

HANDS-ON SONOGRAPHER TRAINING PROGRAM: PILOT

FEBRUARY 2025 - BOOSTUP! GRANT

Final Report

PREPARED AND PRESENTED BY
AMY PORTER
EXECUTIVE DIRECTOR

Report Overview

A PROJECT SUMMARY HIGHLIGHTING KEY INDICATORS AND TOPICS.

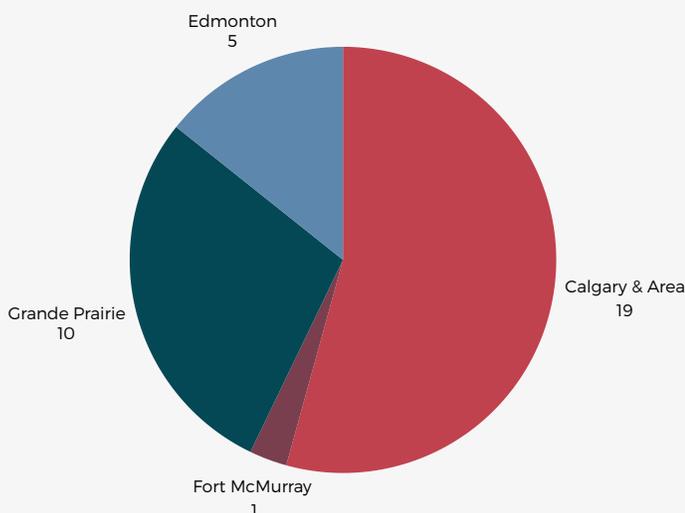

SUBJECT	PAGE NUMBER
PERFORMANCE METRICS FINAL TALLY OF TRAINED SONOGRAPHERS AND RESOURCES SENT	2 - 6
FINANCIAL REPORT HOW FUNDS WERE DISPERSED	7 - 10
PROJECT REFLECTION SUCCESSES, ROADBLOCKS, AND A SHIFT IN FOCUS	11 - 15

Performance Metrics:

People Trained & Resources Delivered

HANDS-ON TRAINING

During the grant period, we provided hands-on training to **35 sonographers** in Alberta, supported by our fetal and paediatric cardiologists.

In addition to hands-on training, we provided additional educational seminars (virtual and in-person) for sonographers.

Other Training Metrics

VIRTUAL TRAINING & IN-PERSON LUNCH-AND-LEARN

Most of our hands-on training was located in Calgary. Alongside this training, Dr. Deborah Fruitman and Dr. Lindsay Mills also provided one hour lunch-and-learn sessions for all sonographers and radiologists at each clinic.

Over the four days of training that they provided, **53 sonographers and radiologists** participated in these sessions, some of whom also received hands-on training.

Dr. Lisa Hornberger and Dr. Angela McBrien discovered that ultrasound clinics in Red Deer, High Level, and Fort McMurray were less interested in hands-on training and instead requested a virtual training which was conducted using Microsoft Teams on December 2, 2024 from 5:30pm - 7:30pm.

This session was hosted by an ultrasound company and approximately **50 sonographers and radiologists** participated in the session titled, "How to Screen and then Unknowns." Participants were mainly from Edmonton, with some participants from Fort McMurray as well as Red Deer Hospital.

Dr. Luke Eckersley also provided a lunch-and-learn session to **16 sonographers and radiologists** in Grande Prairie.

Parent Perspective

GUEST SPEAKER PRESENTATION

Amy Porter was contracted to provide a video regarding the parent perspective during a prenatal CHD diagnosis. The video created was 14 minutes 12 seconds long, with seven minutes exploring the following peer reviewed research articles;

Kaur, A. et al. (2021).

Location of Residence but not socioeconomic status impacts fetal detection of congenital heart disease despite universal health coverage.

Journal of the American College of Cardiology, 77(18), 451.

Kaur, A. et al. (2022).

Trends in the Prenatal Detection of Major Congenital Heart Disease in Alberta From 2008–2018

Journal of Obstetrics and Gynaecology Canada, 44(8), 895-900

Nisselrooij et al. (2020).

Why are congenital heart defects being missed?

Ultrasound in Obstetrics & Gynecology, 55(6), 747-757.

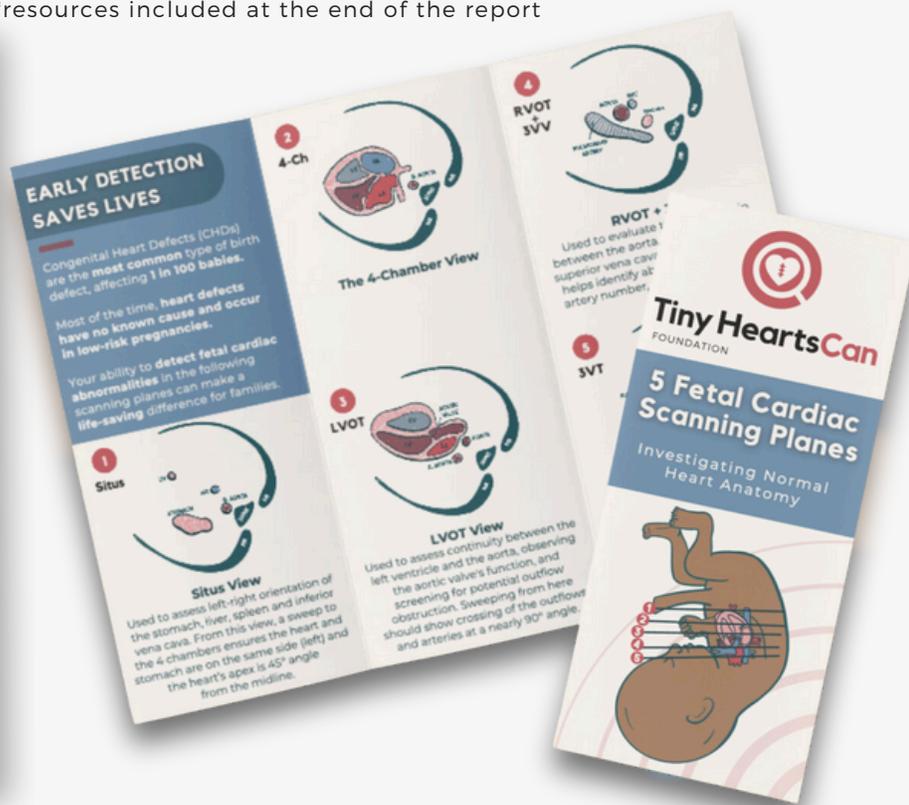

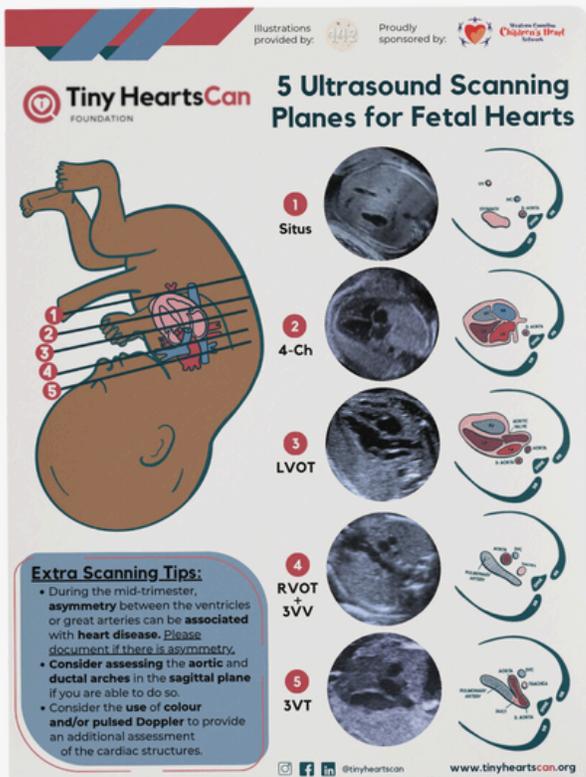

Uzun et al. (2018).

Training: improving antenatal detection and outcomes of congenital heart disease.

BMJ Open Quality, 7(4), e000276.

This video was shown 3 times during various training sessions with comments received saying that it was very impactful. Discussions were had regarding the length of the presentation, wondering if it would be more beneficial to trim the parent video in favour of the presentations created by our team of fetal cardiologists for future trainings outside of the scope of this grant.

*resources included at the end of the report

Physical Resources

POSTERS & PAMPHLETS

During the granting period, we created and printed 180 posters (18"x24") of "5 Ultrasound Scanning Planes for Fetal Hearts" and 2000 pamphlets titled, "5 Fetal Cardiac Scanning Planes; Investigating Normal Heart Anatomy."

A total of **17 posters** have been distributed, with another **16** to be delivered at the end of February upon the clinic's request. Within this distribution, 5 posters were sent to post-secondary institutions for the Diagnostic Medical Imaging students to review during their labs.

The sonographer pamphlets were produced in January. **45 pamphlets** were requested from a clinic in Calgary which will be placed in each of their ultrasound examination rooms for sonographers to utilize as a quick fetal cardiac reference.

A Final Tally

TOTAL PEOPLE TRAINED & RESOURCE DISBURSEMENT

At the onset of the BoostUp! Grant, we had anticipated training between 150 and 300 sonographers over the course of the one-year period.

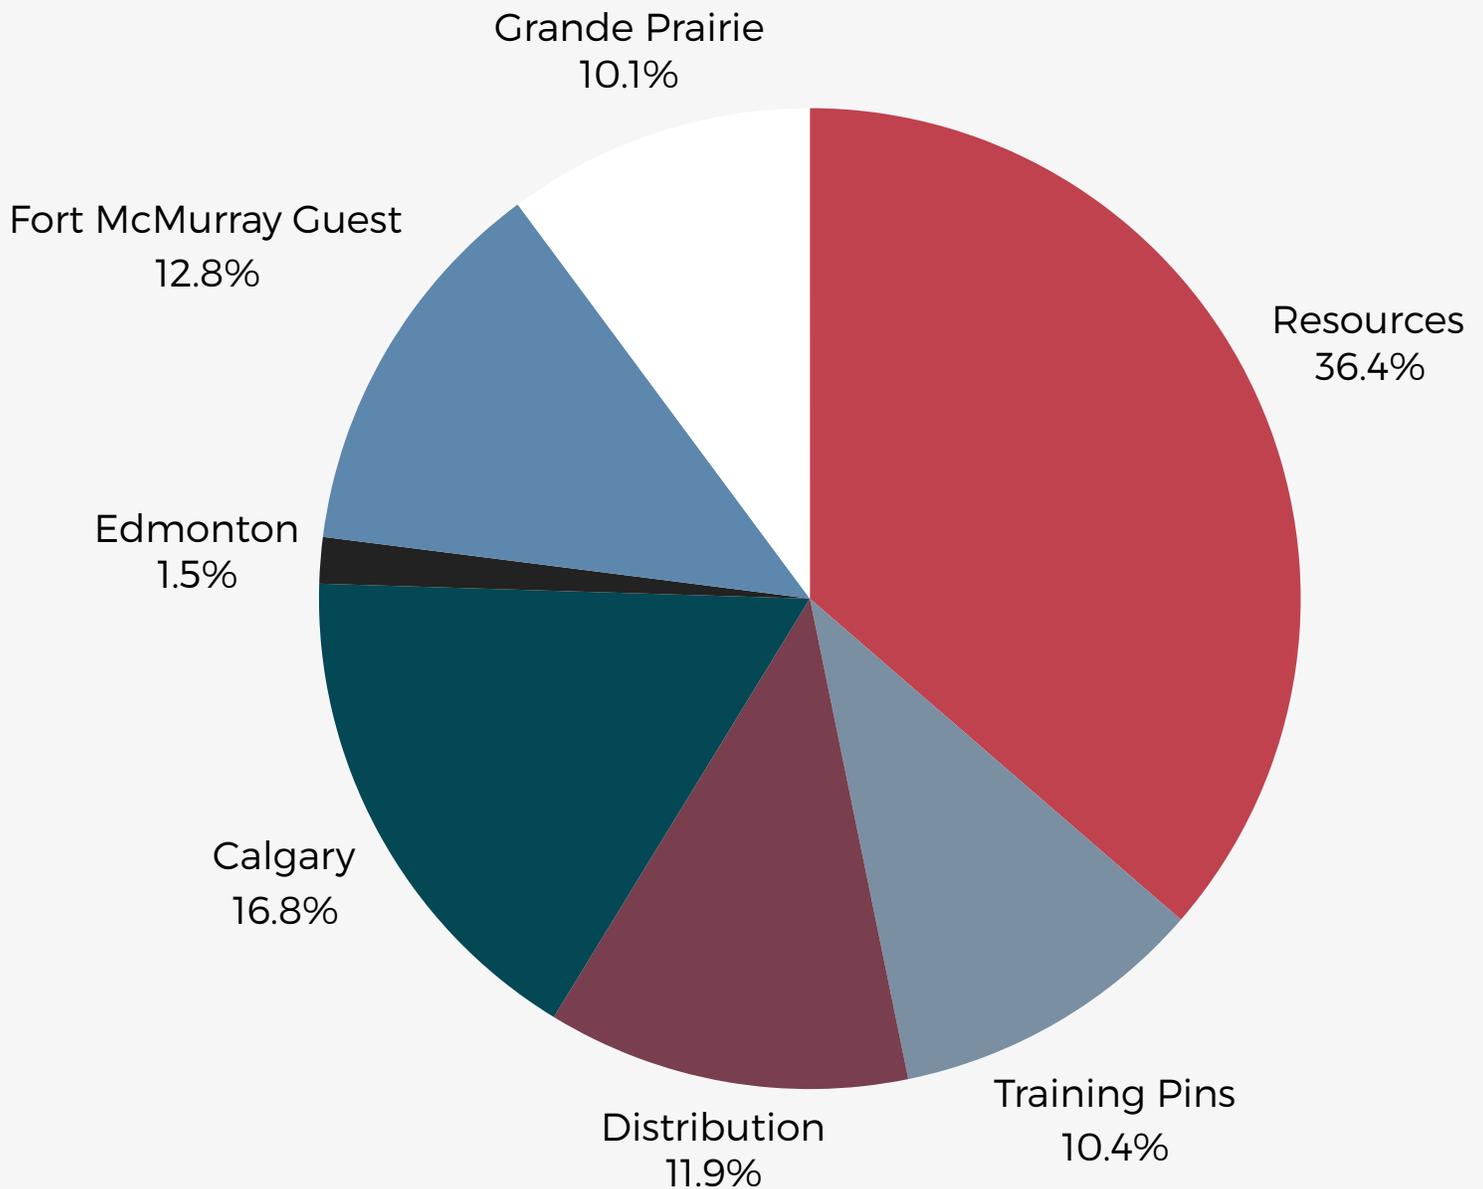

While we were only able to hand out 35 training pins to those who completed our hands-on training initiative, our outreach was expanded by utilizing our time in physical clinics, as well as providing virtual training options. Given that some of the participants may have been double-counted in the “Hands-on” and “Lunch & Learn” categories, we can safely say that we provided some variety of training for at least **119 individuals**.

Posters have been sent to **4 ultrasound companies**, some of which requested more resources to place at other sites, and **2 post-secondary institutions**.

Pamphlets are beginning distribution, and will be dispersed to ultrasound clinics across Alberta.

Project Reflection:

Successes, Roadblocks & A Shift in Focus

Although our Hands-On Sonographer Training Pilot Program did not go quite as planned, this project was largely a success. With the grant funding, we were able to create two NEW resources for sonographers and radiologists to refer to in their own clinics and were able to train around 120 individuals in some capacity.

Being the heart-nerds that we are, our enthusiasm for increased prenatal CHD detection clouded the reality that first and foremost, we are building new relationships with ultrasound clinics. While we understand the value of our training, we did not anticipate how much time would be required to build relationships with Alberta's private clinics.

Cultivating these relationships with ultrasound clinics caused us to pause and reflect on what hands-on training can look like.

Multiple Offerings

WHAT CAN TRAINING LOOK LIKE?

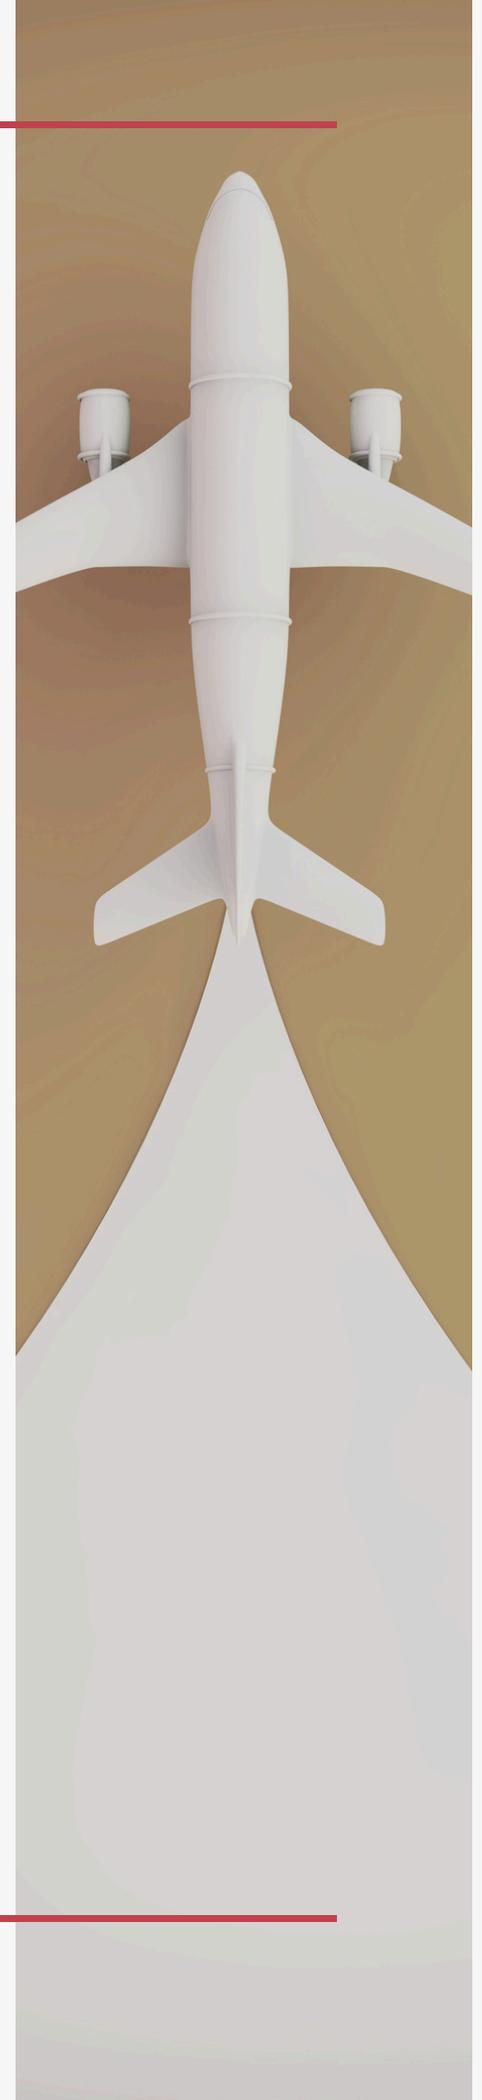

The bulk of our projected grant spending was in travel, accommodation, and per diem costs to send our team to rural communities for training.

Dr. Lisa Hornberger reached out to High Level who rejected our offer. Dr. Angela McBrien reached out to Red Deer, who also rejected our offer. Some clinics said that the quantity of obstetric exams that they have in one day would not be sufficient for multiple days of training.

To accommodate this hurdle, we then offered to fly one of the clinic's sonographers to Edmonton for training. In the end, we had one clinic from Fort McMurray able to take us up on that offer, who had a sonographer join Dr. Lisa Hornberger and Dr. Luke Eckersley in Edmonton mid-December 2024. This representative would then take back the lessons they learned to share with their team.

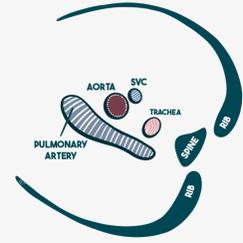

During this training date, Dr. Lisa Hornberger and Dr. Luke Eckersley also hosted 5 other sonographer representatives from the Edmonton area. Feedback from this event was largely positive, stating that the first day of training especially was incredibly valuable.

Moving forward, we will continue to collaborate with rural ultrasound clinics to offer them hands-on training experiences, whether that is through training in Edmonton with our team, or sending one of our representatives to their locations.

A Shift in Focus

HOW CAN WE ACHIEVE OUR GOALS?

The Southern Alberta team had great success in training initiatives within the Calgary area. They continue to build relationships with rural communities, working towards hands-on training in those areas, as none have yet organized a hands-on training date.

To accommodate our spending budget, we agreed that providing lunch for our volunteer educators as well as those participating in the lunch-and-learn was a good use of funds, helping to build our relationship with these companies.

However, our long-term goal is to provide training to rural ultrasound clinics, knowing that their prenatal CHD detection rates are only 37%. Understanding that the granting period was winding down, we took a dramatic shift in focus to help us achieve this goal.

We quickly developed a pamphlet for sonographers, detailing five fetal cardiac scanning planes and their importance, along with useful CHD detection tips. Our plan is to send 2-3 pamphlets to each ultrasound clinic in Alberta alongside an introduction letter, inviting clinics to join our training waitlist. We are hopeful that these pamphlets will position Tiny HeartsCan as experts in fetal cardiology, assisting us in expanding our outreach, as well as helping us to build a broader presence in Alberta - after all, people can't receive training from an organization that they don't know exists.

The images utilized for this pamphlet were already produced for our Scanning Planes poster, which was edited in November of 2024. We found that view #4 should also include the 3 vessel view - a compulsory view for exams. This edit now sets our poster apart from others as we have a combined Right Ventricular Outflow Tract View and 3 Vessel View in one image.

Collecting New Data

ULTRASOUND CLINIC LISTS

Using the January 15, 2025 data from CPSA Accredited Facility Listing website of all ultrasound clinics in Alberta, Allison Rose and I disseminated the list to only include facilities that provide a second trimester ultrasound. We included relevant data, such as phone numbers and email addresses where applicable, and will use it as a central database for our outreach initiatives.

Some clinics are colour coded to represent ultrasound clinics located on Indigenous Nation reserves so that we can carefully and intentionally cultivate respectful relationships with those communities. Others are coded for trainings that have already happened, for resource requests, or for unclear information.

After going through the 375 clinic list, we have narrowed our mailing efforts down to about 200 facilities in Alberta. We will begin mailing letters this spring.

Survey Responses

TESTIMONIALS

Few sonographers completed the online survey, which included four key questions:

1. PRIOR to Tiny HeartsCan's sonographer training, I was very confident in identifying abnormalities in fetal hearts. (Scale 0-5)
2. AFTER Tiny HeartsCan's sonographer training, I am very confident in identifying abnormalities in fetal hearts. (Scale 0-5)
3. What was your biggest takeaway, or "aha moment," from the training you received?
4. How can we improve our training efforts?

For those who took the survey, sonographers increased their knowledge by one point after training.

“Aha” moments included;

“Seeing the heart with colour and how to identify pathology with colour.”

“3VtV view and how to show both pulmonary arteries from the Rvot”

“The discussion of and practice with the 3VT view was the biggest takeaway for me.”

Things to improve on:

“It could be helpful to have a more pre-set order of views or communication of what views we should move through while we are being observed. I felt unsure of what views to move on to once I had taken the images and scanned through the heart while the observers were still in the room watching.”

“I hope it was more days for the training. 2 or 3 days.”

“I feel as it was a very thorough presentation and was fantastic!”

“Maybe if it was recorded that would be better so future hires could check this out.”

Western Canadian
Children's Heart
Network

Thank You

YOUR SUPPORT IS VALUED

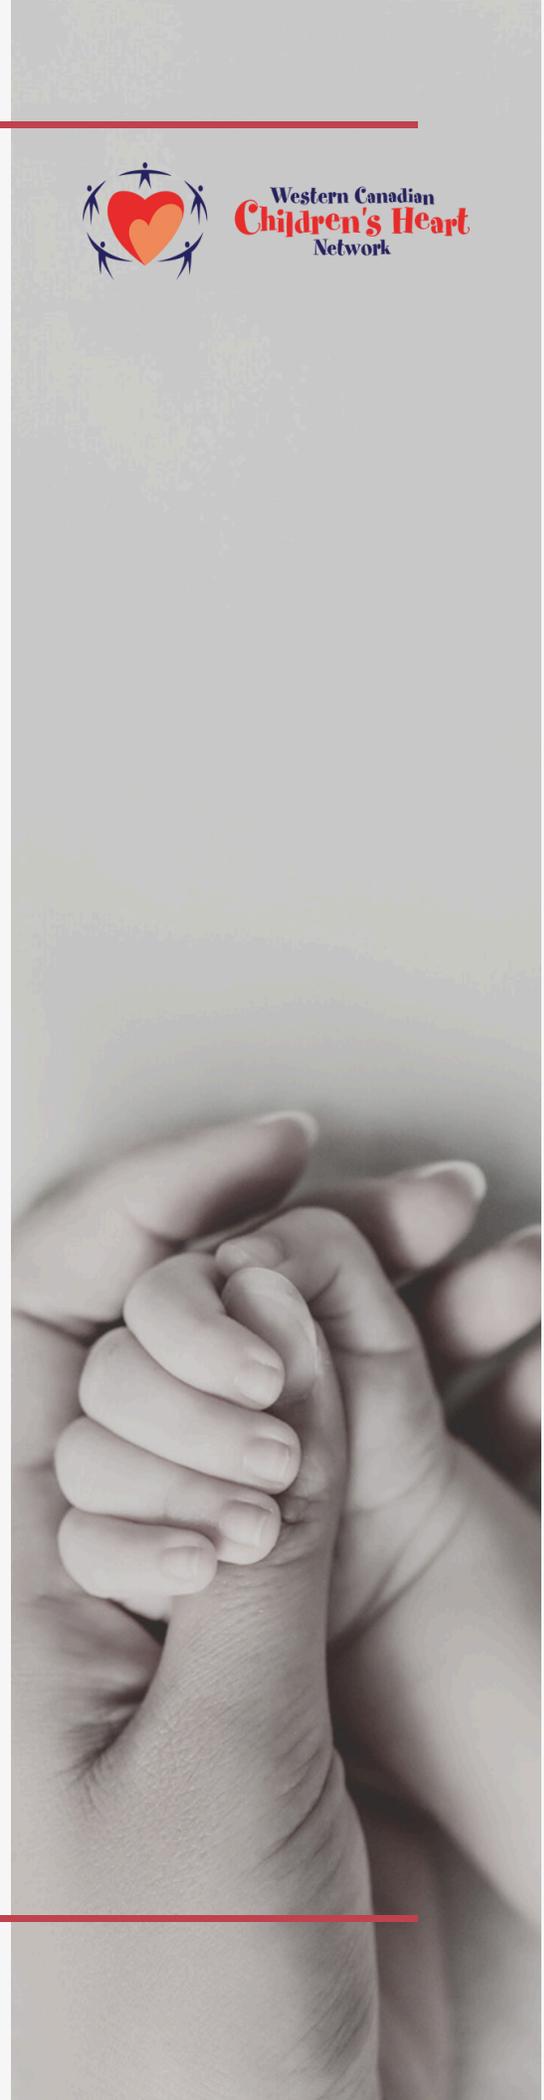

We would like to thank the Western Canadian Children's Heart Network for their continued support for our Alberta hands-on sonographer training program.

This project and the lessons learned from this experience would not have been possible without the financial support we received, allowing us to test theories and to try something that has never been done on such a large scale in Alberta or Canada.

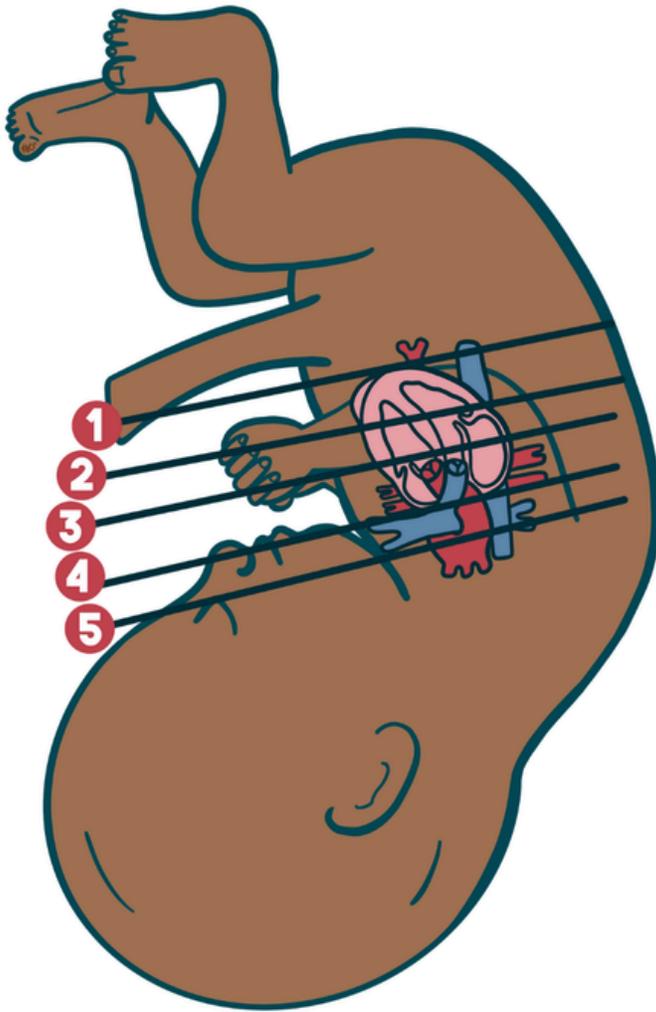

We are excited to be able to help more babies with CHD get their life-saving diagnosis before birth and to see the impact our outreach will have long-term for these infants and their families.

3VT

Extra Scanning Tips:

- During the mid-trimester, **asymmetry** between the ventricles or great arteries can be **associated** with **heart disease**. Please document if there is asymmetry.
- **Consider assessing** the **aortic** and **ductal arches** in the **sagittal plane** if you are able to do so.
- Consider the **use of colour and/or pulsed Doppler** to provide an additional assessment of the cardiac structures.

ADDITIONAL FETAL CARDIAC SCANNING TIPS

1. During the mid-trimester, **asymmetry** between the ventricles or great arteries can be **associated** with **heart disease**.

Please document if there is asymmetry.

2. Consider **assessing** the **aortic** and **ductal arches** in the **sagittal plane** if you are able to do so.

3. Consider the **use** of **colour** and/or **pulsed Doppler** to provide an additional assessment of the cardiac structures.

Helpful Reminders:

Take your time during the cardiac portion of the 20-week anomaly exam to ensure that all structures are seen clearly.

Recognizing the abnormality is more than enough.

Naming the defect is the cherry on top of a potentially life-saving referral.

Communicate clearly with pregnant patients - many people are still learning the importance of the 20-week exam.

ABOUT US

Our mission is to help more babies with heart defects get their lifesaving diagnoses before birth.

Tiny HeartsCan is the **ONLY** charity in Canada working to increase prenatal detection of heart defects. We support sonographers with resources as well as hands-on and virtual trainings.

Tiny HeartsCan is led by doctors, sonographers, and parents.

You can save a life.

FOUNDATION

5 Fetal Cardiac Scanning Planes

Investigating Normal Heart Anatomy

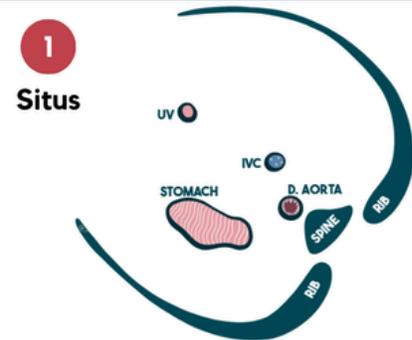

EARLY DETECTION SAVES LIVES

Congenital Heart Defects (CHDs) are the **most common** type of birth defect, affecting **1 in 100 babies**.

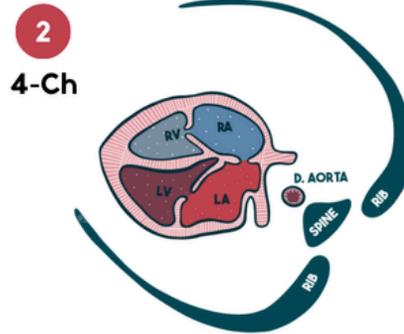

Most of the time, **heart defects have no known cause and occur in low-risk pregnancies**.

Your ability to **detect fetal cardiac abnormalities** in the following scanning planes can make a **life-saving** difference for families.

Situs View

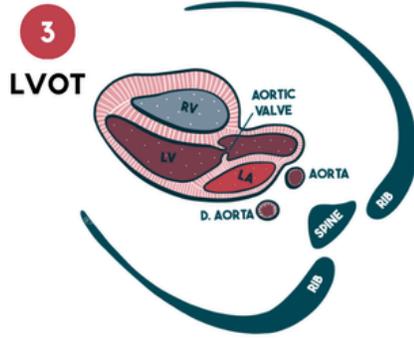

Used to assess left-right orientation of the stomach, liver, spleen and inferior vena cava. From this view, a sweep to the 4 chambers ensures the heart and stomach are on the same side (left) and the heart's apex is 45° angle from the midline.

4-Ch

The 4-Chamber View

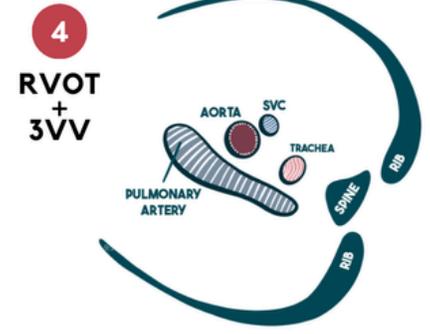

Used to evaluate the heart's chambers and their respective sizes, the septa's integrity, the atrioventricular valves, the heart's systolic function (squeeze), rhythm, and size (1/3 of the fetal chest).

LVOT

LVOT View

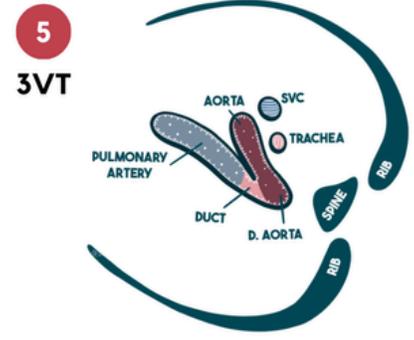

Used to assess continuity between the left ventricle and the aorta, observing the aortic valve's function, and screening for potential outflow obstruction. Sweeping from here should show crossing of the outflows and arteries at a nearly 90° angle.

RVOT + 3VV

RVOT + 3VV

Used to evaluate the relationship between the aorta, pulmonary artery, superior vena cava, and the trachea. It helps identify abnormalities in great artery number, relationship and size.

3VT

3VT View

From the 3VV, a sweep towards the fetal head shows how the great arteries join their respective arches to form a V-shape confluence to the left of the trachea. The arteries and arches (ductus arteriosus and aortic arch) should be comparable in size.
