceMemoryCommitment-memory-parameter
`memory` **must** be a valid `VkDeviceMemory` handle
- VUID-vkGetDeviceMemoryCommitment-pCommittedMemoryInBytes-parameter
`pCommittedMemoryInBytes` **must** be a valid pointer to a `VkDeviceSize` value
- VUID-vkGetDeviceMemoryCommitment-memory-parent
`memory` **must** have been created, allocated, or retrieved from `device`

11.2.12. Protected Memory

Protected memory divides device memory into protected device memory and unprotected device memory.

Protected memory adds the following concepts:

- Memory:
 - Unprotected device memory, which **can** be visible to the device and **can** be visible to the host
 - Protected device memory, which **can** be visible to the device but **must** not be visible to the host
- Resources:
 - Unprotected images and unprotected buffers, to which unprotected memory **can** be bound
 - Protected images and protected buffers, to which protected memory **can** be bound
- Command buffers:
 - Unprotected command buffers, which **can** be submitted to a device queue to execute unprotected queue operations
 - Protected command buffers, which **can** be submitted to a protected-capable device queue to execute protected queue operations
- Device queues:

- Unprotected device queues, to which unprotected command buffers **can** be submitted
- Protected-capable device queues, to which unprotected command buffers or protected command buffers **can** be submitted
- Queue submissions
 - Unprotected queue submissions, through which unprotected command buffers **can** be submitted
 - Protected queue submissions, through which protected command buffers **can** be submitted
- Queue operations
 - Unprotected queue operations
 - Protected queue operations

Protected Memory Access Rules

If `VkPhysicalDeviceProtectedMemoryProperties::protectedNoFault` is `VK_FALSE`, applications **must** not perform any of the following operations:

- Write to unprotected memory within protected queue operations.
- Access protected memory within protected queue operations other than in framebuffer-space pipeline stages, the compute shader stage, or the transfer stage.
- Perform a query within protected queue operations.

If `VkPhysicalDeviceProtectedMemoryProperties::protectedNoFault` is `VK_TRUE`, these operations are valid, but reads will return undefined values, and writes will either be dropped or store undefined values.

Additionally, indirect operations **must** not be performed within protected queue operations.

Whether these operations are valid or not, or if any other invalid usage is performed, the implementation **must** guarantee that:

- Protected device memory **must** never be visible to the host.
- Values written to unprotected device memory **must** not be a function of values from protected memory.

11.2.13. External Memory Handle Types

QNX Screen Buffer

The QNX SDP defines `_screen_buffer` objects, which represent a buffer that the QNX Screen graphics subsystem can use directly in its windowing system APIs. More specifically, a Screen buffer is an area of memory that stores pixel data. It can be attached to Screen windows, streams, or pixmaps. These QNX Screen buffer objects **may** be imported into `VkDeviceMemory` objects for access via Vulkan. An `VkImage` or `VkBuffer` **can** be bound to the imported `VkDeviceMemory` object if it is created with `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX`.

`struct _screen_buffer` is strongly typed, so naming the handle type is redundant. The internal layout

and therefore size of a `struct _screen_buffer` image may depend on native usage flags that do not have corresponding Vulkan counterparts.

QNX Screen Buffer Validity

The design of Screen in the QNX SDP makes it difficult to determine the validity of objects from outside of Screen. Therefore, applications **must** ensure that QNX Screen buffer objects provided used in various Vulkan interfaces are ones created explicitly with QNX Screen APIs. See QNX SDP documentation for more information.

A `VkDeviceMemory` imported from a QNX Screen buffer has no way to acquire a reference to its `_screen_buffer` object. Therefore, during the host execution of a Vulkan command that has a QNX Screen buffer as a parameter (including indirect parameters via `pNext` chains), the application **must** ensure that the QNX Screen buffer resource remains valid.

Generally, for a `_screen_buffer` object to be valid for use within a Vulkan implementation, the buffer object **should** have a `_screen_buffer::SCREEN_PROPERTY_USAGE` that includes at least one of: `SCREEN_USAGE_VULKAN`, `SCREEN_USAGE_OPENGL_ES2`, `SCREEN_USAGE_OPENGL_ES3`, or `SCREEN_USAGE_NATIVE`. The exact Screen-native usage flags required depends on the Vulkan implementation, and QNX Screen itself will not necessarily enforce these requirements. Note that Screen-native usage flags are in no way related to usage flags in the Vulkan specification.

QNX Screen Buffer External Formats

QNX Screen buffers **may** represent images using implementation-specific formats, layouts, color models, etc., which do not have Vulkan equivalents. Such *external formats* are commonly used by external image sources such as video decoders or cameras. Vulkan **can** import QNX Screen buffers that have external formats, but since the image contents are in an undiscoverable and possibly proprietary representation, images with external formats **must** only be used as sampled images, **must** only be sampled with a sampler that has Y'C_BC_R conversion enabled, and **must** have optimal tiling.

Images that will be backed by a QNX Screen buffer **can** use an external format by setting `VkImageCreateInfo::format` to `VK_FORMAT_UNDEFINED` and including a `VkExternalFormatQNX` structure in the `pNext` chain. Images **can** be created with an external format even if the QNX Screen buffer has a format which has an *equivalent Vulkan format* to enable consistent handling of images from sources that might use either category of format. The external format of a QNX Screen buffer **can** be obtained by passing a `VkScreenBufferFormatPropertiesQNX` structure to `vkGetScreenBufferPropertiesQNX`.

QNX Screen Buffer Image Resources

QNX Screen buffers have intrinsic width, height, format, and usage properties, so Vulkan images bound to memory imported from a QNX Screen buffer **must** use dedicated allocations: `VkMemoryDedicatedRequirements::requiresDedicatedAllocation` **must** be `VK_TRUE` for images created with `VkExternalMemoryImageCreateInfo::handleTypes` that includes `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX`. When creating an image that will be bound to an imported QNX Screen buffer, the image creation parameters **must** be equivalent to the `_screen_buffer` properties as described by the valid usage of `VkMemoryAllocateInfo`.

Table 12. QNX Screen Buffer Format Equivalence

QNX Screen Format	Vulkan Format
SCREEN_FORMAT_RGBA8888	VK_FORMAT_B8G8R8A8_UNORM
SCREEN_FORMAT_RGBX8888 ¹	VK_FORMAT_B8G8R8A8_UNORM
SCREEN_FORMAT_BGRA8888	VK_FORMAT_R8G8B8A8_UNORM
SCREEN_FORMAT_BGRX8888 ¹	VK_FORMAT_R8G8B8A8_UNORM
SCREEN_FORMAT_RGBA1010102	VK_FORMAT_A2R10G10B10_UNORM_PACK32
SCREEN_FORMAT_RGBX1010102 ¹	VK_FORMAT_A2R10G10B10_UNORM_PACK32
SCREEN_FORMAT_BGRA1010102	VK_FORMAT_A2B10G10R10_UNORM_PACK32
SCREEN_FORMAT_BGRX1010102 ¹	VK_FORMAT_A2B10G10R10_UNORM_PACK32
SCREEN_FORMAT_RGBA5551	VK_FORMAT_A1R5G5B5_UNORM_PACK16
SCREEN_FORMAT_RGBX5551 ¹	VK_FORMAT_A1R5G5B5_UNORM_PACK16
SCREEN_FORMAT_RGB565	VK_FORMAT_R5G6B5_UNORM_PACK16
SCREEN_FORMAT_RGB888	VK_FORMAT_R8G8B8_UNORM

1

Vulkan does not differentiate between `SCREEN_FORMAT_RGBA8888` and `SCREEN_FORMAT_RGBX8888`: they both behave as `VK_FORMAT_R8G8B8A8_UNORM`. After an external entity writes to a `SCREEN_FORMAT_RGBX8888` QNX Screen buffer, the values read by Vulkan from the X/A component are undefined. To emulate the traditional behavior of the X component during sampling or blending, applications **should** use `VK_COMPONENT_SWIZZLE_ONE` in image view component mappings and `VK_BLEND_FACTOR_ONE` in color blend factors. There is no way to avoid copying these undefined values when copying from such an image to another image or buffer. The same behavior applies to the following pairs: `SCREEN_FORMAT_BGRA8888` and `SCREEN_FORMAT_BGRX8888`, `SCREEN_FORMAT_RGBA1010102` and `SCREEN_FORMAT_RGBX1010102`, `SCREEN_FORMAT_BGRA1010102` and `SCREEN_FORMAT_BGRX1010102`, `SCREEN_FORMAT_RGBA5551` and `SCREEN_FORMAT_RGBX5551`

11.2.14. Peer Memory Features

Peer memory is memory that is allocated for a given physical device and then bound to a resource and accessed by a different physical device, in a logical device that represents multiple physical devices. Some ways of reading and writing peer memory **may** not be supported by a device.

To determine how peer memory **can** be accessed, call:

```
// Provided by VK_VERSION_1_1
void vkGetDeviceGroupPeerMemoryFeatures(
    VkDevice          device,
    uint32_t          heapIndex,
    uint32_t          localDeviceIndex,
    uint32_t          remoteDeviceIndex,
    VkPeerMemoryFeatureFlags* pPeerMemoryFeatures);
```

- `device` is the logical device that owns the memory.

- `heapIndex` is the index of the memory heap from which the memory is allocated.
- `localDeviceIndex` is the device index of the physical device that performs the memory access.
- `remoteDeviceIndex` is the device index of the physical device that the memory is allocated for.
- `pPeerMemoryFeatures` is a pointer to a `VkPeerMemoryFeatureFlags` bitmask indicating which types of memory accesses are supported for the combination of heap, local, and remote devices.

Valid Usage

- VUID-vkGetDeviceGroupPeerMemoryFeatures-heapIndex-00691
`heapIndex` **must** be less than `memoryHeapCount`
- VUID-vkGetDeviceGroupPeerMemoryFeatures-localDeviceIndex-00692
`localDeviceIndex` **must** be a valid device index
- VUID-vkGetDeviceGroupPeerMemoryFeatures-remoteDeviceIndex-00693
`remoteDeviceIndex` **must** be a valid device index
- VUID-vkGetDeviceGroupPeerMemoryFeatures-localDeviceIndex-00694
`localDeviceIndex` **must** not equal `remoteDeviceIndex`

Valid Usage (Implicit)

- VUID-vkGetDeviceGroupPeerMemoryFeatures-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetDeviceGroupPeerMemoryFeatures-pPeerMemoryFeatures-parameter
`pPeerMemoryFeatures` **must** be a valid pointer to a `VkPeerMemoryFeatureFlags` value

Bits which **may** be set in `vkGetDeviceGroupPeerMemoryFeatures::pPeerMemoryFeatures`, indicating supported peer memory features, are:

```
// Provided by VK_VERSION_1_1
typedef enum VkPeerMemoryFeatureFlagBits {
    VK_PEER_MEMORY_FEATURE_COPY_SRC_BIT = 0x00000001,
    VK_PEER_MEMORY_FEATURE_COPY_DST_BIT = 0x00000002,
    VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT = 0x00000004,
    VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT = 0x00000008,
} VkPeerMemoryFeatureFlagBits;
```

- `VK_PEER_MEMORY_FEATURE_COPY_SRC_BIT` specifies that the memory **can** be accessed as the source of any `vkCmdCopy*` command.
- `VK_PEER_MEMORY_FEATURE_COPY_DST_BIT` specifies that the memory **can** be accessed as the destination of any `vkCmdCopy*` command.
- `VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT` specifies that the memory **can** be read as any memory access type.

- `VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT` specifies that the memory **can** be written as any memory access type. Shader atomics are considered to be writes.

NOTE

The peer memory features of a memory heap also apply to any accesses that **may** be performed during [image layout transitions](#).

`VK_PEER_MEMORY_FEATURE_COPY_DST_BIT` **must** be supported for all host local heaps and for at least one device-local memory heap.

If a device does not support a peer memory feature, it is still valid to use a resource that includes both local and peer memory bindings with the corresponding access type as long as only the local bindings are actually accessed. For example, an application doing split-frame rendering would use framebuffer attachments that include both local and peer memory bindings, but would scissor the rendering to only update local memory.

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkPeerMemoryFeatureFlags;
```

`VkPeerMemoryFeatureFlags` is a bitmask type for setting a mask of zero or more [VkPeerMemoryFeatureFlagBits](#).

11.2.15. Opaque Capture Address Query

To query a 64-bit opaque capture address value from a memory object, call:

```
// Provided by VK_VERSION_1_2
uint64_t vkGetDeviceMemoryOpaqueCaptureAddress(
    VkDevice device,
    const VkDeviceMemoryOpaqueCaptureAddressInfo* pInfo);
```

- `device` is the logical device that the memory object was allocated on.
- `pInfo` is a pointer to a [VkDeviceMemoryOpaqueCaptureAddressInfo](#) structure specifying the memory object to retrieve an address for.

The 64-bit return value is an opaque address representing the start of `pInfo->memory`.

If the memory object was allocated with a non-zero value of [VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress](#), the return value **must** be the same address.

NOTE

The expected usage for these opaque addresses is only for trace capture/replay tools to store these addresses in a trace and subsequently specify them during replay.

Valid Usage

- VUID-vkGetDeviceMemoryOpaqueCaptureAddress-None-03334

The `bufferDeviceAddress` and `bufferDeviceAddressCaptureReplay` features **must** be enabled

- VUID-vkGetDeviceMemoryOpaqueCaptureAddress-pInfo-10727
`pInfo->memory` **must** have been allocated using the `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT` flag
- VUID-vkGetDeviceMemoryOpaqueCaptureAddress-device-03335
If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkGetDeviceMemoryOpaqueCaptureAddress-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetDeviceMemoryOpaqueCaptureAddress-pInfo-parameter
`pInfo` **must** be a valid pointer to a valid `VkDeviceMemoryOpaqueCaptureAddressInfo` structure

The `VkDeviceMemoryOpaqueCaptureAddressInfo` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkDeviceMemoryOpaqueCaptureAddressInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceMemory     memory;
} VkDeviceMemoryOpaqueCaptureAddressInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memory` specifies the memory whose address is being queried.

Valid Usage

- VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-memory-03336
`memory` **must** have been allocated with `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT`

Valid Usage (Implicit)

- VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_MEMORY_OPAQUE_CAPTURE_ADDRESS_INFO`
- VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-memory-parameter

`memory` **must** be a valid `VkDeviceMemory` handle

Chapter 12. Resource Creation

Vulkan supports two primary resource types: *buffers* and *images*. Resources are views of memory with associated formatting and dimensionality. Buffers provide access to raw arrays of bytes, whereas images **can** be multidimensional and **may** have associated metadata.

12.1. Buffers

Buffers represent linear arrays of data which are used for various purposes by binding them to a graphics or compute pipeline via descriptor sets or certain commands, or by directly specifying them as parameters to certain commands.

Buffers are represented by `VkBuffer` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkBuffer)
```

To create buffers, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateBuffer(
    VkDevice                                device,
    const VkBufferCreateInfo*               pCreateInfo,
    const VkAllocationCallbacks*           pAllocator,
    VkBuffer*                               pBuffer);
```

- `device` is the logical device that creates the buffer object.
- `pCreateInfo` is a pointer to a `VkBufferCreateInfo` structure containing parameters affecting creation of the buffer.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pBuffer` is a pointer to a `VkBuffer` handle in which the resulting buffer object is returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkCreateBuffer` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkCreateBuffer-device-09664
`device` **must** support at least one queue family with one of the `VK_QUEUE_TRANSFER_BIT`, `VK_QUEUE_COMPUTE_BIT`, or `VK_QUEUE_GRAPHICS_BIT` capabilities
- VUID-vkCreateBuffer-device-05068
The number of buffers currently allocated from `device` plus 1 **must** be less than or equal to the total number of buffers requested via `VkDeviceObjectReservationCreateInfo::bufferRequestCount` specified when `device` was created

Valid Usage (Implicit)

- VUID-vkCreateBuffer-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCreateBuffer-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkBufferCreateInfo` structure
- VUID-vkCreateBuffer-pAllocator-null
`pAllocator` **must** be `NULL`
- VUID-vkCreateBuffer-pBuffer-parameter
`pBuffer` **must** be a valid pointer to a `VkBuffer` handle
- VUID-vkCreateBuffer-device-queuecount
The device **must** have been created with at least `1` queue

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkBufferCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkBufferCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkBufferCreateFlags flags;
    VkDeviceSize        size;
    VkBufferUsageFlags  usage;
    VkSharingMode        sharingMode;
    uint32_t            queueFamilyIndexCount;
    const uint32_t*      pQueueFamilyIndices;
} VkBufferCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkBufferCreateFlagBits` specifying additional parameters of the buffer.
- `size` is the size in bytes of the buffer to be created.

- **usage** is a bitmask of [VkBufferUsageFlagBits](#) specifying allowed usages of the buffer.
- **sharingMode** is a [VkSharingMode](#) value specifying the sharing mode of the buffer when it will be accessed by multiple queue families.
- **queueFamilyIndexCount** is the number of entries in the **pQueueFamilyIndices** array.
- **pQueueFamilyIndices** is a pointer to an array of queue families that will access this buffer. It is ignored if **sharingMode** is not `VK_SHARING_MODE_CONCURRENT`.

Valid Usage

- VUID-VkBufferCreateInfo-None-09499
usage **must** be a valid combination of [VkBufferUsageFlagBits](#) values
- VUID-VkBufferCreateInfo-None-09500
usage **must** not be 0
- VUID-VkBufferCreateInfo-size-00912
size **must** be greater than 0
- VUID-VkBufferCreateInfo-sharingMode-00913
If **sharingMode** is `VK_SHARING_MODE_CONCURRENT`, **pQueueFamilyIndices** **must** be a valid pointer to an array of **queueFamilyIndexCount** `uint32_t` values
- VUID-VkBufferCreateInfo-sharingMode-00914
If **sharingMode** is `VK_SHARING_MODE_CONCURRENT`, **queueFamilyIndexCount** **must** be greater than 1
- VUID-VkBufferCreateInfo-sharingMode-01419
If **sharingMode** is `VK_SHARING_MODE_CONCURRENT`, each element of **pQueueFamilyIndices** **must** be unique and **must** be less than **pQueueFamilyPropertyCount** returned by either [vkGetPhysicalDeviceQueueFamilyProperties2](#) or [vkGetPhysicalDeviceQueueFamilyProperties](#) for the **physicalDevice** that was used to create **device**
- VUID-VkBufferCreateInfo-flags-00915
flags **must** not contain `VK_BUFFER_CREATE_SPARSE_BINDING_BIT`
- VUID-VkBufferCreateInfo-flags-00916
flags **must** not contain `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`
- VUID-VkBufferCreateInfo-flags-00917
flags **must** not contain `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT`
- VUID-VkBufferCreateInfo-pNext-00920
If the **pNext** chain includes a [VkExternalMemoryBufferCreateInfo](#) structure, its **handleTypes** member **must** only contain bits that are also in [VkExternalBufferProperties::externalMemoryProperties.compatibleHandleTypes](#), as returned by [vkGetPhysicalDeviceExternalBufferProperties](#) with **pExternalBufferInfo->handleType** equal to any one of the handle types specified in [VkExternalMemoryBufferCreateInfo::handleTypes](#)
- VUID-VkBufferCreateInfo-flags-01887
If the **protectedMemory** feature is not enabled, **flags** **must** not contain

VK_BUFFER_CREATE_PROTECTED_BIT

- VUID-VkBufferCreateInfo-opaqueCaptureAddress-03337
If `VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress` is not zero, `flags` **must** include `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT`
- VUID-VkBufferCreateInfo-flags-03338
If `flags` includes `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT`, the `bufferDeviceAddressCaptureReplay` feature **must** be enabled
- VUID-VkBufferCreateInfo-flags-09641
If `flags` includes `VK_BUFFER_CREATE_PROTECTED_BIT`, then `usage` **must** not contain any of the following bits

Valid Usage (Implicit)

- VUID-VkBufferCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_BUFFER_CREATE_INFO`
- VUID-VkBufferCreateInfo-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkBufferOpaqueCaptureAddressCreateInfo` or `VkExternalMemoryBufferCreateInfo`
- VUID-VkBufferCreateInfo-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkBufferCreateInfo-flags-parameter
`flags` **must** be a valid combination of `VkBufferCreateFlagBits` values
- VUID-VkBufferCreateInfo-sharingMode-parameter
`sharingMode` **must** be a valid `VkSharingMode` value

Bits which **can** be set in `VkBufferCreateInfo::usage`, specifying usage behavior of a buffer, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkBufferUsageFlagBits {
    VK_BUFFER_USAGE_TRANSFER_SRC_BIT = 0x00000001,
    VK_BUFFER_USAGE_TRANSFER_DST_BIT = 0x00000002,
    VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT = 0x00000004,
    VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT = 0x00000008,
    VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT = 0x00000010,
    VK_BUFFER_USAGE_STORAGE_BUFFER_BIT = 0x00000020,
    VK_BUFFER_USAGE_INDEX_BUFFER_BIT = 0x00000040,
    VK_BUFFER_USAGE_VERTEX_BUFFER_BIT = 0x00000080,
    VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT = 0x00000100,
// Provided by VK_VERSION_1_2
    VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT = 0x00020000,
} VkBufferUsageFlagBits;
```

- `VK_BUFFER_USAGE_TRANSFER_SRC_BIT` specifies that the buffer **can** be used as the source of a *transfer command* (see the definition of `VK_PIPELINE_STAGE_TRANSFER_BIT`).
- `VK_BUFFER_USAGE_TRANSFER_DST_BIT` specifies that the buffer **can** be used as the destination of a transfer command.
- `VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT` specifies that the buffer **can** be used to create a `VkBufferView` suitable for occupying a `VkDescriptorSet` slot of type `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`.
- `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT` specifies that the buffer **can** be used to create a `VkBufferView` suitable for occupying a `VkDescriptorSet` slot of type `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`.
- `VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT` specifies that the buffer **can** be used in a `VkDescriptorBufferInfo` suitable for occupying a `VkDescriptorSet` slot either of type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`.
- `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` specifies that the buffer **can** be used in a `VkDescriptorBufferInfo` suitable for occupying a `VkDescriptorSet` slot either of type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`.
- `VK_BUFFER_USAGE_INDEX_BUFFER_BIT` specifies that the buffer is suitable for passing as the *buffer* parameter to `vkCmdBindIndexBuffer`.
- `VK_BUFFER_USAGE_VERTEX_BUFFER_BIT` specifies that the buffer is suitable for passing as an element of the *pBuffers* array to `vkCmdBindVertexBuffers`.
- `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` specifies that the buffer is suitable for passing as the *buffer* parameter to `vkCmdDrawIndirect`, `vkCmdDrawIndexedIndirect`, or `vkCmdDispatchIndirect`.
- `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT` specifies that the buffer **can** be used to retrieve a buffer device address via `vkGetBufferDeviceAddress` and use that address to access the buffer's memory from a shader.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkBufferUsageFlags;
```

`VkBufferUsageFlags` is a bitmask type for setting a mask of zero or more `VkBufferUsageFlagBits`.

Bits which **can** be set in `VkBufferCreateInfo::flags`, specifying additional parameters of a buffer, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkBufferCreateFlagBits {
    VK_BUFFER_CREATE_SPARSE_BINDING_BIT = 0x00000001,
    VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT = 0x00000002,
    VK_BUFFER_CREATE_SPARSE_ALIASED_BIT = 0x00000004,
    // Provided by VK_VERSION_1_1
    VK_BUFFER_CREATE_PROTECTED_BIT = 0x00000008,
    // Provided by VK_VERSION_1_2
    VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT = 0x00000010,
} VkBufferCreateFlagBits;
```

- **VK_BUFFER_CREATE_SPARSE_BINDING_BIT** specifies that the buffer will be backed using sparse memory binding. This flag is not supported in Vulkan SC [\[SCID-8\]](#).
- **VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT** specifies that the buffer **can** be partially backed using sparse memory binding. Buffers created with this flag **must** also be created with the **VK_BUFFER_CREATE_SPARSE_BINDING_BIT** flag. This flag is not supported in Vulkan SC [\[SCID-8\]](#).
- **VK_BUFFER_CREATE_SPARSE_ALIASED_BIT** specifies that the buffer will be backed using sparse memory binding with memory ranges that might also simultaneously be backing another buffer (or another portion of the same buffer). Buffers created with this flag **must** also be created with the **VK_BUFFER_CREATE_SPARSE_BINDING_BIT** flag. This flag is not supported in Vulkan SC [\[SCID-8\]](#).
- **VK_BUFFER_CREATE_PROTECTED_BIT** specifies that the buffer is a protected buffer.
- **VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT** specifies that the buffer's address **can** be saved and reused on a subsequent run (e.g. for trace capture and replay), see [VkBufferOpaqueCaptureAddressCreateInfo](#) for more detail.

See [Sparse Resource Features](#) and [Physical Device Features](#) for details of the sparse memory features supported on a device.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkBufferCreateFlags;
```

VkBufferCreateFlags is a bitmask type for setting a mask of zero or more [VkBufferCreateFlagBits](#).

To define a set of external memory handle types that **may** be used as backing store for a buffer, add a [VkExternalMemoryBufferCreateInfo](#) structure to the **pNext** chain of the [VkBufferCreateInfo](#) structure. The [VkExternalMemoryBufferCreateInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExternalMemoryBufferCreateInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkExternalMemoryHandleTypeFlags handleTypes;
} VkExternalMemoryBufferCreateInfo;
```

NOTE

A `VkExternalMemoryBufferCreateInfo` structure with a non-zero `handleTypes` field must be included in the creation parameters for a buffer that will be bound to memory that is either exported or imported.

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleTypes` is zero or a bitmask of `VkExternalMemoryHandleTypeFlagBits` specifying one or more external memory handle types.

Valid Usage (Implicit)

- VUID-VkExternalMemoryBufferCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_BUFFER_CREATE_INFO`
- VUID-VkExternalMemoryBufferCreateInfo-handleTypes-parameter
`handleTypes` **must** be a valid combination of `VkExternalMemoryHandleTypeFlagBits` values

To request a specific device address for a buffer, add a `VkBufferOpaqueCaptureAddressCreateInfo` structure to the `pNext` chain of the `VkBufferCreateInfo` structure. The `VkBufferOpaqueCaptureAddressCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkBufferOpaqueCaptureAddressCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint64_t           opaqueCaptureAddress;
} VkBufferOpaqueCaptureAddressCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `opaqueCaptureAddress` is the opaque capture address requested for the buffer.

If `opaqueCaptureAddress` is zero, no specific address is requested.

If `opaqueCaptureAddress` is not zero, then it **should** be an address retrieved from `vkGetBufferOpaqueCaptureAddress` for an identically created buffer on the same implementation.

If this structure is not present, it is as if `opaqueCaptureAddress` is zero.

Applications **should** avoid creating buffers with application-provided addresses and implementation-provided addresses in the same process, to reduce the likelihood of `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS` errors.

NOTE

The expected usage for this is that a trace capture/replay tool will add the `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT` flag to all buffers that use

`VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT`, and during capture will save the queried opaque device addresses in the trace. During replay, the buffers will be created specifying the original address so any address values stored in the trace data will remain valid.

Implementations are expected to separate such buffers in the GPU address space so normal allocations will avoid using these addresses. Applications and tools should avoid mixing application-provided and implementation-provided addresses for buffers created with `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT`, to avoid address space allocation conflicts.

Valid Usage (Implicit)

- VUID-VkBufferOpaqueCaptureAddressCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_BUFFER_OPAQUE_CAPTURE_ADDRESS_CREATE_INFO`

To destroy a buffer, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyBuffer(
    VkDevice          device,
    VkBuffer          buffer,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the buffer.
- `buffer` is the buffer to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroyBuffer-buffer-00922
All submitted commands that refer to `buffer`, either directly or via a `VkBufferView`, **must** have completed execution

Valid Usage (Implicit)

- VUID-vkDestroyBuffer-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkDestroyBuffer-buffer-parameter
If `buffer` is not `VK_NULL_HANDLE`, `buffer` **must** be a valid `VkBuffer` handle
- VUID-vkDestroyBuffer-pAllocator-null
`pAllocator` **must** be `NULL`
- VUID-vkDestroyBuffer-buffer-parent

If **buffer** is a valid handle, it **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **buffer** **must** be externally synchronized

12.2. Buffer Views

A *buffer view* represents a contiguous range of a buffer and a specific format to be used to interpret the data. Buffer views are used to enable shaders to access buffer contents using [image operations](#). In order to create a valid buffer view, the buffer **must** have been created with at least one of the following usage flags:

- **VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT**
- **VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT**

Buffer views are represented by **VkBufferView** handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkBufferView)
```

To create a buffer view, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateBufferView(
    VkDevice                                device,
    const VkBufferViewCreateInfo*           pCreateInfo,
    const VkAllocationCallbacks*           pAllocator,
    VkBufferView*                           pView);
```

- **device** is the logical device that creates the buffer view.
- **pCreateInfo** is a pointer to a **VkBufferViewCreateInfo** structure containing parameters to be used to create the buffer view.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.
- **pView** is a pointer to a **VkBufferView** handle in which the resulting buffer view object is returned.

If **VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations** is **VK_TRUE**, **vkCreateBufferView** **must** not return **VK_ERROR_OUT_OF_HOST_MEMORY**.

Valid Usage

- VUID-vkCreateBufferView-device-09665

device **must** support at least one queue family with one of the `VK_QUEUE_COMPUTE_BIT` or `VK_QUEUE_GRAPHICS_BIT` capabilities

- VUID-vkCreateBufferView-device-05068

The number of buffer views currently allocated from **device** plus 1 **must** be less than or equal to the total number of buffer views requested via `VkDeviceObjectReservationCreateInfo::bufferViewRequestCount` specified when **device** was created

Valid Usage (Implicit)

- VUID-vkCreateBufferView-device-parameter
device **must** be a valid `VkDevice` handle
- VUID-vkCreateBufferView-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid `VkBufferViewCreateInfo` structure
- VUID-vkCreateBufferView-pAllocator-null
pAllocator **must** be `NULL`
- VUID-vkCreateBufferView-pView-parameter
pView **must** be a valid pointer to a `VkBufferView` handle
- VUID-vkCreateBufferView-device-queuecount
The device **must** have been created with at least 1 queue

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkBufferViewCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkBufferViewCreateInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkBufferViewCreateFlags flags;
    VkBuffer              buffer;
    VkFormat              format;
    VkDeviceSize          offset;
    VkDeviceSize          range;
} VkBufferViewCreateInfo;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **buffer** is a **VkBuffer** on which the view will be created.
- **format** is a **VkFormat** describing the format of the data elements in the buffer.
- **offset** is an offset in bytes from the base address of the buffer. Accesses to the buffer view from shaders use addressing that is relative to this starting offset.
- **range** is a size in bytes of the buffer view. If **range** is equal to **VK_WHOLE_SIZE**, the range from **offset** to the end of the buffer is used. If **VK_WHOLE_SIZE** is used and the remaining size of the buffer is not a multiple of the **texel block size** of **format**, the nearest smaller multiple is used.

The buffer view has a *buffer view usage* identifying which descriptor types can be created from it. This usage is equal to the **VkBufferCreateInfo::usage** value used to create **buffer**.

Valid Usage

- VUID-VkBufferViewCreateInfo-offset-00925
offset must be less than the size of **buffer**
- VUID-VkBufferViewCreateInfo-range-00928
If **range** is not equal to **VK_WHOLE_SIZE**, **range must** be greater than 0
- VUID-VkBufferViewCreateInfo-range-00929
If **range** is not equal to **VK_WHOLE_SIZE**, **range must** be an integer multiple of the texel block size of **format**
- VUID-VkBufferViewCreateInfo-range-00930
If **range** is not equal to **VK_WHOLE_SIZE**, the number of texel buffer elements given by $(\lceil \text{range} / (\text{texel block size}) \rceil \times (\text{texels per block}))$ where texel block size and texels per block are as defined in the **Compatible Formats** table for **format**, **must** be less than or equal to **VkPhysicalDeviceLimits::maxTexelBufferElements**
- VUID-VkBufferViewCreateInfo-offset-00931
If **range** is not equal to **VK_WHOLE_SIZE**, the sum of **offset** and **range must** be less than or equal to the size of **buffer**
- VUID-VkBufferViewCreateInfo-range-04059

If **range** is equal to **VK_WHOLE_SIZE**, the number of texel buffer elements given by $\lceil (\text{size} - \text{offset}) / (\text{texel block size}) \rceil \times (\text{texels per block})$ where **size** is the size of **buffer**, and texel block size and texels per block are as defined in the [Compatible Formats](#) table for **format**, **must** be less than or equal to **VkPhysicalDeviceLimits::maxTexelBufferElements**

- VUID-VkBufferViewCreateInfo-buffer-00932

buffer **must** have been created with a **usage** value containing at least one of **VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT** or **VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT**

- VUID-VkBufferViewCreateInfo-format-08778

If the **buffer view usage** contains **VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT**, then **format features** of **format** **must** contain **VK_FORMAT_FEATURE_UNIFORM_TEXEL_BUFFER_BIT**

- VUID-VkBufferViewCreateInfo-format-08779

If the **buffer view usage** contains **VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT**, then **format features** of **format** **must** contain **VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT**

- VUID-VkBufferViewCreateInfo-buffer-00935

If **buffer** is non-sparse then it **must** be bound completely and contiguously to a single **VkDeviceMemory** object

- VUID-VkBufferViewCreateInfo-offset-02749

If the **texelBufferAlignment** feature is not enabled, **offset** **must** be a multiple of **VkPhysicalDeviceLimits::minTexelBufferOffsetAlignment**

- VUID-VkBufferViewCreateInfo-buffer-02750

If the **texelBufferAlignment** feature is enabled and if **buffer** was created with **usage** containing **VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT**, **offset** **must** be a multiple of the lesser of **VkPhysicalDeviceTexelBufferAlignmentProperties::storageTexelBufferOffsetAlignmentBytes** or, if **VkPhysicalDeviceTexelBufferAlignmentProperties::storageTexelBufferOffsetSingleTexelAlignment** is **VK_TRUE**, the size of a texel of the requested **format**. If the size of a texel is a multiple of three bytes, then the size of a single component of **format** is used instead

- VUID-VkBufferViewCreateInfo-buffer-02751

If the **texelBufferAlignment** feature is enabled and if **buffer** was created with **usage** containing **VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT**, **offset** **must** be a multiple of the lesser of **VkPhysicalDeviceTexelBufferAlignmentProperties::uniformTexelBufferOffsetAlignmentBytes** or, if **VkPhysicalDeviceTexelBufferAlignmentProperties::uniformTexelBufferOffsetSingleTexelAlignment** is **VK_TRUE**, the size of a texel of the requested **format**. If the size of a texel is a multiple of three bytes, then the size of a single component of **format** is used instead

Valid Usage (Implicit)

- VUID-VkBufferViewCreateInfo-sType-sType

sType **must** be **VK_STRUCTURE_TYPE_BUFFER_VIEW_CREATE_INFO**

- VUID-VkBufferViewCreateInfo-pNext-pNext

pNext **must** be **NULL**

- VUID-VkBufferViewCreateInfo-flags-zeroBitmask

flags must be 0

- VUID-VkBufferViewCreateInfo-buffer-parameter
buffer must be a valid [VkBuffer](#) handle
- VUID-VkBufferViewCreateInfo-format-parameter
format must be a valid [VkFormat](#) value

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkBufferViewCreateFlags;
```

VkBufferViewCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

To destroy a buffer view, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyBufferView(
    VkDevice          device,
    VkBufferView      bufferView,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the buffer view.
- **bufferView** is the buffer view to destroy.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroyBufferView-bufferView-00936
All submitted commands that refer to **bufferView must** have completed execution

Valid Usage (Implicit)

- VUID-vkDestroyBufferView-device-parameter
device must be a valid [VkDevice](#) handle
- VUID-vkDestroyBufferView-bufferView-parameter
If **bufferView** is not [VK_NULL_HANDLE](#), **bufferView must** be a valid [VkBufferView](#) handle
- VUID-vkDestroyBufferView-pAllocator-null
pAllocator must be [NULL](#)
- VUID-vkDestroyBufferView-bufferView-parent
If **bufferView** is a valid handle, it **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to `bufferView` **must** be externally synchronized

12.2.1. Buffer View Format Features

Valid uses of a `VkBufferView` **may** depend on the buffer view's *format features*, defined below. Such constraints are documented in the affected valid usage statement.

- The buffer view's set of *format features* is the value of `VkFormatProperties::bufferFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` on the same `format` as `VkBufferViewCreateInfo::format`.

12.3. Buffer Device Addresses

To query a 64-bit buffer device address value which can be used to identify a buffer to API commands or through which buffer memory **can** be accessed, call:

```
// Provided by VK_VERSION_1_2
VkDeviceAddress vkGetBufferDeviceAddress(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);
```

- `device` is the logical device that the buffer was created on.
- `pInfo` is a pointer to a `VkBufferDeviceAddressInfo` structure specifying the buffer to retrieve an address for.

The 64-bit return value, `bufferBaseAddress`, is an address of the start of `pInfo->buffer`. Addresses in the range `[bufferBaseAddress, bufferBaseAddress + VkBufferCreateInfo::size)` **can** be used to access the memory bound to this buffer on the device.

A value of zero is reserved as a “null” pointer and **must** not be returned as a valid buffer device address.

If the buffer was created with a non-zero value of `VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress`, the return value will be the same address that was returned at capture time.

The returned address **must** satisfy the alignment requirement specified by `VkMemoryRequirements::alignment` for the buffer in `VkBufferDeviceAddressInfo::buffer`.

If multiple `VkBuffer` objects are bound to overlapping ranges of `VkDeviceMemory`, implementations **may** return address ranges which overlap. In this case, it is ambiguous which `VkBuffer` is associated with any given device address. For purposes of valid usage, if multiple `VkBuffer` objects **can** be attributed to a device address, a `VkBuffer` is selected such that valid usage passes, if it exists.

Valid Usage

- VUID-vkGetBufferDeviceAddress-bufferDeviceAddress-03324

The `bufferDeviceAddress` feature **must** be enabled, and at least one of the following conditions **must** be met

- `buffer` is bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkGetBufferDeviceAddress-device-03325
If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkGetBufferDeviceAddress-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetBufferDeviceAddress-pInfo-parameter
`pInfo` **must** be a valid pointer to a valid `VkBufferDeviceAddressInfo` structure

The `VkBufferDeviceAddressInfo` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkBufferDeviceAddressInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkBuffer            buffer;
} VkBufferDeviceAddressInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `buffer` specifies the buffer whose address is being queried.

Valid Usage

- VUID-VkBufferDeviceAddressInfo-buffer-02601
`buffer` **must** have been created with `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT`

Valid Usage (Implicit)

- VUID-VkBufferDeviceAddressInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_BUFFER_DEVICE_ADDRESS_INFO`
- VUID-VkBufferDeviceAddressInfo-pNext-pNext
`pNext` **must** be `NULL`

- VUID-VkBufferDeviceAddressInfo-buffer-parameter
buffer **must** be a valid [VkBuffer](#) handle

To query a 64-bit buffer opaque capture address, call:

```
// Provided by VK_VERSION_1_2
uint64_t vkGetBufferOpaqueCaptureAddress(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);
```

- **device** is the logical device that the buffer was created on.
- **pInfo** is a pointer to a [VkBufferDeviceAddressInfo](#) structure specifying the buffer to retrieve an address for.

The 64-bit return value is an opaque capture address of the start of **pInfo->buffer**.

If the buffer was created with a non-zero value of [VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress](#) the return value **must** be the same address.

Valid Usage

- VUID-vkGetBufferOpaqueCaptureAddress-None-03326
The **bufferDeviceAddress** and **bufferDeviceAddressCaptureReplay** features **must** be enabled
- VUID-vkGetBufferOpaqueCaptureAddress-pInfo-10725
pInfo->buffer **must** have been created with the **VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT** flag
- VUID-vkGetBufferOpaqueCaptureAddress-device-03327
If **device** was created with multiple physical devices, then the **bufferDeviceAddressMultiDevice** feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkGetBufferOpaqueCaptureAddress-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkGetBufferOpaqueCaptureAddress-pInfo-parameter
pInfo **must** be a valid pointer to a valid [VkBufferDeviceAddressInfo](#) structure

12.4. Images

Images are specialized resources that have multi-dimensional access, as outlined in the [Images](#) chapter. Images **can** be used for various purposes, such as [rendering attachments](#), [for copy operations](#), or accessed through shaders via [resource descriptors](#).

Images are represented by `VkImage` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkImage)
```

To create images, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateImage(
    VkDevice                                device,
    const VkImageCreateInfo*                pCreateInfo,
    const VkAllocationCallbacks*            pAllocator,
    VkImage*                                pImage);
```

- `device` is the logical device that creates the image.
- `pCreateInfo` is a pointer to a `VkImageCreateInfo` structure containing parameters to be used to create the image.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pImage` is a pointer to a `VkImage` handle in which the resulting image object is returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkCreateImage` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkCreateImage-device-09666
`device` **must** support at least one queue family with one of the `VK_QUEUE_TRANSFER_BIT`, `VK_QUEUE_COMPUTE_BIT`, or `VK_QUEUE_GRAPHICS_BIT` capabilities
- VUID-vkCreateImage-device-05068
The number of images currently allocated from `device` plus 1 **must** be less than or equal to the total number of images requested via `VkDeviceObjectReservationCreateInfo::imageRequestCount` specified when `device` was created

Valid Usage (Implicit)

- VUID-vkCreateImage-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCreateImage-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkImageCreateInfo` structure
- VUID-vkCreateImage-pAllocator-null
`pAllocator` **must** be `NULL`
- VUID-vkCreateImage-pImage-parameter

`pImage` **must** be a valid pointer to a `VkImage` handle

- `VUID-vkCreateImage-device-queuecount`
The device **must** have been created with at least `1` queue

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkImageCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkImageCreateInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkImageCreateFlags    flags;
    VkImageType           imageType;
    VkFormat              format;
    VkExtent3D            extent;
    uint32_t              mipLevels;
    uint32_t              arrayLayers;
    VkSampleCountFlagBits samples;
    VkImageTiling          tiling;
    VkImageUsageFlags      usage;
    VkSharingMode          sharingMode;
    uint32_t              queueFamilyIndexCount;
    const uint32_t*        pQueueFamilyIndices;
    VkImageLayout          initialLayout;
} VkImageCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkImageCreateFlagBits` describing additional parameters of the image.
- `imageType` is a `VkImageType` value specifying the basic dimensionality of the image. Layers in array textures do not count as a dimension for the purposes of the image type.
- `format` is a `VkFormat` describing the format and type of the texel blocks that will be contained in the image.

- **extent** is a [VkExtent3D](#) describing the number of texels/pixels in each dimension of the base level.
- **mipLevels** describes the number of levels of detail available for minified sampling of the image.
- **arrayLayers** is the number of layers in the image.
- **samples** is a [VkSampleCountFlagBits](#) value specifying the number of [samples per texel](#).
- **tiling** is a [VkImageTiling](#) value specifying the tiling arrangement of the texel blocks in memory.
- **usage** is a bitmask of [VkImageUsageFlagBits](#) describing the intended usage of the image.
- **sharingMode** is a [VkSharingMode](#) value specifying the sharing mode of the image when it will be accessed by multiple queue families.
- **queueFamilyIndexCount** is the number of entries in the **pQueueFamilyIndices** array.
- **pQueueFamilyIndices** is a pointer to an array of queue families that will access this image. It is ignored if **sharingMode** is not [VK_SHARING_MODE_CONCURRENT](#).
- **initialLayout** is a [VkImageLayout](#) value specifying the initial [VkImageLayout](#) of all image subresources of the image. See [Image Layouts](#).

Images created with **tiling** equal to [VK_IMAGE_TILING_LINEAR](#) have further restrictions on their limits and capabilities compared to images created with **tiling** equal to [VK_IMAGE_TILING_OPTIMAL](#). Creation of images with tiling [VK_IMAGE_TILING_LINEAR](#) **may** not be supported unless other parameters meet all of the constraints:

- **imageType** is [VK_IMAGE_TYPE_2D](#)
- **format** is not a depth/stencil format
- **mipLevels** is 1
- **arrayLayers** is 1
- **samples** is [VK_SAMPLE_COUNT_1_BIT](#)
- **usage** only includes [VK_IMAGE_USAGE_TRANSFER_SRC_BIT](#) and/or [VK_IMAGE_USAGE_TRANSFER_DST_BIT](#)

Images created with one of the [formats that require a sampler Y'C_BC_R conversion](#), have further restrictions on their limits and capabilities compared to images created with other formats. Creation of images with a format requiring [Y'C_BC_R conversion](#) **may** not be supported unless other parameters meet all of the constraints:

- **imageType** is [VK_IMAGE_TYPE_2D](#)
- **mipLevels** is 1
- **arrayLayers** is 1, unless the **ycbcrImageArrays** feature is enabled, or otherwise indicated by [VkImageFormatProperties::maxArrayLayers](#), as returned by [vkGetPhysicalDeviceImageFormatProperties](#)
- **samples** is [VK_SAMPLE_COUNT_1_BIT](#)

Implementations **may** support additional limits and capabilities beyond those listed above.

To determine the set of valid **usage** bits for a given format, call [vkGetPhysicalDeviceFormatProperties](#).

If the size of the resultant image would exceed `maxResourceSize`, then `vkCreateImage` **must** fail and return `VK_ERROR_OUT_OF_DEVICE_MEMORY`. This failure **may** occur even when all image creation parameters satisfy their valid usage requirements.

NOTE

For images created without `VK_IMAGE_CREATE_EXTENDED_USAGE_BIT` a `usage` bit is valid if it is supported for the format the image is created with.

For images created with `VK_IMAGE_CREATE_EXTENDED_USAGE_BIT` a `usage` bit is valid if it is supported for at least one of the formats a `VkImageView` created from the image **can** have (see [Image Views](#) for more detail).

Image Creation Limits

Valid values for some image creation parameters are limited by a numerical upper bound or by inclusion in a bitset. For example, `VkImageCreateInfo::arrayLayers` is limited by `imageCreateMaxArrayLayers`, defined below; and `VkImageCreateInfo::samples` is limited by `imageCreateSampleCounts`, also defined below.

Several limiting values are defined below, as well as assisting values from which the limiting values are derived. The limiting values are referenced by the relevant valid usage statements of `VkImageCreateInfo`.

- Let `uint64_t imageCreateDrmFormatModifiers[]` be the set of [Linux DRM format modifiers](#) that the resultant image **may** have.
 - If `tiling` is not `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `imageCreateDrmFormatModifiers` is empty.
 - If `VkImageCreateInfo::pNext` contains `VkImageDrmFormatModifierExplicitCreateInfoEXT`, then `imageCreateDrmFormatModifiers` contains exactly one modifier, `VkImageDrmFormatModifierExplicitCreateInfoEXT::drmFormatModifier`.
 - If `VkImageCreateInfo::pNext` contains `VkImageDrmFormatModifierListCreateInfoEXT`, then `imageCreateDrmFormatModifiers` contains the entire array `VkImageDrmFormatModifierListCreateInfoEXT::pDrmFormatModifiers`.
- Let `VkBool32 imageCreateMaybeLinear` indicate if the resultant image may be [linear](#).
 - If `tiling` is `VK_IMAGE_TILING_LINEAR`, then `imageCreateMaybeLinear` is `VK_TRUE`.
 - If `tiling` is `VK_IMAGE_TILING_OPTIMAL`, then `imageCreateMaybeLinear` is `VK_FALSE`.
 - If `tiling` is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `imageCreateMaybeLinear` is `VK_TRUE` if and only if `imageCreateDrmFormatModifiers` contains `DRM_FORMAT_MOD_LINEAR`.
- Let `VkFormatFeatureFlags imageCreateFormatFeatures` be the set of valid *format features* available during image creation.
 - If `tiling` is `VK_IMAGE_TILING_LINEAR`, then `imageCreateFormatFeatures` is the value of `VkFormatProperties::linearTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` with parameter `format` equal to `VkImageCreateInfo::format`.

- If `tiling` is `VK_IMAGE_TILING_OPTIMAL`, and if the `pNext` chain includes no `VkExternalFormatQNX` structure with non-zero `externalFormat`, then `imageCreateFormatFeatures` is the value of `VkFormatProperties::optimalTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` with parameter `format` equal to `VkImageCreateInfo::format`.
 - If `tiling` is `VK_IMAGE_TILING_OPTIMAL`, and if the `pNext` chain includes a `VkExternalFormatQNX` structure with non-zero `externalFormat`, then `imageCreateFormatFeatures` is the value of `VkScreenBufferFormatPropertiesQNX::formatFeatures` obtained by `vkGetScreenBufferPropertiesQNX` with a matching `externalFormat` value.
 - If `tiling` is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then the value of `imageCreateFormatFeatures` is found by calling `vkGetPhysicalDeviceFormatProperties2` with `VkImageFormatProperties::format` equal to `VkImageCreateInfo::format` and with `VkDrmFormatModifierPropertiesListEXT` chained into `VkFormatProperties2`; by collecting all members of the returned array `VkDrmFormatModifierPropertiesListEXT::pDrmFormatModifierProperties` whose `drmFormatModifier` belongs to `imageCreateDrmFormatModifiers`; and by taking the bitwise intersection, over the collected array members, of `drmFormatModifierTilingFeatures`. (The resultant `imageCreateFormatFeatures` **may** be empty).
- Let `VkImageFormatProperties2 imageCreateImageFormatPropertiesList[]` be defined as follows.
 - If `VkImageCreateInfo::pNext` contains no `VkExternalFormatQNX` structure with non-zero `externalFormat`, then `imageCreateImageFormatPropertiesList` is the list of structures obtained by calling `vkGetPhysicalDeviceImageFormatProperties2`, possibly multiple times, as follows:
 - The parameters `VkPhysicalDeviceImageFormatInfo2::format`, `imageType`, `tiling`, `usage`, and `flags` **must** be equal to those in `VkImageCreateInfo`.
 - If `VkImageCreateInfo::pNext` contains a `VkExternalMemoryImageCreateInfo` structure whose `handleTypes` is not `0`, then `VkPhysicalDeviceImageFormatInfo2::pNext` **must** contain a `VkPhysicalDeviceExternalImageFormatInfo` structure whose `handleType` is not `0`; and `vkGetPhysicalDeviceImageFormatProperties2` **must** be called for each handle type in `VkExternalMemoryImageCreateInfo::handleTypes`, successively setting `VkPhysicalDeviceExternalImageFormatInfo::handleType` on each call.
 - If `VkImageCreateInfo::pNext` contains no `VkExternalMemoryImageCreateInfo` structure, or contains a structure whose `handleTypes` is `0`, then `VkPhysicalDeviceImageFormatInfo2::pNext` **must** either contain no `VkPhysicalDeviceExternalImageFormatInfo` structure, or contain a structure whose `handleType` is `0`.
 - If `tiling` is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then:
 - `VkPhysicalDeviceImageFormatInfo2::pNext` **must** contain a `VkPhysicalDeviceImageDrmFormatModifierInfoEXT` structure where `sharingMode` is equal to `VkImageCreateInfo::sharingMode`;
 - if `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, then `queueFamilyIndexCount` and

- `pQueueFamilyIndices` **must** be equal to those in `VkImageCreateInfo`;
- if `flags` contains `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`, then the `VkImageFormatListCreateInfo` structure included in the `pNext` chain of `VkPhysicalDeviceImageFormatInfo2` **must** be equivalent to the one included in the `pNext` chain of `VkImageCreateInfo`;
- `vkGetPhysicalDeviceImageFormatProperties2` **must** be called for each modifier in `imageCreateDrmFormatModifiers`, successively setting `VkPhysicalDeviceImageDrmFormatModifierInfoEXT::drmFormatModifier` on each call.
- If `tiling` is not `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `VkPhysicalDeviceImageFormatInfo2::pNext` **must** contain no `VkPhysicalDeviceImageDrmFormatModifierInfoEXT` structure.
- If any call to `vkGetPhysicalDeviceImageFormatProperties2` returns an error, then `imageCreateImageFormatPropertiesList` is defined to be the empty list.
- Let `uint32_t imageCreateMaxMipLevels` be the minimum value of `VkImageFormatProperties::maxMipLevels` in `imageCreateImageFormatPropertiesList`. The value is undefined if `imageCreateImageFormatPropertiesList` is empty.
- Let `uint32_t imageCreateMaxArrayLayers` be the minimum value of `VkImageFormatProperties::maxArrayLayers` in `imageCreateImageFormatPropertiesList`. The value is undefined if `imageCreateImageFormatPropertiesList` is empty.
- Let `VkExtent3D imageCreateMaxExtent` be the component-wise minimum over all `VkImageFormatProperties::maxExtent` values in `imageCreateImageFormatPropertiesList`. The value is undefined if `imageCreateImageFormatPropertiesList` is empty.
- Let `VkSampleCountFlags imageCreateSampleCounts` be the intersection of each `VkImageFormatProperties::sampleCounts` in `imageCreateImageFormatPropertiesList`. The value is undefined if `imageCreateImageFormatPropertiesList` is empty.

Valid Usage

- VUID-VkImageCreateInfo-imageCreateMaxMipLevels-02251
Each of the following values (as described in [Image Creation Limits](#)) **must** not be undefined : `imageCreateMaxMipLevels`, `imageCreateMaxArrayLayers`, `imageCreateMaxExtent`, and `imageCreateSampleCounts`
- VUID-VkImageCreateInfo-sharingMode-00941
If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, `pQueueFamilyIndices` **must** be a valid pointer to an array of `queueFamilyIndexCount` `uint32_t` values
- VUID-VkImageCreateInfo-sharingMode-00942
If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, `queueFamilyIndexCount` **must** be greater than 1
- VUID-VkImageCreateInfo-sharingMode-01420
If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, each element of `pQueueFamilyIndices` **must** be unique and **must** be less than `pQueueFamilyPropertyCount` returned by either

[vkGetPhysicalDeviceQueueFamilyProperties](#)

or

[vkGetPhysicalDeviceQueueFamilyProperties2](#) for the `physicalDevice` that was used to create `device`

- VUID-VkImageCreateInfo-format-00943
`format` **must** not be `VK_FORMAT_UNDEFINED`
- VUID-VkImageCreateInfo-extent-00944
`extent.width` **must** be greater than 0
- VUID-VkImageCreateInfo-extent-00945
`extent.height` **must** be greater than 0
- VUID-VkImageCreateInfo-extent-00946
`extent.depth` **must** be greater than 0
- VUID-VkImageCreateInfo-mipLevels-00947
`mipLevels` **must** be greater than 0
- VUID-VkImageCreateInfo-arrayLayers-00948
`arrayLayers` **must** be greater than 0
- VUID-VkImageCreateInfo-flags-00949
If `flags` contains `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT`, `imageType` **must** be `VK_IMAGE_TYPE_2D`
- VUID-VkImageCreateInfo-flags-08865
If `flags` contains `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT`, `extent.width` and `extent.height` **must** be equal
- VUID-VkImageCreateInfo-flags-08866
If `flags` contains `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT`, `arrayLayers` **must** be greater than or equal to 6
- VUID-VkImageCreateInfo-flags-00950
If `flags` contains `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT`, `imageType` **must** be `VK_IMAGE_TYPE_3D`
- VUID-VkImageCreateInfo-flags-09403
If `flags` contains `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT`, `flags` **must** not include `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT`, `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`, or `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`
- VUID-VkImageCreateInfo-extent-02252
`extent.width` **must** be less than or equal to `imageCreateMaxExtent.width` (as defined in [Image Creation Limits](#))
- VUID-VkImageCreateInfo-extent-02253
`extent.height` **must** be less than or equal to `imageCreateMaxExtent.height` (as defined in [Image Creation Limits](#))
- VUID-VkImageCreateInfo-extent-02254
`extent.depth` **must** be less than or equal to `imageCreateMaxExtent.depth` (as defined in [Image Creation Limits](#))
- VUID-VkImageCreateInfo-imageType-00956
If `imageType` is `VK_IMAGE_TYPE_1D`, both `extent.height` and `extent.depth` **must** be 1

- VUID-VkImageCreateInfo-imageType-00957
If `imageType` is `VK_IMAGE_TYPE_2D`, `extent.depth` **must** be 1
- VUID-VkImageCreateInfo-mipLevels-00958
`mipLevels` **must** be less than or equal to the number of levels in the complete mipmap chain based on `extent.width`, `extent.height`, and `extent.depth`
- VUID-VkImageCreateInfo-mipLevels-02255
`mipLevels` **must** be less than or equal to `imageCreateMaxMipLevels` (as defined in [Image Creation Limits](#))
- VUID-VkImageCreateInfo-arrayLayers-02256
`arrayLayers` **must** be less than or equal to `imageCreateMaxArrayLayers` (as defined in [Image Creation Limits](#))
- VUID-VkImageCreateInfo-imageType-00961
If `imageType` is `VK_IMAGE_TYPE_3D`, `arrayLayers` **must** be 1
- VUID-VkImageCreateInfo-samples-02257
If `samples` is not `VK_SAMPLE_COUNT_1_BIT`, then `imageType` **must** be `VK_IMAGE_TYPE_2D`, `flags` **must** not contain `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT`, `mipLevels` **must** be equal to 1, and `imageCreateMayBeLinear` (as defined in [Image Creation Limits](#)) **must** be `VK_FALSE`,
- VUID-VkImageCreateInfo-usage-00963
If `usage` includes `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`, then bits other than `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, and `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` **must** not be set
- VUID-VkImageCreateInfo-usage-00964
If `usage` includes `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`, `extent.width` **must** be less than or equal to `VkPhysicalDeviceLimits::maxFramebufferWidth`
- VUID-VkImageCreateInfo-usage-00965
If `usage` includes `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`, `extent.height` **must** be less than or equal to `VkPhysicalDeviceLimits::maxFramebufferHeight`
- VUID-VkImageCreateInfo-usage-00966
If `usage` includes `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`, `usage` **must** also contain at least one of `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`
- VUID-VkImageCreateInfo-samples-02258
`samples` **must** be a valid [VkSampleCountFlagBits](#) value that is set in `imageCreateSampleCounts` (as defined in [Image Creation Limits](#))
- VUID-VkImageCreateInfo-usage-00968
If the `shaderStorageImageMultisample` feature is not enabled, and `usage` contains `VK_IMAGE_USAGE_STORAGE_BIT`, `samples` **must** be `VK_SAMPLE_COUNT_1_BIT`
- VUID-VkImageCreateInfo-flags-05062
`flags` **must** not contain `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`,

VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT, VK_IMAGE_CREATE_SPARSE_ALIASED_BIT, or
VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT

- VUID-VkImageCreateInfo-flags-01890

If the `protectedMemory` feature is not enabled, `flags` **must** not contain `VK_IMAGE_CREATE_PROTECTED_BIT`

- VUID-VkImageCreateInfo-pNext-00990

If the `pNext` chain includes a `VkExternalMemoryImageCreateInfo` structure, its `handleTypes` member **must** only contain bits that are also in `VkExternalImageFormatProperties::externalMemoryProperties.compatibleHandleTypes`, as returned by `vkGetPhysicalDeviceImageFormatProperties2` with `format`, `imageType`, `tiling`, `usage`, and `flags` equal to those in this structure, and with a `VkPhysicalDeviceExternalImageFormatInfo` structure included in the `pNext` chain, with a `handleType` equal to any one of the handle types specified in `VkExternalMemoryImageCreateInfo::handleTypes`

- VUID-VkImageCreateInfo-flags-01572

If `flags` contains `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT`, then `format` **must** be a `compressed image format`

- VUID-VkImageCreateInfo-flags-01573

If `flags` contains `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT`, then `flags` **must** also contain `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`

- VUID-VkImageCreateInfo-initialLayout-00993

`initialLayout` **must** be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`

- VUID-VkImageCreateInfo-pNext-01443

If the `pNext` chain includes a `VkExternalMemoryImageCreateInfo` or `VkExternalMemoryImageCreateInfoNV` structure whose `handleTypes` member is not `0`, `initialLayout` **must** be `VK_IMAGE_LAYOUT_UNDEFINED`

- VUID-VkImageCreateInfo-format-06410

If the image `format` is one of the `formats that require a sampler Y'CBCR conversion`, `mipLevels` **must** be 1

- VUID-VkImageCreateInfo-format-06411

If the image `format` is one of the `formats that require a sampler Y'CBCR conversion`, `samples` **must** be `VK_SAMPLE_COUNT_1_BIT`

- VUID-VkImageCreateInfo-format-06412

If the image `format` is one of the `formats that require a sampler Y'CBCR conversion`, `imageType` **must** be `VK_IMAGE_TYPE_2D`

- VUID-VkImageCreateInfo-imageCreateFormatFeatures-02260

If `format` is a *multi-planar* format, and if `imageCreateFormatFeatures` (as defined in `Image Creation Limits`) does not contain `VK_FORMAT_FEATURE_DISJOINT_BIT`, then `flags` **must** not contain `VK_IMAGE_CREATE_DISJOINT_BIT`

- VUID-VkImageCreateInfo-format-01577

If `format` is not a *multi-planar* format, and `flags` does not include `VK_IMAGE_CREATE_ALIAS_BIT`, `flags` **must** not contain `VK_IMAGE_CREATE_DISJOINT_BIT`

- VUID-VkImageCreateInfo-format-04712

If `format` has a `_422` or `_420` suffix, `extent.width` **must** be a multiple of 2

- VUID-VkImageCreateInfo-format-04713

If `format` has a `_420` suffix, `extent.height` **must** be a multiple of 2

- VUID-VkImageCreateInfo-tiling-02261

If `tiling` is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then the `pNext` chain **must** include exactly one of `VkImageDrmFormatModifierListCreateInfoEXT` or `VkImageDrmFormatModifierExplicitCreateInfoEXT` structures

- VUID-VkImageCreateInfo-pNext-02262

If the `pNext` chain includes a `VkImageDrmFormatModifierListCreateInfoEXT` or `VkImageDrmFormatModifierExplicitCreateInfoEXT` structure, then `tiling` **must** be `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`

- VUID-VkImageCreateInfo-tiling-02353

If `tiling` is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` and `flags` contains `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`, then the `pNext` chain **must** include a `VkImageFormatListCreateInfo` structure with non-zero `viewFormatCount`

- VUID-VkImageCreateInfo-flags-01533

If `flags` contains `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` `format` **must** be a depth or depth/stencil format

- VUID-VkImageCreateInfo-pNext-08951

If the `pNext` chain includes a `VkExternalMemoryImageCreateInfo` structure whose `handleTypes` member includes `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX`, `imageType` **must** be `VK_IMAGE_TYPE_2D`

- VUID-VkImageCreateInfo-pNext-08952

If the `pNext` chain includes a `VkExternalMemoryImageCreateInfo` structure whose `handleTypes` member includes `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX`, `mipLevels` **must** either be 1 or equal to the number of levels in the complete mipmap chain based on `extent.width`, `extent.height`, and `extent.depth`

- VUID-VkImageCreateInfo-pNext-08953

If the `pNext` chain includes a `VkExternalFormatQNX` structure whose `externalFormat` member is not 0, `flags` **must** not include `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`

- VUID-VkImageCreateInfo-pNext-08954

If the `pNext` chain includes a `VkExternalFormatQNX` structure whose `externalFormat` member is not 0, `usage` **must** not include any usages except `VK_IMAGE_USAGE_SAMPLED_BIT`

- VUID-VkImageCreateInfo-pNext-08955

If the `pNext` chain includes a `VkExternalFormatQNX` structure whose `externalFormat` member is not 0, `tiling` **must** be `VK_IMAGE_TILING_OPTIMAL`

- VUID-VkImageCreateInfo-format-02795

If `format` is a depth-stencil format, `usage` includes `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, and the `pNext` chain includes a `VkImageStencilUsageCreateInfo` structure, then its `VkImageStencilUsageCreateInfo::stencilUsage` member **must** also include `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkImageCreateInfo-format-02796

If `format` is a depth-stencil format, `usage` does not include

VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, and the pNext chain includes a VkImageStencilUsageCreateInfo structure, then its VkImageStencilUsageCreateInfo::stencilUsage member **must** also not include VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkImageCreateInfo-format-02797

If format is a depth-stencil format, usage includes VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT, and the pNext chain includes a VkImageStencilUsageCreateInfo structure, then its VkImageStencilUsageCreateInfo::stencilUsage member **must** also include VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT

- VUID-VkImageCreateInfo-format-02798

If format is a depth-stencil format, usage does not include VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT, and the pNext chain includes a VkImageStencilUsageCreateInfo structure, then its VkImageStencilUsageCreateInfo::stencilUsage member **must** also not include VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT

- VUID-VkImageCreateInfo-Format-02536

If Format is a depth-stencil format and the pNext chain includes a VkImageStencilUsageCreateInfo structure with its stencilUsage member including VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, extent.width **must** be less than or equal to VkPhysicalDeviceLimits::maxFramebufferWidth

- VUID-VkImageCreateInfo-format-02537

If format is a depth-stencil format and the pNext chain includes a VkImageStencilUsageCreateInfo structure with its stencilUsage member including VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, extent.height **must** be less than or equal to VkPhysicalDeviceLimits::maxFramebufferHeight

- VUID-VkImageCreateInfo-format-02538

If the shaderStorageImageMultisample feature is not enabled, format is a depth-stencil format and the pNext chain includes a VkImageStencilUsageCreateInfo structure with its stencilUsage including VK_IMAGE_USAGE_STORAGE_BIT, samples **must** be VK_SAMPLE_COUNT_1_BIT

- VUID-VkImageCreateInfo-imageType-02082

If usage includes VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, imageType **must** be VK_IMAGE_TYPE_2D

- VUID-VkImageCreateInfo-samples-02083

If usage includes VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, samples **must** be VK_SAMPLE_COUNT_1_BIT

- VUID-VkImageCreateInfo-pNext-06722

If a VkImageFormatListCreateInfo structure was included in the pNext chain and format is not a multi-planar format and VkImageFormatListCreateInfo::viewFormatCount is not zero, then each format in VkImageFormatListCreateInfo::pViewFormats **must** either be compatible with the format as described in the compatibility table or, if flags contains VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT, be an uncompressed format that is size-compatible with format

- VUID-VkImageCreateInfo-pNext-10062

If a VkImageFormatListCreateInfo structure was included in the pNext chain and format is

a `multi-planar format` and `flags` contains `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` and `VkImageFormatListCreateInfo::viewFormatCount` is not zero, then each format in `VkImageFormatListCreateInfo::pViewFormats` **must** be compatible with the `VkFormat` for the plane of the image format

- VUID-VkImageCreateInfo-flags-04738

If `flags` does not contain `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` and the `pNext` chain includes a `VkImageFormatListCreateInfo` structure, then `VkImageFormatListCreateInfo::viewFormatCount` **must** be 0 or 1

Valid Usage (Implicit)

- VUID-VkImageCreateInfo-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_CREATE_INFO`

- VUID-VkImageCreateInfo-pNext-pNext

Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkExternalFormatQNX`, `VkExternalMemoryImageCreateInfo`, `VkImageDrmFormatModifierExplicitCreateInfoEXT`, `VkImageDrmFormatModifierListCreateInfoEXT`, `VkImageFormatListCreateInfo`, `VkImageStencilUsageCreateInfo`, or `VkImageSwapchainCreateInfoKHR`

- VUID-VkImageCreateInfo-sType-unique

The `sType` value of each structure in the `pNext` chain **must** be unique

- VUID-VkImageCreateInfo-flags-parameter

`flags` **must** be a valid combination of `VkImageCreateFlagBits` values

- VUID-VkImageCreateInfo-imageType-parameter

`imageType` **must** be a valid `VkImageType` value

- VUID-VkImageCreateInfo-format-parameter

`format` **must** be a valid `VkFormat` value

- VUID-VkImageCreateInfo-samples-parameter

`samples` **must** be a valid `VkSampleCountFlagBits` value

- VUID-VkImageCreateInfo-tiling-parameter

`tiling` **must** be a valid `VkImageTiling` value

- VUID-VkImageCreateInfo-usage-parameter

`usage` **must** be a valid combination of `VkImageUsageFlagBits` values

- VUID-VkImageCreateInfo-usage-requiredbitmask

`usage` **must** not be 0

- VUID-VkImageCreateInfo-sharingMode-parameter

`sharingMode` **must** be a valid `VkSharingMode` value

- VUID-VkImageCreateInfo-initialLayout-parameter

`initialLayout` **must** be a valid `VkImageLayout` value

The `VkImageStencilUsageCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkImageStencilUsageCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkImageUsageFlags  stencilUsage;
} VkImageStencilUsageCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stencilUsage` is a bitmask of `VkImageUsageFlagBits` describing the intended usage of the stencil aspect of the image.

If the `pNext` chain of `VkImageCreateInfo` includes a `VkImageStencilUsageCreateInfo` structure, then that structure includes the usage flags specific to the stencil aspect of the image for an image with a depth-stencil format.

This structure specifies image usages which only apply to the stencil aspect of a depth/stencil format image. When this structure is included in the `pNext` chain of `VkImageCreateInfo`, the stencil aspect of the image **must** only be used as specified by `stencilUsage`. When this structure is not included in the `pNext` chain of `VkImageCreateInfo`, the stencil aspect of an image **must** only be used as specified by `VkImageCreateInfo::usage`. Use of other aspects of an image are unaffected by this structure.

This structure **can** also be included in the `pNext` chain of `VkPhysicalDeviceImageFormatInfo2` to query additional capabilities specific to image creation parameter combinations including a separate set of usage flags for the stencil aspect of the image using `vkGetPhysicalDeviceImageFormatProperties2`. When this structure is not included in the `pNext` chain of `VkPhysicalDeviceImageFormatInfo2` then the implicit value of `stencilUsage` matches that of `VkPhysicalDeviceImageFormatInfo2::usage`.

Valid Usage

- VUID-VkImageStencilUsageCreateInfo-stencilUsage-02539
If `stencilUsage` includes `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`, it **must** not include bits other than `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

Valid Usage (Implicit)

- VUID-VkImageStencilUsageCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_STENCIL_USAGE_CREATE_INFO`
- VUID-VkImageStencilUsageCreateInfo-stencilUsage-parameter
`stencilUsage` **must** be a valid combination of `VkImageUsageFlagBits` values
- VUID-VkImageStencilUsageCreateInfo-stencilUsage-requiredbitmask
`stencilUsage` **must** not be `0`

To define a set of external memory handle types that **may** be used as backing store for an image, add a `VkExternalMemoryImageCreateInfo` structure to the `pNext` chain of the `VkImageCreateInfo` structure. The `VkExternalMemoryImageCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExternalMemoryImageCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkExternalMemoryHandleTypeFlags handleTypes;
} VkExternalMemoryImageCreateInfo;
```

NOTE

A `VkExternalMemoryImageCreateInfo` structure with a non-zero `handleTypes` field must be included in the creation parameters for an image that will be bound to memory that is either exported or imported.

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleTypes` is zero or a bitmask of `VkExternalMemoryHandleTypeFlagBits` specifying one or more external memory handle types.

Valid Usage (Implicit)

- VUID-VkExternalMemoryImageCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_IMAGE_CREATE_INFO`
- VUID-VkExternalMemoryImageCreateInfo-handleTypes-parameter
`handleTypes` **must** be a valid combination of `VkExternalMemoryHandleTypeFlagBits` values

To create an image with an `QNX Screen external format`, add a `VkExternalFormatQNX` structure in the `pNext` chain of `VkImageCreateInfo`. `VkExternalFormatQNX` is defined as:

```
// Provided by VK_QNX_external_memory_screen_buffer
typedef struct VkExternalFormatQNX {
    VkStructureType    sType;
    void*              pNext;
    uint64_t           externalFormat;
} VkExternalFormatQNX;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `externalFormat` is an implementation-defined identifier for the external format

If `externalFormat` is zero, the effect is as if the `VkExternalFormatQNX` structure was not present. Otherwise, the `image` will have the specified external format.

Valid Usage

- VUID-VkExternalFormatQNX-externalFormat-08956
`externalFormat` **must** be `0` or a value returned in the `externalFormat` member of `VkScreenBufferFormatPropertiesQNX` by an earlier call to `vkGetScreenBufferPropertiesQNX`

Valid Usage (Implicit)

- VUID-VkExternalFormatQNX-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_EXTERNAL_FORMAT_QNX`

If the `pNext` chain of `VkImageCreateInfo` includes a `VkImageSwapchainCreateInfoKHR` structure, then that structure includes a swapchain handle indicating that the image will be bound to memory from that swapchain.

The `VkImageSwapchainCreateInfoKHR` structure is defined as:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain
typedef struct VkImageSwapchainCreateInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkSwapchainKHR     swapchain;
} VkImageSwapchainCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchain` is `VK_NULL_HANDLE` or a handle of a swapchain that the image will be bound to.

Valid Usage

- VUID-VkImageSwapchainCreateInfoKHR-swapchain-00995
If `swapchain` is not `VK_NULL_HANDLE`, the fields of `VkImageCreateInfo` **must** match the `implied image creation parameters` of the swapchain

Valid Usage (Implicit)

- VUID-VkImageSwapchainCreateInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_SWAPCHAIN_CREATE_INFO_KHR`
- VUID-VkImageSwapchainCreateInfoKHR-swapchain-parameter
If `swapchain` is not `VK_NULL_HANDLE`, `swapchain` **must** be a valid `VkSwapchainKHR` handle

If the `pNext` chain of `VkImageCreateInfo` includes a `VkImageFormatListCreateInfo` structure, then that structure contains a list of all formats that **can** be used when creating views of this image.

The `VkImageFormatListCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkImageFormatListCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           viewFormatCount;
    const VkFormat*     pViewFormats;
} VkImageFormatListCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `viewFormatCount` is the number of entries in the `pViewFormats` array.
- `pViewFormats` is a pointer to an array of `VkFormat` values specifying all formats which **can** be used when creating views of this image.

If `viewFormatCount` is zero, `pViewFormats` is ignored and the image is created as if the `VkImageFormatListCreateInfo` structure were not included in the `pNext` chain of `VkImageCreateInfo`.

Valid Usage

- VUID-VkImageFormatListCreateInfo-viewFormatCount-09540
If `viewFormatCount` is not 0, each element of `pViewFormats` **must** not be `VK_FORMAT_UNDEFINED`

Valid Usage (Implicit)

- VUID-VkImageFormatListCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_FORMAT_LIST_CREATE_INFO`
- VUID-VkImageFormatListCreateInfo-pViewFormats-parameter
If `viewFormatCount` is not 0, `pViewFormats` **must** be a valid pointer to an array of `viewFormatCount` valid `VkFormat` values

If the `pNext` chain of `VkImageCreateInfo` includes a `VkImageDrmFormatModifierListCreateInfoEXT` structure, then the image will be created with one of the [Linux DRM format modifiers](#) listed in the structure. The choice of modifier is implementation-dependent.

The `VkImageDrmFormatModifierListCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_image_drm_format_modifier
typedef struct VkImageDrmFormatModifierListCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           drmFormatModifierCount;
    const uint64_t*     pDrmFormatModifiers;
} VkImageDrmFormatModifierListCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `drmFormatModifierCount` is the length of the `pDrmFormatModifiers` array.
- `pDrmFormatModifiers` is a pointer to an array of *Linux DRM format modifiers*.

Valid Usage

- VUID-VkImageDrmFormatModifierListCreateInfoEXT-pDrmFormatModifiers-02263
Each *modifier* in `pDrmFormatModifiers` **must** be compatible with the parameters in `VkImageCreateInfo` and its `pNext` chain, as determined by querying `VkPhysicalDeviceImageFormatInfo2` extended with `VkPhysicalDeviceImageDrmFormatModifierInfoEXT`

Valid Usage (Implicit)

- VUID-VkImageDrmFormatModifierListCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_DRM_FORMAT_MODIFIER_LIST_CREATE_INFO_EXT`
- VUID-VkImageDrmFormatModifierListCreateInfoEXT-pDrmFormatModifiers-parameter
`pDrmFormatModifiers` **must** be a valid pointer to an array of `drmFormatModifierCount` `uint64_t` values
- VUID-VkImageDrmFormatModifierListCreateInfoEXT-drmFormatModifierCount-arraylength
`drmFormatModifierCount` **must** be greater than 0

If the `pNext` chain of `VkImageCreateInfo` includes a `VkImageDrmFormatModifierExplicitCreateInfoEXT` structure, then the image will be created with the *Linux DRM format modifier* and memory layout defined by the structure.

The `VkImageDrmFormatModifierExplicitCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_image_drm_format_modifier
typedef struct VkImageDrmFormatModifierExplicitCreateInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    uint64_t             drmFormatModifier;
    uint32_t             drmFormatModifierPlaneCount;
    const VkSubresourceLayout* pPlaneLayouts;
} VkImageDrmFormatModifierExplicitCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `drmFormatModifier` is the *Linux DRM format modifier* with which the image will be created.
- `drmFormatModifierPlaneCount` is the number of *memory planes* in the image (as reported by `VkDrmFormatModifierPropertiesEXT`) as well as the length of the `pPlaneLayouts` array.
- `pPlaneLayouts` is a pointer to an array of `VkSubresourceLayout` structures describing the image's *memory planes*.

The i^{th} member of `pPlaneLayouts` describes the layout of the image's i^{th} *memory plane* (that is, `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT`). In each element of `pPlaneLayouts`, the implementation **must** ignore `size`. The implementation calculates the size of each plane, which the application **can** query with `vkGetImageSubresourceLayout`.

When creating an image with `VkImageDrmFormatModifierExplicitCreateInfoEXT`, it is the application's responsibility to satisfy all valid usage requirements. However, the implementation **must** validate that the provided `pPlaneLayouts`, when combined with the provided `drmFormatModifier` and other creation parameters in `VkImageCreateInfo` and its `pNext` chain, produce a valid image. (This validation is necessarily implementation-dependent and outside the scope of Vulkan, and therefore not described by valid usage requirements). If this validation fails, then `vkCreateImage` returns `VK_ERROR_INVALID_DRM_FORMAT_MODIFIER_PLANE_LAYOUT_EXT`.

Valid Usage

- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-drmFormatModifier-02264
`drmFormatModifier` **must** be compatible with the parameters in `VkImageCreateInfo` and its `pNext` chain, as determined by querying `VkPhysicalDeviceImageFormatInfo2` extended with `VkPhysicalDeviceImageDrmFormatModifierInfoEXT`
- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-drmFormatModifierPlaneCount-02265
`drmFormatModifierPlaneCount` **must** be equal to the `VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount` associated with `VkImageCreateInfo::format` and `drmFormatModifier`, as found by querying `VkDrmFormatModifierPropertiesListEXT`
- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-size-02267
For each element of `pPlaneLayouts`, `size` **must** be 0
- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-arrayPitch-02268

For each element of `pPlaneLayouts`, `arrayPitch` **must** be 0 if `VkImageCreateInfo::arrayLayers` is 1

- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-depthPitch-02269
For each element of `pPlaneLayouts`, `depthPitch` **must** be 0 if `VkImageCreateInfo::extent.depth` is 1

Valid Usage (Implicit)

- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_DRM_FORMAT_MODIFIER_EXPLICIT_CREATE_INFO_EXT`
- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-pPlaneLayouts-parameter
`pPlaneLayouts` **must** be a valid pointer to an array of `drmFormatModifierPlaneCount` `VkSubresourceLayout` structures
- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-drmFormatModifierPlaneCount-arraylength
`drmFormatModifierPlaneCount` **must** be greater than 0

Bits which **can** be set in

- `VkImageViewUsageCreateInfo::usage`
- `VkImageStencilUsageCreateInfo::stencilUsage`
- `VkImageCreateInfo::usage`

specify intended usage of an image, and are:

```
// Provided by VK_VERSION_1_0
typedef enum VkImageUsageFlagBits {
    VK_IMAGE_USAGE_TRANSFER_SRC_BIT = 0x00000001,
    VK_IMAGE_USAGE_TRANSFER_DST_BIT = 0x00000002,
    VK_IMAGE_USAGE_SAMPLED_BIT = 0x00000004,
    VK_IMAGE_USAGE_STORAGE_BIT = 0x00000008,
    VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT = 0x00000010,
    VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT = 0x00000020,
    VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT = 0x00000040,
    VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT = 0x00000080,
    // Provided by VK_KHR_fragment_shading_rate
    VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR = 0x00000100,
} VkImageUsageFlagBits;
```

- `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` specifies that the image **can** be used as the source of a transfer command.
- `VK_IMAGE_USAGE_TRANSFER_DST_BIT` specifies that the image **can** be used as the destination of a transfer command.
- `VK_IMAGE_USAGE_SAMPLED_BIT` specifies that the image **can** be used to create a `VkImageView` suitable

for occupying a `VkDescriptorSet` slot either of type `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and be sampled by a shader.

- `VK_IMAGE_USAGE_STORAGE_BIT` specifies that the image **can** be used to create a `VkImageView` suitable for occupying a `VkDescriptorSet` slot of type `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`.
- `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` specifies that the image **can** be used to create a `VkImageView` suitable for use as a color or resolve attachment in a `VkFramebuffer`.
- `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` specifies that the image **can** be used to create a `VkImageView` suitable for use as a depth/stencil or depth/stencil resolve attachment in a `VkFramebuffer`.
- `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT` specifies that implementations **may** support using [memory allocations](#) with the `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` to back an image with this usage. This bit **can** be set for any image that **can** be used to create a `VkImageView` suitable for use as a color, resolve, depth/stencil, or input attachment.
- `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` specifies that the image **can** be used to create a `VkImageView` suitable for occupying `VkDescriptorSet` slot of type `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`; be read from a shader as an input attachment; and be used as an input attachment in a framebuffer.
- `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` specifies that the image **can** be used to create a `VkImageView` suitable for use as a [fragment shading rate attachment](#)

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkImageUsageFlags;
```

`VkImageUsageFlags` is a bitmask type for setting a mask of zero or more [VkImageUsageFlagBits](#).

When creating a `VkImageView` one of the following [VkImageUsageFlagBits](#) **must** be set:

- `VK_IMAGE_USAGE_SAMPLED_BIT`
- `VK_IMAGE_USAGE_STORAGE_BIT`
- `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`
- `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`
- `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`
- `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`
- `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

Bits which **can** be set in `VkImageCreateInfo::flags`, specifying additional parameters of an image, are:

```

// Provided by VK_VERSION_1_0
typedef enum VkImageCreateFlagBits {
    VK_IMAGE_CREATE_SPARSE_BINDING_BIT = 0x00000001,
    VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT = 0x00000002,
    VK_IMAGE_CREATE_SPARSE_ALIASED_BIT = 0x00000004,
    VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT = 0x00000008,
    VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT = 0x00000010,
// Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_ALIAS_BIT = 0x00000400,
// Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT = 0x00000040,
// Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT = 0x00000020,
// Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT = 0x00000080,
// Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_EXTENDED_USAGE_BIT = 0x00000100,
// Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_PROTECTED_BIT = 0x00000800,
// Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_DISJOINT_BIT = 0x00000200,
// Provided by VK_EXT_sample_locations
    VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT = 0x00001000,
} VkImageCreateFlagBits;

```

- **VK_IMAGE_CREATE_SPARSE_BINDING_BIT** specifies that the image will be backed using sparse memory binding. This flag is not supported in Vulkan SC [\[SCID-8\]](#).
- **VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT** specifies that the image **can** be partially backed using sparse memory binding. Images created with this flag **must** also be created with the **VK_IMAGE_CREATE_SPARSE_BINDING_BIT** flag. This flag is not supported in Vulkan SC [\[SCID-8\]](#).
- **VK_IMAGE_CREATE_SPARSE_ALIASED_BIT** specifies that the image will be backed using sparse memory binding with memory ranges that might also simultaneously be backing another image (or another portion of the same image). Images created with this flag **must** also be created with the **VK_IMAGE_CREATE_SPARSE_BINDING_BIT** flag. This flag is not supported in Vulkan SC [\[SCID-8\]](#).
- **VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT** specifies that the image **can** be used to create a **VkImageView** with a different format from the image. For **multi-planar formats**, **VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT** specifies that a **VkImageView** can be created of a *plane* of the image.
- **VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT** specifies that the image **can** be used to create a **VkImageView** of type **VK_IMAGE_VIEW_TYPE_CUBE** or **VK_IMAGE_VIEW_TYPE_CUBE_ARRAY**.
- **VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT** specifies that the image **can** be used to create a **VkImageView** of type **VK_IMAGE_VIEW_TYPE_2D** or **VK_IMAGE_VIEW_TYPE_2D_ARRAY**.
- **VK_IMAGE_CREATE_PROTECTED_BIT** specifies that the image is a protected image.
- **VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT** specifies that the image **can** be used with a non-zero value of the **splitInstanceBindRegionCount** member of a

[VkBindImageMemoryDeviceGroupInfo](#) structure passed into [vkBindImageMemory2](#). This flag also has the effect of making the image use the standard sparse image block dimensions. This flag is not supported in Vulkan SC [\[SCID-8\]](#).

- [VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT](#) specifies that the image having a compressed format **can** be used to create a [VkImageView](#) with an uncompressed format where each texel in the image view corresponds to a compressed texel block of the image.
- [VK_IMAGE_CREATE_EXTENDED_USAGE_BIT](#) specifies that the image **can** be created with usage flags that are not supported for the format the image is created with but are supported for at least one format a [VkImageView](#) created from the image **can** have.
- [VK_IMAGE_CREATE_DISJOINT_BIT](#) specifies that an image with a [multi-planar format](#) **must** have each plane separately bound to memory, rather than having a single memory binding for the whole image; the presence of this bit distinguishes a *disjoint image* from an image without this bit set.
- [VK_IMAGE_CREATE_ALIAS_BIT](#) specifies that two images created with the same creation parameters and aliased to the same memory **can** interpret the contents of the memory consistently with each other, subject to the rules described in the [Memory Aliasing](#) section. This flag further specifies that each plane of a *disjoint* image **can** share an in-memory non-linear representation with single-plane images, and that a single-plane image **can** share an in-memory non-linear representation with a plane of a multi-planar disjoint image, according to the rules in [Compatible Formats of Planes of Multi-Planar Formats](#). If the [pNext](#) chain includes a [VkExternalMemoryImageCreateInfo](#) structure whose [handleTypes](#) member is not `0`, it is as if [VK_IMAGE_CREATE_ALIAS_BIT](#) is set.
- [VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT](#) specifies that an image with a depth or depth/stencil format **can** be used with custom sample locations when used as a depth/stencil attachment.

See [Sparse Resource Features](#) and [Sparse Physical Device Features](#) for more details.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkImageCreateFlags;
```

[VkImageCreateFlags](#) is a bitmask type for setting a mask of zero or more [VkImageCreateFlagBits](#).

Possible values of [VkImageCreateInfo::imageType](#), specifying the basic dimensionality of an image, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkImageType {
    VK_IMAGE_TYPE_1D = 0,
    VK_IMAGE_TYPE_2D = 1,
    VK_IMAGE_TYPE_3D = 2,
} VkImageType;
```

- [VK_IMAGE_TYPE_1D](#) specifies a one-dimensional image.

- `VK_IMAGE_TYPE_2D` specifies a two-dimensional image.
- `VK_IMAGE_TYPE_3D` specifies a three-dimensional image.

Possible values of `VkImageCreateInfo::tiling`, specifying the tiling arrangement of texel blocks in an image, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkImageTiling {
    VK_IMAGE_TILING_OPTIMAL = 0,
    VK_IMAGE_TILING_LINEAR = 1,
    // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT = 1000158000,
} VkImageTiling;
```

- `VK_IMAGE_TILING_OPTIMAL` specifies optimal tiling (texels are laid out in an implementation-dependent arrangement, for more efficient memory access).
- `VK_IMAGE_TILING_LINEAR` specifies linear tiling (texels are laid out in memory in row-major order, possibly with some padding on each row).
- `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` specifies that the image's tiling is defined by a [Linux DRM format modifier](#). The modifier is specified at image creation with `VkImageDrmFormatModifierListCreateInfoEXT` or `VkImageDrmFormatModifierExplicitCreateInfoEXT`, and **can** be queried with `vkGetImageDrmFormatModifierPropertiesEXT`.

To query the memory layout of an image subresource, call:

```
// Provided by VK_VERSION_1_0
void vkGetImageSubresourceLayout(
    VkDevice          device,
    VkImage           image,
    const VkImageSubresource* pSubresource,
    VkSubresourceLayout* pLayout);
```

- `device` is the logical device that owns the image.
- `image` is the image whose layout is being queried.
- `pSubresource` is a pointer to a `VkImageSubresource` structure selecting a specific image subresource from the image.
- `pLayout` is a pointer to a `VkSubresourceLayout` structure in which the layout is returned.

If the image is [linear](#), then the returned layout is valid for [host access](#).

If the image's tiling is `VK_IMAGE_TILING_LINEAR` and its format is a [multi-planar format](#), then `vkGetImageSubresourceLayout` describes one *format plane* of the image. If the image's tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `vkGetImageSubresourceLayout` describes one *memory plane* of the image. If the image's tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` and the image is

`non-linear`, then the returned layout has an implementation-dependent meaning; the vendor of the image's `DRM format modifier` **may** provide documentation that explains how to interpret the returned layout.

`vkGetImageSubresourceLayout` is invariant for the lifetime of a single image. However, the subresource layout of images in Android hardware buffer or QNX Screen buffer external memory is not known until the image has been bound to memory, so applications **must** not call `vkGetImageSubresourceLayout` for such an image before it has been bound.

Valid Usage

- VUID-vkGetImageSubresourceLayout-image-07790
The `image` **must** have been created with `tiling` equal to `VK_IMAGE_TILING_LINEAR` or `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`
- VUID-vkGetImageSubresourceLayout-aspectMask-00997
The `aspectMask` member of `pSubresource` **must** only have a single bit set
- VUID-vkGetImageSubresourceLayout-mipLevel-01716
The `mipLevel` member of `pSubresource` **must** be less than the `mipLevels` specified in `image`
- VUID-vkGetImageSubresourceLayout-arrayLayer-01717
The `arrayLayer` member of `pSubresource` **must** be less than the `arrayLayers` specified in `image`
- VUID-vkGetImageSubresourceLayout-format-08886
If `format` of the `image` is a color format that is not a `multi-planar format`, and `tiling` of the `image` is `VK_IMAGE_TILING_LINEAR` or `VK_IMAGE_TILING_OPTIMAL`, the `aspectMask` member of `pSubresource` **must** be `VK_IMAGE_ASPECT_COLOR_BIT`
- VUID-vkGetImageSubresourceLayout-format-04462
If `format` of the `image` has a depth component, the `aspectMask` member of `pSubresource` **must** contain `VK_IMAGE_ASPECT_DEPTH_BIT`
- VUID-vkGetImageSubresourceLayout-format-04463
If `format` of the `image` has a stencil component, the `aspectMask` member of `pSubresource` **must** contain `VK_IMAGE_ASPECT_STENCIL_BIT`
- VUID-vkGetImageSubresourceLayout-format-04464
If `format` of the `image` does not contain a stencil or depth component, the `aspectMask` member of `pSubresource` **must** not contain `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`
- VUID-vkGetImageSubresourceLayout-tiling-08717
If the `tiling` of the `image` is `VK_IMAGE_TILING_LINEAR` and has a `multi-planar format`, then the `aspectMask` member of `pSubresource` **must** be a single valid `multi-planar aspect mask` bit
- VUID-vkGetImageSubresourceLayout-tiling-09433
If the `tiling` of the `image` is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then the `aspectMask` member of `pSubresource` **must** be `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT` and the index `i` **must** be less than the `VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount` associated with the image's `format` and `VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier`

Valid Usage (Implicit)

- VUID-vkGetImageSubresourceLayout-device-parameter
device must be a valid [VkDevice](#) handle
- VUID-vkGetImageSubresourceLayout-image-parameter
image must be a valid [VkImage](#) handle
- VUID-vkGetImageSubresourceLayout-pSubresource-parameter
pSubresource must be a valid pointer to a valid [VkImageSubresource](#) structure
- VUID-vkGetImageSubresourceLayout-pLayout-parameter
pLayout must be a valid pointer to a [VkSubresourceLayout](#) structure
- VUID-vkGetImageSubresourceLayout-image-parent
image must have been created, allocated, or retrieved from **device**

The [VkImageSubresource](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkImageSubresource {
    VkImageAspectFlags    aspectMask;
    uint32_t              mipLevel;
    uint32_t              arrayLayer;
} VkImageSubresource;
```

- **aspectMask** is a [VkImageAspectFlags](#) value selecting the image *aspect*.
- **mipLevel** selects the mipmap level.
- **arrayLayer** selects the array layer.

Valid Usage (Implicit)

- VUID-VkImageSubresource-aspectMask-parameter
aspectMask must be a valid combination of [VkImageAspectFlagBits](#) values
- VUID-VkImageSubresource-aspectMask-requiredbitmask
aspectMask must not be 0

Information about the layout of the image subresource is returned in a [VkSubresourceLayout](#) structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkSubresourceLayout {
    VkDeviceSize    offset;
    VkDeviceSize    size;
    VkDeviceSize    rowPitch;
    VkDeviceSize    arrayPitch;
    VkDeviceSize    depthPitch;
} VkSubresourceLayout;
```

- **offset** is the byte offset from the start of the image or the plane where the image subresource begins.
- **size** is the size in bytes of the image subresource. **size** includes any extra memory that is required based on **rowPitch**.
- **rowPitch** describes the number of bytes between each row of texels in an image.
- **arrayPitch** describes the number of bytes between each array layer of an image.
- **depthPitch** describes the number of bytes between each slice of 3D image.

If the image is **linear**, then **rowPitch**, **arrayPitch** and **depthPitch** describe the layout of the image subresource in linear memory. For uncompressed formats, **rowPitch** is the number of bytes between texels with the same x coordinate in adjacent rows (y coordinates differ by one). **arrayPitch** is the number of bytes between texels with the same x and y coordinate in adjacent array layers of the image (array layer values differ by one). **depthPitch** is the number of bytes between texels with the same x and y coordinate in adjacent slices of a 3D image (z coordinates differ by one). Expressed as an addressing formula, the starting byte of a texel in the image subresource has address:

```
// (x,y,z,layer) are in texel coordinates
address(x,y,z,layer) = layer*arrayPitch + z*depthPitch + y*rowPitch + x*elementSize +
offset
```

For compressed formats, the **rowPitch** is the number of bytes between compressed texel blocks in adjacent rows. **arrayPitch** is the number of bytes between compressed texel blocks in adjacent array layers. **depthPitch** is the number of bytes between compressed texel blocks in adjacent slices of a 3D image.

```
// (x,y,z,layer) are in compressed texel block coordinates
address(x,y,z,layer) = layer*arrayPitch + z*depthPitch + y*rowPitch + x
*compressedTexelBlockByteSize + offset;
```

The value of **arrayPitch** is undefined for images that were not created as arrays. **depthPitch** is defined only for 3D images.

If the image has a *single-plane* color format and its tiling is **VK_IMAGE_TILING_LINEAR**, then the **aspectMask** member of **VkImageSubresource** **must** be **VK_IMAGE_ASPECT_COLOR_BIT**.

If the image has a depth/stencil format and its tiling is **VK_IMAGE_TILING_LINEAR**, then **aspectMask**

must be either `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`. On implementations that store depth and stencil aspects separately, querying each of these image subresource layouts will return a different **offset** and **size** representing the region of memory used for that aspect. On implementations that store depth and stencil aspects interleaved, the same **offset** and **size** are returned and represent the interleaved memory allocation.

If the image has a **multi-planar format** and its tiling is `VK_IMAGE_TILING_LINEAR`, then the **aspectMask** member of `VkImageSubresource` **must** be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or (for 3-plane formats only) `VK_IMAGE_ASPECT_PLANE_2_BIT`. Querying each of these image subresource layouts will return a different **offset** and **size** representing the region of memory used for that plane. If the image is *disjoint*, then the **offset** is relative to the base address of the plane. If the image is *non-disjoint*, then the **offset** is relative to the base address of the image.

If the image's tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then the **aspectMask** member of `VkImageSubresource` **must** be one of `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT`, where the maximum allowed plane index *i* is defined by the `VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount` associated with the image's `VkImageCreateInfo::format` and **modifier**. The memory range used by the subresource is described by **offset** and **size**. If the image is *disjoint*, then the **offset** is relative to the base address of the *memory plane*. If the image is *non-disjoint*, then the **offset** is relative to the base address of the image. If the image is **non-linear**, then **rowPitch**, **arrayPitch**, and **depthPitch** have an implementation-dependent meaning.

If an image was created with `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then the image has a **Linux DRM format modifier**. To query the *modifier*, call:

```
// Provided by VK_EXT_image_drm_format_modifier
VkResult vkGetImageDrmFormatModifierPropertiesEXT(
    VkDevice          device,
    VkImage           image,
    VkImageDrmFormatModifierPropertiesEXT* pProperties);
```

- **device** is the logical device that owns the image.
- **image** is the queried image.
- **pProperties** is a pointer to a `VkImageDrmFormatModifierPropertiesEXT` structure in which properties of the image's *DRM format modifier* are returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetImageDrmFormatModifierPropertiesEXT` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkGetImageDrmFormatModifierPropertiesEXT-image-02272
image **must** have been created with **tiling** equal to `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`

Valid Usage (Implicit)

- VUID-vkGetImageDrmFormatModifierPropertiesEXT-device-parameter **device** **must** be a valid [VkDevice](#) handle
- VUID-vkGetImageDrmFormatModifierPropertiesEXT-image-parameter **image** **must** be a valid [VkImage](#) handle
- VUID-vkGetImageDrmFormatModifierPropertiesEXT-pProperties-parameter **pProperties** **must** be a valid pointer to a [VkImageDrmFormatModifierPropertiesEXT](#) structure
- VUID-vkGetImageDrmFormatModifierPropertiesEXT-image-parent **image** **must** have been created, allocated, or retrieved from **device**

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkImageDrmFormatModifierPropertiesEXT](#) structure is defined as:

```
// Provided by VK_EXT_image_drm_format_modifier
typedef struct VkImageDrmFormatModifierPropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    uint64_t           drmFormatModifier;
} VkImageDrmFormatModifierPropertiesEXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is [NULL](#) or a pointer to a structure extending this structure.
- **drmFormatModifier** returns the image's [Linux DRM format modifier](#).

If the **image** was created with [VkImageDrmFormatModifierListCreateInfoEXT](#), then the returned **drmFormatModifier** **must** belong to the list of modifiers provided at time of image creation in [VkImageDrmFormatModifierListCreateInfoEXT::pDrmFormatModifiers](#). If the **image** was created with [VkImageDrmFormatModifierExplicitCreateInfoEXT](#), then the returned **drmFormatModifier** **must** be the modifier provided at time of image creation in [VkImageDrmFormatModifierExplicitCreateInfoEXT::drmFormatModifier](#).

Valid Usage (Implicit)

- VUID-VkImageDrmFormatModifierPropertiesEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_DRM_FORMAT_MODIFIER_PROPERTIES_EXT`
- VUID-VkImageDrmFormatModifierPropertiesEXT-pNext-pNext
`pNext` **must** be `NULL`

To destroy an image, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyImage(
    VkDevice          device,
    VkImage            image,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the image.
- `image` is the image to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroyImage-image-01000
All submitted commands that refer to `image`, either directly or via a `VkImageView`, **must** have completed execution
- VUID-vkDestroyImage-image-04882
`image` **must** not have been acquired from `vkGetSwapchainImagesKHR`

Valid Usage (Implicit)

- VUID-vkDestroyImage-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkDestroyImage-image-parameter
If `image` is not `VK_NULL_HANDLE`, `image` **must** be a valid `VkImage` handle
- VUID-vkDestroyImage-pAllocator-null
`pAllocator` **must** be `NULL`
- VUID-vkDestroyImage-image-parent
If `image` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `image` **must** be externally synchronized

12.4.1. Image Format Features

Valid uses of a `VkImage` may depend on the image's *format features*, defined below. Such constraints are documented in the affected valid usage statement.

- If the image was created with `VK_IMAGE_TILING_LINEAR`, then its set of *format features* is the value of `VkFormatProperties::linearTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` on the same `format` as `VkImageCreateInfo::format`.
- If the image was created with `VK_IMAGE_TILING_OPTIMAL`, but without a `QNX Screen Buffer external format` then its set of *format features* is the value of `VkFormatProperties::optimalTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` on the same `format` as `VkImageCreateInfo::format`.
- If the image was created with an `QNX Screen buffer external format`, then its set of *format features* is the value of `VkScreenBufferFormatPropertiesQNX::formatFeatures` found by calling `vkGetScreenBufferPropertiesQNX` on the QNX Screen buffer that was imported to the `VkDeviceMemory` to which the image is bound.
- If the image was created with `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then:
 - The image's DRM format modifier is the value of `VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier` found by calling `vkGetImageDrmFormatModifierPropertiesEXT`.
 - Let `VkDrmFormatModifierPropertiesListEXT::pDrmFormatModifierProperties` be the array found by calling `vkGetPhysicalDeviceFormatProperties2` on the same `format` as `VkImageCreateInfo::format`.
 - Let `VkDrmFormatModifierPropertiesEXT prop` be the array element whose `drmFormatModifier` member is the value of the image's DRM format modifier.
 - Then the image's set of *format features* is the value of `prop::drmFormatModifierTilingFeatures`.

12.4.2. Image Mip Level Sizing

A *complete mipmap chain* is the full set of mip levels, from the largest mip level provided, down to the *minimum mip level size*.

Conventional Images

For conventional images, the dimensions of each successive mip level, $n+1$, are:

$$\text{width}_{n+1} = \max(\lfloor \text{width}_n / 2 \rfloor, 1)$$

$$\text{height}_{n+1} = \max(\lfloor \text{height}_n / 2 \rfloor, 1)$$

$$\text{depth}_{n+1} = \max(\lfloor \text{depth}_n / 2 \rfloor, 1)$$

where width_n , height_n , and depth_n are the dimensions of the next larger mip level, n .

The minimum mip level size is:

- 1 for one-dimensional images,
- 1x1 for two-dimensional images, and
- 1x1x1 for three-dimensional images.

The number of levels in a complete mipmap chain is:

$$\lceil \log_2(\max(\text{width}_0, \text{height}_0, \text{depth}_0)) \rceil + 1$$

where width_0 , height_0 , and depth_0 are the dimensions of the largest (most detailed) mip level, 0.

12.5. Image Layouts

Images are stored in implementation-dependent opaque layouts in memory. Each layout has limitations on what kinds of operations are supported for image subresources using the layout. At any given time, the data representing an image subresource in memory exists in a particular layout which is determined by the most recent layout transition that was performed on that image subresource. Applications have control over which layout each image subresource uses, and **can** transition an image subresource from one layout to another. Transitions **can** happen with an image memory barrier, included as part of a [vkCmdPipelineBarrier](#) or a [vkCmdWaitEvents](#) command buffer command (see [Image Memory Barriers](#)), or as part of a subpass dependency within a render pass (see [VkSubpassDependency](#)).

Image layout is per-image subresource. Separate image subresources of the same image **can** be in different layouts at the same time, with the exception that depth and stencil aspects of a given image subresource **can** only be in different layouts if the [separateDepthStencilLayouts](#) feature is enabled. When an [VkImageView](#) descriptor is accessed on the device, all image subresources must be in a valid image layout.

NOTE

Each layout **may** offer optimal performance for a specific usage of image memory. For example, an image with a layout of [VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL](#) **may** provide optimal performance for use as a color attachment, but be unsupported for use in transfer commands. Applications **can** transition an image subresource from one layout to another in order to achieve optimal performance when the image subresource is used for multiple kinds of operations. After initialization, applications need not use any layout other than the general layout, though this **may** produce suboptimal performance on some implementations.

Upon creation, all image subresources of an image are initially in the same layout, where that layout is selected by the [VkImageCreateInfo::initialLayout](#) member. The [initialLayout](#) **must** be either [VK_IMAGE_LAYOUT_UNDEFINED](#) or [VK_IMAGE_LAYOUT_PREINITIALIZED](#). If it is [VK_IMAGE_LAYOUT_PREINITIALIZED](#), then the image data **can** be preinitialized by the host while using this layout, and the transition away from this layout will preserve that data. If it is [VK_IMAGE_LAYOUT_UNDEFINED](#), then the contents of the data are considered to be undefined, and the transition away from this layout is not guaranteed to preserve that data. For either of these initial

layouts, any image subresources **must** be transitioned to another layout before they are accessed by the device.

Host access to image memory is only well-defined for [linear](#) images and for image subresources of those images which are currently in any of the following layouts:

- [VK_IMAGE_LAYOUT_PREINITIALIZED](#)
- [VK_IMAGE_LAYOUT_GENERAL](#)

Calling [vkGetImageSubresourceLayout](#) for a linear image returns a subresource layout mapping that is valid for either of those image layouts.

The set of image layouts consists of:

```

// Provided by VK_VERSION_1_0
typedef enum VkImageLayout {
    VK_IMAGE_LAYOUT_UNDEFINED = 0,
    VK_IMAGE_LAYOUT_GENERAL = 1,
    VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL = 2,
    VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL = 3,
    VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL = 4,
    VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL = 5,
    VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL = 6,
    VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL = 7,
    VK_IMAGE_LAYOUT_PREINITIALIZED = 8,
// Provided by VK_VERSION_1_1
    VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL = 1000117000,
// Provided by VK_VERSION_1_1
    VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL = 1000117001,
// Provided by VK_VERSION_1_2
    VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL = 1000241000,
// Provided by VK_VERSION_1_2
    VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL = 1000241001,
// Provided by VK_VERSION_1_2
    VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL = 1000241002,
// Provided by VK_VERSION_1_2
    VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL = 1000241003,
    VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL = 1000314000,
    VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL = 1000314001,
// Provided by VK_KHR_swapchain
    VK_IMAGE_LAYOUT_PRESENT_SRC_KHR = 1000001002,
// Provided by VK_KHR_shared_presentable_image
    VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR = 1000111000,
// Provided by VK_KHR_fragment_shading_rate
    VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR = 1000164003,
// Provided by VK_KHR_synchronization2
    VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR = VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL,
// Provided by VK_KHR_synchronization2
    VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR = VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL,
} VkImageLayout;

```

The type(s) of device access supported by each layout are:

- **VK_IMAGE_LAYOUT_UNDEFINED** specifies that the layout is unknown. Image memory **cannot** be transitioned into this layout. This layout **can** be used as the **initialLayout** member of **VkImageCreateInfo**. This layout **can** be used in place of the current image layout in a layout transition, but doing so will cause the contents of the image's memory to be undefined.
- **VK_IMAGE_LAYOUT_PREINITIALIZED** specifies that an image's memory is in a defined layout and **can** be populated by data, but that it has not yet been initialized by the driver. Image memory **cannot** be transitioned into this layout. This layout **can** be used as the **initialLayout** member of **VkImageCreateInfo**. This layout is intended to be used as the initial layout for an image whose contents are written by the host, and hence the data **can** be written to memory immediately, without first executing a layout transition. Currently, **VK_IMAGE_LAYOUT_PREINITIALIZED** is only

useful with `linear` images because there is not a standard layout defined for `VK_IMAGE_TILING_OPTIMAL` images.

- `VK_IMAGE_LAYOUT_GENERAL` supports all types of device access, unless specified otherwise.
- `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL` specifies a layout that **must** only be used with attachment accesses in the graphics pipeline.
- `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL` specifies a layout allowing read only access as an attachment, or in shaders as a sampled image, combined image/sampler, or input attachment.
- `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` **must** only be used as a color or resolve attachment in a `VkFramebuffer`. This layout is valid only for image subresources of images created with the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` usage bit enabled.
- `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` specifies a layout for both the depth and stencil aspects of a depth/stencil format image allowing read and write access as a depth/stencil attachment. It is equivalent to `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` and `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`.
- `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` specifies a layout for both the depth and stencil aspects of a depth/stencil format image allowing read only access as a depth/stencil attachment or in shaders as a sampled image, combined image/sampler, or input attachment. It is equivalent to `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL` and `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.
- `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` specifies a layout for depth/stencil format images allowing read and write access to the stencil aspect as a stencil attachment, and read only access to the depth aspect as a depth attachment or in shaders as a sampled image, combined image/sampler, or input attachment. It is equivalent to `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL` and `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`.
- `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` specifies a layout for depth/stencil format images allowing read and write access to the depth aspect as a depth attachment, and read only access to the stencil aspect as a stencil attachment or in shaders as a sampled image, combined image/sampler, or input attachment. It is equivalent to `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` and `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.
- `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` specifies a layout for the depth aspect of a depth/stencil format image allowing read and write access as a depth attachment.
- `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL` specifies a layout for the depth aspect of a depth/stencil format image allowing read-only access as a depth attachment or in shaders as a sampled image, combined image/sampler, or input attachment.
- `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` specifies a layout for the stencil aspect of a depth/stencil format image allowing read and write access as a stencil attachment.
- `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` specifies a layout for the stencil aspect of a depth/stencil format image allowing read-only access as a stencil attachment or in shaders as a sampled image, combined image/sampler, or input attachment.
- `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` specifies a layout allowing read-only access in a shader as a sampled image, combined image/sampler, or input attachment. This layout is valid only for image subresources of images created with the `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` usage bits enabled.

- `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` **must** only be used as a source image of a transfer command (see the definition of `VK_PIPELINE_STAGE_TRANSFER_BIT`). This layout is valid only for image subresources of images created with the `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage bit enabled.
- `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` **must** only be used as a destination image of a transfer command. This layout is valid only for image subresources of images created with the `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage bit enabled.
- `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` **must** only be used for presenting a presentable image for display.
- `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` is valid only for shared presentable images, and **must** be used for any usage the image supports.
- `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR` **must** only be used as a [fragment shading rate attachment](#) or This layout is valid only for image subresources of images created with the `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` usage bit enabled.

The layout of each image subresource is not a state of the image subresource itself, but is rather a property of how the data in memory is organized, and thus for each mechanism of accessing an image in the API the application **must** specify a parameter or structure member that indicates which image layout the image subresource(s) are considered to be in when the image will be accessed. For transfer commands, this is a parameter to the command (see [Clear Commands](#) and [Copy Commands](#)). For use as a framebuffer attachment, this is a member in the substructures of the `VkRenderPassCreateInfo` (see [Render Pass](#)). For use in a descriptor set, this is a member in the `VkDescriptorImageInfo` structure (see [Descriptor Set Updates](#)).

NOTE

`VK_IMAGE_LAYOUT_GENERAL` can be a useful catch-all image layout, but there are situations where a dedicated image layout must be used instead. Some examples include:

- `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`
- `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`

NOTE

While `VK_IMAGE_LAYOUT_GENERAL` suggests that all types of device access is possible, it does not mean that all patterns of memory accesses are safe in all situations. [Common Render Pass Data Races](#) outlines some situations where data races are unavoidable.

12.5.1. Image Layout Matching Rules

At the time that any command buffer command accessing an image executes on any queue, the layouts of the image subresources that are accessed **must** all match exactly the layout specified via the API controlling those accesses, except in case of accesses to an image with a depth/stencil format performed through descriptors referring to only a single aspect of the image, where the following relaxed matching rules apply:

- Descriptors referring just to the depth aspect of a depth/stencil image only need to match in the image layout of the depth aspect, thus `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` and

`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` are considered to match.

- Descriptors referring just to the stencil aspect of a depth/stencil image only need to match in the image layout of the stencil aspect, thus `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` and `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` are considered to match.

When performing a layout transition on an image subresource, the old layout value **must** either equal the current layout of the image subresource (at the time the transition executes), or else be `VK_IMAGE_LAYOUT_UNDEFINED` (implying that the contents of the image subresource need not be preserved). The new layout used in a transition **must** not be any of:

- `VK_IMAGE_LAYOUT_UNDEFINED`
- `VK_IMAGE_LAYOUT_PREINITIALIZED`

The image layout of each image subresource of a depth/stencil image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` is dependent on the last sample locations used to render to the image subresource as a depth/stencil attachment, thus applications **must** provide the same sample locations that were last used to render to the given image subresource whenever a layout transition of the image subresource happens, otherwise the contents of the depth aspect of the image subresource become undefined.

In addition, depth reads from a depth/stencil attachment referring to an image subresource range of a depth/stencil image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` using different sample locations than what have been last used to perform depth writes to the image subresources of the same image subresource range return undefined values.

Similarly, depth writes to a depth/stencil attachment referring to an image subresource range of a depth/stencil image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` using different sample locations than what have been last used to perform depth writes to the image subresources of the same image subresource range make the contents of the depth aspect of those image subresources undefined.

12.6. Image Views

Image objects are not directly accessed by pipeline shaders for reading or writing image data. Instead, *image views* representing contiguous ranges of the image subresources and containing additional metadata are used for that purpose. Views **must** be created on images of compatible types, and **must** represent a valid subset of image subresources.

Image views are represented by `VkImageView` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkImageView)
```

`VK_REMAINING_ARRAY_LAYERS` is a special constant value used for image views to indicate that all remaining array layers in an image after the base layer should be included in the view.

```
#define VK_REMAINING_ARRAY_LAYERS          (~0U)
```

`VK_REMAINING_MIP_LEVELS` is a special constant value used for image views to indicate that all remaining mipmap levels in an image after the base level should be included in the view.

```
#define VK_REMAINING_MIP_LEVELS          (~0U)
```

The types of image views that **can** be created are:

```
// Provided by VK_VERSION_1_0
typedef enum VkImageViewType {
    VK_IMAGE_VIEW_TYPE_1D = 0,
    VK_IMAGE_VIEW_TYPE_2D = 1,
    VK_IMAGE_VIEW_TYPE_3D = 2,
    VK_IMAGE_VIEW_TYPE_CUBE = 3,
    VK_IMAGE_VIEW_TYPE_1D_ARRAY = 4,
    VK_IMAGE_VIEW_TYPE_2D_ARRAY = 5,
    VK_IMAGE_VIEW_TYPE_CUBE_ARRAY = 6,
} VkImageViewType;
```

To create an image view, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateImageView(
    VkDevice                                device,
    const VkImageViewCreateInfo*            pCreateInfo,
    const VkAllocationCallbacks*           pAllocator,
    VkImageView*                            pView);
```

- `device` is the logical device that creates the image view.
- `pCreateInfo` is a pointer to a `VkImageViewCreateInfo` structure containing parameters to be used to create the image view.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pView` is a pointer to a `VkImageView` handle in which the resulting image view object is returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkCreateImageView` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkCreateImageView-device-09667
`device` **must** support at least one queue family with one of the `VK_QUEUE_COMPUTE_BIT`, or `VK_QUEUE_GRAPHICS_BIT` capabilities

- VUID-vkCreateImageView-image-09179
`VkImageViewCreateInfo::image` **must** have been created from `device`
- VUID-vkCreateImageView-device-05068
The number of image views currently allocated from `device` plus 1 **must** be less than or equal to the total number of image views requested via `VkDeviceObjectReservationCreateInfo::imageViewRequestCount` specified when `device` was created
- VUID-vkCreateImageView-subresourceRange-05063
If `VkImageViewCreateInfo::subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS` and is greater than 1, or if `VkImageViewCreateInfo::subresourceRange.layerCount` is `VK_REMAINING_ARRAY_LAYERS` and the remaining number of layers in `VkImageViewCreateInfo::image` is greater than 1, the number of image views with more than one array layer currently allocated from `device` plus 1 **must** be less than or equal to the total number of image views requested via `VkDeviceObjectReservationCreateInfo::layeredImageViewRequestCount` specified when `device` was created

Valid Usage (Implicit)

- VUID-vkCreateImageView-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCreateImageView-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkImageViewCreateInfo` structure
- VUID-vkCreateImageView-pAllocator-null
`pAllocator` **must** be `NULL`
- VUID-vkCreateImageView-pView-parameter
`pView` **must** be a valid pointer to a `VkImageView` handle
- VUID-vkCreateImageView-device-queuecount
The device **must** have been created with at least 1 queue

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkImageViewCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkImageViewCreateInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkImageViewCreateFlags flags;
    VkImage               image;
    VkImageViewType       viewType;
    VkFormat              format;
    VkComponentMapping     components;
    VkImageSubresourceRange subresourceRange;
} VkImageViewCreateInfo;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of **VkImageViewCreateFlagBits** specifying additional parameters of the image view.
- **image** is a **VkImage** on which the view will be created.
- **viewType** is a **VkImageViewType** value specifying the type of the image view.
- **format** is a **VkFormat** specifying the format and type used to interpret texel blocks of the image.
- **components** is a **VkComponentMapping** structure specifying a remapping of color components (or of depth or stencil components after they have been converted into color components).
- **subresourceRange** is a **VkImageSubresourceRange** structure selecting the set of mipmap levels and array layers to be accessible to the view.

Some of the **image** creation parameters are inherited by the view. In particular, image view creation inherits the implicit parameter **usage** specifying the allowed usages of the image view that, by default, takes the value of the corresponding **usage** parameter specified in **VkImageCreateInfo** at image creation time. The implicit **usage** **can** be overridden by adding a **VkImageViewUsageCreateInfo** structure to the **pNext** chain, but the view usage **must** be a subset of the image usage. If **image** has a depth-stencil format and was created with a **VkImageStencilUsageCreateInfo** structure included in the **pNext** chain of **VkImageCreateInfo**, the usage is calculated based on the **subresource.aspectMask** provided:

- If **aspectMask** includes only **VK_IMAGE_ASPECT_STENCIL_BIT**, the implicit **usage** is equal to **VkImageStencilUsageCreateInfo::stencilUsage**.
- If **aspectMask** includes only **VK_IMAGE_ASPECT_DEPTH_BIT**, the implicit **usage** is equal to **VkImageCreateInfo::usage**.
- If both aspects are included in **aspectMask**, the implicit **usage** is equal to the intersection of **VkImageCreateInfo::usage** and **VkImageStencilUsageCreateInfo::stencilUsage**.

If **image** was created with the **VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT** flag, and if the **format** of the image is not **multi-planar format** **can** be different from the image's format, but if **image** was created without the **VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT** flag and they are not equal they **must** be *compatible*. Image format compatibility is defined in the **Format Compatibility Classes** section.

Views of compatible formats will have the same mapping between texel coordinates and memory locations irrespective of the **format**, with only the interpretation of the bit pattern changing.

If **image** was created with a **multi-planar format**, and the image view's **aspectMask** is one of **VK_IMAGE_ASPECT_PLANE_0_BIT**, **VK_IMAGE_ASPECT_PLANE_1_BIT** or **VK_IMAGE_ASPECT_PLANE_2_BIT**, the view's aspect mask is considered to be equivalent to **VK_IMAGE_ASPECT_COLOR_BIT** when used as a framebuffer attachment.

NOTE

Values intended to be used with one view format **may** not be exactly preserved when written or read through a different format. For example, an integer value that happens to have the bit pattern of a floating-point denorm or NaN **may** be flushed or canonicalized when written or read through a view with a floating-point format. Similarly, a value written through a signed normalized format that has a bit pattern exactly equal to -2^b **may** be changed to $-2^b + 1$ as described in [Conversion from Normalized Fixed-Point to Floating-Point](#).

If **image** was created with the **VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT** flag, **format** **must** be *compatible* with the image's format as described above; or **must** be an uncompressed format, in which case it **must** be *size-compatible* with the image's format. In this case, the resulting image view's texel dimensions equal the dimensions of the selected mip level divided by the compressed texel block size and rounded up.

The **VkComponentMapping** **components** member describes a remapping from components of the image to components of the vector returned by shader image instructions. This remapping **must** be the identity swizzle for any **VkImageView** used with a combined image sampler that enables **sampler Y'C_BC_R conversion**, input attachment descriptors, framebuffer attachments, and storage image descriptors.

If the image view is to be used with a sampler which supports **sampler Y'C_BC_R conversion**, an *identically defined object* of type **VkSamplerYcbcrConversion** to that used to create the sampler **must** be passed to **vkCreateImageView** in a **VkSamplerYcbcrConversionInfo** included in the **pNext** chain of **VkImageViewCreateInfo**. Conversely, if a **VkSamplerYcbcrConversion** object is passed to **vkCreateImageView**, an *identically defined* **VkSamplerYcbcrConversion** object **must** be used when sampling the image.

If the image has a **multi-planar format**, **subresourceRange.aspectMask** is **VK_IMAGE_ASPECT_COLOR_BIT**, and **usage** includes **VK_IMAGE_USAGE_SAMPLED_BIT**, then the **format** **must** be identical to the image **format** and the sampler to be used with the image view **must** enable **sampler Y'C_BC_R conversion**.

If **image** was created with the **VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT** and the image has a **multi-planar format**, and if **subresourceRange.aspectMask** is **VK_IMAGE_ASPECT_PLANE_0_BIT**, **VK_IMAGE_ASPECT_PLANE_1_BIT**, or **VK_IMAGE_ASPECT_PLANE_2_BIT**, **format** **must** be *compatible* with the corresponding plane of the image, and the sampler to be used with the image view **must** not enable **sampler Y'C_BC_R conversion**. The **width** and **height** of the single-plane image view **must** be derived from the multi-planar image's dimensions in the manner listed for **plane compatibility** for the plane.

Any view of an image plane will have the same mapping between texel coordinates and memory locations as used by the components of the color aspect, subject to the formulae relating texel

coordinates to lower-resolution planes as described in [Chroma Reconstruction](#). That is, if an R or B plane has a reduced resolution relative to the G plane of the multi-planar image, the image view operates using the (u_{plane}, v_{plane}) unnormalized coordinates of the reduced-resolution plane, and these coordinates access the same memory locations as the (u_{color}, v_{color}) unnormalized coordinates of the color aspect for which chroma reconstruction operations operate on the same (u_{plane}, v_{plane}) or (i_{plane}, j_{plane}) coordinates.

Table 13. Image Type and Image View Type Compatibility Requirements

Image View Type	Compatible Image Types
VK_IMAGE_VIEW_TYPE_1D	VK_IMAGE_TYPE_1D
VK_IMAGE_VIEW_TYPE_1D_ARRAY	VK_IMAGE_TYPE_1D
VK_IMAGE_VIEW_TYPE_2D	VK_IMAGE_TYPE_2D , VK_IMAGE_TYPE_3D
VK_IMAGE_VIEW_TYPE_2D_ARRAY	VK_IMAGE_TYPE_2D , VK_IMAGE_TYPE_3D
VK_IMAGE_VIEW_TYPE_CUBE	VK_IMAGE_TYPE_2D
VK_IMAGE_VIEW_TYPE_CUBE_ARRAY	VK_IMAGE_TYPE_2D
VK_IMAGE_VIEW_TYPE_3D	VK_IMAGE_TYPE_3D

Valid Usage

- VUID-VkImageViewCreateInfo-image-01003
If **image** was not created with **VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT** then **viewType** **must** not be **VK_IMAGE_VIEW_TYPE_CUBE** or **VK_IMAGE_VIEW_TYPE_CUBE_ARRAY**
- VUID-VkImageViewCreateInfo-viewType-01004
If the **imageCubeArray** feature is not enabled, **viewType** **must** not be **VK_IMAGE_VIEW_TYPE_CUBE_ARRAY**
- VUID-VkImageViewCreateInfo-image-06723
If **image** was created with **VK_IMAGE_TYPE_3D** but without **VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT** set then **viewType** **must** not be **VK_IMAGE_VIEW_TYPE_2D_ARRAY**
- VUID-VkImageViewCreateInfo-image-06727
If **image** was created with **VK_IMAGE_TYPE_3D** but without **VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT** set then **viewType** **must** not be **VK_IMAGE_VIEW_TYPE_2D**
- VUID-VkImageViewCreateInfo-image-04970
If **image** was created with **VK_IMAGE_TYPE_3D** and **viewType** is **VK_IMAGE_VIEW_TYPE_2D** or **VK_IMAGE_VIEW_TYPE_2D_ARRAY** then **subresourceRange.levelCount** **must** be 1
- VUID-VkImageViewCreateInfo-image-04972
If **image** was created with a **samples** value not equal to **VK_SAMPLE_COUNT_1_BIT** then **viewType** **must** be either **VK_IMAGE_VIEW_TYPE_2D** or **VK_IMAGE_VIEW_TYPE_2D_ARRAY**
- VUID-VkImageViewCreateInfo-image-04441
image **must** have been created with a **usage** value containing at least one of the usages defined in the [valid image usage](#) list for image views

- VUID-VkImageViewCreateInfo-None-02273
The **format features** of the resultant image view **must** contain at least one bit
- VUID-VkImageViewCreateInfo-usage-02274
If **usage** contains **VK_IMAGE_USAGE_SAMPLED_BIT**, then the **format features** of the resultant image view **must** contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT**
- VUID-VkImageViewCreateInfo-usage-02275
If **usage** contains **VK_IMAGE_USAGE_STORAGE_BIT**, then the image view's **format features must** contain **VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT**
- VUID-VkImageViewCreateInfo-usage-02276
If **usage** contains **VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT**, then the image view's **format features must** contain **VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT**
- VUID-VkImageViewCreateInfo-usage-02277
If **usage** contains **VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT**, then the image view's **format features must** contain **VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT**
- VUID-VkImageViewCreateInfo-usage-08932
If **usage** contains **VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT**,

then the image view's **format features must** contain at least one of
VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or
VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT
- VUID-VkImageViewCreateInfo-subresourceRange-01478
subresourceRange.baseMipLevel must be less than the **mipLevels** specified in **VkImageCreateInfo** when **image** was created
- VUID-VkImageViewCreateInfo-subresourceRange-01718
If **subresourceRange.levelCount** is not **VK_REMAINING_MIP_LEVELS**, **subresourceRange.baseMipLevel + subresourceRange.levelCount must** be less than or equal to the **mipLevels** specified in **VkImageCreateInfo** when **image** was created
- VUID-VkImageViewCreateInfo-image-01482
If **image** is not a 3D image created with **VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT** set, or **viewType** is not **VK_IMAGE_VIEW_TYPE_2D** or **VK_IMAGE_VIEW_TYPE_2D_ARRAY**, **subresourceRange.baseArrayLayer must** be less than the **arrayLayers** specified in **VkImageCreateInfo** when **image** was created
- VUID-VkImageViewCreateInfo-subresourceRange-01483
If **subresourceRange.layerCount** is not **VK_REMAINING_ARRAY_LAYERS**, **image** is not a 3D image created with **VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT** set, or **viewType** is not **VK_IMAGE_VIEW_TYPE_2D** or **VK_IMAGE_VIEW_TYPE_2D_ARRAY**, **subresourceRange.layerCount must** be non-zero and **subresourceRange.baseArrayLayer + subresourceRange.layerCount must** be less than or equal to the **arrayLayers** specified in **VkImageCreateInfo** when **image** was created
- VUID-VkImageViewCreateInfo-image-02724
If **image** is a 3D image created with **VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT** set, and **viewType** is **VK_IMAGE_VIEW_TYPE_2D** or **VK_IMAGE_VIEW_TYPE_2D_ARRAY**, **subresourceRange.baseArrayLayer must** be less than the depth computed from **baseMipLevel** and **extent.depth** specified in **VkImageCreateInfo** when **image** was created, according to

the formula defined in [Image Mip Level Sizing](#)

- VUID-VkImageViewCreateInfo-subresourceRange-02725

If `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `image` is a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set, and `viewType` is `VK_IMAGE_VIEW_TYPE_2D` or `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, `subresourceRange.layerCount` **must** be non-zero and `subresourceRange.baseArrayLayer + subresourceRange.layerCount` **must** be less than or equal to the depth computed from `baseMipLevel` and `extent.depth` specified in `VkImageCreateInfo` when `image` was created, according to the formula defined in [Image Mip Level Sizing](#)

- VUID-VkImageViewCreateInfo-image-01761

If `image` was created with the `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` flag, but without the `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` flag, and if the `format` of the `image` is not a [multi-planar format](#), `format` **must** be compatible with the `format` used to create `image`, as defined in [Format Compatibility Classes](#)

- VUID-VkImageViewCreateInfo-image-01583

If `image` was created with the `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` flag, `format` **must** be compatible with, or **must** be an uncompressed format that is [size-compatible](#) with, the `format` used to create `image`

- VUID-VkImageViewCreateInfo-image-07072

If `image` was created with the `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` flag and `format` is a non-compressed format, the `levelCount` member of `subresourceRange` **must** be 1

- VUID-VkImageViewCreateInfo-image-09487

If `image` was created with the `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` flag, and `format` is a non-compressed format, then the `layerCount` member of `subresourceRange` **must** be 1

- VUID-VkImageViewCreateInfo-pNext-01585

If a `VkImageFormatListCreateInfo` structure was included in the `pNext` chain of the `VkImageCreateInfo` structure used when creating `image` and `VkImageFormatListCreateInfo::viewFormatCount` is not zero then `format` **must** be one of the formats in `VkImageFormatListCreateInfo::pViewFormats`

- VUID-VkImageViewCreateInfo-image-01586

If `image` was created with the `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` flag, if the `format` of the `image` is a [multi-planar format](#), and if `subresourceRange.aspectMask` is one of the [multi-planar aspect mask](#) bits, then `format` **must** be compatible with the `VkFormat` for the plane of the `image format` indicated by `subresourceRange.aspectMask`, as defined in [Compatible Formats of Planes of Multi-Planar Formats](#)

- VUID-VkImageViewCreateInfo-subresourceRange-07818

`subresourceRange.aspectMask` **must** only have at most 1 valid [multi-planar aspect mask](#) bit

- VUID-VkImageViewCreateInfo-image-01762

If `image` was not created with the `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` flag, or if the `format` of the `image` is a [multi-planar format](#) and if `subresourceRange.aspectMask` is `VK_IMAGE_ASPECT_COLOR_BIT`, `format` **must** be identical to the `format` used to create `image`

- VUID-VkImageViewCreateInfo-format-06415

If the image view [requires a sampler Y'C_BR conversion](#) and `usage` contains

VK_IMAGE_USAGE_SAMPLED_BIT, then the pNext chain **must** include a VkSamplerYcbcrConversionInfo structure with a conversion value other than VK_NULL_HANDLE

- VUID-VkImageViewCreateInfo-format-04714

If format has a _422 or _420 suffix then image **must** have been created with a width that is a multiple of 2

- VUID-VkImageViewCreateInfo-format-04715

If format has a _420 suffix then image **must** have been created with a height that is a multiple of 2

- VUID-VkImageViewCreateInfo-pNext-01970

If the pNext chain includes a VkSamplerYcbcrConversionInfo structure with a conversion value other than VK_NULL_HANDLE, all members of components **must** have the identity swizzle

- VUID-VkImageViewCreateInfo-pNext-06658

If the pNext chain includes a VkSamplerYcbcrConversionInfo structure with a conversion value other than VK_NULL_HANDLE, format **must** be the same used in VkSamplerYcbcrConversionCreateInfo::format

- VUID-VkImageViewCreateInfo-image-01020

If image is non-sparse then it **must** be bound completely and contiguously to a single VkDeviceMemory object

- VUID-VkImageViewCreateInfo-subResourceRange-01021

viewType **must** be compatible with the type of image as shown in the view type compatibility table

- VUID-VkImageViewCreateInfo-image-08957

If image has an QNX Screen external format, format **must** be VK_FORMAT_UNDEFINED

- VUID-VkImageViewCreateInfo-image-08958

If image has an QNX Screen external format, the pNext chain **must** include a VkSamplerYcbcrConversionInfo structure with a conversion object created with the same external format as image

- VUID-VkImageViewCreateInfo-image-08959

If image has an QNX Screen external format, all members of components **must** be the identity swizzle

- VUID-VkImageViewCreateInfo-image-02086

If image was created with usage containing VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, viewType **must** be VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY

- VUID-VkImageViewCreateInfo-usage-04550

If the attachmentFragmentShadingRate feature is enabled, and the usage for the image view includes VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, then the image view's format features **must** contain VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-VkImageViewCreateInfo-usage-04551

If the attachmentFragmentShadingRate feature is enabled, the usage for the image view

includes `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`, and `layeredShadingRateAttachments` is `VK_FALSE`, `subresourceRange.layerCount` **must** be 1

- VUID-VkImageViewCreateInfo-pNext-02662

If the `pNext` chain includes a `VkImageViewUsageCreateInfo` structure, and `image` was not created with a `VkImageStencilUsageCreateInfo` structure included in the `pNext` chain of `VkImageCreateInfo`, its `usage` member **must** not include any bits that were not set in the `usage` member of the `VkImageCreateInfo` structure used to create `image`

- VUID-VkImageViewCreateInfo-pNext-02663

If the `pNext` chain includes a `VkImageViewUsageCreateInfo` structure, `image` was created with a `VkImageStencilUsageCreateInfo` structure included in the `pNext` chain of `VkImageCreateInfo`, and `subresourceRange.aspectMask` includes `VK_IMAGE_ASPECT_STENCIL_BIT`, the `usage` member of the `VkImageViewUsageCreateInfo` structure **must** not include any bits that were not set in the `usage` member of the `VkImageStencilUsageCreateInfo` structure used to create `image`

- VUID-VkImageViewCreateInfo-pNext-02664

If the `pNext` chain includes a `VkImageViewUsageCreateInfo` structure, `image` was created with a `VkImageStencilUsageCreateInfo` structure included in the `pNext` chain of `VkImageCreateInfo`, and `subresourceRange.aspectMask` includes bits other than `VK_IMAGE_ASPECT_STENCIL_BIT`, the `usage` member of the `VkImageViewUsageCreateInfo` structure **must** not include any bits that were not set in the `usage` member of the `VkImageCreateInfo` structure used to create `image`

- VUID-VkImageViewCreateInfo-imageViewType-04973

If `viewType` is `VK_IMAGE_VIEW_TYPE_1D`, `VK_IMAGE_VIEW_TYPE_2D`, or `VK_IMAGE_VIEW_TYPE_3D`; and `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, then `subresourceRange.layerCount` **must** be 1

- VUID-VkImageViewCreateInfo-imageViewType-04974

If `viewType` is `VK_IMAGE_VIEW_TYPE_1D`, `VK_IMAGE_VIEW_TYPE_2D`, or `VK_IMAGE_VIEW_TYPE_3D`; and `subresourceRange.layerCount` is `VK_REMAINING_ARRAY_LAYERS`, then the remaining number of layers **must** be 1

- VUID-VkImageViewCreateInfo-viewType-02960

If `viewType` is `VK_IMAGE_VIEW_TYPE_CUBE` and `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `subresourceRange.layerCount` **must** be 6

- VUID-VkImageViewCreateInfo-viewType-02961

If `viewType` is `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY` and `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `subresourceRange.layerCount` **must** be a multiple of 6

- VUID-VkImageViewCreateInfo-viewType-02962

If `viewType` is `VK_IMAGE_VIEW_TYPE_CUBE` and `subresourceRange.layerCount` is `VK_REMAINING_ARRAY_LAYERS`, the remaining number of layers **must** be 6

- VUID-VkImageViewCreateInfo-viewType-02963

If `viewType` is `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY` and `subresourceRange.layerCount` is `VK_REMAINING_ARRAY_LAYERS`, the remaining number of layers **must** be a multiple of 6

- VUID-VkImageViewCreateInfo-subresourceRange-05064

If `subresourceRange.levelCount` is not `VK_REMAINING_MIP_LEVELS`, `subresourceRange.levelCount` **must** be less than or equal to

VkDeviceObjectReservationCreateInfo::maxImageViewMipLevels

- VUID-VkImageViewCreateInfo-subresourceRange-05200

If `subresourceRange.levelCount` is `VK_REMAINING_MIP_LEVELS`, the remaining number of mip levels **must** be less than or equal to `VkDeviceObjectReservationCreateInfo::maxImageViewMipLevels`

- VUID-VkImageViewCreateInfo-subresourceRange-05065

If `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `subresourceRange.layerCount` **must** be less than or equal to `VkDeviceObjectReservationCreateInfo::maxImageViewArrayLayers`

- VUID-VkImageViewCreateInfo-subresourceRange-05201

If `subresourceRange.layerCount` is `VK_REMAINING_ARRAY_LAYERS`, the remaining number of layers **must** be less than or equal to `VkDeviceObjectReservationCreateInfo::maxImageViewMipLevels`

- VUID-VkImageViewCreateInfo-subresourceRange-05066

If `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS` and is greater than 1, or if `subresourceRange.layerCount` is `VK_REMAINING_ARRAY_LAYERS` and the remaining number of layers is greater than 1, then if `subresourceRange.levelCount` is not `VK_REMAINING_MIP_LEVELS`, `subresourceRange.levelCount` **must** be less than or equal to `VkDeviceObjectReservationCreateInfo::maxLayeredImageViewMipLevels`

- VUID-VkImageViewCreateInfo-subresourceRange-05202

If `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS` and is greater than 1, or if `subresourceRange.layerCount` is `VK_REMAINING_ARRAY_LAYERS` and the remaining number of layers is greater than 1, then if `subresourceRange.levelCount` is `VK_REMAINING_MIP_LEVELS`, the remaining number of mip levels **must** be less than or equal to `VkDeviceObjectReservationCreateInfo::maxLayeredImageViewMipLevels`

- VUID-VkImageViewCreateInfo-subresourceRange-09594

`subresourceRange.aspectMask` **must** be valid for the format the image was created with

Valid Usage (Implicit)

- VUID-VkImageViewCreateInfo-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_VIEW_CREATE_INFO`

- VUID-VkImageViewCreateInfo-pNext-pNext

Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkImageViewASTCDecodeModeEXT`, `VkImageViewUsageCreateInfo`, or `VkSamplerYcbcrConversionInfo`

- VUID-VkImageViewCreateInfo-sType-unique

The `sType` value of each structure in the `pNext` chain **must** be unique

- VUID-VkImageViewCreateInfo-flags-zeroBitmask

`flags` **must** be 0

- VUID-VkImageViewCreateInfo-image-parameter

`image` **must** be a valid `VkImage` handle

- VUID-VkImageViewCreateInfo-viewType-parameter
`viewType` **must** be a valid `VkImageViewType` value
- VUID-VkImageViewCreateInfo-format-parameter
`format` **must** be a valid `VkFormat` value
- VUID-VkImageViewCreateInfo-components-parameter
`components` **must** be a valid `VkComponentMapping` structure
- VUID-VkImageViewCreateInfo-subresourceRange-parameter
`subresourceRange` **must** be a valid `VkImageSubresourceRange` structure

Bits which **can** be set in `VkImageViewCreateInfo::flags`, specifying additional parameters of an image view, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkImageViewCreateFlagBits {
} VkImageViewCreateFlagBits;
```

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkImageViewCreateFlags;
```

`VkImageViewCreateFlags` is a bitmask type for setting a mask of zero or more `VkImageViewCreateFlagBits`.

The set of usages for the created image view **can** be restricted compared to the parent image's `usage` flags by adding a `VkImageViewUsageCreateInfo` structure to the `pNext` chain of `VkImageViewCreateInfo`.

The `VkImageViewUsageCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkImageViewUsageCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkImageUsageFlags  usage;
} VkImageViewUsageCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `usage` is a bitmask of `VkImageUsageFlagBits` specifying allowed usages of the image view.

When this structure is chained to `VkImageViewCreateInfo` the `usage` field overrides the implicit `usage` parameter inherited from image creation time and its value is used instead for the purposes of determining the valid usage conditions of `VkImageViewCreateInfo`.

Valid Usage (Implicit)

- VUID-VkImageViewUsageCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_VIEW_USAGE_CREATE_INFO`
- VUID-VkImageViewUsageCreateInfo-usage-parameter
`usage` **must** be a valid combination of `VkImageUsageFlagBits` values
- VUID-VkImageViewUsageCreateInfo-usage-requiredbitmask
`usage` **must** not be `0`

The `VkImageSubresourceRange` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkImageSubresourceRange {
    VkImageAspectFlags    aspectMask;
    uint32_t              baseMipLevel;
    uint32_t              levelCount;
    uint32_t              baseArrayLayer;
    uint32_t              layerCount;
} VkImageSubresourceRange;
```

- `aspectMask` is a bitmask of `VkImageAspectFlagBits` specifying which aspect(s) of the image are included in the view.
- `baseMipLevel` is the first mipmap level accessible to the view.
- `levelCount` is the number of mipmap levels (starting from `baseMipLevel`) accessible to the view.
- `baseArrayLayer` is the first array layer accessible to the view.
- `layerCount` is the number of array layers (starting from `baseArrayLayer`) accessible to the view.

The number of mipmap levels and array layers **must** be a subset of the image subresources in the image. If an application wants to use all mip levels or layers in an image after the `baseMipLevel` or `baseArrayLayer`, it **can** set `levelCount` and `layerCount` to the special values `VK_REMAINING_MIP_LEVELS` and `VK_REMAINING_ARRAY_LAYERS` without knowing the exact number of mip levels or layers.

For cube and cube array image views, the layers of the image view starting at `baseArrayLayer` correspond to faces in the order +X, -X, +Y, -Y, +Z, -Z. For cube arrays, each set of six sequential layers is a single cube, so the number of cube maps in a cube map array view is `layerCount / 6`, and image array layer (`baseArrayLayer + i`) is face index (`i mod 6`) of cube `i / 6`. If the number of layers in the view, whether set explicitly in `layerCount` or implied by `VK_REMAINING_ARRAY_LAYERS`, is not a multiple of 6, the last cube map in the array **must** not be accessed.

`aspectMask` **must** be only `VK_IMAGE_ASPECT_COLOR_BIT`, `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT` if `format` is a color, depth-only or stencil-only format, respectively, except if `format` is a `multi-planar format`. If using a depth/stencil format with both depth and stencil components, `aspectMask` **must** include at least one of `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`, and **can** include both.

When the `VkImageSubresourceRange` structure is used to select a subset of the slices of a 3D image's mip level in order to create a 2D or 2D array image view of a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT`, `baseArrayLayer` and `layerCount` specify the first slice index and the number of slices to include in the created image view. Such an image view **can** be used as a framebuffer attachment that refers only to the specified range of slices of the selected mip level. However, any layout transitions performed on such an attachment view during a render pass instance still apply to the entire subresource referenced which includes all the slices of the selected mip level.

When using an image view of a depth/stencil image to populate a descriptor set (e.g. for sampling in the shader, or for use as an input attachment), the `aspectMask` **must** only include one bit, which selects whether the image view is used for depth reads (i.e. using a floating-point sampler or input attachment in the shader) or stencil reads (i.e. using an unsigned integer sampler or input attachment in the shader). When an image view of a depth/stencil image is used as a depth/stencil framebuffer attachment, the `aspectMask` is ignored and both depth and stencil image subresources are used.

When creating a `VkImageView`, if sampler Y'_BC_R conversion is enabled in the sampler, the `aspectMask` of a `subresourceRange` used by the `VkImageView` **must** be `VK_IMAGE_ASPECT_COLOR_BIT`.

When creating a `VkImageView`, if sampler Y'_BC_R conversion is not enabled in the sampler and the image `format` is `multi-planar format`, the image **must** have been created with `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`, and the `aspectMask` of the `VkImageView`'s `subresourceRange` **must** be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT` or `VK_IMAGE_ASPECT_PLANE_2_BIT`.

Valid Usage

- VUID-VkImageSubresourceRange-levelCount-01720
If `levelCount` is not `VK_REMAINING_MIP_LEVELS`, it **must** be greater than 0
- VUID-VkImageSubresourceRange-layerCount-01721
If `layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, it **must** be greater than 0
- VUID-VkImageSubresourceRange-aspectMask-01670
If `aspectMask` includes `VK_IMAGE_ASPECT_COLOR_BIT`, then it **must** not include any of `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT`
- VUID-VkImageSubresourceRange-aspectMask-02278
`aspectMask` **must** not include `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT` for any index *i*

Valid Usage (Implicit)

- VUID-VkImageSubresourceRange-aspectMask-parameter
`aspectMask` **must** be a valid combination of `VkImageAspectFlagBits` values
- VUID-VkImageSubresourceRange-aspectMask-requiredbitmask
`aspectMask` **must** not be 0

Bits which **can** be set in an aspect mask to specify aspects of an image for purposes such as

identifying a subresource, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkImageAspectFlagBits {
    VK_IMAGE_ASPECT_COLOR_BIT = 0x00000001,
    VK_IMAGE_ASPECT_DEPTH_BIT = 0x00000002,
    VK_IMAGE_ASPECT_STENCIL_BIT = 0x00000004,
    VK_IMAGE_ASPECT_METADATA_BIT = 0x00000008,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANE_0_BIT = 0x00000010,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANE_1_BIT = 0x00000020,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANE_2_BIT = 0x00000040,
    // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_ASPECT_MEMORY_PLANE_0_BIT_EXT = 0x00000080,
    // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_ASPECT_MEMORY_PLANE_1_BIT_EXT = 0x00000100,
    // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_ASPECT_MEMORY_PLANE_2_BIT_EXT = 0x00000200,
    // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_ASPECT_MEMORY_PLANE_3_BIT_EXT = 0x00000400,
} VkImageAspectFlagBits;
```

- `VK_IMAGE_ASPECT_COLOR_BIT` specifies the color aspect.
- `VK_IMAGE_ASPECT_DEPTH_BIT` specifies the depth aspect.
- `VK_IMAGE_ASPECT_STENCIL_BIT` specifies the stencil aspect.
- `VK_IMAGE_ASPECT_METADATA_BIT` specifies the metadata aspect used for [sparse resource](#) operations.
- `VK_IMAGE_ASPECT_PLANE_0_BIT` specifies plane 0 of a *multi-planar* image format.
- `VK_IMAGE_ASPECT_PLANE_1_BIT` specifies plane 1 of a *multi-planar* image format.
- `VK_IMAGE_ASPECT_PLANE_2_BIT` specifies plane 2 of a *multi-planar* image format.
- `VK_IMAGE_ASPECT_MEMORY_PLANE_0_BIT_EXT` specifies *memory plane 0*.
- `VK_IMAGE_ASPECT_MEMORY_PLANE_1_BIT_EXT` specifies *memory plane 1*.
- `VK_IMAGE_ASPECT_MEMORY_PLANE_2_BIT_EXT` specifies *memory plane 2*.
- `VK_IMAGE_ASPECT_MEMORY_PLANE_3_BIT_EXT` specifies *memory plane 3*.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkImageAspectFlags;
```

`VkImageAspectFlags` is a bitmask type for setting a mask of zero or more `VkImageAspectFlagBits`.

The `VkComponentMapping` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkComponentMapping {
    VkComponentSwizzle    r;
    VkComponentSwizzle    g;
    VkComponentSwizzle    b;
    VkComponentSwizzle    a;
} VkComponentMapping;
```

- **r** is a [VkComponentSwizzle](#) specifying the component value placed in the R component of the output vector.
- **g** is a [VkComponentSwizzle](#) specifying the component value placed in the G component of the output vector.
- **b** is a [VkComponentSwizzle](#) specifying the component value placed in the B component of the output vector.
- **a** is a [VkComponentSwizzle](#) specifying the component value placed in the A component of the output vector.

Valid Usage (Implicit)

- VUID-VkComponentMapping-r-parameter
r must be a valid [VkComponentSwizzle](#) value
- VUID-VkComponentMapping-g-parameter
g must be a valid [VkComponentSwizzle](#) value
- VUID-VkComponentMapping-b-parameter
b must be a valid [VkComponentSwizzle](#) value
- VUID-VkComponentMapping-a-parameter
a must be a valid [VkComponentSwizzle](#) value

Possible values of the members of [VkComponentMapping](#), specifying the component values placed in each component of the output vector, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkComponentSwizzle {
    VK_COMPONENT_SWIZZLE_IDENTITY = 0,
    VK_COMPONENT_SWIZZLE_ZERO = 1,
    VK_COMPONENT_SWIZZLE_ONE = 2,
    VK_COMPONENT_SWIZZLE_R = 3,
    VK_COMPONENT_SWIZZLE_G = 4,
    VK_COMPONENT_SWIZZLE_B = 5,
    VK_COMPONENT_SWIZZLE_A = 6,
} VkComponentSwizzle;
```

- **VK_COMPONENT_SWIZZLE_IDENTITY** specifies that the component is set to the identity swizzle.

- `VK_COMPONENT_SWIZZLE_ZERO` specifies that the component is set to zero.
- `VK_COMPONENT_SWIZZLE_ONE` specifies that the component is set to either 1 or 1.0, depending on whether the type of the image view format is integer or floating-point respectively, as determined by the [Format Definition](#) section for each `VkFormat`.
- `VK_COMPONENT_SWIZZLE_R` specifies that the component is set to the value of the R component of the image.
- `VK_COMPONENT_SWIZZLE_G` specifies that the component is set to the value of the G component of the image.
- `VK_COMPONENT_SWIZZLE_B` specifies that the component is set to the value of the B component of the image.
- `VK_COMPONENT_SWIZZLE_A` specifies that the component is set to the value of the A component of the image.

Setting the identity swizzle on a component is equivalent to setting the identity mapping on that component. That is:

Table 14. Component Mappings Equivalent To `VK_COMPONENT_SWIZZLE_IDENTITY`

Component	Identity Mapping
<code>components.r</code>	<code>VK_COMPONENT_SWIZZLE_R</code>
<code>components.g</code>	<code>VK_COMPONENT_SWIZZLE_G</code>
<code>components.b</code>	<code>VK_COMPONENT_SWIZZLE_B</code>
<code>components.a</code>	<code>VK_COMPONENT_SWIZZLE_A</code>

If the `pNext` chain includes a `VkImageViewASTCDecodeModeEXT` structure, then that structure includes a parameter specifying the decode mode for image views using ASTC compressed formats.

The `VkImageViewASTCDecodeModeEXT` structure is defined as:

```
// Provided by VK_EXT_astc_decode_mode
typedef struct VkImageViewASTCDecodeModeEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkFormat            decodeMode;
} VkImageViewASTCDecodeModeEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `decodeMode` is the intermediate format used to decode ASTC compressed formats.

Valid Usage

- VUID-VkImageViewASTCDecodeModeEXT-decodeMode-02230
`decodeMode` **must** be one of `VK_FORMAT_R16G16B16A16_SFLOAT`, `VK_FORMAT_R8G8B8A8_UNORM`, or `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`

- VUID-VkImageViewASTCDecodeModeEXT-decodeMode-02231
If the `decodeModeSharedExponent` feature is not enabled, `decodeMode` **must** not be `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`
- VUID-VkImageViewASTCDecodeModeEXT-decodeMode-02232
If `decodeMode` is `VK_FORMAT_R8G8B8A8_UNORM` the image view **must** not include blocks using any of the ASTC HDR modes
- VUID-VkImageViewASTCDecodeModeEXT-format-04084
`format` of the image view **must** be one of the [ASTC Compressed Image Formats](#)

If `format` uses sRGB encoding then the `decodeMode` has no effect.

Valid Usage (Implicit)

- VUID-VkImageViewASTCDecodeModeEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_VIEW_ASTC_DECODE_MODE_EXT`
- VUID-VkImageViewASTCDecodeModeEXT-decodeMode-parameter
`decodeMode` **must** be a valid [VkFormat](#) value

To destroy an image view, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyImageView(
    VkDevice          device,
    VkImageView       imageView,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the image view.
- `imageView` is the image view to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroyImageView-imageView-01026
All submitted commands that refer to `imageView` **must** have completed execution

Valid Usage (Implicit)

- VUID-vkDestroyImageView-device-parameter
`device` **must** be a valid [VkDevice](#) handle
- VUID-vkDestroyImageView-imageView-parameter
If `imageView` is not `VK_NULL_HANDLE`, `imageView` **must** be a valid [VkImageView](#) handle
- VUID-vkDestroyImageView-pAllocator-null

`pAllocator` must be `NULL`

- `VUID-vkDestroyImageView-imageView-parent`

If `imageView` is a valid handle, it **must** have been created, allocated, or retrieved from device

Host Synchronization

- Host access to `imageView` **must** be externally synchronized

12.6.1. Image View Format Features

Valid uses of a `VkImageView` may depend on the image view's *format features*, defined below. Such constraints are documented in the affected valid usage statement.

- If `VkImageViewCreateInfo::image` was created with `VK_IMAGE_TILING_LINEAR`, then the image view's set of *format features* is the value of `VkFormatProperties::linearTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` on the same `format` as `VkImageViewCreateInfo::format`.
- If `VkImageViewCreateInfo::image` was created with `VK_IMAGE_TILING_OPTIMAL`, or a QNX Screen buffer external format, then the image view's set of *format features* is the value of `VkFormatProperties::optimalTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` on the same `format` as `VkImageViewCreateInfo::format`.
- If `VkImageViewCreateInfo::image` was created with a QNX Screen buffer external format, then the image view's set of *format features* is the value of `VkScreenBufferFormatPropertiesQNX::formatFeatures` found by calling `vkGetScreenBufferPropertiesQNX` on the QNX Screen buffer that was imported to the `VkDeviceMemory` to which the `VkImageViewCreateInfo::image` is bound.
- If `VkImageViewCreateInfo::image` was created with `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then:
 - The image's DRM format modifier is the value of `VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier` found by calling `vkGetImageDrmFormatModifierPropertiesEXT`.
 - Let `VkDrmFormatModifierPropertiesListEXT::pDrmFormatModifierProperties` be the array found by calling `vkGetPhysicalDeviceFormatProperties2` on the same `format` as `VkImageViewCreateInfo::format`.
 - Let `VkDrmFormatModifierPropertiesEXT prop` be the array element whose `drmFormatModifier` member is the value of the image's DRM format modifier.
 - Then the image view's set of *format features* is `prop::drmFormatModifierTilingFeatures`.

12.7. Resource Memory Association

Resources are initially created as *virtual allocations* with no backing memory. Device memory is allocated separately (see [Device Memory](#)) and then associated with the resource. This association is

done differently for sparse and non-sparse resources.

Resources created with any of the sparse creation flags are considered sparse resources. Resources created without these flags are non-sparse. The details on resource memory association for sparse resources is described in [Sparse Resources](#).

Non-sparse resources **must** be bound completely and contiguously to a single `VkDeviceMemory` object before the resource is passed as a parameter to any of the following operations:

- creating image or buffer views
- updating descriptor sets
- recording commands in a command buffer

Once bound, the memory binding is immutable for the lifetime of the resource.

In a logical device representing more than one physical device, buffer and image resources exist on all physical devices but **can** be bound to memory differently on each. Each such replicated resource is an *instance* of the resource. For sparse resources, each instance **can** be bound to memory arbitrarily differently. For non-sparse resources, each instance **can** either be bound to the local or a peer instance of the memory, or for images **can** be bound to rectangular regions from the local and/or peer instances. When a resource is used in a descriptor set, each physical device interprets the descriptor according to its own instance's binding to memory.

NOTE

There are no new copy commands to transfer data between physical devices. Instead, an application **can** create a resource with a peer mapping and use it as the source or destination of a transfer command executed by a single physical device to copy the data from one physical device to another.

To determine the memory requirements for a buffer resource, call:

```
// Provided by VK_VERSION_1_0
void vkGetBufferMemoryRequirements(
    VkDevice          device,
    VkBuffer          buffer,
    VkMemoryRequirements* pMemoryRequirements);
```

- `device` is the logical device that owns the buffer.
- `buffer` is the buffer to query.
- `pMemoryRequirements` is a pointer to a `VkMemoryRequirements` structure in which the memory requirements of the buffer object are returned.

Valid Usage (Implicit)

- VUID-vkGetBufferMemoryRequirements-device-parameter `device` **must** be a valid `VkDevice` handle
- VUID-vkGetBufferMemoryRequirements-buffer-parameter

buffer **must** be a valid [VkBuffer](#) handle

- VUID-vkGetBufferMemoryRequirements-pMemoryRequirements-parameter
pMemoryRequirements **must** be a valid pointer to a [VkMemoryRequirements](#) structure
- VUID-vkGetBufferMemoryRequirements-buffer-parent
buffer **must** have been created, allocated, or retrieved from **device**

To determine the memory requirements for an image resource which is not created with the **VK_IMAGE_CREATE_DISJOINT_BIT** flag set, call:

```
// Provided by VK_VERSION_1_0
void vkGetImageMemoryRequirements(
    VkDevice          device,
    VkImage           image,
    VkMemoryRequirements* pMemoryRequirements);
```

- **device** is the logical device that owns the image.
- **image** is the image to query.
- **pMemoryRequirements** is a pointer to a [VkMemoryRequirements](#) structure in which the memory requirements of the image object are returned.

Valid Usage

- VUID-vkGetImageMemoryRequirements-image-01588
image **must** not have been created with the **VK_IMAGE_CREATE_DISJOINT_BIT** flag set
- VUID-vkGetImageMemoryRequirements-image-08960
If **image** was created with the **VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX** external memory handle type, then **image** **must** be bound to memory

Valid Usage (Implicit)

- VUID-vkGetImageMemoryRequirements-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkGetImageMemoryRequirements-image-parameter
image **must** be a valid [VkImage](#) handle
- VUID-vkGetImageMemoryRequirements-pMemoryRequirements-parameter
pMemoryRequirements **must** be a valid pointer to a [VkMemoryRequirements](#) structure
- VUID-vkGetImageMemoryRequirements-image-parent
image **must** have been created, allocated, or retrieved from **device**

The [VkMemoryRequirements](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkMemoryRequirements {
    VkDeviceSize    size;
    VkDeviceSize    alignment;
    uint32_t        memoryTypeBits;
} VkMemoryRequirements;
```

- **size** is the size, in bytes, of the memory allocation **required** for the resource.
- **alignment** is the alignment, in bytes, of the offset within the allocation **required** for the resource.
- **memoryTypeBits** is a bitmask and contains one bit set for every supported memory type for the resource. Bit **i** is set if and only if the memory type **i** in the `VkPhysicalDeviceMemoryProperties` structure for the physical device is supported for the resource.

The implementation guarantees certain properties about the memory requirements returned by `vkGetBufferMemoryRequirements` and `vkGetImageMemoryRequirements`:

- The **memoryTypeBits** member always contains at least one bit set.
- If **buffer** is a `VkBuffer` not created with the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` or `VK_BUFFER_CREATE_PROTECTED_BIT` bits set, or if **image** is a **linear** image that was not created with the `VK_IMAGE_CREATE_PROTECTED_BIT` bit set, then the **memoryTypeBits** member always contains at least one bit set corresponding to a `VkMemoryType` with a **propertyFlags** that has both the `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` bit and the `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` bit set. In other words, mappable coherent memory **can** always be attached to these objects.
- If **buffer** was created with `VkExternalMemoryBufferCreateInfo::handleTypes` set to 0 or **image** was created with `VkExternalMemoryImageCreateInfo::handleTypes` set to 0, the **memoryTypeBits** member always contains at least one bit set corresponding to a `VkMemoryType` with a **propertyFlags** that has the `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT` bit set.
- The **memoryTypeBits** member is identical for all `VkBuffer` objects created with the same value for the **flags** and **usage** members in the `VkBufferCreateInfo` structure and the **handleTypes** member of the `VkExternalMemoryBufferCreateInfo` structure passed to `vkCreateBuffer`. Further, if **usage1** and **usage2** of type `VkBufferUsageFlags` are such that the bits set in **usage2** are a subset of the bits set in **usage1**, and they have the same **flags** and `VkExternalMemoryBufferCreateInfo::handleTypes`, then the bits set in **memoryTypeBits** returned for **usage1** **must** be a subset of the bits set in **memoryTypeBits** returned for **usage2**, for all values of **flags**.
- The **alignment** member is a power of two.
- The **alignment** member is identical for all `VkBuffer` objects created with the same combination of values for the **usage** and **flags** members in the `VkBufferCreateInfo` structure passed to `vkCreateBuffer`.
- The **alignment** member satisfies the buffer descriptor offset alignment requirements associated with the `VkBuffer`'s **usage**:
 - If **usage** included `VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT` or `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT`, **alignment** **must** be an integer multiple of `VkPhysicalDeviceLimits::minTexelBufferOffsetAlignment`.

- If `usage` included `VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT`, `alignment` **must** be an integer multiple of `VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment`.
- If `usage` included `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT`, `alignment` **must** be an integer multiple of `VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment`.
- For images created with a color format, the `memoryTypeBits` member is identical for all `VkImage` objects created with the same combination of values for the `tiling` member, the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` bit and `VK_IMAGE_CREATE_PROTECTED_BIT` bit of the `flags` member, the `VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT` bit of the `flags` member, `handleTypes` member of `VkExternalMemoryImageCreateInfo`, and the `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT` of the `usage` member in the `VkImageCreateInfo` structure passed to `vkCreateImage`.
- For images created with a depth/stencil format, the `memoryTypeBits` member is identical for all `VkImage` objects created with the same combination of values for the `format` member, the `tiling` member, the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` bit and `VK_IMAGE_CREATE_PROTECTED_BIT` bit of the `flags` member, the `VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT` bit of the `flags` member, `handleTypes` member of `VkExternalMemoryImageCreateInfo`, and the `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT` of the `usage` member in the `VkImageCreateInfo` structure passed to `vkCreateImage`.
- If the memory requirements are for a `VkImage`, the `memoryTypeBits` member **must** not refer to a `VkMemoryType` with a `propertyFlags` that has the `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` bit set if the `image` did not have `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT` bit set in the `usage` member of the `VkImageCreateInfo` structure passed to `vkCreateImage`.
- If the memory requirements are for a `VkBuffer`, the `memoryTypeBits` member **must** not refer to a `VkMemoryType` with a `propertyFlags` that has the `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` bit set.

NOTE

The implication of this requirement is that lazily allocated memory is disallowed for buffers in all cases.

- The `size` member is identical for all `VkBuffer` objects created with the same combination of creation parameters specified in `VkBufferCreateInfo` and its `pNext` chain.
- The `size` member is identical for all `VkImage` objects created with the same combination of creation parameters specified in `VkImageCreateInfo` and its `pNext` chain.

NOTE

This, however, does not imply that they interpret the contents of the bound memory identically with each other. That additional guarantee, however, **can** be explicitly requested using `VK_IMAGE_CREATE_ALIAS_BIT`.

To determine the memory requirements for a buffer resource, call:

```
// Provided by VK_VERSION_1_1
void vkGetBufferMemoryRequirements2(
    VkDevice                device,
    const VkBufferMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2*   pMemoryRequirements);
```

- **device** is the logical device that owns the buffer.
- **pInfo** is a pointer to a [VkBufferMemoryRequirementsInfo2](#) structure containing parameters required for the memory requirements query.
- **pMemoryRequirements** is a pointer to a [VkMemoryRequirements2](#) structure in which the memory requirements of the buffer object are returned.

Valid Usage (Implicit)

- VUID-vkGetBufferMemoryRequirements2-device-parameter **device** **must** be a valid [VkDevice](#) handle
- VUID-vkGetBufferMemoryRequirements2-pInfo-parameter **pInfo** **must** be a valid pointer to a valid [VkBufferMemoryRequirementsInfo2](#) structure
- VUID-vkGetBufferMemoryRequirements2-pMemoryRequirements-parameter **pMemoryRequirements** **must** be a valid pointer to a [VkMemoryRequirements2](#) structure

The [VkBufferMemoryRequirementsInfo2](#) structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkBufferMemoryRequirementsInfo2 {
    VkStructureType    sType;
    const void*        pNext;
    VkBuffer           buffer;
} VkBufferMemoryRequirementsInfo2;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **buffer** is the buffer to query.

Valid Usage (Implicit)

- VUID-VkBufferMemoryRequirementsInfo2-sType-sType **sType** **must** be `VK_STRUCTURE_TYPE_BUFFER_MEMORY_REQUIREMENTS_INFO_2`
- VUID-VkBufferMemoryRequirementsInfo2-pNext-pNext **pNext** **must** be `NULL`
- VUID-VkBufferMemoryRequirementsInfo2-buffer-parameter **buffer** **must** be a valid [VkBuffer](#) handle

To determine the memory requirements for an image resource, call:

```
// Provided by VK_VERSION_1_1
void vkGetImageMemoryRequirements2(
    VkDevice                device,
    const VkImageMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

- **device** is the logical device that owns the image.
- **pInfo** is a pointer to a [VkImageMemoryRequirementsInfo2](#) structure containing parameters required for the memory requirements query.
- **pMemoryRequirements** is a pointer to a [VkMemoryRequirements2](#) structure in which the memory requirements of the image object are returned.

Valid Usage (Implicit)

- VUID-vkGetImageMemoryRequirements2-device-parameter **device** **must** be a valid [VkDevice](#) handle
- VUID-vkGetImageMemoryRequirements2-pInfo-parameter **pInfo** **must** be a valid pointer to a valid [VkImageMemoryRequirementsInfo2](#) structure
- VUID-vkGetImageMemoryRequirements2-pMemoryRequirements-parameter **pMemoryRequirements** **must** be a valid pointer to a [VkMemoryRequirements2](#) structure

The [VkImageMemoryRequirementsInfo2](#) structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkImageMemoryRequirementsInfo2 {
    VkStructureType    sType;
    const void*        pNext;
    VkImage            image;
} VkImageMemoryRequirementsInfo2;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **image** is the image to query.

Valid Usage

- VUID-VkImageMemoryRequirementsInfo2-image-01589
If **image** was created with a *multi-planar* format and the `VK_IMAGE_CREATE_DISJOINT_BIT` flag, there **must** be a [VkImagePlaneMemoryRequirementsInfo](#) included in the **pNext** chain of the [VkImageMemoryRequirementsInfo2](#) structure
- VUID-VkImageMemoryRequirementsInfo2-image-02279
If **image** was created with `VK_IMAGE_CREATE_DISJOINT_BIT` and with

`VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then there **must** be a `VkImagePlaneMemoryRequirementsInfo` included in the `pNext` chain of the `VkImageMemoryRequirementsInfo2` structure

- VUID-VkImageMemoryRequirementsInfo2-image-01590

If `image` was not created with the `VK_IMAGE_CREATE_DISJOINT_BIT` flag, there **must** not be a `VkImagePlaneMemoryRequirementsInfo` included in the `pNext` chain of the `VkImageMemoryRequirementsInfo2` structure

- VUID-VkImageMemoryRequirementsInfo2-image-02280

If `image` was created with a single-plane format and with any `tiling` other than `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then there **must** not be a `VkImagePlaneMemoryRequirementsInfo` included in the `pNext` chain of the `VkImageMemoryRequirementsInfo2` structure

- VUID-VkImageMemoryRequirementsInfo2-image-08961

If `image` was created with the `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX` external memory handle type, then `image` **must** be bound to memory

Valid Usage (Implicit)

- VUID-VkImageMemoryRequirementsInfo2-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_MEMORY_REQUIREMENTS_INFO_2`

- VUID-VkImageMemoryRequirementsInfo2-pNext-pNext

`pNext` **must** be `NULL` or a pointer to a valid instance of `VkImagePlaneMemoryRequirementsInfo`

- VUID-VkImageMemoryRequirementsInfo2-sType-unique

The `sType` value of each structure in the `pNext` chain **must** be unique

- VUID-VkImageMemoryRequirementsInfo2-image-parameter

`image` **must** be a valid `VkImage` handle

To determine the memory requirements for a plane of a disjoint image, add a `VkImagePlaneMemoryRequirementsInfo` structure to the `pNext` chain of the `VkImageMemoryRequirementsInfo2` structure.

The `VkImagePlaneMemoryRequirementsInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkImagePlaneMemoryRequirementsInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkImageAspectFlags planeAspect;
} VkImagePlaneMemoryRequirementsInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `planeAspect` is a `VkImageAspectFlagBits` value specifying the aspect corresponding to the image plane to query.

Valid Usage

- VUID-VkImagePlaneMemoryRequirementsInfo-planeAspect-02281
If the image's `tiling` is `VK_IMAGE_TILING_LINEAR` or `VK_IMAGE_TILING_OPTIMAL`, then `planeAspect` **must** be a single valid `multi-planar aspect mask` bit
- VUID-VkImagePlaneMemoryRequirementsInfo-planeAspect-02282
If the image's `tiling` is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `planeAspect` **must** be a single valid *memory plane* for the image (that is, `aspectMask` **must** specify a plane index that is less than the `VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount` associated with the image's `format` and `VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier`)

Valid Usage (Implicit)

- VUID-VkImagePlaneMemoryRequirementsInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_PLANE_MEMORY_REQUIREMENTS_INFO`
- VUID-VkImagePlaneMemoryRequirementsInfo-planeAspect-parameter
`planeAspect` **must** be a valid `VkImageAspectFlagBits` value

The `VkMemoryRequirements2` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkMemoryRequirements2 {
    VkStructureType    sType;
    void*              pNext;
    VkMemoryRequirements memoryRequirements;
} VkMemoryRequirements2;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryRequirements` is a `VkMemoryRequirements` structure describing the memory requirements of the resource.

Valid Usage (Implicit)

- VUID-VkMemoryRequirements2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_MEMORY_REQUIREMENTS_2`
- VUID-VkMemoryRequirements2-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkMemoryDedicatedRequirements`
- VUID-VkMemoryRequirements2-sType-unique

The `sType` value of each structure in the `pNext` chain **must** be unique

The `VkMemoryDedicatedRequirements` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkMemoryDedicatedRequirements {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           prefersDedicatedAllocation;
    VkBool32           requiresDedicatedAllocation;
} VkMemoryDedicatedRequirements;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `prefersDedicatedAllocation` specifies that the implementation would prefer a dedicated allocation for this resource. The application is still free to suballocate the resource but it **may** get better performance if a dedicated allocation is used.
- `requiresDedicatedAllocation` specifies that a dedicated allocation is required for this resource.

To determine the dedicated allocation requirements of a buffer or image resource, add a `VkMemoryDedicatedRequirements` structure to the `pNext` chain of the `VkMemoryRequirements2` structure passed as the `pMemoryRequirements` parameter of `vkGetBufferMemoryRequirements2`, or `vkGetImageMemoryRequirements2` respectively.

Constraints on the values returned for buffer resources are:

- `requiresDedicatedAllocation` **may** be `VK_TRUE` if the `pNext` chain of `VkBufferCreateInfo` for the call to `vkCreateBuffer` used to create the buffer being queried included a `VkExternalMemoryBufferCreateInfo` structure, and any of the handle types specified in `VkExternalMemoryBufferCreateInfo::handleTypes` requires dedicated allocation, as reported by `vkGetPhysicalDeviceExternalBufferProperties` in `VkExternalBufferProperties::externalMemoryProperties.externalMemoryFeatures`. Otherwise, `requiresDedicatedAllocation` will be `VK_FALSE`.
- When the implementation sets `requiresDedicatedAllocation` to `VK_TRUE`, it **must** also set `prefersDedicatedAllocation` to `VK_TRUE`.
- If `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` was set in `VkBufferCreateInfo::flags` when `buffer` was created, then both `prefersDedicatedAllocation` and `requiresDedicatedAllocation` will be `VK_FALSE`.

Constraints on the values returned for image resources are:

- `requiresDedicatedAllocation` **may** be `VK_TRUE` if the `pNext` chain of `VkImageCreateInfo` for the call to `vkCreateImage` used to create the image being queried included a `VkExternalMemoryImageCreateInfo` structure, and any of the handle types specified in `VkExternalMemoryImageCreateInfo::handleTypes` requires dedicated allocation, as reported by `vkGetPhysicalDeviceImageFormatProperties2` in `VkExternalImageFormatProperties::externalMemoryProperties.externalMemoryFeatures`.

- `requiresDedicatedAllocation` may be `VK_TRUE` if the image's tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`.
- `requiresDedicatedAllocation` will otherwise be `VK_FALSE`
- If `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` was set in `VkImageCreateInfo::flags` when `image` was created, then both `prefersDedicatedAllocation` and `requiresDedicatedAllocation` will be `VK_FALSE`.

Valid Usage (Implicit)

- VUID-VkMemoryDedicatedRequirements-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_MEMORY_DEDICATED_REQUIREMENTS`

To attach memory to a buffer object, call:

```
// Provided by VK_VERSION_1_0
VkResult vkBindBufferMemory(
    VkDevice          device,
    VkBuffer          buffer,
    VkDeviceMemory    memory,
    VkDeviceSize      memoryOffset);
```

- `device` is the logical device that owns the buffer and memory.
- `buffer` is the buffer to be attached to memory.
- `memory` is a `VkDeviceMemory` object describing the device memory to attach.
- `memoryOffset` is the start offset of the region of `memory` which is to be bound to the buffer. The number of bytes returned in the `VkMemoryRequirements::size` member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified buffer.

`vkBindBufferMemory` is equivalent to passing the same parameters through `VkBindBufferMemoryInfo` to `vkBindBufferMemory2`.

If the `memory` was obtained by a memory import operation with `VkExternalMemoryBufferCreateInfo::handleTypes` assigned to `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCI_BUF_BIT_NV`, the properties of `buffer` and the `memoryOffset` must be compatible with the attributes used to create `NvSciBufObj`, otherwise the implementation will return `VK_ERROR_VALIDATION_FAILED`.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkBindBufferMemory` must not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkBindBufferMemory-buffer-07459
`buffer` must not have been bound to a memory object
- VUID-vkBindBufferMemory-buffer-01030

buffer **must** not have been created with any sparse memory binding flags

- VUID-vkBindBufferMemory-memoryOffset-01031
memoryOffset **must** be less than the size of **memory**
- VUID-vkBindBufferMemory-memory-01035
memory **must** have been allocated using one of the memory types allowed in the **memoryTypeBits** member of the **VkMemoryRequirements** structure returned from a call to **vkGetBufferMemoryRequirements** with **buffer**
- VUID-vkBindBufferMemory-None-10739
memoryOffset **must** be an integer multiple of the **alignment** member of the **VkMemoryRequirements** structure returned from a call to **vkGetBufferMemoryRequirements** with **buffer**
- VUID-vkBindBufferMemory-None-10741
size member of the **VkMemoryRequirements** structure returned from a call to **vkGetBufferMemoryRequirements** with **buffer** **must** be less than or equal to the size of **memory** minus **memoryOffset**
- VUID-vkBindBufferMemory-buffer-01444
If **buffer** requires a dedicated allocation (as reported by **vkGetBufferMemoryRequirements2** in **VkMemoryDedicatedRequirements::requiresDedicatedAllocation** for **buffer**), **memory** **must** have been allocated with **VkMemoryDedicatedAllocateInfo::buffer** equal to **buffer**
- VUID-vkBindBufferMemory-memory-01508
If the **VkMemoryAllocateInfo** provided when **memory** was allocated included a **VkMemoryDedicatedAllocateInfo** structure in its **pNext** chain, and **VkMemoryDedicatedAllocateInfo::buffer** was not **VK_NULL_HANDLE**, then **buffer** **must** equal **VkMemoryDedicatedAllocateInfo::buffer**, and **memoryOffset** **must** be zero
- VUID-vkBindBufferMemory-memory-10925
If the **VkMemoryAllocateInfo** provided when **memory** was allocated included a **VkMemoryDedicatedAllocateInfo** structure in its **pNext** chain, **VkMemoryDedicatedAllocateInfo::image** **must** have been **VK_NULL_HANDLE**
- VUID-vkBindBufferMemory-None-01898
If **buffer** was created with the **VK_BUFFER_CREATE_PROTECTED_BIT** bit set, the **buffer** **must** be bound to a memory object allocated with a memory type that reports **VK_MEMORY_PROPERTY_PROTECTED_BIT**
- VUID-vkBindBufferMemory-None-01899
If **buffer** was created with the **VK_BUFFER_CREATE_PROTECTED_BIT** bit not set, the **buffer** **must** not be bound to a memory object allocated with a memory type that reports **VK_MEMORY_PROPERTY_PROTECTED_BIT**
- VUID-vkBindBufferMemory-memory-02726
If the value of **VkExportMemoryAllocateInfo::handleTypes** used to allocate **memory** is not **0**, it **must** include at least one of the handles set in **VkExternalMemoryBufferCreateInfo::handleTypes** when **buffer** was created
- VUID-vkBindBufferMemory-memory-02985
If **memory** was allocated by a memory import operation, the external handle type of the

imported memory **must** also have been set in `VkExternalMemoryBufferCreateInfo::handleTypes` when `buffer` was created

- VUID-vkBindBufferMemory-bufferDeviceAddress-03339

If the `VkPhysicalDeviceBufferDeviceAddressFeatures::bufferDeviceAddress` feature is enabled and `buffer` was created with the `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT` bit set, memory **must** have been allocated with the `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT` bit set

- VUID-vkBindBufferMemory-bufferDeviceAddressCaptureReplay-09200

If the `VkPhysicalDeviceBufferDeviceAddressFeatures::bufferDeviceAddressCaptureReplay` feature is enabled and `buffer` was created with the `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT` bit set, memory **must** have been allocated with the `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT` bit set

Valid Usage (Implicit)

- VUID-vkBindBufferMemory-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkBindBufferMemory-buffer-parameter
`buffer` **must** be a valid `VkBuffer` handle
- VUID-vkBindBufferMemory-memory-parameter
`memory` **must** be a valid `VkDeviceMemory` handle
- VUID-vkBindBufferMemory-buffer-parent
`buffer` **must** have been created, allocated, or retrieved from `device`
- VUID-vkBindBufferMemory-memory-parent
`memory` **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `buffer` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

To attach memory to buffer objects for one or more buffers at a time, call:

```
// Provided by VK_VERSION_1_1
VkResult vkBindBufferMemory2(
    VkDevice          device,
    uint32_t          bindInfoCount,
    const VkBindBufferMemoryInfo* pBindInfos);
```

- **device** is the logical device that owns the buffers and memory.
- **bindInfoCount** is the number of elements in **pBindInfos**.
- **pBindInfos** is a pointer to an array of **bindInfoCount** **VkBindBufferMemoryInfo** structures describing buffers and memory to bind.

On some implementations, it **may** be more efficient to batch memory bindings into a single command.

If any of the memory binding operations described by **pBindInfos** fail, the **VkResult** returned by this command **must** be the return value of any one of the memory binding operations which did not return **VK_SUCCESS**.

NOTE

If the **vkBindBufferMemory2** command failed, and **bindInfoCount** was greater than one, then the buffers referenced by **pBindInfos** will be in an indeterminate state, and must not be used.

Applications should destroy these buffers.

If **VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations** is **VK_TRUE**, **vkBindBufferMemory2** **must** not return **VK_ERROR_OUT_OF_HOST_MEMORY**.

Valid Usage (Implicit)

- VUID-vkBindBufferMemory2-device-parameter
device **must** be a valid **VkDevice** handle
- VUID-vkBindBufferMemory2-pBindInfos-parameter
pBindInfos **must** be a valid pointer to an array of **bindInfoCount** valid **VkBindBufferMemoryInfo** structures
- VUID-vkBindBufferMemory2-bindInfoCount-arraylength
bindInfoCount **must** be greater than 0

Return Codes

Success

- **VK_SUCCESS**

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

`VkBindBufferMemoryInfo` contains members corresponding to the parameters of `vkBindBufferMemory`.

The `VkBindBufferMemoryInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkBindBufferMemoryInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkBuffer            buffer;
    VkDeviceMemory      memory;
    VkDeviceSize        memoryOffset;
} VkBindBufferMemoryInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `buffer` is the buffer to be attached to memory.
- `memory` is a `VkDeviceMemory` object describing the device memory to attach.
- `memoryOffset` is the start offset of the region of `memory` which is to be bound to the buffer. The number of bytes returned in the `VkMemoryRequirements::size` member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified buffer.

Valid Usage

- VUID-VkBindBufferMemoryInfo-buffer-07459
`buffer` **must** not have been bound to a memory object
- VUID-VkBindBufferMemoryInfo-buffer-01030
`buffer` **must** not have been created with any sparse memory binding flags
- VUID-VkBindBufferMemoryInfo-memoryOffset-01031
`memoryOffset` **must** be less than the size of `memory`
- VUID-VkBindBufferMemoryInfo-memory-01035
`memory` **must** have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the `VkMemoryRequirements` structure returned from a call to `vkGetBufferMemoryRequirements` with `buffer`
- VUID-VkBindBufferMemoryInfo-None-10739
`memoryOffset` **must** be an integer multiple of the `alignment` member of the

`VkMemoryRequirements` structure returned from a call to `vkGetBufferMemoryRequirements` with `buffer`

- VUID-VkBindBufferMemoryInfo-None-10741
`size` member of the `VkMemoryRequirements` structure returned from a call to `vkGetBufferMemoryRequirements` with `buffer` **must** be less than or equal to the size of `memory` minus `memoryOffset`
- VUID-VkBindBufferMemoryInfo-buffer-01444
If `buffer` requires a dedicated allocation (as reported by `vkGetBufferMemoryRequirements2` in `VkMemoryDedicatedRequirements::requiresDedicatedAllocation` for `buffer`), `memory` **must** have been allocated with `VkMemoryDedicatedAllocateInfo::buffer` equal to `buffer`
- VUID-VkBindBufferMemoryInfo-memory-01508
If the `VkMemoryAllocateInfo` provided when `memory` was allocated included a `VkMemoryDedicatedAllocateInfo` structure in its `pNext` chain, and `VkMemoryDedicatedAllocateInfo::buffer` was not `VK_NULL_HANDLE`, then `buffer` **must** equal `VkMemoryDedicatedAllocateInfo::buffer`, and `memoryOffset` **must** be zero
- VUID-VkBindBufferMemoryInfo-memory-10925
If the `VkMemoryAllocateInfo` provided when `memory` was allocated included a `VkMemoryDedicatedAllocateInfo` structure in its `pNext` chain, `VkMemoryDedicatedAllocateInfo::image` **must** have been `VK_NULL_HANDLE`
- VUID-VkBindBufferMemoryInfo-None-01898
If `buffer` was created with the `VK_BUFFER_CREATE_PROTECTED_BIT` bit set, the buffer **must** be bound to a memory object allocated with a memory type that reports `VK_MEMORY_PROPERTY_PROTECTED_BIT`
- VUID-VkBindBufferMemoryInfo-None-01899
If `buffer` was created with the `VK_BUFFER_CREATE_PROTECTED_BIT` bit not set, the buffer **must** not be bound to a memory object allocated with a memory type that reports `VK_MEMORY_PROPERTY_PROTECTED_BIT`
- VUID-VkBindBufferMemoryInfo-memory-02726
If the value of `VkExportMemoryAllocateInfo::handleTypes` used to allocate `memory` is not `0`, it **must** include at least one of the handles set in `VkExternalMemoryBufferCreateInfo::handleTypes` when `buffer` was created
- VUID-VkBindBufferMemoryInfo-memory-02985
If `memory` was allocated by a memory import operation, the external handle type of the imported memory **must** also have been set in `VkExternalMemoryBufferCreateInfo::handleTypes` when `buffer` was created
- VUID-VkBindBufferMemoryInfo-bufferDeviceAddress-03339
If the `VkPhysicalDeviceBufferDeviceAddressFeatures::bufferDeviceAddress` feature is enabled and `buffer` was created with the `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT` bit set, `memory` **must** have been allocated with the `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT` bit set
- VUID-VkBindBufferMemoryInfo-bufferDeviceAddressCaptureReplay-09200
If the `VkPhysicalDeviceBufferDeviceAddressFeatures::bufferDeviceAddressCaptureReplay` feature is enabled and `buffer` was created with the

`VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT` bit set, `memory` **must** have been allocated with the `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT` bit set

- VUID-VkBindBufferMemoryInfo-pNext-01605

If the `pNext` chain includes a `VkBindBufferMemoryDeviceGroupInfo` structure, all instances of `memory` specified by `VkBindBufferMemoryDeviceGroupInfo::pDeviceIndices` **must** have been allocated

Valid Usage (Implicit)

- VUID-VkBindBufferMemoryInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_BIND_BUFFER_MEMORY_INFO`
- VUID-VkBindBufferMemoryInfo-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkBindBufferMemoryDeviceGroupInfo`
- VUID-VkBindBufferMemoryInfo-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkBindBufferMemoryInfo-buffer-parameter
`buffer` **must** be a valid `VkBuffer` handle
- VUID-VkBindBufferMemoryInfo-memory-parameter
`memory` **must** be a valid `VkDeviceMemory` handle
- VUID-VkBindBufferMemoryInfo-commonparent
Both of `buffer`, and `memory` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `buffer` **must** be externally synchronized

The `VkBindBufferMemoryDeviceGroupInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkBindBufferMemoryDeviceGroupInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           deviceIndexCount;
    const uint32_t*     pDeviceIndices;
} VkBindBufferMemoryDeviceGroupInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceIndexCount` is the number of elements in `pDeviceIndices`.

- `pDeviceIndices` is a pointer to an array of device indices.

If the `pNext` chain of `VkBindBufferMemoryInfo` includes a `VkBindBufferMemoryDeviceGroupInfo` structure, then that structure determines how memory is bound to buffers across multiple devices in a device group.

If `deviceIndexCount` is greater than zero, then on device index `i` the buffer is attached to the instance of `memory` on the physical device with device index `pDeviceIndices[i]`.

If `deviceIndexCount` is zero and `memory` comes from a memory heap with the `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` bit set, then it is as if `pDeviceIndices` contains consecutive indices from zero to the number of physical devices in the logical device, minus one. In other words, by default each physical device attaches to its own instance of `memory`.

If `deviceIndexCount` is zero and `memory` comes from a memory heap without the `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` bit set, then it is as if `pDeviceIndices` contains an array of zeros. In other words, by default each physical device attaches to instance zero.

Valid Usage

- VUID-VkBindBufferMemoryDeviceGroupInfo-deviceIndexCount-01606
`deviceIndexCount` **must** either be zero or equal to the number of physical devices in the logical device
- VUID-VkBindBufferMemoryDeviceGroupInfo-pDeviceIndices-01607
All elements of `pDeviceIndices` **must** be valid device indices

Valid Usage (Implicit)

- VUID-VkBindBufferMemoryDeviceGroupInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_BIND_BUFFER_MEMORY_DEVICE_GROUP_INFO`
- VUID-VkBindBufferMemoryDeviceGroupInfo-pDeviceIndices-parameter
If `deviceIndexCount` is not 0, `pDeviceIndices` **must** be a valid pointer to an array of `deviceIndexCount` `uint32_t` values

To attach memory to a `VkImage` object created without the `VK_IMAGE_CREATE_DISJOINT_BIT` set, call:

```
// Provided by VK_VERSION_1_0
VkResult vkBindImageMemory(
    VkDevice          device,
    VkImage           image,
    VkDeviceMemory    memory,
    VkDeviceSize      memoryOffset);
```

- `device` is the logical device that owns the image and memory.
- `image` is the image.

- `memory` is the `VkDeviceMemory` object describing the device memory to attach.
- `memoryOffset` is the start offset of the region of `memory` which is to be bound to the image. The number of bytes returned in the `VkMemoryRequirements::size` member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified image.

`vkBindImageMemory` is equivalent to passing the same parameters through `VkBindImageMemoryInfo` to `vkBindImageMemory2`.

If the `memory` is allocated by a memory import operation with `VkExternalMemoryBufferCreateInfo::handleTypes` assigned to `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCI_BUF_BIT_NV`, the properties of `image` and the `memoryOffset` **must** be compatible with the attributes used to create `NvSciBufObj`, otherwise the implementation will return `VK_ERROR_VALIDATION_FAILED`.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkBindImageMemory` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkBindImageMemory-image-07460
`image` **must** not have been bound to a memory object
- VUID-vkBindImageMemory-image-01045
`image` **must** not have been created with any sparse memory binding flags
- VUID-vkBindImageMemory-memoryOffset-01046
`memoryOffset` **must** be less than the size of `memory`
- VUID-vkBindImageMemory-image-01445
If `image` requires a dedicated allocation (as reported by `vkGetImageMemoryRequirements2` in `VkMemoryDedicatedRequirements::requiresDedicatedAllocation` for `image`), `memory` **must** have been created with `VkMemoryDedicatedAllocateInfo::image` equal to `image`
- VUID-vkBindImageMemory-memory-02628
If the `VkMemoryAllocateInfo` provided when `memory` was allocated included a `VkMemoryDedicatedAllocateInfo` structure in its `pNext` chain, and `VkMemoryDedicatedAllocateInfo::image` was not `VK_NULL_HANDLE`, then `image` **must** equal `VkMemoryDedicatedAllocateInfo::image` and `memoryOffset` **must** be zero
- VUID-vkBindImageMemory-memory-10926
If the `VkMemoryAllocateInfo` provided when `memory` was allocated included a `VkMemoryDedicatedAllocateInfo` structure in its `pNext` chain, `VkMemoryDedicatedAllocateInfo::buffer` **must** have been `VK_NULL_HANDLE`
- VUID-vkBindImageMemory-None-01901
If `image` was created with the `VK_IMAGE_CREATE_PROTECTED_BIT` bit set, the `image` **must** be bound to a memory object allocated with a memory type that reports `VK_MEMORY_PROPERTY_PROTECTED_BIT`
- VUID-vkBindImageMemory-None-01902
If `image` was created with the `VK_IMAGE_CREATE_PROTECTED_BIT` bit not set, the `image` **must** not be bound to a memory object created with a memory type that reports

VK_MEMORY_PROPERTY_PROTECTED_BIT

- VUID-vkBindImageMemory-memory-02728
If the value of `VkExportMemoryAllocateInfo::handleTypes` used to allocate `memory` is not `0`, it **must** include at least one of the handles set in `VkExternalMemoryImageCreateInfo::handleTypes` when `image` was created
- VUID-vkBindImageMemory-memory-02989
If `memory` was created by a memory import operation, the external handle type of the imported memory **must** also have been set in `VkExternalMemoryImageCreateInfo::handleTypes` when `image` was created
- VUID-vkBindImageMemory-image-01608
`image` **must** not have been created with the `VK_IMAGE_CREATE_DISJOINT_BIT` set
- VUID-vkBindImageMemory-memory-01047
`memory` **must** have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements` with `image`
- VUID-vkBindImageMemory-None-10735
`memoryOffset` **must** be an integer multiple of the `alignment` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements` with `image`
- VUID-vkBindImageMemory-None-10737
`size` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements` with `image` **must** be less than or equal to the size of `memory` minus `memoryOffset`

Valid Usage (Implicit)

- VUID-vkBindImageMemory-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkBindImageMemory-image-parameter
`image` **must** be a valid `VkImage` handle
- VUID-vkBindImageMemory-memory-parameter
`memory` **must** be a valid `VkDeviceMemory` handle
- VUID-vkBindImageMemory-image-parent
`image` **must** have been created, allocated, or retrieved from `device`
- VUID-vkBindImageMemory-memory-parent
`memory` **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `image` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

To attach memory to image objects for one or more images at a time, call:

```
// Provided by VK_VERSION_1_1
VkResult vkBindImageMemory2(
    VkDevice          device,
    uint32_t          bindInfoCount,
    const VkBindImageMemoryInfo* pBindInfos);
```

- `device` is the logical device that owns the images and memory.
- `bindInfoCount` is the number of elements in `pBindInfos`.
- `pBindInfos` is a pointer to an array of `VkBindImageMemoryInfo` structures, describing images and memory to bind.

On some implementations, it **may** be more efficient to batch memory bindings into a single command.

If any of the memory binding operations described by `pBindInfos` fail, the `VkResult` returned by this command **must** be the return value of any one of the memory binding operations which did not return `VK_SUCCESS`.

NOTE

If the `vkBindImageMemory2` command failed, and `bindInfoCount` was greater than one, then the images referenced by `pBindInfos` will be in an indeterminate state, and must not be used.

Applications should destroy these images.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkBindImageMemory2` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkBindImageMemory2-pBindInfos-02858

If any `VkBindImageMemoryInfo::image` was created with `VK_IMAGE_CREATE_DISJOINT_BIT` then all planes of `VkBindImageMemoryInfo::image` **must** be bound individually in

separate `pBindInfos`

- VUID-vkBindImageMemory2-pBindInfos-04006
`pBindInfos` **must** not refer to the same image subresource more than once

Valid Usage (Implicit)

- VUID-vkBindImageMemory2-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkBindImageMemory2-pBindInfos-parameter
`pBindInfos` **must** be a valid pointer to an array of `bindInfoCount` valid `VkBindImageMemoryInfo` structures
- VUID-vkBindImageMemory2-bindInfoCount-arraylength
`bindInfoCount` **must** be greater than 0

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

`VkBindImageMemoryInfo` contains members corresponding to the parameters of `vkBindImageMemory`.

The `VkBindImageMemoryInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkBindImageMemoryInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkImage             image;
    VkDeviceMemory      memory;
    VkDeviceSize        memoryOffset;
} VkBindImageMemoryInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `image` is the image to be attached to memory.

- `memory` is a `VkDeviceMemory` object describing the device memory to attach.
- `memoryOffset` is the start offset of the region of `memory` which is to be bound to the image. The number of bytes returned in the `VkMemoryRequirements::size` member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified image.

Valid Usage

- VUID-VkBindImageMemoryInfo-image-07460
`image` **must** not have been bound to a memory object
- VUID-VkBindImageMemoryInfo-image-01045
`image` **must** not have been created with any sparse memory binding flags
- VUID-VkBindImageMemoryInfo-memoryOffset-01046
`memoryOffset` **must** be less than the size of `memory`
- VUID-VkBindImageMemoryInfo-image-01445
If `image` requires a dedicated allocation (as reported by `vkGetImageMemoryRequirements2` in `VkMemoryDedicatedRequirements::requiresDedicatedAllocation` for `image`), `memory` **must** have been created with `VkMemoryDedicatedAllocateInfo::image` equal to `image`
- VUID-VkBindImageMemoryInfo-memory-02628
If the `VkMemoryAllocateInfo` provided when `memory` was allocated included a `VkMemoryDedicatedAllocateInfo` structure in its `pNext` chain, and `VkMemoryDedicatedAllocateInfo::image` was not `VK_NULL_HANDLE`, then `image` **must** equal `VkMemoryDedicatedAllocateInfo::image` and `memoryOffset` **must** be zero
- VUID-VkBindImageMemoryInfo-memory-10926
If the `VkMemoryAllocateInfo` provided when `memory` was allocated included a `VkMemoryDedicatedAllocateInfo` structure in its `pNext` chain, `VkMemoryDedicatedAllocateInfo::buffer` **must** have been `VK_NULL_HANDLE`
- VUID-VkBindImageMemoryInfo-None-01901
If image was created with the `VK_IMAGE_CREATE_PROTECTED_BIT` bit set, the image **must** be bound to a memory object allocated with a memory type that reports `VK_MEMORY_PROPERTY_PROTECTED_BIT`
- VUID-VkBindImageMemoryInfo-None-01902
If image was created with the `VK_IMAGE_CREATE_PROTECTED_BIT` bit not set, the image **must** not be bound to a memory object created with a memory type that reports `VK_MEMORY_PROPERTY_PROTECTED_BIT`
- VUID-VkBindImageMemoryInfo-memory-02728
If the value of `VkExportMemoryAllocateInfo::handleTypes` used to allocate `memory` is not `0`, it **must** include at least one of the handles set in `VkExternalMemoryImageCreateInfo::handleTypes` when `image` was created
- VUID-VkBindImageMemoryInfo-memory-02989
If `memory` was created by a memory import operation, the external handle type of the imported memory **must** also have been set in `VkExternalMemoryImageCreateInfo::handleTypes` when `image` was created

- VUID-VkBindImageMemoryInfo-pNext-01615
If the `pNext` chain does not include a `VkBindImagePlaneMemoryInfo` structure, `memory` **must** have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements2` with `image`
- VUID-VkBindImageMemoryInfo-pNext-01616
If the `pNext` chain does not include a `VkBindImagePlaneMemoryInfo` structure, `memoryOffset` **must** be an integer multiple of the `alignment` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements2` with `image`
- VUID-VkBindImageMemoryInfo-pNext-01617
If the `pNext` chain does not include a `VkBindImagePlaneMemoryInfo` structure, the difference of the size of `memory` and `memoryOffset` **must** be greater than or equal to the `size` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements2` with the same `image`
- VUID-VkBindImageMemoryInfo-pNext-01618
If the `pNext` chain includes a `VkBindImagePlaneMemoryInfo` structure, `image` **must** have been created with the `VK_IMAGE_CREATE_DISJOINT_BIT` bit set
- VUID-VkBindImageMemoryInfo-image-07736
If `image` was created with the `VK_IMAGE_CREATE_DISJOINT_BIT` bit set, then the `pNext` chain **must** include a `VkBindImagePlaneMemoryInfo` structure
- VUID-VkBindImageMemoryInfo-pNext-01619
If the `pNext` chain includes a `VkBindImagePlaneMemoryInfo` structure, `memory` **must** have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements2` with `image` and where `VkBindImagePlaneMemoryInfo::planeAspect` corresponds to the `VkImagePlaneMemoryRequirementsInfo::planeAspect` in the `VkImageMemoryRequirementsInfo2` structure's `pNext` chain
- VUID-VkBindImageMemoryInfo-pNext-01620
If the `pNext` chain includes a `VkBindImagePlaneMemoryInfo` structure, `memoryOffset` **must** be an integer multiple of the `alignment` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements2` with `image` and where `VkBindImagePlaneMemoryInfo::planeAspect` corresponds to the `VkImagePlaneMemoryRequirementsInfo::planeAspect` in the `VkImageMemoryRequirementsInfo2` structure's `pNext` chain
- VUID-VkBindImageMemoryInfo-pNext-01621
If the `pNext` chain includes a `VkBindImagePlaneMemoryInfo` structure, the difference of the size of `memory` and `memoryOffset` **must** be greater than or equal to the `size` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements2` with the same `image` and where `VkBindImagePlaneMemoryInfo::planeAspect` corresponds to the `VkImagePlaneMemoryRequirementsInfo::planeAspect` in the `VkImageMemoryRequirementsInfo2` structure's `pNext` chain
- VUID-VkBindImageMemoryInfo-pNext-01626

If the **pNext** chain includes a **VkBindImageMemoryDeviceGroupInfo** structure, all instances of **memory** specified by **VkBindImageMemoryDeviceGroupInfo::pDeviceIndices** **must** have been allocated

- VUID-VkBindImageMemoryInfo-image-01630

If **image** was created with a valid swapchain handle in **VkImageSwapchainCreateInfoKHR::swapchain**, then the **pNext** chain **must** include a **VkBindImageMemorySwapchainInfoKHR** structure containing the same swapchain handle

- VUID-VkBindImageMemoryInfo-pNext-01631

If the **pNext** chain includes a **VkBindImageMemorySwapchainInfoKHR** structure, **memory** **must** be **VK_NULL_HANDLE**

- VUID-VkBindImageMemoryInfo-pNext-01632

If the **pNext** chain does not include a **VkBindImageMemorySwapchainInfoKHR** structure, **memory** **must** be a valid **VkDeviceMemory** handle

Valid Usage (Implicit)

- VUID-VkBindImageMemoryInfo-sType-sType

sType **must** be **VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_INFO**

- VUID-VkBindImageMemoryInfo-pNext-pNext

Each **pNext** member of any structure (including this one) in the **pNext** chain **must** be either **NULL** or a pointer to a valid instance of **VkBindImageMemoryDeviceGroupInfo**, **VkBindImageMemorySwapchainInfoKHR**, or **VkBindImagePlaneMemoryInfo**

- VUID-VkBindImageMemoryInfo-sType-unique

The **sType** value of each structure in the **pNext** chain **must** be unique

- VUID-VkBindImageMemoryInfo-image-parameter

image **must** be a valid **VkImage** handle

- VUID-VkBindImageMemoryInfo-commonparent

Both of **image**, and **memory** that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same **VkDevice**

Host Synchronization

- Host access to **image** **must** be externally synchronized

The **VkBindImageMemoryDeviceGroupInfo** structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkBindImageMemoryDeviceInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           deviceIndexCount;
    const uint32_t*     pDeviceIndices;
    uint32_t           splitInstanceBindRegionCount;
    const VkRect2D*     pSplitInstanceBindRegions;
} VkBindImageMemoryDeviceInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceIndexCount` is the number of elements in `pDeviceIndices`.
- `pDeviceIndices` is a pointer to an array of device indices.
- `splitInstanceBindRegionCount` is the number of elements in `pSplitInstanceBindRegions`.
- `pSplitInstanceBindRegions` is a pointer to an array of `VkRect2D` structures describing which regions of the image are attached to each instance of memory.

If the `pNext` chain of `VkBindImageMemoryInfo` includes a `VkBindImageMemoryDeviceInfo` structure, then that structure determines how memory is bound to images across multiple devices in a device group.

If `deviceIndexCount` is greater than zero, then on device index `i` `image` is attached to the instance of the memory on the physical device with device index `pDeviceIndices[i]`.

In Vulkan SC, `splitInstanceBindRegionCount` **must** be zero because sparse allocations are not supported [SCID-8].

If `splitInstanceBindRegionCount` and `deviceIndexCount` are zero and the memory comes from a memory heap with the `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` bit set, then it is as if `pDeviceIndices` contains consecutive indices from zero to the number of physical devices in the logical device, minus one. In other words, by default each physical device attaches to its own instance of the memory.

If `splitInstanceBindRegionCount` and `deviceIndexCount` are zero and the memory comes from a memory heap without the `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` bit set, then it is as if `pDeviceIndices` contains an array of zeros. In other words, by default each physical device attaches to instance zero.

Valid Usage

- VUID-VkBindImageMemoryDeviceInfo-deviceIndexCount-01634
`deviceIndexCount` **must** either be zero or equal to the number of physical devices in the logical device
- VUID-VkBindImageMemoryDeviceInfo-pDeviceIndices-01635
All elements of `pDeviceIndices` **must** be valid device indices

- VUID-VkBindImageMemoryDeviceGroupInfo-splitInstanceBindRegionCount-05067
`splitInstanceBindRegionCount` **must** be zero

Valid Usage (Implicit)

- VUID-VkBindImageMemoryDeviceGroupInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_DEVICE_GROUP_INFO`
- VUID-VkBindImageMemoryDeviceGroupInfo-pDeviceIndices-parameter
If `deviceIndexCount` is not 0, `pDeviceIndices` **must** be a valid pointer to an array of `deviceIndexCount` `uint32_t` values
- VUID-VkBindImageMemoryDeviceGroupInfo-pSplitInstanceBindRegions-parameter
If `splitInstanceBindRegionCount` is not 0, `pSplitInstanceBindRegions` **must** be a valid pointer to an array of `splitInstanceBindRegionCount` `VkRect2D` structures

If the `pNext` chain of `VkBindImageMemoryInfo` includes a `VkBindImageMemorySwapchainInfoKHR` structure, then that structure includes a swapchain handle and image index indicating that the image will be bound to memory from that swapchain.

The `VkBindImageMemorySwapchainInfoKHR` structure is defined as:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain
typedef struct VkBindImageMemorySwapchainInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkSwapchainKHR     swapchain;
    uint32_t           imageIndex;
} VkBindImageMemorySwapchainInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchain` is `VK_NULL_HANDLE` or a swapchain handle.
- `imageIndex` is an image index within `swapchain`.

If `swapchain` is not `NULL`, the `swapchain` and `imageIndex` are used to determine the memory that the image is bound to, instead of `memory` and `memoryOffset`.

Memory **can** be bound to a swapchain and use the `pDeviceIndices` or `pSplitInstanceBindRegions` members of `VkBindImageMemoryDeviceGroupInfo`.

Valid Usage

- VUID-VkBindImageMemorySwapchainInfoKHR-imageIndex-01644
`imageIndex` **must** be less than the number of images in `swapchain`

Valid Usage (Implicit)

- VUID-VkBindImageMemorySwapchainInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_SWAPCHAIN_INFO_KHR`
- VUID-VkBindImageMemorySwapchainInfoKHR-swapchain-parameter
`swapchain` **must** be a valid `VkSwapchainKHR` handle

Host Synchronization

- Host access to `swapchain` **must** be externally synchronized

In order to bind *planes* of a *disjoint image*, add a `VkBindImagePlaneMemoryInfo` structure to the `pNext` chain of `VkBindImageMemoryInfo`.

The `VkBindImagePlaneMemoryInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkBindImagePlaneMemoryInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkImageAspectFlagBits planeAspect;
} VkBindImagePlaneMemoryInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `planeAspect` is a `VkImageAspectFlagBits` value specifying the aspect of the disjoint image plane to bind.

Valid Usage

- VUID-VkBindImagePlaneMemoryInfo-planeAspect-02283
If the image's `tiling` is `VK_IMAGE_TILING_LINEAR` or `VK_IMAGE_TILING_OPTIMAL`, then `planeAspect` **must** be a single valid `multi-planar aspect mask` bit
- VUID-VkBindImagePlaneMemoryInfo-planeAspect-02284
If the image's `tiling` is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `planeAspect` **must** be a single valid *memory plane* for the image (that is, `aspectMask` **must** specify a plane index that is less than the `VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount` associated with the image's `format` and `VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier`)

Valid Usage (Implicit)

- VUID-VkBindImagePlaneMemoryInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_BIND_IMAGE_PLANE_MEMORY_INFO`
- VUID-VkBindImagePlaneMemoryInfo-planeAspect-parameter
`planeAspect` **must** be a valid `VkImageAspectFlagBits` value

Buffer-Image Granularity

The implementation-dependent limit `bufferImageGranularity` specifies a page-like granularity at which linear and non-linear resources **must** be placed in adjacent memory locations to avoid aliasing. Two resources which do not satisfy this granularity requirement are said to *alias*. `bufferImageGranularity` is specified in bytes, and **must** be a power of two. Implementations which do not impose a granularity restriction **may** report a `bufferImageGranularity` value of one.

NOTE

Despite its name, `bufferImageGranularity` is really a granularity between “linear” and “non-linear” resources.

Given resourceA at the lower memory offset and resourceB at the higher memory offset in the same `VkDeviceMemory` object, where one resource is linear and the other is non-linear (as defined in the [Glossary](#)), and the following:

```
resourceA.end      = resourceA.memoryOffset + resourceA.size - 1
resourceA.endPage  = resourceA.end & ~(bufferImageGranularity-1)
resourceB.start    = resourceB.memoryOffset
resourceB.startPage = resourceB.start & ~(bufferImageGranularity-1)
```

The following property **must** hold:

```
resourceA.endPage < resourceB.startPage
```

That is, the end of the first resource (A) and the beginning of the second resource (B) **must** be on separate “pages” of size `bufferImageGranularity`. `bufferImageGranularity` **may** be different than the physical page size of the memory heap. This restriction is only needed when a linear resource and a non-linear resource are adjacent in memory and will be used simultaneously. The memory ranges of adjacent resources **can** be closer than `bufferImageGranularity`, provided they meet the *alignment* requirement for the objects in question.

Sparse block size in bytes and sparse image and buffer memory alignments **must** all be multiples of the `bufferImageGranularity`. Therefore, memory bound to sparse resources naturally satisfies the `bufferImageGranularity`.

12.8. Resource Sharing Mode

Buffer and image objects are created with a *sharing mode* controlling how they **can** be accessed

from queues. The supported sharing modes are:

```
// Provided by VK_VERSION_1_0
typedef enum VkSharingMode {
    VK_SHARING_MODE_EXCLUSIVE = 0,
    VK_SHARING_MODE_CONCURRENT = 1,
} VkSharingMode;
```

- **VK_SHARING_MODE_EXCLUSIVE** specifies that access to any range or image subresource of the object will be exclusive to a single queue family at a time.
- **VK_SHARING_MODE_CONCURRENT** specifies that concurrent access to any range or image subresource of the object from multiple queue families is supported.

NOTE

VK_SHARING_MODE_CONCURRENT **may** result in lower performance access to the buffer or image than **VK_SHARING_MODE_EXCLUSIVE**.

Ranges of buffers and image subresources of image objects created using **VK_SHARING_MODE_EXCLUSIVE** **must** only be accessed by queues in the queue family that has *ownership* of the resource. Upon creation, such resources are not owned by any queue family; ownership is implicitly acquired upon first use within a queue. Once a resource using **VK_SHARING_MODE_EXCLUSIVE** is owned by some queue family, the application **must** perform a [queue family ownership transfer](#) if it wishes to make the memory contents of a range or image subresource accessible to a different queue family. **VK_SHARING_MODE_EXCLUSIVE** resources that are already owned by a queue family **may** be acquired by a different queue family without a queue family ownership transfer, but their contents become undefined.

NOTE

Before being used on the first queue, images still require a [layout transition](#) from these layouts:

- **VK_IMAGE_LAYOUT_UNDEFINED**
- **VK_IMAGE_LAYOUT_PREINITIALIZED**

A queue family **can** take ownership of an image subresource or buffer range of a resource created with **VK_SHARING_MODE_EXCLUSIVE**, without an ownership transfer, in the same way as for a resource that was just created; however, taking ownership in this way has the effect that the contents of the image subresource or buffer range are undefined.

Ranges of buffers and image subresources of image objects created using **VK_SHARING_MODE_CONCURRENT** **must** only be accessed by queues from the queue families specified through the **queueFamilyIndexCount** and **pQueueFamilyIndices** members of the corresponding create info structures.

12.8.1. External Resource Sharing

Resources **should** only be accessed in the Vulkan instance that has exclusive ownership of their underlying memory. Only one Vulkan instance has exclusive ownership of a resource's underlying memory at a given time, regardless of whether the resource was created using

`VK_SHARING_MODE_EXCLUSIVE` or `VK_SHARING_MODE_CONCURRENT`. Applications can transfer ownership of a resource's underlying memory only if the memory has been imported from or exported to another instance or external API using external memory handles. The semantics for transferring ownership outside of the instance are similar to those used for transferring ownership of `VK_SHARING_MODE_EXCLUSIVE` resources between queues, and is also accomplished using `VkBufferMemoryBarrier` or `VkImageMemoryBarrier` operations. To make the contents of the underlying memory accessible in the destination instance or API, applications **must**

1. Release exclusive ownership from the source instance or API.
2. Ensure the release operation has completed using semaphores or fences.
3. Acquire exclusive ownership in the destination instance or API

Unlike queue family ownership transfers, the destination instance or API is not specified explicitly when releasing ownership, nor is the source instance or API specified when acquiring ownership. Instead, the image or memory barrier's `dstQueueFamilyIndex` or `srcQueueFamilyIndex` parameters are set to the reserved queue family index `VK_QUEUE_FAMILY_EXTERNAL` or `VK_QUEUE_FAMILY_FOREIGN_EXT` to represent the external destination or source respectively.

Binding a resource to a memory object shared between multiple Vulkan instances or other APIs does not change the ownership of the underlying memory. The first entity to access the resource implicitly acquires ownership. An entity **can** also implicitly take ownership from another entity in the same way without an explicit ownership transfer. However, taking ownership in this way has the effect that the contents of the underlying memory are undefined.

Accessing a resource backed by memory that is owned by a particular instance or API has the same semantics as accessing a `VK_SHARING_MODE_EXCLUSIVE` resource, with one exception: Implementations **must** ensure layout transitions performed on one member of a set of identical subresources of identical images that alias the same range of an underlying memory object affect the layout of all the subresources in the set.

As a corollary, writes to any image subresources in such a set **must** not make the contents of memory used by other subresources in the set undefined. An application **can** define the content of a subresource of one image by performing device writes to an identical subresource of another image provided both images are bound to the same region of external memory. Applications **may** also add resources to such a set after the content of the existing set members has been defined without making the content undefined by creating a new image with the initial layout `VK_IMAGE_LAYOUT_UNDEFINED` and binding it to the same region of external memory as the existing images.

NOTE

Because layout transitions apply to all identical images aliasing the same region of external memory, the actual layout of the memory backing a new image as well as an existing image with defined content will not be undefined. Such an image is not usable until it acquires ownership of its memory from the existing owner. Therefore, the layout specified as part of this transition will be the true initial layout of the image. The undefined layout specified when creating it is a placeholder to simplify valid usage requirements.

12.9. Memory Aliasing

A range of a `VkDeviceMemory` allocation is *aliased* if it is bound to multiple resources simultaneously, as described below, via `vkBindImageMemory`, `vkBindBufferMemory`, or by binding the memory to resources in multiple Vulkan instances or external APIs using external memory handle export and import mechanisms.

Consider two resources, `resourceA` and `resourceB`, bound respectively to memory `rangeA` and `rangeB`. Let `paddedRangeA` and `paddedRangeB` be, respectively, `rangeA` and `rangeB` aligned to `bufferImageGranularity`. If the resources are both linear or both non-linear (as defined in the [Glossary](#)), then the resources *alias* the memory in the intersection of `rangeA` and `rangeB`. If one resource is linear and the other is non-linear, then the resources *alias* the memory in the intersection of `paddedRangeA` and `paddedRangeB`.

Applications **can** alias memory, but use of multiple aliases is subject to several constraints.

NOTE

Memory aliasing **can** be useful to reduce the total device memory footprint of an application, if some large resources are used for disjoint periods of time.

When a [non-linear](#), non-`VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` image is bound to an aliased range, all image subresources of the image *overlap* the range. When a linear image is bound to an aliased range, the image subresources that (according to the image's advertised layout) include bytes from the aliased range overlap the range. When a `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` image has sparse image blocks bound to an aliased range, only image subresources including those sparse image blocks overlap the range, and when the memory bound to the image's mip tail overlaps an aliased range all image subresources in the mip tail overlap the range.

Buffers, and linear image subresources are considered *host-accessible subresources* when they are in any of these layouts:

- `VK_IMAGE_LAYOUT_PREINITIALIZED`
- `VK_IMAGE_LAYOUT_GENERAL`

That is, the host has a well-defined addressing scheme to interpret the contents, and thus the layout of the data in memory **can** be consistently interpreted across aliases if each of those aliases is a host-accessible subresource. Non-linear images, and linear image subresources in other layouts, are not host-accessible.

If two aliases are both host-accessible, then they interpret the contents of the memory in consistent ways, and data written to one alias **can** be read by the other alias.

If two aliases are both images that were created with identical creation parameters, both were created with the `VK_IMAGE_CREATE_ALIAS_BIT` flag set, and both are bound identically to memory except for `VkBindImageMemoryDeviceGroupInfo::pDeviceIndices` and `VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions`, then they interpret the contents of the memory in consistent ways, and data written to one alias **can** be read by the other alias.

Additionally, if an individual plane of a multi-planar image and a single-plane image alias the same memory, then they also interpret the contents of the memory in consistent ways under the same

conditions, but with the following modifications:

- Both **must** have been created with the `VK_IMAGE_CREATE_DISJOINT_BIT` flag.
- The single-plane image **must** have a `VkFormat` that is **equivalent** to that of the multi-planar image's individual plane.
- The single-plane image and the individual plane of the multi-planar image **must** be bound identically to memory except for `VkBindImageMemoryDeviceGroupInfo::pDeviceIndices` and `VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions`.
- The **width** and **height** of the single-plane image are derived from the multi-planar image's dimensions in the manner listed for **plane compatibility** for the aliased plane.
- If either image's **tiling** is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then both images **must** be **linear**.
- All other creation parameters **must** be identical

Aliases created by binding the same memory to resources in multiple Vulkan instances or external APIs using external memory handle export and import mechanisms interpret the contents of the memory in consistent ways, and data written to one alias **can** be read by the other alias.

Otherwise, the aliases interpret the contents of the memory differently, and writes via one alias make the contents of memory partially or completely undefined to the other alias. If the first alias is a host-accessible subresource, then the bytes affected are those written by the memory operations according to its addressing scheme. If the first alias is not host-accessible, then the bytes affected are those overlapped by the image subresources that were written. If the second alias is a host-accessible subresource, the affected bytes become undefined. If the second alias is not host-accessible, all sparse image blocks (for sparse partially-resident images) or all image subresources (for non-sparse image and fully resident sparse images) that overlap the affected bytes become undefined.

If any image subresources are made undefined due to writes to an alias, then each of those image subresources **must** have its layout transitioned from `VK_IMAGE_LAYOUT_UNDEFINED` to a valid layout before it is used, or from `VK_IMAGE_LAYOUT_PREINITIALIZED` if the memory has been written by the host. If any sparse blocks of a sparse image have been made undefined, then only the image subresources containing them **must** be transitioned.

Use of an overlapping range by two aliases **must** be separated by a memory dependency using the appropriate **access types** if at least one of those uses performs writes, whether the aliases interpret memory consistently or not. If buffer or image memory barriers are used, the scope of the barrier **must** contain the entire range and/or set of image subresources that overlap.

If two aliasing image views are used in the same framebuffer, then the render pass **must** declare the attachments using the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT`, and follow the other rules listed in that section.

NOTE

Memory recycled via an application suballocator (i.e. without freeing and reallocating the memory objects) is not substantially different from memory aliasing. However, a suballocator usually waits on a fence before recycling a region of memory, and signaling a fence involves sufficient implicit dependencies to satisfy

all the above requirements.

12.9.1. Resource Memory Overlap

Applications **can** safely access resources concurrently via separate device and host operations as long as the accessed memory locations are guaranteed to not overlap, as defined in [Memory Location](#), and the operation, resource, and access are otherwise independently valid.

Some operations have alignment requirements or access ambiguous [memory locations](#), so the semantics of a particular operation **should** be considered when determining the overlap. Such requirements will be described alongside the operation. Operations between host and device when using non-coherent memory are aligned to [nonCoherentAtomSize](#), as defined by [vkFlushMappedMemoryRanges](#) and [vkInvalidateMappedMemoryRanges](#).

NOTE

The intent is that buffers (or linear images) can be accessed concurrently, even when they share cache lines, but otherwise do not access the same memory range. The concept of a device cache line size is not exposed in the memory model.

Chapter 13. Images

Images are specialized resources that have multi-dimensional access rather than the typical linear access to memory. These resources allow implementations to optimize the memory layout for common access patterns, by mapping multi-dimensional coordinates to an implementation-dependent offset in the underlying memory.

Additionally, images are homogeneous, with every discrete coordinate associated with data that is in the same format as the data associated with any other coordinate. Each set of data associated with one of these coordinates is referred to in this specification as a *texel*. A texel can consist of up to 4 separate components, labeled as (R,G,B,A) in this chapter.

NOTE

This terminology is historical; texel is a combination of the words “**texture**” and “**element**”, and (R,G,B,A) are abbreviations for **Red**, **Green**, **Blue**, and **Alpha**. Early interactive computer graphics only supported operations that allowed image data to be used to add color “texture” to rendered objects, which is just a small subset of what the image operations on images described here enable. These terms are deeply embedded in the industry, and so are still used here by convention, despite images being used in far more varied ways than they were in the past.

Some image formats identify components as D for **depth**, S for **stencil**, or X for padding elements. Image format components identified as D are treated as R, and S components are treated as G for the purpose of image accesses. X components are ignored when reading, and **may** be modified in implementation-dependent ways when writing to that texel.

The coordinates used to identify a texel are six-dimensional, made up of the following integer indices:

- x - The first spatial index
- y - The second spatial index
- z - The third spatial index
- layer - The array index for arrayed images
- sample - The sample index
- level - The detail level

Each image is constructed with a number of texels in each dimension, with the integer size in each dimension for that image identified as:

- width - The number of x indices
- height - The number of y indices
- depth - The number of z indices
- layers - The number of layers
- samples - The number of samples
- levels - The number of detail levels

Of these sizes, the number of levels is somewhat unique - each further level reduces the number of indices in each of the x, y, and z dimensions by half, according to these formulae:

- $\text{width}_{\text{level}} = \max(1, \lceil \text{width} / 2^{\text{level}} \rceil)$
- $\text{height}_{\text{level}} = \max(1, \lceil \text{height} / 2^{\text{level}} \rceil)$
- $\text{depth}_{\text{level}} = \max(1, \lceil \text{depth} / 2^{\text{level}} \rceil)$

An image will have no more than one level where all of the above dimensions are set to 1. See [Image Mip Level Sizing](#) for more details.

The Vulkan specification allows the creation of resources with fewer dimensions than this (e.g. texel buffers); these can be considered equivalent to an image with all dimensions specified, with the missing dimensions having a size of 1, and an implicit coordinate value of 0.

13.1. Image Coordinate Validation

When accessing an image, a set of (x,y,z,layer,sample,level) coordinates are used to indicate which texel is accessed. These coordinates are first checked to see if they refer to texels within the image dimensions, according to the following equations:

- $x < \text{width}_{\text{level}}$
- $y < \text{height}_{\text{level}}$
- $z < \text{depth}_{\text{level}}$
- $\text{layer} < \text{layers}$
- $\text{sample} < \text{samples}$
- $\text{level} < \text{levels}$

If any of these equations evaluates to false, the coordinate is considered [out of bounds](#), otherwise they are *in bounds*.

13.2. Image Reads

Image reads use a set of (x,y,z,layer,sample,level) coordinates, validated as per [Image Coordinate Validation](#), and return a converted value for the texel at that coordinate. If the coordinates are out of bounds, behavior of the read is as described in [Shader Out-of-Bounds Memory Access](#). Otherwise, the read proceeds as follows.

13.2.1. Texel Decode

The formatted value of the texel at the (x,y,z,layer,sample,level) coordinate is read and decoded according to the procedures outlined in the [Khronos Data Format Specification](#).

For sRGB formats, the (R,G,B,A) components are first converted as if they are **UNORM** formats, and then sRGB to linear conversion is performed on the converted (R,G,B) components, as described in the “sRGB EOTF” section of the [Khronos Data Format Specification](#).

13.2.2. Component Substitution

If after conversion, less than four of the (R,G,B,A) components are present, missing components are substituted by the components of (0,0,0,1) for missing (R,G,B,A) components, respectively.

13.2.3. Numeric Encoding

The values are encoded according to the bit width and [numeric format](#) of each component:

- Components with a fixed-point numeric format or with a floating-point numeric format and a bit width less than or equal to 32 are encoded into the [IEEE-754](#) binary32 format.
- Components with a floating-point numeric format and a bit width greater than 32 are encoded into the [IEEE-754](#) binary64 format.
- Components with an integer numeric format and a bit width less than or equal to 32 are directly encoded as 32-bit integer values with the same signedness.
- Components with an integer numeric format and a bit width greater than 32 are directly encoded as 64-bit integer values with the same signedness.

These values are then returned as the result of the image read.

13.3. Image Writes

Image writes also use a set of (x,y,z,layer,sample,level) coordinates, validated as per [Image Coordinate Validation](#), and a value to be written. If the coordinates are out of bounds, behavior of the write is as described in [Shader Out-of-Bounds Memory Access](#). Otherwise, an image write is performed as follows:

13.3.1. Texel Encode

If the image format is sRGB, a linear to sRGB conversion is applied to the (R,G,B) components of value as described in the “sRGB EOTF” section of the [Khronos Data Format Specification](#).

The converted (R,G,B) and original A values are then encoded to the image format according to the procedures outlined in the [Khronos Data Format Specification](#). Components not present in the image format are discarded.

The final value is then written to the texel at (x,y,z,layer,sample,level).

Chapter 14. Samplers

VkSampler objects represent the state of an image sampler which is used by the implementation to read image data and apply filtering and other transformations for the shader.

Samplers are represented by **VkSampler** handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSampler)
```

To create a sampler object, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateSampler(
    VkDevice                                device,
    const VkSamplerCreateInfo*              pCreateInfo,
    const VkAllocationCallbacks*            pAllocator,
    VkSampler*                              pSampler);
```

- **device** is the logical device that creates the sampler.
- **pCreateInfo** is a pointer to a **VkSamplerCreateInfo** structure specifying the state of the sampler object.
- **pAllocator** controls host memory allocation as described in the **Memory Allocation** chapter.
- **pSampler** is a pointer to a **VkSampler** handle in which the resulting sampler object is returned.

If **VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations** is **VK_TRUE**, **vkCreateSampler** **must** not return **VK_ERROR_OUT_OF_HOST_MEMORY**.

Valid Usage

- VUID-vkCreateSampler-device-09668
device **must** support at least one queue family with one of the **VK_QUEUE_COMPUTE_BIT** or **VK_QUEUE_GRAPHICS_BIT** capabilities
- VUID-vkCreateSampler-maxSamplerAllocationCount-04110
There **must** be less than **VkPhysicalDeviceLimits::maxSamplerAllocationCount** **VkSampler** objects currently created on the device
- VUID-vkCreateSampler-device-05068
The number of samplers currently allocated from **device** plus 1 **must** be less than or equal to the total number of samplers requested via **VkDeviceObjectReservationCreateInfo::samplerRequestCount** specified when **device** was created

Valid Usage (Implicit)

- VUID-vkCreateSampler-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkCreateSampler-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkSamplerCreateInfo](#) structure
- VUID-vkCreateSampler-pAllocator-null
pAllocator **must** be **NULL**
- VUID-vkCreateSampler-pSampler-parameter
pSampler **must** be a valid pointer to a [VkSampler](#) handle

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_UNKNOWN**
- **VK_ERROR_VALIDATION_FAILED**

The [VkSamplerCreateInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSamplerCreateInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkSamplerCreateFlags  flags;
    VkFilter              magFilter;
    VkFilter              minFilter;
    VkSamplerMipmapMode   mipmapMode;
    VkSamplerAddressMode   addressModeU;
    VkSamplerAddressMode   addressModeV;
    VkSamplerAddressMode   addressModeW;
    float                 mipLodBias;
    VkBool32              anisotropyEnable;
    float                 maxAnisotropy;
    VkBool32              compareEnable;
    VkCompareOp           compareOp;
    float                 minLod;
    float                 maxLod;
    VkBorderColor         borderColor;
    VkBool32              unnormalizedCoordinates;
} VkSamplerCreateInfo;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of [VkSamplerCreateFlagBits](#) describing additional parameters of the sampler.
- **magFilter** is a [VkFilter](#) value specifying the magnification filter to apply to lookups.
- **minFilter** is a [VkFilter](#) value specifying the minification filter to apply to lookups.
- **mipmapMode** is a [VkSamplerMipmapMode](#) value specifying the mipmap filter to apply to lookups.
- **addressModeU** is a [VkSamplerAddressMode](#) value specifying the addressing mode for U coordinates outside [0,1).
- **addressModeV** is a [VkSamplerAddressMode](#) value specifying the addressing mode for V coordinates outside [0,1).
- **addressModeW** is a [VkSamplerAddressMode](#) value specifying the addressing mode for W coordinates outside [0,1).
- **mipLodBias** is the bias to be added to mipmap LOD calculation and bias provided by image sampling functions in SPIR-V, as described in the [LOD Operation](#) section.
- **anisotropyEnable** is `VK_TRUE` to enable anisotropic filtering, as described in the [Texel Anisotropic Filtering](#) section, or `VK_FALSE` otherwise.
- **maxAnisotropy** is the anisotropy value clamp used by the sampler when **anisotropyEnable** is `VK_TRUE`. If **anisotropyEnable** is `VK_FALSE`, **maxAnisotropy** is ignored.
- **compareEnable** is `VK_TRUE` to enable comparison against a reference value during lookups, or `VK_FALSE` otherwise.
 - Note: Some implementations will default to shader state if this member does not match.

- `compareOp` is a `VkCompareOp` value specifying the comparison operator to apply to fetched data before filtering as described in the [Depth Compare Operation](#) section.
- `minLod` is used to clamp the [minimum of the computed LOD value](#).
- `maxLod` is used to clamp the [maximum of the computed LOD value](#). To avoid clamping the maximum value, set `maxLod` to the constant `VK_LOD_CLAMP_NONE`.
- `borderColor` is a `VkBorderColor` value specifying the predefined border color to use.
- `unnormalizedCoordinates` controls whether to use unnormalized or normalized texel coordinates to address texels of the image. When `unnormalizedCoordinates` is `VK_TRUE`, the range of the image coordinates used to lookup the texel is in the range of zero to the image size in each dimension. When `unnormalizedCoordinates` is `VK_FALSE`, the range of image coordinates is zero to one.

When `unnormalizedCoordinates` is `VK_TRUE`, images the sampler is used with in the shader have the following requirements:

- The `viewType` **must** be either `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`.
- The image view **must** have a single layer and a single mip level.

When `unnormalizedCoordinates` is `VK_TRUE`, image built-in functions in the shader that use the sampler have the following requirements:

- The functions **must** not use projection.
- The functions **must** not use offsets.

NOTE

Mapping of OpenGL to Vulkan Filter Modes

`magFilter` values of `VK_FILTER_NEAREST` and `VK_FILTER_LINEAR` directly correspond to `GL_NEAREST` and `GL_LINEAR` magnification filters. `minFilter` and `mipmapMode` combine to correspond to the similarly named OpenGL minification filter of `GL_minFilter_MIPMAP_mipmapMode` (e.g. `minFilter` of `VK_FILTER_LINEAR` and `mipmapMode` of `VK_SAMPLER_MIPMAP_MODE_NEAREST` correspond to `GL_LINEAR_MIPMAP_NEAREST`).

There are no Vulkan filter modes that directly correspond to OpenGL minification filters of `GL_LINEAR` or `GL_NEAREST`, but they **can** be emulated using `VK_SAMPLER_MIPMAP_MODE_NEAREST`, `minLod` = 0, and `maxLod` = 0.25, and using `minFilter` = `VK_FILTER_LINEAR` or `minFilter` = `VK_FILTER_NEAREST`, respectively.

Note that using a `maxLod` of zero would cause [magnification](#) to always be performed, and the `magFilter` to always be used. This is valid, just not an exact match for OpenGL behavior. Clamping the maximum LOD to 0.25 allows the λ value to be non-zero and minification to be performed, while still always rounding down to the base level. If the `minFilter` and `magFilter` are equal, then using a `maxLod` of zero also works.

The maximum number of sampler objects which **can** be simultaneously created on a device is implementation-dependent and specified by the `maxSamplerAllocationCount` member of the `VkPhysicalDeviceLimits` structure.

NOTE

For historical reasons, if `maxSamplerAllocationCount` is exceeded, some implementations may return `VK_ERROR_TOO_MANY_OBJECTS`. Exceeding this limit will result in undefined behavior, and an application should not rely on the use of the returned error code in order to identify when the limit is reached.

Since `VkSampler` is a non-dispatchable handle type, implementations **may** return the same handle for sampler state vectors that are identical. In such cases, all such objects would only count once against the `maxSamplerAllocationCount` limit.

Valid Usage

- VUID-VkSamplerCreateInfo-mipLodBias-01069
The absolute value of `mipLodBias` **must** be less than or equal to `VkPhysicalDeviceLimits::maxSamplerLodBias`
- VUID-VkSamplerCreateInfo-maxLod-01973
`maxLod` **must** be greater than or equal to `minLod`
- VUID-VkSamplerCreateInfo-anisotropyEnable-01070
If the `samplerAnisotropy` feature is not enabled, `anisotropyEnable` **must** be `VK_FALSE`
- VUID-VkSamplerCreateInfo-anisotropyEnable-01071
If `anisotropyEnable` is `VK_TRUE`, `maxAnisotropy` **must** be between `1.0` and `VkPhysicalDeviceLimits::maxSamplerAnisotropy`, inclusive
- VUID-VkSamplerCreateInfo-minFilter-01645
If `sampler YCBCR conversion` is enabled and the `potential format features` of the sampler `YCBCR conversion` do not support `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_SEPARATE_RECONSTRUCTION_FILTER_BIT`, `minFilter` and `magFilter` **must** be equal to the sampler `YCBCR conversion's` `chromaFilter`
- VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01072
If `unnormalizedCoordinates` is `VK_TRUE`, `minFilter` and `magFilter` **must** be equal
- VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01073
If `unnormalizedCoordinates` is `VK_TRUE`, `mipmapMode` **must** be `VK_SAMPLER_MIPMAP_MODE_NEAREST`
- VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01074
If `unnormalizedCoordinates` is `VK_TRUE`, `minLod` and `maxLod` **must** be zero
- VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01075
If `unnormalizedCoordinates` is `VK_TRUE`, `addressModeU` and `addressModeV` **must** each be either `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE` or `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER`
- VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01076
If `unnormalizedCoordinates` is `VK_TRUE`, `anisotropyEnable` **must** be `VK_FALSE`
- VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01077
If `unnormalizedCoordinates` is `VK_TRUE`, `compareEnable` **must** be `VK_FALSE`
- VUID-VkSamplerCreateInfo-addressModeU-01078
If any of `addressModeU`, `addressModeV` or `addressModeW` are `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER`, `borderColor` **must** be a valid `VkBorderColor` value

- VUID-VkSamplerCreateInfo-addressModeU-01646
If **sampler Y'C_BC_R conversion** is enabled, **addressModeU**, **addressModeV**, and **addressModeW** **must** be **VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE**, **anisotropyEnable** **must** be **VK_FALSE**, and **unnormalizedCoordinates** **must** be **VK_FALSE**
- VUID-VkSamplerCreateInfo-None-01647
If **sampler Y'C_BC_R conversion** is enabled and the **pNext** chain includes a **VkSamplerReductionModeCreateInfo** structure, then the sampler reduction mode **must** be **VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE**
- VUID-VkSamplerCreateInfo-pNext-06726
If the **samplerFilterMinmax** feature is not enabled and the **pNext** chain includes a **VkSamplerReductionModeCreateInfo** structure, then the sampler reduction mode **must** be **VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE**
- VUID-VkSamplerCreateInfo-addressModeU-01079
If the **samplerMirrorClampToEdge** feature is not enabled, and if the **VK_KHR_sampler_mirror_clamp_to_edge** extension is not enabled, **addressModeU**, **addressModeV** and **addressModeW** **must** not be **VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE**
- VUID-VkSamplerCreateInfo-compareEnable-01080
If **compareEnable** is **VK_TRUE**, **compareOp** **must** be a valid **VkCompareOp** value
- VUID-VkSamplerCreateInfo-magFilter-01081
If either **magFilter** or **minFilter** is **VK_FILTER_CUBIC_EXT**, **anisotropyEnable** **must** be **VK_FALSE**
- VUID-VkSamplerCreateInfo-compareEnable-01423
If **compareEnable** is **VK_TRUE**, the **reductionMode** member **must** be **VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE**
- VUID-VkSamplerCreateInfo-borderColor-04011
If **borderColor** is one of **VK_BORDER_COLOR_FLOAT_CUSTOM_EXT** or **VK_BORDER_COLOR_INT_CUSTOM_EXT**, then a **VkSamplerCustomBorderColorCreateInfoEXT** **must** be included in the **pNext** chain
- VUID-VkSamplerCreateInfo-customBorderColors-04085
If the **customBorderColors** feature is not enabled, **borderColor** **must** not be **VK_BORDER_COLOR_FLOAT_CUSTOM_EXT** or **VK_BORDER_COLOR_INT_CUSTOM_EXT**
- VUID-VkSamplerCreateInfo-borderColor-04442
If **borderColor** is one of **VK_BORDER_COLOR_FLOAT_CUSTOM_EXT** or **VK_BORDER_COLOR_INT_CUSTOM_EXT**, and **VkSamplerCustomBorderColorCreateInfoEXT::format** is not **VK_FORMAT_UNDEFINED**, **VkSamplerCustomBorderColorCreateInfoEXT::customBorderColor** **must** be within the range of values representable in **format**
- VUID-VkSamplerCreateInfo-None-04012
The maximum number of samplers with custom border colors which **can** be simultaneously created on a device is implementation-dependent and specified by the **maxCustomBorderColorSamplers** member of the **VkPhysicalDeviceCustomBorderColorPropertiesEXT** structure

Valid Usage (Implicit)

- VUID-VkSamplerCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SAMPLER_CREATE_INFO`
- VUID-VkSamplerCreateInfo-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkSamplerCustomBorderColorCreateInfoEXT`, `VkSamplerReductionModeCreateInfo`, or `VkSamplerYcbcrConversionInfo`
- VUID-VkSamplerCreateInfo-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkSamplerCreateInfo-flags-zeroBitmask
`flags` **must** be `0`
- VUID-VkSamplerCreateInfo-magFilter-parameter
`magFilter` **must** be a valid `VkFilter` value
- VUID-VkSamplerCreateInfo-minFilter-parameter
`minFilter` **must** be a valid `VkFilter` value
- VUID-VkSamplerCreateInfo-mipmapMode-parameter
`mipmapMode` **must** be a valid `VkSamplerMipmapMode` value
- VUID-VkSamplerCreateInfo-addressModeU-parameter
`addressModeU` **must** be a valid `VkSamplerAddressMode` value
- VUID-VkSamplerCreateInfo-addressModeV-parameter
`addressModeV` **must** be a valid `VkSamplerAddressMode` value
- VUID-VkSamplerCreateInfo-addressModeW-parameter
`addressModeW` **must** be a valid `VkSamplerAddressMode` value

`VK_LOD_CLAMP_NONE` is a special constant value used for `VkSamplerCreateInfo::maxLod` to indicate that maximum LOD clamping should not be performed.

```
#define VK_LOD_CLAMP_NONE 1000.0F
```

Bits which **can** be set in `VkSamplerCreateInfo::flags`, specifying additional parameters of a sampler, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkSamplerCreateFlagBits {
} VkSamplerCreateFlagBits;
```

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkSamplerCreateFlags;
```

`VkSamplerCreateFlags` is a bitmask type for setting a mask of zero or more `VkSamplerCreateFlagBits`.

The `VkSamplerReductionModeCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkSamplerReductionModeCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkSamplerReductionMode reductionMode;
} VkSamplerReductionModeCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `reductionMode` is a `VkSamplerReductionMode` value controlling how texture filtering combines texel values.

If the `pNext` chain of `VkSamplerCreateInfo` includes a `VkSamplerReductionModeCreateInfo` structure, then that structure includes a mode controlling how texture filtering combines texel values.

If this structure is not present, `reductionMode` is considered to be `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`.

Valid Usage (Implicit)

- VUID-VkSamplerReductionModeCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SAMPLER_REDUCTION_MODE_CREATE_INFO`
- VUID-VkSamplerReductionModeCreateInfo-reductionMode-parameter
`reductionMode` **must** be a valid `VkSamplerReductionMode` value

Reduction modes are specified by `VkSamplerReductionMode`, which takes values:

```
// Provided by VK_VERSION_1_2
typedef enum VkSamplerReductionMode {
    VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE = 0,
    VK_SAMPLER_REDUCTION_MODE_MIN = 1,
    VK_SAMPLER_REDUCTION_MODE_MAX = 2,
} VkSamplerReductionMode;
```

- `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE` specifies that texel values are combined by computing a weighted average of values in the footprint, using weights as specified in [the image operations chapter](#).
- `VK_SAMPLER_REDUCTION_MODE_MIN` specifies that texel values are combined by taking the component-wise minimum of values in the footprint with non-zero weights.
- `VK_SAMPLER_REDUCTION_MODE_MAX` specifies that texel values are combined by taking the

component-wise maximum of values in the footprint with non-zero weights.

Possible values of the `VkSamplerCreateInfo::magFilter` and `minFilter` parameters, specifying filters used for texture lookups, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkFilter {
    VK_FILTER_NEAREST = 0,
    VK_FILTER_LINEAR = 1,
    // Provided by VK_EXT_filter_cubic
    VK_FILTER_CUBIC_EXT = 1000015000,
} VkFilter;
```

- `VK_FILTER_NEAREST` specifies nearest filtering.
- `VK_FILTER_LINEAR` specifies linear filtering.
- `VK_FILTER_CUBIC_EXT` specifies cubic filtering.

These filters are described in detail in [Texel Filtering](#).

Possible values of the `VkSamplerCreateInfo::mipmapMode`, specifying the mipmap mode used for texture lookups, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkSamplerMipmapMode {
    VK_SAMPLER_MIPMAP_MODE_NEAREST = 0,
    VK_SAMPLER_MIPMAP_MODE_LINEAR = 1,
} VkSamplerMipmapMode;
```

- `VK_SAMPLER_MIPMAP_MODE_NEAREST` specifies nearest filtering.
- `VK_SAMPLER_MIPMAP_MODE_LINEAR` specifies linear filtering.

These modes are described in detail in [Texel Filtering](#).

Possible values of the `VkSamplerCreateInfo::addressMode*` parameters, specifying the behavior of sampling with coordinates outside the range [0,1] for the respective u, v, or w coordinate as defined in the [Wrapping Operation](#) section, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkSamplerAddressMode {
    VK_SAMPLER_ADDRESS_MODE_REPEAT = 0,
    VK_SAMPLER_ADDRESS_MODE_MIRRORED_REPEAT = 1,
    VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE = 2,
    VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER = 3,
    // Provided by VK_VERSION_1_2
    VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE = 4,
} VkSamplerAddressMode;
```

- `VK_SAMPLER_ADDRESS_MODE_REPEAT` specifies that the repeat wrap mode will be used.
- `VK_SAMPLER_ADDRESS_MODE_MIRRORED_REPEAT` specifies that the mirrored repeat wrap mode will be used.
- `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE` specifies that the clamp to edge wrap mode will be used.
- `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER` specifies that the clamp to border wrap mode will be used.
- `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE` specifies that the mirror clamp to edge wrap mode will be used. This is only valid if the `samplerMirrorClampToEdge` feature is enabled, or if the `VK_KHR_sampler_mirror_clamp_to_edge` extension is enabled.

Comparison operators compare a *reference* and a *test* value, and return a true (“passed”) or false (“failed”) value depending on the comparison operator chosen. The supported operators are:

```
// Provided by VK_VERSION_1_0
typedef enum VkCompareOp {
    VK_COMPARE_OP_NEVER = 0,
    VK_COMPARE_OP_LESS = 1,
    VK_COMPARE_OP_EQUAL = 2,
    VK_COMPARE_OP_LESS_OR_EQUAL = 3,
    VK_COMPARE_OP_GREATER = 4,
    VK_COMPARE_OP_NOT_EQUAL = 5,
    VK_COMPARE_OP_GREATER_OR_EQUAL = 6,
    VK_COMPARE_OP_ALWAYS = 7,
} VkCompareOp;
```

- `VK_COMPARE_OP_NEVER` specifies that the comparison always evaluates false.
- `VK_COMPARE_OP_LESS` specifies that the comparison evaluates *reference* < *test*.
- `VK_COMPARE_OP_EQUAL` specifies that the comparison evaluates *reference* = *test*.
- `VK_COMPARE_OP_LESS_OR_EQUAL` specifies that the comparison evaluates *reference* ≤ *test*.
- `VK_COMPARE_OP_GREATER` specifies that the comparison evaluates *reference* > *test*.
- `VK_COMPARE_OP_NOT_EQUAL` specifies that the comparison evaluates *reference* ≠ *test*.
- `VK_COMPARE_OP_GREATER_OR_EQUAL` specifies that the comparison evaluates *reference* ≥ *test*.
- `VK_COMPARE_OP_ALWAYS` specifies that the comparison always evaluates true.

Comparison operators are used for:

- The **Depth Compare Operation** operator for a sampler, specified by `VkSamplerCreateInfo::compareOp`.
- The stencil comparison operator for the **stencil test**, specified by `vkCmdSetStencilOpEXT::compareOp` or `VkStencilOpState::compareOp`.
- The **Depth Comparison** operator for the **depth test**, specified by `vkCmdSetDepthCompareOpEXT::depthCompareOp` or `VkPipelineDepthStencilStateCreateInfo::depthCompareOp`.

Each such use describes how the *reference* and *test* values for that comparison are determined.

Possible values of `VkSamplerCreateInfo::borderColor`, specifying the border color used for texture lookups, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkBorderColor {
    VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK = 0,
    VK_BORDER_COLOR_INT_TRANSPARENT_BLACK = 1,
    VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK = 2,
    VK_BORDER_COLOR_INT_OPAQUE_BLACK = 3,
    VK_BORDER_COLOR_FLOAT_OPAQUE_WHITE = 4,
    VK_BORDER_COLOR_INT_OPAQUE_WHITE = 5,
    // Provided by VK_EXT_custom_border_color
    VK_BORDER_COLOR_FLOAT_CUSTOM_EXT = 1000287003,
    // Provided by VK_EXT_custom_border_color
    VK_BORDER_COLOR_INT_CUSTOM_EXT = 1000287004,
} VkBorderColor;
```

- `VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK` specifies a transparent, floating-point format, black color.
- `VK_BORDER_COLOR_INT_TRANSPARENT_BLACK` specifies a transparent, integer format, black color.
- `VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK` specifies an opaque, floating-point format, black color.
- `VK_BORDER_COLOR_INT_OPAQUE_BLACK` specifies an opaque, integer format, black color.
- `VK_BORDER_COLOR_FLOAT_OPAQUE_WHITE` specifies an opaque, floating-point format, white color.
- `VK_BORDER_COLOR_INT_OPAQUE_WHITE` specifies an opaque, integer format, white color.
- `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT` specifies that a `VkSamplerCustomBorderColorCreateInfoEXT` structure is included in the `VkSamplerCreateInfo::pNext` chain containing the color data in floating-point format.
- `VK_BORDER_COLOR_INT_CUSTOM_EXT` specifies that a `VkSamplerCustomBorderColorCreateInfoEXT` structure is included in the `VkSamplerCreateInfo::pNext` chain containing the color data in integer format.

These colors are described in detail in [Border Replacement](#).

To destroy a sampler, call:

```
// Provided by VK_VERSION_1_0
void vkDestroySampler(
    VkDevice          device,
    VkSampler          sampler,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the sampler.
- `sampler` is the sampler to destroy.

- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroySampler-sampler-01082
All submitted commands that refer to **sampler** **must** have completed execution

Valid Usage (Implicit)

- VUID-vkDestroySampler-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkDestroySampler-sampler-parameter
If **sampler** is not [VK_NULL_HANDLE](#), **sampler** **must** be a valid [VkSampler](#) handle
- VUID-vkDestroySampler-pAllocator-null
pAllocator **must** be [NULL](#)
- VUID-vkDestroySampler-sampler-parent
If **sampler** is a valid handle, it **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **sampler** **must** be externally synchronized

14.1. Sampler Y'C_BC_R Conversion

To create a sampler with Y'C_BC_R conversion enabled, add a [VkSamplerYcbcrConversionInfo](#) structure to the **pNext** chain of the [VkSamplerCreateInfo](#) structure. To create a sampler Y'C_BC_R conversion, the **samplerYcbcrConversion** feature **must** be enabled. Conversion **must** be fixed at pipeline creation time, through use of a combined image sampler with an immutable sampler in [VkDescriptorSetLayoutBinding](#).

A [VkSamplerYcbcrConversionInfo](#) **must** be provided for samplers to be used with image views that access [VK_IMAGE_ASPECT_COLOR_BIT](#) if the format is one of the [formats that require a sampler Y'C_BC_R conversion](#).

The [VkSamplerYcbcrConversionInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkSamplerYcbcrConversionInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkSamplerYcbcrConversion conversion;
} VkSamplerYcbcrConversionInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `conversion` is a `VkSamplerYcbcrConversion` handle created with `vkCreateSamplerYcbcrConversion`.

Valid Usage (Implicit)

- VUID-VkSamplerYcbcrConversionInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SAMPLER_YCBCR_CONVERSION_INFO`
- VUID-VkSamplerYcbcrConversionInfo-conversion-parameter
`conversion` **must** be a valid `VkSamplerYcbcrConversion` handle

A sampler Y'C_BC_R conversion is an opaque representation of a device-specific sampler Y'C_BC_R conversion description, represented as a `VkSamplerYcbcrConversion` handle:

```
// Provided by VK_VERSION_1_1
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSamplerYcbcrConversion)
```

To create a `VkSamplerYcbcrConversion`, call:

```
// Provided by VK_VERSION_1_1
VkResult vkCreateSamplerYcbcrConversion(
    VkDevice device,
    const VkSamplerYcbcrConversionCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSamplerYcbcrConversion* pYcbcrConversion);
```

- `device` is the logical device that creates the sampler Y'C_BC_R conversion.
- `pCreateInfo` is a pointer to a `VkSamplerYcbcrConversionCreateInfo` structure specifying the requested sampler Y'C_BC_R conversion.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pYcbcrConversion` is a pointer to a `VkSamplerYcbcrConversion` handle in which the resulting sampler Y'C_BC_R conversion is returned.

The interpretation of the configured sampler Y'C_BC_R conversion is described in more detail in [the description of sampler Y'C_BC_R conversion](#) in the [Image Operations](#) chapter.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkCreateSamplerYcbcrConversion` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkCreateSamplerYcbcrConversion-None-01648

The `samplerYcbcrConversion` feature **must** be enabled

- VUID-vkCreateSamplerYcbcrConversion-device-05068

The number of sampler conversions currently allocated from `device` plus 1 **must** be less than or equal to the total number of sampler conversions requested via `VkDeviceObjectReservationCreateInfo::samplerYcbcrConversionRequestCount` specified when `device` was created

Valid Usage (Implicit)

- VUID-vkCreateSamplerYcbcrConversion-device-parameter `device` **must** be a valid `VkDevice` handle
- VUID-vkCreateSamplerYcbcrConversion-pCreateInfo-parameter `pCreateInfo` **must** be a valid pointer to a valid `VkSamplerYcbcrConversionCreateInfo` structure
- VUID-vkCreateSamplerYcbcrConversion-pAllocator-null `pAllocator` **must** be `NULL`
- VUID-vkCreateSamplerYcbcrConversion-pYcbcrConversion-parameter `pYcbcrConversion` **must** be a valid pointer to a `VkSamplerYcbcrConversion` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkSamplerYcbcrConversionCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkSamplerYcbcrConversionCreateInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkFormat              format;
    VkSamplerYcbcrModelConversion ycbcrModel;
    VkSamplerYcbcrRange   ycbcrRange;
    VkComponentMapping     components;
    VkChromaLocation       xChromaOffset;
    VkChromaLocation       yChromaOffset;
    VkFilter               chromaFilter;
    VkBool32               forceExplicitReconstruction;
} VkSamplerYcbcrConversionCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `format` is the format of the image from which color information will be retrieved.
- `ycbcrModel` describes the color matrix for conversion between color models.
- `ycbcrRange` describes whether the encoded values have headroom and foot room, or whether the encoding uses the full numerical range.
- `components` applies a *swizzle* based on `VkComponentSwizzle` enums prior to range expansion and color model conversion.
- `xChromaOffset` describes the *sample location* associated with downsampled chroma components in the x dimension. `xChromaOffset` has no effect for formats in which chroma components are not downsampled horizontally.
- `yChromaOffset` describes the *sample location* associated with downsampled chroma components in the y dimension. `yChromaOffset` has no effect for formats in which the chroma components are not downsampled vertically.
- `chromaFilter` is the filter for chroma reconstruction.
- `forceExplicitReconstruction` **can** be used to ensure that reconstruction is done explicitly, if supported.

NOTE

Setting `forceExplicitReconstruction` to `VK_TRUE` **may** have a performance penalty on implementations where explicit reconstruction is not the default mode of operation.

If `format` supports `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT` the `forceExplicitReconstruction` value behaves as if it were `VK_TRUE`.

Sampler Y'_{C_B}R_{C_R} conversion objects do not support *external format conversion* without additional extensions defining *external formats*.

Valid Usage

- VUID-VkSamplerYcbcrConversionCreateInfo-format-04061
format **must** represent unsigned normalized values (i.e. the format **must** be a UNORM format)
- VUID-VkSamplerYcbcrConversionCreateInfo-format-01650
The potential format features of the sampler Y'C_BC_R conversion **must** support VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT or VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT
- VUID-VkSamplerYcbcrConversionCreateInfo-xChromaOffset-01651
If the potential format features of the sampler Y'C_BC_R conversion do not support VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT, xChromaOffset and yChromaOffset **must** not be VK_CHROMA_LOCATION_COSITED_EVEN if the corresponding components are downsampled
- VUID-VkSamplerYcbcrConversionCreateInfo-xChromaOffset-01652
If the potential format features of the sampler Y'C_BC_R conversion do not support VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT, xChromaOffset and yChromaOffset **must** not be VK_CHROMA_LOCATION_MIDPOINT if the corresponding components are downsampled
- VUID-VkSamplerYcbcrConversionCreateInfo-components-02581
If the format has a _422 or _420 suffix, then components.g **must** be the identity swizzle
- VUID-VkSamplerYcbcrConversionCreateInfo-components-02582
If the format has a _422 or _420 suffix, then components.a **must** be the identity swizzle, VK_COMPONENT_SWIZZLE_ONE, or VK_COMPONENT_SWIZZLE_ZERO
- VUID-VkSamplerYcbcrConversionCreateInfo-components-02583
If the format has a _422 or _420 suffix, then components.r **must** be the identity swizzle or VK_COMPONENT_SWIZZLE_B
- VUID-VkSamplerYcbcrConversionCreateInfo-components-02584
If the format has a _422 or _420 suffix, then components.b **must** be the identity swizzle or VK_COMPONENT_SWIZZLE_R
- VUID-VkSamplerYcbcrConversionCreateInfo-components-02585
If the format has a _422 or _420 suffix, and if either components.r or components.b is the identity swizzle, both values **must** be the identity swizzle
- VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrModel-01655
If ycbcrModel is not VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY, then components.r, components.g, and components.b **must** correspond to components of the format; that is, components.r, components.g, and components.b **must** not be VK_COMPONENT_SWIZZLE_ZERO or VK_COMPONENT_SWIZZLE_ONE, and **must** not correspond to a component containing zero or one as a consequence of component substitution
- VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrRange-02748
If ycbcrRange is VK_SAMPLER_YCBCR_RANGE_ITU_NARROW then the R, G and B components obtained by applying the component swizzle to format **must** each have a bit-depth greater than or equal to 8
- VUID-VkSamplerYcbcrConversionCreateInfo-forceExplicitReconstruction-01656
If the potential format features of the sampler Y'C_BC_R conversion do not support

`VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT` `forceExplicitReconstruction` **must** be `VK_FALSE`

- VUID-VkSamplerYcbcrConversionCreateInfo-chromaFilter-01657
If the [potential format features](#) of the sampler $Y'C_B C_R$ conversion do not support `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT`, `chromaFilter` **must** not be `VK_FILTER_LINEAR`

Valid Usage (Implicit)

- VUID-VkSamplerYcbcrConversionCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SAMPLER_YCBCR_CONVERSION_CREATE_INFO`
- VUID-VkSamplerYcbcrConversionCreateInfo-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of [VkExternalFormatQNX](#)
- VUID-VkSamplerYcbcrConversionCreateInfo-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkSamplerYcbcrConversionCreateInfo-format-parameter
`format` **must** be a valid [VkFormat](#) value
- VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrModel-parameter
`ycbcrModel` **must** be a valid [VkSamplerYcbcrModelConversion](#) value
- VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrRange-parameter
`ycbcrRange` **must** be a valid [VkSamplerYcbcrRange](#) value
- VUID-VkSamplerYcbcrConversionCreateInfo-components-parameter
`components` **must** be a valid [VkComponentMapping](#) structure
- VUID-VkSamplerYcbcrConversionCreateInfo-xChromaOffset-parameter
`xChromaOffset` **must** be a valid [VkChromaLocation](#) value
- VUID-VkSamplerYcbcrConversionCreateInfo-yChromaOffset-parameter
`yChromaOffset` **must** be a valid [VkChromaLocation](#) value
- VUID-VkSamplerYcbcrConversionCreateInfo-chromaFilter-parameter
`chromaFilter` **must** be a valid [VkFilter](#) value

If `chromaFilter` is `VK_FILTER_NEAREST`, chroma samples are reconstructed to luma component resolution using nearest-neighbour sampling. Otherwise, chroma samples are reconstructed using interpolation. More details can be found in [the description of sampler \$Y'C_B C_R\$ conversion](#) in the [Image Operations](#) chapter.

[VkSamplerYcbcrModelConversion](#) defines the conversion from the source color model to the shader color model. Possible values are:

```
// Provided by VK_VERSION_1_1
typedef enum VkSamplerYcbcrModelConversion {
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY = 0,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY = 1,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709 = 2,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601 = 3,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020 = 4,
} VkSamplerYcbcrModelConversion;
```

- `VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY` specifies that the input values to the conversion are unmodified.
- `VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY` specifies no model conversion but the inputs are range expanded as for $Y'C_B C_R$.
- `VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709` specifies the color model conversion from $Y'C_B C_R$ to R'G'B' defined in BT.709 and described in the “BT.709 $Y'C_B C_R$ conversion” section of the [Khronos Data Format Specification](#).
- `VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601` specifies the color model conversion from $Y'C_B C_R$ to R'G'B' defined in BT.601 and described in the “BT.601 $Y'C_B C_R$ conversion” section of the [Khronos Data Format Specification](#).
- `VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020` specifies the color model conversion from $Y'C_B C_R$ to R'G'B' defined in BT.2020 and described in the “BT.2020 $Y'C_B C_R$ conversion” section of the [Khronos Data Format Specification](#).

In the `VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_*` color models, for the input to the sampler $Y'C_B C_R$ range expansion and model conversion:

- the Y (Y' luma) component corresponds to the G component of an RGB image.
- the CB (C_B or “U” blue color difference) component corresponds to the B component of an RGB image.
- the CR (C_R or “V” red color difference) component corresponds to the R component of an RGB image.
- the alpha component, if present, is not modified by color model conversion.

These rules reflect the mapping of components after the component swizzle operation (controlled by `VkSamplerYcbcrConversionCreateInfo::components`).

NOTE

For example, an “YUVA” 32-bit format comprising four 8-bit components can be implemented as `VK_FORMAT_R8G8B8A8_UNORM` with a component mapping:

- `components.a = VK_COMPONENT_SWIZZLE_IDENTITY`
- `components.r = VK_COMPONENT_SWIZZLE_B`
- `components.g = VK_COMPONENT_SWIZZLE_R`
- `components.b = VK_COMPONENT_SWIZZLE_G`

The [VkSamplerYcbcrRange](#) enum describes whether color components are encoded using the full range of numerical values or whether values are reserved for headroom and foot room. [VkSamplerYcbcrRange](#) is defined as:

```
// Provided by VK_VERSION_1_1
typedef enum VkSamplerYcbcrRange {
    VK_SAMPLER_YCBCR_RANGE_ITU_FULL = 0,
    VK_SAMPLER_YCBCR_RANGE_ITU_NARROW = 1,
} VkSamplerYcbcrRange;
```

- [VK_SAMPLER_YCBCR_RANGE_ITU_FULL](#) specifies that the full range of the encoded values are valid and interpreted according to the ITU “full range” quantization rules.
- [VK_SAMPLER_YCBCR_RANGE_ITU_NARROW](#) specifies that headroom and foot room are reserved in the numerical range of encoded values, and the remaining values are expanded according to the ITU “narrow range” quantization rules.

The formulae for these conversions is described in the [Sampler Y'C_BC_R Range Expansion](#) section of the [Image Operations](#) chapter.

No range modification takes place if [ycbcrModel](#) is [VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY](#); the [ycbcrRange](#) field of [VkSamplerYcbcrConversionCreateInfo](#) is ignored in this case.

The [VkChromaLocation](#) enum defines the location of downsampled chroma component samples relative to the luma samples, and is defined as:

```
// Provided by VK_VERSION_1_1
typedef enum VkChromaLocation {
    VK_CHROMA_LOCATION_COSITED_EVEN = 0,
    VK_CHROMA_LOCATION_MIDPOINT = 1,
} VkChromaLocation;
```

- [VK_CHROMA_LOCATION_COSITED_EVEN](#) specifies that downsampled chroma samples are aligned with luma samples with even coordinates.
- [VK_CHROMA_LOCATION_MIDPOINT](#) specifies that downsampled chroma samples are located half way between each even luma sample and the nearest higher odd luma sample.

To destroy a sampler Y'C_BC_R conversion, call:

```
// Provided by VK_VERSION_1_1
void vkDestroySamplerYcbcrConversion(
    VkDevice device,
    VkSamplerYcbcrConversion ycbcrConversion,
    const VkAllocationCallbacks* pAllocator);
```

- [device](#) is the logical device that destroys the Y'C_BC_R conversion.
- [ycbcrConversion](#) is the conversion to destroy.

- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage (Implicit)

- VUID-vkDestroySamplerYcbcrConversion-device-parameter `device` **must** be a valid `VkDevice` handle
- VUID-vkDestroySamplerYcbcrConversion-ycbcrConversion-parameter
If `ycbcrConversion` is not `VK_NULL_HANDLE`, `ycbcrConversion` **must** be a valid `VkSamplerYcbcrConversion` handle
- VUID-vkDestroySamplerYcbcrConversion-pAllocator-null
`pAllocator` **must** be `NULL`
- VUID-vkDestroySamplerYcbcrConversion-ycbcrConversion-parent
If `ycbcrConversion` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `ycbcrConversion` **must** be externally synchronized

In addition to the predefined border color values, applications **can** provide a custom border color value by including the `VkSamplerCustomBorderColorCreateInfoEXT` structure in the `VkSamplerCreateInfo::pNext` chain.

The `VkSamplerCustomBorderColorCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_custom_border_color
typedef struct VkSamplerCustomBorderColorCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkClearColorValue  customBorderColor;
    VkFormat            format;
} VkSamplerCustomBorderColorCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `customBorderColor` is a `VkClearColorValue` representing the desired custom sampler border color.
- `format` is a `VkFormat` representing the format of the sampled image view(s). This field may be `VK_FORMAT_UNDEFINED` if the `customBorderColorWithoutFormat` feature is enabled.

NOTE

If `format` is a depth/stencil format, the aspect is determined by the value of `VkSamplerCreateInfo::borderColor`. If `VkSamplerCreateInfo::borderColor` is `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT`, the depth aspect is considered. If

`VkSamplerCreateInfo::borderColor` is `VK_BORDER_COLOR_INT_CUSTOM_EXT`, the stencil aspect is considered.

If `format` is `VK_FORMAT_UNDEFINED`, the `VkSamplerCreateInfo::borderColor` is `VK_BORDER_COLOR_INT_CUSTOM_EXT`, and the sampler is used with an image with a stencil format, then the implementation **must** source the custom border color from either the first or second components of `VkSamplerCreateInfo::borderColor` and **should** source it from the first component.

Valid Usage

- VUID-VkSamplerCustomBorderColorCreateInfoEXT-format-07605
If `format` is not `VK_FORMAT_UNDEFINED` and `format` is not a depth/stencil format then the `VkSamplerCreateInfo::borderColor` type **must** match the sampled type of the provided `format`, as shown in the *SPIR-V Type* column of the [Interpretation of Numeric Format](#) table
- VUID-VkSamplerCustomBorderColorCreateInfoEXT-format-04014
If the `customBorderColorWithoutFormat` feature is not enabled then `format` **must** not be `VK_FORMAT_UNDEFINED`
- VUID-VkSamplerCustomBorderColorCreateInfoEXT-format-04015
If the sampler is used to sample an image view of `VK_FORMAT_B4G4R4A4_UNORM_PACK16`, `VK_FORMAT_B5G6R5_UNORM_PACK16`, or `VK_FORMAT_B5G5R5A1_UNORM_PACK16` format then `format` **must** not be `VK_FORMAT_UNDEFINED`

Valid Usage (Implicit)

- VUID-VkSamplerCustomBorderColorCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SAMPLER_CUSTOM_BORDER_COLOR_CREATE_INFO_EXT`
- VUID-VkSamplerCustomBorderColorCreateInfoEXT-format-parameter
`format` **must** be a valid `VkFormat` value

Chapter 15. Resource Descriptors

A *descriptor* is an opaque data structure representing a shader resource such as a buffer, buffer view, image view, sampler, or combined image sampler. Descriptors are organized into *descriptor sets*, which are bound during command recording for use in subsequent drawing commands. The arrangement of content in each descriptor set is determined by a *descriptor set layout*, which determines what descriptors can be stored within it. The sequence of descriptor set layouts that **can** be used by a pipeline is specified in a *pipeline layout*. Each pipeline object **can** use up to `maxBoundDescriptorSets` (see [Limits](#)) descriptor sets.

Shaders access resources via variables decorated with a descriptor set and binding number that link them to a descriptor in a descriptor set. The shader interface mapping to bound descriptor sets is described in the [Shader Resource Interface](#) section.

Shaders **can** also access buffers without going through descriptors by using [Physical Storage Buffer Access](#) to access them through 64-bit addresses.

15.1. Descriptor Types

There are a number of different types of descriptor supported by Vulkan, corresponding to different resources or usage. The following sections describe the API definitions of each descriptor type. The mapping of each type to SPIR-V is listed in the [Shader Resource and Descriptor Type Correspondence](#) and [Shader Resource and Storage Class Correspondence](#) tables in the [Shader Interfaces](#) chapter.

15.1.1. Storage Image

A *storage image* (`VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`) is a descriptor type associated with an [image resource](#) via an [image view](#) that load, store, and atomic operations **can** be performed on.

Storage image loads are supported in all shader stages for image views whose [format features](#) contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT`.

Stores to storage images are supported in compute shaders for image views whose [format features](#) contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT`.

Atomic operations on storage images are supported in compute shaders for image views whose [format features](#) contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

When the `fragmentStoresAndAtomics` feature is enabled, stores and atomic operations are also supported for storage images in fragment shaders with the same set of image formats as supported in compute shaders. When the `vertexPipelineStoresAndAtomics` feature is enabled, stores and atomic operations are also supported in vertex, tessellation, and geometry shaders with the same set of image formats as supported in compute shaders.

The image subresources for a storage image **must** be in the `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` or `VK_IMAGE_LAYOUT_GENERAL` layout in order to access its data in a shader.

15.1.2. Sampler

A *sampler descriptor* (`VK_DESCRIPTOR_TYPE_SAMPLER`) is a descriptor type associated with a [sampler](#) object, used to control the behavior of [sampling operations](#) performed on a [sampled image](#).

15.1.3. Sampled Image

A *sampled image* (`VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`) is a descriptor type associated with an [image resource](#) via an [image view](#) that [sampling operations](#) **can** be performed on.

Shaders combine a sampled image variable and a sampler variable to perform sampling operations.

Sampled images are supported in all shader stages for image views whose [format features](#) contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`.

An image subresources for a sampled image **must** be in one of the following layouts:

- `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`
- `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`
- `VK_IMAGE_LAYOUT_GENERAL`
- `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`
- `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`
- `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`
- `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`
- `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`

15.1.4. Combined Image Sampler

A *combined image sampler* (`VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`) is a single descriptor type associated with both a [sampler](#) and an [image resource](#), combining both a [sampler](#) and [sampled image](#) descriptor into a single descriptor.

If the descriptor refers to a sampler that performs [Y'C_BC_R conversion](#), the sampler **must** only be used to sample the image in the same descriptor. Otherwise, the sampler and image in this type of descriptor **can** be used freely with any other samplers and images.

An image subresources for a combined image sampler **must** be in one of the following layouts:

- `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`
- `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`
- `VK_IMAGE_LAYOUT_GENERAL`
- `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`
- `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`

- `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`
- `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`
- `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`

NOTE

On some implementations, it **may** be more efficient to sample from an image using a combination of sampler and sampled image that are stored together in the descriptor set in a combined descriptor.

15.1.5. Uniform Texel Buffer

A *uniform texel buffer* (`VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`) is a descriptor type associated with a [buffer resource](#) via a [buffer view](#) that [image sampling operations](#) **can** be performed on.

Uniform texel buffers define a tightly-packed 1-dimensional linear array of texels, with texels going through format conversion when read in a shader in the same way as they are for an image.

Load operations from uniform texel buffers are supported in all shader stages for buffer view formats which report [format features](#) support for `VK_FORMAT_FEATURE_UNIFORM_TEXEL_BUFFER_BIT`

15.1.6. Storage Texel Buffer

A *storage texel buffer* (`VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`) is a descriptor type associated with a [buffer resource](#) via a [buffer view](#) that [image load, store, and atomic operations](#) **can** be performed on.

Storage texel buffers define a tightly-packed 1-dimensional linear array of texels, with texels going through format conversion when read in a shader in the same way as they are for an image. Unlike [uniform texel buffers](#), these buffers can also be written to in the same way as for [storage images](#).

Storage texel buffer loads are supported in all shader stages for texel buffer view formats which report [format features](#) support for `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT`

Stores to storage texel buffers are supported in compute shaders for texel buffer formats which report [format features](#) support for `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT`

Atomic operations on storage texel buffers are supported in compute shaders for texel buffer formats which report [format features](#) support for `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`

When the `fragmentStoresAndAtomics` feature is enabled, stores and atomic operations are also supported for storage texel buffers in fragment shaders with the same set of texel buffer formats as supported in compute shaders. When the `vertexPipelineStoresAndAtomics` feature is enabled, stores and atomic operations are also supported in vertex, tessellation, and geometry shaders with the same set of texel buffer formats as supported in compute shaders.

15.1.7. Storage Buffer

A *storage buffer* (`VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`) is a descriptor type associated with a [buffer resource](#) directly, described in a shader as a structure with various members that load, store, and atomic operations **can** be performed on.

NOTE

Atomic operations **can** only be performed on members of certain types as defined in the [SPIR-V environment appendix](#).

15.1.8. Uniform Buffer

A *uniform buffer* (`VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`) is a descriptor type associated with a [buffer resource](#) directly, described in a shader as a structure with various members that load operations **can** be performed on.

15.1.9. Dynamic Uniform Buffer

A *dynamic uniform buffer* (`VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`) is almost identical to a [uniform buffer](#), and differs only in how the offset into the buffer is specified. The base offset calculated by the `VkDescriptorBufferInfo` when initially [updating the descriptor set](#) is added to a [dynamic offset](#) when binding the descriptor set.

15.1.10. Dynamic Storage Buffer

A *dynamic storage buffer* (`VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`) is almost identical to a [storage buffer](#), and differs only in how the offset into the buffer is specified. The base offset calculated by the `VkDescriptorBufferInfo` when initially [updating the descriptor set](#) is added to a [dynamic offset](#) when binding the descriptor set.

15.1.11. Input Attachment

An *input attachment* (`VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`) is a descriptor type associated with an [image resource](#) via an [image view](#) that **can** be used for [framebuffer local](#) load operations in fragment shaders.

All image formats that are supported for color attachments (`VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`) or depth/stencil attachments (`VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`) for a given image tiling mode are also supported for input attachments.

An image view used as an input attachment **must** be in one of the following layouts:

- `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`
- `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`
- `VK_IMAGE_LAYOUT_GENERAL`
- `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`
- `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`

- `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`
- `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`

15.2. Descriptor Sets

Descriptors are grouped together into descriptor set objects. A descriptor set object is an opaque object containing storage for a set of descriptors, where the types and number of descriptors is defined by a descriptor set layout. The layout object **may** be used to define the association of each descriptor binding with memory or other implementation resources. The layout is used both for determining the resources that need to be associated with the descriptor set, and determining the interface between shader stages and shader resources.

15.2.1. Descriptor Set Layout

A descriptor set layout object is defined by an array of zero or more descriptor bindings. Each individual descriptor binding is specified by a descriptor type, a count (array size) of the number of descriptors in the binding, a set of shader stages that **can** access the binding, and (if using immutable samplers) an array of sampler descriptors.

Descriptor set layout objects are represented by `VkDescriptorSetLayout` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorSetLayout)
```

To create descriptor set layout objects, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateDescriptorSetLayout(
    VkDevice                                device,
    const VkDescriptorSetLayoutCreateInfo*  pCreateInfo,
    const VkAllocationCallbacks*           pAllocator,
    VkDescriptorSetLayout*                  pSetLayout);
```

- `device` is the logical device that creates the descriptor set layout.
- `pCreateInfo` is a pointer to a `VkDescriptorSetLayoutCreateInfo` structure specifying the state of the descriptor set layout object.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pSetLayout` is a pointer to a `VkDescriptorSetLayout` handle in which the resulting descriptor set layout object is returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkCreateDescriptorSetLayout` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkCreateDescriptorSetLayout-support-09582

If the descriptor layout exceeds the limits reported through the [physical device limits](#), then [vkGetDescriptorSetLayoutSupport](#) **must** have returned [VkDescriptorSetLayoutSupport](#) with [support](#) equal to [VK_TRUE](#) for [pCreateInfo](#)

- VUID-vkCreateDescriptorSetLayout-device-05068

The number of descriptor set layouts currently allocated from [device](#) plus 1 **must** be less than or equal to the total number of descriptor set layouts requested via [VkDeviceObjectReservationCreateInfo::descriptorSetLayoutRequestCount](#) specified when [device](#) was created

- VUID-vkCreateDescriptorSetLayout-layoutbindings-device-05089

The number of descriptor set layout bindings currently allocated from [device](#) across all [VkDescriptorSetLayout](#) objects plus [pCreateInfo->bindingCount](#) **must** be less than or equal to the total number of descriptor set layout bindings requested via [VkDeviceObjectReservationCreateInfo::descriptorSetLayoutBindingRequestCount](#) specified when [device](#) was created

Valid Usage (Implicit)

- VUID-vkCreateDescriptorSetLayout-device-parameter

[device](#) **must** be a valid [VkDevice](#) handle

- VUID-vkCreateDescriptorSetLayout-pCreateInfo-parameter

[pCreateInfo](#) **must** be a valid pointer to a valid [VkDescriptorSetLayoutCreateInfo](#) structure

- VUID-vkCreateDescriptorSetLayout-pAllocator-null

[pAllocator](#) **must** be [NULL](#)

- VUID-vkCreateDescriptorSetLayout-pSetLayout-parameter

[pSetLayout](#) **must** be a valid pointer to a [VkDescriptorSetLayout](#) handle

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

Information about the descriptor set layout is passed in a [VkDescriptorSetLayoutCreateInfo](#)

structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorSetLayoutCreateInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkDescriptorSetLayoutCreateFlags flags;
    uint32_t                 bindingCount;
    const VkDescriptorSetLayoutBinding* pBindings;
} VkDescriptorSetLayoutCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask specifying options for descriptor set layout creation.
- `bindingCount` is the number of elements in `pBindings`.
- `pBindings` is a pointer to an array of `VkDescriptorSetLayoutBinding` structures.

Valid Usage

- VUID-VkDescriptorSetLayoutCreateInfo-binding-00279
The `VkDescriptorSetLayoutBinding::binding` members of the elements of the `pBindings` array **must** each have different values
- VUID-VkDescriptorSetLayoutCreateInfo-flags-03000
If any binding has the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` bit set, `flags` **must** include `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT`
- VUID-VkDescriptorSetLayoutCreateInfo-descriptorType-03001
If any binding has the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` bit set, then all bindings **must** not have `descriptorType` of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`
- VUID-VkDescriptorSetLayoutCreateInfo-bindingCount-05011
`bindingCount` **must** be less than or equal to `maxDescriptorSetLayoutBindings`
- VUID-VkDescriptorSetLayoutCreateInfo-descriptorCount-05071
The sum of `descriptorCount` over all bindings in `pBindings` that have `descriptorType` of `VK_DESCRIPTOR_TYPE_SAMPLER` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` and `pImmutableSamplers` not equal to `NULL` **must** be less than or equal to `VkDeviceObjectReservationCreateInfo::maxImmutableSamplersPerDescriptorSetLayout`

Valid Usage (Implicit)

- VUID-VkDescriptorSetLayoutCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO`
- VUID-VkDescriptorSetLayoutCreateInfo-pNext-pNext

`pNext` **must** be `NULL` or a pointer to a valid instance of `VkDescriptorSetLayoutBindingFlagsCreateInfo`

- VUID-VkDescriptorSetLayoutCreateInfo-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkDescriptorSetLayoutCreateInfo-flags-parameter
`flags` **must** be a valid combination of `VkDescriptorSetLayoutCreateFlagBits` values
- VUID-VkDescriptorSetLayoutCreateInfo-pBindings-parameter
If `bindingCount` is not 0, `pBindings` **must** be a valid pointer to an array of `bindingCount` valid `VkDescriptorSetLayoutBinding` structures

Bits which **can** be set in `VkDescriptorSetLayoutCreateInfo::flags`, specifying options for descriptor set layout, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkDescriptorSetLayoutCreateFlagBits {
    // Provided by VK_VERSION_1_2
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT = 0x00000002,
} VkDescriptorSetLayoutCreateFlagBits;
```

- `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` specifies that descriptor sets using this layout **must** be allocated from a descriptor pool created with the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` bit set. Descriptor set layouts created with this bit set have alternate limits for the maximum number of descriptors per-stage and per-pipeline layout. The non-UpdateAfterBind limits only count descriptors in sets created without this flag. The UpdateAfterBind limits count all descriptors, but the limits **may** be higher than the non-UpdateAfterBind limits.

NOTE

All bits for this type are defined by extensions, and none of those extensions are enabled in this build of the specification.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkDescriptorSetLayoutCreateFlags;
```

`VkDescriptorSetLayoutCreateFlags` is a bitmask type for setting a mask of zero or more `VkDescriptorSetLayoutCreateFlagBits`.

The `VkDescriptorSetLayoutBinding` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorSetLayoutBinding {
    uint32_t          binding;
    VkDescriptorType   descriptorType;
    uint32_t          descriptorCount;
    VkShaderStageFlags stageFlags;
    const VkSampler*   pImmutableSamplers;
} VkDescriptorSetLayoutBinding;
```

- **binding** is the binding number of this entry and corresponds to a resource of the same binding number in the shader stages.
- **descriptorType** is a **VkDescriptorType** specifying which type of resource descriptors are used for this binding.
- **descriptorCount** is the number of descriptors contained in the binding, accessed in a shader as an array. If **descriptorCount** is zero this binding entry is reserved and the resource **must** not be accessed from any stage via this binding within any pipeline using the set layout.
- **stageFlags** member is a bitmask of **VkShaderStageFlagBits** specifying which pipeline shader stages **can** access a resource for this binding. **VK_SHADER_STAGE_ALL** is a shorthand specifying that all defined shader stages, including any additional stages defined by extensions, **can** access the resource.

If a shader stage is not included in **stageFlags**, then a resource **must** not be accessed from that stage via this binding within any pipeline using the set layout. Other than input attachments which are limited to the fragment shader, there are no limitations on what combinations of stages **can** use a descriptor binding, and in particular a binding **can** be used by both graphics stages and the compute stage.

- **pImmutableSamplers** affects initialization of samplers. If **descriptorType** specifies a **VK_DESCRIPTOR_TYPE_SAMPLER** or **VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER** type descriptor, then **pImmutableSamplers** **can** be used to initialize a set of *immutable samplers*. Immutable samplers are permanently bound into the set layout and **must** not be changed; updating a **VK_DESCRIPTOR_TYPE_SAMPLER** descriptor with immutable samplers is not allowed and updates to a **VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER** descriptor with immutable samplers does not modify the samplers (the image views are updated, but the sampler updates are ignored). If **pImmutableSamplers** is not **NULL**, then it is a pointer to an array of sampler handles that will be copied into the set layout and used for the corresponding binding. Only the sampler handles are copied; the sampler objects **must** not be destroyed before the final use of the set layout and any descriptor pools and sets created using it. If **pImmutableSamplers** is **NULL**, then the sampler slots are dynamic and sampler handles **must** be bound into descriptor sets using this layout. If **descriptorType** is not one of these descriptor types, then **pImmutableSamplers** is ignored.

The above layout definition allows the descriptor bindings to be specified sparsely such that not all binding numbers between 0 and the maximum binding number need to be specified in the **pBindings** array. Bindings that are not specified have a **descriptorCount** and **stageFlags** of zero, and the value of **descriptorType** is undefined. However, all binding numbers between 0 and the maximum binding number in the **VkDescriptorSetLayoutCreateInfo::pBindings** array **may** consume memory in the descriptor set layout even if not all descriptor bindings are used, though it **should**

not consume additional memory from the descriptor pool.

NOTE

The maximum binding number specified **should** be as compact as possible to avoid wasted memory.

Valid Usage

- VUID-VkDescriptorSetLayoutBinding-descriptorType-00282
If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLER` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and `descriptorCount` is not 0 and `pImmutableSamplers` is not NULL, `pImmutableSamplers` **must** be a valid pointer to an array of `descriptorCount` valid `VkSampler` handles
- VUID-VkDescriptorSetLayoutBinding-descriptorCount-09465
If `descriptorCount` is not 0, `stageFlags` **must** be `VK_SHADER_STAGE_ALL` or a valid combination of other `VkShaderStageFlagBits` values
- VUID-VkDescriptorSetLayoutBinding-descriptorType-01510
If `descriptorType` is `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` and `descriptorCount` is not 0, then `stageFlags` **must** be 0 or `VK_SHADER_STAGE_FRAGMENT_BIT`
- VUID-VkDescriptorSetLayoutBinding-pImmutableSamplers-04009
The sampler objects indicated by `pImmutableSamplers` **must** not have a `borderColor` with one of the values `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT` or `VK_BORDER_COLOR_INT_CUSTOM_EXT`
- VUID-VkDescriptorSetLayoutBinding-binding-05012
`binding` **must** be less than the value of `VkDeviceObjectReservationCreateInfo::descriptorSetLayoutBindingLimit` provided when the device was created

Valid Usage (Implicit)

- VUID-VkDescriptorSetLayoutBinding-descriptorType-parameter
`descriptorType` **must** be a valid `VkDescriptorType` value

If the `pNext` chain of a `VkDescriptorSetLayoutCreateInfo` structure includes a `VkDescriptorSetLayoutBindingFlagsCreateInfo` structure, then that structure includes an array of flags, one for each descriptor set layout binding.

The `VkDescriptorSetLayoutBindingFlagsCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkDescriptorSetLayoutBindingFlagsCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           bindingCount;
    const VkDescriptorBindingFlags* pBindingFlags;
} VkDescriptorSetLayoutBindingFlagsCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `bindingCount` is zero or the number of elements in `pBindingFlags`.
- `pBindingFlags` is a pointer to an array of `VkDescriptorBindingFlags` bitfields, one for each descriptor set layout binding.

If `bindingCount` is zero or if this structure is not included in the `pNext` chain, the `VkDescriptorBindingFlags` for each descriptor set layout binding is considered to be zero. Otherwise, the descriptor set layout binding at `VkDescriptorSetLayoutCreateInfo::pBindings[i]` uses the flags in `pBindingFlags[i]`.

Valid Usage

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-bindingCount-03002
If `bindingCount` is not zero, `bindingCount` **must** equal `VkDescriptorSetLayoutCreateInfo::bindingCount`
- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-pBindingFlags-03004
If an element of `pBindingFlags` includes `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT`, then it **must** be the element with the highest `binding` number
- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingUniformBufferUpdateAfterBind-03005
If `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingUniformBufferUpdateAfterBind` is not enabled, all bindings with descriptor type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` **must** not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`
- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingSampledImageUpdateAfterBind-03006
If `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingSampledImageUpdateAfterBind` is not enabled, all bindings with descriptor type `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, or `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` **must** not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`
- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingStorageImageUpdateAfterBind-03007
If `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingStorageImageUpdateAfterBind` is not enabled, all bindings with descriptor type `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` **must** not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`
- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingStorageBufferUpdateAfterBind-03008
If `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingStorageBufferUpdateAfterBind` is not enabled, all bindings with descriptor type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` **must** not use

VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingUniformTexelBufferUpdateAfterBind-03009
If [VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingUniformTexelBufferUpdateAfterBind](#) is not enabled, all bindings with descriptor type `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` **must** not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`
- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingStorageTexelBufferUpdateAfterBind-03010
If [VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingStorageTexelBufferUpdateAfterBind](#) is not enabled, all bindings with descriptor type `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` **must** not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`
- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-None-03011
All bindings with descriptor type `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` **must** not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`
- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingUpdateUnusedWhilePending-03012
If [VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingUpdateUnusedWhilePending](#) is not enabled, all elements of `pBindingFlags` **must** not include `VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT`
- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingPartiallyBound-03013
If [VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingPartiallyBound](#) is not enabled, all elements of `pBindingFlags` **must** not include `VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT`
- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingVariableDescriptorCount-03014
If [VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingVariableDescriptorCount](#) is not enabled, all elements of `pBindingFlags` **must** not include `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT`
- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-pBindingFlags-03015
If an element of `pBindingFlags` includes `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT`, that element's `descriptorType` **must** not be `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`

Valid Usage (Implicit)

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_BINDING_FLAGS_CREATE_INFO`
- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-pBindingFlags-parameter

If `bindingCount` is not 0, `pBindingFlags` **must** be a valid pointer to an array of `bindingCount` valid combinations of `VkDescriptorBindingFlagBits` values

Bits which **can** be set in each element of `VkDescriptorSetLayoutBindingFlagsCreateInfo::pBindingFlags`, specifying options for the corresponding descriptor set layout binding, are:

```
// Provided by VK_VERSION_1_2
typedef enum VkDescriptorBindingFlagBits {
    VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT = 0x00000001,
    VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT = 0x00000002,
    VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT = 0x00000004,
    VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT = 0x00000008,
} VkDescriptorBindingFlagBits;
```

- `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` specifies that if descriptors in this binding are updated between when the descriptor set is bound in a command buffer and when that command buffer is submitted to a queue, then the submission will use the most recently set descriptors for this binding and the updates do not invalidate the command buffer. Descriptor bindings created with this flag are also partially exempt from the external synchronization requirement in `vkUpdateDescriptorSets`. Multiple descriptors with this flag set **can** be updated concurrently in different threads, though the same descriptor **must** not be updated concurrently by two threads. Descriptors with this flag set **can** be updated concurrently with the set being bound to a command buffer in another thread, but not concurrently with the set being reset or freed.
- `VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT` specifies that descriptors in this binding that are not *dynamically used* need not contain valid descriptors at the time the descriptors are consumed. A descriptor is dynamically used if any shader invocation executes an instruction that performs any memory access using the descriptor. If a descriptor is not dynamically used, any resource referenced by the descriptor is not considered to be referenced during command execution.
- `VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT` specifies that descriptors in this binding **can** be updated after a command buffer has bound this descriptor set, or while a command buffer that uses this descriptor set is pending execution, as long as the descriptors that are updated are not used by those command buffers. Descriptor bindings created with this flag are also partially exempt from the external synchronization requirement in `vkUpdateDescriptorSetWithTemplateKHR` and `vkUpdateDescriptorSets` in the same way as for `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`. If `VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT` is also set, then descriptors **can** be updated as long as they are not dynamically used by any shader invocations. If `VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT` is not set, then descriptors **can** be updated as long as they are not statically used by any shader invocations.
- `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT` specifies that this is a *variable-sized descriptor binding* whose size will be specified when a descriptor set is allocated using this layout. The value of `descriptorCount` is treated as an upper bound on the size of the binding. This **must** only be used for the last binding in the descriptor set layout (i.e. the binding with the largest value of `binding`). For the purposes of counting against limits such as `maxDescriptorSet*` and `maxPerStageDescriptor*`, the full value of `descriptorCount` is counted.

NOTE

Note that while `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` and `VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT` both involve updates to descriptor sets after they are bound, `VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT` is a weaker requirement since it is only about descriptors that are not used, whereas `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` requires the implementation to observe updates to descriptors that are used.

```
// Provided by VK_VERSION_1_2
typedef VkFlags VkDescriptorBindingFlags;
```

`VkDescriptorBindingFlags` is a bitmask type for setting a mask of zero or more `VkDescriptorBindingFlagBits`.

To query information about whether a descriptor set layout **can** be created, call:

```
// Provided by VK_VERSION_1_1
void vkGetDescriptorSetLayoutSupport(
    VkDevice device,
    const VkDescriptorSetLayoutCreateInfo* pCreateInfo,
    VkDescriptorSetLayoutSupport* pSupport);
```

- `device` is the logical device that would create the descriptor set layout.
- `pCreateInfo` is a pointer to a `VkDescriptorSetLayoutCreateInfo` structure specifying the state of the descriptor set layout object.
- `pSupport` is a pointer to a `VkDescriptorSetLayoutSupport` structure, in which information about support for the descriptor set layout object is returned.

Some implementations have limitations on what fits in a descriptor set which are not easily expressible in terms of existing limits like `maxDescriptorSet*`, for example if all descriptor types share a limited space in memory but each descriptor is a different size or alignment. This command returns information about whether a descriptor set satisfies this limit. If the descriptor set layout satisfies the `VkPhysicalDeviceMaintenance3Properties::maxPerSetDescriptors` limit, this command is guaranteed to return `VK_TRUE` in `VkDescriptorSetLayoutSupport::supported`. If the descriptor set layout exceeds the `VkPhysicalDeviceMaintenance3Properties::maxPerSetDescriptors` limit, whether the descriptor set layout is supported is implementation-dependent and **may** depend on whether the descriptor sizes and alignments cause the layout to exceed an internal limit.

This command does not consider other limits such as `maxPerStageDescriptor*`, and so a descriptor set layout that is supported according to this command **must** still satisfy the pipeline layout limits such as `maxPerStageDescriptor*` in order to be used in a pipeline layout.

NOTE

This is a `VkDevice` query rather than `VkPhysicalDevice` because the answer **may** depend on enabled features.

Valid Usage (Implicit)

- VUID-vkGetDescriptorSetLayoutSupport-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkGetDescriptorSetLayoutSupport-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkDescriptorSetLayoutCreateInfo](#) structure
- VUID-vkGetDescriptorSetLayoutSupport-pSupport-parameter
pSupport **must** be a valid pointer to a [VkDescriptorSetLayoutSupport](#) structure

Information about support for the descriptor set layout is returned in a [VkDescriptorSetLayoutSupport](#) structure:

```
// Provided by VK_VERSION_1_1
typedef struct VkDescriptorSetLayoutSupport {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           supported;
} VkDescriptorSetLayoutSupport;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **supported** specifies whether the descriptor set layout **can** be created.

supported will be **VK_TRUE** if the descriptor set **can** be created, or else **VK_FALSE**.

Valid Usage (Implicit)

- VUID-VkDescriptorSetLayoutSupport-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_SUPPORT**
- VUID-VkDescriptorSetLayoutSupport-pNext-pNext
pNext **must** be **NULL** or a pointer to a valid instance of [VkDescriptorSetVariableDescriptorCountLayoutSupport](#)
- VUID-VkDescriptorSetLayoutSupport-sType-unique
The **sType** value of each structure in the **pNext** chain **must** be unique

If the **pNext** chain of a [VkDescriptorSetLayoutSupport](#) structure includes a [VkDescriptorSetVariableDescriptorCountLayoutSupport](#) structure, then that structure returns additional information about whether the descriptor set layout is supported.

```
// Provided by VK_VERSION_1_2
typedef struct VkDescriptorSetVariableDescriptorCountLayoutSupport {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           maxVariableDescriptorCount;
} VkDescriptorSetVariableDescriptorCountLayoutSupport;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxVariableDescriptorCount` indicates the maximum number of descriptors supported in the highest numbered binding of the layout, if that binding is variable-sized.

If the `VkDescriptorSetLayoutCreateInfo` structure specified in `vkGetDescriptorSetLayoutSupport::pCreateInfo` includes a variable-sized descriptor, then `supported` is determined assuming the requested size of the variable-sized descriptor, and `maxVariableDescriptorCount` is the maximum size of that descriptor that **can** be successfully created (which is greater than or equal to the requested size passed in). If the `VkDescriptorSetLayoutCreateInfo` structure does not include a variable-sized descriptor, or if the `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingVariableDescriptorCount` feature is not enabled, then `maxVariableDescriptorCount` is zero. For the purposes of this command, a variable-sized descriptor binding with a `descriptorCount` of zero is treated as having a `descriptorCount` of one, and thus the binding is not ignored and the maximum descriptor count will be returned. If the layout is not supported, then the value written to `maxVariableDescriptorCount` is undefined.

Valid Usage (Implicit)

- VUID-VkDescriptorSetVariableDescriptorCountLayoutSupport-sType-sType `must` be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_VARIABLE_DESCRIPTOR_COUNT_LAYOUT_SUPPORT`

The following examples show a shader snippet using two descriptor sets, and application code that creates corresponding descriptor set layouts.

GLSL Example

```
//
// binding to a single sampled image descriptor in set 0
//
layout (set=0, binding=0) uniform texture2D mySampledImage;

//
// binding to an array of sampled image descriptors in set 0
//
layout (set=0, binding=1) uniform texture2D myArrayOfSampledImages[12];

//
// binding to a single uniform buffer descriptor in set 1
```

```
//
layout (set=1, binding=0) uniform myUniformBuffer
{
    vec4 myElement[32];
};
```

SPIR-V Example

```
...
%1 = OpExtInstImport "GLSL.std.450"
...
OpName %9 "mySampledImage"
OpName %14 "myArrayOfSampledImages"
OpName %18 "myUniformBuffer"
OpMemberName %18 0 "myElement"
OpName %20 ""
OpDecorate %9 DescriptorSet 0
OpDecorate %9 Binding 0
OpDecorate %14 DescriptorSet 0
OpDecorate %14 Binding 1
OpDecorate %17 ArrayStride 16
OpMemberDecorate %18 0 Offset 0
OpDecorate %18 Block
OpDecorate %20 DescriptorSet 1
OpDecorate %20 Binding 0
%2 = OpTypeVoid
%3 = OpTypeFunction %2
%6 = OpTypeFloat 32
%7 = OpTypeImage %6 2D 0 0 0 1 Unknown
%8 = OpTypePointer UniformConstant %7
%9 = OpVariable %8 UniformConstant
%10 = OpTypeInt 32 0
%11 = OpConstant %10 12
%12 = OpTypeArray %7 %11
%13 = OpTypePointer UniformConstant %12
%14 = OpVariable %13 UniformConstant
%15 = OpTypeVector %6 4
%16 = OpConstant %10 32
%17 = OpTypeArray %15 %16
%18 = OpTypeStruct %17
%19 = OpTypePointer Uniform %18
%20 = OpVariable %19 Uniform
...
```

API Example

```
VkResult myResult;

const VkDescriptorSetLayoutBinding myDescriptorSetLayoutBinding[] =
{
```

```

// binding to a single image descriptor
{
    .binding = 0,
    .descriptorType = VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE,
    .descriptorCount = 1,
    .stageFlags = VK_SHADER_STAGE_FRAGMENT_BIT,
    .pImmutableSamplers = NULL
},

// binding to an array of image descriptors
{
    .binding = 1,
    .descriptorType = VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE,
    .descriptorCount = 12,
    .stageFlags = VK_SHADER_STAGE_FRAGMENT_BIT,
    .pImmutableSamplers = NULL
},

// binding to a single uniform buffer descriptor
{
    .binding = 0,
    .descriptorType = VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER,
    .descriptorCount = 1,
    .stageFlags = VK_SHADER_STAGE_FRAGMENT_BIT,
    .pImmutableSamplers = NULL
}
};

const VkDescriptorSetLayoutCreateInfo myDescriptorSetLayoutCreateInfo[] =
{
    // Information for first descriptor set with two descriptor bindings
    {
        .sType = VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO,
        .pNext = NULL,
        .flags = 0,
        .bindingCount = 2,
        .pBindings = &myDescriptorSetLayoutBinding[0]
    },

    // Information for second descriptor set with one descriptor binding
    {
        .sType = VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO,
        .pNext = NULL,
        .flags = 0,
        .bindingCount = 1,
        .pBindings = &myDescriptorSetLayoutBinding[2]
    }
};

VkDescriptorSetLayout myDescriptorSetLayout[2];

```

```
//
// Create first descriptor set layout
//
myResult = vkCreateDescriptorSetLayout(
    myDevice,
    &myDescriptorSetLayoutCreateInfo[0],
    NULL,
    &myDescriptorSetLayout[0]);

//
// Create second descriptor set layout
//
myResult = vkCreateDescriptorSetLayout(
    myDevice,
    &myDescriptorSetLayoutCreateInfo[1],
    NULL,
    &myDescriptorSetLayout[1]);
```

To destroy a descriptor set layout, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyDescriptorSetLayout(
    VkDevice          device,
    VkDescriptorSetLayout descriptorSetLayout,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the descriptor set layout.
- **descriptorSetLayout** is the descriptor set layout to destroy.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage (Implicit)

- VUID-vkDestroyDescriptorSetLayout-device-parameter **device** **must** be a valid [VkDevice](#) handle
- VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-parameter
If **descriptorSetLayout** is not [VK_NULL_HANDLE](#), **descriptorSetLayout** **must** be a valid [VkDescriptorSetLayout](#) handle
- VUID-vkDestroyDescriptorSetLayout-pAllocator-null **pAllocator** **must** be [NULL](#)
- VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-parent
If **descriptorSetLayout** is a valid handle, it **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to `descriptorSetLayout` **must** be externally synchronized

15.2.2. Pipeline Layouts

Access to descriptor sets from a pipeline is accomplished through a *pipeline layout*. Zero or more descriptor set layouts and zero or more push constant ranges are combined to form a pipeline layout object describing the complete set of resources that **can** be accessed by a pipeline. The pipeline layout represents a sequence of descriptor sets with each having a specific layout. This sequence of layouts is used to determine the interface between shader stages and shader resources. Each pipeline is created using a pipeline layout.

Pipeline layout objects are represented by `VkPipelineLayout` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipelineLayout)
```

To create a pipeline layout, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreatePipelineLayout(
    VkDevice                                device,
    const VkPipelineLayoutCreateInfo*       pCreateInfo,
    const VkAllocationCallbacks*           pAllocator,
    VkPipelineLayout*                       pPipelineLayout);
```

- `device` is the logical device that creates the pipeline layout.
- `pCreateInfo` is a pointer to a `VkPipelineLayoutCreateInfo` structure specifying the state of the pipeline layout object.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pPipelineLayout` is a pointer to a `VkPipelineLayout` handle in which the resulting pipeline layout object is returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkCreatePipelineLayout` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkCreatePipelineLayout-device-05068

The number of pipeline layouts currently allocated from `device` plus 1 **must** be less than or equal to the total number of pipeline layouts requested via `VkDeviceObjectReservationCreateInfo::pipelineLayoutRequestCount` specified when `device` was created

Valid Usage (Implicit)

- VUID-vkCreatePipelineLayout-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCreatePipelineLayout-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkPipelineLayoutCreateInfo` structure
- VUID-vkCreatePipelineLayout-pAllocator-null
`pAllocator` **must** be `NULL`
- VUID-vkCreatePipelineLayout-pPipelineLayout-parameter
`pPipelineLayout` **must** be a valid pointer to a `VkPipelineLayout` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkPipelineLayoutCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineLayoutCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkPipelineLayoutCreateFlags flags;
    uint32_t           setLayoutCount;
    const VkDescriptorSetLayout* pSetLayouts;
    uint32_t           pushConstantRangeCount;
    const VkPushConstantRange* pPushConstantRanges;
} VkPipelineLayoutCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPipelineLayoutCreateFlagBits` specifying options for pipeline layout creation.
- `setLayoutCount` is the number of descriptor sets included in the pipeline layout.
- `pSetLayouts` is a pointer to an array of `VkDescriptorSetLayout` objects. The implementation **must** not access these objects outside of the duration of the command this structure is passed to.

- `pushConstantRangeCount` is the number of push constant ranges included in the pipeline layout.
- `pPushConstantRanges` is a pointer to an array of `VkPushConstantRange` structures defining a set of push constant ranges for use in a single pipeline layout. In addition to descriptor set layouts, a pipeline layout also describes how many push constants **can** be accessed by each stage of the pipeline.

NOTE

Push constants represent a high speed path to modify constant data in pipelines that is expected to outperform memory-backed resource updates.

In Vulkan SC, the pipeline compilation process occurs `offline`, but the application **must** still provide values to `VkPipelineLayoutCreateInfo` that match the values used for offline compilation of pipelines using this `VkPipelineLayout`.

Valid Usage

- VUID-VkPipelineLayoutCreateInfo-setLayoutCount-00286
`setLayoutCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxBoundDescriptorSets`
- VUID-VkPipelineLayoutCreateInfo-descriptorType-03016
The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_SAMPLER` and `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` accessible to any given shader stage across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorSamplers`
- VUID-VkPipelineLayoutCreateInfo-descriptorType-03017
The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` and `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` accessible to any given shader stage across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorUniformBuffers`
- VUID-VkPipelineLayoutCreateInfo-descriptorType-03018
The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` and `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` accessible to any given shader stage across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorStorageBuffers`
- VUID-VkPipelineLayoutCreateInfo-descriptorType-06939
The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, and `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`, accessible to any given shader stage across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorSampledImages`
- VUID-VkPipelineLayoutCreateInfo-descriptorType-03020
The total number of descriptors in descriptor set layouts created without the

VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, and `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` accessible to any given shader stage across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorStorageImages`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03021

The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` accessible to any given shader stage across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorInputAttachments`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03022

If the `descriptorBindingSampledImageUpdateAfterBind` feature is supported on the device, the total number of descriptors with a `descriptorType` of `VK_DESCRIPTOR_TYPE_SAMPLER` and `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` accessible to any given shader stage across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindSamplers`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03023

If the `descriptorBindingUniformBufferUpdateAfterBind` feature is supported on the device, the total number of descriptors with a `descriptorType` of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` and `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` accessible to any given shader stage across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindUniformBuffers`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03024

If the `descriptorBindingStorageBufferUpdateAfterBind` feature is supported on the device, the total number of descriptors with a `descriptorType` of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` and `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` accessible to any given shader stage across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindStorageBuffers`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03025

If the `descriptorBindingSampledImageUpdateAfterBind` feature is supported on the device, the total number of descriptors with a `descriptorType` of `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, and `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` accessible to any given shader stage across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindSampledImages`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03026

If the `descriptorBindingStorageImageUpdateAfterBind` feature is supported on the device, the total number of descriptors with a `descriptorType` of `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, and `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` accessible to any given shader stage across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties`

`::maxPerStageDescriptorUpdateAfterBindStorageImages`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03027

If any element of `pSetLayouts` is created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set, the total number of descriptors with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` accessible to any given shader stage across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindInputAttachments`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03028

The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_SAMPLER` and `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceLimits::maxDescriptorSetSamplers`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03029

The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceLimits::maxDescriptorSetUniformBuffers`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03030

The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceLimits::maxDescriptorSetUniformBuffersDynamic`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03031

The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceLimits::maxDescriptorSetStorageBuffers`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03032

The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceLimits::maxDescriptorSetStorageBuffersDynamic`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03033

The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, and `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceLimits::maxDescriptorSetSampledImages`

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03034
The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, and `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceLimits::maxDescriptorSetStorageImages`
- VUID-VkPipelineLayoutCreateInfo-descriptorType-03035
The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceLimits::maxDescriptorSetInputAttachments`
- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03036
If the `descriptorBindingSampledImageUpdateAfterBind` feature is supported on the device, the total number of descriptors of the type `VK_DESCRIPTOR_TYPE_SAMPLER` and `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindSamplers`
- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03037
If the `descriptorBindingUniformBufferUpdateAfterBind` feature is supported on the device, the total number of descriptors of the type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindUniformBuffers`
- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03038
If the `descriptorBindingUniformBufferUpdateAfterBind` feature is supported on the device, the total number of descriptors of the type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceLimits::maxDescriptorSetUpdateAfterBindUniformBuffersDynamic`
- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03039
If the `descriptorBindingStorageBufferUpdateAfterBind` feature is supported on the device, the total number of descriptors of the type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindStorageBuffers`
- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03040
If the `descriptorBindingStorageBufferUpdateAfterBind` feature is supported on the device, the total number of descriptors of the type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceLimits::maxDescriptorSetUpdateAfterBindStorageBuffersDynamic`
- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03041
If the `descriptorBindingSampledImageUpdateAfterBind` feature is supported on the device, the total number of descriptors of the type `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`,

`VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, and `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindSampledImages`

- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03042

If the `descriptorBindingStorageImageUpdateAfterBind` feature is supported on the device, the total number of descriptors of the type `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, and `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindStorageImages`

- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03043

If any element of `pSetLayouts` is created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set, the total number of descriptors of the type `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindInputAttachments`

- VUID-VkPipelineLayoutCreateInfo-pPushConstantRanges-00292

Any two elements of `pPushConstantRanges` **must** not include the same stage in `stageFlags`

- VUID-VkPipelineLayoutCreateInfo-graphicsPipelineLibrary-06753

Elements of `pSetLayouts` **must** be valid `VkDescriptorSetLayout` objects

Valid Usage (Implicit)

- VUID-VkPipelineLayoutCreateInfo-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_LAYOUT_CREATE_INFO`

- VUID-VkPipelineLayoutCreateInfo-flags-zeroBitmask

`flags` **must** be 0

- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-parameter

If `setLayoutCount` is not 0, `pSetLayouts` **must** be a valid pointer to an array of `setLayoutCount` valid or `VK_NULL_HANDLE` `VkDescriptorSetLayout` handles

- VUID-VkPipelineLayoutCreateInfo-pPushConstantRanges-parameter

If `pushConstantRangeCount` is not 0, `pPushConstantRanges` **must** be a valid pointer to an array of `pushConstantRangeCount` valid `VkPushConstantRange` structures

```
typedef enum VkPipelineLayoutCreateFlagBits {  
} VkPipelineLayoutCreateFlagBits;
```

All values for this enum are defined by extensions.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineLayoutCreateFlags;
```

`VkPipelineLayoutCreateFlags` is a bitmask type for setting a mask of `VkPipelineLayoutCreateFlagBits`.

The `VkPushConstantRange` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPushConstantRange {
    VkShaderStageFlags    stageFlags;
    uint32_t              offset;
    uint32_t              size;
} VkPushConstantRange;
```

- `stageFlags` is a set of stage flags describing the shader stages that will access a range of push constants. If a particular stage is not included in the range, then accessing members of that range of push constants from the corresponding shader stage will return undefined values.
- `offset` and `size` are the start offset and size, respectively, consumed by the range. Both `offset` and `size` are in units of bytes and **must** be a multiple of 4. The layout of the push constant variables is specified in the shader.

Valid Usage

- VUID-VkPushConstantRange-offset-00294
`offset` **must** be less than `VkPhysicalDeviceLimits::maxPushConstantsSize`
- VUID-VkPushConstantRange-offset-00295
`offset` **must** be a multiple of 4
- VUID-VkPushConstantRange-size-00296
`size` **must** be greater than 0
- VUID-VkPushConstantRange-size-00297
`size` **must** be a multiple of 4
- VUID-VkPushConstantRange-size-00298
`size` **must** be less than or equal to `VkPhysicalDeviceLimits::maxPushConstantsSize` minus `offset`

Valid Usage (Implicit)

- VUID-VkPushConstantRange-stageFlags-parameter
`stageFlags` **must** be a valid combination of `VkShaderStageFlagBits` values
- VUID-VkPushConstantRange-stageFlags-requiredbitmask
`stageFlags` **must** not be 0

Once created, pipeline layouts are used as part of pipeline creation (see [Pipelines](#)), as part of binding descriptor sets (see [Descriptor Set Binding](#)), and as part of setting push constants (see [Push Constant Updates](#)). Pipeline creation accepts a pipeline layout as input, and the layout **may** be used to map (set, binding, arrayElement) tuples to implementation resources or memory locations within a descriptor set. The assignment of implementation resources depends only on the bindings defined in the descriptor sets that comprise the pipeline layout, and not on any shader source.

All resource variables [statically used](#) in all shaders in a pipeline **must** be declared with a (set, binding, arrayElement) that exists in the corresponding descriptor set layout and is of an appropriate descriptor type and includes the set of shader stages it is used by in [stageFlags](#). The pipeline layout **can** include entries that are not used by a particular pipeline. The pipeline layout allows the application to provide a consistent set of bindings across multiple pipeline compiles, which enables those pipelines to be compiled in a way that the implementation **may** cheaply switch pipelines without reprogramming the bindings.

Similarly, the push constant block declared in each shader (if present) **must** only place variables at offsets that are each included in a push constant range with [stageFlags](#) including the bit corresponding to the shader stage that uses it. The pipeline layout **can** include ranges or portions of ranges that are not used by a particular pipeline.

There is a limit on the total number of resources of each type that **can** be included in bindings in all descriptor set layouts in a pipeline layout as shown in [Pipeline Layout Resource Limits](#). The “Total Resources Available” column gives the limit on the number of each type of resource that **can** be included in bindings in all descriptor sets in the pipeline layout. Some resource types count against multiple limits. Additionally, there are limits on the total number of each type of resource that **can** be used in any pipeline stage as described in [Shader Resource Limits](#).

Table 15. Pipeline Layout Resource Limits

Total Resources Available	Resource Types
maxDescriptorSetSamplers or maxDescriptorSetUpdateAfterBindSamplers	sampler
	combined image sampler
maxDescriptorSetSampledImages or maxDescriptorSetUpdateAfterBindSampledImages	sampled image
	combined image sampler
	uniform texel buffer
maxDescriptorSetStorageImages or maxDescriptorSetUpdateAfterBindStorageImages	storage image
	storage texel buffer
maxDescriptorSetUniformBuffers or maxDescriptorSetUpdateAfterBindUniformBuffers	uniform buffer
	uniform buffer dynamic
maxDescriptorSetUniformBuffersDynamic or maxDescriptorSetUpdateAfterBindUniformBuffersDynamic	uniform buffer dynamic
maxDescriptorSetStorageBuffers or maxDescriptorSetUpdateAfterBindStorageBuffers	storage buffer
	storage buffer dynamic

Total Resources Available	Resource Types
<code>maxDescriptorSetStorageBuffersDynamic</code> or <code>maxDescriptorSetUpdateAfterBindStorageBuffersDynamic</code>	storage buffer dynamic
<code>maxDescriptorSetInputAttachments</code> or <code>maxDescriptorSetUpdateAfterBindInputAttachments</code>	input attachment

To destroy a pipeline layout, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyPipelineLayout(
    VkDevice          device,
    VkPipelineLayout  pipelineLayout,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the pipeline layout.
- `pipelineLayout` is the pipeline layout to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroyPipelineLayout-pipelineLayout-02004
`pipelineLayout` **must** not have been passed to any `vkCmd*` command for any command buffers that are still in the [recording state](#) when `vkDestroyPipelineLayout` is called

Valid Usage (Implicit)

- VUID-vkDestroyPipelineLayout-device-parameter
`device` **must** be a valid [VkDevice](#) handle
- VUID-vkDestroyPipelineLayout-pipelineLayout-parameter
If `pipelineLayout` is not [VK_NULL_HANDLE](#), `pipelineLayout` **must** be a valid [VkPipelineLayout](#) handle
- VUID-vkDestroyPipelineLayout-pAllocator-null
`pAllocator` **must** be `NULL`
- VUID-vkDestroyPipelineLayout-pipelineLayout-parent
If `pipelineLayout` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `pipelineLayout` **must** be externally synchronized

Pipeline Layout Compatibility

Two pipeline layouts are defined to be “compatible for [push constants](#)” if they were created with identical push constant ranges. Two pipeline layouts are defined to be “compatible for set N” if they were created with [identically defined](#) descriptor set layouts for sets zero through N, and if they were created with identical push constant ranges.

When binding a descriptor set (see [Descriptor Set Binding](#)) to set number N, a previously bound descriptor set bound with lower index M than N is disturbed if the pipeline layouts for set M and N are not compatible for set M. Otherwise, the bound descriptor set in M is not disturbed.

If, additionally, the previously bound descriptor set for set N was bound using a pipeline layout not compatible for set N, then all bindings in sets numbered greater than N are disturbed.

When binding a pipeline, the pipeline **can** correctly access any previously bound descriptor set N if it was bound with compatible pipeline layout for set N, and it was not disturbed.

Layout compatibility means that descriptor sets **can** be bound to a command buffer for use by any pipeline created with a compatible pipeline layout, and without having bound a particular pipeline first. It also means that descriptor sets **can** remain valid across a pipeline change, and the same resources will be accessible to the newly bound pipeline.

When a descriptor set is disturbed by binding descriptor sets, the disturbed set is considered to contain undefined descriptors bound with the same pipeline layout as the disturbing descriptor set.

Implementor’s Note

A consequence of layout compatibility is that when the implementation compiles a pipeline layout and maps pipeline resources to implementation resources, the mechanism for set N **should** only be a function of sets [0..N].

NOTE

Place the least frequently changing descriptor sets near the start of the pipeline layout, and place the descriptor sets representing the most frequently changing resources near the end. When pipelines are switched, only the descriptor set bindings that have been invalidated will need to be updated and the remainder of the descriptor set bindings will remain in place.

The maximum number of descriptor sets that **can** be bound to a pipeline layout is queried from physical device properties (see [maxBoundDescriptorSets](#) in [Limits](#)).

API Example

```
const VkDescriptorSetLayout layouts[] = { layout1, layout2 };

const VkPushConstantRange ranges[] =
{
    {
        .stageFlags = VK_SHADER_STAGE_VERTEX_BIT,
        .offset = 0,
```

```

        .size = 4
    },
    {
        .stageFlags = VK_SHADER_STAGE_FRAGMENT_BIT,
        .offset = 4,
        .size = 4
    },
};

const VkPipelineLayoutCreateInfo createInfo =
{
    .sType = VK_STRUCTURE_TYPE_PIPELINE_LAYOUT_CREATE_INFO,
    .pNext = NULL,
    .flags = 0,
    .setLayoutCount = 2,
    .pSetLayouts = layouts,
    .pushConstantRangeCount = 2,
    .pPushConstantRanges = ranges
};

VkPipelineLayout myPipelineLayout;
myResult = vkCreatePipelineLayout(
    myDevice,
    &createInfo,
    NULL,
    &myPipelineLayout);

```

15.2.3. Allocation of Descriptor Sets

A *descriptor pool* maintains a pool of descriptors, from which descriptor sets are allocated. Descriptor pools are externally synchronized, meaning that the application **must** not allocate and/or free descriptor sets from the same pool in multiple threads simultaneously.

Descriptor pools **cannot** be destroyed [\[SCID-4\]](#).

If `VkPhysicalDeviceVulkanSC10Properties::deviceDestroyFreesMemory` is `VK_TRUE`, the memory is returned to the system when the device is destroyed. Otherwise, it **may** not be returned to the system until the process is terminated.

Descriptor pools are represented by `VkDescriptorPool` handles:

```

// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorPool)

```

To create a descriptor pool object, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateDescriptorPool(
    VkDevice                                device,
    const VkDescriptorPoolCreateInfo*       pCreateInfo,
    const VkAllocationCallbacks*           pAllocator,
    VkDescriptorPool*                       pDescriptorPool);
```

- **device** is the logical device that creates the descriptor pool.
- **pCreateInfo** is a pointer to a [VkDescriptorPoolCreateInfo](#) structure specifying the state of the descriptor pool object.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.
- **pDescriptorPool** is a pointer to a [VkDescriptorPool](#) handle in which the resulting descriptor pool object is returned.

The created descriptor pool is returned in **pDescriptorPool**.

If [VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations](#) is **VK_TRUE**, **vkCreateDescriptorPool** **must** not return **VK_ERROR_OUT_OF_HOST_MEMORY**.

Valid Usage

- VUID-vkCreateDescriptorPool-device-05068
The number of descriptor pools currently allocated from **device** plus 1 **must** be less than or equal to the total number of descriptor pools requested via [VkDeviceObjectReservationCreateInfo::descriptorPoolRequestCount](#) specified when **device** was created

Valid Usage (Implicit)

- VUID-vkCreateDescriptorPool-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkCreateDescriptorPool-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkDescriptorPoolCreateInfo](#) structure
- VUID-vkCreateDescriptorPool-pAllocator-null
pAllocator **must** be **NULL**
- VUID-vkCreateDescriptorPool-pDescriptorPool-parameter
pDescriptorPool **must** be a valid pointer to a [VkDescriptorPool](#) handle
- VUID-vkCreateDescriptorPool-device-queuecount
The device **must** have been created with at least **1** queue

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

Additional information about the pool is passed in a `VkDescriptorPoolCreateInfo` structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorPoolCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkDescriptorPoolCreateFlags flags;
    uint32_t           maxSets;
    uint32_t           poolSizeCount;
    const VkDescriptorPoolSize* pPoolSizes;
} VkDescriptorPoolCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkDescriptorPoolCreateFlagBits` specifying certain supported operations on the pool.
- `maxSets` is the maximum number of descriptor sets that **can** be allocated from the pool.
- `poolSizeCount` is the number of elements in `pPoolSizes`.
- `pPoolSizes` is a pointer to an array of `VkDescriptorPoolSize` structures, each containing a descriptor type and number of descriptors of that type to be allocated in the pool.

If multiple `VkDescriptorPoolSize` structures containing the same descriptor type appear in the `pPoolSizes` array then the pool will be created with enough storage for the total number of descriptors of each type.

Fragmentation of a descriptor pool is possible and **may** lead to descriptor set allocation failures. A failure due to fragmentation is defined as failing a descriptor set allocation despite the sum of all outstanding descriptor set allocations from the pool plus the requested allocation requiring no more than the total number of descriptors requested at pool creation. Implementations provide certain guarantees of when fragmentation **must** not cause allocation failure, as described below.

If a descriptor pool has not had any descriptor sets freed since it was created or most recently reset then fragmentation **must** not cause an allocation failure (note that this is always the case for a pool

created without the `VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT` bit set). Additionally, if all sets allocated from the pool since it was created or most recently reset use the same number of descriptors (of each type) and the requested allocation also uses that same number of descriptors (of each type), then fragmentation **must** not cause an allocation failure.

If an allocation failure occurs due to fragmentation, an application **can** create an additional descriptor pool to perform further descriptor set allocations.

If `flags` has the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` bit set, descriptor pool creation **may** fail with the error `VK_ERROR_FRAGMENTATION` if the total number of descriptors across all pools (including this one) created with this bit set exceeds `maxUpdateAfterBindDescriptorsInAllPools`, or if fragmentation of the underlying hardware resources occurs.

Valid Usage

- VUID-VkDescriptorPoolCreateInfo-descriptorPoolOverallocation-09227
`maxSets` **must** be greater than 0

Valid Usage (Implicit)

- VUID-VkDescriptorPoolCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DESCRIPTOR_POOL_CREATE_INFO`
- VUID-VkDescriptorPoolCreateInfo-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkDescriptorPoolCreateInfo-flags-parameter
`flags` **must** be a valid combination of `VkDescriptorPoolCreateFlagBits` values
- VUID-VkDescriptorPoolCreateInfo-pPoolSizes-parameter
If `poolSizeCount` is not 0, `pPoolSizes` **must** be a valid pointer to an array of `poolSizeCount` valid `VkDescriptorPoolSize` structures

Bits which **can** be set in `VkDescriptorPoolCreateInfo::flags`, enabling operations on a descriptor pool, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkDescriptorPoolCreateFlagBits {
    VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT = 0x00000001,
    // Provided by VK_VERSION_1_2
    VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT = 0x00000002,
} VkDescriptorPoolCreateFlagBits;
```

- `VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT` specifies that descriptor sets **can** return their individual allocations to the pool, i.e. all of `vkAllocateDescriptorSets`, `vkFreeDescriptorSets`, and `vkResetDescriptorPool` are allowed. Otherwise, descriptor sets allocated from the pool **must** not be individually freed back to the pool, i.e. only

[vkAllocateDescriptorSets](#) and [vkResetDescriptorPool](#) are allowed.

- [VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT](#) specifies that descriptor sets allocated from this pool **can** include bindings with the [VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT](#) bit set. It is valid to allocate descriptor sets that have bindings that do not set the [VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT](#) bit from a pool that has [VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT](#) set.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkDescriptorPoolCreateFlags;
```

[VkDescriptorPoolCreateFlags](#) is a bitmask type for setting a mask of zero or more [VkDescriptorPoolCreateFlagBits](#).

The [VkDescriptorPoolSize](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorPoolSize {
    VkDescriptorType    type;
    uint32_t            descriptorCount;
} VkDescriptorPoolSize;
```

- [type](#) is the type of descriptor.
- [descriptorCount](#) is the number of descriptors of that type to allocate.

NOTE

When creating a descriptor pool that will contain descriptors for combined image samplers of [multi-planar formats](#), an application needs to account for non-trivial descriptor consumption when choosing the [descriptorCount](#) value, as indicated by [VkSamplerYcbcrConversionImageFormatProperties::combinedImageSamplerDescriptorCount](#).

Valid Usage

- VUID-VkDescriptorPoolSize-descriptorCount-00302
[descriptorCount](#) **must** be greater than 0

Valid Usage (Implicit)

- VUID-VkDescriptorPoolSize-type-parameter
[type](#) **must** be a valid [VkDescriptorType](#) value

Descriptor sets are allocated from descriptor pool objects, and are represented by [VkDescriptorSet](#) handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorSet)
```

To allocate descriptor sets from a descriptor pool, call:

```
// Provided by VK_VERSION_1_0
VkResult vkAllocateDescriptorSets(
    VkDevice device,
    const VkDescriptorSetAllocateInfo* pAllocateInfo,
    VkDescriptorSet* pDescriptorSets);
```

- **device** is the logical device that owns the descriptor pool.
- **pAllocateInfo** is a pointer to a [VkDescriptorSetAllocateInfo](#) structure describing parameters of the allocation.
- **pDescriptorSets** is a pointer to an array of [VkDescriptorSet](#) handles in which the resulting descriptor set objects are returned.

The allocated descriptor sets are returned in **pDescriptorSets**.

When a descriptor set is allocated, the initial state is largely uninitialized and all descriptors are undefined, with the exception that samplers with a non-null **pImmutableSamplers** are initialized on allocation. Descriptors also become undefined if the underlying resource or view object is destroyed. Descriptor sets containing undefined descriptors **can** still be bound and used, subject to the following conditions:

- For descriptor set bindings created with the **VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT** bit set, all descriptors in that binding that are dynamically used **must** have been populated before the descriptor set is [consumed](#).
- For descriptor set bindings created without the **VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT** bit set, all descriptors in that binding that are statically used **must** have been populated before the descriptor set is [consumed](#).
- Entries that are not used by a pipeline **can** have undefined descriptors.

If a call to **vkAllocateDescriptorSets** would cause the total number of descriptor sets allocated from the pool to exceed the value of [VkDescriptorPoolCreateInfo::maxSets](#) used to create **pAllocateInfo->descriptorPool**, then the allocation **may** fail due to lack of space in the descriptor pool. Similarly, the allocation **may** fail due to lack of space if the call to **vkAllocateDescriptorSets** would cause the number of any given descriptor type to exceed the sum of all the **descriptorCount** members of each element of [VkDescriptorPoolCreateInfo::pPoolSizes](#) with a **type** equal to that type.

If the allocation fails due to no more space in the descriptor pool, and not because of system or device memory exhaustion, then **VK_ERROR_OUT_OF_POOL_MEMORY** **must** be returned.

vkAllocateDescriptorSets **can** be used to create multiple descriptor sets. If the creation of any of those descriptor sets fails, then the implementation **must** destroy all successfully created descriptor set objects from this command, set all entries of the **pDescriptorSets** array to [VK_NULL_HANDLE](#)

and return the error.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkAllocateDescriptorSets` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkAllocateDescriptorSets-device-05068

The number of descriptor sets currently allocated from `device` plus `VkDescriptorSetAllocateInfo::descriptorSetCount` **must** be less than or equal to the total number of descriptor sets requested via `VkDeviceObjectReservationCreateInfo::descriptorSetRequestCount` specified when `device` was created

Valid Usage (Implicit)

- VUID-vkAllocateDescriptorSets-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkAllocateDescriptorSets-pAllocateInfo-parameter
`pAllocateInfo` **must** be a valid pointer to a valid `VkDescriptorSetAllocateInfo` structure
- VUID-vkAllocateDescriptorSets-pDescriptorSets-parameter
`pDescriptorSets` **must** be a valid pointer to an array of `pAllocateInfo->descriptorSetCount` `VkDescriptorSet` handles
- VUID-vkAllocateDescriptorSets-device-queuecount
The device **must** have been created with at least `1` queue
- VUID-vkAllocateDescriptorSets-pAllocateInfo::descriptorSetCount-arraylength
`pAllocateInfo->descriptorSetCount` **must** be greater than `0`

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_FRAGMENTED_POOL`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_POOL_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkDescriptorSetAllocateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorSetAllocateInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkDescriptorPool      descriptorPool;
    uint32_t             descriptorSetCount;
    const VkDescriptorSetLayout* pSetLayouts;
} VkDescriptorSetAllocateInfo;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **descriptorPool** is the pool which the sets will be allocated from.
- **descriptorSetCount** determines the number of descriptor sets to be allocated from the pool.
- **pSetLayouts** is a pointer to an array of descriptor set layouts, with each member specifying how the corresponding descriptor set is allocated.

Valid Usage

- VUID-VkDescriptorSetAllocateInfo-pSetLayouts-03044
If any element of **pSetLayouts** was created with the **VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT** bit set, **descriptorPool** **must** have been created with the **VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT** flag set
- VUID-VkDescriptorSetAllocateInfo-pSetLayouts-09380
If **pSetLayouts[i]** was created with an element of **pBindingFlags** that includes **VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT**, and **VkDescriptorSetVariableDescriptorCountAllocateInfo** is included in the **pNext** chain, and **VkDescriptorSetVariableDescriptorCountAllocateInfo::descriptorSetCount** is not zero, then **VkDescriptorSetVariableDescriptorCountAllocateInfo::pDescriptorCounts[i]** **must** be less than or equal to **VkDescriptorSetLayoutBinding::descriptorCount** for the corresponding binding used to create **pSetLayouts[i]**

Valid Usage (Implicit)

- VUID-VkDescriptorSetAllocateInfo-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_DESCRIPTOR_SET_ALLOCATE_INFO**
- VUID-VkDescriptorSetAllocateInfo-pNext-pNext
pNext **must** be **NULL** or a pointer to a valid instance of **VkDescriptorSetVariableDescriptorCountAllocateInfo**
- VUID-VkDescriptorSetAllocateInfo-sType-unique
The **sType** value of each structure in the **pNext** chain **must** be unique
- VUID-VkDescriptorSetAllocateInfo-descriptorPool-parameter
descriptorPool **must** be a valid **VkDescriptorPool** handle

- VUID-VkDescriptorSetAllocateInfo-pSetLayouts-parameter
`pSetLayouts` **must** be a valid pointer to an array of `descriptorSetCount` valid `VkDescriptorSetLayout` handles
- VUID-VkDescriptorSetAllocateInfo-descriptorSetCount-arraylength
`descriptorSetCount` **must** be greater than 0
- VUID-VkDescriptorSetAllocateInfo-commonparent
Both of `descriptorPool`, and the elements of `pSetLayouts` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `descriptorPool` **must** be externally synchronized

If the `pNext` chain of a `VkDescriptorSetAllocateInfo` structure includes a `VkDescriptorSetVariableDescriptorCountAllocateInfo` structure, then that structure includes an array of descriptor counts for variable-sized descriptor bindings, one for each descriptor set being allocated.

The `VkDescriptorSetVariableDescriptorCountAllocateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkDescriptorSetVariableDescriptorCountAllocateInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           descriptorSetCount;
    const uint32_t*     pDescriptorCounts;
} VkDescriptorSetVariableDescriptorCountAllocateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `descriptorSetCount` is zero or the number of elements in `pDescriptorCounts`.
- `pDescriptorCounts` is a pointer to an array of descriptor counts, with each member specifying the number of descriptors in a variable-sized descriptor binding in the corresponding descriptor set being allocated.

If `descriptorSetCount` is zero or this structure is not included in the `pNext` chain, then the variable lengths are considered to be zero. Otherwise, `pDescriptorCounts[i]` is the number of descriptors in the variable-sized descriptor binding in the corresponding descriptor set layout. If `VkDescriptorSetAllocateInfo::pSetLayouts[i]` does not include a variable-sized descriptor binding, then `pDescriptorCounts[i]` is ignored.

Valid Usage

- VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-descriptorSetCount-03045

If `descriptorSetCount` is not zero, `descriptorSetCount` **must** equal `VkDescriptorSetAllocateInfo::descriptorSetCount`

Valid Usage (Implicit)

- VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-sType-sType `sType` **must** be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_VARIABLE_DESCRIPTOR_COUNT_ALLOCATE_INFO`
- VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-pDescriptorCounts-parameter
If `descriptorSetCount` is not 0, `pDescriptorCounts` **must** be a valid pointer to an array of `descriptorSetCount` `uint32_t` values

To free allocated descriptor sets, call:

```
// Provided by VK_VERSION_1_0
VkResult vkFreeDescriptorSets(
    VkDevice          device,
    VkDescriptorPool   descriptorPool,
    uint32_t          descriptorSetCount,
    const VkDescriptorSet* pDescriptorSets);
```

- `device` is the logical device that owns the descriptor pool.
- `descriptorPool` is the descriptor pool from which the descriptor sets were allocated.
- `descriptorSetCount` is the number of elements in the `pDescriptorSets` array.
- `pDescriptorSets` is a pointer to an array of handles to `VkDescriptorSet` objects.

After calling `vkFreeDescriptorSets`, all descriptor sets in `pDescriptorSets` are invalid.

If `recycleDescriptorSetMemory` is `VK_FALSE`, then freeing a descriptor set does not make the pool memory it used available to be reallocated until the descriptor pool is reset. If `recycleDescriptorSetMemory` is `VK_TRUE`, then the memory is available to be reallocated immediately after freeing the descriptor set.

Valid Usage

- VUID-vkFreeDescriptorSets-pDescriptorSets-00309
All submitted commands that refer to any element of `pDescriptorSets` **must** have completed execution
- VUID-vkFreeDescriptorSets-pDescriptorSets-00310
`pDescriptorSets` **must** be a valid pointer to an array of `descriptorSetCount` `VkDescriptorSet` handles, each element of which **must** either be a valid handle or `VK_NULL_HANDLE`
- VUID-vkFreeDescriptorSets-descriptorPool-00312
`descriptorPool` **must** have been created with the

VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT flag

Valid Usage (Implicit)

- VUID-vkFreeDescriptorSets-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkFreeDescriptorSets-descriptorPool-parameter
descriptorPool **must** be a valid [VkDescriptorPool](#) handle
- VUID-vkFreeDescriptorSets-descriptorSetCount-arraylength
descriptorSetCount **must** be greater than 0
- VUID-vkFreeDescriptorSets-descriptorPool-parent
descriptorPool **must** have been created, allocated, or retrieved from **device**
- VUID-vkFreeDescriptorSets-pDescriptorSets-parent
Each element of **pDescriptorSets** that is a valid handle **must** have been created, allocated, or retrieved from **descriptorPool**

Host Synchronization

- Host access to **descriptorPool** **must** be externally synchronized
- Host access to each member of **pDescriptorSets** **must** be externally synchronized

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_UNKNOWN**
- **VK_ERROR_VALIDATION_FAILED**

To return all descriptor sets allocated from a given pool to the pool, rather than freeing individual descriptor sets, call:

```
// Provided by VK_VERSION_1_0
VkResult vkResetDescriptorPool(
    VkDevice                device,
    VkDescriptorPool        descriptorPool,
    VkDescriptorPoolResetFlags flags);
```

- **device** is the logical device that owns the descriptor pool.
- **descriptorPool** is the descriptor pool to be reset.

- `flags` is reserved for future use.

Resetting a descriptor pool recycles all of the resources from all of the descriptor sets allocated from the descriptor pool back to the descriptor pool, and the descriptor sets are implicitly freed.

Valid Usage

- VUID-vkResetDescriptorPool-descriptorPool-00313
All uses of `descriptorPool` (via any allocated descriptor sets) **must** have completed execution

Valid Usage (Implicit)

- VUID-vkResetDescriptorPool-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkResetDescriptorPool-descriptorPool-parameter
`descriptorPool` **must** be a valid `VkDescriptorPool` handle
- VUID-vkResetDescriptorPool-flags-zeroBitmask
`flags` **must** be 0
- VUID-vkResetDescriptorPool-descriptorPool-parent
`descriptorPool` **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `descriptorPool` **must** be externally synchronized
- Host access to any `VkDescriptorSet` objects allocated from `descriptorPool` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkDescriptorPoolResetFlags;
```

`VkDescriptorPoolResetFlags` is a bitmask type for setting a mask, but is currently reserved for future

use.

15.2.4. Descriptor Set Updates

Once allocated, descriptor sets **can** be updated with a combination of write and copy operations. To update descriptor sets, call:

```
// Provided by VK_VERSION_1_0
void vkUpdateDescriptorSets(
    VkDevice          device,
    uint32_t          descriptorWriteCount,
    const VkWriteDescriptorSet* pDescriptorWrites,
    uint32_t          descriptorCopyCount,
    const VkCopyDescriptorSet* pDescriptorCopies);
```

- **device** is the logical device that updates the descriptor sets.
- **descriptorWriteCount** is the number of elements in the **pDescriptorWrites** array.
- **pDescriptorWrites** is a pointer to an array of **VkWriteDescriptorSet** structures describing the descriptor sets to write to.
- **descriptorCopyCount** is the number of elements in the **pDescriptorCopies** array.
- **pDescriptorCopies** is a pointer to an array of **VkCopyDescriptorSet** structures describing the descriptor sets to copy between.

The operations described by **pDescriptorWrites** are performed first, followed by the operations described by **pDescriptorCopies**. Within each array, the operations are performed in the order they appear in the array.

Each element in the **pDescriptorWrites** array describes an operation updating the descriptor set using descriptors for resources specified in the structure.

Each element in the **pDescriptorCopies** array is a **VkCopyDescriptorSet** structure describing an operation copying descriptors between sets.

If the **dstSet** member of any element of **pDescriptorWrites** or **pDescriptorCopies** is bound, accessed, or modified by any command that was recorded to a command buffer which is currently in the **recording or executable state**, and any of the descriptor bindings that are updated were not created with the **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT** or **VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT** bits set, that command buffer becomes **invalid**.

Copying a descriptor from a descriptor set does not constitute a use of the referenced resource or view, as it is the reference itself that is copied. Applications **can** copy a descriptor referencing a destroyed resource, and it **can** copy an undefined descriptor. The destination descriptor becomes undefined in both cases.

Valid Usage

- VUID-vkUpdateDescriptorSets-pDescriptorWrites-06236

For each element `i` where `pDescriptorWrites[i].descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`, elements of the `pTexelBufferView` member of `pDescriptorWrites[i]` **must** have been created on `device`

- VUID-vkUpdateDescriptorSets-pDescriptorWrites-06237

For each element `i` where `pDescriptorWrites[i].descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`, `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`, `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, the `buffer` member of any element of the `pBufferInfo` member of `pDescriptorWrites[i]` **must** have been created on `device`

- VUID-vkUpdateDescriptorSets-pDescriptorWrites-06238

For each element `i` where `pDescriptorWrites[i].descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLER` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and `dstSet` was not allocated with a layout that included immutable samplers for `dstBinding` with `descriptorType`, the `sampler` member of any element of the `pImageInfo` member of `pDescriptorWrites[i]` **must** have been created on `device`

- VUID-vkUpdateDescriptorSets-pDescriptorWrites-06239

For each element `i` where `pDescriptorWrites[i].descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` the `imageView` member of any element of `pDescriptorWrites[i]` **must** have been created on `device`

- VUID-vkUpdateDescriptorSets-pDescriptorWrites-06493

For each element `i` where `pDescriptorWrites[i].descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, `pDescriptorWrites[i].pImageInfo` **must** be a valid pointer to an array of `pDescriptorWrites[i].descriptorCount` valid `VkDescriptorImageInfo` structures

- VUID-vkUpdateDescriptorSets-None-03047

The `dstSet` member of each element of `pDescriptorWrites` or `pDescriptorCopies` for bindings which were created without the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` or `VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT` bits set **must** not be used by any command that was recorded to a command buffer which is in the `pending state`

- VUID-vkUpdateDescriptorSets-pDescriptorWrites-06993

Host access to `pDescriptorWrites[i].dstSet` and `pDescriptorCopies[i].dstSet` **must** be `externally synchronized` unless explicitly denoted otherwise for specific flags

Valid Usage (Implicit)

- VUID-vkUpdateDescriptorSets-device-parameter

device **must** be a valid [VkDevice](#) handle

- VUID-vkUpdateDescriptorSets-pDescriptorWrites-parameter
If **descriptorWriteCount** is not 0, **pDescriptorWrites** **must** be a valid pointer to an array of **descriptorWriteCount** valid [VkWriteDescriptorSet](#) structures
- VUID-vkUpdateDescriptorSets-pDescriptorCopies-parameter
If **descriptorCopyCount** is not 0, **pDescriptorCopies** **must** be a valid pointer to an array of **descriptorCopyCount** valid [VkCopyDescriptorSet](#) structures

The [VkWriteDescriptorSet](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkWriteDescriptorSet {
    VkStructureType      sType;
    const void*          pNext;
    VkDescriptorSet       dstSet;
    uint32_t             dstBinding;
    uint32_t             dstArrayElement;
    uint32_t             descriptorCount;
    VkDescriptorType      descriptorType;
    const VkDescriptorImageInfo* pImageInfo;
    const VkDescriptorBufferInfo* pBufferInfo;
    const VkBufferView*    pTexelBufferView;
} VkWriteDescriptorSet;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **dstSet** is the destination descriptor set to update.
- **dstBinding** is the descriptor binding within that set.
- **dstArrayElement** is the starting element in that array.
- **descriptorCount** is the number of descriptors to update. **descriptorCount** is one of
 - the number of elements in **pImageInfo**
 - the number of elements in **pBufferInfo**
 - the number of elements in **pTexelBufferView**
- **descriptorType** is a [VkDescriptorType](#) specifying the type of each descriptor in **pImageInfo**, **pBufferInfo**, or **pTexelBufferView**, as described below. It **must** be the same type as the **descriptorType** specified in [VkDescriptorSetLayoutBinding](#) for **dstSet** at **dstBinding**. The type of the descriptor also controls which array the descriptors are taken from.
- **pImageInfo** is a pointer to an array of [VkDescriptorImageInfo](#) structures or is ignored, as described below.
- **pBufferInfo** is a pointer to an array of [VkDescriptorBufferInfo](#) structures or is ignored, as described below.
- **pTexelBufferView** is a pointer to an array of [VkBufferView](#) handles as described in the [Buffer](#)

[Views](#) section or is ignored, as described below.

Only one of `pImageInfo`, `pBufferInfo`, or `pTexelBufferView` members is used according to the descriptor type specified in the `descriptorType` member of the containing `VkWriteDescriptorSet` structure, as specified below.

If the `nullDescriptor` feature is enabled, the buffer, imageView, or bufferView **can** be `VK_NULL_HANDLE`. Loads from a null descriptor return zero values and stores and atomics to a null descriptor are discarded.

Consecutive Binding Updates

If the `dstBinding` has fewer than `descriptorCount` array elements remaining starting from `dstArrayElement`, then the remainder will be used to update the subsequent binding - `dstBinding+1` starting at array element zero. If a binding has a `descriptorCount` of zero, it is skipped. This behavior applies recursively, with the update affecting consecutive bindings as needed to update all `descriptorCount` descriptors. Consecutive bindings **must** have identical `VkDescriptorType`, `VkShaderStageFlags`, `VkDescriptorBindingFlagBits`, and immutable samplers references.

Valid Usage

- VUID-VkWriteDescriptorSet-dstBinding-00315
`dstBinding` **must** be less than or equal to the maximum value of `binding` of all `VkDescriptorSetLayoutBinding` structures specified when `dstSet`'s descriptor set layout was created
- VUID-VkWriteDescriptorSet-dstBinding-00316
`dstBinding` **must** be a binding with a non-zero `descriptorCount`
- VUID-VkWriteDescriptorSet-dstBinding-10009
`dstBinding` **must** be a binding with a non-zero `VkDescriptorSetLayoutCreateInfo::bindingCount`
- VUID-VkWriteDescriptorSet-descriptorCount-00317
All consecutive bindings updated via a single `VkWriteDescriptorSet` structure, except those with a `descriptorCount` of zero, **must** have identical `descriptorType`
- VUID-VkWriteDescriptorSet-descriptorCount-10776
All consecutive bindings updated via a single `VkWriteDescriptorSet` structure, except those with a `descriptorCount` of zero, **must** have identical `stageFlags`
- VUID-VkWriteDescriptorSet-descriptorCount-00318
All consecutive bindings updated via a single `VkWriteDescriptorSet` structure, except those with a `descriptorCount` of zero, **must** all either use immutable samplers or **must** all not use immutable samplers
- VUID-VkWriteDescriptorSet-descriptorCount-10777
All consecutive bindings updated via a single `VkWriteDescriptorSet` structure, except those with a `descriptorCount` of zero, **must** have identical `VkDescriptorBindingFlagBits`
- VUID-VkWriteDescriptorSet-descriptorType-00319
`descriptorType` **must** match the type of `dstBinding` within `dstSet`
- VUID-VkWriteDescriptorSet-dstSet-00320

`dstSet` **must** be a valid `VkDescriptorSet` handle

- VUID-VkWriteDescriptorSet-dstArrayElement-00321

The sum of `dstArrayElement` and `descriptorCount` **must** be less than or equal to the number of array elements in the descriptor set binding specified by `dstBinding`, and all applicable consecutive bindings

- VUID-VkWriteDescriptorSet-descriptorType-02994

If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`, each element of `pTexelBufferView` **must** be either a valid `VkBufferView` handle or `VK_NULL_HANDLE`

- VUID-VkWriteDescriptorSet-descriptorType-02995

If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` and the `nullDescriptor` feature is not enabled, each element of `pTexelBufferView` **must** not be `VK_NULL_HANDLE`

- VUID-VkWriteDescriptorSet-descriptorType-00324

If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`, `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`, `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, `pBufferInfo` **must** be a valid pointer to an array of `descriptorCount` valid `VkDescriptorBufferInfo` structures

- VUID-VkWriteDescriptorSet-descriptorType-00325

If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLER` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and `dstSet` was not allocated with a layout that included immutable samplers for `dstBinding` with `descriptorType`, the `sampler` member of each element of `pImageInfo` **must** be a valid `VkSampler` object

- VUID-VkWriteDescriptorSet-descriptorType-02996

If `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, or `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, the `imageView` member of each element of `pImageInfo` **must** be either a valid `VkImageView` handle or `VK_NULL_HANDLE`

- VUID-VkWriteDescriptorSet-descriptorType-02997

If `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, or `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, and the `nullDescriptor` feature is not enabled, the `imageView` member of each element of `pImageInfo` **must** not be `VK_NULL_HANDLE`

- VUID-VkWriteDescriptorSet-descriptorType-07683

If `descriptorType` is `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, the `imageView` member of each element of `pImageInfo` **must** not be `VK_NULL_HANDLE`

- VUID-VkWriteDescriptorSet-descriptorType-01946

If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, then the `imageView` member of each `pImageInfo` element **must** have been created without a `VkSamplerYcbcrConversionInfo` structure in its `pNext` chain

- VUID-VkWriteDescriptorSet-descriptorType-02738

If `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and if any element of `pImageInfo` has an `imageView` member that was created with a `VkSamplerYcbcrConversionInfo` structure in its `pNext` chain, then `dstSet` **must** have been

allocated with a layout that included immutable samplers for `dstBinding`, and the corresponding immutable sampler **must** have been created with an `identically defined` `VkSamplerYcbcrConversionInfo` object

- VUID-VkWriteDescriptorSet-descriptorType-01948

If `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and `dstSet` was allocated with a layout that included immutable samplers for `dstBinding`, then the `imageView` member of each element of `pImageInfo` which corresponds to an immutable sampler that enables `sampler Y'CBCR conversion` **must** have been created with a `VkSamplerYcbcrConversionInfo` structure in its `pNext` chain with an `identically defined` `VkSamplerYcbcrConversionInfo` to the corresponding immutable sampler

- VUID-VkWriteDescriptorSet-descriptorType-09506

If `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `dstSet` was allocated with a layout that included immutable samplers for `dstBinding`, and those samplers enable `sampler Y'CBCR conversion`, then `imageView` **must** not be `VK_NULL_HANDLE`

- VUID-VkWriteDescriptorSet-descriptorType-00327

If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, the `offset` member of each element of `pBufferInfo` **must** be a multiple of `VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment`

- VUID-VkWriteDescriptorSet-descriptorType-00328

If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, the `offset` member of each element of `pBufferInfo` **must** be a multiple of `VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment`

- VUID-VkWriteDescriptorSet-descriptorType-00329

If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`, `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`, or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, and the `buffer` member of any element of `pBufferInfo` is the handle of a non-sparse buffer, then that buffer **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-VkWriteDescriptorSet-descriptorType-00330

If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, the `buffer` member of each element of `pBufferInfo` **must** have been created with `VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT` set

- VUID-VkWriteDescriptorSet-descriptorType-00331

If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, the `buffer` member of each element of `pBufferInfo` **must** have been created with `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` set

- VUID-VkWriteDescriptorSet-descriptorType-00332

If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, the `range` member of each element of `pBufferInfo`, or the `effective range` if `range` is `VK_WHOLE_SIZE`, **must** be less than or equal to `VkPhysicalDeviceLimits::maxUniformBufferRange`

- VUID-VkWriteDescriptorSet-descriptorType-00333

If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, the `range` member of each element of `pBufferInfo`, or the `effective range` if `range` is `VK_WHOLE_SIZE`, **must** be less than or equal to `VkPhysicalDeviceLimits::maxStorageBufferRange`

- VUID-VkWriteDescriptorSet-descriptorType-08765

If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`, the `pTexelBufferView` `buffer view usage` **must** include `VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT`

- VUID-VkWriteDescriptorSet-descriptorType-08766

If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`, the `pTexelBufferView` `buffer view usage` **must** include `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT`

- VUID-VkWriteDescriptorSet-descriptorType-00336

If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, the `imageView` member of each element of `pImageInfo` **must** have been created with the `identity swizzle`

- VUID-VkWriteDescriptorSet-descriptorType-00337

If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, the `imageView` member of each element of `pImageInfo` **must** have been created with `VK_IMAGE_USAGE_SAMPLED_BIT` set

- VUID-VkWriteDescriptorSet-descriptorType-04149

If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` the `imageLayout` member of each element of `pImageInfo` **must** be a member of the list given in `Sampled Image`

- VUID-VkWriteDescriptorSet-descriptorType-04150

If `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` the `imageLayout` member of each element of `pImageInfo` **must** be a member of the list given in `Combined Image Sampler`

- VUID-VkWriteDescriptorSet-descriptorType-04151

If `descriptorType` is `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` the `imageLayout` member of each element of `pImageInfo` **must** be a member of the list given in `Input Attachment`

- VUID-VkWriteDescriptorSet-descriptorType-04152

If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` the `imageLayout` member of each element of `pImageInfo` **must** be a member of the list given in `Storage Image`

- VUID-VkWriteDescriptorSet-descriptorType-00338

If `descriptorType` is `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, the `imageView` member of each element of `pImageInfo` **must** have been created with `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` set

- VUID-VkWriteDescriptorSet-descriptorType-00339

If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, the `imageView` member of each element of `pImageInfo` **must** have been created with `VK_IMAGE_USAGE_STORAGE_BIT` set

- VUID-VkWriteDescriptorSet-descriptorType-02752

If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLER`, then `dstSet` **must** not have been allocated with a layout that included immutable samplers for `dstBinding`

Valid Usage (Implicit)

- VUID-VkWriteDescriptorSet-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET`
- VUID-VkWriteDescriptorSet-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkWriteDescriptorSet-descriptorType-parameter
`descriptorType` **must** be a valid `VkDescriptorType` value
- VUID-VkWriteDescriptorSet-descriptorCount-arraylength
`descriptorCount` **must** be greater than `0`
- VUID-VkWriteDescriptorSet-commonparent
Both of `dstSet`, and the elements of `pTexelBufferView` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

The type of descriptors in a descriptor set is specified by `VkWriteDescriptorSet::descriptorType`, which **must** be one of the values:

```
// Provided by VK_VERSION_1_0
typedef enum VkDescriptorType {
    VK_DESCRIPTOR_TYPE_SAMPLER = 0,
    VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER = 1,
    VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE = 2,
    VK_DESCRIPTOR_TYPE_STORAGE_IMAGE = 3,
    VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER = 4,
    VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER = 5,
    VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER = 6,
    VK_DESCRIPTOR_TYPE_STORAGE_BUFFER = 7,
    VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC = 8,
    VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC = 9,
    VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT = 10,
} VkDescriptorType;
```

- `VK_DESCRIPTOR_TYPE_SAMPLER` specifies a `sampler descriptor`.
- `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` specifies a `combined image sampler descriptor`.
- `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` specifies a `sampled image descriptor`.
- `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` specifies a `storage image descriptor`.
- `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` specifies a `uniform texel buffer descriptor`.
- `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` specifies a `storage texel buffer descriptor`.
- `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` specifies a `uniform buffer descriptor`.
- `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` specifies a `storage buffer descriptor`.
- `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` specifies a `dynamic uniform buffer descriptor`.
- `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` specifies a `dynamic storage buffer descriptor`.

- `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` specifies an [input attachment descriptor](#).

When a descriptor set is updated via elements of `VkWriteDescriptorSet`, members of `pImageInfo`, `pBufferInfo` and `pTexelBufferView` are only accessed by the implementation when they correspond to descriptor type being defined - otherwise they are ignored. The members accessed are as follows for each descriptor type:

- For `VK_DESCRIPTOR_TYPE_SAMPLER`, only the `sampler` member of each element of `VkWriteDescriptorSet::pImageInfo` is accessed.
- For `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, only the `imageView` and `imageLayout` members of each element of `VkWriteDescriptorSet::pImageInfo` are accessed.
- For `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, all members of each element of `VkWriteDescriptorSet::pImageInfo` are accessed.
- For `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`, `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`, `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, all members of each element of `VkWriteDescriptorSet::pBufferInfo` are accessed.
- For `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`, each element of `VkWriteDescriptorSet::pTexelBufferView` is accessed.

The `VkDescriptorBufferInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorBufferInfo {
    VkBuffer      buffer;
    VkDeviceSize  offset;
    VkDeviceSize  range;
} VkDescriptorBufferInfo;
```

- `buffer` is `VK_NULL_HANDLE` or the buffer resource.
- `offset` is the offset in bytes from the start of `buffer`. Access to buffer memory via this descriptor uses addressing that is relative to this starting offset.
- `range` is the size in bytes that is used for this descriptor update, or `VK_WHOLE_SIZE` to use the range from `offset` to the end of the buffer.

NOTE

When setting `range` to `VK_WHOLE_SIZE`, the [effective range](#) **must** not be larger than the maximum range for the descriptor type (`maxUniformBufferRange` or `maxStorageBufferRange`). This means that `VK_WHOLE_SIZE` is not typically useful in the common case where uniform buffer descriptors are suballocated from a buffer that is much larger than `maxUniformBufferRange`.

For `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` and `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` descriptor types, `offset` is the base offset from which the dynamic offset is applied and `range` is the static size used for all dynamic offsets.

When `range` is `VK_WHOLE_SIZE` the effective range is calculated at `vkUpdateDescriptorSets` is by taking

the size of `buffer` minus the `offset`.

Valid Usage

- VUID-VkDescriptorBufferInfo-offset-00340
`offset` **must** be less than the size of `buffer`
- VUID-VkDescriptorBufferInfo-range-00341
If `range` is not equal to `VK_WHOLE_SIZE`, `range` **must** be greater than 0
- VUID-VkDescriptorBufferInfo-range-00342
If `range` is not equal to `VK_WHOLE_SIZE`, `range` **must** be less than or equal to the size of `buffer` minus `offset`
- VUID-VkDescriptorBufferInfo-buffer-02998
If the `nullDescriptor` feature is not enabled, `buffer` **must** not be `VK_NULL_HANDLE`
- VUID-VkDescriptorBufferInfo-buffer-02999
If `buffer` is `VK_NULL_HANDLE`, `offset` **must** be zero and `range` **must** be `VK_WHOLE_SIZE`

Valid Usage (Implicit)

- VUID-VkDescriptorBufferInfo-buffer-parameter
If `buffer` is not `VK_NULL_HANDLE`, `buffer` **must** be a valid `VkBuffer` handle

The `VkDescriptorImageInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorImageInfo {
    VkSampler      sampler;
    VkImageView    imageView;
    VkImageLayout  imageLayout;
} VkDescriptorImageInfo;
```

- `sampler` is a sampler handle, and is used in descriptor updates for types `VK_DESCRIPTOR_TYPE_SAMPLER` and `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` if the binding being updated does not use immutable samplers.
- `imageView` is `VK_NULL_HANDLE` or an image view handle, and is used in descriptor updates for types `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`.
- `imageLayout` is the layout that the image subresources accessible from `imageView` will be in at the time this descriptor is accessed. `imageLayout` is used in descriptor updates for types `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`.

Members of `VkDescriptorImageInfo` that are not used in an update (as described above) are ignored.

Valid Usage

- VUID-VkDescriptorImageInfo-imageView-06712
`imageView` **must** not be a 2D array image view created from a 3D image
- VUID-VkDescriptorImageInfo-descriptorType-06713
`imageView` **must** not be a 2D view created from a 3D image
- VUID-VkDescriptorImageInfo-descriptorType-06714
`imageView` **must** not be a 2D view created from a 3D image
- VUID-VkDescriptorImageInfo-imageView-01976
If `imageView` is created from a depth/stencil image, the `aspectMask` used to create the `imageView` **must** include either `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT` but not both
- VUID-VkDescriptorImageInfo-imageLayout-09425
If `imageLayout` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`, then the `aspectMask` used to create `imageView` **must** not include either `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`
- VUID-VkDescriptorImageInfo-imageLayout-09426
If `imageLayout` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, then the `aspectMask` used to create `imageView` **must** not include `VK_IMAGE_ASPECT_COLOR_BIT`
- VUID-VkDescriptorImageInfo-sampler-01564
If `sampler` is used and the `VkFormat` of the image is a `multi-planar format`, the image **must** have been created with `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`, and the `aspectMask` of the `imageView` **must** be a valid `multi-planar aspect mask` bit

Valid Usage (Implicit)

- VUID-VkDescriptorImageInfo-commonparent
Both of `imageView`, and `sampler` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

The `VkCopyDescriptorSet` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkCopyDescriptorSet {
    VkStructureType    sType;
    const void*        pNext;
    VkDescriptorSet    srcSet;
    uint32_t           srcBinding;
    uint32_t           srcArrayElement;
    VkDescriptorSet    dstSet;
    uint32_t           dstBinding;
    uint32_t           dstArrayElement;
    uint32_t           descriptorCount;
} VkCopyDescriptorSet;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcSet`, `srcBinding`, and `srcArrayElement` are the source set, binding, and array element, respectively.
- `dstSet`, `dstBinding`, and `dstArrayElement` are the destination set, binding, and array element, respectively.
- `descriptorCount` is the number of descriptors to copy from the source to destination. If `descriptorCount` is greater than the number of remaining array elements in the source or destination binding, those affect consecutive bindings in a manner similar to `VkWriteDescriptorSet` above.

Valid Usage

- VUID-VkCopyDescriptorSet-srcBinding-00345
`srcBinding` **must** be a valid binding within `srcSet`
- VUID-VkCopyDescriptorSet-srcArrayElement-00346
The sum of `srcArrayElement` and `descriptorCount` **must** be less than or equal to the number of array elements in the descriptor set binding specified by `srcBinding`, and all applicable `consecutive bindings`
- VUID-VkCopyDescriptorSet-dstBinding-00347
`dstBinding` **must** be a valid binding within `dstSet`
- VUID-VkCopyDescriptorSet-dstArrayElement-00348
The sum of `dstArrayElement` and `descriptorCount` **must** be less than or equal to the number of array elements in the descriptor set binding specified by `dstBinding`, and all applicable `consecutive bindings`
- VUID-VkCopyDescriptorSet-dstBinding-02632
The type of `dstBinding` within `dstSet` **must** be equal to the type of `srcBinding` within `srcSet`
- VUID-VkCopyDescriptorSet-srcSet-00349
If `srcSet` is equal to `dstSet`, then the source and destination ranges of descriptors **must** not overlap, where the ranges **may** include array elements from `consecutive bindings`

- VUID-VkCopyDescriptorSet-srcSet-01918
If `srcSet`'s layout was created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` flag set, then `dstSet`'s layout **must** also have been created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` flag set
- VUID-VkCopyDescriptorSet-srcSet-04885
If `srcSet`'s layout was created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` flag set, then `dstSet`'s layout **must** have been created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` flag set
- VUID-VkCopyDescriptorSet-srcSet-01920
If the descriptor pool from which `srcSet` was allocated was created with the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` flag set, then the descriptor pool from which `dstSet` was allocated **must** also have been created with the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` flag set
- VUID-VkCopyDescriptorSet-srcSet-04887
If the descriptor pool from which `srcSet` was allocated was created without the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` flag set, then the descriptor pool from which `dstSet` was allocated **must** have been created without the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` flag set
- VUID-VkCopyDescriptorSet-dstBinding-02753
If the descriptor type of the descriptor set binding specified by `dstBinding` is `VK_DESCRIPTOR_TYPE_SAMPLER`, then `dstSet` **must** not have been allocated with a layout that included immutable samplers for `dstBinding`

Valid Usage (Implicit)

- VUID-VkCopyDescriptorSet-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_COPY_DESCRIPTOR_SET`
- VUID-VkCopyDescriptorSet-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkCopyDescriptorSet-srcSet-parameter
`srcSet` **must** be a valid `VkDescriptorSet` handle
- VUID-VkCopyDescriptorSet-dstSet-parameter
`dstSet` **must** be a valid `VkDescriptorSet` handle
- VUID-VkCopyDescriptorSet-commonparent
Both of `dstSet`, and `srcSet` **must** have been created, allocated, or retrieved from the same `VkDevice`

15.2.5. Descriptor Set Binding

To bind one or more descriptor sets to a command buffer, call:

```
// Provided by VK_VERSION_1_0
void vkCmdBindDescriptorSets(
    VkCommandBuffer                commandBuffer,
    VkPipelineBindPoint            pipelineBindPoint,
    VkPipelineLayout               layout,
    uint32_t                      firstSet,
    uint32_t                      descriptorSetCount,
    const VkDescriptorSet*         pDescriptorSets,
    uint32_t                      dynamicOffsetCount,
    const uint32_t*                pDynamicOffsets);
```

- `commandBuffer` is the command buffer that the descriptor sets will be bound to.
- `pipelineBindPoint` is a `VkPipelineBindPoint` indicating the type of the pipeline that will use the descriptors. There is a separate set of bind points for each pipeline type, so binding one does not disturb the others.
- `layout` is a `VkPipelineLayout` object used to program the bindings.
- `firstSet` is the set number of the first descriptor set to be bound.
- `descriptorSetCount` is the number of elements in the `pDescriptorSets` array.
- `pDescriptorSets` is a pointer to an array of handles to `VkDescriptorSet` objects describing the descriptor sets to bind to.
- `dynamicOffsetCount` is the number of dynamic offsets in the `pDynamicOffsets` array.
- `pDynamicOffsets` is a pointer to an array of `uint32_t` values specifying dynamic offsets.

`vkCmdBindDescriptorSets` binds descriptor sets `pDescriptorSets[0..descriptorSetCount-1]` to set numbers `[firstSet..firstSet+descriptorSetCount-1]` for subsequent `bound pipeline commands` set by `pipelineBindPoint`. Any bindings that were previously applied via these sets are no longer valid.

Once bound, a descriptor set affects rendering of subsequent commands that interact with the given pipeline type in the command buffer until either a different set is bound to the same set number, or the set is disturbed as described in [Pipeline Layout Compatibility](#).

A compatible descriptor set **must** be bound for all set numbers that any shaders in a pipeline access, at the time that a drawing or dispatching command is recorded to execute using that pipeline. However, if none of the shaders in a pipeline statically use any bindings with a particular set number, then no descriptor set need be bound for that set number, even if the pipeline layout includes a non-trivial descriptor set layout for that set number.

When consuming a descriptor, a descriptor is considered valid if the descriptor is not undefined as described by [descriptor set allocation](#). If the `nullDescriptor` feature is enabled, a null descriptor is also considered valid. A descriptor that was disturbed by [Pipeline Layout Compatibility](#), or was never bound by `vkCmdBindDescriptorSets` is not considered valid. If a pipeline accesses a descriptor either statically or dynamically depending on the `VkDescriptorBindingFlagBits`, the consuming descriptor type in the pipeline **must** match the `VkDescriptorType` in `VkDescriptorSetLayoutCreateInfo` for the descriptor to be considered valid.

NOTE

Further validation may be carried out beyond validation for descriptor types, e.g. [Texel Input Validation](#).

If any of the sets being bound include dynamic uniform or storage buffers, then `pDynamicOffsets` includes one element for each array element in each dynamic descriptor type binding in each set. Values are taken from `pDynamicOffsets` in an order such that all entries for set N come before set $N+1$; within a set, entries are ordered by the binding numbers in the descriptor set layouts; and within a binding array, elements are in order. `dynamicOffsetCount` **must** equal the total number of dynamic descriptors in the sets being bound.

The effective offset used for dynamic uniform and storage buffer bindings is the sum of the relative offset taken from `pDynamicOffsets`, and the base address of the buffer plus base offset in the descriptor set. The range of the dynamic uniform and storage buffer bindings is the buffer range as specified in the descriptor set.

Each of the `pDescriptorSets` **must** be compatible with the pipeline layout specified by `layout`. The layout used to program the bindings **must** also be compatible with the pipeline used in subsequent [bound pipeline commands](#) with that pipeline type, as defined in the [Pipeline Layout Compatibility](#) section.

The descriptor set contents bound by a call to `vkCmdBindDescriptorSets` **may** be consumed at the following times:

- For descriptor bindings created with the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` bit set, the contents **may** be consumed when the command buffer is submitted to a queue, or during shader execution of the resulting draws and dispatches, or any time in between. Otherwise,
- during host execution of the command, or during shader execution of the resulting draws and dispatches, or any time in between.

Thus, the contents of a descriptor set binding **must** not be altered (overwritten by an update command, or freed) between the first point in time that it **may** be consumed, and when the command completes executing on the queue.

The contents of `pDynamicOffsets` are consumed immediately during execution of `vkCmdBindDescriptorSets`. Once all pending uses have completed, it is legal to update and reuse a descriptor set.

Valid Usage

- VUID-vkCmdBindDescriptorSets-pDescriptorSets-00358
Each element of `pDescriptorSets` **must** have been allocated with a `VkDescriptorSetLayout` that matches (is the same as, or identically defined as) the `VkDescriptorSetLayout` at set n in `layout`, where n is the sum of `firstSet` and the index into `pDescriptorSets`
- VUID-vkCmdBindDescriptorSets-dynamicOffsetCount-00359
`dynamicOffsetCount` **must** be equal to the total number of dynamic descriptors in `pDescriptorSets`
- VUID-vkCmdBindDescriptorSets-firstSet-00360

The sum of `firstSet` and `descriptorSetCount` **must** be less than or equal to `VkPipelineLayoutCreateInfo::setLayoutCount` provided when `layout` was created

- VUID-vkCmdBindDescriptorSets-pDynamicOffsets-01971
Each element of `pDynamicOffsets` which corresponds to a descriptor binding with type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` **must** be a multiple of `VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment`
- VUID-vkCmdBindDescriptorSets-pDynamicOffsets-01972
Each element of `pDynamicOffsets` which corresponds to a descriptor binding with type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` **must** be a multiple of `VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment`
- VUID-vkCmdBindDescriptorSets-pDescriptorSets-01979
For each dynamic uniform or storage buffer binding in `pDescriptorSets`, the sum of the `effective offset` and the range of the binding **must** be less than or equal to the size of the buffer
- VUID-vkCmdBindDescriptorSets-pDescriptorSets-06715
For each dynamic uniform or storage buffer binding in `pDescriptorSets`, if the range was set with `VK_WHOLE_SIZE` then `pDynamicOffsets` which corresponds to the descriptor binding **must** be 0
- VUID-vkCmdBindDescriptorSets-pDescriptorSets-06563
Each element of `pDescriptorSets` **must** be a valid `VkDescriptorSet`
- VUID-vkCmdBindDescriptorSets-pipelineBindPoint-00361
`pipelineBindPoint` **must** be supported by the `commandBuffer`'s parent `VkCommandPool`'s queue family

Valid Usage (Implicit)

- VUID-vkCmdBindDescriptorSets-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdBindDescriptorSets-pipelineBindPoint-parameter
`pipelineBindPoint` **must** be a valid `VkPipelineBindPoint` value
- VUID-vkCmdBindDescriptorSets-layout-parameter
`layout` **must** be a valid `VkPipelineLayout` handle
- VUID-vkCmdBindDescriptorSets-pDescriptorSets-parameter
`pDescriptorSets` **must** be a valid pointer to an array of `descriptorSetCount` valid or `VK_NULL_HANDLE` `VkDescriptorSet` handles
- VUID-vkCmdBindDescriptorSets-pDynamicOffsets-parameter
If `dynamicOffsetCount` is not 0, `pDynamicOffsets` **must** be a valid pointer to an array of `dynamicOffsetCount` `uint32_t` values
- VUID-vkCmdBindDescriptorSets-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdBindDescriptorSets-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support

VK_QUEUE_COMPUTE_BIT, or VK_QUEUE_GRAPHICS_BIT operations

- VUID-vkCmdBindDescriptorSets-descriptorSetCount-arraylength
descriptorSetCount **must** be greater than 0

- VUID-vkCmdBindDescriptorSets-commonparent

Each of commandBuffer, layout, and the elements of pDescriptorSets that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT	State

15.2.6. Push Constant Updates

As described above in section [Pipeline Layouts](#), the pipeline layout defines shader push constants which are updated via Vulkan commands rather than via writes to memory or copy commands.

NOTE

Push constants represent a high speed path to modify constant data in pipelines that is expected to outperform memory-backed resource updates.

To update push constants, call:

```
// Provided by VK_VERSION_1_0
void vkCmdPushConstants(
    VkCommandBuffer          commandBuffer,
    VkPipelineLayout         layout,
    VkShaderStageFlags       stageFlags,
    uint32_t                 offset,
    uint32_t                 size,
    const void*              pValues);
```

- `commandBuffer` is the command buffer in which the push constant update will be recorded.
- `layout` is the pipeline layout used to program the push constant updates.
- `stageFlags` is a bitmask of `VkShaderStageFlagBits` specifying the shader stages that will use the push constants in the updated range.
- `offset` is the start offset of the push constant range to update, in units of bytes.
- `size` is the size of the push constant range to update, in units of bytes.
- `pValues` is a pointer to an array of `size` bytes containing the new push constant values.

When a command buffer begins recording, all push constant values are undefined.

Push constant values **can** be updated incrementally, causing shader stages in `stageFlags` to read the new data from `pValues` for push constants modified by this command, while still reading the previous data for push constants not modified by this command. When a `bind pipeline command` is issued, the bound pipeline's layout **must** be compatible with the layouts used to set the values of all push constants in the pipeline layout's push constant ranges, as described in [Pipeline Layout Compatibility](#). Binding a pipeline with a layout that is not compatible with the push constant layout does not disturb the push constant values.

NOTE

As `stageFlags` needs to include all flags the relevant push constant ranges were created with, any flags that are not supported by the queue family that the `VkCommandPool` used to allocate `commandBuffer` was created on are ignored.

Valid Usage

- VUID-vkCmdPushConstants-offset-01795
For each byte in the range specified by `offset` and `size` and for each shader stage in `stageFlags`, there **must** be a push constant range in `layout` that includes that byte and that stage
- VUID-vkCmdPushConstants-offset-01796
For each byte in the range specified by `offset` and `size` and for each push constant range that overlaps that byte, `stageFlags` **must** include all stages in that push constant range's `VkPushConstantRange::stageFlags`
- VUID-vkCmdPushConstants-offset-00368
`offset` **must** be a multiple of 4
- VUID-vkCmdPushConstants-size-00369
`size` **must** be a multiple of 4
- VUID-vkCmdPushConstants-offset-00370
`offset` **must** be less than `VkPhysicalDeviceLimits::maxPushConstantsSize`
- VUID-vkCmdPushConstants-size-00371
`size` **must** be less than or equal to `VkPhysicalDeviceLimits::maxPushConstantsSize` minus `offset`

Valid Usage (Implicit)

- VUID-vkCmdPushConstants-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdPushConstants-layout-parameter
`layout` **must** be a valid `VkPipelineLayout` handle
- VUID-vkCmdPushConstants-stageFlags-parameter
`stageFlags` **must** be a valid combination of `VkShaderStageFlagBits` values
- VUID-vkCmdPushConstants-stageFlags-requiredbitmask
`stageFlags` **must** not be `0`
- VUID-vkCmdPushConstants-pValues-parameter
`pValues` **must** be a valid pointer to an array of `size` bytes
- VUID-vkCmdPushConstants-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdPushConstants-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, or `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdPushConstants-size-arraylength
`size` **must** be greater than `0`
- VUID-vkCmdPushConstants-commonparent
Both of `commandBuffer`, and `layout` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT	State

15.3. Physical Storage Buffer Access

Buffer device addresses **can** also be used to access buffer memory in a shader, using the `SPV_KHR_physical_storage_buffer` extension and the `PhysicalStorageBuffer` storage class. For example, this value **can** be stored in a uniform buffer, and the shader **can** read the value from the uniform buffer and use it to do a dependent read/write to this buffer. All loads, stores, and atomics in a shader through `PhysicalStorageBuffer` pointers **must** access addresses in the address range of some buffer.

Chapter 16. Shader Interfaces

When a pipeline is created, the set of shaders specified in the corresponding `VkPipelineCreateInfo` structure are implicitly linked at a number of different interfaces.

- [Shader Input and Output Interface](#)
- [Vertex Input Interface](#)
- [Fragment Output Interface](#)
- [Fragment Input Attachment Interface](#)
- [Shader Resource Interface](#)

In Vulkan SC, the pipeline compilation process occurs [offline](#) using the implementation-provided pipeline cache compiler. The set of shaders being used to create a pipeline **can** be specified using the pipeline JSON schema.

This chapter describes valid uses for a set of SPIR-V decorations. Any other use of one of these decorations is invalid, with the exception that, when using SPIR-V versions 1.4 and earlier: `Block`, `BufferBlock`, `Offset`, `ArrayStride`, and `MatrixStride` can also decorate types and type members used by variables in the `Private` and `Function` storage classes.

NOTE

In this chapter, there are references to SPIR-V terms such as the `MeshNV` execution model. These terms will appear even in a build of the specification which does not support any extensions. This is as intended, since these terms appear in the unified SPIR-V specification without such qualifiers.

16.1. Shader Input and Output Interfaces

When multiple stages are present in a pipeline, the outputs of one stage form an interface with the inputs of the next stage. When such an interface involves a shader, shader outputs are matched against the inputs of the next stage, and shader inputs are matched against the outputs of the previous stage.

All the variables forming the shader input and output *interfaces* are listed as operands to the `OpEntryPoint` instruction and are declared with the `Input` or `Output` storage classes, respectively, in the SPIR-V module. These generally form the interfaces between consecutive shader stages, regardless of any non-shader stages between the consecutive shader stages.

There are two classes of variables that **can** be matched between shader stages, built-in variables and user-defined variables. Each class has a different set of matching criteria.

`Output` variables of a shader stage have undefined values until the shader writes to them or uses the `Initializer` operand when declaring the variable.

For compute shaders, the input interface is formed by the built-in interface. The output interface is empty.

16.1.1. Built-In Interface Block

Shader **built-in** variables meeting the following requirements define the *built-in interface block*. They **must**

- be explicitly declared (there are no implicit built-ins),
- be identified with a **BuiltIn** decoration,
- form object types as described in the **Built-in Variables** section, and
- be declared in a block whose top-level members are the built-ins.

There **must** be no more than one built-in interface block per shader per interface .

Built-ins **must** not have any **Location** or **Component** decorations.

16.1.2. User-Defined Variable Interface

The non-built-in variables listed by **OpEntryPoint** with the **Input** or **Output** storage class form the *user-defined variable interface*. These **must** have **numeric type** or, recursively, composite types of such types. If an implementation supports **storageInputOutput16**, components **can** have a width of 16 bits. These variables **must** be identified with a **Location** decoration and **can** also be identified with a **Component** decoration.

16.1.3. Interface Matching

An output variable, block, or structure member in a given shader stage has an interface match with an input variable, block, or structure member in a subsequent shader stage if they both adhere to the following conditions:

- They have equivalent decorations, other than:
 - one is not decorated with **Component** and the other is declared with a **Component** of 0
 - **Interpolation decorations**
 - **RelaxedPrecision** if one is an input variable and the other an output variable
- Their types match as follows:
 - if the input is declared in a tessellation control or geometry shader as an **OpTypeArray** with an **Element Type** equivalent to the **OpType*** declaration of the output, and neither is a structure member; or
 - if in any other case they are declared with an equivalent **OpType*** declaration.
- If both are structures and every member has an interface match.

NOTE

The word “structure” above refers to both variables that have an **OpTypeStruct** type and interface blocks (which are also declared as **OpTypeStruct**).

All input variables and blocks **must** have an interface match in the preceding shader stage, except for built-in variables in fragment shaders. Shaders **can** declare and write to output variables that are not declared or read by the subsequent stage.

The value of an input variable is undefined if the preceding stage does not write to a matching output variable, as described above.

16.1.4. Location and Component Assignment

User-defined variables in interfaces between shader stages in the graphics pipeline consume a unique set of Location and Component values.

Available space for user-defined interface variables is partitioned into a number of 32-bit four-component vectors, each identified by a Location value. Each individual 32-bit component of a vector is then further identified by a Component value.

16-bit scalar or vector values consume one Component slot per 16-bit component and **must** be specified within a single Location. 32-bit scalar or vector values consume one Component slot per 32-bit component and **must** be specified within a single Location. 64-bit scalar or vector values consume two consecutive Component slots per 64-bit component from up to two consecutive Location slots.

For any shader interface variable where one level of the array is disregarded for type matching, the outer array level is also disregarded when assigning Location slots.

An array of size n with elements consuming l Location slots each will consume $l \times n$ Location slots. Each element of the array will consume Component slots in each Location slot identically to a declaration using the element type.

Matrices of size $n \times m$ are assigned locations identically to arrays of size n of vectors of length 4 (consuming all Component slots) with an identical element type.

When a variable with a structure type is decorated with a Location, the members in the structure type **must** not be decorated with a Location. The variable's members are assigned consecutive locations in declaration order, starting from the first member, which is assigned the location decoration from the variable. The Location slots consumed by structure members are determined by applying the rules above in a depth-first traversal of the instantiated members as though the structure or block member were declared as an input or output variable of the same type.

A variable with a structure type that is not decorated with Block **must** be decorated with a Location.

When a variable with a structure type decorated with Block is declared without a Location decoration, each member in the structure **must** be decorated with a Location. Types nested deeper than the top-level members **must** not have Location decorations.

Multiple variable declarations in the same storage class **must** not have overlapping Component slots within the same Location.

The number of input and output locations available for a shader input or output interface depend on the shader stage as described in Shader Input and Output Locations. All variables in both the built-in interface block and the user-defined variable interface count against these limits. Each effective Location **must** have a value less than the number of Location slots available for the given interface, as specified in the "Locations Available" column in Shader Input and Output Locations.

Table 16. Shader Input and Output Locations

Shader Interface	Locations Available
vertex input	<code>maxVertexInputAttributes</code>
vertex output	<code>maxVertexOutputComponents</code> / 4
tessellation control input	<code>maxTessellationControlPerVertexInputComponents</code> / 4
tessellation control output	<code>maxTessellationControlPerVertexOutputComponents</code> / 4
tessellation evaluation input	<code>maxTessellationEvaluationInputComponents</code> / 4
tessellation evaluation output	<code>maxTessellationEvaluationOutputComponents</code> / 4
geometry input	<code>maxGeometryInputComponents</code> / 4
geometry output	<code>maxGeometryOutputComponents</code> / 4
fragment input	<code>maxFragmentInputComponents</code> / 4
fragment output	<code>maxFragmentOutputAttachments</code>

16.2. Vertex Input Interface

When the vertex stage is present in a pipeline, the vertex shader input variables form an interface with the vertex input attributes. The vertex shader input variables are matched by the `Location` and `Component` decorations to the vertex input attributes specified in the `pVertexInputState` member of the `VkGraphicsPipelineCreateInfo` structure.

The vertex shader input variables listed by `OpEntryPoint` with the `Input` storage class form the *vertex input interface*. These variables **must** be identified with a `Location` decoration and **can** also be identified with a `Component` decoration.

For the purposes of interface matching: variables declared without a `Component` decoration are considered to have a `Component` decoration of zero. The number of available vertex input `Location` slots is given by the `maxVertexInputAttributes` member of the `VkPhysicalDeviceLimits` structure.

See [Attribute Location and Component Assignment](#) for details.

All vertex shader inputs declared as above **must** have a corresponding attribute and binding in the pipeline.

Components and locations are consumed as defined for [Location and Component Assignment](#). Multiple [user-defined input variable](#) declarations **must** not have overlapping `Component` slots within the same `Location`.

16.3. Fragment Output Interface

When the fragment stage is present in a pipeline, the fragment shader outputs form an interface with the output attachments defined by a [render pass instance](#). The fragment shader output variables are matched by the `Location` and `Component` decorations to specified color attachments.

The fragment shader output variables listed by `OpEntryPoint` with the `Output` storage class form the *fragment output interface*. These variables **must** be identified with a `Location` decoration. They **can** also be identified with a `Component` decoration and/or an `Index` decoration. For the purposes of interface matching: variables declared without a `Component` decoration are considered to have a `Component` decoration of zero, and variables declared without an `Index` decoration are considered to have an `Index` decoration of zero.

A fragment shader output variable identified with a `Location` decoration of i is associated with the color attachment indicated by `VkSubpassDescription::pColorAttachments[i]`. Values are written to those attachments after passing through the blending unit as described in [Blending](#), if enabled. The number of available fragment output `Location` slots is given by the `maxFragmentOutputAttachments` member of the `VkPhysicalDeviceLimits` structure.

When an active fragment shader invocation finishes, the values of all fragment shader outputs are copied out and used as blend inputs or color attachments writes. If the invocation does not set a value for them, the input values to those blending or color attachment writes are undefined. If there is no color attachment indicated by `Location`, the values that would have been written to the color attachments are discarded.

Output `Component` words identified as 0, 1, 2, and 3 will be directed to the R, G, B, and A inputs to the blending unit, respectively, or to the output attachment if blending is disabled. If two variables are placed within the same `Location`, they **must** have the same underlying type (floating-point or integer). `Component` words which do not correspond to any fragment shader output will also result in undefined values for blending or color attachment writes.

Fragment outputs identified with an `Index` of zero are directed to the first input of the blending unit associated with the corresponding `Location`. Outputs identified with an `Index` of one are directed to the second input of the corresponding blending unit.

Components and locations are consumed as defined for [Location and Component Assignment](#). Output variable declarations **must** not consume any of the same `Component` slots within the same `Location` and with the same `Index` value as any other output variable declaration.

Output values written by a fragment shader **must** be declared with either `OpTypeFloat` or `OpTypeInt`, and a `Width` of 32. If `storageInputOutput16` is supported, output values written by a fragment shader **can** be also declared with either `OpTypeFloat` or `OpTypeInt` and a `Width` of 16. Composites of these types are also permitted. If the color attachment has a signed or unsigned normalized fixed-point format, color values are assumed to be floating-point and are converted to fixed-point as described in [Conversion From Floating-Point to Normalized Fixed-Point](#); If the color attachment has an integer format, color values are assumed to be integers and converted to the bit-depth of the target. Any value that cannot be represented in the attachment's format is undefined. For any other attachment format no conversion is performed. If the type of the values written by the fragment shader do not match the format of the corresponding color attachment, the resulting values are undefined for those components.

16.4. Fragment Input Attachment Interface

When a fragment stage is present in a pipeline, the fragment shader subpass inputs form an interface with the input attachments of the current subpass. The fragment shader subpass input

variables are matched by `InputAttachmentIndex` decorations to the input attachments specified in the `pInputAttachments` array of the `VkSubpassDescription` structure describing the subpass that the fragment shader is executed in.

The fragment shader subpass input variables with the `UniformConstant` storage class and a decoration of `InputAttachmentIndex` that are statically used by `OpEntryPoint` form the *fragment input attachment interface*. These variables **must** be declared with a type of `OpTypeImage`, a `Dim` operand of `SubpassData`, an `Arrayed` operand of 0, and a `Sampled` operand of 2. The `MS` operand of the `OpTypeImage` **must** be 0 if the `samples` field of the corresponding `VkAttachmentDescription` is `VK_SAMPLE_COUNT_1_BIT` and 1 otherwise.

A subpass input variable identified with an `InputAttachmentIndex` decoration of *i* reads from the input attachment indicated by `pInputAttachments[i]` member of `VkSubpassDescription`. If the subpass input variable is declared as an array of size *N*, it consumes *N* consecutive input attachments, starting with the index specified. There **must** not be more than one input variable with the same `InputAttachmentIndex` whether explicitly declared or implied by an array declaration per image aspect. A multi-aspect image (e.g. a depth/stencil format) **can** use the same input variable. The number of available input attachment indices is given by the `maxPerStageDescriptorInputAttachments` member of the `VkPhysicalDeviceLimits` structure.

Variables identified with the `InputAttachmentIndex` **must** only be used by a fragment stage. The `numeric format` of the subpass input **must** match the format of the corresponding input attachment, or the values of subpass loads from these variables are undefined. If the framebuffer attachment contains both depth and stencil aspects, the numeric format of the subpass input determines if depth or stencil aspect is accessed by the shader.

See [Input Attachment](#) for more details.

16.4.1. Fragment Input Attachment Compatibility

An input attachment that is statically accessed by a fragment shader **must** be backed by a descriptor that is equivalent to the `VkImageView` in the `VkFramebuffer`, except for `subresourceRange.aspectMask`. The `aspectMask` **must** be equal to the aspect accessed by the shader.

16.5. Shader Resource Interface

When a shader stage accesses buffer or image resources, as described in the [Resource Descriptors](#) section, the shader resource variables **must** be matched with the [pipeline layout](#) that is provided at pipeline creation time.

The set of shader variables that form the *shader resource interface* for a stage are the variables statically used by that stage's `OpEntryPoint` with a storage class of `Uniform`, `UniformConstant`, `StorageBuffer`, or `PushConstant`. For the fragment shader, this includes the [fragment input attachment interface](#).

The shader resource interface consists of two sub-interfaces: the push constant interface and the descriptor set interface.

16.5.1. Push Constant Interface

The shader variables defined with a storage class of **PushConstant** that are statically used by the shader entry points for the pipeline define the *push constant interface*. They **must** be:

- typed as **OpTypeStruct**,
- identified with a **Block** decoration, and
- laid out explicitly using the **Offset**, **ArrayStride**, and **MatrixStride** decorations as specified in [Offset and Stride Assignment](#).

There **must** be no more than one push constant block statically used per shader entry point.

Each statically used member of a push constant block **must** be placed at an **Offset** such that the entire member is entirely contained within the **VkPushConstantRange** for each **OpEntryPoint** that uses it, and the **stageFlags** for that range **must** specify the appropriate **VkShaderStageFlagBits** for that stage. The **Offset** decoration for any member of a push constant block **must** not cause the space required for that member to extend outside the range [0, **maxPushConstantsSize**).

Any member of a push constant block that is declared as an array **must** only be accessed with *dynamically uniform* indices.

16.5.2. Descriptor Set Interface

The *descriptor set interface* is comprised of the shader variables with the storage class of **StorageBuffer**, **Uniform** or **UniformConstant** (including the variables in the [fragment input attachment interface](#)) that are statically used by the shader entry points for the pipeline.

These variables **must** have **DescriptorSet** and **Binding** decorations specified, which are assigned and matched with the **VkDescriptorSetLayout** objects in the pipeline layout as described in [DescriptorSet and Binding Assignment](#).

The **Image Format** of an **OpTypeImage** declaration **must** not be **Unknown**, for variables which are used for **OpImageRead**, **OpImageSparseRead**, or **OpImageWrite** operations, except under the following conditions:

- For **OpImageWrite**, if the image format is listed in the [storage without format](#) list and if the **shaderStorageImageWriteWithoutFormat** feature is enabled and the shader module declares the **StorageImageWriteWithoutFormat** capability.
- For **OpImageRead** or **OpImageSparseRead**, if the image format is listed in the [storage without format](#) list and if the **shaderStorageImageReadWithoutFormat** feature is enabled and the shader module declares the **StorageImageReadWithoutFormat** capability.
- For **OpImageRead**, if **Dim** is **SubpassData** (indicating a read from an input attachment).

The **Image Format** of an **OpTypeImage** declaration **must** not be **Unknown**, for variables which are used for **OpAtomic*** operations.

Variables identified with the **Uniform** storage class are used to access transparent buffer backed resources. Such variables **must** be:

- typed as `OpTypeStruct`, or an array of this type,
- identified with a `Block` or `BufferBlock` decoration, and
- laid out explicitly using the `Offset`, `ArrayStride`, and `MatrixStride` decorations as specified in [Offset and Stride Assignment](#).

Variables identified with the `StorageBuffer` storage class are used to access transparent buffer backed resources. Such variables **must** be:

- typed as `OpTypeStruct`, or an array of this type,
- identified with a `Block` decoration, and
- laid out explicitly using the `Offset`, `ArrayStride`, and `MatrixStride` decorations as specified in [Offset and Stride Assignment](#).

The `Offset` decoration for any member of a `Block`-decorated variable in the `Uniform` storage class **must** not cause the space required for that variable to extend outside the range `[0, maxUniformBufferRange)`. The `Offset` decoration for any member of a `Block`-decorated variable in the `StorageBuffer` storage class **must** not cause the space required for that variable to extend outside the range `[0, maxStorageBufferRange)`.

Variables identified with a storage class of `UniformConstant` and a decoration of `InputAttachmentIndex` **must** be declared as described in [Fragment Input Attachment Interface](#).

SPIR-V variables decorated with a descriptor set and binding that identify a [combined image sampler descriptor](#) **can** have a type of `OpTypeImage`, `OpTypeSampler` (`Sampled=1`), or `OpTypeSampledImage`.

When accessing a resource through such a variable, the resource **must** be selected via compile time constant expressions unless features are enabled to allow dynamically uniform or non-uniform expressions, as described below:

- Storage images (except storage texel buffers and input attachments):
 - Dynamically uniform: `shaderStorageImageArrayDynamicIndexing` and `StorageImageArrayDynamicIndexing`
 - Non-uniform: `shaderStorageImageArrayNonUniformIndexing` and `StorageImageArrayNonUniformIndexing`
- Storage texel buffers:
 - Dynamically uniform: `shaderStorageTexelBufferArrayDynamicIndexing` and `StorageTexelBufferArrayDynamicIndexing`
 - Non-uniform: `shaderStorageTexelBufferArrayNonUniformIndexing` and `StorageTexelBufferArrayNonUniformIndexing`
- Input attachments:
 - Dynamically uniform: `shaderInputAttachmentArrayDynamicIndexing` and `InputAttachmentArrayDynamicIndexing`
 - Non-uniform: `shaderInputAttachmentArrayNonUniformIndexing` and `InputAttachmentArrayNonUniformIndexing`

- Sampled images (except uniform texel buffers), samplers and combined image samplers:
 - Dynamically uniform: `shaderSampledImageArrayDynamicIndexing` and `SampledImageArrayDynamicIndexing`
 - Non-uniform: `shaderSampledImageArrayNonUniformIndexing` and `SampledImageArrayNonUniformIndexing`
- Uniform texel buffers:
 - Dynamically uniform: `shaderUniformTexelBufferArrayDynamicIndexing` and `UniformTexelBufferArrayDynamicIndexing`
 - Non-uniform: `shaderUniformTexelBufferArrayNonUniformIndexing` and `UniformTexelBufferArrayNonUniformIndexing`
- Uniform buffers:
 - Dynamically uniform: `shaderUniformBufferArrayDynamicIndexing` and `UniformBufferArrayDynamicIndexing`
 - Non-uniform: `shaderUniformBufferArrayNonUniformIndexing` and `UniformBufferArrayNonUniformIndexing`
- Storage buffers:
 - Dynamically uniform: `shaderStorageBufferArrayDynamicIndexing` and `StorageBufferArrayDynamicIndexing`
 - Non-uniform: `shaderStorageBufferArrayNonUniformIndexing` and `StorageBufferArrayNonUniformIndexing`

NOTE

Implementations must take care when implementing this if subgroups are not necessarily a subset of the invocation group for their hardware (e.g. if multiple draw calls are packed together). If such an implementation needs uniformity across the subgroup for any resource access, the implementation is responsible for ensuring that indices that are only dynamically uniform across the invocation group still function as expected if they advertise the respective feature.

A combined image sampler in an array that enables sampler $Y'C_B C_R$ conversion **must** only be indexed by constant integral expressions.

Table 17. Shader Resource and Descriptor Type Correspondence

Resource type	Descriptor Type
sampler	<code>VK_DESCRIPTOR_TYPE_SAMPLER</code> or <code>VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER</code>
sampled image	<code>VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE</code> or <code>VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER</code>
storage image	<code>VK_DESCRIPTOR_TYPE_STORAGE_IMAGE</code>
combined image sampler	<code>VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER</code>
uniform texel buffer	<code>VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER</code>
storage texel buffer	<code>VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER</code>

Resource type	Descriptor Type
uniform buffer	VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC
storage buffer	VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC
input attachment	VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT

Table 18. Shader Resource and Storage Class Correspondence

Resource type	Storage Class	Type ¹	Decoration(s) ²
sampler	UniformConstant	OpTypeSampler	
sampled image	UniformConstant	OpTypeImage (Sampled=1)	
storage image	UniformConstant	OpTypeImage (Sampled=2)	
combined image sampler	UniformConstant	OpTypeSampledImage OpTypeImage (Sampled=1) OpTypeSampler	
uniform texel buffer	UniformConstant	OpTypeImage (Dim=Buffer, Sampled=1)	
storage texel buffer	UniformConstant	OpTypeImage (Dim=Buffer, Sampled=2)	
uniform buffer	Uniform	OpTypeStruct	Block, Offset, (ArrayStride), (MatrixStride)
storage buffer	Uniform	OpTypeStruct	BufferBlock, Offset, (ArrayStride), (MatrixStride)
	StorageBuffer		Block, Offset, (ArrayStride), (MatrixStride)
input attachment	UniformConstant	OpTypeImage (Dim=SubpassData, Sampled=2)	InputAttachmentIndex

1

Where **OpTypeImage** is referenced, the **Dim** values **Buffer** and **Subpassdata** are only accepted where they are specifically referenced. They do not correspond to resource types where a generic **OpTypeImage** is specified.

2

In addition to **DescriptorSet** and **Binding**.

16.5.3. DescriptorSet and Binding Assignment

A variable decorated with a **DescriptorSet** decoration of **s** and a **Binding** decoration of **b** indicates that this variable is associated with the **VkDescriptorSetLayoutBinding** that has a **binding** equal to **b** in **pSetLayouts[s]** that was specified in **VkPipelineLayoutCreateInfo**.

DescriptorSet decoration values **must** be between zero and **maxBoundDescriptorSets** minus one,

inclusive. **Binding** decoration values **can** be any 32-bit unsigned integer value, as described in [Descriptor Set Layout](#). Each descriptor set has its own binding name space.

If the **Binding** decoration is used with an array, the entire array is assigned that binding value. The decorated array **must** have an **Element Type** corresponding to a descriptor type, and the size of the array **must** be no larger than the number of descriptors in the binding. If the array is runtime-sized, then array elements greater than or equal to the size of that binding in the bound descriptor set **must** not be used. If the array is runtime-sized, the **runtimeDescriptorArray** feature **must** be enabled and the **RuntimeDescriptorArray** capability **must** be declared. The index of each element of the array is referred to as the *arrayElement*. For the purposes of interface matching and descriptor set [operations](#), if a resource variable is not an array, it is treated as if it has an *arrayElement* of zero.

There is a limit on the number of resources of each type that **can** be accessed by a pipeline stage as shown in [Shader Resource Limits](#). The “Resources Per Stage” column gives the limit on the number each type of resource that **can** be statically used for an entry point in any given stage in a pipeline. The “Resource Types” column lists which resource types are counted against the limit. Some resource types count against multiple limits.

The pipeline layout **may** include descriptor sets and bindings which are not referenced by any variables statically used by the entry points for the shader stages in the binding’s **stageFlags**.

However, if a variable assigned to a given **DescriptorSet** and **Binding** is statically used by the entry point for a shader stage, the pipeline layout **must** contain a descriptor set layout binding in that descriptor set layout and for that binding number, and that binding’s **stageFlags** **must** include the appropriate **VkShaderStageFlagBits** for that stage. The variable **must** be of a valid resource type determined by its SPIR-V type and storage class, as defined in [Shader Resource and Storage Class Correspondence](#). The descriptor set layout binding **must** be of a corresponding descriptor type, as defined in [Shader Resource and Descriptor Type Correspondence](#).

NOTE

There are no limits on the number of shader variables that can have overlapping set and binding values in a shader; but which resources are [statically used](#) has an impact. If any shader variable identifying a resource is [statically used](#) in a shader, then the underlying descriptor bound at the declared set and binding **must support the declared type in the shader** when the shader executes.

If multiple shader variables are declared with the same set and binding values, and with the same underlying descriptor type, they can all be statically used within the same shader. However, accesses are not automatically synchronized, and **Aliased** decorations should be used to avoid data hazards (see [section 2.18.2 Aliasing in the SPIR-V specification](#)).

If multiple shader variables with the same set and binding values are declared in a single shader, but with different declared types, where any of those are not supported by the relevant bound descriptor, that shader can only be executed if the variables with the unsupported type are not statically used.

A noteworthy example of using multiple statically-used shader variables sharing the same descriptor set and binding values is a descriptor of type **VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER** that has multiple corresponding shader

variables in the `UniformConstant` storage class, where some could be `OpTypeImage (Sampled=1)`, some could be `OpTypeSampler`, and some could be `OpTypeSampledImage`.

Table 19. Shader Resource Limits

Resources per Stage	Resource Types
<code>maxPerStageDescriptorSamplers</code> or <code>maxPerStageDescriptorUpdateAfterBindSamplers</code>	sampler
	combined image sampler
<code>maxPerStageDescriptorSampledImages</code> or <code>maxPerStageDescriptorUpdateAfterBindSampledImages</code>	sampled image
	combined image sampler
	uniform texel buffer
<code>maxPerStageDescriptorStorageImages</code> or <code>maxPerStageDescriptorUpdateAfterBindStorageImages</code>	storage image
	storage texel buffer
<code>maxPerStageDescriptorUniformBuffers</code> or <code>maxPerStageDescriptorUpdateAfterBindUniformBuffers</code>	uniform buffer
	uniform buffer dynamic
<code>maxPerStageDescriptorStorageBuffers</code> or <code>maxPerStageDescriptorUpdateAfterBindStorageBuffers</code>	storage buffer
	storage buffer dynamic
<code>maxPerStageDescriptorInputAttachments</code> or <code>maxPerStageDescriptorUpdateAfterBindInputAttachments</code>	input attachment ¹

1

Input attachments **can** only be used in the fragment shader stage

16.5.4. Offset and Stride Assignment

When a SPIR-V object is declared using an [explicit layout](#), it **must** be laid out according to the following additional requirements.

NOTE The numeric order of `Offset` decorations does not need to follow member declaration order.

Alignment Requirements

There are different alignment requirements depending on the specific resources and on the features enabled.

Matrix types are defined in terms of arrays as follows:

- A column-major matrix with C columns and R rows is equivalent to a C element array of vectors with R components.
- A row-major matrix with C columns and R rows is equivalent to an R element array of vectors with C components.

The *scalar alignment* of the type of an `OpTypeStruct` member is defined recursively as follows:

- A scalar of size N has a scalar alignment of N.
- A vector type has a scalar alignment equal to that of its component type.
- An array type has a scalar alignment equal to that of its element type.
- A structure has a scalar alignment equal to the largest scalar alignment of any of its members.
- A matrix type inherits *scalar alignment* from the equivalent array declaration.

The *base alignment* of the type of an `OpTypeStruct` member is defined recursively as follows:

- A scalar has a base alignment equal to its scalar alignment.
- A two-component vector has a base alignment equal to twice its scalar alignment.
- A three- or four-component vector has a base alignment equal to four times its scalar alignment.
- An array has a base alignment equal to the base alignment of its element type.
- A structure has a base alignment equal to the largest base alignment of any of its members. An empty structure has a base alignment equal to the size of the smallest scalar type permitted by the capabilities declared in the SPIR-V module. (e.g., for a 1 byte aligned empty structure in the `StorageBuffer` storage class, `StorageBuffer8BitAccess` or `UniformAndStorageBuffer8BitAccess` **must** be declared in the SPIR-V module.)
- A matrix type inherits *base alignment* from the equivalent array declaration.

The *extended alignment* of the type of an `OpTypeStruct` member is similarly defined as follows:

- A scalar or vector type has an extended alignment equal to its base alignment.
- An array or structure type has an extended alignment equal to the largest extended alignment of any of its members, rounded up to a multiple of 16.
- A matrix type inherits extended alignment from the equivalent array declaration.

A member is defined to *improperly straddle* if either of the following are true:

- It is a vector with total size less than or equal to 16 bytes, and has `Offset` decorations placing its first byte at F and its last byte at L, where $\text{floor}(F / 16) \neq \text{floor}(L / 16)$.
- It is a vector with total size greater than 16 bytes and has its `Offset` decorations placing its first byte at a non-integer multiple of 16.

Standard Buffer Layout

Every member of an `OpTypeStruct` that is required to be explicitly laid out **must** be aligned according to the first matching rule as follows. If the structure is contained in pointer types of multiple storage classes, it **must** satisfy the requirements for every storage class used to reference it.

1. If the `scalarBlockLayout` feature is enabled and the storage class is `Uniform`, `StorageBuffer`, `PhysicalStorageBuffer`, or `PushConstant` then every member **must** be aligned according to its scalar alignment.

2. All vectors **must** be aligned according to their scalar alignment.
3. If the `uniformBufferStandardLayout` feature is not enabled, then any member of an `OpTypeStruct` with a storage class of `Uniform` and a decoration of `Block` **must** be aligned according to its extended alignment.
4. Every other member **must** be aligned according to its base alignment.

NOTE

Even if scalar alignment is supported, it is generally more performant to use the *base alignment*.

The memory layout **must** obey the following rules:

- The `Offset` decoration of any member **must** be a multiple of its alignment.
- Any `ArrayStride` or `MatrixStride` decoration **must** be a multiple of the alignment of the array or matrix as defined above.

If one of the conditions below applies

- The storage class is `Uniform`, `StorageBuffer`, `PhysicalStorageBuffer`, or `PushConstant`, and the `scalarBlockLayout` feature is not enabled.
- The storage class is any other storage class.

the memory layout **must** also obey the following rules:

- Vectors **must** not improperly straddle, as defined above.
- The `Offset` decoration of a member **must** not place it between the end of a structure, an array or a matrix and the next multiple of the alignment of that structure, array or matrix.

NOTE

The **std430 layout** in GLSL satisfies these rules for types using the base alignment. The **std140 layout** satisfies the rules for types using the extended alignment.

16.6. Built-In Variables

Built-in variables are accessed in shaders by declaring a variable decorated with a `BuiltIn` SPIR-V decoration. The meaning of each `BuiltIn` decoration is as follows. In the remainder of this section, the name of a built-in is used interchangeably with a term equivalent to a variable decorated with that particular built-in. Built-ins that represent integer values **can** be declared as either signed or unsigned 32-bit integers.

[As mentioned above](#), some inputs and outputs have an additional level of arrayness relative to other shader inputs and outputs. This level of arrayness is not included in the type descriptions below, but **must** be included when declaring the built-in.

Any two variables declared in the `Input` storage class listed as operands on the same `OpEntryPoint` **must** not have the same `BuiltIn` decoration. Any two variables declared in the `Output` storage class listed as operands on the same `OpEntryPoint` **must** not have the same `BuiltIn` decoration.

BaseInstance

Decorating a variable with the **BaseInstance** built-in will make that variable contain the integer value corresponding to the first instance that was passed to the command that invoked the current vertex shader invocation. **BaseInstance** is the **firstInstance** parameter to a *direct drawing command* or the **firstInstance** member of a structure consumed by an *indirect drawing command*.

Valid Usage

- VUID-BaseInstance-BaseInstance-04181
The **BaseInstance** decoration **must** be used only within the **Vertex Execution Model**
- VUID-BaseInstance-BaseInstance-04182
The variable decorated with **BaseInstance** **must** be declared using the **Input Storage Class**
- VUID-BaseInstance-BaseInstance-04183
The variable decorated with **BaseInstance** **must** be declared as a scalar 32-bit integer value

BaseVertex

Decorating a variable with the **BaseVertex** built-in will make that variable contain the integer value corresponding to the first vertex or vertex offset that was passed to the command that invoked the current vertex shader invocation. For *non-indexed drawing commands*, this variable is the **firstVertex** parameter to a *direct drawing command* or the **firstVertex** member of the structure consumed by an *indirect drawing command*. For *indexed drawing commands*, this variable is the **vertexOffset** parameter to a *direct drawing command* or the **vertexOffset** member of the structure consumed by an *indirect drawing command*.

Valid Usage

- VUID-BaseVertex-BaseVertex-04184
The **BaseVertex** decoration **must** be used only within the **Vertex Execution Model**
- VUID-BaseVertex-BaseVertex-04185
The variable decorated with **BaseVertex** **must** be declared using the **Input Storage Class**
- VUID-BaseVertex-BaseVertex-04186
The variable decorated with **BaseVertex** **must** be declared as a scalar 32-bit integer value

ClipDistance

Decorating a variable with the **ClipDistance** built-in decoration will make that variable contain the mechanism for controlling user clipping. **ClipDistance** is an array such that the i^{th} element of the array specifies the clip distance for plane i . A clip distance of 0 means the vertex is on the plane, a positive distance means the vertex is inside the clip half-space, and a negative distance means the vertex is outside the clip half-space.

NOTE The array variable decorated with **ClipDistance** is explicitly sized by the shader.

NOTE

In the last [pre-rasterization shader stage](#), these values will be linearly interpolated across the primitive and the portion of the primitive with interpolated distances less than 0 will be considered outside the clip volume. If [ClipDistance](#) is then used by a fragment shader, [ClipDistance](#) contains these linearly interpolated values.

Valid Usage

- VUID-ClipDistance-ClipDistance-04187
The [ClipDistance](#) decoration **must** be used only within the [MeshEXT](#), [MeshNV](#), [Vertex](#), [Fragment](#), [TessellationControl](#), [TessellationEvaluation](#), or [Geometry Execution Model](#)
- VUID-ClipDistance-ClipDistance-04188
The variable decorated with [ClipDistance](#) within the [MeshEXT](#), [MeshNV](#), or [Vertex Execution Model](#) **must** be declared using the [Output Storage Class](#)
- VUID-ClipDistance-ClipDistance-04189
The variable decorated with [ClipDistance](#) within the [Fragment Execution Model](#) **must** be declared using the [Input Storage Class](#)
- VUID-ClipDistance-ClipDistance-04190
The variable decorated with [ClipDistance](#) within the [TessellationControl](#), [TessellationEvaluation](#), or [Geometry Execution Model](#) **must** not be declared in a [Storage Class](#) other than [Input](#) or [Output](#)
- VUID-ClipDistance-ClipDistance-04191
The variable decorated with [ClipDistance](#) **must** be declared as an array of 32-bit floating-point values

CullDistance

Decorating a variable with the [CullDistance](#) built-in decoration will make that variable contain the mechanism for controlling user culling. If any member of this array is assigned a negative value for all vertices belonging to a primitive, then the primitive is discarded before rasterization.

NOTE

In fragment shaders, the values of the [CullDistance](#) array are linearly interpolated across each primitive.

NOTE

If [CullDistance](#) decorates an input variable, that variable will contain the corresponding value from the [CullDistance](#) decorated output variable from the previous shader stage.

Valid Usage

- VUID-CullDistance-CullDistance-04196
The [CullDistance](#) decoration **must** be used only within the [MeshEXT](#), [MeshNV](#), [Vertex](#), [Fragment](#), [TessellationControl](#), [TessellationEvaluation](#), or [Geometry Execution Model](#)
- VUID-CullDistance-CullDistance-04197

The variable decorated with **CullDistance** within the **MeshEXT**, **MeshNV** or **Vertex Execution Model** **must** be declared using the **Output Storage Class**

- VUID-CullDistance-CullDistance-04198

The variable decorated with **CullDistance** within the **Fragment Execution Model** **must** be declared using the **Input Storage Class**

- VUID-CullDistance-CullDistance-04199

The variable decorated with **CullDistance** within the **TessellationControl**, **TessellationEvaluation**, or **Geometry Execution Model** **must** not be declared using a **Storage Class** other than **Input** or **Output**

- VUID-CullDistance-CullDistance-04200

The variable decorated with **CullDistance** **must** be declared as an array of 32-bit floating-point values

DeviceIndex

The **DeviceIndex** decoration **can** be applied to a shader input which will be filled with the device index of the physical device that is executing the current shader invocation. This value will be in the range $[0, \max(1, \text{physicalDeviceCount})]$, where **physicalDeviceCount** is the **physicalDeviceCount** member of **VkDeviceGroupDeviceCreateInfo**.

Valid Usage

- VUID-DeviceIndex-DeviceIndex-04205

The variable decorated with **DeviceIndex** **must** be declared using the **Input Storage Class**

- VUID-DeviceIndex-DeviceIndex-04206

The variable decorated with **DeviceIndex** **must** be declared as a scalar 32-bit integer value

DrawIndex

Decorating a variable with the **DrawIndex** built-in will make that variable contain the integer value corresponding to the zero-based index of the draw that invoked the current vertex shader invocation. For *indirect drawing commands*, **DrawIndex** begins at zero and increments by one for each draw executed. The number of draws is given by the **drawCount** parameter. For *direct drawing commands*, **DrawIndex** is always zero. **DrawIndex** is dynamically uniform.

Valid Usage

- VUID-DrawIndex-DrawIndex-04207

The **DrawIndex** decoration **must** be used only within the **Vertex**, **MeshEXT**, **TaskEXT**, **MeshNV**, or **TaskNV Execution Model**

- VUID-DrawIndex-DrawIndex-04208

The variable decorated with **DrawIndex** **must** be declared using the **Input Storage Class**

- VUID-DrawIndex-DrawIndex-04209

The variable decorated with **DrawIndex** **must** be declared as a scalar 32-bit integer value

FragCoord

Decorating a variable with the **FragCoord** built-in decoration will make that variable contain the coordinates (x,y,z,1/w) of the fragment being processed.

The (x,y) values are the framebuffer coordinates ($x_{f,y,f}$) of the fragment.

When **Sample Shading** is enabled, the x and y components of **FragCoord** reflect the location of one of the samples corresponding to the shader invocation.

Otherwise, the x and y components of **FragCoord** reflect the location of the center of the fragment.

The z component of **FragCoord** is the interpolated depth value of the primitive.

The w component is the interpolated $\frac{1}{w}$.

The **Centroid** interpolation decoration is ignored, but allowed, on **FragCoord**.

Valid Usage

- VUID-FragCoord-FragCoord-04210
The **FragCoord** decoration **must** be used only within the **Fragment Execution Model**
- VUID-FragCoord-FragCoord-04211
The variable decorated with **FragCoord** **must** be declared using the **Input Storage Class**
- VUID-FragCoord-FragCoord-04212
The variable decorated with **FragCoord** **must** be declared as a four-component vector of 32-bit floating-point values

FragDepth

To have a shader supply a fragment-depth value, the shader **must** declare the **DepthReplacing** execution mode. Such a shader's fragment-depth value will come from the variable decorated with the **FragDepth** built-in decoration.

This value will be used for any subsequent depth testing performed by the implementation or writes to the depth attachment. See [fragment shader depth replacement](#) for details.

Valid Usage

- VUID-FragDepth-FragDepth-04213
The **FragDepth** decoration **must** be used only within the **Fragment Execution Model**
- VUID-FragDepth-FragDepth-04214
The variable decorated with **FragDepth** **must** be declared using the **Output Storage Class**
- VUID-FragDepth-FragDepth-04215
The variable decorated with **FragDepth** **must** be declared as a scalar 32-bit floating-point value
- VUID-FragDepth-FragDepth-04216

If the shader dynamically writes to the variable decorated with **FragDepth**, the **DepthReplacing Execution Mode** **must** be declared

FragStencilRefEXT

Decorating a variable with the **FragStencilRefEXT** built-in decoration will make that variable contain the new stencil reference value for all samples covered by the fragment. This value will be used as the stencil reference value used in stencil testing.

To write to **FragStencilRefEXT**, a shader **must** declare the **StencilRefReplacingEXT** execution mode. If a shader declares the **StencilRefReplacingEXT** execution mode and there is an execution path through the shader that does not set **FragStencilRefEXT**, then the fragment's stencil reference value is undefined for executions of the shader that take that path.

Only the least significant **s** bits of the integer value of the variable decorated with **FragStencilRefEXT** are considered for stencil testing, where **s** is the number of bits in the stencil framebuffer attachment, and higher order bits are discarded.

See [fragment shader stencil reference replacement](#) for more details.

Valid Usage

- VUID-FragStencilRefEXT-FragStencilRefEXT-04223
The **FragStencilRefEXT** decoration **must** be used only within the **Fragment Execution Model**
- VUID-FragStencilRefEXT-FragStencilRefEXT-04224
The variable decorated with **FragStencilRefEXT** **must** be declared using the **Output Storage Class**
- VUID-FragStencilRefEXT-FragStencilRefEXT-04225
The variable decorated with **FragStencilRefEXT** **must** be declared as a scalar integer value

FrontFacing

Decorating a variable with the **FrontFacing** built-in decoration will make that variable contain whether the fragment is front or back facing. This variable is non-zero if the current fragment is considered to be part of a **front-facing** polygon primitive or of a non-polygon primitive and is zero if the fragment is considered to be part of a back-facing polygon primitive.

Valid Usage

- VUID-FrontFacing-FrontFacing-04229
The **FrontFacing** decoration **must** be used only within the **Fragment Execution Model**
- VUID-FrontFacing-FrontFacing-04230
The variable decorated with **FrontFacing** **must** be declared using the **Input Storage Class**
- VUID-FrontFacing-FrontFacing-04231
The variable decorated with **FrontFacing** **must** be declared as a boolean value

FullyCoveredEXT

Decorating a variable with the **FullyCoveredEXT** built-in decoration will make that variable indicate whether the **fragment area** is fully covered by the generating primitive. This variable is non-zero if conservative rasterization is enabled and the current fragment area is fully covered by the generating primitive, and is zero if the fragment is not covered or partially covered, or conservative rasterization is disabled.

Valid Usage

- VUID-FullyCoveredEXT-FullyCoveredEXT-04232
The **FullyCoveredEXT** decoration **must** be used only within the **Fragment Execution Model**
- VUID-FullyCoveredEXT-FullyCoveredEXT-04233
The variable decorated with **FullyCoveredEXT** **must** be declared using the **Input Storage Class**
- VUID-FullyCoveredEXT-FullyCoveredEXT-04234
The variable decorated with **FullyCoveredEXT** **must** be declared as a boolean value
- VUID-FullyCoveredEXT-conservativeRasterizationPostDepthCoverage-04235
If **VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativeRasterizationPostDepthCoverage** is not supported the **PostDepthCoverage Execution Mode** **must** not be declared, when a variable with the **FullyCoveredEXT** decoration is declared

GlobalInvocationId

Decorating a variable with the **GlobalInvocationId** built-in decoration will make that variable contain the location of the current invocation within the global workgroup. Each component is equal to the index of the local workgroup multiplied by the size of the local workgroup plus **LocalInvocationId**.

Valid Usage

- VUID-GlobalInvocationId-GlobalInvocationId-04236
The **GlobalInvocationId** decoration **must** be used only within the **GLCompute, MeshEXT, TaskEXT, MeshNV, or TaskNV Execution Model**
- VUID-GlobalInvocationId-GlobalInvocationId-04237
The variable decorated with **GlobalInvocationId** **must** be declared using the **Input Storage Class**
- VUID-GlobalInvocationId-GlobalInvocationId-04238
The variable decorated with **GlobalInvocationId** **must** be declared as a three-component vector of 32-bit integer values

HelperInvocation

Decorating a variable with the **HelperInvocation** built-in decoration will make that variable contain whether the current invocation is a helper invocation. This variable is non-zero if the

current fragment being shaded is a helper invocation and zero otherwise. A helper invocation is an invocation of the shader that is produced to satisfy internal requirements such as the generation of derivatives.

NOTE

It is very likely that a helper invocation will have a value of `SampleMask` fragment shader input value that is zero.

Valid Usage

- VUID-HelperInvocation-HelperInvocation-04239
The `HelperInvocation` decoration **must** be used only within the `Fragment Execution Model`
- VUID-HelperInvocation-HelperInvocation-04240
The variable decorated with `HelperInvocation` **must** be declared using the `Input Storage Class`
- VUID-HelperInvocation-HelperInvocation-04241
The variable decorated with `HelperInvocation` **must** be declared as a boolean value

InvocationId

Decorating a variable with the `InvocationId` built-in decoration will make that variable contain the index of the current shader invocation in a geometry shader, or the index of the output patch vertex in a tessellation control shader.

In a geometry shader, the index of the current shader invocation ranges from zero to the number of `instances` declared in the shader minus one. If the instance count of the geometry shader is one or is not specified, then `InvocationId` will be zero.

Valid Usage

- VUID-InvocationId-InvocationId-04257
The `InvocationId` decoration **must** be used only within the `TessellationControl` or `Geometry Execution Model`
- VUID-InvocationId-InvocationId-04258
The variable decorated with `InvocationId` **must** be declared using the `Input Storage Class`
- VUID-InvocationId-InvocationId-04259
The variable decorated with `InvocationId` **must** be declared as a scalar 32-bit integer value

InstanceIndex

Decorating a variable in a vertex shader with the `InstanceIndex` built-in decoration will make that variable contain the index of the instance that is being processed by the current vertex shader invocation. `InstanceIndex` begins at the `firstInstance` parameter to `vkCmdDraw` or `vkCmdDrawIndexed` or at the `firstInstance` member of a structure consumed by `vkCmdDrawIndirect` or `vkCmdDrawIndexedIndirect`.

Valid Usage

- VUID-InstanceIndex-InstanceIndex-04263
The **InstanceIndex** decoration **must** be used only within the **Vertex Execution Model**
- VUID-InstanceIndex-InstanceIndex-04264
The variable decorated with **InstanceIndex** **must** be declared using the **Input Storage Class**
- VUID-InstanceIndex-InstanceIndex-04265
The variable decorated with **InstanceIndex** **must** be declared as a scalar 32-bit integer value

Layer

Decorating a variable with the **Layer** built-in decoration will make that variable contain the select layer of a multi-layer framebuffer attachment.

In a vertex, tessellation evaluation, or geometry shader, any variable decorated with **Layer** can be written with the framebuffer layer index to which the primitive produced by that shader will be directed.

The last active **pre-rasterization shader stage** (in pipeline order) controls the **Layer** that is used. Outputs in previous shader stages are not used, even if the last stage fails to write the **Layer**.

If the last active **pre-rasterization shader stage** shader entry point's interface does not include a variable decorated with **Layer**, then the first layer is used. If a **pre-rasterization shader stage** shader entry point's interface includes a variable decorated with **Layer**, it **must** write the same value to **Layer** for all output vertices of a given primitive. If the **Layer** value is less than 0 or greater than or equal to the number of layers in the framebuffer, then primitives **may** still be rasterized, fragment shaders **may** be executed, and the framebuffer values for all layers are undefined.

In a fragment shader, a variable decorated with **Layer** contains the layer index of the primitive that the fragment invocation belongs to.

Valid Usage

- VUID-Layer-Layer-04272
The **Layer** decoration **must** be used only within the **MeshEXT**, **MeshNV**, **Vertex**, **TessellationEvaluation**, **Geometry**, or **Fragment Execution Model**
- VUID-Layer-Layer-04273
If the **shaderOutputLayer** feature is not enabled then the **Layer** decoration **must** be used only within the **Geometry** or **Fragment Execution Model**
- VUID-Layer-Layer-04274
The variable decorated with **Layer** within the **MeshEXT**, **MeshNV**, **Vertex**, **TessellationEvaluation**, or **Geometry Execution Model** **must** be declared using the **Output Storage Class**
- VUID-Layer-Layer-04275

The variable decorated with **Layer** within the **Fragment Execution Model** **must** be declared using the **Input Storage Class**

- VUID-Layer-Layer-04276

The variable decorated with **Layer** **must** be declared as a scalar 32-bit integer value for all supported execution models except **MeshEXT**

- VUID-Layer-Layer-07039

The variable decorated with **Layer** within the **MeshEXT Execution Model** **must** also be decorated with the **PerPrimitiveEXT** decoration

- VUID-Layer-Layer-10592

Layer within the **MeshEXT Execution Model** **must** decorate a scalar 32-bit integer member of a structure decorated as **Block**, or decorate a variable of type **OpTypeArray** of scalar 32-bit integer values

- VUID-Layer-Layer-10593

If **Layer** is declared as an array of 32-bit integer values, within the **MeshEXT Execution Model**, size of the array **must** match the value specified by **OutputPrimitivesEXT**

- VUID-Layer-Layer-10594

If **Layer** decorates a member of a structure, the variable declaration of the containing **Block** type **must** have an array size that matches the value specified by **OutputPrimitivesEXT**

LocalInvocationId

Decorating a variable with the **LocalInvocationId** built-in decoration will make that variable contain the location of the current compute shader invocation within the local workgroup. Each component ranges from zero through to the size of the workgroup in that dimension minus one.

NOTE

If the size of the workgroup in a particular dimension is one, then the **LocalInvocationId** in that dimension will be zero. If the workgroup is effectively two-dimensional, then **LocalInvocationId.z** will be zero. If the workgroup is effectively one-dimensional, then both **LocalInvocationId.y** and **LocalInvocationId.z** will be zero.

Valid Usage

- VUID-LocalInvocationId-LocalInvocationId-04281

The **LocalInvocationId** decoration **must** be used only within the **GLCompute**, **MeshEXT**, **TaskEXT**, **MeshNV**, or **TaskNV Execution Model**

- VUID-LocalInvocationId-LocalInvocationId-04282

The variable decorated with **LocalInvocationId** **must** be declared using the **Input Storage Class**

- VUID-LocalInvocationId-LocalInvocationId-04283

The variable decorated with **LocalInvocationId** **must** be declared as a three-component vector of 32-bit integer values

LocalInvocationIndex

Decorating a variable with the **LocalInvocationIndex** built-in decoration will make that variable contain a one-dimensional representation of **LocalInvocationId**. This is computed as:

```
LocalInvocationIndex =  
    LocalInvocationId.z * WorkgroupSize.x * WorkgroupSize.y +  
    LocalInvocationId.y * WorkgroupSize.x +  
    LocalInvocationId.x;
```

Valid Usage

- VUID-LocalInvocationIndex-LocalInvocationIndex-04284
The **LocalInvocationIndex** decoration **must** be used only within the **GLCompute**, **MeshEXT**, **TaskEXT**, **MeshNV**, or **TaskNV Execution Model**
- VUID-LocalInvocationIndex-LocalInvocationIndex-04285
The variable decorated with **LocalInvocationIndex** **must** be declared using the **Input Storage Class**
- VUID-LocalInvocationIndex-LocalInvocationIndex-04286
The variable decorated with **LocalInvocationIndex** **must** be declared as a scalar 32-bit integer value

NumSubgroups

Decorating a variable with the **NumSubgroups** built-in decoration will make that variable contain the number of subgroups in the local workgroup.

Valid Usage

- VUID-NumSubgroups-NumSubgroups-04293
The **NumSubgroups** decoration **must** be used only within the **GLCompute**, **MeshEXT**, **TaskEXT**, **MeshNV**, or **TaskNV Execution Model**
- VUID-NumSubgroups-NumSubgroups-04294
The variable decorated with **NumSubgroups** **must** be declared using the **Input Storage Class**
- VUID-NumSubgroups-NumSubgroups-04295
The variable decorated with **NumSubgroups** **must** be declared as a scalar 32-bit integer value

NumWorkgroups

Decorating a variable with the **NumWorkgroups** built-in decoration will make that variable contain the number of local workgroups that are part of the dispatch that the invocation belongs to. Each component is equal to the values of the workgroup count parameters passed into the dispatching commands.

Valid Usage

- VUID-NumWorkgroups-NumWorkgroups-04296
The **NumWorkgroups** decoration **must** be used only within the **GLCompute**, **MeshEXT**, or **TaskEXT Execution Model**
- VUID-NumWorkgroups-NumWorkgroups-04297
The variable decorated with **NumWorkgroups** **must** be declared using the **Input Storage Class**
- VUID-NumWorkgroups-NumWorkgroups-04298
The variable decorated with **NumWorkgroups** **must** be declared as a three-component vector of 32-bit integer values

PatchVertices

Decorating a variable with the **PatchVertices** built-in decoration will make that variable contain the number of vertices in the input patch being processed by the shader. In a Tessellation Control Shader, this is the same as the `name:patchControlPoints` member of **VkPipelineTessellationStateCreateInfo**. In a Tessellation Evaluation Shader, **PatchVertices** is equal to the tessellation control output patch size. When the same shader is used in different pipelines where the patch sizes are configured differently, the value of the **PatchVertices** variable will also differ.

Valid Usage

- VUID-PatchVertices-PatchVertices-04308
The **PatchVertices** decoration **must** be used only within the **TessellationControl** or **TessellationEvaluation Execution Model**
- VUID-PatchVertices-PatchVertices-04309
The variable decorated with **PatchVertices** **must** be declared using the **Input Storage Class**
- VUID-PatchVertices-PatchVertices-04310
The variable decorated with **PatchVertices** **must** be declared as a scalar 32-bit integer value

PointCoord

Decorating a variable with the **PointCoord** built-in decoration will make that variable contain the coordinate of the current fragment within the point being rasterized, normalized to the size of the point with origin in the upper left corner of the point, as described in **Basic Point Rasterization**. If the primitive the fragment shader invocation belongs to is not a point, then the variable decorated with **PointCoord** contains an undefined value.

NOTE Depending on how the point is rasterized, **PointCoord** **may** never reach (0,0) or (1,1).

Valid Usage

- VUID-PointCoord-PointCoord-04311

The **PointCoord** decoration **must** be used only within the **Fragment Execution Model**

- VUID-PointCoord-PointCoord-04312

The variable decorated with **PointCoord** **must** be declared using the **Input Storage Class**

- VUID-PointCoord-PointCoord-04313

The variable decorated with **PointCoord** **must** be declared as a two-component vector of 32-bit floating-point values

PointSize

Decorating a variable with the **PointSize** built-in decoration will make that variable contain the size of point primitives. The value written to the variable decorated with **PointSize** by the last **pre-rasterization shader stage** in the pipeline is used as the framebuffer-space size of points produced by rasterization.

NOTE

When **PointSize** decorates a variable in the **Input Storage Class**, it contains the data written to the output variable decorated with **PointSize** from the previous shader stage.

Valid Usage

- VUID-PointSize-PointSize-04314

The **PointSize** decoration **must** be used only within the **MeshEXT**, **MeshNV**, **Vertex**, **TessellationControl**, **TessellationEvaluation**, or **Geometry Execution Model**

- VUID-PointSize-PointSize-04315

The variable decorated with **PointSize** within the **MeshEXT**, **MeshNV**, or **Vertex Execution Model** **must** be declared using the **Output Storage Class**

- VUID-PointSize-PointSize-04316

The variable decorated with **PointSize** within the **TessellationControl**, **TessellationEvaluation**, or **Geometry Execution Model** **must** not be declared using a **Storage Class** other than **Input** or **Output**

- VUID-PointSize-PointSize-04317

The variable decorated with **PointSize** **must** be declared as a scalar 32-bit floating-point value

Position

Decorating a variable with the **Position** built-in decoration will make that variable contain the position of the current vertex. In the last **pre-rasterization shader stage**, the value of the variable decorated with **Position** is used in subsequent primitive assembly, clipping, and rasterization operations.

NOTE

When **Position** decorates a variable in the **Input Storage Class**, it contains the data written to the output variable decorated with **Position** from the previous shader stage.

Valid Usage

- VUID-Position-Position-04318
The **Position** decoration **must** be used only within the **MeshEXT**, **MeshNV**, **Vertex**, **TessellationControl**, **TessellationEvaluation**, or **Geometry Execution Model**
- VUID-Position-Position-04319
The variable decorated with **Position** within the **MeshEXT**, **MeshNV**, or **Vertex Execution Model** **must** be declared using the **Output Storage Class**
- VUID-Position-Position-04320
The variable decorated with **Position** within the **TessellationControl**, **TessellationEvaluation**, or **Geometry Execution Model** **must** not be declared using a **Storage Class** other than **Input** or **Output**
- VUID-Position-Position-04321
The variable decorated with **Position** **must** be declared as a four-component vector of 32-bit floating-point values

PrimitiveId

Decorating a variable with the **PrimitiveId** built-in decoration will make that variable contain the index of the current primitive.

The index of the first primitive generated by a drawing command is zero, and the index is incremented after every individual point, line, or triangle primitive is processed.

For triangles drawn as points or line segments (see **Polygon Mode**), the primitive index is incremented only once, even if multiple points or lines are eventually drawn.

Variables decorated with **PrimitiveId** are reset to zero between each instance drawn.

Restarting a primitive topology using primitive restart has no effect on the value of variables decorated with **PrimitiveId**.

In tessellation control and tessellation evaluation shaders, it will contain the index of the patch within the current set of rendering primitives that corresponds to the shader invocation.

In a geometry shader, it will contain the number of primitives presented as input to the shader since the current set of rendering primitives was started.

In a fragment shader, it will contain the primitive index written by the geometry shader if a geometry shader is present, or with the value that would have been presented as input to the geometry shader had it been present.

NOTE

When the **PrimitiveId** decoration is applied to an output variable in the geometry shader, the resulting value is seen through the **PrimitiveId** decorated input variable in the fragment shader.

The fragment shader using **PrimitiveId** will need to declare either the **Geometry** or **Tessellation** capability to satisfy the requirement SPIR-V has to use **PrimitiveId**.

Valid Usage

- VUID-PrimitiveId-PrimitiveId-04330
The **PrimitiveId** decoration **must** be used only within the **MeshEXT**, **MeshNV**, **IntersectionKHR**, **AnyHitKHR**, **ClosestHitKHR**, **TessellationControl**, **TessellationEvaluation**, **Geometry**, or **Fragment Execution Model**
- VUID-PrimitiveId-Fragment-04331
If pipeline contains both the **Fragment** and **Geometry Execution Model** and a variable decorated with **PrimitiveId** is read from **Fragment** shader, then the **Geometry** shader **must** write to the output variables decorated with **PrimitiveId** in all execution paths
- VUID-PrimitiveId-Fragment-04332
If pipeline contains both the **Fragment** and **MeshEXT** or **MeshNV Execution Model** and a variable decorated with **PrimitiveId** is read from **Fragment** shader, then the **MeshEXT** or **MeshNV** shader **must** write to the output variables decorated with **PrimitiveId** in all execution paths
- VUID-PrimitiveId-Fragment-04333
If **Fragment Execution Model** contains a variable decorated with **PrimitiveId**, then either the **MeshShadingEXT**, **MeshShadingNV**, **Geometry** or **Tessellation** capability **must** also be declared
- VUID-PrimitiveId-PrimitiveId-04334
The variable decorated with **PrimitiveId** within the **TessellationControl**, **TessellationEvaluation**, **Fragment**, **IntersectionKHR**, **AnyHitKHR**, or **ClosestHitKHR Execution Model** **must** be declared using the **Input Storage Class**
- VUID-PrimitiveId-PrimitiveId-04335
The variable decorated with **PrimitiveId** within the **Geometry Execution Model** **must** be declared using the **Input** or **Output Storage Class**
- VUID-PrimitiveId-PrimitiveId-04336
The variable decorated with **PrimitiveId** within the **MeshEXT** or **MeshNV Execution Model** **must** be declared using the **Output Storage Class**
- VUID-PrimitiveId-PrimitiveId-04337
The variable decorated with **PrimitiveId** **must** be declared as a scalar 32-bit integer value for all supported execution models except **MeshEXT**
- VUID-PrimitiveId-PrimitiveId-07040
The variable decorated with **PrimitiveId** within the **MeshEXT Execution Model** **must** also be decorated with the **PerPrimitiveEXT** decoration
- VUID-PrimitiveId-PrimitiveId-10595
PrimitiveId within the **MeshEXT Execution Model** **must** decorate a scalar 32-bit integer member of a structure decorated as **Block**, or decorate a variable of type **OpTypeArray** of 32-bit integer values
- VUID-PrimitiveId-PrimitiveId-10596
If **PrimitiveId** is declared as an array of 32-bit integer values, within the **MeshEXT Execution Model**, size of the array **must** match the value specified by **OutputPrimitivesEXT**
- VUID-PrimitiveId-PrimitiveId-10597
If **PrimitiveId** decorates a member of a structure, the variable declaration of the

containing **Block** type **must** have an array size that matches the value specified by **OutputPrimitivesEXT**

PrimitiveShadingRateKHR

Decorating a variable with the **PrimitiveShadingRateKHR** built-in decoration will make that variable contain the **primitive fragment shading rate**.

The value written to the variable decorated with **PrimitiveShadingRateKHR** by the last **pre-rasterization shader stage** in the pipeline is used as the **primitive fragment shading rate**. Outputs in previous shader stages are ignored.

If the last active **pre-rasterization shader stage** shader entry point's interface does not include a variable decorated with **PrimitiveShadingRateKHR**, then it is as if the shader specified a fragment shading rate value of 0, indicating a horizontal and vertical rate of 1 pixel.

If a shader has **PrimitiveShadingRateKHR** in the output interface and there is an execution path through the shader that does not write to it, its value is undefined for executions of the shader that take that path.

Valid Usage

- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04484
The **PrimitiveShadingRateKHR** decoration **must** be used only within the **MeshEXT**, **MeshNV**, **Vertex**, or **Geometry Execution Model**
- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04485
The variable decorated with **PrimitiveShadingRateKHR** **must** be declared using the **Output Storage Class**
- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04486
The variable decorated with **PrimitiveShadingRateKHR** **must** be declared as a scalar 32-bit integer value for all supported execution models except **MeshEXT**
- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04487
The value written to **PrimitiveShadingRateKHR** **must** include no more than one of **Vertical2Pixels** and **Vertical4Pixels**
- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04488
The value written to **PrimitiveShadingRateKHR** **must** include no more than one of **Horizontal2Pixels** and **Horizontal4Pixels**
- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04489
The value written to **PrimitiveShadingRateKHR** **must** not have any bits set other than those defined by **Fragment Shading Rate Flags** enumerants in the SPIR-V specification
- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-07059
The variable decorated with **PrimitiveShadingRateKHR** within the **MeshEXT Execution Model** **must** also be decorated with the **PerPrimitiveEXT** decoration
- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-10598
PrimitiveShadingRateKHR within the **MeshEXT Execution Model** **must** decorate a scalar 32-bit integer member of a structure decorated as **Block**, or decorate a variable of type

OpTypeArray of 32-bit integer values

- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-10599

If **PrimitiveShadingRateKHR** is declared as an array of 32-bit integer values, within the **MeshEXT Execution Model**, size of the array **must** match the value specified by **OutputPrimitivesEXT**

- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-10600

If **PrimitiveShadingRateKHR** decorates a member of a structure, the variable declaration of the containing **Block** type **must** have an array size that matches the value specified by **OutputPrimitivesEXT**

SampleId

Decorating a variable with the **SampleId** built-in decoration will make that variable contain the **coverage index** for the current fragment shader invocation. **SampleId** ranges from zero to the number of samples in the framebuffer minus one. If a fragment shader entry point's interface includes an input variable decorated with **SampleId**, **Sample Shading** is considered enabled with a **minSampleShading** value of 1.0.

Valid Usage

- VUID-SampleId-SampleId-04354

The **SampleId** decoration **must** be used only within the **Fragment Execution Model**

- VUID-SampleId-SampleId-04355

The variable decorated with **SampleId** **must** be declared using the **Input Storage Class**

- VUID-SampleId-SampleId-04356

The variable decorated with **SampleId** **must** be declared as a scalar 32-bit integer value

SampleMask

Decorating a variable with the **SampleMask** built-in decoration will make any variable contain the **sample mask** for the current fragment shader invocation.

A variable in the **Input** storage class decorated with **SampleMask** will contain a bitmask of the set of samples covered by the primitive generating the fragment during rasterization. It has a sample bit set if and only if the sample is considered covered for this fragment shader invocation. **SampleMask[]** is an array of integers. Bits are mapped to samples in a manner where bit B of mask M (**SampleMask[M]**) corresponds to sample $32 \times M + B$.

A variable in the **Output** storage class decorated with **SampleMask** is an array of integers forming a bit array in a manner similar to an input variable decorated with **SampleMask**, but where each bit represents coverage as computed by the shader. This computed **SampleMask** is combined with the generated coverage mask in the **multisample coverage** operation.

Variables decorated with **SampleMask** **must** be either an unsized array, or explicitly sized to be no larger than the implementation-dependent maximum sample-mask (as an array of 32-bit elements), determined by the maximum number of samples.

If a fragment shader entry point's interface includes an output variable decorated with **SampleMask**, the sample mask will be undefined for any array elements of any fragment shader invocations that fail to assign a value. If a fragment shader entry point's interface does not include an output variable decorated with **SampleMask**, the sample mask has no effect on the processing of a fragment.

Valid Usage

- VUID-SampleMask-SampleMask-04357
The **SampleMask** decoration **must** be used only within the **Fragment Execution Model**
- VUID-SampleMask-SampleMask-04358
The variable decorated with **SampleMask** **must** be declared using the **Input** or **Output Storage Class**
- VUID-SampleMask-SampleMask-04359
The variable decorated with **SampleMask** **must** be declared as an array of 32-bit integer values

SamplePosition

Decorating a variable with the **SamplePosition** built-in decoration will make that variable contain the sub-pixel position of the sample being shaded. The top left of the pixel is considered to be at coordinate (0,0) and the bottom right of the pixel is considered to be at coordinate (1,1).

If a fragment shader entry point's interface includes an input variable decorated with **SamplePosition**, **Sample Shading** is considered enabled with a **minSampleShading** value of 1.0.

If the current pipeline uses **custom sample locations** the value of any variable decorated with the **SamplePosition** built-in decoration is undefined.

Valid Usage

- VUID-SamplePosition-SamplePosition-04360
The **SamplePosition** decoration **must** be used only within the **Fragment Execution Model**
- VUID-SamplePosition-SamplePosition-04361
The variable decorated with **SamplePosition** **must** be declared using the **Input Storage Class**
- VUID-SamplePosition-SamplePosition-04362
The variable decorated with **SamplePosition** **must** be declared as a two-component vector of 32-bit floating-point values

ShadingRateKHR

Decorating a variable with the **ShadingRateKHR** built-in decoration will make that variable contain the **fragment shading rate** for the current fragment invocation.

Valid Usage

- VUID-ShadingRateKHR-ShadingRateKHR-04490
The **ShadingRateKHR** decoration **must** be used only within the **Fragment Execution Model**
- VUID-ShadingRateKHR-ShadingRateKHR-04491
The variable decorated with **ShadingRateKHR** **must** be declared using the **Input Storage Class**
- VUID-ShadingRateKHR-ShadingRateKHR-04492
The variable decorated with **ShadingRateKHR** **must** be declared as a scalar 32-bit integer value

SubgroupId

Decorating a variable with the **SubgroupId** built-in decoration will make that variable contain the index of the subgroup within the local workgroup. This variable is in range [0, **NumSubgroups**-1].

Valid Usage

- VUID-SubgroupId-SubgroupId-04367
The **SubgroupId** decoration **must** be used only within the **GLCompute**, **MeshEXT**, **TaskEXT**, **MeshNV**, or **TaskNV Execution Model**
- VUID-SubgroupId-SubgroupId-04368
The variable decorated with **SubgroupId** **must** be declared using the **Input Storage Class**
- VUID-SubgroupId-SubgroupId-04369
The variable decorated with **SubgroupId** **must** be declared as a scalar 32-bit integer value

SubgroupEqMask

Decorating a variable with the **SubgroupEqMask** builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bit corresponding to the **SubgroupLocalInvocationId** is set in the variable decorated with **SubgroupEqMask**. All other bits are set to zero.

SubgroupEqMaskKHR is an alias of **SubgroupEqMask**.

Valid Usage

- VUID-SubgroupEqMask-SubgroupEqMask-04370
The variable decorated with **SubgroupEqMask** **must** be declared using the **Input Storage Class**
- VUID-SubgroupEqMask-SubgroupEqMask-04371
The variable decorated with **SubgroupEqMask** **must** be declared as a four-component vector of 32-bit integer values

SubgroupGeMask

Decorating a variable with the `SubgroupGeMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations greater than or equal to `SubgroupLocalInvocationId` through `SubgroupSize-1` are set in the variable decorated with `SubgroupGeMask`. All other bits are set to zero.

`SubgroupGeMaskKHR` is an alias of `SubgroupGeMask`.

Valid Usage

- VUID-SubgroupGeMask-SubgroupGeMask-04372
The variable decorated with `SubgroupGeMask` **must** be declared using the `Input Storage Class`
- VUID-SubgroupGeMask-SubgroupGeMask-04373
The variable decorated with `SubgroupGeMask` **must** be declared as a four-component vector of 32-bit integer values

SubgroupGtMask

Decorating a variable with the `SubgroupGtMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations greater than `SubgroupLocalInvocationId` through `SubgroupSize-1` are set in the variable decorated with `SubgroupGtMask`. All other bits are set to zero.

`SubgroupGtMaskKHR` is an alias of `SubgroupGtMask`.

Valid Usage

- VUID-SubgroupGtMask-SubgroupGtMask-04374
The variable decorated with `SubgroupGtMask` **must** be declared using the `Input Storage Class`
- VUID-SubgroupGtMask-SubgroupGtMask-04375
The variable decorated with `SubgroupGtMask` **must** be declared as a four-component vector of 32-bit integer values

SubgroupLeMask

Decorating a variable with the `SubgroupLeMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations less than or equal to `SubgroupLocalInvocationId` are set in the variable decorated with `SubgroupLeMask`. All other bits are set to zero.

`SubgroupLeMaskKHR` is an alias of `SubgroupLeMask`.

Valid Usage

- VUID-SubgroupLeMask-SubgroupLeMask-04376

The variable decorated with **SubgroupLeMask** **must** be declared using the **Input Storage Class**

- VUID-SubgroupLeMask-SubgroupLeMask-04377

The variable decorated with **SubgroupLeMask** **must** be declared as a four-component vector of 32-bit integer values

SubgroupLtMask

Decorating a variable with the **SubgroupLtMask** builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations less than **SubgroupLocalInvocationId** are set in the variable decorated with **SubgroupLtMask**. All other bits are set to zero.

SubgroupLtMaskKHR is an alias of **SubgroupLtMask**.

Valid Usage

- VUID-SubgroupLtMask-SubgroupLtMask-04378

The variable decorated with **SubgroupLtMask** **must** be declared using the **Input Storage Class**

- VUID-SubgroupLtMask-SubgroupLtMask-04379

The variable decorated with **SubgroupLtMask** **must** be declared as a four-component vector of 32-bit integer values

SubgroupLocalInvocationId

Decorating a variable with the **SubgroupLocalInvocationId** builtin decoration will make that variable contain the index of the invocation within the subgroup. This variable is in range $[0, \text{SubgroupSize}-1]$.

If **VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT** is specified, full subgroups are enabled for that pipeline stage. When full subgroups are enabled, subgroups **must** be launched with all invocations active, i.e., there is an active invocation with **SubgroupLocalInvocationId** for each value in range $[0, \text{SubgroupSize}-1]$.

NOTE

There is no direct relationship between **SubgroupLocalInvocationId** and **LocalInvocationId** or **LocalInvocationIndex**. If the pipeline was created with full subgroups applications can compute their own local invocation index to serve the same purpose:

$$\text{index} = \text{SubgroupLocalInvocationId} + \text{SubgroupId} \times \text{SubgroupSize}$$

If full subgroups are not enabled, some subgroups may be dispatched with inactive invocations that do not correspond to a local workgroup invocation, making the value of index unreliable.

Valid Usage

- VUID-SubgroupLocalInvocationId-SubgroupLocalInvocationId-04380
The variable decorated with **SubgroupLocalInvocationId** **must** be declared using the **Input Storage Class**
- VUID-SubgroupLocalInvocationId-SubgroupLocalInvocationId-04381
The variable decorated with **SubgroupLocalInvocationId** **must** be declared as a scalar 32-bit integer value

SubgroupSize

Decorating a variable with the **SubgroupSize** builtin decoration will make that variable contain the implementation-dependent **number of invocations in a subgroup**. This value **must** be a power-of-two integer.

If the pipeline was created with the **VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT** flag set, the **SubgroupSize** decorated variable will contain the subgroup size for each subgroup that gets dispatched. This value **must** be between **minSubgroupSize** and **maxSubgroupSize** and **must** be uniform with **subgroup scope**. The value **may** vary across a single draw call, and for fragment shaders **may** vary across a single primitive. In compute dispatches, **SubgroupSize** **must** be uniform with **command scope**.

If the pipeline was created with a chained **VkPipelineShaderStageRequiredSubgroupSizeCreateInfo** structure, the **SubgroupSize** decorated variable will match **requiredSubgroupSize**.

If the pipeline was not created with the **VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT** flag set and no **VkPipelineShaderStageRequiredSubgroupSizeCreateInfo** structure was chained, the variable decorated with **SubgroupSize** will match **subgroupSize**.

The maximum number of invocations that an implementation can support per subgroup is 128.

Valid Usage

- VUID-SubgroupSize-SubgroupSize-04382
The variable decorated with **SubgroupSize** **must** be declared using the **Input Storage Class**
- VUID-SubgroupSize-SubgroupSize-04383
The variable decorated with **SubgroupSize** **must** be declared as a scalar 32-bit integer value

TessCoord

Decorating a variable with the **TessCoord** built-in decoration will make that variable contain the three-dimensional (u,v,w) barycentric coordinate of the tessellated vertex within the patch. u, v, and w are in the range [0,1] and vary linearly across the primitive being subdivided. For the

tessellation modes of **Quads** or **Isolines**, the third component is always zero.

Valid Usage

- VUID-TessCoord-TessCoord-04387
The **TessCoord** decoration **must** be used only within the **TessellationEvaluation Execution Model**
- VUID-TessCoord-TessCoord-04388
The variable decorated with **TessCoord** **must** be declared using the **Input Storage Class**
- VUID-TessCoord-TessCoord-04389
The variable decorated with **TessCoord** **must** be declared as a three-component vector of 32-bit floating-point values

TessLevelOuter

Decorating a variable with the **TessLevelOuter** built-in decoration will make that variable contain the outer tessellation levels for the current patch.

In tessellation control shaders, the variable decorated with **TessLevelOuter** **can** be written to, controlling the tessellation factors for the resulting patch. These values are used by the tessellator to control primitive tessellation and **can** be read by tessellation evaluation shaders.

In tessellation evaluation shaders, the variable decorated with **TessLevelOuter** **can** read the values written by the tessellation control shader.

Valid Usage

- VUID-TessLevelOuter-TessLevelOuter-04390
The **TessLevelOuter** decoration **must** be used only within the **TessellationControl** or **TessellationEvaluation Execution Model**
- VUID-TessLevelOuter-TessLevelOuter-04391
The variable decorated with **TessLevelOuter** within the **TessellationControl Execution Model** **must** be declared using the **Output Storage Class**
- VUID-TessLevelOuter-TessLevelOuter-04392
The variable decorated with **TessLevelOuter** within the **TessellationEvaluation Execution Model** **must** be declared using the **Input Storage Class**
- VUID-TessLevelOuter-TessLevelOuter-04393
The variable decorated with **TessLevelOuter** **must** be declared as an array of size four, containing 32-bit floating-point values

TessLevelInner

Decorating a variable with the **TessLevelInner** built-in decoration will make that variable contain the inner tessellation levels for the current patch.

In tessellation control shaders, the variable decorated with **TessLevelInner** **can** be written to,

controlling the tessellation factors for the resulting patch. These values are used by the tessellator to control primitive tessellation and **can** be read by tessellation evaluation shaders.

In tessellation evaluation shaders, the variable decorated with **TessLevelInner** **can** read the values written by the tessellation control shader.

Valid Usage

- VUID-TessLevelInner-TessLevelInner-04394
The **TessLevelInner** decoration **must** be used only within the **TessellationControl** or **TessellationEvaluation** Execution Model
- VUID-TessLevelInner-TessLevelInner-04395
The variable decorated with **TessLevelInner** within the **TessellationControl** Execution Model **must** be declared using the **Output Storage Class**
- VUID-TessLevelInner-TessLevelInner-04396
The variable decorated with **TessLevelInner** within the **TessellationEvaluation** Execution Model **must** be declared using the **Input Storage Class**
- VUID-TessLevelInner-TessLevelInner-04397
The variable decorated with **TessLevelInner** **must** be declared as an array of size two, containing 32-bit floating-point values

VertexIndex

Decorating a variable with the **VertexIndex** built-in decoration will make that variable contain the index of the vertex that is being processed by the current vertex shader invocation. For non-indexed draws, this variable begins at the **firstVertex** parameter to **vkCmdDraw** or the **firstVertex** member of a structure consumed by **vkCmdDrawIndirect** and increments by one for each vertex in the draw. For indexed draws, its value is the content of the index buffer for the vertex plus the **vertexOffset** parameter to **vkCmdDrawIndexed** or the **vertexOffset** member of the structure consumed by **vkCmdDrawIndexedIndirect**.

NOTE **VertexIndex** starts at the same starting value for each instance.

Valid Usage

- VUID-VertexIndex-VertexIndex-04398
The **VertexIndex** decoration **must** be used only within the **Vertex** Execution Model
- VUID-VertexIndex-VertexIndex-04399
The variable decorated with **VertexIndex** **must** be declared using the **Input Storage Class**
- VUID-VertexIndex-VertexIndex-04400
The variable decorated with **VertexIndex** **must** be declared as a scalar 32-bit integer value

ViewIndex

The **ViewIndex** decoration **can** be applied to a shader input which will be filled with the index of the view that is being processed by the current shader invocation.

If multiview is enabled in the render pass, this value will be the index of one of the bits set in the view mask of the subpass the pipeline is compiled against. If multiview is not enabled in the render pass, this value will be zero.

Valid Usage

- VUID-ViewIndex-ViewIndex-04401
The **ViewIndex** decoration **must** be used only within the **MeshEXT**, **Vertex**, **Geometry**, **TessellationControl**, **TessellationEvaluation** or **Fragment Execution Model**
- VUID-ViewIndex-ViewIndex-04402
The variable decorated with **ViewIndex** **must** be declared using the **Input Storage Class**
- VUID-ViewIndex-ViewIndex-04403
The variable decorated with **ViewIndex** **must** be declared as a scalar 32-bit integer value

ViewportIndex

Decorating a variable with the **ViewportIndex** built-in decoration will make that variable contain the index of the viewport.

In a vertex, tessellation evaluation, or geometry shader, the variable decorated with **ViewportIndex** can be written to with the viewport index to which the primitive produced by that shader will be directed.

The selected viewport index is used to select the viewport transform and scissor rectangle.

The last active *pre-rasterization shader stage* (in pipeline order) controls the **ViewportIndex** that is used. Outputs in previous shader stages are not used, even if the last stage fails to write the **ViewportIndex**.

If the last active *pre-rasterization shader stage* shader entry point's interface does not include a variable decorated with **ViewportIndex** then the first viewport is used. If a *pre-rasterization shader stage* shader entry point's interface includes a variable decorated with **ViewportIndex**, it **must** write the same value to **ViewportIndex** for all output vertices of a given primitive.

In a fragment shader, the variable decorated with **ViewportIndex** contains the viewport index of the primitive that the fragment invocation belongs to.

Valid Usage

- VUID-ViewportIndex-ViewportIndex-04404
The **ViewportIndex** decoration **must** be used only within the **MeshEXT**, **MeshNV**, **Vertex**, **TessellationEvaluation**, **Geometry**, or **Fragment Execution Model**
- VUID-ViewportIndex-ViewportIndex-04405
If the **shaderOutputViewportIndex** feature is not enabled then the **ViewportIndex** decoration **must** be used only within the **Geometry** or **Fragment Execution Model**
- VUID-ViewportIndex-ViewportIndex-04406
The variable decorated with **ViewportIndex** within the **MeshEXT**, **MeshNV**, **Vertex**,

TessellationEvaluation, or **Geometry Execution Model** **must** be declared using the **Output Storage Class**

- VUID-ViewportIndex-ViewportIndex-04407
The variable decorated with **ViewportIndex** within the **Fragment Execution Model** **must** be declared using the **Input Storage Class**
- VUID-ViewportIndex-ViewportIndex-04408
The variable decorated with **ViewportIndex** **must** be declared as a scalar 32-bit integer value for all supported execution models except **MeshEXT**
- VUID-ViewportIndex-ViewportIndex-07060
The variable decorated with **ViewportIndex** within the **MeshEXT Execution Model** **must** also be decorated with the **PerPrimitiveEXT** decoration
- VUID-ViewportIndex-ViewportIndex-10601
ViewportIndex within the **MeshEXT Execution Model** **must** decorate a scalar 32-bit integer member of a structure decorated as **Block**, or decorate a variable of type **OpTypeArray** of scalar 32-bit integer values
- VUID-ViewportIndex-ViewportIndex-10602
If **ViewportIndex** is declared as an array of 32-bit integer values, within the **MeshEXT Execution Model**, size of the array **must** match the value specified by **OutputPrimitivesEXT**
- VUID-ViewportIndex-ViewportIndex-10603
If **ViewportIndex** decorates a member of a structure, the variable declaration of the containing **Block** type **must** have an array size that matches the value specified by **OutputPrimitivesEXT**

WorkgroupId

Decorating a variable with the **WorkgroupId** built-in decoration will make that variable contain the global coordinate of the local workgroup that the current invocation is a member of. Each component is in the range [base,base + count), where base and count are based on the parameters passed into the dispatching commands in each dimension.

Valid Usage

- VUID-WorkgroupId-WorkgroupId-04422
The **WorkgroupId** decoration **must** be used only within the **GLCompute**, **MeshEXT**, **TaskEXT**, **MeshNV**, or **TaskNV Execution Model**
- VUID-WorkgroupId-WorkgroupId-04423
The variable decorated with **WorkgroupId** **must** be declared using the **Input Storage Class**
- VUID-WorkgroupId-WorkgroupId-04424
The variable decorated with **WorkgroupId** **must** be declared as a three-component vector of 32-bit integer values

WorkgroupSize

Decorating an object with the **WorkgroupSize** built-in decoration will make that object contain the dimensions of a local workgroup. If an object is decorated with the **WorkgroupSize** decoration, this

takes precedence over any **LocalSize** execution mode.

Valid Usage

- VUID-WorkgroupSize-WorkgroupSize-04425
The **WorkgroupSize** decoration **must** be used only within the **GLCompute**, **MeshEXT**, **TaskEXT**, **MeshNV**, or **TaskNV Execution Model**
- VUID-WorkgroupSize-WorkgroupSize-04426
The variable decorated with **WorkgroupSize** **must** be a specialization constant or a constant
- VUID-WorkgroupSize-WorkgroupSize-04427
The variable decorated with **WorkgroupSize** **must** be declared as a three-component vector of 32-bit integer values

Chapter 17. Image Operations

17.1. Image Operations Overview

Vulkan Image Operations are operations performed on **images** by SPIR-V Image Instructions which take an **OpTypeImage** (representing a **VkImageView**) or **OpTypeSampledImage** (representing a (**VkImageView**, **VkSampler**) pair). Read, write, and atomic operations also take texel coordinates as operands, and return a value based on a neighborhood of texture elements (*texels*) within the image. Query operations return properties of the bound image or of the lookup itself. The “Depth” operand of **OpTypeImage** is ignored.

Image Operations include the functionality of the following SPIR-V Image Instructions:

- **OpImageSample*** and **OpImageSparseSample*** read one or more neighboring texels of the image, and **filter** the texel values based on the state of the sampler.
 - Instructions with **ImplicitLod** in the name **determine** the LOD used in the sampling operation based on the coordinates used in neighboring fragments.
 - Instructions with **ExplicitLod** in the name **determine** the LOD used in the sampling operation based on additional coordinates.
 - Instructions with **Proj** in the name apply homogeneous **projection** to the coordinates.
- **OpImageFetch** and **OpImageSparseFetch** return a single texel of the image. No sampler is used.
- **OpImage*Gather** and **OpImageSparse*Gather** read neighboring texels and **return a single component** of each.
- **OpImageRead** (and **OpImageSparseRead**) and **OpImageWrite** read and write, respectively, a texel in the image. No sampler is used.
- **OpImage*Dref*** instructions apply **depth comparison** on the texel values.
- **OpImageSparse*** instructions additionally return a **sparse residency** code.
- **OpImageQuerySize**, **OpImageQuerySizeLod**, **OpImageQueryLevels**, and **OpImageQuerySamples** return properties of the image descriptor that would be accessed. The image itself is not accessed.
- **OpImageQueryLod** returns the LOD parameters that would be used in a sample operation. The actual operation is not performed.

17.1.1. Sampling Coordinate Systems

There are three *sampling coordinate systems* used in this chapter:

- normalized sampling coordinates [0.0, 1.0]
- unnormalized sampling coordinates [0.0, width / height / depth)
- integer sampling coordinates [0, width / height / depth)

SPIR-V **OpImageFetch**, **OpImageSparseFetch**, **OpImageRead**, **OpImageSparseRead**, and **OpImageWrite** instructions use integer sampling coordinates.

Other image instructions **can** use either normalized or unnormalized sampling coordinates (selected by the `unnormalizedCoordinates` state of the sampler used in the instruction), but there are **limitations** on what operations, image state, and sampler state is supported. Normalized coordinates are logically **converted** to unnormalized as part of image operations, and **certain steps** are only performed on normalized coordinates. The array layer coordinate is always treated as unnormalized even when other coordinates are normalized.

Normalized texel coordinates are referred to as (s,t,r,q,a), with the coordinates having the following meanings:

- s: Coordinate in the first dimension of an image.
- t: Coordinate in the second dimension of an image.
- r: Coordinate in the third dimension of an image.
 - (s,t,r) are interpreted as a direction vector for Cube images.
- q: Fourth coordinate, for homogeneous (projective) coordinates.
- a: Coordinate for array layer.

The coordinates are extracted from the SPIR-V operand based on the dimensionality of the image variable and type of instruction. For **Proj** instructions, the components are in order (s, [t,] [r,] q), with t and r being conditionally present based on the **Dim** of the image. For non-**Proj** instructions, the coordinates are (s [t] [r] [a]), with t and r being conditionally present based on the **Dim** of the image and a being conditionally present based on the **Arrayed** property of the image. Projective image instructions are not supported on **Arrayed** images.

Unnormalized texel coordinates are referred to as (u,v,w,a), with the coordinates having the following meanings:

- u: Coordinate in the first dimension of an image.
- v: Coordinate in the second dimension of an image.
- w: Coordinate in the third dimension of an image.
- a: Coordinate for array layer.

Only the u and v coordinates are directly extracted from the SPIR-V operand, because only 1D and 2D (non-**Arrayed**) dimensionalities support unnormalized coordinates. The components are in order (u [v]), with v being conditionally present when the dimensionality is 2D. When normalized coordinates are converted to unnormalized coordinates, all four coordinates are used.

Integer sampling coordinates are referred to as (i,j,k,l,n), with the coordinates having the following meanings:

- i: Coordinate in the first dimension of an image.
- j: Coordinate in the second dimension of an image.
- k: Coordinate in the third dimension of an image.
- l: Coordinate for array layer.
- n: Index of the sample within the texel.

They are extracted from the SPIR-V operand in order (i [j] [k] [l] [n]), with j and k conditionally present based on the **Dim** of the image, and l conditionally present based on the **Arrayed** property of the image. n is conditionally present and is taken from the **Sample** image operand.

Final integer coordinates are used as **image coordinates** to perform an **image read** after sampling calculations, directly translating each coordinate as follows:

- $i \rightarrow x$
- $j \rightarrow y$
- $k \rightarrow z$
- $l \rightarrow \text{layer}$
- $n \rightarrow \text{sample}$

level is calculated separately via the **Lod** image operand if present, or is set to 0 otherwise.

For all coordinate types, unused coordinates are assigned a value of zero.

Figure 3. Texel Coordinate Systems, Linear Filtering

The Texel Coordinate Systems - For the example shown of an 8×4 texel two dimensional image.

- Normalized texel coordinates:
 - The s coordinate goes from 0.0 to 1.0.
 - The t coordinate goes from 0.0 to 1.0.
- Unnormalized texel coordinates:
 - The u coordinate within the range 0.0 to 8.0 is within the image, otherwise it is outside the image.
 - The v coordinate within the range 0.0 to 4.0 is within the image, otherwise it is outside the

image.

- Integer texel coordinates:
 - The i coordinate within the range 0 to 7 addresses texels within the image, otherwise it is outside the image.
 - The j coordinate within the range 0 to 3 addresses texels within the image, otherwise it is outside the image.
- Also shown for linear filtering:
 - Given the unnormalized coordinates (u,v) , the four texels selected are i_0j_0 , i_1j_0 , i_0j_1 , and i_1j_1 .
 - The fractions α and β .
 - Given the offset Δ_i and Δ_j , the four texels selected by the offset are $i_0j'_0$, $i_1j'_0$, $i_0j'_1$, and $i_1j'_1$.

NOTE

For formats with reduced-resolution components, Δ_i and Δ_j are relative to the resolution of the highest-resolution component, and therefore may be divided by two relative to the unnormalized coordinate space of the lower-resolution components.

Figure 4. Texel Coordinate Systems, Nearest Filtering

The Texel Coordinate Systems - For the example shown of an 8x4 texel two dimensional image.

- Texel coordinates as above. Also shown for nearest filtering:
 - Given the unnormalized coordinates (u,v) , the texel selected is ij .
 - Given the offset Δ_i and Δ_j , the texel selected by the offset is ij' .

17.2. Sampling Operations

Sampling instructions are SPIR-V image instructions that read from an image with a sampler.

Sampling operations are a set of steps that are performed on state, coordinates, and texel values while processing a sampling instruction, and which are common to some or all sampling instructions. They include the following steps, which are performed in the listed order:

- Validation operations
 - Instruction/Sampler/Image validation
 - Coordinate validation
 - Layout validation
 - Cube Map Edge Handling
- Border Replacement
- Texel Reads
- Depth comparison
- Component swizzle
- Chroma reconstruction
- Y'C_BC_R conversion

For texel input instructions involving multiple texels (for sampling or gathering), these steps are applied for each texel that is used in the instruction. Depending on the type of image instruction, other steps are conditionally performed between these steps or involving multiple coordinate or texel values.

If [Chroma Reconstruction](#) is implicit, [Texel Filtering](#) instead takes place during chroma reconstruction, before [sampler Y'C_BC_R conversion](#) occurs.

17.2.1. Texel Input Validation Operations

Texel input validation operations inspect instruction/image/sampler state or coordinates, and in certain circumstances cause the texel value to be replaced or become undefined. There are a series of validations that the texel undergoes.

Instruction/Sampler/Image View Validation

There are a number of cases where a SPIR-V instruction **can** mismatch with the sampler, the image view, or both, and a number of further cases where the sampler **can** mismatch with the image view. In such cases the value of the texel returned is undefined.

These cases include:

- The sampler `borderColor` is an integer type and the image view `format` is not one of the [VkFormat](#) integer types or a stencil component of a depth/stencil format.
- The sampler `borderColor` is a float type and the image view `format` is not one of the [VkFormat](#) float types or a depth component of a depth/stencil format.
- The sampler `borderColor` is one of the opaque black colors (`VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK` or `VK_BORDER_COLOR_INT_OPAQUE_BLACK`) and the image view [VkComponentSwizzle](#) for any of the [VkComponentMapping](#) components is not the [identity swizzle](#).

- The sampler `borderColor` is a custom color (`VK_BORDER_COLOR_FLOAT_CUSTOM_EXT` or `VK_BORDER_COLOR_INT_CUSTOM_EXT`) and the supplied `VkSamplerCustomBorderColorCreateInfoEXT::customBorderColor` is outside the bounds of the values representable in the image view's `format`.
- The sampler `borderColor` is a custom color (`VK_BORDER_COLOR_FLOAT_CUSTOM_EXT` or `VK_BORDER_COLOR_INT_CUSTOM_EXT`) and the image view `VkComponentSwizzle` for any of the `VkComponentMapping` components is not the `identity swizzle`.
- The `VkImageLayout` of any subresource in the image view does not match the `VkDescriptorImageInfo::imageLayout` used to write the image descriptor.
- The SPIR-V Image Format is not `compatible` with the image view's `format`.
- The sampler `unnormalizedCoordinates` is `VK_TRUE` and any of the `limitations of unnormalized coordinates` are violated.
- The SPIR-V instruction is one of the `OpImage*Dref*` instructions and the sampler `compareEnable` is `VK_FALSE`
- The SPIR-V instruction is not one of the `OpImage*Dref*` instructions and the sampler `compareEnable` is `VK_TRUE`
- The SPIR-V instruction is one of the `OpImage*Dref*` instructions and the image view `format` is not one of the depth/stencil formats with a depth component, or the image view aspect is not `VK_IMAGE_ASPECT_DEPTH_BIT`.
- The SPIR-V instruction's image variable's properties are not compatible with the image view:
 - If the image view's `viewType` is one of `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY` then the instruction **must** have `Arrayed` = 1. Otherwise the instruction **must** have `Arrayed` = 0.
 - If the image was created with `VkImageCreateInfo::samples` equal to `VK_SAMPLE_COUNT_1_BIT`, the instruction **must** have `MS` = 0.
 - If the image was created with `VkImageCreateInfo::samples` not equal to `VK_SAMPLE_COUNT_1_BIT`, the instruction **must** have `MS` = 1.
 - If the `Sampled Type` of the `OpTypeImage` does not match the `SPIR-V Type`.
 - If the `signedness of any read or sample operation` does not match the signedness of the image's format.
- The sampler was created with a specified `VkSamplerCustomBorderColorCreateInfoEXT::format` which does not match the `VkFormat` of the image view(s) it is sampling.
- The sampler is sampling an image view of `VK_FORMAT_B4G4R4A4_UNORM_PACK16`, `VK_FORMAT_B5G6R5_UNORM_PACK16`, or `VK_FORMAT_B5G5R5A1_UNORM_PACK16` format without a specified `VkSamplerCustomBorderColorCreateInfoEXT::format`.

Only `OpImageSample*` and `OpImageSparseSample*` **can** be used with a sampler or image view that enables `sampler Y'CBCR conversion`.

`OpImageFetch`, `OpImageSparseFetch`, `OpImage*Gather`, and `OpImageSparse*Gather` **must** not be used with a sampler or image view that enables `sampler Y'CBCR conversion`.

The `ConstOffset` and `Offset` operands **must** not be used with a sampler or image view that enables

sampler Y'C_BC_R conversion.

If the underlying **VkImage** format has an X component in its format description, undefined values are read from those bits.

NOTE

If the **VkImage** format and **VkImageView** format are the same, these bits will be unused by format conversion and this will have no effect. However, if the **VkImageView** format is different, then some bits of the result may be undefined. For example, when a **VK_FORMAT_R10X6_UNORM_PACK16** **VkImage** is sampled via a **VK_FORMAT_R16_UNORM** **VkImageView**, the low 6 bits of the value before format conversion are undefined and format conversion may return a range of different values.

NOTE

Some implementations will return undefined values in the case where a sampler uses a **VkSamplerAddressMode** of **VK_SAMPLER_ADDRESS_MODE_MIRRORED_REPEAT**, the sampler is used with operands **Offset**, **ConstOffset**, or **ConstOffsets**, and the value of the offset is larger than or equal to the corresponding width, height, or depth of any accessed image level.

This behavior was not tested prior to Vulkan conformance test suite version 1.3.8.0. Affected implementations will have a conformance test waiver for this issue.

Layout Validation

If all planes of a *disjoint multi-planar* image are not in the same **image layout**, the image **must** not be sampled with **sampler Y'C_BC_R conversion** enabled.

Coordinate Validation

Once the **normalized** or **unnormalized coordinates** have been converted to integer image coordinates, the integer coordinates are validated as image coordinates, as outlined in **Image Coordinate Validation**, converted as follows:

- $x = i$
- $y = j$
- $z = k$
- $\text{layer} = l$
- $\text{sample} = n$
- $\text{level} = d$

Cube Map Edge Handling

When sampling a cube map, if the image coordinates are out of bounds of the **selected cube map face**, the following steps are performed.

NOTE

This does not occur when using **VK_FILTER_NEAREST** filtering within a mip level, since **VK_FILTER_NEAREST** is treated as using **VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE**.

- Cube Map Edge Texel
 - If the texel lies beyond the selected cube map face in either only x or only y, then the coordinates (x,y,layer) are transformed to select the adjacent texel from the appropriate neighboring face.
- Cube Map Corner Texel
 - If the texel lies beyond the selected cube map face in both x and y, then there is no unique neighboring face from which to read that texel. The texel **should** be replaced by the average of the three values of the adjacent texels in each incident face. However, implementations **may** replace the cube map corner texel by other methods. The methods are subject to the constraint that for linear filtering if the three available texels have the same value, the resulting filtered texel **must** have that value, and for cubic filtering if the twelve available samples have the same value, the resulting filtered texel **must** have that value.

17.2.2. Border Replacement

If the sampler includes a border, out of bounds texels are replaced with a value based on the image format and the **borderColor** of the sampler. The border color is:

Table 20. Border Color B, Custom Border Color *VkSamplerCustomBorderColorCreateInfoEXT*
::customBorderColor U

Sampler borderColor	Corresponding Border Color
VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK	$[B_r, B_g, B_b, B_a] = [0.0, 0.0, 0.0, 0.0]$
VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK	$[B_r, B_g, B_b, B_a] = [0.0, 0.0, 0.0, 1.0]$
VK_BORDER_COLOR_FLOAT_OPAQUE_WHITE	$[B_r, B_g, B_b, B_a] = [1.0, 1.0, 1.0, 1.0]$
VK_BORDER_COLOR_INT_TRANSPARENT_BLACK	$[B_r, B_g, B_b, B_a] = [0, 0, 0, 0]$
VK_BORDER_COLOR_INT_OPAQUE_BLACK	$[B_r, B_g, B_b, B_a] = [0, 0, 0, 1]$
VK_BORDER_COLOR_INT_OPAQUE_WHITE	$[B_r, B_g, B_b, B_a] = [1, 1, 1, 1]$
VK_BORDER_COLOR_FLOAT_CUSTOM_EXT	$[B_r, B_g, B_b, B_a] = [U_r, U_g, U_b, U_a]$
VK_BORDER_COLOR_INT_CUSTOM_EXT	$[B_r, B_g, B_b, B_a] = [U_r, U_g, U_b, U_a]$

The custom border color (U) **may** be rounded by implementations prior to texel replacement, but the error introduced by such a rounding **must** not exceed one ULP of the image's **format**.

NOTE

The names **VK_BORDER_COLOR*_TRANSPARENT_BLACK**, **VK_BORDER_COLOR*_OPAQUE_BLACK**, and **VK_BORDER_COLOR*_OPAQUE_WHITE** are meant to describe which components are zeros and ones in the vocabulary of compositing, and are not meant to imply that the numerical value of **VK_BORDER_COLOR_INT_OPAQUE_WHITE** is a saturating value for integers.

This is substituted for the texel value by replacing the number of components in the image format

Table 21. Border Texel Components After Replacement

Texel Aspect or Format	Component Assignment
Depth aspect	$D = B_r$
Stencil aspect	$S = B_r^\dagger$
One component color format	$\text{Color}_r = B_r$
Two component color format	$[\text{Color}_r, \text{Color}_g] = [B_r, B_g]$
Three component color format	$[\text{Color}_r, \text{Color}_g, \text{Color}_b] = [B_r, B_g, B_b]$
Four component color format	$[\text{Color}_r, \text{Color}_g, \text{Color}_b, \text{Color}_a] = [B_r, B_g, B_b, B_a]$

$\dagger S = B_g$ **may** be substituted as the replacement method by the implementation when `VkSamplerCreateInfo::borderColor` is `VK_BORDER_COLOR_INT_CUSTOM_EXT` and `VkSamplerCustomBorderColorCreateInfoEXT::format` is `VK_FORMAT_UNDEFINED`. Implementations **should** use $S = B_r$ as the replacement method.

Implementations **may** swap the blue and alpha channels when sampling non-custom border colors with the `VK_FORMAT_B4G4R4A4_UNORM_PACK16` format, or the red and alpha channels with the `VK_FORMAT_R4G4B4A4_UNORM_PACK16` format.

NOTE

As `VK_FORMAT_B4G4R4A4_UNORM_PACK16` is required by Vulkan, support must be advertised for this format. Some Vulkan implementations on Apple hardware implement these formats through a hardware format with a different channel order, swizzled to match Vulkan's expectations. Unfortunately the swizzle cannot be readily applied to the fixed border colors - resulting in the apparent channel swap. For most standard border colors this does not result in a modification to the sampled output. However, `VK_BORDER_COLOR_*_OPAQUE_BLACK` will instead be sampled as transparent red or blue. If the `customBorderColorWithoutFormat` feature is supported and enabled, this functionality is expected to work without issue, but this feature may come with a performance cost.

When border color replacement occurs, [texel reads](#) are skipped, and the replaced color is used for ongoing operations instead.

17.2.3. Texel Reads

A texel is read from an image, performed as outlined in [Image Reads](#), using the converted image coordinates.

The returned components of each texel are then processed by further input operations.

17.2.4. Depth Compare Operation

If the image view has a depth/stencil format, the depth component is selected by the `aspectMask`, and the operation is an `OpImage*Dref*` instruction, a depth comparison is performed. The result is 1.0 if the comparison evaluates to true, and 0.0 otherwise. This value replaces the depth component D.

The compare operation is selected by the `VkCompareOp` value set by `VkSamplerCreateInfo::compareOp`. The reference value from the SPIR-V operand D_{ref} and the texel depth value D_{tex} are used

as the *reference* and *test* values, respectively, in that operation.

If the image being sampled has an unsigned normalized fixed-point format, then D_{ref} is clamped to [0,1] before the compare operation.

If the value of `magFilter` is `VK_FILTER_LINEAR`, or the value of `minFilter` is `VK_FILTER_LINEAR`, then D may be computed in an implementation-dependent manner which differs from the normal rules of linear filtering. The resulting value **must** be in the range [0,1] and should be proportional to, or a weighted average of, the number of comparison passes or failures.

17.2.5. Component Swizzle

All texel input instructions apply a *swizzle* based on:

- the `VkComponentSwizzle` enums in the `components` member of the `VkImageViewCreateInfo` structure for the image being read if `sampler Y'CBCR conversion` is not enabled, and
- the `VkComponentSwizzle` enums in the `components` member of the `VkSamplerYcbcrConversionCreateInfo` structure for the `sampler Y'CBCR conversion` if `sampler Y'CBCR conversion` is enabled.

The swizzle **can** rearrange the components of the texel, or substitute zero or one for any components. It is defined as follows for each color component:

$$Color'_{component} = \begin{cases} Color_r & \text{for RED swizzle} \\ Color_g & \text{for GREEN swizzle} \\ Color_b & \text{for BLUE swizzle} \\ Color_a & \text{for ALPHA swizzle} \\ 0 & \text{for ZERO swizzle} \\ one & \text{for ONE swizzle} \\ identity & \text{for IDENTITY swizzle} \end{cases}$$

where:

$$one = \begin{cases} 1.0f & \text{for floating-point components} \\ 1 & \text{for integer components} \end{cases}$$

$$identity = \begin{cases} Color_r & \text{for } component = r \\ Color_g & \text{for } component = g \\ Color_b & \text{for } component = b \\ Color_a & \text{for } component = a \end{cases}$$

If the border color is one of the `VK_BORDER_COLOR_*_OPAQUE_BLACK` enums and the `VkComponentSwizzle` is not the `identity swizzle` for all components, the value of the texel after swizzle is undefined.

If the image view has a depth/stencil format and the `VkComponentSwizzle` is `VK_COMPONENT_SWIZZLE_ONE`, the value of the texel after swizzle is undefined.

17.2.6. Sparse Residency

`OpImageSparse*` instructions return a structure which includes a *residency code* indicating whether any texels accessed by the instruction are sparse unbound texels. This code **can** be interpreted by the `OpImageSparseTexelsResident` instruction which converts the residency code to a boolean value.

17.2.7. Chroma Reconstruction

In some color models, the color representation is defined in terms of monochromatic light intensity (often called “luma”) and color differences relative to this intensity, often called “chroma”. It is common for color models other than RGB to represent the chroma components at lower spatial resolution than the luma component. This approach is used to take advantage of the eye’s lower spatial sensitivity to color compared with its sensitivity to brightness. Less commonly, the same approach is used with additive color, since the green component dominates the eye’s sensitivity to light intensity and the spatial sensitivity to color introduced by red and blue is lower.

Lower-resolution components are “downsampled” by resizing them to a lower spatial resolution than the component representing luminance. This process is also commonly known as “chroma subsampling”. There is one luminance sample in each texture texel, but each chrominance sample may be shared among several texels in one or both texture dimensions.

- “_444” formats do not spatially downsample chroma values compared with luma: there are unique chroma samples for each texel.
- “_422” formats have downsampling in the x dimension (corresponding to *u* or *s* coordinates): they are sampled at half the resolution of luma in that dimension.
- “_420” formats have downsampling in the x dimension (corresponding to *u* or *s* coordinates) and the y dimension (corresponding to *v* or *t* coordinates): they are sampled at half the resolution of luma in both dimensions.

The process of reconstructing a full color value for texture access involves accessing both chroma and luma values at the same location. To generate the color accurately, the values of the lower-resolution components at the location of the luma samples are reconstructed from the lower-resolution sample locations, an operation known here as “chroma reconstruction” irrespective of the actual color model.

The location of the chroma samples relative to the luma coordinates is determined by the `xChromaOffset` and `yChromaOffset` members of the `VkSamplerYcbcrConversionCreateInfo` structure used to create the sampler Y’C_BC_R conversion.

The following diagrams show the relationship between unnormalized (*u,v*) coordinates and (*i,j*) integer texel positions in the luma component (shown in black, with circles showing integer sample positions) and the texel coordinates of reduced-resolution chroma components, shown as crosses in red.

NOTE

If the chroma values are reconstructed at the locations of the luma samples by means of interpolation, chroma samples from outside the image bounds are needed; these are determined according to [Wrapping Operation](#). These diagrams represent this by showing the bounds of the “chroma texel” extending beyond the

image bounds, and including additional chroma sample positions where required for interpolation. The limits of a sample for **NEAREST** sampling is shown as a grid.

Figure 5. 422 downsampling, $xChromaOffset=COSITED\_EVEN$

Figure 6. 422 downsampling, $xChromaOffset=MIDPOINT$

Figure 7. 420 downsampling, $x\text{ChromaOffset}=\text{COSITED\_EVEN}$, $y\text{ChromaOffset}=\text{COSITED\_EVEN}$

Figure 8. 420 downsampling, $x\text{ChromaOffset}=\text{MIDPOINT}$, $y\text{ChromaOffset}=\text{COSITED\_EVEN}$

Figure 9. 420 downsampling, $xChromaOffset=COSITED\_EVEN$, $yChromaOffset=MIDPOINT$

Figure 10. 420 downsampling, $xChromaOffset=MIDPOINT$, $yChromaOffset=MIDPOINT$

Reconstruction is implemented in one of two ways:

If the format of the image that is to be sampled sets `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT`, or the `VkSamplerYcbcrConversionCreateInfo`'s `forceExplicitReconstruction` is `VK_TRUE`, reconstruction is performed as an explicit step independent of filtering, described in the [Explicit Reconstruction](#) section.

If the format of the image that is to be sampled does not set `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT` and if the

`VkSamplerYcbcrConversionCreateInfo`'s `forceExplicitReconstruction` is `VK_FALSE`, reconstruction is performed as an implicit part of filtering prior to color model conversion, with no separate post-conversion texel filtering step, as described in the [Implicit Reconstruction](#) section.

Explicit Reconstruction

- If the `chromaFilter` member of the `VkSamplerYcbcrConversionCreateInfo` structure is `VK_FILTER_NEAREST`:
 - If the format's R and B components are reduced in resolution in just width by a factor of two relative to the G component (i.e. this is a “_422” format), the τ_{ijk}^{level} values accessed by [texel filtering](#) are reconstructed as follows:

$$\begin{aligned}\tau_R' [i, j] &= \tau_R [i \times 0.5, j]^{level} \\ \tau_B' [i, j] &= \tau_B [i \times 0.5, j]^{level}\end{aligned}$$

- If the format's R and B components are reduced in resolution in width and height by a factor of two relative to the G component (i.e. this is a “_420” format), the τ_{ijk}^{level} values accessed by [texel filtering](#) are reconstructed as follows:

$$\begin{aligned}\tau_R' [i, j] &= \tau_R [i \times 0.5, \lfloor j \times 0.5 \rfloor]^{level} \\ \tau_B' [i, j] &= \tau_B [i \times 0.5, \lfloor j \times 0.5 \rfloor]^{level}\end{aligned}$$

NOTE

`xChromaOffset` and `yChromaOffset` have no effect if `chromaFilter` is `VK_FILTER_NEAREST` for explicit reconstruction.

- If the `chromaFilter` member of the `VkSamplerYcbcrConversionCreateInfo` structure is `VK_FILTER_LINEAR`:
 - If the format's R and B components are reduced in resolution in just width by a factor of two relative to the G component (i.e. this is a “_422” format):
 - If `xChromaOffset` is `VK_CHROMA_LOCATION_COSITED_EVEN`:

$$\tau_{RB}' [i, j] = \begin{cases} \tau_{RB} [i \times 0.5, j]^{level}, & 0.5 \times i = \lfloor 0.5 \times i \rfloor \\ 0.5 \times \tau_{RB} [i \times 0.5, j]^{level} + \\ 0.5 \times \tau_{RB} [i \times 0.5] + 1, j]^{level}, & 0.5 \times i \neq \lfloor 0.5 \times i \rfloor \end{cases}$$

- If `xChromaOffset` is `VK_CHROMA_LOCATION_MIDPOINT`:

$$\tau_{RB}' [i, j] = \begin{cases} 0.25 \times \tau_{RB} [i \times 0.5] - 1, j]^{level} + \\ 0.75 \times \tau_{RB} [i \times 0.5, j]^{level}, & 0.5 \times i = \lfloor 0.5 \times i \rfloor \\ 0.75 \times \tau_{RB} [i \times 0.5, j]^{level} + \\ 0.25 \times \tau_{RB} [i \times 0.5] + 1, j]^{level}, & 0.5 \times i \neq \lfloor 0.5 \times i \rfloor \end{cases}$$

- If the format's R and B components are reduced in resolution in width and height by a factor of two relative to the G component (i.e. this is a “_420” format), a similar relationship applies. Due to the number of options, these formulae are expressed more concisely as follows:

$$i_{RB} = \begin{cases} 0.5 \times \lceil i \rceil & \text{xChromaOffset=COSITED\_EVEN} \\ 0.5 \times \lceil i \rceil - 0.5 & \text{xChromaOffset=MIDPOINT} \end{cases}$$

$$j_{RB} = \begin{cases} 0.5 \times \lceil j \rceil & \text{yChromaOffset=COSITED\_EVEN} \\ 0.5 \times \lceil j \rceil - 0.5 & \text{yChromaOffset=MIDPOINT} \end{cases}$$

$$i_{floor} = \lfloor i_{RB} \rfloor$$

$$j_{floor} = \lfloor j_{RB} \rfloor$$

$$i_{frac} = i_{RB} - i_{floor}$$

$$j_{frac} = j_{RB} - j_{floor}$$

$$\tau_{RB}(\lceil i \rceil, \lceil j \rceil) = \tau_{RB}(i_{floor}, j_{floor}, \lceil level \rceil) \times (1 - i_{frac}) \times (1 - j_{frac}) +$$

$$\tau_{RB}(1 + i_{floor}, j_{floor}, \lceil level \rceil) \times i_{frac} \times (1 - j_{frac}) +$$

$$\tau_{RB}(i_{floor}, 1 + j_{floor}, \lceil level \rceil) \times (1 - i_{frac}) \times j_{frac} +$$

$$\tau_{RB}(1 + i_{floor}, 1 + j_{floor}, \lceil level \rceil) \times i_{frac} \times j_{frac}$$

NOTE

In the case where the texture itself is bilinearly interpolated as described in [Texel Filtering](#), thus requiring four full-color samples for the filtering operation, and where the reconstruction of these samples uses bilinear interpolation in the chroma components due to `chromaFilter=VK_FILTER_LINEAR`, up to nine chroma samples may be required, depending on the sample location.

Implicit Reconstruction

Implicit reconstruction takes place by the samples being interpolated, as required by the filter settings of the sampler, except that `chromaFilter` takes precedence for the chroma samples.

If `chromaFilter` is `VK_FILTER_NEAREST`, an implementation **may** behave as if `xChromaOffset` and `yChromaOffset` were both `VK_CHROMA_LOCATION_MIDPOINT`, irrespective of the values set.

NOTE

This will not have any visible effect if the locations of the luma samples coincide with the location of the samples used for rasterization.

The sample coordinates are adjusted by the downsample factor of the component (such that, for example, the sample coordinates are divided by two if the component has a downsample factor of two relative to the luma component):

$$u_{RB}(\lceil 422/420 \rceil) = \begin{cases} 0.5 \times \lceil u + 0.5 \rceil, & \text{xChromaOffset=COSITED\_EVEN} \\ 0.5 \times u, & \text{xChromaOffset=MIDPOINT} \end{cases}$$

$$v_{RB}(\lceil 420 \rceil) = \begin{cases} 0.5 \times \lceil v + 0.5 \rceil, & \text{yChromaOffset=COSITED\_EVEN} \\ 0.5 \times v, & \text{yChromaOffset=MIDPOINT} \end{cases}$$

17.2.8. Sampler Y'C_BC_R Conversion

Sampler Y'C_BC_R conversion performs the following operations on sampled data, in order:

1. Sampler Y'C_BC_R Component Swizzle

2. Sampler Y'C_BC_R Range Expansion

3. Sampler Y'C_BC_R Model Conversion

An implementation **may** combine the range expansion and model conversion into a single mathematical operation.

These operations are applied to color component values after [sampling operations](#) which are not specific to sampler Y'C_BC_R conversion have completed.

Sampler Y'C_BC_R Component Swizzle

Rather than the [component swizzle performed as part of sampling](#), which is banned for Y'C_BC_R image views used with sampler Y'C_BC_R conversion, the component swizzle specified by [VkSamplerYcbcrConversionCreateInfo::components](#) is applied to the sampled data instead. This is applied in the same way as the component swizzle usually performed during sampling.

Sampler Y'C_BC_R Range Expansion

Sampler Y'C_BC_R range expansion is not applied if [ycbcrModel](#) is [VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY](#).

For other values of [ycbcrModel](#), range expansion applies independently to each component of the sampled data. For the purposes of range expansion and Y'C_BC_R model conversion, the R and B components contain color difference (chroma) values and the G component contains luma. The A component is not modified by sampler Y'C_BC_R range expansion.

The range expansion to be applied is defined by the [ycbcrRange](#) member of the [VkSamplerYcbcrConversionCreateInfo](#) structure:

- If [ycbcrRange](#) is [VK_SAMPLER_YCBCR_RANGE_ITU_FULL](#), the following transformations are applied:

$$\begin{aligned} Y' &= C'_{rgba} \parallel G_i \\ C_B &= C'_{rgba} \parallel B_i - \frac{2^{in} - 1}{2^n - 1} \\ C_R &= C'_{rgba} \parallel R_i - \frac{2^{in} - 1}{2^n - 1} \end{aligned}$$

NOTE

These formulae correspond to the “full range” encoding in the “Quantization schemes” chapter of the [Khronos Data Format Specification](#).

Should any future amendments be made to the ITU specifications from which these equations are derived, the formulae used by Vulkan **may** also be updated to maintain parity.

- If [ycbcrRange](#) is [VK_SAMPLER_YCBCR_RANGE_ITU_NARROW](#), the following transformations are applied:

$$Y' = \frac{C'_{rgba} \cdot G \times (2^n - 1) - 16 \times 2^{n-8}}{219 \times 2^{n-8}}$$

$$C_B = \frac{C'_{rgba} \cdot B \times (2^n - 1) - 128 \times 2^{n-8}}{224 \times 2^{n-8}}$$

$$C_R = \frac{C'_{rgba} \cdot R \times (2^n - 1) - 128 \times 2^{n-8}}{224 \times 2^{n-8}}$$

NOTE

These formulae correspond to the “narrow range” encoding in the “Quantization schemes” chapter of the [Khronos Data Format Specification](#).

- n is the bit-depth of the components in the format.

The precision of the operations performed during range expansion **must** be at least that of the source format.

An implementation **may** clamp the results of these range expansion operations such that Y' falls in the range $[0,1]$, and/or such that C_B and C_R fall in the range $[-0.5,0.5]$.

Sampler Y'C_BC_R Model Conversion

The range-expanded values are converted between color models, according to the color model conversion specified in the `ycbcrModel` member:

VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY

The color components are not modified by the color model conversion since they are assumed already to represent the desired color model in which the shader is operating; Y'C_BC_R range expansion is also ignored.

VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY

The color components are not modified by the color model conversion and are assumed to be treated as though in Y'C_BC_R form both in memory and in the shader; Y'C_BC_R range expansion is applied to the components as for other Y'C_BC_R models, with the vector (C_R,Y',C_B,A) provided to the shader.

VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709

The color components are transformed from a Y'C_BC_R representation to an R'G'B' representation as described in the “BT.709 Y'C_BC_R conversion” section of the [Khronos Data Format Specification](#).

VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601

The color components are transformed from a Y'C_BC_R representation to an R'G'B' representation as described in the “BT.601 Y'C_BC_R conversion” section of the [Khronos Data Format Specification](#).

VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020

The color components are transformed from a Y'C_BC_R representation to an R'G'B' representation as described in the “BT.2020 Y'C_BC_R conversion” section of the [Khronos Data Format Specification](#).

In this operation, each output component is dependent on each input component.

An implementation **may** clamp the R'G'B' results of these conversions to the range [0,1].

The precision of the operations performed during model conversion **must** be at least that of the source format.

The alpha component is not modified by these model conversions.

NOTE

Sampling operations in a non-linear color space can introduce color and intensity shifts at sharp transition boundaries. To avoid this issue, the technically precise color correction sequence described in the “Introduction to Color Conversions” chapter of the [Khronos Data Format Specification](#) may be performed as follows:

- Calculate the [unnormalized texel coordinates](#) corresponding to the desired sample position.
- For a [minFilter](#) or [magFilter](#) of [VK_FILTER_NEAREST](#):
 1. Calculate (i,j) for the sample location as described under the “nearest filtering” formulae in [\(u,v,w,a\) to \(i,j,k,l,n\) Transformation and Array Layer Selection](#)
 2. Calculate the normalized texel coordinates corresponding to these integer coordinates.
 3. Sample using [sampler Y'C_BC_R conversion](#) at this location.
- For a [minFilter](#) or [magFilter](#) of [VK_FILTER_LINEAR](#):
 1. Calculate $(i_{[0,1]},j_{[0,1]})$ for the sample location as described under the “linear filtering” formulae in [\(u,v,w,a\) to \(i,j,k,l,n\) Transformation and Array Layer Selection](#)
 2. Calculate the normalized texel coordinates corresponding to these integer coordinates.
 3. Sample using [sampler Y'C_BC_R conversion](#) at each of these locations.
 4. Convert the non-linear A'R'G'B' outputs of the Y'C_BC_R conversions to linear ARGB values as described in the “Transfer Functions” chapter of the [Khronos Data Format Specification](#).
 5. Interpolate the linear ARGB values using the α and β values described in the “linear filtering” section of [\(u,v,w,a\) to \(i,j,k,l,n\) Transformation and Array Layer Selection](#) and the equations in [Texel Filtering](#).

The additional calculations and, especially, additional number of sampling operations in the [VK_FILTER_LINEAR](#) case can be expected to have a performance impact compared with using the outputs directly. Since the variations from “correct” results are subtle for most content, the application author should determine whether a more costly implementation is strictly necessary.

If [chromaFilter](#), and [minFilter](#) or [magFilter](#) are both [VK_FILTER_NEAREST](#), these operations are redundant and sampling using [sampler Y'C_BC_R conversion](#) at the desired sample coordinates will produce the “correct” results without further processing.

17.3. Normalized Texel Coordinate Operations

If the image sampler instruction provides normalized texel coordinates, some of the following operations are performed.

17.3.1. Projection Operation

For **Proj** image operations, the normalized texel coordinates (s,t,r,q,a) and (if present) the D_{ref} coordinate are transformed as follows:

$$\begin{aligned} s &= \frac{s}{q}, & \text{for 1D, 2D, or 3D image} \\ t &= \frac{t}{q}, & \text{for 2D or 3D image} \\ r &= \frac{r}{q}, & \text{for 3D image} \\ D_{ref} &= \frac{D_{ref}}{q}, & \text{if provided} \end{aligned}$$

17.3.2. Derivative Image Operations

Derivatives are used for LOD selection. These derivatives are either implicit (in an **ImplicitLod** image instruction in a fragment shader) or explicit (provided explicitly by shader to the image instruction in any shader).

For implicit derivatives image instructions, the derivatives of texel coordinates are calculated in the same manner as [derivative operations](#). That is:

$$\begin{aligned} \partial s / \partial x &= dPdx \dot{s}, & \partial s / \partial y &= dPdy \dot{s}, & \text{for 1D, 2D, Cube, or 3D image} \\ \partial t / \partial x &= dPdx \dot{t}, & \partial t / \partial y &= dPdy \dot{t}, & \text{for 2D, Cube, or 3D image} \\ \partial r / \partial x &= dPdx \dot{r}, & \partial r / \partial y &= dPdy \dot{r}, & \text{for Cube or 3D image} \end{aligned}$$

Partial derivatives not defined above for certain image dimensionalities are set to zero.

For explicit LOD image instructions, if the **optional** SPIR-V operand **Grad** is provided, then the operand values are used for the derivatives. The number of components present in each derivative for a given image dimensionality matches the number of partial derivatives computed above.

If the **optional** SPIR-V operand **Lod** is provided, then derivatives are set to zero, the cube map derivative transformation is skipped, and the scale factor operation is skipped. Instead, the floating-point scalar coordinate is directly assigned to λ_{base} as described in [LOD Operation](#).

If the image or sampler object used by an implicit derivative image instruction is not uniform across the quad and **quadDivergentImplicitLod** is not supported, then the derivative and LOD values are undefined. Implicit derivatives are well-defined when the image and sampler and control flow are uniform across the quad, even if they diverge between different quads.

If **quadDivergentImplicitLod** is supported, then derivatives and implicit LOD values are well-defined

even if the image or sampler object are not uniform within a quad. The derivatives are computed as specified above, and the implicit LOD calculation proceeds for each shader invocation using its respective image and sampler object.

17.3.3. Cube Map Face Selection and Transformations

For cube map image instructions, the (s,t,r) coordinates are treated as a direction vector (r_x, r_y, r_z). The direction vector is used to select a cube map face. The direction vector is transformed to a per-face texel coordinate system ($s_{\text{face}}, t_{\text{face}}$). The direction vector is also used to transform the derivatives to per-face derivatives.

17.3.4. Cube Map Face Selection

The direction vector selects one of the cube map's faces based on the largest magnitude coordinate direction (the major axis direction). Since two or more coordinates **can** have identical magnitude, the implementation **must** have rules to disambiguate this situation.

The rules **should** have as the first rule that r_z wins over r_y and r_x , and the second rule that r_y wins over r_x . An implementation **may** choose other rules, but the rules **must** be deterministic and depend only on (r_x, r_y, r_z).

The layer number (corresponding to a cube map face), the coordinate selections for s_c , t_c , r_c , and the selection of derivatives, are determined by the major axis direction as specified in the following two tables.

Table 22. Cube Map Face and Coordinate Selection

Major Axis Direction	Layer Number	Cube Map Face	s_c	t_c	r_c
$+r_x$	0	Positive X	$-r_z$	$-r_y$	r_x
$-r_x$	1	Negative X	$+r_z$	$-r_y$	r_x
$+r_y$	2	Positive Y	$+r_x$	$+r_z$	r_y
$-r_y$	3	Negative Y	$+r_x$	$-r_z$	r_y
$+r_z$	4	Positive Z	$+r_x$	$-r_y$	r_z
$-r_z$	5	Negative Z	$-r_x$	$-r_y$	r_z

Table 23. Cube Map Derivative Selection

Major Axis Direction	$\partial s_c / \partial x$	$\partial s_c / \partial y$	$\partial t_c / \partial x$	$\partial t_c / \partial y$	$\partial r_c / \partial x$	$\partial r_c / \partial y$
$+r_x$	$-\partial r_z / \partial x$	$-\partial r_z / \partial y$	$-\partial r_y / \partial x$	$-\partial r_y / \partial y$	$+\partial r_x / \partial x$	$+\partial r_x / \partial y$
$-r_x$	$+\partial r_z / \partial x$	$+\partial r_z / \partial y$	$-\partial r_y / \partial x$	$-\partial r_y / \partial y$	$-\partial r_x / \partial x$	$-\partial r_x / \partial y$
$+r_y$	$+\partial r_x / \partial x$	$+\partial r_x / \partial y$	$+\partial r_z / \partial x$	$+\partial r_z / \partial y$	$+\partial r_y / \partial x$	$+\partial r_y / \partial y$

Major Axis Direction	$\partial s_c / \partial x$	$\partial s_c / \partial y$	$\partial t_c / \partial x$	$\partial t_c / \partial y$	$\partial r_c / \partial x$	$\partial r_c / \partial y$
$-r_y$	$+\partial r_x / \partial x$	$+\partial r_x / \partial y$	$-\partial r_z / \partial x$	$-\partial r_z / \partial y$	$-\partial r_y / \partial x$	$-\partial r_y / \partial y$
$+r_z$	$+\partial r_x / \partial x$	$+\partial r_x / \partial y$	$-\partial r_y / \partial x$	$-\partial r_y / \partial y$	$+\partial r_z / \partial x$	$+\partial r_z / \partial y$
$-r_z$	$-\partial r_x / \partial x$	$-\partial r_x / \partial y$	$-\partial r_y / \partial x$	$-\partial r_y / \partial y$	$-\partial r_z / \partial x$	$-\partial r_z / \partial y$

17.3.5. Cube Map Coordinate Transformation

$$s_{face} = \frac{1}{2} \times \frac{s_c}{|r_c|} + \frac{1}{2}$$

$$t_{face} = \frac{1}{2} \times \frac{t_c}{|r_c|} + \frac{1}{2}$$

17.3.6. Cube Map Derivative Transformation

The partial derivatives of the [Cube Map Coordinate Transformations](#) can be computed as:

$$\begin{aligned} \frac{\partial s_{face}}{\partial x} &= \frac{\partial}{\partial x} \left[\frac{1}{2} \times \frac{s_c}{|r_c|} + \frac{1}{2} \right] \\ &= \frac{1}{2} \times \frac{\partial}{\partial x} \left[\frac{s_c}{|r_c|} \right] \\ &= \frac{1}{2} \times \frac{|r_c| \times \partial s_c / \partial x - s_c \times \partial r_c / \partial x}{|r_c|^2} \end{aligned}$$

The other derivatives are simplified similarly, resulting in

$$\begin{aligned} \frac{\partial s_{face}}{\partial y} &= \frac{1}{2} \times \frac{|r_c| \times \partial s_c / \partial y - s_c \times \partial r_c / \partial y}{|r_c|^2} \\ \frac{\partial t_{face}}{\partial x} &= \frac{1}{2} \times \frac{|r_c| \times \partial t_c / \partial x - t_c \times \partial r_c / \partial x}{|r_c|^2} \\ \frac{\partial t_{face}}{\partial y} &= \frac{1}{2} \times \frac{|r_c| \times \partial t_c / \partial y - t_c \times \partial r_c / \partial y}{|r_c|^2} \end{aligned}$$

17.3.7. Scale Factor Operation, LOD Operation and Image Level(s) Selection

LOD selection **can** be either explicit (provided explicitly by the image instruction) or implicit (determined from a scale factor calculated from the derivatives). The LOD **must** be computed with `mipmapPrecisionBits` of accuracy.

Scale Factor Operation

The magnitude of the derivatives are calculated by:

$$m_{ux} = |\partial s / \partial x| \times w_{base}$$

$$m_{vx} = |\partial t / \partial x| \times h_{base}$$

$$m_{wx} = |\partial r / \partial x| \times d_{base}$$

$$m_{uy} = |\partial s / \partial y| \times w_{base}$$

$$m_{vy} = |\partial t / \partial y| \times h_{base}$$

$$m_{wy} = |\partial r / \partial y| \times d_{base}$$

where:

$$\partial t / \partial x = \partial t / \partial y = 0 \text{ (for 1D images)}$$

$$\partial r / \partial x = \partial r / \partial y = 0 \text{ (for 1D, 2D or Cube images)}$$

and:

$$w_{base} = \text{image.w}$$

$$h_{base} = \text{image.h}$$

$$d_{base} = \text{image.d}$$

(for the `baseMipLevel`, from the image descriptor).

A point sampled in screen space has an elliptical footprint in texture space. The minimum and maximum scale factors (ρ_{min} , ρ_{max}) **should** be the minor and major axes of this ellipse.

The *scale factors* ρ_x and ρ_y , calculated from the magnitude of the derivatives in x and y, are used to compute the minimum and maximum scale factors.

ρ_x and ρ_y **may** be approximated with functions f_x and f_y , subject to the following constraints:

f_x is continuous and monotonically increasing in each of m_{ux} , m_{vx} , and m_{wx}
 f_y is continuous and monotonically increasing in each of m_{uy} , m_{vy} , and m_{wy}

$$\max(|m_{ux}|, |m_{vx}|, |m_{wx}|) \leq f_x \leq \sqrt{2}(|m_{ux}| + |m_{vx}| + |m_{wx}|)$$

$$\max(|m_{uy}|, |m_{vy}|, |m_{wy}|) \leq f_y \leq \sqrt{2}(|m_{uy}| + |m_{vy}| + |m_{wy}|)$$

The minimum and maximum scale factors ($\rho_{\min}, \rho_{\max}$) are determined by:

$$\rho_{\max} = \max(\rho_x, \rho_y)$$

$$\rho_{\min} = \min(\rho_x, \rho_y)$$

The ratio of anisotropy is determined by:

$$\eta = \min(\rho_{\max}/\rho_{\min}, \max_{\text{Aniso}})$$

where:

$\text{sampler.max}_{\text{Aniso}} = \text{maxAnisotropy}$ (from sampler descriptor)

$\text{limits.max}_{\text{Aniso}} = \text{maxSamplerAnisotropy}$ (from physical device limits)

$$\max_{\text{Aniso}} = \min(\text{sampler.max}_{\text{Aniso}}, \text{limits.max}_{\text{Aniso}})$$

If $\rho_{\max} = \rho_{\min} = 0$, then all the partial derivatives are zero, the fragment's footprint in texel space is a point, and η **should** be treated as 1. If $\rho_{\max} \neq 0$ and $\rho_{\min} = 0$ then all partial derivatives along one axis are zero, the fragment's footprint in texel space is a line segment, and η **should** be treated as $\max_{\text{Aniso}}$. However, anytime the footprint is small in texel space the implementation **may** use a smaller value of η , even when $\rho_{\min}$ is zero or close to zero. If either `VkPhysicalDeviceFeatures::samplerAnisotropy` or `VkSamplerCreateInfo::anisotropyEnable` are `VK_FALSE`, $\max_{\text{Aniso}}$ is set to 1.

If $\eta = 1$, sampling is isotropic. If $\eta > 1$, sampling is anisotropic.

The sampling rate (N) is derived as:

$$N = \lceil \eta \rceil$$

An implementation **may** round N up to the nearest supported sampling rate. An implementation **may** use the value of N as an approximation of η .

LOD Operation

The LOD parameter λ is computed as follows:

$$\lambda_{base}(x, y) = \begin{cases} shaderOp.Lod & \text{(from optional SPIR-V operand)} \\ \log_2 \left\lceil \frac{\rho_{max}}{\eta} \right\rceil & \text{otherwise} \end{cases}$$

$$\lambda'(x, y) = \lambda_{base} + \text{clamp}(\text{sampler.bias} + \text{shaderOp.bias}, -\text{maxSamplerLodBias}, \text{maxSamplerLodBias})$$

$$\lambda = \begin{cases} lod_{max}, & \lambda' > lod_{max} \\ \lambda', & lod_{min} \leq \lambda' \leq lod_{max} \\ lod_{min}, & \lambda' < lod_{min} \\ undefined, & lod_{min} > lod_{max} \end{cases}$$

where:

$$\text{sampler.bias} = \text{mipLodBias} \quad \text{(from sampler descriptor)}$$

$$\text{shaderOp.bias} = \begin{cases} Bias & \text{(from optional SPIR-V operand)} \\ 0 & \text{otherwise} \end{cases}$$

$$\text{sampler.lod}_{min} = \text{minLod} \quad \text{(from sampler descriptor)}$$

$$\text{shaderOp.lod}_{min} = \begin{cases} \text{MinLod} & \text{(from optional SPIR-V operand)} \\ 0 & \text{otherwise} \end{cases}$$

$$\text{lod}_{min} = \max(\text{sampler.lod}_{min}, \text{shaderOp.lod}_{min})$$

$$\text{lod}_{max} = \text{maxLod} \quad \text{(from sampler descriptor)}$$

and maxSamplerLodBias is the value of the [VkPhysicalDeviceLimits](#) feature [maxSamplerLodBias](#).

Image Level(s) Selection

The image level(s) d , d_{hi} , and d_{lo} which texels are read from are determined by an image-level parameter d_l , which is computed based on the LOD parameter, as follows:

$$d_l = \begin{cases} \text{nearest}(d'), & \text{mipmapMode is VK\_SAMPLER\_MIPMAP\_MODE\_NEAREST} \\ d', & \text{otherwise} \end{cases}$$

where:

$$d' = \text{level}_{base} + \text{clamp}(\lambda, 0, q)$$

$$\text{nearest}(d') = \begin{cases} \lfloor d' + 0.5 \rfloor - 1, & \text{preferred} \\ \lfloor d' + 0.5 \rfloor, & \text{alternative} \end{cases}$$

and:

$$\text{level}_{base} = \text{baseMipLevel}$$

$$q = \text{levelCount} - 1$$

[baseMipLevel](#) and [levelCount](#) are taken from the [subresourceRange](#) of the image view.

If the sampler's [mipmapMode](#) is [VK_SAMPLER_MIPMAP_MODE_NEAREST](#), then the level selected is $d = d_l$.

If the sampler's [mipmapMode](#) is [VK_SAMPLER_MIPMAP_MODE_LINEAR](#), two neighboring levels are selected:

$$\begin{aligned}
d_{hi} &= \lfloor d_l \rfloor \\
d_{lo} &= \min(d_{hi} + 1, level_{base} + q) \\
\delta &= d_l - d_{hi}
\end{aligned}$$

δ is the fractional value, quantized to the number of [mipmap precision bits](#), used for [linear filtering](#) between levels.

17.3.8. (s,t,r,q,a) to (u,v,w,a) Transformation

The normalized texel coordinates are scaled by the image level dimensions and the array layer is selected.

This transformation is performed once for each level used in [filtering](#) (either d , or d_{hi} and d_{lo}).

$$\begin{aligned}
u[x, y] &= s[x, y] \times width_{scale} + \Delta_i \\
v[x, y] &= \begin{cases} 0 & \text{for 1D images} \\ t[x, y] \times height_{scale} + \Delta_j & \text{otherwise} \end{cases} \\
w[x, y] &= \begin{cases} 0 & \text{for 2D or Cube images} \\ r[x, y] \times depth_{scale} + \Delta_k & \text{otherwise} \end{cases} \\
a[x, y] &= \begin{cases} a[x, y] & \text{for array images} \\ 0 & \text{otherwise} \end{cases}
\end{aligned}$$

where:

$$width_{scale} = width_{level}$$

$$height_{scale} = height_{level}$$

$$depth_{scale} = depth_{level}$$

and where $(\Delta_i, \Delta_j, \Delta_k)$ are taken from the image instruction if it includes a [ConstOffset](#) or [Offset](#) operand, otherwise they are taken to be zero.

Operations then proceed to Unnormalized Texel Coordinate Operations.

17.4. Unnormalized Texel Coordinate Operations

17.4.1. (u,v,w,a) to (i,j,k,l,n) Transformation and Array Layer Selection

The unnormalized texel coordinates are transformed to integer texel coordinates relative to the selected mipmap level.

The layer index l is computed as:

$$l = \text{clamp}(\text{RNE}(a), 0, \text{layerCount} - 1) + \text{baseArrayLayer}$$

where `layerCount` is the number of layers in the image subresource range of the image view, `baseArrayLayer` is the first layer from the subresource range, and where:

$$\text{RNE } \tilde{a} = \begin{cases} \text{roundTiesToEven } \tilde{a} & \text{preferred, from IEEE Std 754-2008 Floating-Point Arithmetic} \\ \lfloor a + 0.5 \rfloor & \text{alternative} \end{cases}$$

The sample index `n` is assigned the value 0.

Nearest filtering (`VK_FILTER_NEAREST`) computes the integer texel coordinates that the unnormalized coordinates lie within:

$$\begin{aligned} i &= \lfloor u + \text{shift} \rfloor \\ j &= \lfloor v + \text{shift} \rfloor \\ k &= \lfloor w + \text{shift} \rfloor \end{aligned}$$

where:

$$\text{shift} = 0.0$$

Linear filtering (`VK_FILTER_LINEAR`) computes a set of neighboring coordinates which bound the unnormalized coordinates. The integer texel coordinates are combinations of i_0 or i_1 , j_0 or j_1 , k_0 or k_1 , as well as weights α , β , and γ .

$$\begin{aligned} i_0 &= \lfloor u - \text{shift} \rfloor \\ i_1 &= i_0 + 1 \\ j_0 &= \lfloor v - \text{shift} \rfloor \\ j_1 &= j_0 + 1 \\ k_0 &= \lfloor w - \text{shift} \rfloor \\ k_1 &= k_0 + 1 \end{aligned}$$

$$\begin{aligned} \alpha &= \text{frac } \tilde{u} - \text{shift} \\ \beta &= \text{frac } \tilde{v} - \text{shift} \\ \gamma &= \text{frac } \tilde{w} - \text{shift} \end{aligned}$$

where:

$$\text{shift} = 0.5$$

and where:

$$\text{frac } \tilde{x} = x - \lfloor x \rfloor$$

where the number of fraction bits retained is specified by `VkPhysicalDeviceLimits::subTexelPrecisionBits`.

Cubic filtering (`VK_FILTER_CUBIC_EXT`) computes a set of neighboring coordinates which bound the unnormalized coordinates. The integer texel coordinates are combinations of i_0, i_1, i_2 or i_3, j_0, j_1, j_2 or j_3, k_0, k_1, k_2 or k_3 , as well as weights α, β , and γ .

$$i_0 = \lfloor u - \frac{3}{2} \rfloor \quad i_1 = i_0 + 1 \quad i_2 = i_1 + 1 \quad i_3 = i_2 + 1$$

$$j_0 = \lfloor v - \frac{3}{2} \rfloor \quad j_1 = j_0 + 1 \quad j_2 = j_1 + 1 \quad j_3 = j_2 + 1$$

$$k_0 = \lfloor w - \frac{3}{2} \rfloor \quad k_1 = k_0 + 1 \quad k_2 = k_1 + 1 \quad k_3 = k_2 + 1$$

$$\alpha = \text{frac} \left(\frac{\lceil u - \frac{1}{2} \rceil}{A} \right)$$

$$\beta = \text{frac} \left(\frac{\lceil v - \frac{1}{2} \rceil}{A} \right)$$

$$\gamma = \text{frac} \left(\frac{\lceil w - \frac{1}{2} \rceil}{A} \right)$$

where:

$$\text{frac} \left(\frac{x}{A} \right) = x - \lfloor x \rfloor$$

where the number of fraction bits retained is specified by `VkPhysicalDeviceLimits::subTexelPrecisionBits`.

17.5. Integer Texel Coordinate Operations

The `OpImageFetch` and `OpImageFetchSparse` SPIR-V instructions **may** supply a LOD from which texels are to be fetched using the optional SPIR-V operand `Lod`. Other integer-coordinate operations **must** not. If the `Lod` is provided then it **must** be an integer.

The image level selected is:

$$d = level_{base} + \begin{cases} Lod & \text{(from optional SPIR-V operand)} \\ 0 & \text{otherwise} \end{cases}$$

If d does not lie in the range $[baseMipLevel, baseMipLevel + levelCount)$ then any values fetched are zero if the `robustImageAccess2` feature is enabled, otherwise are undefined, and any writes (if supported) are discarded.

17.6. Image Sample Operations

17.6.1. Wrapping Operation

`Cube` images ignore the wrap modes specified in the sampler. Instead, if `VK_FILTER_NEAREST` is used

within a mip level then `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE` is used, and if `VK_FILTER_LINEAR` is used within a mip level then sampling at the edges is performed as described earlier in the [Cube map edge handling](#) section.

The first integer texel coordinate i is transformed based on the `addressModeU` parameter of the sampler.

$$i = \begin{cases} i \bmod size & \text{for repeat} \\ size - 1 - \text{mirror } i \bmod 2 \times size - size & \text{for mirrored repeat} \\ \text{clamp } i, 0, size - 1 & \text{for clamp to edge} \\ \text{clamp } i, -1, size & \text{for clamp to border} \\ \text{clamp } \text{mirror } i, 0, size - 1 & \text{for mirror clamp to edge} \end{cases}$$

where:

$$\text{mirror } n = \begin{cases} n & \text{for } n \geq 0 \\ -1 + n & \text{otherwise} \end{cases}$$

j (for 2D and Cube image) and k (for 3D image) are similarly transformed based on the `addressModeV` and `addressModeW` parameters of the sampler, respectively.

17.6.2. Texel Gathering

SPIR-V instructions with `Gather` in the name return a vector derived from 4 texels in the base level of the image view. The rules for the `VK_FILTER_LINEAR` minification filter are applied to identify the four selected texels. Each texel is then converted to an RGBA value according to [component substitution](#) and then [swizzled](#). A four-component vector is then assembled by taking the component indicated by the `Component` value in the instruction from the swizzled color value of the four texels. If the operation does not use the `ConstOffsets` image operand then the four texels form the 2×2 rectangle used for texture filtering:

$$\begin{aligned} \tau[R]_i &= \tau_{i0j1} \text{level}_{base}[i]_{comp}[i] \\ \tau[G]_i &= \tau_{i1j1} \text{level}_{base}[i]_{comp}[i] \\ \tau[B]_i &= \tau_{i1j0} \text{level}_{base}[i]_{comp}[i] \\ \tau[A]_i &= \tau_{i0j0} \text{level}_{base}[i]_{comp}[i] \end{aligned}$$

If the operation does use the `ConstOffsets` image operand then the offsets allow a custom filter to be defined:

$$\begin{aligned} \tau[R]_i &= \tau_{i0j0 + \Delta_0} \text{level}_{base}[i]_{comp}[i] \\ \tau[G]_i &= \tau_{i0j0 + \Delta_1} \text{level}_{base}[i]_{comp}[i] \\ \tau[B]_i &= \tau_{i0j0 + \Delta_2} \text{level}_{base}[i]_{comp}[i] \\ \tau[A]_i &= \tau_{i0j0 + \Delta_3} \text{level}_{base}[i]_{comp}[i] \end{aligned}$$

where:

$$\tau_{\text{level}_{base}}[\text{comp}] = \begin{cases} \tau_{\text{level}_{base}}[R], & \text{for } comp = 0 \\ \tau_{\text{level}_{base}}[G], & \text{for } comp = 1 \\ \tau_{\text{level}_{base}}[B], & \text{for } comp = 2 \\ \tau_{\text{level}_{base}}[A], & \text{for } comp = 3 \end{cases}$$

comp from SPIR-V operand Component

OpImage*Gather must not be used on a sampled image with **sampler Y'C_BC_R conversion** enabled.

17.6.3. Texel Filtering

Texel filtering is first performed for each level (either d or d_{hi} and d_{lo}).

If λ is less than or equal to zero, the texture is said to be *magnified*, and the filter mode within a mip level is selected by the **magFilter** in the sampler. If λ is greater than zero, the texture is said to be *minified*, and the filter mode within a mip level is selected by the **minFilter** in the sampler.

Texel Nearest Filtering

Within a mip level, **VK_FILTER_NEAREST** filtering selects a single value using the (i, j, k) texel coordinates, with all texels taken from layer l.

$$\tau_{\text{level}}[i] = \begin{cases} \tau_{ijk}[\text{level}], & \text{for 3D image} \\ \tau_{ij}[\text{level}], & \text{for 2D or Cube image} \\ \tau_i[\text{level}], & \text{for 1D image} \end{cases}$$

Texel Linear Filtering

Within a mip level, **VK_FILTER_LINEAR** filtering combines 8 (for 3D), 4 (for 2D or Cube), or 2 (for 1D) texel values, together with their linear weights. The linear weights are derived from the fractions computed earlier:

$$\begin{aligned} w_{i_0} &= 1 - \alpha \\ w_{i_1} &= \alpha \\ w_{j_0} &= 1 - \beta \\ w_{j_1} &= \beta \\ w_{k_0} &= 1 - \gamma \\ w_{k_1} &= \gamma \end{aligned}$$

The values of multiple texels, together with their weights, are combined to produce a filtered value.

The **VkSamplerReductionModeCreateInfo::reductionMode** can control the process by which multiple texels, together with their weights, are combined to produce a filtered texture value.

When the **reductionMode** is set (explicitly or implicitly) to **VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE**, a weighted average is computed:

$$\begin{aligned}\tau_{3D} &= \sum_{k=k_0}^{k_1} \sum_{j=j_0}^{j_1} \sum_{i=i_0}^{i_1} w_i w_j w_k \tau_{ijk} \\ \tau_{2D} &= \sum_{j=j_0}^{j_1} \sum_{i=i_0}^{i_1} w_i w_j \tau_{ij} \\ \tau_{1D} &= \sum_{i=i_0}^{i_1} w_i \tau_i\end{aligned}$$

However, if the reduction mode is `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX`, the process operates on the above set of multiple texels, together with their weights, computing a component-wise minimum or maximum, respectively, of the components of the set of texels with non-zero weights.

Texel Cubic Filtering

Within a mip level, `VK_FILTER_CUBIC_EXT`, filtering computes a weighted average of 64 (for 3D), 16 (for 2D), or 4 (for 1D) texel values, together with their Catmull-Rom weights.

Catmull-Rom weights are derived from the fractions computed earlier.

$$\begin{aligned}\begin{bmatrix} w_{i_0} & w_{i_1} & w_{i_2} & w_{i_3} \end{bmatrix} &= \frac{1}{2} \begin{bmatrix} 1 & \alpha & \alpha^2 & \alpha^3 \end{bmatrix} \begin{bmatrix} 0 & 2 & 0 & 0 \\ -1 & 0 & 1 & 0 \\ 2 & -5 & 4 & -1 \\ -1 & 3 & -3 & 1 \end{bmatrix} \\ \begin{bmatrix} w_{j_0} & w_{j_1} & w_{j_2} & w_{j_3} \end{bmatrix} &= \frac{1}{2} \begin{bmatrix} 1 & \beta & \beta^2 & \beta^3 \end{bmatrix} \begin{bmatrix} 0 & 2 & 0 & 0 \\ -1 & 0 & 1 & 0 \\ 2 & -5 & 4 & -1 \\ -1 & 3 & -3 & 1 \end{bmatrix} \\ \begin{bmatrix} w_{k_0} & w_{k_1} & w_{k_2} & w_{k_3} \end{bmatrix} &= \frac{1}{2} \begin{bmatrix} 1 & \gamma & \gamma^2 & \gamma^3 \end{bmatrix} \begin{bmatrix} 0 & 2 & 0 & 0 \\ -1 & 0 & 1 & 0 \\ 2 & -5 & 4 & -1 \\ -1 & 3 & -3 & 1 \end{bmatrix}\end{aligned}$$

The values of multiple texels, together with their weights, are combined to produce a filtered value.

The `VkSamplerReductionModeCreateInfo::reductionMode` can control the process by which multiple texels, together with their weights, are combined to produce a filtered texture value.

When the `reductionMode` is set (explicitly or implicitly) to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, a weighted average is computed:

$$\begin{aligned}\tau_{3D} &= \sum_{k=j_0}^{k_3} \sum_{j=j_0}^{j_3} \sum_{i=i_0}^{i_3} w_i w_j w_k \tau_{ijk} \\ \tau_{2D} &= \sum_{j=j_0}^{j_3} \sum_{i=i_0}^{i_3} w_i w_j \tau_{ij} \\ \tau_{1D} &= \sum_{i=i_0}^{i_3} w_i \tau_i\end{aligned}$$

However, if the reduction mode is `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX`, the process operates on the above set of multiple texels, together with their weights, computing a component-wise minimum or maximum, respectively, of the components of the set of texels with non-zero weights.

Texel Mipmap Filtering

`VK_SAMPLER_MIPMAP_MODE_NEAREST` filtering returns the value of a single mipmap level,

$$\tau = \tau[d].$$

`VK_SAMPLER_MIPMAP_MODE_LINEAR` filtering combines the values of multiple mipmap levels ($\tau[hi]$ and $\tau[lo]$), together with their linear weights.

The linear weights are derived from the fraction computed earlier:

$$\begin{aligned} w_{hi} &= 1 - \delta \\ w_{lo} &= \delta \end{aligned}$$

The values of multiple mipmap levels, together with their weights, are combined to produce a final filtered value.

The `VkSamplerReductionModeCreateInfo::reductionMode` can control the process by which multiple texels, together with their weights, are combined to produce a filtered texture value.

When the `reductionMode` is set (explicitly or implicitly) to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, a weighted average is computed:

$$\tau = w_{hi} \tau[hi] + w_{lo} \tau[lo]$$

However, if the reduction mode is `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX`, the process operates on the above values, together with their weights, computing a component-wise minimum or maximum, respectively, of the components of the values with non-zero weights.

Texel Anisotropic Filtering

Anisotropic filtering is enabled by the `anisotropyEnable` in the sampler. When enabled, the image filtering scheme accounts for a degree of anisotropy.

The particular scheme for anisotropic texture filtering is implementation-dependent. Implementations **should** consider the `magFilter`, `minFilter` and `mipmapMode` of the sampler to control the specifics of the anisotropic filtering scheme used. In addition, implementations **should** consider `minLod` and `maxLod` of the sampler.

NOTE

For historical reasons, vendor implementations of anisotropic filtering interpret these sampler parameters in different ways, particularly in corner cases such as `magFilter`, `minFilter` of `VK_FILTER_NEAREST` or `maxAnisotropy` equal to 1.0. Applications should not expect consistent behavior in such cases, and should use anisotropic filtering only with parameters which are expected to give a quality improvement relative to `LINEAR` filtering.

The following describes one particular approach to implementing anisotropic filtering for the 2D Image case; implementations **may** choose other methods:

Given a `magFilter`, `minFilter` of `VK_FILTER_LINEAR` and a `mipmapMode` of `VK_SAMPLER_MIPMAP_MODE_NEAREST`:

Instead of a single isotropic sample, N isotropic samples are sampled within the image footprint of the image level d to approximate an anisotropic filter. The sum $\tau_{2D_{aniso}}$ is defined using the single isotropic $\tau_{2D}(u,v)$ at level d .

$$\tau_{2D_{aniso}} = \frac{1}{N} \sum_{i=1}^N \tau_{2D} \left(\left\lfloor u - \frac{1}{2} + \frac{i}{N+1}, y \right\rfloor, \left\lfloor v - \frac{1}{2} + \frac{i}{N+1}, y \right\rfloor \right), \quad \text{when } \rho_x > \rho_y$$

$$\tau_{2D_{aniso}} = \frac{1}{N} \sum_{i=1}^N \tau_{2D} \left(\left\lfloor u, y - \frac{1}{2} + \frac{i}{N+1} \right\rfloor, \left\lfloor v, y - \frac{1}{2} + \frac{i}{N+1} \right\rfloor \right), \quad \text{when } \rho_y \geq \rho_x$$

When `VkSamplerReductionModeCreateInfo::reductionMode` is `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, the above summation is used. However, if the reduction mode is `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX`, the process operates on the above values, together with their weights, computing a component-wise minimum or maximum, respectively, of the components of the values with non-zero weights.

17.7. Image Operation Steps

Each step described in this chapter is performed by a subset of the image instructions:

- Texel Input Validation Operations, Format Conversion, Texel Replacement, Conversion to RGBA, and Component Swizzle: Performed by all instructions except `OpImageWrite`.
- Depth Comparison: Performed by `OpImage*Dref` instructions.
- All Texel output operations: Performed by `OpImageWrite`.
- Projection: Performed by all `OpImage*Proj` instructions.
- Derivative Image Operations, Cube Map Operations, Scale Factor Operation, LOD Operation and Image Level(s) Selection, and Texel Anisotropic Filtering: Performed by all `OpImageSample*` and `OpImageSparseSample*` instructions.
- (s,t,r,q,a) to (u,v,w,a) Transformation, Wrapping, and (u,v,w,a) to (i,j,k,l,n) Transformation And Array Layer Selection: Performed by all `OpImageSample`, `OpImageSparseSample`, and `OpImage*Gather` instructions.
- Texel Gathering: Performed by `OpImage*Gather` instructions.
- Texel Filtering: Performed by all `OpImageSample*` and `OpImageSparseSample*` instructions.
- Sparse Residency: Performed by all `OpImageSparse*` instructions.

17.8. Image Query Instructions

17.8.1. Image Property Queries

`OpImageQuerySize`, `OpImageQuerySizeLod`, `OpImageQueryLevels`, and `OpImageQuerySamples` query properties of the image descriptor that would be accessed by a shader image operation. They return 0 if the bound descriptor is a null descriptor.

`OpImageQuerySizeLod` returns the size of the image level identified by the `Level of Detail` operand. If that level does not exist in the image, and the descriptor is not null, then the value returned is undefined.

17.8.2. LOD Query

`OpImageQueryLod` returns the LOD parameters that would be used in an image operation with the given image and coordinates. If the descriptor that would be accessed is a null descriptor then (0,0) is returned. Otherwise, the steps described in this chapter are performed as if for `OpImageSampleImplicitLod`, up to [Scale Factor Operation, LOD Operation and Image Level\(s\) Selection](#). The return value is the vector $(\lambda', d_l - \text{level}_{\text{base}})$. These values **may** be subject to implementation-specific maxima and minima for very large, out-of-range values.

Chapter 18. Queries

Queries provide a mechanism to return information about the processing of a sequence of Vulkan commands. Query operations are asynchronous, and as such, their results are not returned immediately. Instead, their results, and their availability status are stored in a [Query Pool](#). The state of these queries **can** be read back on the host, or copied to a buffer object on the device.

The supported query types are [Occlusion Queries](#), [Pipeline Statistics Queries](#), and [Timestamp Queries](#). [Performance Queries](#) are supported if the associated extension is available.

18.1. Query Pools

Queries are managed using *query pool* objects. Each query pool is a collection of a specific number of queries of a particular type.

Query pools **cannot** be destroyed [\[SCID-4\]](#).

If `VkPhysicalDeviceVulkanSC10Properties::deviceDestroyFreesMemory` is `VK_TRUE`, the memory is returned to the system when the device is destroyed. Otherwise, it **may** not be returned to the system until the process is terminated.

Query pools are represented by `VkQueryPool` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkQueryPool)
```

To create a query pool, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateQueryPool(
    VkDevice                                device,
    const VkQueryPoolCreateInfo*            pCreateInfo,
    const VkAllocationCallbacks*            pAllocator,
    VkQueryPool*                            pQueryPool);
```

- `device` is the logical device that creates the query pool.
- `pCreateInfo` is a pointer to a [VkQueryPoolCreateInfo](#) structure containing the number and type of queries to be managed by the pool.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pQueryPool` is a pointer to a [VkQueryPool](#) handle in which the resulting query pool object is returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkCreateQueryPool` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkCreateQueryPool-device-09663
`device` **must** support at least one queue family with one of the `VK_QUEUE_COMPUTE_BIT`, or `VK_QUEUE_GRAPHICS_BIT` capabilities
- VUID-vkCreateQueryPool-device-05068
The number of query pools currently allocated from `device` plus 1 **must** be less than or equal to the total number of query pools requested via `VkDeviceObjectReservationCreateInfo::queryPoolRequestCount` specified when `device` was created

Valid Usage (Implicit)

- VUID-vkCreateQueryPool-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCreateQueryPool-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkQueryPoolCreateInfo` structure
- VUID-vkCreateQueryPool-pAllocator-null
`pAllocator` **must** be `NULL`
- VUID-vkCreateQueryPool-pQueryPool-parameter
`pQueryPool` **must** be a valid pointer to a `VkQueryPool` handle
- VUID-vkCreateQueryPool-device-queuecount
The device **must** have been created with at least 1 queue

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkQueryPoolCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkQueryPoolCreateInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkQueryPoolCreateFlags flags;
    VkQueryType          queryType;
    uint32_t             queryCount;
    VkQueryPipelineStatisticFlags pipelineStatistics;
} VkQueryPoolCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkQueryPoolCreateFlagBits`
- `queryType` is a `VkQueryType` value specifying the type of queries managed by the pool.
- `queryCount` is the number of queries managed by the pool.
- `pipelineStatistics` is a bitmask of `VkQueryPipelineStatisticFlagBits` specifying which counters will be returned in queries on the new pool, as described below in [Pipeline Statistics Queries](#).

`pipelineStatistics` is ignored if `queryType` is not `VK_QUERY_TYPE_PIPELINE_STATISTICS`.

Valid Usage

- VUID-VkQueryPoolCreateInfo-queryType-00791
If the `pipelineStatisticsQuery` feature is not enabled, `queryType` **must** not be `VK_QUERY_TYPE_PIPELINE_STATISTICS`
- VUID-VkQueryPoolCreateInfo-queryType-00792
If `queryType` is `VK_QUERY_TYPE_PIPELINE_STATISTICS`, `pipelineStatistics` **must** be a valid combination of `VkQueryPipelineStatisticFlagBits` values
- VUID-VkQueryPoolCreateInfo-queryType-09534
If `queryType` is `VK_QUERY_TYPE_PIPELINE_STATISTICS`, `pipelineStatistics` **must** not be zero
- VUID-VkQueryPoolCreateInfo-queryType-03222
If `queryType` is `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the `pNext` chain **must** include a `VkQueryPoolPerformanceCreateInfoKHR` structure
- VUID-VkQueryPoolCreateInfo-queryCount-02763
`queryCount` **must** be greater than 0
- VUID-VkQueryPoolCreateInfo-queryType-05046
If `queryType` is `VK_QUERY_TYPE_OCCLUSION` then `queryCount` **must** be less than or equal to the maximum of all `VkDeviceObjectReservationCreateInfo::maxOcclusionQueriesPerPool` values specified when `device` was created
- VUID-VkQueryPoolCreateInfo-queryType-05047
If `queryType` is `VK_QUERY_TYPE_PIPELINE_STATISTICS` then `queryCount` **must** be less than or equal to the maximum of all `VkDeviceObjectReservationCreateInfo::maxPipelineStatisticsQueriesPerPool` values specified when `device` was created

- VUID-VkQueryPoolCreateInfo-queryType-05048
If `queryType` is `VK_QUERY_TYPE_TIMESTAMP` then `queryCount` **must** be less than or equal to the maximum of all `VkDeviceObjectReservationCreateInfo::maxTimestampQueriesPerPool` values specified when `device` was created
- VUID-VkQueryPoolCreateInfo-queryType-05049
If `queryType` is `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` then `queryCount` **must** be less than or equal to the maximum of all `VkPerformanceQueryReservationInfoKHR::maxPerformanceQueriesPerPool` values specified when `device` was created

Valid Usage (Implicit)

- VUID-VkQueryPoolCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_QUERY_POOL_CREATE_INFO`
- VUID-VkQueryPoolCreateInfo-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkQueryPoolPerformanceCreateInfoKHR`
- VUID-VkQueryPoolCreateInfo-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkQueryPoolCreateInfo-flags-zeroBitmask
`flags` **must** be 0
- VUID-VkQueryPoolCreateInfo-queryType-parameter
`queryType` **must** be a valid `VkQueryType` value

Bits which **can** be set in `VkQueryPoolCreateInfo::flags`, specifying options for query pools, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkQueryPoolCreateFlagBits {
} VkQueryPoolCreateFlagBits;
```

NOTE

All bits for this type are defined by extensions, and none of those extensions are enabled in this build of the specification.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryPoolCreateFlags;
```

`VkQueryPoolCreateFlags` is a bitmask type for setting a mask of zero or more `VkQueryPoolCreateFlagBits`.

The `VkQueryPoolPerformanceCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_performance_query
typedef struct VkQueryPoolPerformanceCreateInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t            queueFamilyIndex;
    uint32_t            counterIndexCount;
    const uint32_t*     pCounterIndices;
} VkQueryPoolPerformanceCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `queueFamilyIndex` is the queue family index to create this performance query pool for.
- `counterIndexCount` is the length of the `pCounterIndices` array.
- `pCounterIndices` is a pointer to an array of indices into the `vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR::pCounters` to enable in this performance query pool.

Valid Usage

- VUID-VkQueryPoolPerformanceCreateInfoKHR-queueFamilyIndex-03236
`queueFamilyIndex` **must** be a valid queue family index of the device
- VUID-VkQueryPoolPerformanceCreateInfoKHR-performanceCounterQueryPools-03237
The `performanceCounterQueryPools` feature **must** be enabled
- VUID-VkQueryPoolPerformanceCreateInfoKHR-pCounterIndices-03321
Each element of `pCounterIndices` **must** be in the range of counters reported by `vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR` for the queue family specified in `queueFamilyIndex`

Valid Usage (Implicit)

- VUID-VkQueryPoolPerformanceCreateInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_QUERY_POOL_PERFORMANCE_CREATE_INFO_KHR`
- VUID-VkQueryPoolPerformanceCreateInfoKHR-pCounterIndices-parameter
`pCounterIndices` **must** be a valid pointer to an array of `counterIndexCount` `uint32_t` values
- VUID-VkQueryPoolPerformanceCreateInfoKHR-counterIndexCount-arraylength
`counterIndexCount` **must** be greater than 0

To query the number of passes required to query a performance query pool on a physical device, call:

```
// Provided by VK_KHR_performance_query
void vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR(
    VkPhysicalDevice          physicalDevice,
    const VkQueryPoolPerformanceCreateInfoKHR* pPerformanceQueryCreateInfo,
    uint32_t*                 pNumPasses);
```

- `physicalDevice` is the handle to the physical device whose queue family performance query counter properties will be queried.
- `pPerformanceQueryCreateInfo` is a pointer to a `VkQueryPoolPerformanceCreateInfoKHR` of the performance query that is to be created.
- `pNumPasses` is a pointer to an integer related to the number of passes required to query the performance query pool, as described below.

The `pPerformanceQueryCreateInfo` member `VkQueryPoolPerformanceCreateInfoKHR::queueFamilyIndex` **must** be a queue family of `physicalDevice`. The number of passes required to capture the counters specified in the `pPerformanceQueryCreateInfo` member `VkQueryPoolPerformanceCreateInfoKHR::pCounters` is returned in `pNumPasses`.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR-pPerformanceQueryCreateInfo-parameter
`pPerformanceQueryCreateInfo` **must** be a valid pointer to a valid `VkQueryPoolPerformanceCreateInfoKHR` structure
- VUID-vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR-pNumPasses-parameter
`pNumPasses` **must** be a valid pointer to a `uint32_t` value

Possible values of `VkQueryPoolCreateInfo::queryType`, specifying the type of queries managed by the pool, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkQueryType {
    VK_QUERY_TYPE_OCCLUSION = 0,
    VK_QUERY_TYPE_PIPELINE_STATISTICS = 1,
    VK_QUERY_TYPE_TIMESTAMP = 2,
    // Provided by VK_KHR_performance_query
    VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR = 1000116000,
} VkQueryType;
```

- `VK_QUERY_TYPE_OCCLUSION` specifies an `occlusion query`.

- `VK_QUERY_TYPE_PIPELINE_STATISTICS` specifies a [pipeline statistics query](#).
- `VK_QUERY_TYPE_TIMESTAMP` specifies a [timestamp query](#).
- `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` specifies a [performance query](#).

18.2. Query Operation

The operation of queries is controlled by the commands [vkCmdBeginQuery](#), [vkCmdEndQuery](#), [vkCmdResetQueryPool](#), [vkCmdCopyQueryPoolResults](#), [vkCmdWriteTimestamp2KHR](#), and [vkCmdWriteTimestamp](#).

In order for a `VkCommandBuffer` to record query management commands, the queue family for which its `VkCommandPool` was created **must** support the appropriate type of operations (graphics, compute) suitable for the query type of a given query pool.

Each query in a query pool has a status that is either *unavailable* or *available*, and also has state to store the numerical results of a query operation of the type requested when the query pool was created. Resetting a query via [vkCmdResetQueryPool](#) or [vkResetQueryPool](#) sets the status to unavailable and makes the numerical results undefined. A query is made available by the operation of [vkCmdEndQuery](#), [vkCmdWriteTimestamp2KHR](#), or [vkCmdWriteTimestamp](#). Both the availability status and numerical results **can** be retrieved by calling either [vkGetQueryPoolResults](#) or [vkCmdCopyQueryPoolResults](#).

After query pool creation, each query is in an uninitialized state and **must** be reset before it is used. Queries **must** also be reset between uses.

If a logical device includes multiple physical devices, then each command that writes a query **must** execute on a single physical device, and any call to [vkCmdBeginQuery](#) **must** execute the corresponding [vkCmdEndQuery](#) command on the same physical device.

To reset a range of queries in a query pool on a queue, call:

```
// Provided by VK_VERSION_1_0
void vkCmdResetQueryPool(
    VkCommandBuffer          commandBuffer,
    VkQueryPool              queryPool,
    uint32_t                 firstQuery,
    uint32_t                 queryCount);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the handle of the query pool managing the queries being reset.
- `firstQuery` is the initial query index to reset.
- `queryCount` is the number of queries to reset.

When executed on a queue, this command sets the status of query indices [`firstQuery`, `firstQuery` + `queryCount` - 1] to unavailable.

This command defines an execution dependency between other query commands that reference

the same query.

The first [synchronization scope](#) includes all commands which reference the queries in [queryPool](#) indicated by [firstQuery](#) and [queryCount](#) that occur earlier in [submission order](#).

The second [synchronization scope](#) includes all commands which reference the queries in [queryPool](#) indicated by [firstQuery](#) and [queryCount](#) that occur later in [submission order](#).

The operation of this command happens after the first scope and happens before the second scope.

If the [queryType](#) used to create [queryPool](#) was [VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR](#), this command sets the status of query indices [[firstQuery](#), [firstQuery](#) + [queryCount](#) - 1] to unavailable for each pass of [queryPool](#), as indicated by a call to [vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR](#).

NOTE

Because [vkCmdResetQueryPool](#) resets all the passes of the indicated queries, applications must not record a [vkCmdResetQueryPool](#) command for a [queryPool](#) created with [VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR](#) in a command buffer that needs to be submitted multiple times as indicated by a call to [vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR](#). Otherwise applications will never be able to complete the recorded queries.

Valid Usage

- VUID-vkCmdResetQueryPool-firstQuery-09436
[firstQuery](#) **must** be less than the number of queries in [queryPool](#)
- VUID-vkCmdResetQueryPool-firstQuery-09437
The sum of [firstQuery](#) and [queryCount](#) **must** be less than or equal to the number of queries in [queryPool](#)
- VUID-vkCmdResetQueryPool-None-02841
All queries used by the command **must** not be active
- VUID-vkCmdResetQueryPool-firstQuery-02862
If [queryPool](#) was created with [VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR](#), this command **must** not be recorded in a command buffer that, either directly or through secondary command buffers, also contains begin commands for a query from the set of queries [[firstQuery](#), [firstQuery](#) + [queryCount](#) - 1]

Valid Usage (Implicit)

- VUID-vkCmdResetQueryPool-commandBuffer-parameter
[commandBuffer](#) **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdResetQueryPool-queryPool-parameter
[queryPool](#) **must** be a valid [VkQueryPool](#) handle
- VUID-vkCmdResetQueryPool-commandBuffer-recording
[commandBuffer](#) **must** be in the [recording state](#)

- VUID-vkCmdResetQueryPool-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, or `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdResetQueryPool-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdResetQueryPool-commonparent
Both of `commandBuffer`, and `queryPool` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT	Action

To reset a range of queries in a query pool on the host, call:

```
// Provided by VK_VERSION_1_2
void vkResetQueryPool(
    VkDevice          device,
    VkQueryPool       queryPool,
    uint32_t          firstQuery,
    uint32_t          queryCount);
```

- `device` is the logical device that owns the query pool.
- `queryPool` is the handle of the query pool managing the queries being reset.
- `firstQuery` is the initial query index to reset.
- `queryCount` is the number of queries to reset.

This command sets the status of query indices [`firstQuery`, `firstQuery + queryCount - 1`] to unavailable.

If `queryPool` is `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` this command sets the status of query indices

[[firstQuery](#), [firstQuery](#) + [queryCount](#) - 1] to unavailable for each pass.

Valid Usage

- VUID-vkResetQueryPool-firstQuery-09436
[firstQuery](#) **must** be less than the number of queries in [queryPool](#)
- VUID-vkResetQueryPool-firstQuery-09437
The sum of [firstQuery](#) and [queryCount](#) **must** be less than or equal to the number of queries in [queryPool](#)
- VUID-vkResetQueryPool-None-02665
The [hostQueryReset](#) feature **must** be enabled
- VUID-vkResetQueryPool-firstQuery-02741
Submitted commands that refer to the range specified by [firstQuery](#) and [queryCount](#) in [queryPool](#) **must** have completed execution
- VUID-vkResetQueryPool-firstQuery-02742
The range of queries specified by [firstQuery](#) and [queryCount](#) in [queryPool](#) **must** not be in use by calls to [vkGetQueryPoolResults](#) or [vkResetQueryPool](#) in other threads

Valid Usage (Implicit)

- VUID-vkResetQueryPool-device-parameter
[device](#) **must** be a valid [VkDevice](#) handle
- VUID-vkResetQueryPool-queryPool-parameter
[queryPool](#) **must** be a valid [VkQueryPool](#) handle
- VUID-vkResetQueryPool-queryPool-parent
[queryPool](#) **must** have been created, allocated, or retrieved from [device](#)

Once queries are reset and ready for use, query commands **can** be issued to a command buffer. Occlusion queries and pipeline statistics queries count events - drawn samples and pipeline stage invocations, respectively - resulting from commands that are recorded between a [vkCmdBeginQuery](#) command and a [vkCmdEndQuery](#) command within a specified command buffer, effectively scoping a set of drawing and/or dispatching commands. Timestamp queries write timestamps to a query pool. Performance queries record performance counters to a query pool.

A query **must** begin and end in the same command buffer, although if it is a primary command buffer, and the [inheritedQueries](#) feature is enabled, it **can** execute secondary command buffers during the query operation. For a secondary command buffer to be executed while a query is active, it **must** set the [occlusionQueryEnable](#), [queryFlags](#), and/or [pipelineStatistics](#) members of [VkCommandBufferInheritanceInfo](#) to conservative values, as described in the [Command Buffer Recording](#) section. A query **must** either begin and end inside the same subpass of a render pass instance, or **must** both begin and end outside of a render pass instance (i.e. contain entire render pass instances).

If queries are used while executing a render pass instance that has multiview enabled, the query uses N consecutive query indices in the query pool (starting at `query`) where N is the number of bits set in the view mask in the subpass the query is used in. How the numerical results of the query are distributed among the queries is implementation-dependent. For example, some implementations **may** write each view's results to a distinct query, while other implementations **may** write the total result to the first query and write zero to the other queries. However, the sum of the results in all the queries **must** accurately reflect the total result of the query summed over all views. Applications **can** sum the results from all the queries to compute the total result.

Queries used with multiview rendering **must** not span subpasses, i.e. they **must** begin and end in the same subpass.

To begin a query, call:

```
// Provided by VK_VERSION_1_0
void vkCmdBeginQuery(
    VkCommandBuffer          commandBuffer,
    VkQueryPool              queryPool,
    uint32_t                 query,
    VkQueryControlFlags      flags);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the query pool that will manage the results of the query.
- `query` is the query index within the query pool that will contain the results.
- `flags` is a bitmask of `VkQueryControlFlagBits` specifying constraints on the types of queries that **can** be performed.

If the `queryType` of the pool is `VK_QUERY_TYPE_OCCLUSION` and `flags` contains `VK_QUERY_CONTROL_PRECISE_BIT`, an implementation **must** return a result that matches the actual number of samples passed. This is described in more detail in [Occlusion Queries](#).

After beginning a query, that query is considered *active* within the command buffer it was called in until that same query is ended. Queries active in a primary command buffer when secondary command buffers are executed are considered active for those secondary command buffers.

This command defines an execution dependency between other query commands that reference the same query.

The first [synchronization scope](#) includes all commands which reference the queries in `queryPool` indicated by `query` that occur earlier in [submission order](#).

The second [synchronization scope](#) includes all commands which reference the queries in `queryPool` indicated by `query` that occur later in [submission order](#).

The operation of this command happens after the first scope and happens before the second scope.

Valid Usage

- VUID-vkCmdBeginQuery-None-00807
All queries used by the command **must** be *unavailable*
- VUID-vkCmdBeginQuery-queryType-02804
The `queryType` used to create `queryPool` **must** not be `VK_QUERY_TYPE_TIMESTAMP`
- VUID-vkCmdBeginQuery-queryType-00800
If the `occlusionQueryPrecise` feature is not enabled, or the `queryType` used to create `queryPool` was not `VK_QUERY_TYPE_OCCLUSION`, `flags` **must** not contain `VK_QUERY_CONTROL_PRECISE_BIT`
- VUID-vkCmdBeginQuery-query-00802
`query` **must** be less than the number of queries in `queryPool`
- VUID-vkCmdBeginQuery-queryType-00803
If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_OCCLUSION`, the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdBeginQuery-queryType-00804
If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PIPELINE_STATISTICS` and any of the `pipelineStatistics` indicate graphics operations, the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdBeginQuery-queryType-00805
If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PIPELINE_STATISTICS` and any of the `pipelineStatistics` indicate compute operations, the `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- VUID-vkCmdBeginQuery-commandBuffer-01885
`commandBuffer` **must** not be a protected command buffer
- VUID-vkCmdBeginQuery-query-00808
If called within a render pass instance, the sum of `query` and the number of bits set in the current subpass's view mask **must** be less than or equal to the number of queries in `queryPool`
- VUID-vkCmdBeginQuery-queryPool-01922
`queryPool` **must** have been created with a `queryType` that differs from that of any queries that are `active` within `commandBuffer`
- VUID-vkCmdBeginQuery-queryPool-07289
If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, then the `VkQueryPoolPerformanceCreateInfoKHR::queueFamilyIndex` `queryPool` was created with **must** equal the queue family index of the `VkCommandPool` that `commandBuffer` was allocated from
- VUID-vkCmdBeginQuery-queryPool-03223
If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the `profiling lock` **must** have been held before `vkBeginCommandBuffer` was called on `commandBuffer`
- VUID-vkCmdBeginQuery-queryPool-03224

If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and one of the counters used to create `queryPool` was `VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR`, the query begin **must** be the first recorded command in `commandBuffer`

- VUID-vkCmdBeginQuery-queryPool-03225

If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and one of the counters used to create `queryPool` was `VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR`, the begin command **must** not be recorded within a render pass instance

- VUID-vkCmdBeginQuery-queryPool-03226

If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and another query pool with a `queryType` `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` has been used within `commandBuffer`, its parent primary command buffer or secondary command buffer recorded within the same parent primary command buffer as `commandBuffer`, the `performanceCounterMultipleQueryPools` feature **must** be enabled

- VUID-vkCmdBeginQuery-None-02863

If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, this command **must** not be recorded in a command buffer that, either directly or through secondary command buffers, also contains a `vkCmdResetQueryPool` command affecting the same query

Valid Usage (Implicit)

- VUID-vkCmdBeginQuery-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdBeginQuery-queryPool-parameter
`queryPool` **must** be a valid `VkQueryPool` handle

- VUID-vkCmdBeginQuery-flags-parameter
`flags` **must** be a valid combination of `VkQueryControlFlagBits` values

- VUID-vkCmdBeginQuery-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state

- VUID-vkCmdBeginQuery-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, or `VK_QUEUE_GRAPHICS_BIT` operations

- VUID-vkCmdBeginQuery-commonparent
Both of `commandBuffer`, and `queryPool` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally

synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT	Action State

Bits which **can** be set in `vkCmdBeginQuery::flags`, specifying constraints on the types of queries that **can** be performed, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkQueryControlFlagBits {
    VK_QUERY_CONTROL_PRECISE_BIT = 0x00000001,
} VkQueryControlFlagBits;
```

- `VK_QUERY_CONTROL_PRECISE_BIT` specifies the precision of [occlusion queries](#).

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryControlFlags;
```

`VkQueryControlFlags` is a bitmask type for setting a mask of zero or more `VkQueryControlFlagBits`.

To end a query after the set of desired drawing or dispatching commands is executed, call:

```
// Provided by VK_VERSION_1_0
void vkCmdEndQuery(
    VkCommandBuffer          commandBuffer,
    VkQueryPool              queryPool,
    uint32_t                 query);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the query pool that is managing the results of the query.
- `query` is the query index within the query pool where the result is stored.

The command completes the query in `queryPool` identified by `query`, and marks it as available.

This command defines an execution dependency between other query commands that reference the same query.

The first [synchronization scope](#) includes all commands which reference the queries in [queryPool](#) indicated by [query](#) that occur earlier in [submission order](#).

The second [synchronization scope](#) includes only the operation of this command.

Valid Usage

- VUID-vkCmdEndQuery-None-01923
All queries used by the command **must** be [active](#)
- VUID-vkCmdEndQuery-query-00810
[query](#) **must** be less than the number of queries in [queryPool](#)
- VUID-vkCmdEndQuery-commandBuffer-01886
[commandBuffer](#) **must** not be a protected command buffer
- VUID-vkCmdEndQuery-query-00812
If [vkCmdEndQuery](#) is called within a render pass instance, the sum of [query](#) and the number of bits set in the current subpass's view mask **must** be less than or equal to the number of queries in [queryPool](#)
- VUID-vkCmdEndQuery-queryPool-03227
If [queryPool](#) was created with a [queryType](#) of [VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR](#) and one or more of the counters used to create [queryPool](#) was [VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR](#), the [vkCmdEndQuery](#) **must** be the last recorded command in [commandBuffer](#)
- VUID-vkCmdEndQuery-queryPool-03228
If [queryPool](#) was created with a [queryType](#) of [VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR](#) and one or more of the counters used to create [queryPool](#) was [VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR](#), the [vkCmdEndQuery](#) **must** not be recorded within a render pass instance
- VUID-vkCmdEndQuery-None-07007
If called within a subpass of a render pass instance, the corresponding [vkCmdBeginQuery*](#) command **must** have been called previously within the same subpass

Valid Usage (Implicit)

- VUID-vkCmdEndQuery-commandBuffer-parameter
[commandBuffer](#) **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdEndQuery-queryPool-parameter
[queryPool](#) **must** be a valid [VkQueryPool](#) handle
- VUID-vkCmdEndQuery-commandBuffer-recording
[commandBuffer](#) **must** be in the [recording state](#)
- VUID-vkCmdEndQuery-commandBuffer-cmdpool
The [VkCommandPool](#) that [commandBuffer](#) was allocated from **must** support [VK_QUEUE_COMPUTE_BIT](#), or [VK_QUEUE_GRAPHICS_BIT](#) operations

- VUID-vkCmdEndQuery-commonparent

Both of **commandBuffer**, and **queryPool** **must** have been created, allocated, or retrieved from the same **VkDevice**

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Both	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHIC_BIT	Action State

An application **can** retrieve results either by requesting they be written into application-provided memory, or by requesting they be copied into a **VkBuffer**. In either case, the layout in memory is defined as follows:

- The first query's result is written starting at the first byte requested by the command, and each subsequent query's result begins **stride** bytes later.
- Each query writes results in a tightly packed array of result values as follows:
 - Occlusion queries write one unsigned integer value - the number of samples passed.
 - Pipeline statistics queries write one unsigned integer value for each bit that is enabled in the **pipelineStatistics** when the pool is created, and the statistics values are written in bit order starting from the least significant bit.
 - Timestamp queries write one unsigned integer value.
 - Performance queries write one **VkPerformanceCounterResultKHR** value for each **VkPerformanceCounterKHR** in the query.
- If **VK_QUERY_RESULT_WITH_AVAILABILITY_BIT** is specified, an additional unsigned integer result value is written indicating whether the query's result is available, with any non-zero value indicating that it is available.
- The bit width of all integer result values written by all query types is either 32- or 64-bits, as requested by the command. The only exceptions are the **VkPerformanceCounterResultKHR** values written by performance queries whose type is determined by the **unit** member of the corresponding **VkPerformanceCounterKHR**.
- If more than one query is retrieved and **stride** is not at least as large as the size of the array of

values corresponding to a single query, the values written to memory are undefined.

To retrieve status and results for a set of queries, call:

```
// Provided by VK_VERSION_1_0
VkResult vkGetQueryPoolResults(
    VkDevice                device,
    VkQueryPool             queryPool,
    uint32_t                firstQuery,
    uint32_t                queryCount,
    size_t                  dataSize,
    void*                   pData,
    VkDeviceSize            stride,
    VkQueryResultFlags      flags);
```

- **device** is the logical device that owns the query pool.
- **queryPool** is the query pool managing the queries containing the desired results.
- **firstQuery** is the initial query index.
- **queryCount** is the number of queries to read.
- **dataSize** is the size in bytes of the buffer pointed to by **pData**.
- **pData** is a pointer to an application-allocated buffer where the results will be written
- **stride** is the stride in bytes between results for individual queries within **pData**.
- **flags** is a bitmask of **VkQueryResultFlagBits** specifying how and when results are returned.

Any results written for a query are written according to [a layout dependent on the query type](#).

If no bits are set in **flags**, and all requested queries are in the available state, results are written as an array of 32-bit unsigned integer values. Behavior when not all queries are available is described [below](#).

If **VK_QUERY_RESULT_WITH_AVAILABILITY_BIT** is set, results for all queries in **queryPool** identified by **firstQuery** and **queryCount** are copied to **pData**, along with an extra availability value written directly after the results of each query and interpreted as an unsigned integer. A value of zero indicates that the results are not yet available, otherwise the query is complete and results are available. The size of the availability values is 64 bits if **VK_QUERY_RESULT_64_BIT** is set in **flags**. Otherwise, it is 32 bits.

NOTE

If **VK_QUERY_RESULT_WITH_AVAILABILITY_BIT** is set, the layout of data in the buffer is a *(result,availability)* pair for each query returned, and **stride** is the stride between each pair.

Results for any available query written by this command are final and represent the final result of the query. If **VK_QUERY_RESULT_PARTIAL_BIT** is set, then for any query that is unavailable, an intermediate result between zero and the final result value is written for that query. Otherwise, any result written by this command is undefined.

If `VK_QUERY_RESULT_64_BIT` is set, results and, if returned, availability values for all queries are written as an array of 64-bit values. If the `queryPool` was created with `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, results for each query are written as an array of the type indicated by `VkPerformanceCounterKHR::storage` for the counter being queried. Otherwise, results and availability values are written as an array of 32-bit values. If an unsigned integer query's value overflows the result type, the value **may** either wrap or saturate. If a signed integer query's value overflows the result type, the value is undefined. If a floating-point query's value is not representable as the result type, the value is undefined.

If `VK_QUERY_RESULT_WAIT_BIT` is set, this command defines an execution dependency with any earlier commands that writes one of the identified queries. The first `synchronization scope` includes all instances of `vkCmdEndQuery`, `vkCmdWriteTimestamp2KHR`, and `vkCmdWriteTimestamp` that reference any query in `queryPool` indicated by `firstQuery` and `queryCount`. The second `synchronization scope` includes the host operations of this command.

If `VK_QUERY_RESULT_WAIT_BIT` is not set, `vkGetQueryPoolResults` **may** return `VK_NOT_READY` if there are queries in the unavailable state.

NOTE

Applications **must** take care to ensure that use of the `VK_QUERY_RESULT_WAIT_BIT` bit has the desired effect.

For example, if a query has been used previously and a command buffer records the commands `vkCmdResetQueryPool`, `vkCmdBeginQuery`, and `vkCmdEndQuery` for that query, then the query will remain in the available state until `vkResetQueryPool` is called or the `vkCmdResetQueryPool` command executes on a queue. Applications **can** use fences or events to ensure that a query has already been reset before checking for its results or availability status. Otherwise, a stale value could be returned from a previous use of the query.

The above also applies when `VK_QUERY_RESULT_WAIT_BIT` is used in combination with `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT`. In this case, the returned availability status **may** reflect the result of a previous use of the query unless `vkResetQueryPool` is called or the `vkCmdResetQueryPool` command has been executed since the last use of the query.

NOTE

Applications **can** double-buffer query pool usage, with a pool per frame, and reset queries at the end of the frame in which they are read.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetQueryPoolResults` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage

- VUID-vkGetQueryPoolResults-firstQuery-09436
`firstQuery` **must** be less than the number of queries in `queryPool`
- VUID-vkGetQueryPoolResults-firstQuery-09437
The sum of `firstQuery` and `queryCount` **must** be less than or equal to the number of queries in `queryPool`

- VUID-vkGetQueryPoolResults-queryCount-09438
If **queryCount** is greater than 1, **stride** **must** not be zero
- VUID-vkGetQueryPoolResults-queryType-09439
If the **queryType** used to create **queryPool** was **VK_QUERY_TYPE_TIMESTAMP**, **flags** **must** not contain **VK_QUERY_RESULT_PARTIAL_BIT**
- VUID-vkGetQueryPoolResults-queryType-09440
If the **queryType** used to create **queryPool** was **VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR**, **flags** **must** not contain **VK_QUERY_RESULT_WITH_AVAILABILITY_BIT**, **VK_QUERY_RESULT_PARTIAL_BIT**, or **VK_QUERY_RESULT_64_BIT**
- VUID-vkGetQueryPoolResults-queryType-09441
If the **queryType** used to create **queryPool** was **VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR**, the **queryPool** **must** have been recorded once for each pass as retrieved via a call to [vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR](#)
- VUID-vkGetQueryPoolResults-None-09401
All queries used by the command **must** not be uninitialized
- VUID-vkGetQueryPoolResults-flags-02828
If **VK_QUERY_RESULT_64_BIT** is not set in **flags** and the **queryType** used to create **queryPool** was not **VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR**, then **pData** and **stride** **must** be multiples of 4
- VUID-vkGetQueryPoolResults-flags-00815
If **VK_QUERY_RESULT_64_BIT** is set in **flags** then **pData** and **stride** **must** be multiples of 8
- VUID-vkGetQueryPoolResults-stride-08993
If **VK_QUERY_RESULT_WITH_AVAILABILITY_BIT** is set, **stride** **must** be large enough to contain the unsigned integer representing availability in addition to the query result
- VUID-vkGetQueryPoolResults-queryType-03229
If the **queryType** used to create **queryPool** was **VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR**, then **pData** and **stride** **must** be multiples of the size of [VkPerformanceCounterResultKHR](#)
- VUID-vkGetQueryPoolResults-queryType-04519
If the **queryType** used to create **queryPool** was **VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR**, then **stride** **must** be large enough to contain the [VkQueryPoolPerformanceCreateInfoKHR::counterIndexCount](#) used to create **queryPool** times the size of [VkPerformanceCounterResultKHR](#)
- VUID-vkGetQueryPoolResults-dataSize-00817
dataSize **must** be large enough to contain the result of each query, as described [here](#)

Valid Usage (Implicit)

- VUID-vkGetQueryPoolResults-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkGetQueryPoolResults-queryPool-parameter
queryPool **must** be a valid [VkQueryPool](#) handle
- VUID-vkGetQueryPoolResults-pData-parameter
pData **must** be a valid pointer to an array of **dataSize** bytes

- VUID-vkGetQueryPoolResults-flags-parameter
flags **must** be a valid combination of `VkQueryResultFlagBits` values
- VUID-vkGetQueryPoolResults-dataSize-arraylength
dataSize **must** be greater than 0
- VUID-vkGetQueryPoolResults-queryPool-parent
queryPool **must** have been created, allocated, or retrieved from **device**

Return Codes

Success

- `VK_NOT_READY`
- `VK_SUCCESS`

Failure

- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

Bits which **can** be set in `vkGetQueryPoolResults::flags` and `vkCmdCopyQueryPoolResults::flags`, specifying how and when results are returned, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkQueryResultFlagBits {
    VK_QUERY_RESULT_64_BIT = 0x00000001,
    VK_QUERY_RESULT_WAIT_BIT = 0x00000002,
    VK_QUERY_RESULT_WITH_AVAILABILITY_BIT = 0x00000004,
    VK_QUERY_RESULT_PARTIAL_BIT = 0x00000008,
} VkQueryResultFlagBits;
```

- `VK_QUERY_RESULT_64_BIT` specifies the results will be written as an array of 64-bit unsigned integer values. If this bit is not set, the results will be written as an array of 32-bit unsigned integer values.
- `VK_QUERY_RESULT_WAIT_BIT` specifies that Vulkan will wait for each query's status to become available before retrieving its results.
- `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT` specifies that the availability status accompanies the results.
- `VK_QUERY_RESULT_PARTIAL_BIT` specifies that returning partial results is acceptable.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryResultFlags;
```

`VkQueryResultFlags` is a bitmask type for setting a mask of zero or more `VkQueryResultFlagBits`.

To copy query statuses and numerical results directly to buffer memory, call:

```
// Provided by VK_VERSION_1_0
void vkCmdCopyQueryPoolResults(
    VkCommandBuffer          commandBuffer,
    VkQueryPool              queryPool,
    uint32_t                 firstQuery,
    uint32_t                 queryCount,
    VkBuffer                  dstBuffer,
    VkDeviceSize              dstOffset,
    VkDeviceSize              stride,
    VkQueryResultFlags        flags);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the query pool managing the queries containing the desired results.
- `firstQuery` is the initial query index.
- `queryCount` is the number of queries. `firstQuery` and `queryCount` together define a range of queries.
- `dstBuffer` is a `VkBuffer` object that will receive the results of the copy command.
- `dstOffset` is an offset into `dstBuffer`.
- `stride` is the stride in bytes between results for individual queries within `dstBuffer`. The required size of the backing memory for `dstBuffer` is determined as described above for `vkGetQueryPoolResults`.
- `flags` is a bitmask of `VkQueryResultFlagBits` specifying how and when results are returned.

Any results written for a query are written according to [a layout dependent on the query type](#).

Results for any query in `queryPool` identified by `firstQuery` and `queryCount` that is available are copied to `dstBuffer`.

If `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT` is set, results for all queries in `queryPool` identified by `firstQuery` and `queryCount` are copied to `dstBuffer`, along with an extra availability value written directly after the results of each query and interpreted as an unsigned integer. A value of zero indicates that the results are not yet available, otherwise the query is complete and results are available.

Results for any available query written by this command are final and represent the final result of the query. If `VK_QUERY_RESULT_PARTIAL_BIT` is set, then for any query that is unavailable, an intermediate result between zero and the final result value is written for that query. Otherwise, any result written by this command is undefined.

If `VK_QUERY_RESULT_64_BIT` is set, results and availability values for all queries are written as an array of 64-bit values. If the `queryPool` was created with `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, results for each query are written as an array of the type indicated by `VkPerformanceCounterKHR::storage` for the counter being queried. Otherwise, results and availability values are written as an array of 32-bit values. If an unsigned integer query's value overflows the result type, the value **may** either wrap or saturate. If a signed integer query's value overflows the result type, the value is undefined. If a floating-point query's value is not representable as the result type, the value is undefined.

This command defines an execution dependency between other query commands that reference the same query.

The first [synchronization scope](#) includes all commands which reference the queries in `queryPool` indicated by `query` that occur earlier in [submission order](#). If `flags` does not include `VK_QUERY_RESULT_WAIT_BIT`, `vkCmdEndQuery`, `vkCmdWriteTimestamp2KHR`, and `vkCmdWriteTimestamp` are excluded from this scope.

The second [synchronization scope](#) includes all commands which reference the queries in `queryPool` indicated by `query` that occur later in [submission order](#).

The operation of this command happens after the first scope and happens before the second scope.

`vkCmdCopyQueryPoolResults` is considered to be a transfer operation, and its writes to buffer memory **must** be synchronized using `VK_PIPELINE_STAGE_TRANSFER_BIT` and `VK_ACCESS_TRANSFER_WRITE_BIT` before using the results.

Valid Usage

- VUID-vkCmdCopyQueryPoolResults-firstQuery-09436
`firstQuery` **must** be less than the number of queries in `queryPool`
- VUID-vkCmdCopyQueryPoolResults-firstQuery-09437
The sum of `firstQuery` and `queryCount` **must** be less than or equal to the number of queries in `queryPool`
- VUID-vkCmdCopyQueryPoolResults-queryCount-09438
If `queryCount` is greater than 1, `stride` **must** not be zero
- VUID-vkCmdCopyQueryPoolResults-queryType-09439
If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TIMESTAMP`, `flags` **must** not contain `VK_QUERY_RESULT_PARTIAL_BIT`
- VUID-vkCmdCopyQueryPoolResults-queryType-09440
If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, `flags` **must** not contain `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT`, `VK_QUERY_RESULT_PARTIAL_BIT`, or `VK_QUERY_RESULT_64_BIT`
- VUID-vkCmdCopyQueryPoolResults-queryType-09441
If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the `queryPool` **must** have been recorded once for each pass as retrieved via a call to `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`

- VUID-vkCmdCopyQueryPoolResults-None-09402
All queries used by the command **must** not be uninitialized when the command is executed
- VUID-vkCmdCopyQueryPoolResults-dstOffset-00819
dstOffset **must** be less than the size of **dstBuffer**
- VUID-vkCmdCopyQueryPoolResults-flags-00822
If **VK_QUERY_RESULT_64_BIT** is not set in **flags** then **dstOffset** and **stride** **must** be multiples of 4
- VUID-vkCmdCopyQueryPoolResults-flags-00823
If **VK_QUERY_RESULT_64_BIT** is set in **flags** then **dstOffset** and **stride** **must** be multiples of 8
- VUID-vkCmdCopyQueryPoolResults-dstBuffer-00824
dstBuffer **must** have enough storage, from **dstOffset**, to contain the result of each query, as described [here](#)
- VUID-vkCmdCopyQueryPoolResults-dstBuffer-00825
dstBuffer **must** have been created with **VK_BUFFER_USAGE_TRANSFER_DST_BIT** usage flag
- VUID-vkCmdCopyQueryPoolResults-dstBuffer-00826
If **dstBuffer** is non-sparse then it **must** be bound completely and contiguously to a single **VkDeviceMemory** object
- VUID-vkCmdCopyQueryPoolResults-queryType-03232
If the **queryType** used to create **queryPool** was **VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR**, **VkPhysicalDevicePerformanceQueryPropertiesKHR::allowCommandBufferQueryCopies** **must** be **VK_TRUE**
- VUID-vkCmdCopyQueryPoolResults-None-07429
All queries used by the command **must** not be active
- VUID-vkCmdCopyQueryPoolResults-None-08752
All queries used by the command **must** have been made *available* by prior executed commands

Valid Usage (Implicit)

- VUID-vkCmdCopyQueryPoolResults-commandBuffer-parameter
commandBuffer **must** be a valid **VkCommandBuffer** handle
- VUID-vkCmdCopyQueryPoolResults-queryPool-parameter
queryPool **must** be a valid **VkQueryPool** handle
- VUID-vkCmdCopyQueryPoolResults-dstBuffer-parameter
dstBuffer **must** be a valid **VkBuffer** handle
- VUID-vkCmdCopyQueryPoolResults-flags-parameter
flags **must** be a valid combination of **VkQueryResultFlagBits** values
- VUID-vkCmdCopyQueryPoolResults-commandBuffer-recording
commandBuffer **must** be in the **recording state**
- VUID-vkCmdCopyQueryPoolResults-commandBuffer-cmdpool

The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, or `VK_QUEUE_GRAPHICS_BIT` operations

- `VUID-vkCmdCopyQueryPoolResults-renderpass`
This command **must** only be called outside of a render pass instance
- `VUID-vkCmdCopyQueryPoolResults-commonparent`
Each of `commandBuffer`, `dstBuffer`, and `queryPool` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	<code>VK_QUEUE_COMPUTE_BIT</code> <code>VK_QUEUE_GRAPHICS_BIT</code>	Action

Rendering operations such as clears, MSAA resolves, attachment load/store operations, and blits **may** count towards the results of queries. This behavior is implementation-dependent and **may** vary depending on the path used within an implementation. For example, some implementations have several types of clears, some of which **may** include vertices and some not.

18.3. Occlusion Queries
